Electronic Brake Control Module: Technical Service Bulletins Antilock Brakes - Service Tips

Article No. 93-15-16

07/21/93

^ BRAKES - REAR ANTI-LOCK BRAKE SYSTEM (RABS) - ADVERSE BRAKING CHARACTERISTICS - RABS WARNING LIGHT NOT ON, MAY OCCUR WHEN INCORRECT RABS MODULE IS INSTALLED - SERVICE TIP

^ BRAKES - REAR ANTI-LOCK BRAKE SYSTEM (RABS) - INCORRECT (RABS I) ELECTRONIC CONTROL UNIT INSTALLED IN RABS II EQUIPPED VEHICLES - SERVICE TIP

LIGHT TRUCK: 1987-90 BRONCO II 1987-92 BRONCO 1987-93 F-150 1989-93 RANGER 1990-93 AEROSTAR, E SERIES 1991-92 EXPLORER

ISSUE: Adverse braking characteristics and failure of the RABS light to indicate a RABS failure may be caused by improper servicing of RABS II equipped vehicles with RABS I electronic control units.

ACTION:

When replacing a RABS electronic control unit, refer to the following RABS Module Chart for correct parts usage.

RABS II modules have been designed with Keep Alive Memory and are to be used to service all prior year RABS I systems, except for 1987 and 1988 Bronco II vehicles.

SRW = SINGLE REAR WHEEL; DRW = DUAL REAR WHEEL

SERVICE PARTS RETURN OF BRAKE COMPUTER MODULE

LIGHT TRUCK: 1987-93 F-150-350 SERIES 1989-93 BRONCO, RANGER 1990-93 AEROSTAR 1991-92 EXPLORER

ISSUE: The subject Module - Brake Computer (E7TZ-2C018-A, F2UZ-2C018-A, F2TZ-2C018-A, FOUZ-2C018-A and E99Z-2C018-A) are being replaced by different part numbers. They should be withdrawn from your inventory and returned to your facing PDC within 30 days of this TSB.

ACTION: Remove and return the obsolete parts from your dealership's inventory.

1. Return obsolete parts (Noted above) to your facing PDC using the least expensive transportation.

2. If claim is processed electronically via DOES II use return code "GB"; otherwise, complete a separate paper claim form FPS-340 using return code "J".

3. In the Remarks Section write "Returned per TSB 93-17-13".

LIMITS

^ The returns must be received within 30 days from the date of this TSB.

^ Returns are restricted to the subject parts.

^ The parts returned must have been purchased from FPSD in accordance with Policy and Procedure Bulletin 4000.

CREDIT

Credit for parts and prepaid freight costs will be issued.

NOTE: REPLACEMENT STOCK IS AVAILABLE FOR ORDERING IMMEDIATELY.

Electronic Brake Control Module: Locations

I/P Components

Behind Center Of I/P, LH Side Of Ashtray

Electronic Brake Control Module: Service and Repair

1. Disconnect battery ground cable.

2. Disconnect wiring harness from RABS module.

3. On Bronco, Bronco II, F-Series, Ranger and Explorer models, remove module to instrument panel retaining screws behind center of instrument panel.

4. On Aerostar models, remove module to instrument panel anti-skid plate retaining screws on lefthand side of engine cover under instrument panel.

5.

On E-Series models, remove parking brake actuator assembly as follows: a.

Loosen adjusting nut at equalizer.

b. From inside engine compartment, remove nuts attaching actuator assembly to cowl.

c. From under instrument panel, remove one bolt attaching actuator assembly to lower flange of instrument panel.

d. Remove parking brake cable from actuator assembly by compressing conduit end fitting prongs using a 1/2 inch box wrench.

e. Remove actuator assembly.

6. On Aerostar and E-Series models, remove two module attaching screws, then the module.

7. On all models, reverse procedure to install, then check system for proper operation.

Cruise Control Module: Customer Interest Radio - AM Band Noise With Speed Control ON

Article No. 91-8-21

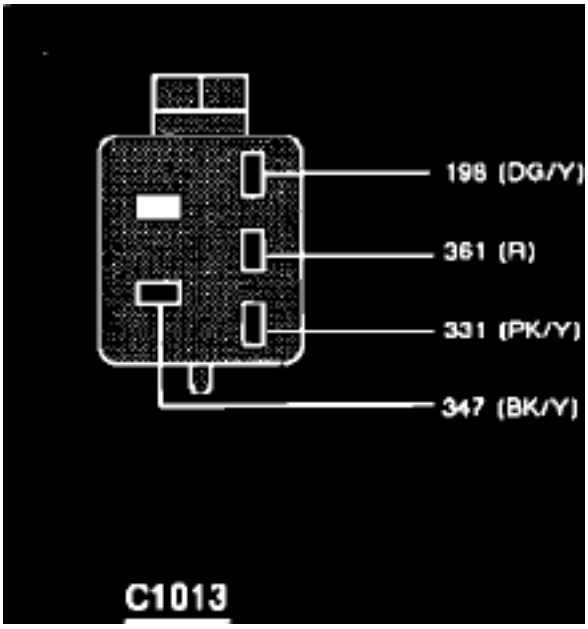
Relay And Diagnostic Connectors



Wide Open Throttle (WOT) Cutout Relay Connector

Compressor Clutch Relay: Description and Operation

When the vehicle operator goes to Wide Open Throttle (WOT), the Wide open throttle A/C (WAC) relay opens, suspending A/C operation until normal vehicle operation resumes. This is done to allow maximum power to the drive wheels under heavy acceleration or load.

• Compressor Clutch doesn't operate.	• No voltage at Clutch Cycling Pressure Switch.	• Fuse 7 blown. • Remove Connector from Cluich Cycling Pressure Switch. With the A/C-Heater Control Assembly Switch in the ON position, check for battery voltage at the 348 (P) wire.
	• Inoperative Clutch Cycling Pressure Switch.	• Check the Clutch Cycling Pressure Switch for continuity. No continuity indicates low refrigerant, or an inoperative Clutch Cycling Pressure Switch. Check refrigerant system.
	• No voltage at A/C Clutch Field Coil.	• Remove connector from the A/C Clutch Field Coil. Check the wire connector for battery voltage. Check the EEC Module (including Throttle Position Sensor and Coolant Temperature Sensor) and the WOT Cutout Relay for correct operation.
	• Inoperative A/C Clutch Field Coil.	• Repair A/C Clutch Field Coil or terminals as required.
• Compressor Clutch won't shut off.	• A/C Switch or Defrost Switch in A/C-Heater Control Assembly is stuck closed.	• Remove connector from the A/C Clutch Field Coil. Ensure correct voltage for each switch position.
• No cooling or not enough cooling (compressor operates).	• Clutch plates have no air gap. • Loose A/C Compressor drive belt. • Temperature Blend door out of adjustment. • Too much or too little Refrigerant in system.	• If compressor continues to run with connector disconnected, repair clutch air gap • Check drive belt tension. • Check operation of temperature control cable • Perform refrigerant system diagnosis and problem evaluation

Customer Notification Letter

Attachment I - Admin. and Refund Information

Administrative Information

OASIS OASIS will not contain this Owner Notification Program. Verify through OASIS if a vehicle, involved in this program, has any other outstanding Recalls or Programs. Complete all uncompleted Recall and Program service actions during a single visit by the owner.

Promptly Perform Program On: Affected vehicles with the program condition which are brought to your dealership.

Dealership Responsibilities Promptly perform this program service, if required, on all eligible vehicles. Promptly report to the "Customer Assistance Centre" at Oakville any instance in which an owner will not allow you to complete this program because of objections in scheduling or for any other reason. Advise the Company of any vehicle's ownership status change (refer Warranty and Policy Manual - Section 3.3).

Reimbursement For Program Completion And Claims Preparation Instructions Claim reimbursement through the Direct Warranty Entry (DWE) system using the RECALLS screen only (PF3 Recall Entry/Retrieval on the DWE Menu Screen). If the claim number contains more than six digits, enter only the last six digits.

NOTE:

Claim Form 1864 is no longer mailed to owners. Use a Form 6125-2, an authorized computer generated claim form or a Form 1864 as an internal repair order to support DWE Entry through the RECALLS screen. Ensure that only the RECALLS screen is used when inputting completion and reimbursement information.

Dealers without DWE capability must mail a completed Form 1864 (Company Claim Copy No. 2) to Warranty Claims Processing at Oakville for reimbursement. Forms submitted must show labor times, all parts used and their costs, the parts handling allowance, and be imprinted, dated and signed by authorized dealership personnel. All claims must show 92M78 in the Recall box.

Refunds Refund requests must be submitted on a separate claim from the program completion claim. Refund requests are governed by the following guidelines:

^

Refunds are provided only for dealer and/or owner-paid repairs directly related to this program (DRL module replacement only - parts and labor) and performed within the program coverage provision. The original copy of the paid repair order or parts invoices must be presented to any Ford or Mercury dealership.

^ Using the DWE Recall Screen, enter the following:

Administrative Allowance ..... 0.3 Hrs. Labor Code.....A Recall Code.....R92M78 Enter "REFUND INV # _____ " in the area on the claim designated for PARTS USED. Enter the owner refund amount as a "MISCELLANEOUS" cost. ^

Provide prompt refund to all eligible owners having proper documentation regardless of the source of the original service.

^ Retain the copy of the paid repair or parts invoice with a copy of the refund request in your service file for reference.

^ Dealers without DWE capability must mail their refund requests on a separate completed Form 1864 with the owner's original paid repair order or parts purchase receipt to Warranty Claims Processing. Enter the 0.3 Hrs. in Box A and "R92M78" in the Recall box of the Form. Include all amounts in the TOTAL CLAIM box.

Attachment II - Labor and Parts Information

Labour Allowance Replace DRL Module (Includes Verification of DRL System Function).

FOHZ-15A272-A ^ 1990-91 Medium/Heavy Trucks (with single headlights)

Attachment III - Tech. Instruct./Daytime Lamp Module Locations

Technical Instructions

Correction of wiring connections and/or replacement of burned out fuses and bulbs is not covered by this program.

Description of Daytime Running Light (DRL) System Operation

The DRL System is designed to turn the Hi beam headlights ON with a reduced light output, and without illuminating the high beam indicator lamp in the instrument panel when the following conditions are met: ^

The vehicle is running.

^ The parking brake is fully released.

^ The headlight switch is in OFF position.

NOTE:

If the vehicle is equipped with an automatic lighting system, the DRL System is active until the automatic system turns on the headlights.

DRL Module Removal and Installation Procedure (Refer to Daytime Running Light Module Location Table.) Refer to the Vehicle's 1990 or 1991 Shop Manual, Section 32 "Lighting System", for Removal and Installation instructions. Mutilate and scrap the removed DRL module.

NOTE:

For the 1989 Thunderbird and Cougar cars refer to the 1990 Model Year Shop Manual.

After Installing The Replacement DRL Module Verify DRL System Function As Follows Ensure the vehicle's road wheels are blocked to preclude inadvertent vehicle movement. ^

Manual transmission in NEUTRAL.

^ Automatic Transmission in PARK. (Neutral on Heavy Trucks with Allison automatic.)

1. Parking brake applied and headlight switch OFF, start engine.

^ The headlights (Hi or Lo beam) should not be illuminated.

2. Parking brake released and headlight switch OFF, engine running.

^ The high beams should be ON at reduced intensity.

NOTE:

A comparison check for full intensity can be made using flash-to-pass or by putting headlight switch ON and switching to high beams.

a. Turn on Park Lights.

The high beams should be ON at reduced intensity.

The high beam indicator should NOT be ON.

b. Turn on headlights (LOW BEAMS).

The low beams should be ON at full intensity. The high beams should be OFF. The high beam indicator should NOT be ON.

c. Turn on headlights (HIGH BEAMS).

The high beams should be ON at full intensity. The high beam indicator should be ON.

NOTE:

LL and LTL models use quad highlight systems and are not affected by this program.

Dealer Letter

To: All Ford of Canada Dealers

Attention: Dealer Principal, Service Manager, Parts Manager

Subject: Owner Notification Program 92M78 - Extended Coverage of Daytime Running Lights Module on Certain 1989-91 Vehicles

In OASIS NO

Listings NO

Return Removed Parts NO (Mutilate and Scrap). Program Coverage Available for 36 months or 60,000 kilometers, whichever occurs first, from original warranty start date or through July 31, 1992, whichever provides greatest coverage.

Refund Provisions YES

NOTE:

Please read and circulate this bulletin to your Service and Parts Personnel. They should become familiar with this program and be able to respond to owner inquiries.

Vehicles Affected

^ All 1989-90-91 Thunderbird and Cougar

^ All 1990 Escort

^ All 1990-91 Taurus, Sable, Tempo, Topaz, Mustang, Econoline, Aerostar, Bronco, F-Series Light Trucks, F-Super Duty, Ranger, Bronco II, Explorer and Medium/Heavy Trucks (except LL/LTL and CL with quad rectangular headlights)

Reason For This Program The Daytime Running Lights (DRL) control module may malfunction. A malfunctioning DRL module can result in Daytime Running Lights that dim, flicker or go off and in some instances may remain on after the ignition is turned OFF. Normal manual Lo and Hi beam headlight operation is not affected.

Service Action Replace the Daytime Running Light (DRL) module if the customer is experiencing any of the above described symptoms.

NOTE:

Replacement of headlight bulbs or sealed beams is not covered by this program.

Refunds If all or a portion of the repair covered by the program (DRL module replacement only - parts and labor) has been paid by the owner and/or the dealer, within program coverage provisions, both the owner and/or the dealer are eligible for a refund. Company Contacts: (Dealer use only)

Owner Letter

Mailing Date

Mr. John Sample 123 Main Street Anywhere, Prov. ANA NAN Ford Motor Company of Canada, Limited (Ford) is providing an Extended Coverage Program, number "92M78", for the Daytime

Running Lights (DRL) control module. This Program provides extended coverage to owners of certain 1989 through 1991 Model Year cars and trucks. Our records show you own the 19xx (vehicle) with the serial number shown above your name and address.

Reason For This Program And Program Period: Ford is extending the coverage for the Daytime Running Lights module in your vehicle.

This extended coverage will be provided for 3 years or 60,000 kilometers, whichever occurs first, from your vehicle's Original Warranty Start Date, or until July 31, 1992, whichever gives you the

greater coverage.

Description Of DRL System Operation: The DRL System is designed to turn the Hi beam headlights ON with a reduced light output. This is accomplished when the following conditions are met: ^

the vehicle is running.

^ the parking brake is fully released.

^ the headlight switch is in OFF position.

Symptoms Of Abnormal DRL System Operation: Symptoms associated with an improperly operating DRL module, normally include reduced, flickering or no DRL illumination. In some instances, the DRL may remain on when the ignition is turned OFF. Normal Lo and Hi beam headlight operation is not affected.

No Cost Service: Should you encounter symptoms such as described above, contact your Ford or Mercury dealer. Your dealer will replace the DRL control module on your vehicle under the terms of this program at no cost to you.

NOTE:

Headlight bulb or sealed beam replacement is not covered by this program.

How Long Will It Take? The time needed for this service is less than one hour. However, due to service scheduling times, your dealer may need your vehicle for one full working day.

Call Your Dealer: Call your dealer should your vehicle experience any of the above described conditions. Ask your dealer for a service appointment and if parts are in stock. Also ask your dealer to check the OASIS system for any other recalls or programs that may be required on your vehicle. If you have leased this vehicle to another person or organization, please immediately inform the lessee of the program. When you bring your vehicle in, show the dealer this letter. If you lose the letter your dealer will still do the work, free of charge.

Refunds: A full refund is available if you paid for the service covered by this Program (Daytime Running Light Control Module replacement only - parts and labor). Please give the original copy of your paid work-order or parts receipt to your dealer. Your dealer will arrange for the refund (which could take about one month).

Changed Name, Address, Or Sold The Vehicle? If you have changed your name or address, or have sold the vehicle, please fill out the enclosed prepaid postcard. Sign and date it, and mail the card to Ford. If you cannot get the service performed, contact the Ford "Customer Assistance Centre" at the address identified in the letterhead of this letter. Please identify your vehicle's serial number in any correspondence. We are taking this action as part of our efforts to ensure your long term satisfaction with the DRL feature in your vehicle. We hope this program will confirm your continued satisfaction with your Ford built vehicle.

Customer Notification Letter

Attachment I - Admin. and Refund Information

Administrative Information

OASIS OASIS will not contain this Owner Notification Program. Verify through OASIS if a vehicle, involved in this program, has any other outstanding Recalls or Programs. Complete all uncompleted Recall and Program service actions during a single visit by the owner.

Promptly Perform Program On: Affected vehicles with the program condition which are brought to your dealership.

Dealership Responsibilities Promptly perform this program service, if required, on all eligible vehicles. Promptly report to the "Customer Assistance Centre" at Oakville any instance in which an owner will not allow you to complete this program because of objections in scheduling or for any other reason. Advise the Company of any vehicle's ownership status change (refer Warranty and Policy Manual - Section 3.3).

Reimbursement For Program Completion And Claims Preparation Instructions Claim reimbursement through the Direct Warranty Entry (DWE) system using the RECALLS screen only (PF3 Recall Entry/Retrieval on the DWE Menu Screen). If the claim number contains more than six digits, enter only the last six digits.

NOTE:

Claim Form 1864 is no longer mailed to owners. Use a Form 6125-2, an authorized computer generated claim form or a Form 1864 as an internal repair order to support DWE Entry through the RECALLS screen. Ensure that only the RECALLS screen is used when inputting completion and reimbursement information.

Dealers without DWE capability must mail a completed Form 1864 (Company Claim Copy No. 2) to Warranty Claims Processing at Oakville for reimbursement. Forms submitted must show labor times, all parts used and their costs, the parts handling allowance, and be imprinted, dated and signed by authorized dealership personnel. All claims must show 92M78 in the Recall box.

Refunds Refund requests must be submitted on a separate claim from the program completion claim. Refund requests are governed by the following guidelines:

^

Refunds are provided only for dealer and/or owner-paid repairs directly related to this program (DRL module replacement only - parts and labor) and performed within the program coverage provision. The original copy of the paid repair order or parts invoices must be presented to any Ford or Mercury dealership.

^ Using the DWE Recall Screen, enter the following:

Administrative Allowance ..... 0.3 Hrs. Labor Code.....A Recall Code.....R92M78 Enter "REFUND INV # _____ " in the area on the claim designated for PARTS USED. Enter the owner refund amount as a "MISCELLANEOUS" cost. ^

Provide prompt refund to all eligible owners having proper documentation regardless of the source of the original service.

^ Retain the copy of the paid repair or parts invoice with a copy of the refund request in your service file for reference.

^ Dealers without DWE capability must mail their refund requests on a separate completed Form 1864 with the owner's original paid repair order or parts purchase receipt to Warranty Claims Processing. Enter the 0.3 Hrs. in Box A and "R92M78" in the Recall box of the Form. Include all amounts in the TOTAL CLAIM box.

Attachment II - Labor and Parts Information

Labour Allowance Replace DRL Module (Includes Verification of DRL System Function).

VEHICLE LINE LABOR TIME LABOR CODE

Thunderbird, Cougar, Tempo, Topaz, Escort, Mustang, 0.3 Hrs. B

Ranger, Explorer and Econoline.

FOHZ-15A272-A ^ 1990-91 Medium/Heavy Trucks (with single headlights)

Attachment III - Tech. Instruct./Daytime Lamp Module Locations

Technical Instructions

Correction of wiring connections and/or replacement of burned out fuses and bulbs is not covered by this program.

Description of Daytime Running Light (DRL) System Operation

The DRL System is designed to turn the Hi beam headlights ON with a reduced light output, and without illuminating the high beam indicator lamp in the instrument panel when the following conditions are met: ^

The vehicle is running.

^ The parking brake is fully released.

^ The headlight switch is in OFF position.

NOTE:

If the vehicle is equipped with an automatic lighting system, the DRL System is active until the automatic system turns on the headlights.

DRL Module Removal and Installation Procedure (Refer to Daytime Running Light Module Location Table.) Refer to the Vehicle's 1990 or 1991 Shop Manual, Section 32 "Lighting System", for Removal and Installation instructions. Mutilate and scrap the removed DRL module.

NOTE:

For the 1989 Thunderbird and Cougar cars refer to the 1990 Model Year Shop Manual.

After Installing The Replacement DRL Module Verify DRL System Function As Follows Ensure the vehicle's road wheels are blocked to preclude inadvertent vehicle movement. ^

Manual transmission in NEUTRAL.

^ Automatic Transmission in PARK. (Neutral on Heavy Trucks with Allison automatic.)

1. Parking brake applied and headlight switch OFF, start engine.

^ The headlights (Hi or Lo beam) should not be illuminated.

2. Parking brake released and headlight switch OFF, engine running.

^ The high beams should be ON at reduced intensity.

NOTE:

A comparison check for full intensity can be made using flash-to-pass or by putting headlight switch ON and switching to high beams.

a. Turn on Park Lights.

The high beams should be ON at reduced intensity.

The high beam indicator should NOT be ON.

b. Turn on headlights (LOW BEAMS).

The low beams should be ON at full intensity. The high beams should be OFF. The high beam indicator should NOT be ON.

c. Turn on headlights (HIGH BEAMS).

The high beams should be ON at full intensity. The high beam indicator should be ON.

NOTE:

LL and LTL models use quad highlight systems and are not affected by this program.

Daytime Running Light Module Locations

1989 MODEL YEAR (CARS/LIGHT TRUCKS) LOCATION

Thunderbird/Cougar In front of driver's side radiator support, vertically mounted behind bumper.

1990-1991 MODEL YEAR LOCATION

Thunderbird/Cougar In front of driver's side radiator support, vertically mounted behind bumper.

Tempo/Topaz Inside on the RH side radiator support, vertically mounted below radiator cap.

Ford Mustang Under the LH front fender apron, directly below the battery.

Taurus/Sable On the LH front fender apron, directly under the battery. (Remove LH side fender liner for access.)

Horn Relay: Locations

The horn relay is located behind the lower left side of the instrument panel, to the right of the steering column. It is attached to the speed control amplifier bracket. Vehicles not equipped with speed control do not use a horn relay.

Horn Relay: Testing and Inspection

Connectors should remain connected during following test.

1. Measure voltage between circuit 460 (yellow/light blue) and ground. If 12 volts are not indicated, check fuse F20A and repair or replace as required.

2. If circuit 460 (yellow/light blue) is as indicated, depress horn switch. Voltage at circuit 460 (horn relay terminal No. 4) should drop to about zero volts and horn should sound. If horn does not sound and circuit 460 remains at 12 volts, proceed to step 3.

3. Check for 12 volts at circuit 6 (yellow/light green) at horn relay terminals No. 2, if voltage is not present, replace relay, then repeat step 2.

4. If 12 volts are indicated at horn relay terminal No. 2, connect terminal No. 2 to ground. If horn sounds replace horn pad or buttons. If horn does not sound, check for 12 volts at circuit 1 (dark blue) at horn relay terminal No. 3 with terminal No. 2 grounded. If voltage is not indicated, replace relay and repeat step 2. If voltage is indicated, check horn connectors and function.

Engine Control Module: Customer Interest Exhaust System - Sulfur Odor

Article No. 93-24-19

11/24/93

EXHAUST - 4.0L - SULFUR ODOR

LIGHT TRUCK: 1990-93 RANGER 1991-93 EXPLORER

This TSB article is being republished in its entirety to correct the model application.

CALIBRATION: 0-58A-R00, 0-58P-R00, 1-58A-R10, 1-58P-R10, 2-58A-R00, 2-58P-R00, 0-58B-R00, 0-58R-R00, 1-58B-R10, 1-58R-R10, 2-58B-R00, 2-58R-R00

WARNING: THIS MODIFICATION IS AUTHORIZED ONLY FOR THE LISTED ENGINE. PERFORMING THIS MODIFICATION ON OTHER ENGINE CALIBRATIONS IS UNAUTHORIZED AND COULD CREATE LIABILITY UNDER APPLICABLE FEDERAL OR LOCAL LAWS.

ISSUE: An objectionable exhaust sulfur odor may be experienced during various driving conditions. This may be caused by the operating strategy of the EEC IV processor or by the catalytic converter, depending on the particular application.

ACTION: Use the following procedure to determine if a new EEC IV processor or a new catalytic converter is required. Vehicles previously serviced by TSB 93-3-17 may already have had the processor changed.

1. Perform the diagnostic procedure in the 1993 Powertrain Control/Emissions Diagnosis Service Manual, Page 2A-73. Service as required.

2. If the vehicle is a 1991-1992 Explorer with automatic transmission and the sulfur odor still exists:

a. Verify the processor part number. If not already updated, install a new EEC IV processor. Refer to the EEC IV Processor Application Chart contained in this TSB article for correct parts usage.

NOTE: THE BAP SENSOR IS NOT REQUIRED WITH THE NEW POWERTRAIN CONTROL MODULE BUT MAY REMAIN CONNECTED WITHOUT INTERFERENCE.

b. For 1991 models only, in addition to the standard entries on the Authorized Modifications Decal, write in the following instructions: "USE 1992 POWERTRAIN CONTROL/EMISSION DIAGNOSIS SERVICE MANUAL".

3. If the vehicle is:

a. a 1991-1992 Explorer with manual transmission,

b. a 1993 California Ranger/Explorer (automatic or manual transmission), or

Pin locations given for reference only. Probing 60 pin connector with DVOM probe will result in permanent damage to the pin connectors. Always probe as directed, using the Breakout Box.

ECA Connector Pin Identification

Engine Control Module: Description and Operation Electronic Control Assembly (ECA)

The Electronic Control Assembly (ECA) receives ignition ground and Profile Ignition Pickup (PIP) signals from the EDIS module then generates a Spark Angle Word (SAW) output signal based on fuel, air and other sensor information. An IDM signal is received from the EDIS module to determine if a failure mode should be recorded. For diagnosis and testing of the ECA refer to "COMPUTERIZED ENGINE CONTROLS".

Engine Control Module: Description and Operation Failure Mode Effects Management

PURPOSE

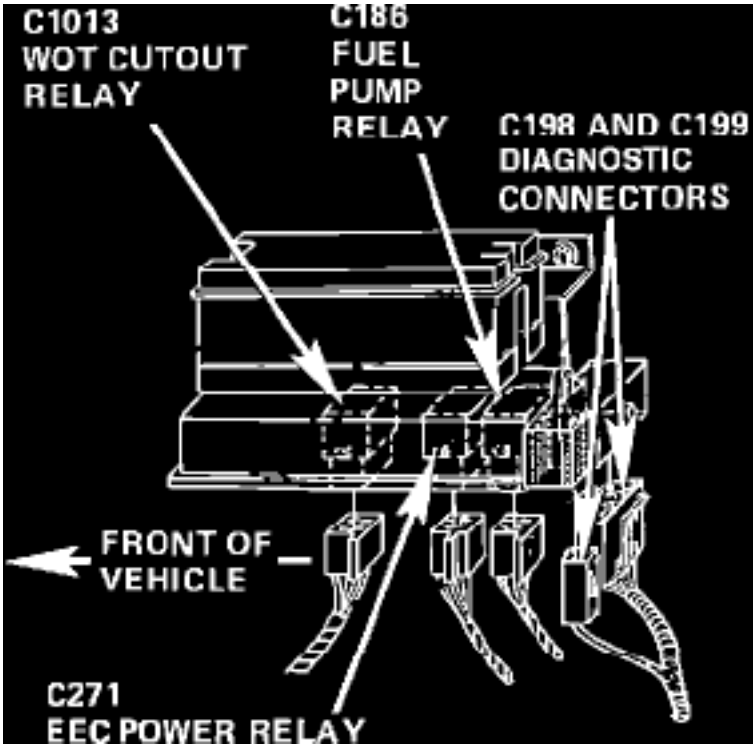
Operating mode that attempts to keep the vehicle driveable in the event of certain Electronic Engine Control (EEC) or ignition system failures.

Engine Control Module: Service and Repair

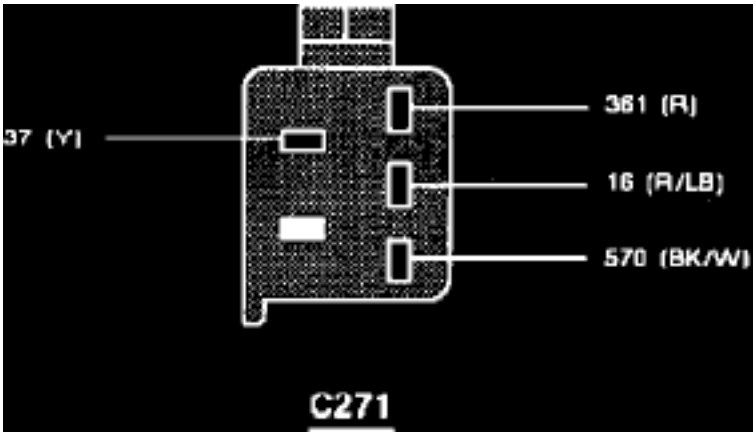
The processor stores data about vehicle operating conditions and uses this information to compensate for component tolerances. When an emission related component is replaced, Keep Alive Memory (KAM) should be cleared to erase the data stored by the processor from the original component.

1. With the ignition switch OFF, disconnect the negative battery cable for a minimum of five minutes, then reconnect the cable.

2. Operate the vehicle for a minimum of ten miles to allow the Engine Control Assembly (ECA) to relearn values for optimum driveability and performance. NOTE: Distance varies with vehicle application.



Relay And Diagnostic Connectors



EEC-IV Power Relay Connector

Main Relay (Computer/Fuel System): Description and Operation

The Engine Control Assembly (ECA) receives its operating voltage from the Electronic Engine Control (EEC) power relay. When the ignition switch is turned ON, the normally OPEN contact points of the relay CLOSE and supply power to the ECA. The control coil circuit of the relay contains a diode, wired in series, to prevent relay operation if the battery polarity is reversed, preventing damage to the ECA.

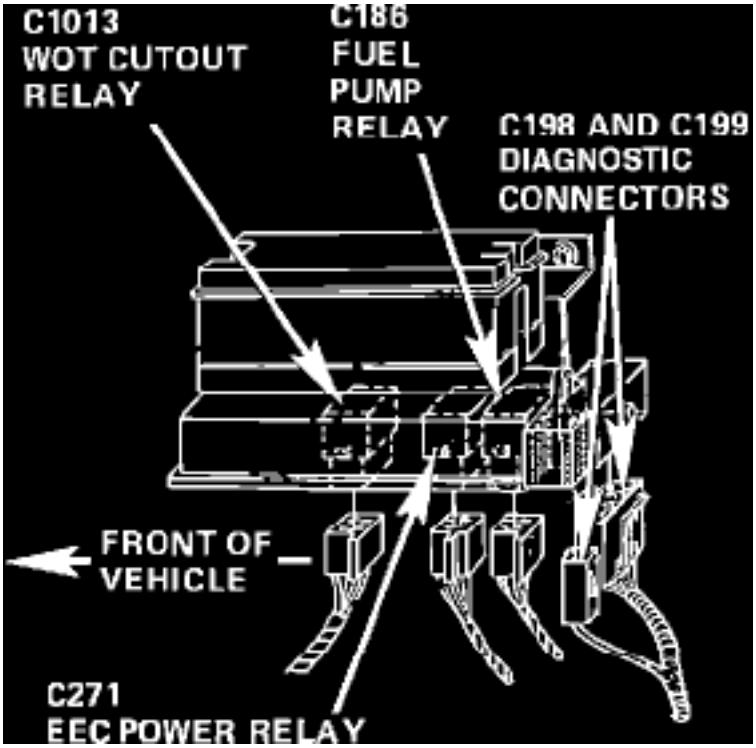
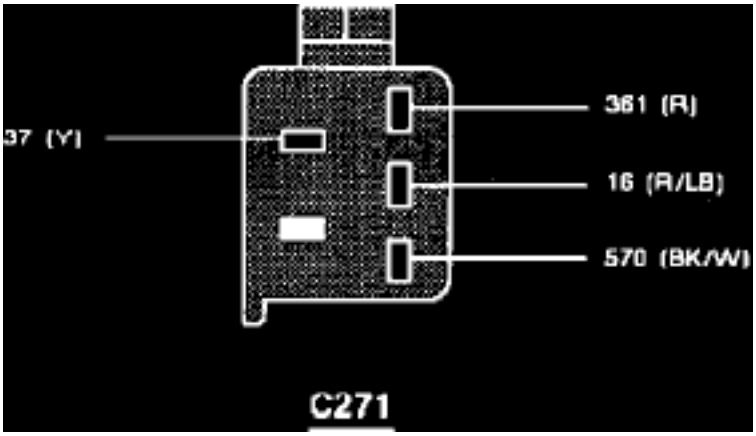
Fuel Pump Relay Connector

Fuel Pump Relay: Description and Operation

When the ignition switch is turned ON, the Electronic Engine Control (EEC) power relay is ENERGIZED, providing power to the fuel pump relay. Fuel pump power is provided through the fuel pump relay contacts and an inertia switch. If the ignition switch is not turned to the START position in approximately one second, a timer circuit in the Engine Control Assembly (ECA) will open the ground circuit to the fuel pump relay, causing the fuel pump relay contacts to OPEN. This action stops the power supply to the fuel pump. When the ignition switch is turned to the START position, the ECA closes the ground circuit to the fuel pump relay, resuming operation of the fuel pump. After the engine switch is returned to the ON position, power to the fuel pump is supplied through the fuel pump relay. The ECA monitors engine speed and OPENS the fuel pump relay ground circuit if the engine speed drops below 120 rpm.



Relay And Diagnostic Connectors



EEC-IV Power Relay Connector

Main Relay (Computer/Fuel System): Description and Operation

The Engine Control Assembly (ECA) receives its operating voltage from the Electronic Engine Control (EEC) power relay. When the ignition switch is turned ON, the normally OPEN contact points of the relay CLOSE and supply power to the ECA. The control coil circuit of the relay contains a diode, wired in series, to prevent relay operation if the battery polarity is reversed, preventing damage to the ECA.

Ignition Control Module: Customer Interest Engine - Loss of Power At High Engine Speeds

Article No. 92-3-8

01/29/92

LOSS OF POWER - 4.0L - AT HIGH ENGINE SPEEDS BETWEEN 3800 AND 4700 RPM - CANADIAN VEHICLES

LIGHT TRUCK: 1990-92 RANGER 1991-92 EXPLORER

ISSUE: A loss of power may occur at engine speeds between 3800 and 4700 RPM under wide open throttle. After several months use, this can be caused by an interaction between MMT (octane enhancer additive in Canadian fuel) contaminated spark plugs and the EDIS (Electronic Distributorless Ignition System) module. A check engine light concern may be present with Self-Test Codes 18 (212 three digit code) and 45 in continuous memory.

ACTION: If service is required, confirm the concern and, if necessary, replace the EDIS module and spark plugs. Refer to the following procedure for service details.

1. Confirm the customer concern by accelerating the vehicle at wide open throttle from 3000 RPM to 4700 RPM with the transmission in second gear.

^ If the vehicle exhibits a loss of power (caused by fuel shutoff of one of the fuel banks) in this RPM range, follow Steps 2 and 3.

^ Otherwise, follow the Powertrain Control/Emissions Diagnosis Manual's diagnostic procedures.

NOTE:

FUEL SHUTOFF (REV. LIMITER) AT 4850 RPM FOR AUTOMATICS AND 5200 RPM FOR MANUAL TRANSMISSIONS IS NORMAL AND SHOULD NOT BE CONFUSED WITH THIS CONCERN.

2. Replace all the spark plugs.

3. Replace the EDIS module (F1TZ-12KO72-B).

NOTE:

THIS MODULE WILL ELIMINATE THE PREMATURE FUEL SHUTOFF CONCERN. THE RED DEPOSITS ON THE SPARK PLUGS WILL STILL OCCUR AFTER TIME. THIS IS CONSIDERED NORMAL FOR THIS TYPE OF FUEL.

LIGHT TRUCK: 1990-94 AEROSTAR, RANGER 1991-94 EXPLORER

ISSUE: Some vehicles may have a disconnect of the Ignition Control Module (ICM) connector or moisture buildup within the connector. This can cause hard to start/no start, rough idle, or "check engine light" illumination concerns. The improved gasket and connector retainer that are currently used in production are now available for service of prior model distributorless ignition systems.

ACTION: Install new Connector Sleeve Retainer Clip and a current production seal (gasket). The clip assembles in between the connector beams and the ICM which will prevent accidental disconnects. The new seal is a "solid silicone" gasket that provides improved resistance to moisture entry into the connector. Refer to the ICM Connector Harness Wire Service kit (F5CZ-14A411-AA) for service details (I.S. 6621).

AFFECTED ENGINES

^ Escort/Tracer - 1.9L

^ Crown Victoria/Grand Marquis/Town Car/Mark VIII- 4.6L

Ignition Control Module: All Technical Service Bulletins Engine - Loss of Power At High Engine Speeds

Article No. 92-3-8

01/29/92

LOSS OF POWER - 4.0L - AT HIGH ENGINE SPEEDS BETWEEN 3800 AND 4700 RPM - CANADIAN VEHICLES

LIGHT TRUCK: 1990-92 RANGER 1991-92 EXPLORER

ISSUE: A loss of power may occur at engine speeds between 3800 and 4700 RPM under wide open throttle. After several months use, this can be caused by an interaction between MMT (octane enhancer additive in Canadian fuel) contaminated spark plugs and the EDIS (Electronic Distributorless Ignition System) module. A check engine light concern may be present with Self-Test Codes 18 (212 three digit code) and 45 in continuous memory.

ACTION: If service is required, confirm the concern and, if necessary, replace the EDIS module and spark plugs. Refer to the following procedure for service details.

1. Confirm the customer concern by accelerating the vehicle at wide open throttle from 3000 RPM to 4700 RPM with the transmission in second gear.

^ If the vehicle exhibits a loss of power (caused by fuel shutoff of one of the fuel banks) in this RPM range, follow Steps 2 and 3.

^ Otherwise, follow the Powertrain Control/Emissions Diagnosis Manual's diagnostic procedures.

NOTE:

FUEL SHUTOFF (REV. LIMITER) AT 4850 RPM FOR AUTOMATICS AND 5200 RPM FOR MANUAL TRANSMISSIONS IS NORMAL AND SHOULD NOT BE CONFUSED WITH THIS CONCERN.

2. Replace all the spark plugs.

3. Replace the EDIS module (F1TZ-12KO72-B).

NOTE:

THIS MODULE WILL ELIMINATE THE PREMATURE FUEL SHUTOFF CONCERN. THE RED DEPOSITS ON THE SPARK PLUGS WILL STILL OCCUR AFTER TIME. THIS IS CONSIDERED NORMAL FOR THIS TYPE OF FUEL.

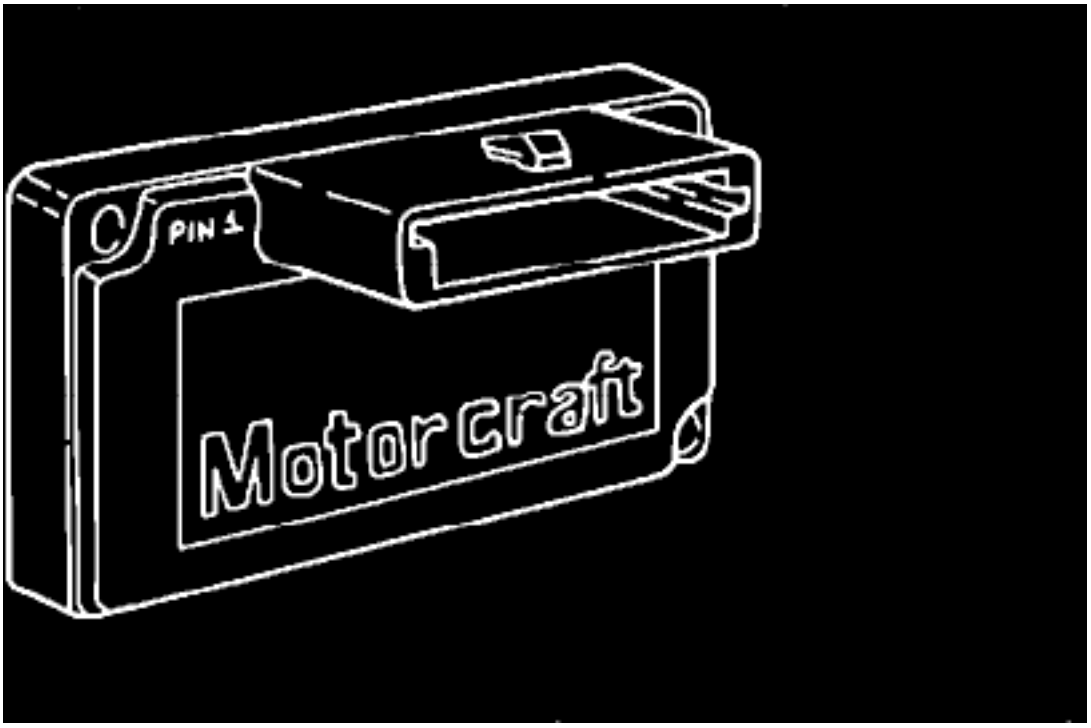
Electronic Distributorless Ignition System (EDIS) Module Connector



Ignition Control Module: Description and Operation

Module And Pin-Out

The EDIS module receives the Variable Reluctance Sensor (VRS) signal from the crankshaft sensor and the Spark Advance Word (SAW) signal from the EEC IV module. During normal operation, Profile Ignition Pickup (PIP) is sent to the EEC IV module from the EDIS module, providing base timing and RPM information. The VRS signal provides the EDIS module with the information required to synchronize the ignition coils for proper firing sequence. The Spark Angle Word (SAW) signal is a pulse width modulated signal and contains the optimum spark timing information. Spark angle is determined by the EDIS module using a zero excess dwell control routine.

Ignition Control Module: Service and Repair

REMOVAL:

Ignition Module

1. Disconnect both battery cables, then remove the battery from the vehicle. 2. Disconnect the electrical connector from the ignition module.

NOTE: To disconnect the module connector, push on the connector where it says PUSH, then slide the connector from the module.

3. Remove the ignition module retaining bolt and remove the module by sliding the assembly up until it is released from the teardrop shaped hole in

the sheet metal.

INSTALLATION:

1. Place the module on the sheet metal so the retaining rivet passes through the hole, then slide the module down into position. Install the retaining

bolt. Torque to 22-31 in lb (2.2-3.5 Nm).

2. Connect the electrical connector to the module. 3. Install the battery and cables.

Electronic Shift Control Module: Technical Service Bulletins Transfer Case - Revised Shift Procedures

Article No. 90-18-10

^ ELECTRONIC SHIFT MODULE (4X4) - MODIFIED OPERATION

^ TRANSFER CASE - 4X4 ELECTRONIC SHIFT MODULE - REVISED OPERATION PROCEDURE

LIGHT TRUCK: 1986-90 BRONCO II

1986-91 BRONCO, RANGER 1991 EXPLORER

ISSUE: The shift procedures into and out of LOW RANGE are revised for Ranger, Bronco and Explorer trucks built after 8/1/90 due to module changes. The new module will also be used to service prior model year trucks.

ACTION: If service is required on models built prior to 8/1/90, advise the customers of the following changes made to their vehicles.

Operation of the 1991 modules have been changed as follows:

To shift into 4 LOW: ^

Truck must be in 4x4 HIGH by previously pressing the 4x4 switch

^ Truck must be stopped (condition A)

^ The clutch must be depressed or the automatic transmission must be in neutral (condition B)

^ Then press LOW RANGE switch

To shift out of 4 LOW:

^ Truck must be stopped (condition A)

^ The clutch must be depressed or the automatic transmission must be in neutral (condition B)

^ Then press the LOW RANGE switch to shift back into 4x4 HIGH

^ Press the 4x4 HIGH switch to shift into 2 HIGH if desired

Previously, the module would respond to the LOW RANGE input from any mode (2H, 4H, 4L). If conditions A and B above are not met, the module would respond by flashing the 4 LOW indicator and wait until conditions A and B are met before completing the shift into or out of LOW RANGE. If LOW RANGE was selected while in 2 HIGH mode, the module would shift to 4 HIGH before flashing the indicator.

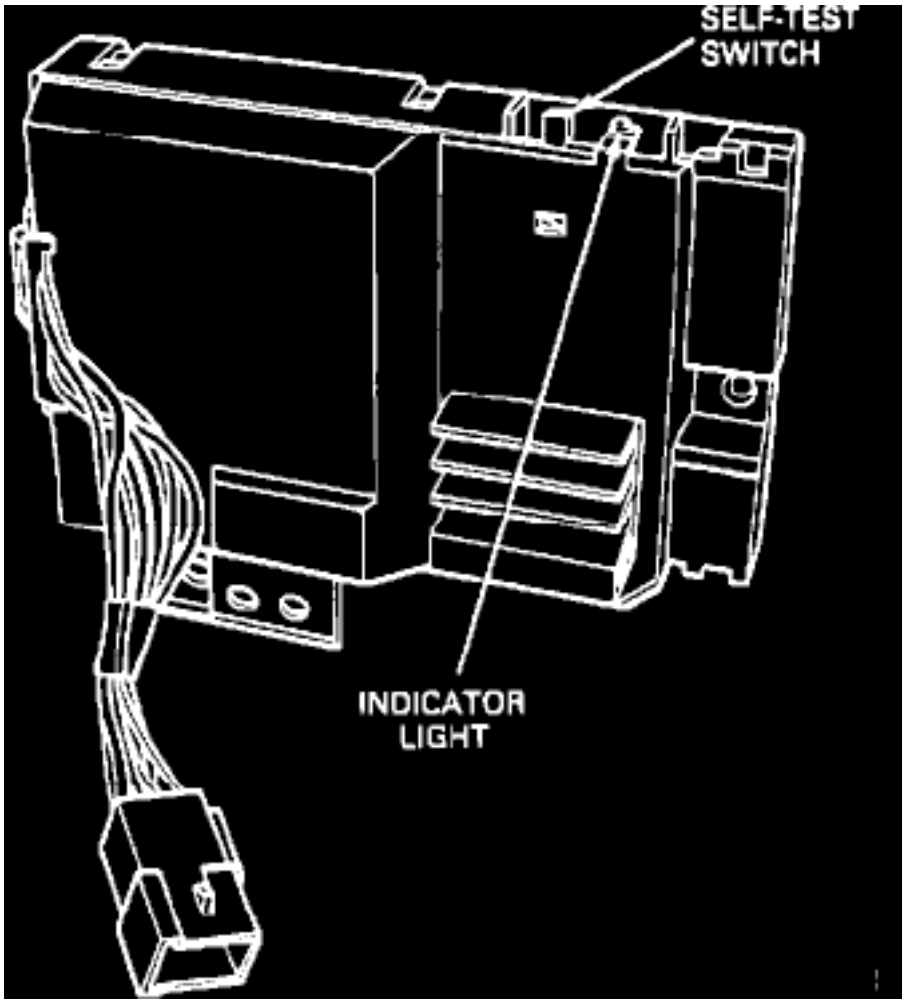
Electronic Shift Control Module: Description and Operation

The electronic control module conducts transfer case operation in response to inputs from the vehicle speed sensor, neutral start switch and clutch interlock switch and push-button actuation made by the operator.



Electronic Shift Control Module: Testing and Inspection

The electronic control module has a diagnostic capability of its internal circuitry. Self test procedure is as follows:

1. Disconnect five-wire and eight wire connectors from electronic control module.

2. Turn ignition switch to the RUN position.

3. Activate the self test switch and note result:

Control Module Self Test

NOTE: The self test switch and indicator light is located on the Electronic Control Module.

A FLASHING INDICATOR LAMP, (approximately one flash per second), indicates control module is functioning properly.

A STEADY INDICATOR LIGHT, indicates that control module is inoperative and must be replaced.

Wire Color Code Identification

NOTE: Whenever a wire is labeled with two colors; the first color listed is the basic color of the wire, and the second color is the tracer marking of the wire. If the second color is followed by by a D, the tracer is dots. If the second color is followed by an H, the tracer is hash marks.

For example: BR/O is a brown wire with an orange stripe, R/Y D is a red wire with yellow dots and BK/W H is a black wire with white hash marks.

ISSUE

This article is to provide information on replacement hood lamp switches. The 27 degree Mercury style hood switches will no longer be available. Replacement 27 degree Mechanical switches will be available as a service replacement.

ACTION

For vehicles requiring hood lamp switch replacement, replace the 27 degree Mercury switch with new 27 degree Mechanical switch. Replace hood lamp switch per the appropriate model year Workshop Manual as needed.

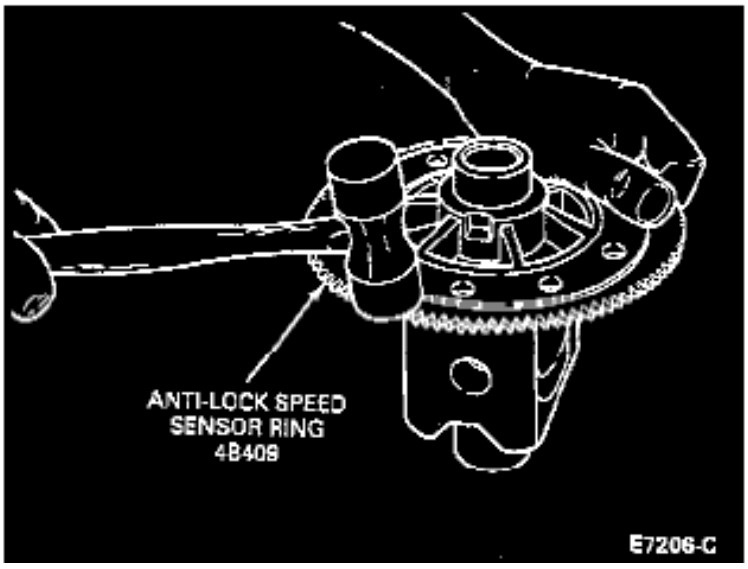
SPEED SENSOR
RING-4B409
RING GEAR
PART OF 4209
GE0976-A



ANTI-LOCK SPEED
SENSOR RING
4B409
E7206-C

Wheel Speed Sensor: Service and Repair Toothed Ring

NOTE: To service the speed sensor ring, the differential case must be removed from the axle housing.

REMOVAL

1. Remove the bolts retaining the ring gear to the differential case. Remove the ring gear by striking at alternate holes around the gear.

CAUTION: Extreme care should be taken not to scratch, dent, chip or otherwise cause damage to anti-lock brake sensor ring teeth while handling or during assembly.

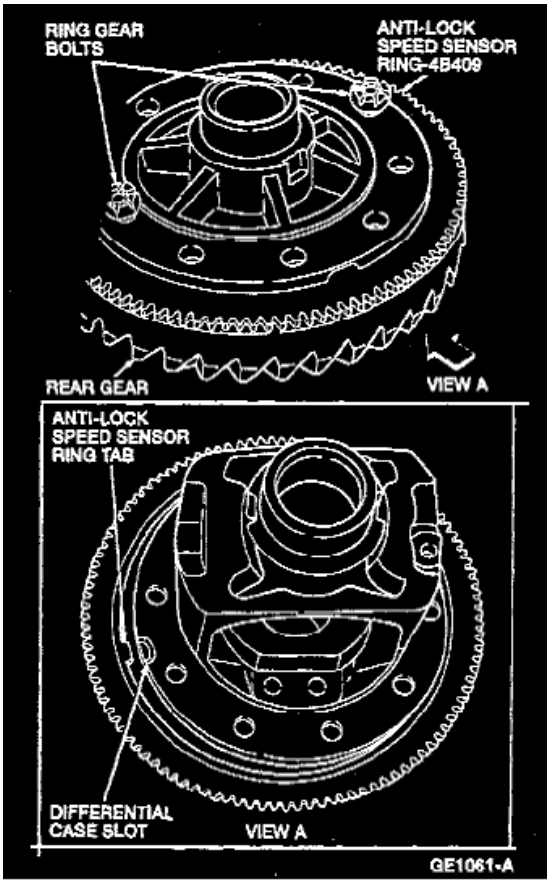
NOTE:

^ Before removing ring gear inspect it and determine if ring runout check is necessary.

^ Do not remove anti-lock speed sensor ring unless replacement is required. It does not have to be removed for ring gear replacement.

2. If replacement is required remove the anti-lock brake sensor ring by tapping with a soft-faced hammer. Discard the anti-lock speed sensor ring.

CAUTION: The anti-lock speed sensor ring must be discarded upon removal. If removed, a new anti-lock brake sensor ring must be installed.



RING GEAR BOLTS

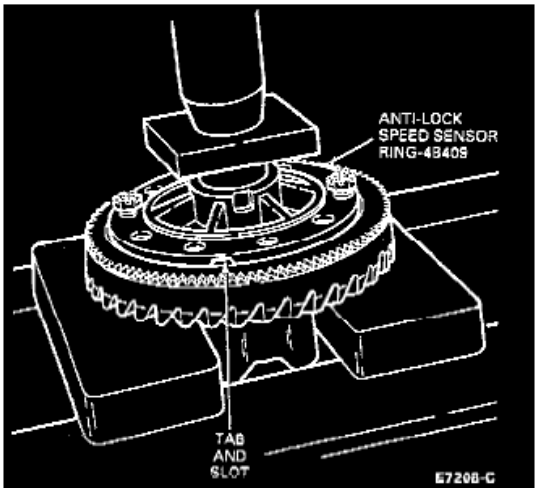
REAR GEAR
VIEW A
ANTI-LOCK SPEED SENSOR RING TAB
DIFFERENTIAL CASE SLOT
VIEW A
GE1061-A



ANTI-LOCK SPEED SENSOR RING-4B409
TAB AND SLOT
E7208-C

INSTALLATION

1. Position the ring gear and anti-lock speed sensor ring on the differential case. The tab on the anti-lock speed sensor ring must be aligned with the

slot in the differential case as shown. Start two ring gear retaining bolts through the differential case into the ring gear to make sure case-to-ring gear bolt hole alignment is achieved.

CAUTION:

^ Extreme care should be taken not to scratch, dent, chip or otherwise cause damage to anti-lock speed sensor ring teeth while handling or during assembly.

^ The tab on the anti-lock speed sensor ring must be aligned with the slot in the differential case.

2. Press the ring gear and anti-lock speed sensor ring on the differential case using the ring gear as a pilot.

3. Coat the threads of the ring gear retaining bolts with Stud and Bearing Mount EOAZ-19554-BA or equivalent meeting Ford specification

WSK-M2G349-A1. Install the bolts and alternately and evenly tighten to 95-115 Nm (70-85 ft. lbs.).

Wheel Speed Sensor: Service and Repair Wheel Speed Sensor

REMOVAL

1. At the rear axle housing pull the wiring harness connector from the speed sensor. 2. Remove the speed sensor hold down bolt and remove the speed sensor from the rear axle housing.

INSTALLATION

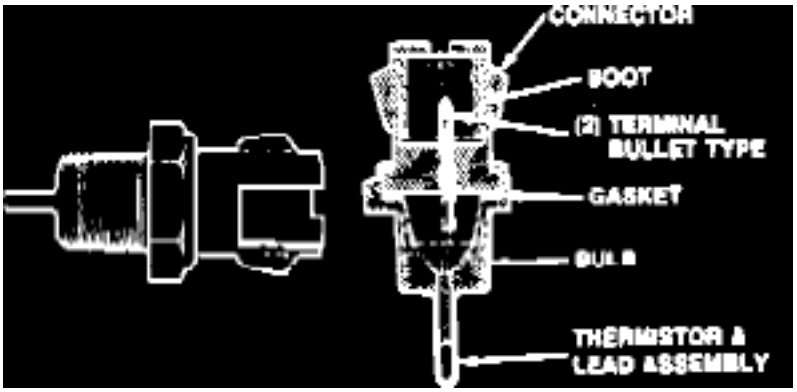
1. Clean the rear axle housing mounting surface. Use care to prevent dirt from entering the rear axle housing. 2. Inspect and clean the magnetized sensor pole piece to make sure that it is free from loose metal particles which could cause erratico■ system

operation. Inspect the speed sensor O-ring for damage and replace if necessary.

3. Lightly lubricate the speed sensor O-ring with motor oil, align the bolt hole, and install.

NOTE: Do not apply force to the plastic sensor connector. The sensor flange should slide to the mounting surface. This will make sure the air gap setting is between 0.127-1.143 mm (0.005-0.045 inches).

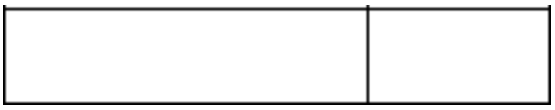
4. Install the speed sensor hold-down bolt and tighten to 34-40 Nm (25-29 ft. lbs.). 5. Push the connector on the speed sensor.



Coolant Temperature Sensor/Switch (For Computer): Description and Operation

Engine Coolant Temperature Sensor

The Engine Coolant Temperature (ECT) sensor is threaded into a coolant passage with the sensing bulb extending into the coolant. The ECT sensor is a negative temperature coefficient sensor, meaning that as the temperature of the sensor increases, the resistance will decrease. As the resistance value changes, the signal sensed by the Engine Control Assembly (ECA) also changes. The ECA reads the varying sensor resistance and determines the engine operating temperature, using this information to optimize the air/fuel mixture and ignition timing. The ECT sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.



Radiator Cooling Fan Temperature Sensor / Switch: Specifications Switch Torque

Switch Torque

Cooling Fan Switch 8-18 ft.lb

Temperature Sensor (Gauge): Technical Service Bulletins Temperature Gauge - Reads Low/Erratic

Article No. 95-13-2

07/03/95

^ GAUGE - TEMPERATURE-READS IN LOW RANGE - ERRATIC READINGS

^ SERVICE PARTS - RETURN OF OBSOLETE TEMPERATURE SENDERS

FORD: 1981-94 ESCORT 1981-95 MUSTANG, THUNDERBIRD 1983-95 CROWN VICTORIA 1984-94 TEMPO 1986-95 TAURUS

LINCOLN-MERCURY: 1981-92 TOWN CAR 1981-95 COUGAR 1983-95 GRAND MARQUIS 1984-92 MARK VII 1984-94 TOPAZ 1986-95 SABLE 1987-89 TRACER 1991-94 TRACER 1993-95 MARK VIII

LIGHT TRUCK: 1982-95 BRONCO 1983-95 RANGER 1986-94 AEROSTAR 1990-95 F-150-350 SERIES 1991-95 EXPLORER 1992-95 ECONOLINE 1995 WINDSTAR

ISSUE: Temperature Sender F1SZ-10884-A with a build date code prior to 2774 (277th day of 1994) should be purged from your inventory and returned to your facing PDC. These parts are being made obsolete because of an incorrect crimp during assembly. Installing these parts on a vehicle could result in early loss of temperature sender function.

ACTION: Remove and return the suspect parts from your dealership's inventory. The obsolete parts should be withdrawn from your inventory and returned to your facing PDC within 30 days of this TSB.

NOTE:

USE TSB ARTICLE 93-24-8 FOR DIAGNOSIS PROCEDURE IN DETERMINING IF LOW GAUGE READINGS COULD BE ASSOCIATED WITH A TEMPERATURE SENDER CONCERN.

1. Perform 100% sort of all stock on hand.

2. Suspect stock has a build date code prior to 2774. Usable stock will have a build date code of 2774 or later.

NOTE:

DATE CODES ARE LOCATED ON THE SIDE OF THE SENDER HEX.

3. Usable stock can be returned to your inventory and released for normal sales.

4. Return suspect part (F1SZ-10884-A) to your facing PDC using the least expensive transportation.

5. If claim is processed electronically via DOES II, use return code "GB"; otherwise, complete a separate paper claim form FPS-340 using return code "J".

6. In the Remarks Section, write "Returned per TSB 95-13-2".

LIMITS

^ The returns must be received within 30 days from the date of this TSB.

^ Returns are restricted to the subject parts.

^ The parts returned must have been purchased from FCSD in accordance with Policy and Procedure Bulletin 4000.

CREDIT

Credit for parts and prepaid freight costs will be issued.

Replacement stock is available for ordering

Brake Switch (Cruise Control): Testing and Inspection

Perform this test only when brake application will not disconnect the speed control system.

1. Check operation of stop lamps by applying approximately 6 lbs. of pressure to brake pedal. If more than 6 lbs. is required, check brake pedal actuation and stop lamp switch.

2. If stop lamps do not function properly, check bulbs, circuit fuse or stop lamp switch.

3. If stop lamps function properly, check for battery voltage at 6-way connector using white wire w/purple stripe.

4. Depress brake pedal until stop lamps are illuminated. Check voltage at red wire w/black stripe on E-Series models, or the light green wire on Bronco and F-Series and Ranger, Bronco II, Explorer and Aerostar. The difference between the two voltage readings must not exceed 1.5 volts. If voltage is greater, a high resistance exists in the circuit and must be and corrected.

Clutch Switch: Service and Repair

1. Remove bracket mounting screw(s).
2. Disconnect electrical connector and remove switch and bracket assembly.
3. Remove switch from bracket.
4. Reverse procedure to install.

Ford Ranger 4wd Workshop Manual (V6-245 4.0L (1991))
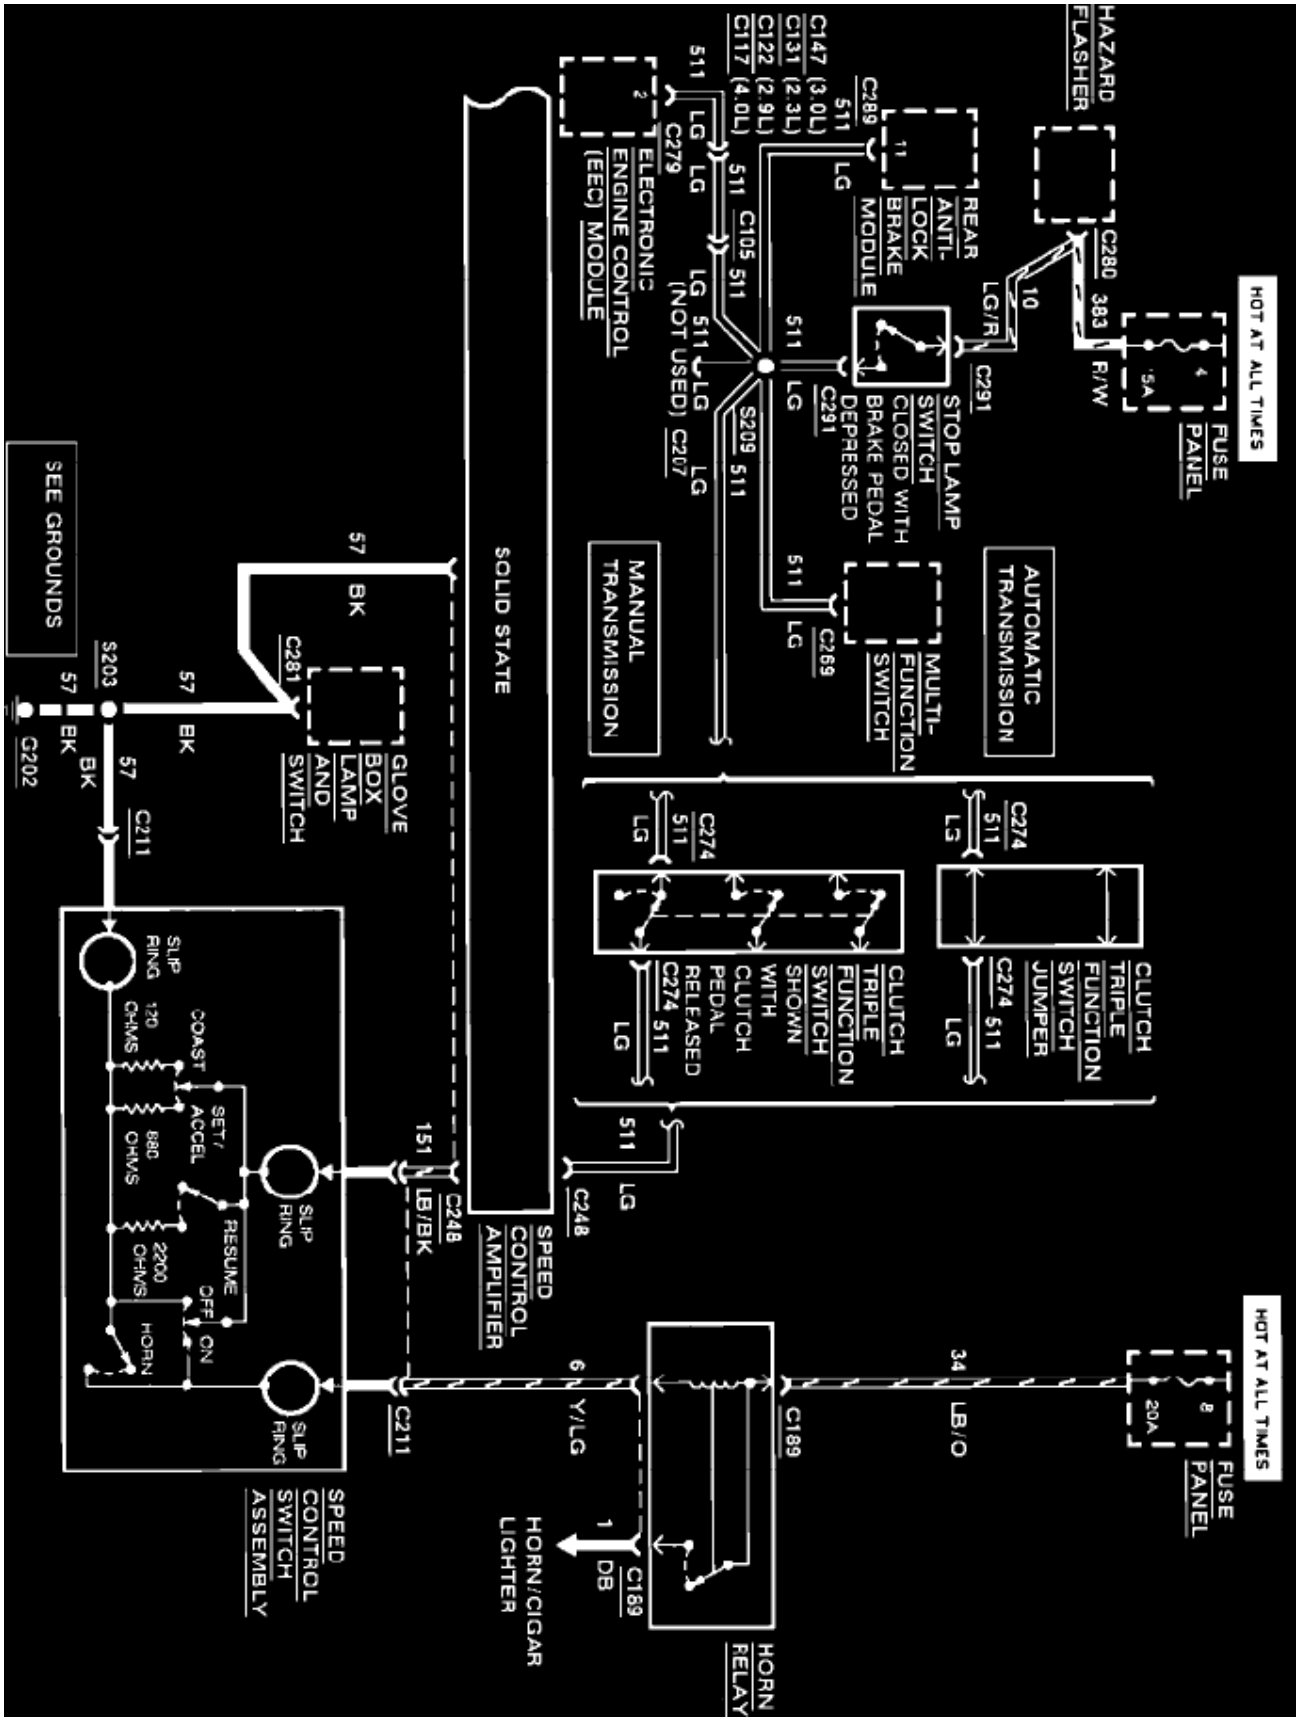
Ford Workshop Manuals > Sensors and Switches > Sensors and Switches - Cruise Control > Cruise Control Switch > Component Information > Diagrams > Diagram Information and Instructions > Page 351



Cruise Control

Cruise Control Switch: Testing and Inspection

1. Apply brake pedal and ensure brake lights operate. If found satisfactory, proceed to step 2. If found unsatisfactory, check stop lamps circuit.

2. Press horn pad to sound horn. If found satisfactory, proceed to step 3. If found unsatisfactory, check horn circuit.

3. Locate 6-pin connector at speed control amplifier.

4. With ignition Off and 6-pin connector still connected to amplifier, connect an ohmmeter between black wire and ground on Ranger, Bronco II, Explorer and Aerostar with mechanical cluster or black-white wire on Aerostar with electronic cluster.

5. Check resistance to ground to ensure amplifier is grounded. If amplifier is not grounded, repair and retest. If amplifier is properly grounded, turn ignition to On position while making the following voltage checks: a.

Check circuit 296 (white/purple wire) on Aerostar models or circuit 302 (dark blue wire) on Bronco II, Explorer and Ranger models. If 12 volts are present, proceed to step b. If not present, check speed control fuse and 296 circuit wire continuity.

b. Apply brake pedal and check circuit 511 (light green wire) for 12 volts on Ranger, Bronco II and Explorer or circuit 810 (red/light green wire) on Aerostar. If 12 volts is not present, check continuity between stop lamp switch and amplifier and repair as necessary. If there is continuity, replace amplifier.

c. Check circuit 151 (light blue/black wire) for approximately 7.8 volts. If 7.8 volts is not present with amplifier properly grounded and 12 volts at circuit 296 white/purple wire on Aerostar models or 302 dark blue wire on Bronco II, Explorer and Ranger models, verified, check for On button sticking. If 12 volts is present or a short circuit to ground on circuit 151 (light blue/black wire) between amplifier and steering column brush assembly. If zero volts is present and both the On button and 151 wire are functioning properly, replace amplifier and repeat test. If 7.8 volts is present, proceed to step 6.

6. Check following voltages between circuit 151 (light blue/black wire) and amplifier ground while rotating the steering wheel with horn pad switch depressed making the following checks: a.

No button pressed, 7.8 volts.

b. On, 12.0 volts.

c. Off, 0.0 volts.

d. Resume, 6.5 volts.

e. Accel, 4.5 volts.

f. Coast, 1.5 volts.

7. If values are incorrect or fluctuate, proceed to Step 8. If values are correct, horn pad switches are operating properly. Proceed to step 17.

8. With ignition Off, disconnect the 6-pin connector from amplifier, then check following resistances between circuit 151 (light blue/black wire) and amplifier ground with horn pad switch depressed while rotating steering wheel. Ohmmeter readings should as follows with switch positions as indicated: a.

Off, 0--1 ohm.

b. Accel, 646-714 ohms,

c. Coast, 114-126 ohms.

d. Resume, 2090-2310 ohms.

9. If values are incorrect or fluctuate, proceed to step 10. If values are correct, replace amplifier and repeat step 4.

10. On models except 1992 Aerostar, remove steering wheel horn pad attaching screws in back cover, then disconnect electrical connectors from wheel.

11. On 1992 Aerostar, disable airbag system as outlined in MAINTENANCE PROCEDURES Remove airbag module, then disconnect clockspring contact electrical connector at upper center area of steering wheel.

12. On all models, connect suitable ohmmeter between circuit 151 (yellow/light blue wire) and circuit 6 (dark/blue wire) on horn pad on all models, except 1992 Aerostar or black wire connector on 1992 Aerostar models. Depress On switch and check for a reading of 0-1 ohms.

12. If reading is not correct, replace switch assembly.

13. Pull steering wheel, then check for continuity of circuit 151 (light blue/black wire) and circuit 57 (black wire) between amplifier 6-pin connector and brush assembly on models except 1992 Aerostar or clockspring on 1992 Aerostar models.

14. If there is no continuity, check for continuity between 3-pin brush assembly wiring connector and brushes or clockspring at steering wheel, then between mating 3-pin connector and amplifier 6-pin connector. Repair or replace brush or clockspring assembly as necessary.

15. If there is continuity for both circuits, clean brush assembly and slip rings in a suitable solvent and lubricate with suitable lubricant.

16. Install wheel and horn pad and repeat step 4.

17. Connect a suitable ohmmeter between circuit 150 (green/white wire) and speed sensor ground circuit 563 (orange/yellow wire) on Ranger, Bronco II and Explorer or 397 (black/white wire) on Aerostar.

18. If resistance is not between 180-250 ohms, check continuity between 6-pin connector at amplifier and 2-pin speed sensor connector at transmission and repair as necessary.

19. If resistance is correct, the speed sensor wiring is functioning properly. Not all speed sensor problems can be identified by a resistance check. Replacement with a known good sensor may be required.

Cruise Control Switch: Service and Repair

1. Remove steering wheel pad attaching screws from behind steering wheel.

2. While pulling pad away from steering wheel, disconnect horn and speed control wire connectors and remove pad.

3. Remove retaining nuts securing the speed control switches and trim plate retainer to the steering wheel pad.

4. Disconnect wiring connector on rear of steering wheel pad assembly, then remove switch and trim retainer assembly.

5. Remove speed control switches by snapping out of plastic retainer.

6. To remove the ground brush, remove steering wheel for access.

7. Snap the ground brush assembly out of the turn signal switch.

8. Reverse procedure to install.

Vehicle Speed Sensor/Transducer - Cruise Control: Testing and Inspection

1. Disconnect speed sensor connector, then connect an ohmmeter between dark green/white and black wires.

2. A reading of 180-250 ohms should be obtained. A reading of 0 ohms indicates a shorted coil and an infinity reading indicates an open coil.

3. Replace sensor if a proper reading has not been obtained.

• Compressor Clutch doesn't operate.	• No voltage at Clutch Cycling Pressure Switch. • Inoperative Clutch Cycling Pressure Switch. • No voltage at A/C Clutch Field Coil. • Inoperative A/C Clutch Field Coil.	• Fuse 7 blown. • Remove Connector from Cluich Cycling Pressure Switch. With the A/C-Heater Control Assembly Switch in the ON position, check for battery voltage at the 348 (P) wire. • Check the Clutch Cycling Pressure Switch for continuity. No continuity indicates low refrigerant, or an inoperative Clutch Cycling Pressure Switch. Check refrigerant system. • Remove connector from the A/C Clutch Field Coil. Check the wire connector for battery voltage. Check the EEC Module (including Throttle Position Sensor and Coolant Temperature Sensor) and the WOT Cutout Relay for correct operation. • Repair A/C Clutch Field Coil or terminals as required.
• Compressor Clutch won't shut off. • No cooling or not enough cooling (compressor operates).	• A/C Switch or Defrost Switch in A/C-Heater Control Assembly is stuck closed. • Clutch plates have no air gap. • Loose A/C Compressor drive belt. • Temperature Blend door out of adjustment. • Too much or too little Refrigerant in system.	• Remove connector from the A/C Clutch Field Coil. Ensure correct voltage for each switch position. • If compressor continues to run with connector disconnected, repair clutch air gap • Check drive belt tension. • Check operation of temperature control cable • Perform refrigerant system diagnosis and problem evaluation

Troubleshooting Hints - Compressor

Refrigerant Pressure Sensor / Switch: Service and Repair

The clutch cycling pressure switch is mounted on a schrader type fitting on the accumulator. Replacement of switch does not require discharge of refrigerant from system.

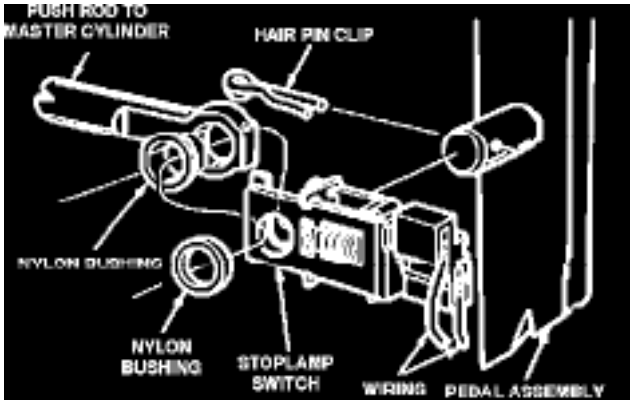
Brake And Clutch Switches

Brake Light Switch: Description and Operation

The Brake On Off (BOO) signal is sent by the brake switch when the brakes are APPLIED. The Engine Control Assembly (ECA) uses this signal to modify the operation of the torque converter clutch (if equipped), A/C compressor (if equipped), and idle speed during periods of decel and idle with the brakes APPLIED.



Brake Light Switch: Service and Repair

Fig. 12 Stop Light Switch Replacement

REMOVAL

1. Disconnect electrical connector from switch, Fig. 12.

2. Remove hairpin clip, then slide switch, pushrod, nylon washer and bushings away from pedal.

3. Remove washer, then the switch by sliding switch up or down.

INSTALLATION

1. Position switch so that U-shaped side is nearest pedal and directly over or under pin.

2. Slide switch up or down, trapping vacuum booster input rod and bushing between switch side plates.

3. Push switch and push rod assembly toward brake pedal arm, then assemble plastic washer to pin and install hairpin clip to retain assembly.

4. Connect electrical connector to switch, then check for proper operation.

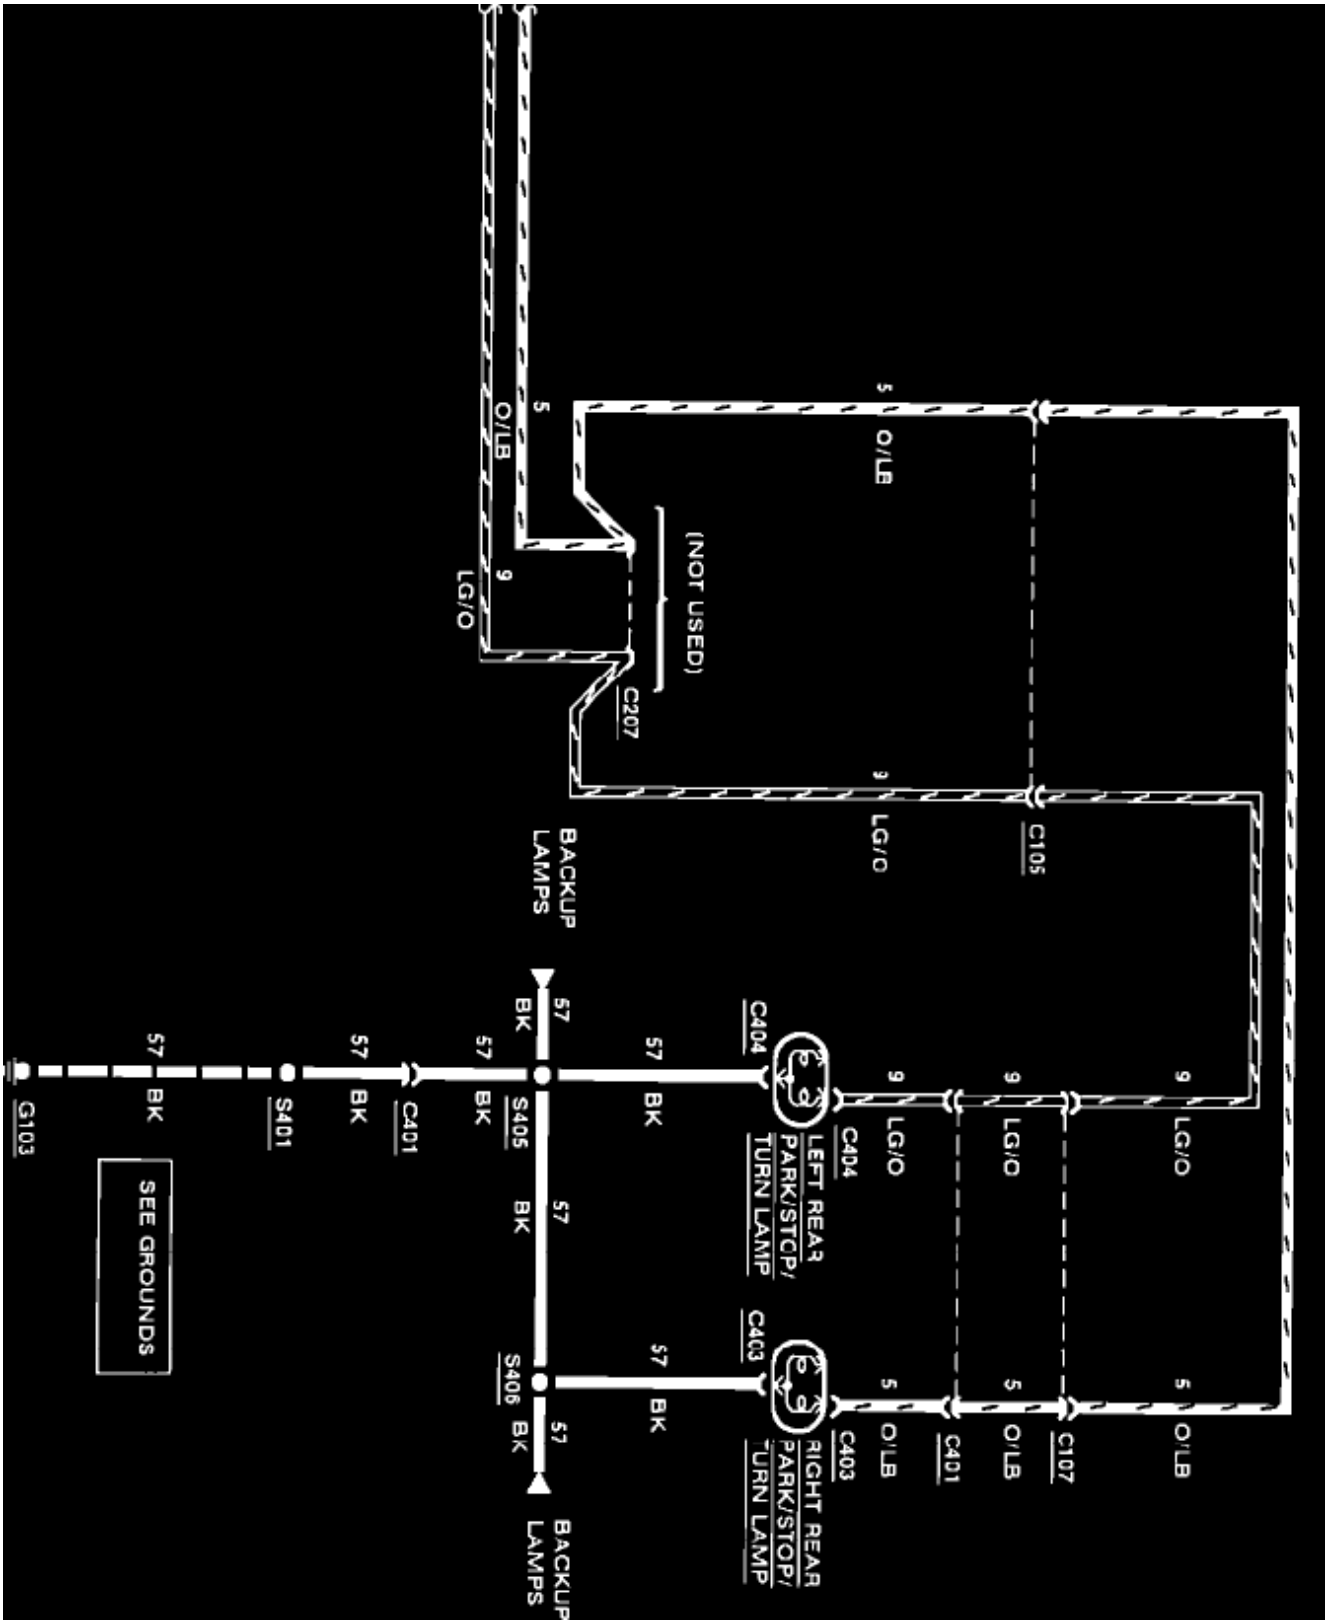
Hazard Warning Switch: Electrical Diagrams

Turn/Stop/Hazard Lamps



Turn/Stop/Hazard Lamps

Hazard Warning Switch: Service and Repair

REMOVAL

1. Disconnect battery ground cable.

2. On models with tilt steering, remove tilt lever, then the steering column collar by pressing on collar from top and bottom while removing.

3. On all models, remove lower dash panel trim cover, then the column shroud retaining screws from bottom of column shroud.

4. Remove bottom half of shroud by pulling shroud down and toward rear of vehicle. Move shift lever as required to ease shroud removal on models with automatic transmission.

5. Lift top half of shroud from column.

6. Remove two switch attaching screws, then disconnect switch from casting.

7. Disconnect three electrical connectors, using care not to damage locking tabs. Use care not to damage selector indicator cable on models with automatic transmission.

INSTALLATION

1. Install three electrical connectors, ensuring they are fully engaged. Wiring for switch is routed under selector indicator cable on models with automatic transmission.

2. Align switch mounting holes with holes in steering column casting, then install screws and torque to 18-27 inch lbs.

3.

On models with automatic transmission, verify that selector indicator is adjusted properly.

4.

On all models, position top half of steering column shroud onto column so that screw moldings on shroud seat in mounting bores in column. Place shift lever in lowest position to aid assembly on vehicles with automatic transmission.

5. Install bottom half of shroud by sliding guides in bottom half of shroud into tabs in top half.

6. Install shroud retaining screws and torque to 18.5-25.6 inch lbs.

7. On models with tilt steering, install steering column collar by pressing on top and bottom while installing on column.

8. Install tilt lever and torque to 2.2-3.6 ft. lbs.

9. On all models, install lower dash panel trim cover, then connect battery ground cable.

10. Check multi-function switch and steering column for proper operation.

REMOVAL

1. Disconnect battery ground cable.

2. On models with tilt steering, remove tilt lever, then the steering column collar by pressing on collar from top and bottom while removing.

3. On all models, remove lower dash panel trim cover, then the column shroud retaining screws from bottom of column shroud.

4. Remove bottom half of shroud by pulling shroud down and toward rear of vehicle. Move shift lever as required to ease shroud removal on models with automatic transmission.

5. Lift top half of shroud from column.

6. Remove two switch attaching screws, then disconnect switch from casting.

7. Disconnect three electrical connectors, using care not to damage locking tabs. Use care not to damage selector indicator cable on models with automatic transmission.

INSTALLATION

1. Install three electrical connectors, ensuring they are fully engaged. Wiring for switch is routed under selector indicator cable on models with automatic transmission.

2. Align switch mounting holes with holes in steering column casting, then install screws and torque to 18-27 inch lbs.

3.

On models with automatic transmission, verify that selector indicator is adjusted properly.

4.

On all models, position top half of steering column shroud onto column so that screw moldings on shroud seat in mounting bores in column. Place shift lever in lowest position to aid assembly on vehicles with automatic transmission.

5. Install bottom half of shroud by sliding guides in bottom half of shroud into tabs in top half.

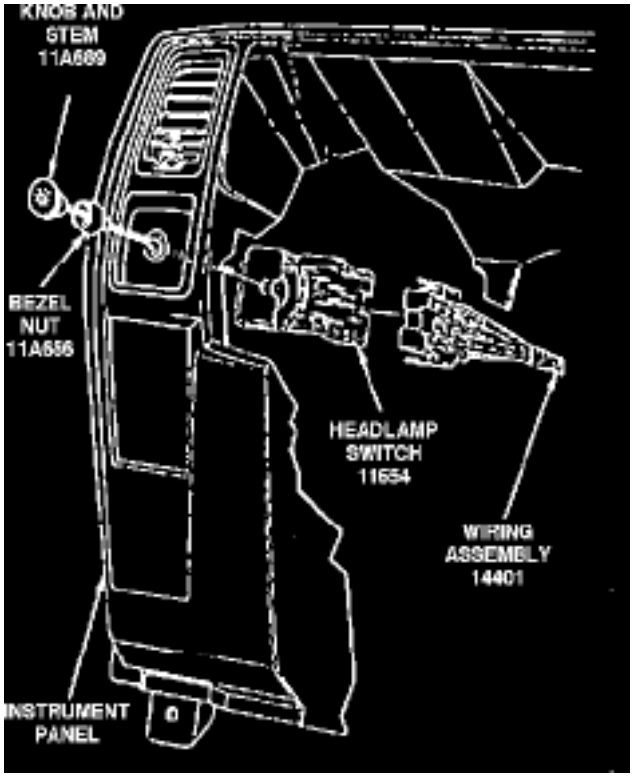
6. Install shroud retaining screws and torque to 18.5-25.6 inch lbs.

7. On models with tilt steering, install steering column collar by pressing on top and bottom while installing on column.

8. Install tilt lever and torque to 2.2-3.6 ft. lbs.

9. On all models, install lower dash panel trim cover, then connect battery ground cable.

10. Check multi-function switch and steering column for proper operation.



Headlamp Switch: Service and Repair

Fig. 11 Headlamp Switch Replacement.

1. Disconnect battery ground cable, remove ash tray assembly and two finish panel retaining screws, then the finish panel (snaps off).

2. On Bronco II or Explorer models, remove rear window wash/wipe and heated backlit switch assembly (snaps out).

3. On Ranger models, remove storage bin (snaps out).

4. On all models, pull headlamp switch knob to ON position, then depress shaft release button on switch and remove knob and shaft assembly, Fig. 11.

5. Remove bezel nut, pull switch down through opening, disconnect electrical connector, then remove switch.

6. Reverse procedure to install.

INSTALLATION

1. Install three electrical connectors, ensuring they are fully engaged. Wiring for switch is routed under selector indicator cable on models with automatic transmission.

2. Align switch mounting holes with holes in steering column casting, then install screws and torque to 18-27 inch lbs.

3.

On models with automatic transmission, verify that selector indicator is adjusted properly.

4.

On all models, position top half of steering column shroud onto column so that screw moldings on shroud seat in mounting bores in column. Place shift lever in lowest position to aid assembly on vehicles with automatic transmission.

5. Install bottom half of shroud by sliding guides in bottom half of shroud into tabs in top half.

6. Install shroud retaining screws and torque to 18.5-25.6 inch lbs.

7. On models with tilt steering, install steering column collar by pressing on top and bottom while installing on column.

8. Install tilt lever and torque to 2.2-3.6 ft. lbs.

9. On all models, install lower dash panel trim cover, then connect battery ground cable.

10. Check multi-function switch and steering column for proper operation.

ISSUE

This article is to provide information on replacement hood lamp switches. The 27 degree Mercury style hood switches will no longer be available. Replacement 27 degree Mechanical switches will be available as a service replacement.

ACTION

For vehicles requiring hood lamp switch replacement, replace the 27 degree Mercury switch with new 27 degree Mechanical switch. Replace hood lamp switch per the appropriate model year Workshop Manual as needed.

ISSUE This TSB article is a diagnostic procedure to address vehicles that exhibit lean driveability symptoms and may or may not have any Diagnostic Trouble Codes (DTCs) stored in memory.

ACTION Follow the diagnostic procedures described in the following Service Tip. The revised diagnostic procedure is a more accurate means of diagnosing the symptoms.

SERVICE TIP

MASS AIR FLOW (MAF) DISCUSSION

MAF sensors can get contaminated from a variety of sources: dirt, oil, silicon, spider webs, potting compound from the sensor itself, etc. When a MAF sensor gets contaminated, it skews the transfer function such that the sensor over-estimates air flow at idle (causes the fuel system to go rich) and under-estimates air flow at high air flows (causes fuel system to go lean). This means Long Term Fuel Trims will learn lean (negative) corrections at idle and learn rich (positive) corrections at higher air flows.

If vehicle is driven at Wide Open Throttle (WOT) or high loads, the fuel system normally goes open loop rich to provide maximum power. If the MAF sensor is contaminated, the fuel system will actually be lean because of under-estimated air flow. During open loop fuel operation, the vehicle applies Long Term Fuel Trim corrections that have been learned during closed loop operation. These corrections are often lean corrections learned at lower air flows. This combination of under-estimated air flow and lean fuel trim corrections can result in spark knock/detonation and lack of power concerns at WOT and high loads.

One of the indicators for diagnosing this condition is barometric pressure. Barometric pressure (BARO) is inferred by the Powertrain Control Module (PCM) software at part throttle and WOT (there is no actual BARO sensor on MAF-equipped vehicles, except for the 3.8L Supercharged engine). At high air flows, a contaminated MAF sensor will under-estimate air flow coming into the engine, hence the PCM infers that the vehicle is operating at a higher altitude. The BARO reading is stored in Keep Alive Memory (KAM) after it is updated. Other indicators are Long Term Fuel Trim and MAF

voltage at idle.

NOTE

THE FOLLOWING PROCEDURE MAY ALSO BE USED TO DIAGNOSE VEHICLES THAT DO NOT HAVE FUEL SYSTEM/HO2S SENSOR DTCS.

Symptoms

^ Lack of Power

^ Spark Knock/Detonation

^ Buck/Jerk

^ Hesitation/Surge on Acceleration

^ Malfunction Indicator Lamp (MIL) Illuminated -

DTCs P0171, P0172, P0174, P0175 may be stored in memory

OBDII DTCs

^ P0171, P0174 (Fuel system lean, Bank 1 or 2)

^ P0172, P0175, (Fuel system rich, Bank 1 or 2)

^ P1130, P1131, P1132, (HO2S11 lack of switching, Bank 1)

^ P1150, P1151, P1152, (HO2S21 lack of switching, Bank 2)

OBDI DTCs

^ 181, 189 (Fuel system lean, Bank 1 or 2)

^ 179, 188 (Fuel system rich, Bank 1 or 2)

^ 171, 172, 173 (HO2S11 lack of switching, Bank 1)

^ 175, 176, 177 (HO2S21 lack of switching, Bank 2)

^ 184, 185 (MAF higher/lower than expected)

^ 186, 187 (Injector pulse width higher/lower than expected)

NOTE:

DO NOT DISCONNECT THE BATTERY. IT WILL ERASE KEEP ALIVE MEMORY AND RESET LONG TERM FUEL TRIM AND BARO TO THEIR STARTING/BASE VALUES. THE BARO PARAMETER IDENTIFICATION DISPLAY (PID) IS USED FOR THIS DIAGNOSTIC PROCEDURE. ALL OBDII APPLICATIONS HAVE THIS PID AVAILABLE. THERE ARE SOME OBDI VEHICLES THAT DO NOT HAVE THE BARO PID, FOR THESE VEHICLES OMIT THE BARO CHECK AND REFER ONLY TO STEPS 2, 3, AND 4 IN THE DIAGNOSTIC PROCEDURE.

BAROMETRIC PRESSURE REFERENCE

Barometric Pressure (in. Hg.)	Barometric Pressure (kPa)	BARO/MAP PID (Hz)	Altitude above sea level (ft)
3.5	11.8	89.3	
5	16.9	92.8	
10	33.8	104.6	
15	50.7	117.0	14,000
20	67.5	129.6	10,000
21	70.9	132.5	9,000
22	74.3	135.4	8,000
23	77.7	138.3	7,000
24	81.1	141.1	6,000
25	84.4	144.0	5,000
26	87.8	146.9	4,000
27	91.2	149.8	3,000
28	94.6	152.8	2,000
29	97.9	155.8	1,000
30	101.3	158.9	0 (sea level)
31	104.7	162.0	
31.875	107.7	164.7	

1. Look at the BARO PID. Refer to the Barometric Pressure Reference Chart in this article. At sea level, BARO should read about 159 Hz (29.91 in. Hg). As a reference, Denver, Colorado at 1524 meters (5000 ft.) altitude should be about 144 Hz (24.88 in.Hg). Normal learned BARO variability is up to +/- 6 Hz (+/- 2 in. Hg.). If BARO indicates a higher altitude than you are not at (7 or more Hz lower than expected), you may have MAF contamination. If available, Service Bay Diagnostic System (SBDS) has a Manifold Absolute Pressure (MAP) sensor that can be used as a barometric pressure reference. Use "MAP/BARO" test under "Powertrain," "Testers and Meters." Ignore the hookup screen. Connect GP2 to the reference MAP on the following screen.

NOTE

REMEMBER THAT MOST WEATHER SERVICES REPORT A LOCAL BAROMETRIC PRESSURE THAT HAS BEEN CORRECTED TO SEA LEVEL. THE BARO PID, ON THE OTHER HAND, REPORTS THE ACTUAL BAROMETRIC PRESSURE FOR THE ALTITUDE THE VEHICLE IS BEING OPERATED IN. LOCAL WEATHER CONDITIONS (HIGH AND LOW PRESSURE AREAS) WILL CHANGE THE LOCAL BAROMETRIC PRESSURE BY SEVERAL INCHES OF MERCURY (+/- 3 Hz, +/- 1 in. Hg.).

NOTE

BARO IS UPDATED ONLY WHEN THE VEHICLE IS AT HIGH THROTTLE OPENINGS. THEREFORE, A VEHICLE WHICH IS DRIVEN DOWN FROM A HIGHER ALTITUDE MAY NOT HAVE HAD AN OPPORTUNITY TO UPDATE THE BARO VALUE IN KAM. IF YOU ARE NOT CONFIDENT THAT BARO HAS BEEN UPDATED, PERFORM THREE OR FOUR HEAVY, SUSTAINED ACCELERATIONS AT GREATER THAN HALF-THROTTLE TO ALLOW BARO TO UPDATE.

2. On a fully warmed up engine, look at Long Term Fuel Trim at idle, in Neutral, A/C off, (LONGFT1 and/or LONGFT2 PIDs). If it is more negative than -12%, the fuel system has learned lean corrections which may be due to the MAF sensor over-estimating air flow at idle. Note that both Banks 1 and 2 will exhibit negative corrections for 2-bank system. If only one bank of a 2-bank system has negative corrections, the MAF sensor is probably not contaminated.

3. On a fully warmed up engine, look at MAF voltage at idle, in Neutral, A/C off (MAF V PID). If it's 30% greater than the nominal MAF V voltage listed in the Powertrain Control/Emissions Diagnosis (PC/ED) Diagnostic Value Reference Charts for your vehicle, or greater than 1.1 volts as a rough guide, the MAF sensor is over-estimating air flow at idle.

4. If at least tow of the previous three steps are true, proceed to disconnect the MAF sensor connector. This puts the vehicle into Failure Mode and Effects Management (FMEM). In FMEM mode, air flow is inferred by using rpm and throttle position instead of reading the MAF sensor. (In addition, the BARO value is reset to a base/unlearned value.) If the lean driveability symptoms go away, the MAF sensor is probably contaminated and should be replaced. If the lean driveability symptoms do not go away, go to the PC/ED Service Manual for the appropriate diagnostics.

NOTE

DUE TO INCREASINGLY STRINGENT EMISSION/OBDII REQUIREMENTS, IT IS POSSIBLE FOR SOME VEHICLES WITH MAF SENSOR CONTAMINATION TO SET FUEL SYSTEM DTCs AND ILLUMINATE THE MIL WITH NO DRIVEABILITY CONCERNS. DISCONNECTING THE MAF ON THESE VEHICLES WILL, THEREFORE, PRODUCE NO IMPROVEMENTS IN DRIVEABILITY. IN THESE CASES, IF THE BARO, LONGFT1, LONGFT2, AND MAF V PIDs INDICATE THAT THE MAF IS CONTAMINATED, PROCEED TO REPLACE THE MAF SENSOR.

After replacing the MAF sensor, disconnect the vehicle battery (5 minutes, minimum to reset KAM, or on newer vehicles, use the "KAM Reset" feature on the New Generation Star (NGS) Tester and verify that the lean driveability symptoms are gone.

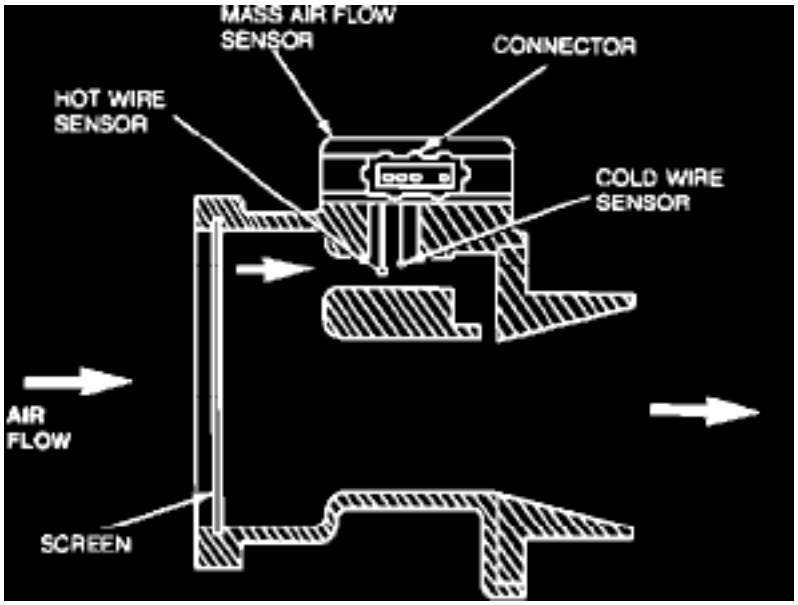
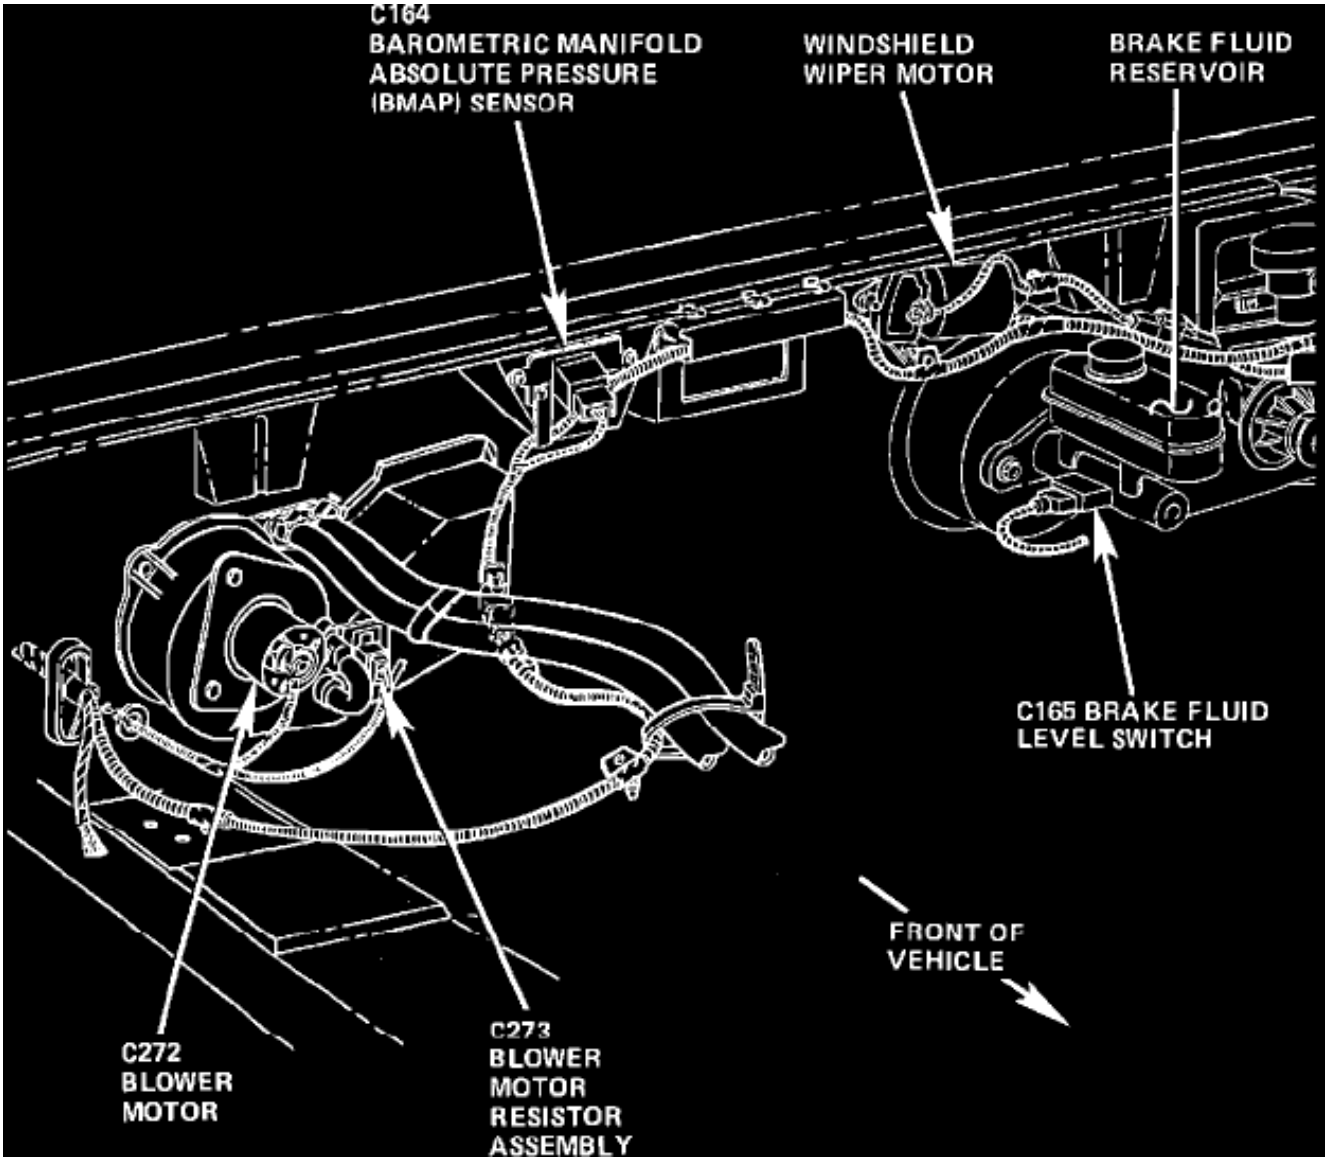
Mass Air Flow (MAF) Sensor



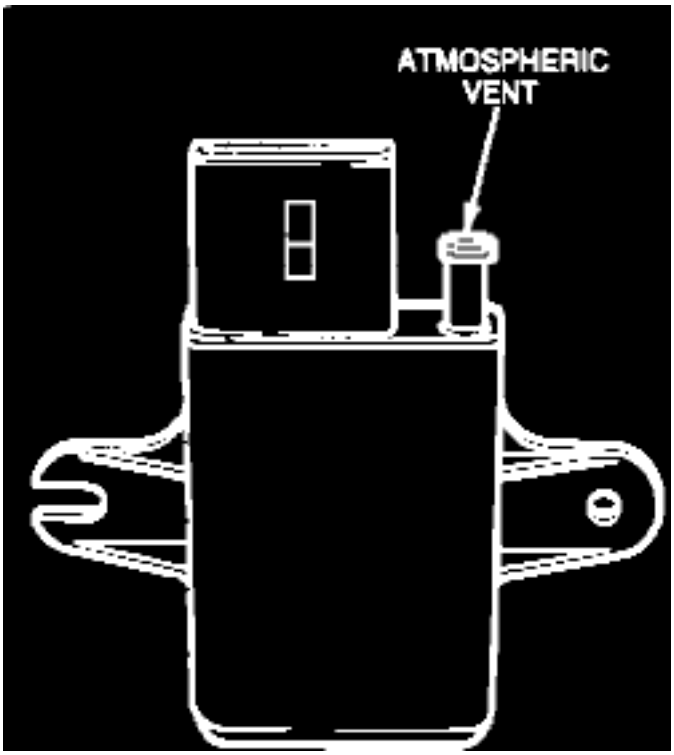
Mass Air Flow (MAF) Sensor: Description and Operation

Mass Air Flow Sensor

The Mass AirFlow (MAF) sensor, located between the air filter and the throttle body, is used to measure the mass of the air entering the engine due to volumetric displacement. The MAF sensor operates on the principle that if a mass is maintained at a constant temperature above the ambient environment, then the thermal loss is proportional to the mass flow of the cooling medium it is subjected to. The electronic module of the MAF sensor heats a wire element to 392°F (200°C) above ambient temperature. As air passes through the sensor, the air cools the wire element. The MAF sensor supplies more power to the wire to keep it at a constant temperature difference. When a drop in power useage occurs, the MAF sends a signal to the Engine Control Assembly (ECA) indicating the drop. The signal increases with the airflow into the engine.



Barometric/manifold Absolute Pressure (BMAP) Sensor



Barometric Pressure Sensor: Description and Operation

Barometric Pressure Sensor

The Barometric Pressure (BP) sensor is a frequency generating device that produces a varying signal depending on the amount of atmospheric (barometric) pressure. The Engine Control Assembly (ECA) monitors the frequency emitted from the BP sensor and converts the signal to atmospheric pressure. The ECA uses this reading to update the barometric pressure value stored in RAM memory. The ECA uses the input from the BP sensor to optimize the air/fuel ratio, ignition timing adjustment, and EGR flow control. The BP sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

Coolant Temperature Sensor/Switch (For Computer): Description and Operation

Engine Coolant Temperature Sensor

The Engine Coolant Temperature (ECT) sensor is threaded into a coolant passage with the sensing bulb extending into the coolant. The ECT sensor is a negative temperature coefficient sensor, meaning that as the temperature of the sensor increases, the resistance will decrease. As the resistance value changes, the signal sensed by the Engine Control Assembly (ECA) also changes. The ECA reads the varying sensor resistance and determines the engine operating temperature, using this information to optimize the air/fuel mixture and ignition timing. The ECT sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

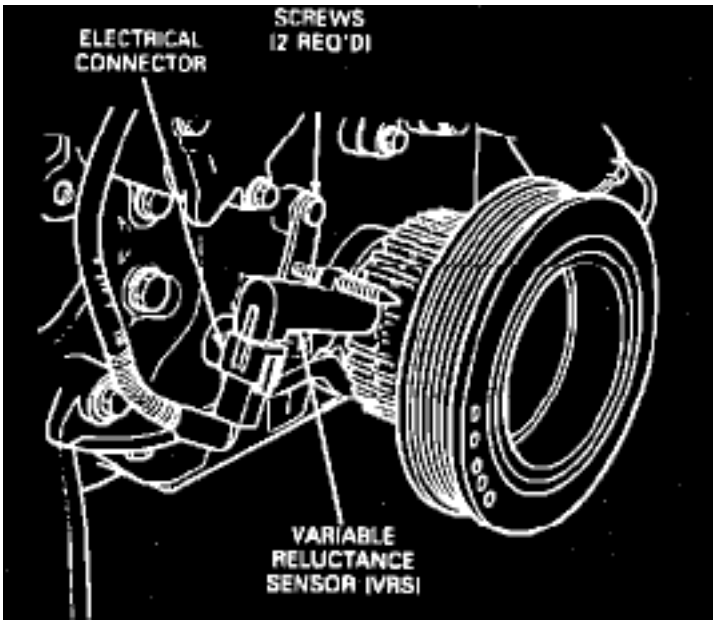
Crankshaft Position Sensor: Description and Operation

Crankshaft Timing Sensor

The crankshaft timing sensor is a variable reluctance type sensor. It is triggered by a 35 tooth trigger wheel tooth configuration machined into the rear of the crankshaft dampener. The signal generated by this sensor is called a Variable Reluctance Sensor (VRS) signal. The VRS signal provides the base timing and rpm information to the EDIS module. Base timing is set at 10° and is not adjustable.



Crankshaft Position Sensor: Service and Repair

Variable Reluctance (Crankshaft Position) Sensor

REMOVAL:

1. Disconnect the negative battery cable.

2. Disconnect the sensor electrical connector from the wiring harness.

3. Remove the Variable Reluctance (Crankshaft Position) Sensor mounting bolts and remove the sensor.

INSTALLATION:

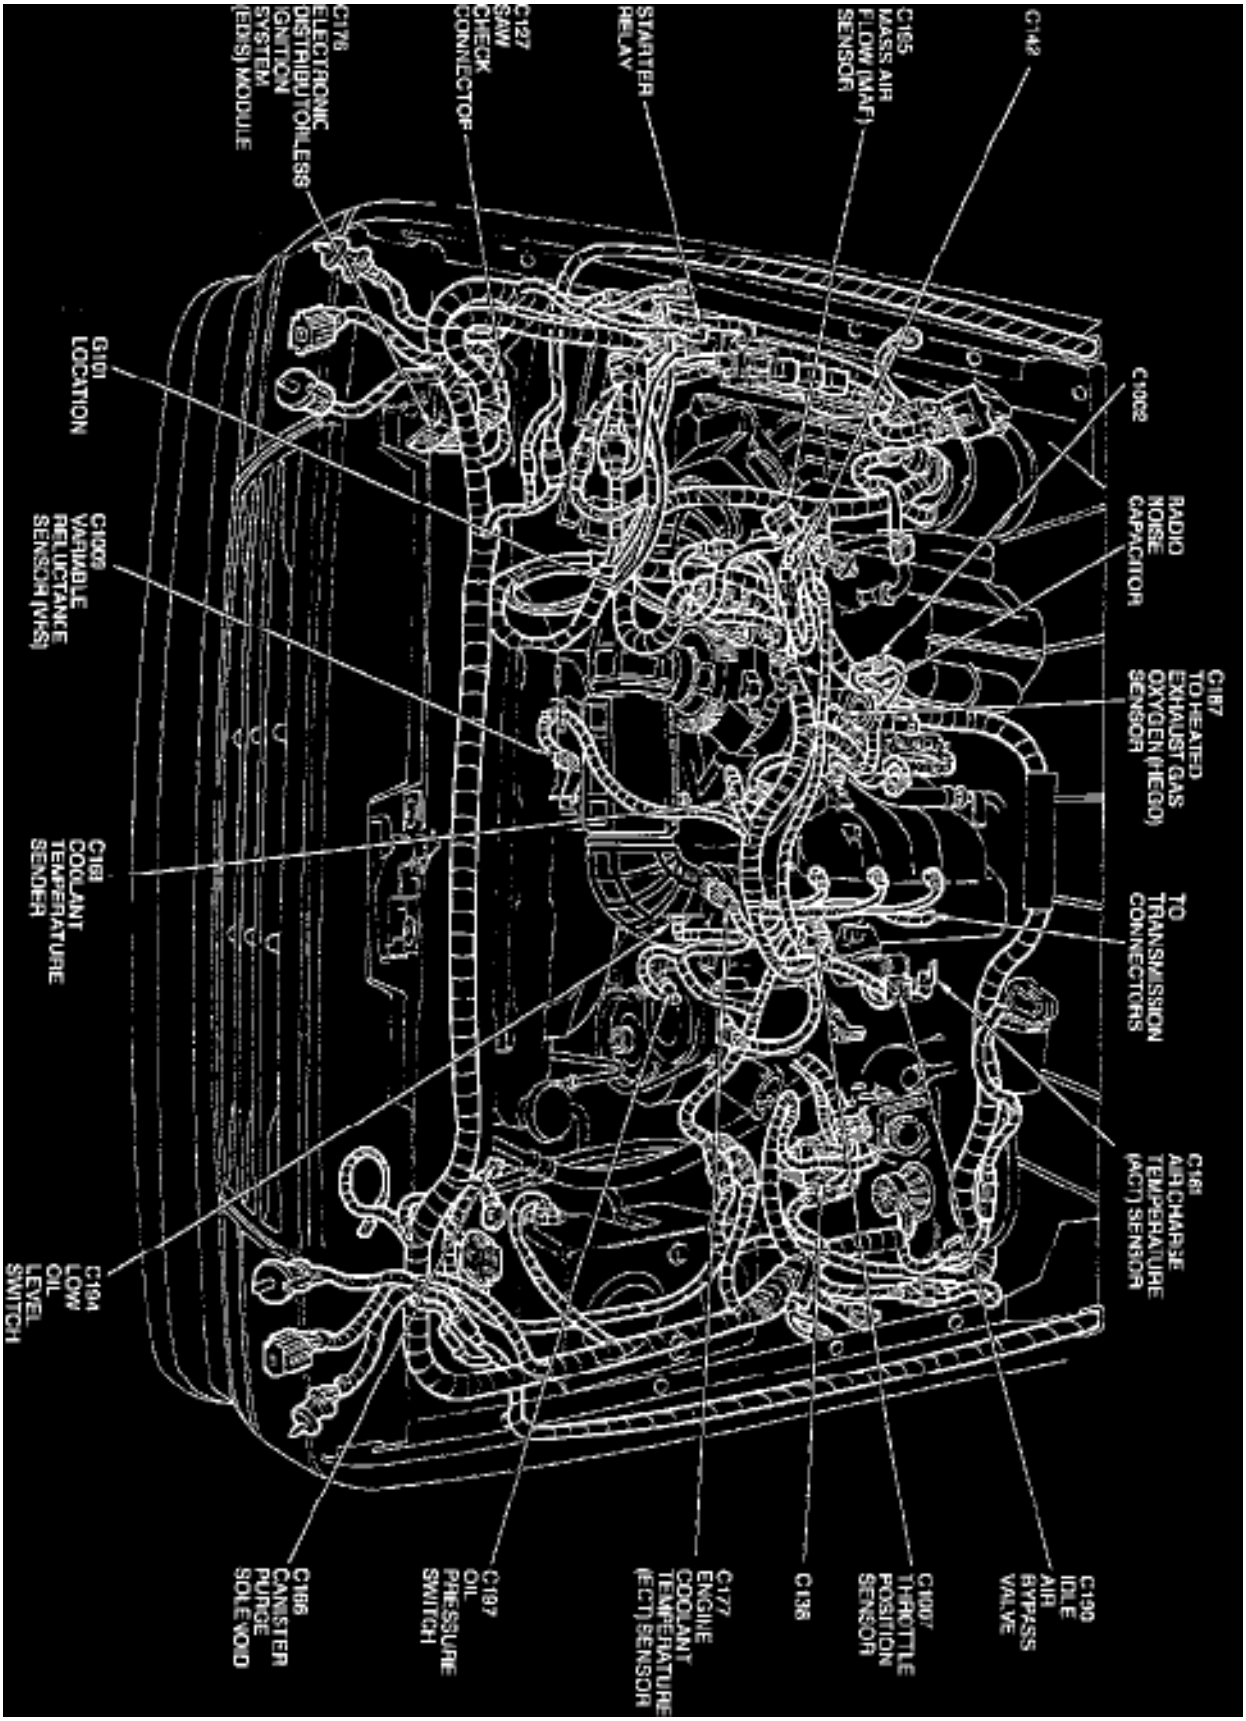
1. Position the Variable Reluctance (Crankshaft Position) Sensor assembly on the engine.

2. Install the two sensor attaching bolts and tighten to specified torque. (SEE SPECIFICATIONS/MECHANICAL)

3. Route the sensor wiring harness and connect the electrical connector to the sensor.

4. Connect the negative battery cable.

Ford Ranger 4wd Workshop Manual (V6-245 4.0L (1991))
Ford Workshop Manuals > Sensors and Switches > Sensors and Switches - Powertrain Management > Sensors and Switches - Computers and Control Systems > Intake Air Temperature Sensor > Component Information > Locations

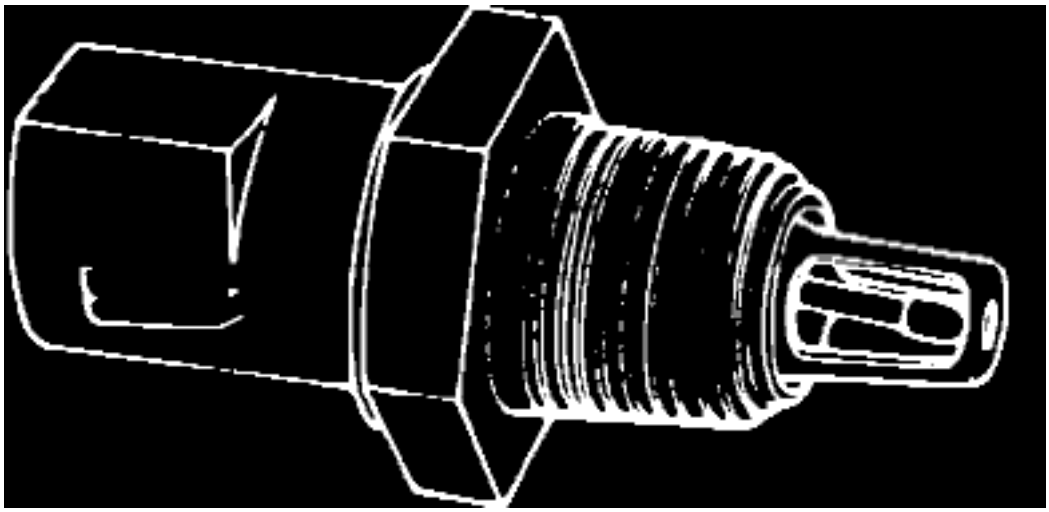


Intake Air Temperature Sensor: Locations

Engine Compartment Components.

Top LH Side Of Engine

Applicable to: 4.0L/V6-244



Intake Air Temperature Sensor: Description and Operation

Air Charge Temperature (ACT) Sensor

The Air Charge Temperature (ACT) sensor is threaded into the intake air passage with a sensing element extending into the air chamber. The ACT sensor is a negative temperature coefficient sensor, meaning that as the temperature of the sensor increases, the resistance will decrease. As the resistance value changes, the signal sensed by the Engine Control Assembly (ECA) will also change. The ECA reads the varying sensor resistance and determines the air charge temperature, using this information to optimize the air/fuel mixture. The ACT sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

This TSB article is being republished in its entirety to update model applicability and to revise the part number of the Low Volatility Sealant.

ISSUE: EGO sensors can be contaminated if volatile types of silicone are used when servicing the engine. Volatile silicones can migrate throughout the system during the first one hundred hours of service. They are commonly found in liquid "silicone rubber" sealants and gasket material. These products are commonly sold in tubes and caulking-type cartridges.

ACTION: When service is performed on the engine, only use new low volatility silicone sealant (F1AZ-19662-A) where specified. Also replace the contaminated EGO sensor if required.

CAUTION: DO NOT SUBSTITUTE CONVENTIONAL SILICONE RUBBER SEALANTS WHEN LOW VOLATILITY SILICONE SEALANT IS SPECIFIED.

Oxygen Sensor: Description and Operation

Heated Oxygen Sensor

The Heated Exhaust Gas Oxygen (HEGO) sensor is threaded into the exhaust manifold with a sampling tip extending into the exhaust stream. The sensor is a zirconium dioxide ceramic thimble with platinum surface electrodes. The ceramic thimble is oxygen ion conductive and generates voltage due to the oxygen content difference between the atmosphere and the exhaust gas. The sensor will generate a voltage signal between 0 volts (lean condition) and 1.1 volts (rich condition). The ECU reads this signal to achieve an air/fuel ratio of 14.7:1 when operating in CLOSED LOOP. The HEGO sensor must operate above 600°F. To quickly heat up the sensor, a heating element is incorporated into the sensor. The HEGO sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

Oxygen Sensor: Service and Repair

The oxygen sensor has a permanently attached wire and connector. This should not be removed, since the removal will affect proper operation of the oxygen sensor.

1. Disconnect electrical connector from oxygen sensor.

2. Using a suitable oxygen sensor wrench, carefully remove the sensor from exhaust manifold or pipe. The oxygen sensor may be difficult to remove when engine temperature is below 120°F. CAUTION: Excessive force may damage threads in exhaust manifold or pipe.

3. If a new sensor is being used, install the new sensor into the manifold or pipe.

4. If an old sensor is being reused, coat threads with anti-seize compound, then install the sensor into the manifold or pipe.

5. Torque the oxygen sensor to 30-36 lb. ft. (40-50 N-m), and reconnect the electrical connector.

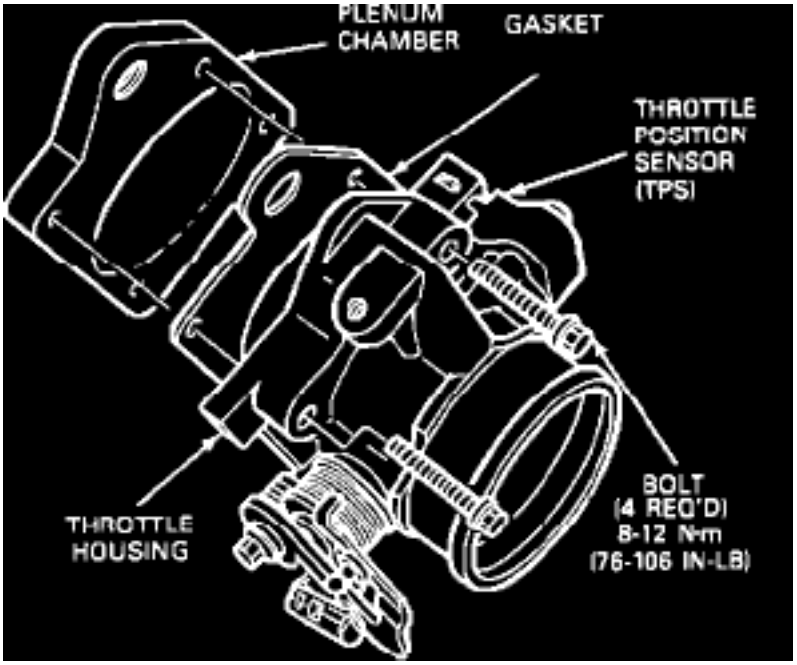
Throttle Position Sensor: Locations

Engine Compartment Components.

Top LH Front Of Engine

Applicable to: 4.0L/V6-244



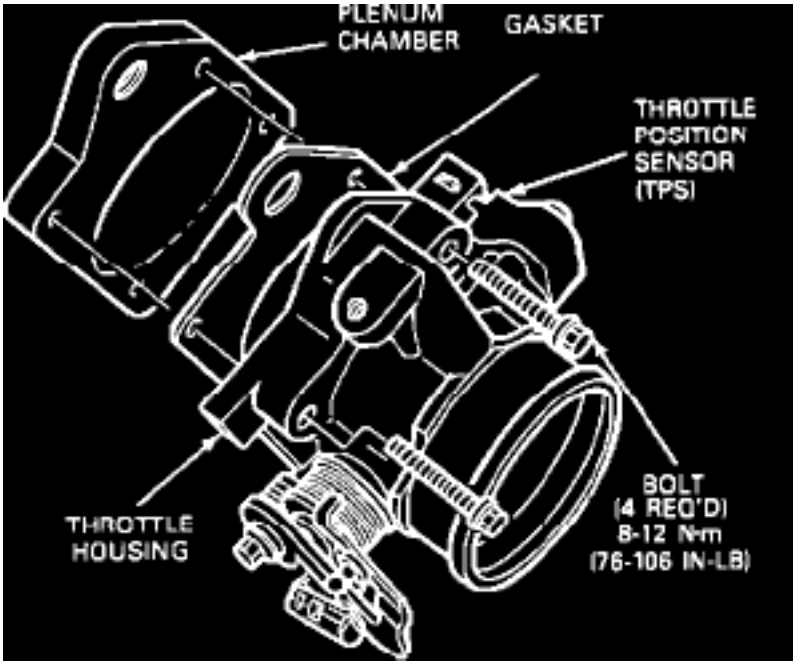
Throttle Position Sensor: Description and Operation

Throttle Body Assembly

The Throttle Position (TP) sensor, mounted on the throttle body, is a potentiometer that monitors throttle plate angle and sends a signal to the Engine Control Assembly (ECA). The TP sensor contains a pivot arm that moves along a curved resistor. One of the sensor leads supplies a five (5) volt reference signal (sent by the ECA) to the resistor. The second lead is used to ground the resistor. The third lead is for the voltage signal to the ECA. As the throttle plates move, the pivot arm moves along the curved resistor and receives a varying voltage signal. The ECA reads this signal and converts it into throttle plate angle. The voltage signal ranges from approximately one (1) volt at idle to approximately five (5) volts at wide open throttle. The TP sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

Throttle Position Sensor: Adjustments

The Throttle Position (TP) sensor is non-adjustable. If the voltage readings are out of range, the sensor must be replaced.



Throttle Position Sensor: Service and Repair

Throttle Body Assembly

1. Disconnect the Throttle Position (TP) sensor from the wiring harness.

2. If reinstalling the same TP sensor, mark the position of the TP sensor by scribing a mark on the sensor and throttle body.

3. Remove the TP sensor retaining screws, then remove the TP sensor and gasket.

4. Install a new gasket and the TP sensor, positioning the throttle position sensor so that the connector is facing rearward. Rotate the TP sensor clockwise to align the scribe mark (from step 2).

5. Install the TP sensor retaining screws, tightening to 11-16 lb. in. (1.2-1.8 N-m).

6. Connect the TP sensor electrical connector.

NOTE: The TP sensor is not adjustable.

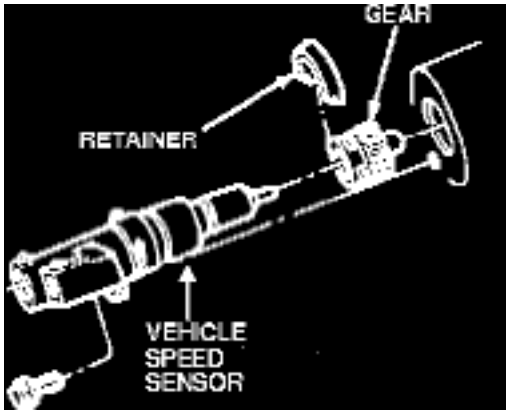
Vehicle Speed Sensor



Vehicle Speed Sensor: Description and Operation

Vehicle Speed Sensor

The Vehicle Speed Sensor (VSS) is a magnetic pulse generator driven by the transmission speedometer gear. The VSS produces 16 AC signals per revolution and sends this signal to the Engine Control Unit (ECA). The ECA converts this signal to a vehicle speed value and stores that value in RAM memory. The ECA uses this value to aid in controlling torque converter lock-up, coolant fan control, vehicle speed control, air/fuel ratio, and igniting timing.

Vehicle Speed Sensor: Service and Repair

1. Separate electrical connector leading to the amplifier assembly.

2. Disconnect upper and lower speedometer cables at the speed sensor. Remove speed sensor.

3. Reverse procedure to install.

ISSUE This TSB article is a diagnostic procedure to address vehicles that exhibit lean driveability symptoms and may or may not have any Diagnostic Trouble Codes (DTCs) stored in memory.

ACTION Follow the diagnostic procedures described in the following Service Tip. The revised diagnostic procedure is a more accurate means of diagnosing the symptoms.

SERVICE TIP

MASS AIR FLOW (MAF) DISCUSSION

MAF sensors can get contaminated from a variety of sources: dirt, oil, silicon, spider webs, potting compound from the sensor itself, etc. When a MAF sensor gets contaminated, it skews the transfer function such that the sensor over-estimates air flow at idle (causes the fuel system to go rich) and under-estimates air flow at high air flows (causes fuel system to go lean). This means Long Term Fuel Trims will learn lean (negative) corrections at idle and learn rich (positive) corrections at higher air flows.

If vehicle is driven at Wide Open Throttle (WOT) or high loads, the fuel system normally goes open loop rich to provide maximum power. If the MAF sensor is contaminated, the fuel system will actually be lean because of under-estimated air flow. During open loop fuel operation, the vehicle applies Long Term Fuel Trim corrections that have been learned during closed loop operation. These corrections are often lean corrections learned at lower air flows. This combination of under-estimated air flow and lean fuel trim corrections can result in spark knock/detonation and lack of power concerns at WOT and high loads.

One of the indicators for diagnosing this condition is barometric pressure. Barometric pressure (BARO) is inferred by the Powertrain Control Module (PCM) software at part throttle and WOT (there is no actual BARO sensor on MAF-equipped vehicles, except for the 3.8L Supercharged engine). At high air flows, a contaminated MAF sensor will under-estimate air flow coming into the engine, hence the PCM infers that the vehicle is operating at a higher altitude. The BARO reading is stored in Keep Alive Memory (KAM) after it is updated. Other indicators are Long Term Fuel Trim and MAF

voltage at idle.

NOTE

THE FOLLOWING PROCEDURE MAY ALSO BE USED TO DIAGNOSE VEHICLES THAT DO NOT HAVE FUEL SYSTEM/HO2S SENSOR DTCS.

Symptoms

^ Lack of Power

^ Spark Knock/Detonation

^ Buck/Jerk

^ Hesitation/Surge on Acceleration

^ Malfunction Indicator Lamp (MIL) Illuminated -

DTCs P0171, P0172, P0174, P0175 may be stored in memory

OBDII DTCs

^ P0171, P0174 (Fuel system lean, Bank 1 or 2)

^ P0172, P0175, (Fuel system rich, Bank 1 or 2)

^ P1130, P1131, P1132, (HO2S11 lack of switching, Bank 1)

^ P1150, P1151, P1152, (HO2S21 lack of switching, Bank 2)

OBDI DTCs

^ 181, 189 (Fuel system lean, Bank 1 or 2)

^ 179, 188 (Fuel system rich, Bank 1 or 2)

^ 171, 172, 173 (HO2S11 lack of switching, Bank 1)

^ 175, 176, 177 (HO2S21 lack of switching, Bank 2)

^ 184, 185 (MAF higher/lower than expected)

^ 186, 187 (Injector pulse width higher/lower than expected)

NOTE:

DO NOT DISCONNECT THE BATTERY. IT WILL ERASE KEEP ALIVE MEMORY AND RESET LONG TERM FUEL TRIM AND BARO TO THEIR STARTING/BASE VALUES. THE BARO PARAMETER IDENTIFICATION DISPLAY (PID) IS USED FOR THIS DIAGNOSTIC PROCEDURE. ALL OBDII APPLICATIONS HAVE THIS PID AVAILABLE. THERE ARE SOME OBDI VEHICLES THAT DO NOT HAVE THE BARO PID, FOR THESE VEHICLES OMIT THE BARO CHECK AND REFER ONLY TO STEPS 2, 3, AND 4 IN THE DIAGNOSTIC PROCEDURE.

BAROMETRIC PRESSURE REFERENCE

Barometric Pressure (in. Hg.)	Barometric Pressure (kPa)	BARO/MAP PID (Hz)	Altitude above sea level (ft)

21	70.9	132.5	9,000
22	74.3	135.4	8,000
23	77.7	138.3	7,000
24	81.1	141.1	6,000
25	84.4	144.0	5,000
26	87.8	146.9	4,000
27	91.2	149.8	3,000
28	94.6	152.8	2,000
29	97.9	155.8	1,000
30	101.3	158.9	0 (sea level)
31	104.7	162.0	
31.875	107.7	164.7	

1. Look at the BARO PID. Refer to the Barometric Pressure Reference Chart in this article. At sea level, BARO should read about 159 Hz (29.91 in. Hg). As a reference, Denver, Colorado at 1524 meters (5000 ft.) altitude should be about 144 Hz (24.88 in.Hg). Normal learned BARO variability is up to +/- 6 Hz (+/- 2 in. Hg.). If BARO indicates a higher altitude than you are not at (7 or more Hz lower than expected), you may have MAF contamination. If available, Service Bay Diagnostic System (SBDS) has a Manifold Absolute Pressure (MAP) sensor that can be used as a barometric pressure reference. Use "MAP/BARO" test under "Powertrain," "Testers and Meters." Ignore the hookup screen. Connect GP2 to the reference MAP on the following screen.

NOTE

REMEMBER THAT MOST WEATHER SERVICES REPORT A LOCAL BAROMETRIC PRESSURE THAT HAS BEEN CORRECTED TO SEA LEVEL. THE BARO PID, ON THE OTHER HAND, REPORTS THE ACTUAL BAROMETRIC PRESSURE FOR THE ALTITUDE THE VEHICLE IS BEING OPERATED IN. LOCAL WEATHER CONDITIONS (HIGH AND LOW PRESSURE AREAS) WILL CHANGE THE LOCAL BAROMETRIC PRESSURE BY SEVERAL INCHES OF MERCURY (+/- 3 Hz, +/- 1 in. Hg.).

NOTE

BARO IS UPDATED ONLY WHEN THE VEHICLE IS AT HIGH THROTTLE OPENINGS. THEREFORE, A VEHICLE WHICH IS DRIVEN DOWN FROM A HIGHER ALTITUDE MAY NOT HAVE HAD AN OPPORTUNITY TO UPDATE THE BARO VALUE IN KAM. IF YOU ARE NOT CONFIDENT THAT BARO HAS BEEN UPDATED, PERFORM THREE OR FOUR HEAVY, SUSTAINED ACCELERATIONS AT GREATER THAN HALF-THROTTLE TO ALLOW BARO TO UPDATE.

2. On a fully warmed up engine, look at Long Term Fuel Trim at idle, in Neutral, A/C off, (LONGFT1 and/or LONGFT2 PIDs). If it is more negative than -12%, the fuel system has learned lean corrections which may be due to the MAF sensor over-estimating air flow at idle. Note that both Banks 1 and 2 will exhibit negative corrections for 2-bank system. If only one bank of a 2-bank system has negative corrections, the MAF sensor is probably not contaminated.

3. On a fully warmed up engine, look at MAF voltage at idle, in Neutral, A/C off (MAF V PID). If it's 30% greater than the nominal MAF V voltage listed in the Powertrain Control/Emissions Diagnosis (PC/ED) Diagnostic Value Reference Charts for your vehicle, or greater than 1.1 volts as a rough guide, the MAF sensor is over-estimating air flow at idle.

4. If at least tow of the previous three steps are true, proceed to disconnect the MAF sensor connector. This puts the vehicle into Failure Mode and Effects Management (FMEM). In FMEM mode, air flow is inferred by using rpm and throttle position instead of reading the MAF sensor. (In addition, the BARO value is reset to a base/unlearned value.) If the lean driveability symptoms go away, the MAF sensor is probably contaminated and should be replaced. If the lean driveability symptoms do not go away, go to the PC/ED Service Manual for the appropriate diagnostics.

NOTE

DUE TO INCREASINGLY STRINGENT EMISSION/OBDII REQUIREMENTS, IT IS POSSIBLE FOR SOME VEHICLES WITH MAF SENSOR CONTAMINATION TO SET FUEL SYSTEM DTCs AND ILLUMINATE THE MIL WITH NO DRIVEABILITY CONCERNS. DISCONNECTING THE MAF ON THESE VEHICLES WILL, THEREFORE, PRODUCE NO IMPROVEMENTS IN DRIVEABILITY. IN THESE CASES, IF THE BARO, LONGFT1, LONGFT2, AND MAF V PIDs INDICATE THAT THE MAF IS CONTAMINATED, PROCEED TO REPLACE THE MAF SENSOR.

After replacing the MAF sensor, disconnect the vehicle battery (5 minutes, minimum to reset KAM, or on newer vehicles, use the "KAM Reset" feature on the New Generation Star (NGS) Tester and verify that the lean driveability symptoms are gone.

ISSUE This TSB article is a diagnostic procedure to address vehicles that exhibit lean driveability symptoms and may or may not have any Diagnostic Trouble Codes (DTCs) stored in memory.

ACTION Follow the diagnostic procedures described in the following Service Tip. The revised diagnostic procedure is a more accurate means of diagnosing the symptoms.

SERVICE TIP

MASS AIR FLOW (MAF) DISCUSSION

MAF sensors can get contaminated from a variety of sources: dirt, oil, silicon, spider webs, potting compound from the sensor itself, etc. When a MAF sensor gets contaminated, it skews the transfer function such that the sensor over-estimates air flow at idle (causes the fuel system to go rich) and under-estimates air flow at high air flows (causes fuel system to go lean). This means Long Term Fuel Trims will learn lean (negative) corrections at idle and learn rich (positive) corrections at higher air flows.

If vehicle is driven at Wide Open Throttle (WOT) or high loads, the fuel system normally goes open loop rich to provide maximum power. If the MAF sensor is contaminated, the fuel system will actually be lean because of under-estimated air flow. During open loop fuel operation, the vehicle applies Long Term Fuel Trim corrections that have been learned during closed loop operation. These corrections are often lean corrections learned at lower air flows. This combination of under-estimated air flow and lean fuel trim corrections can result in spark knock/detonation and lack of power concerns at WOT and high loads.

One of the indicators for diagnosing this condition is barometric pressure. Barometric pressure (BARO) is inferred by the Powertrain Control Module (PCM) software at part throttle and WOT (there is no actual BARO sensor on MAF-equipped vehicles, except for the 3.8L Supercharged engine). At high air flows, a contaminated MAF sensor will under-estimate air flow coming into the engine, hence the PCM infers that the vehicle is operating at a higher altitude. The BARO reading is stored in Keep Alive Memory (KAM) after it is updated. Other indicators are Long Term Fuel Trim and MAF

voltage at idle.

NOTE

THE FOLLOWING PROCEDURE MAY ALSO BE USED TO DIAGNOSE VEHICLES THAT DO NOT HAVE FUEL SYSTEM/HO2S SENSOR DTCS.

Symptoms

^ Lack of Power

^ Spark Knock/Detonation

^ Buck/Jerk

^ Hesitation/Surge on Acceleration

^ Malfunction Indicator Lamp (MIL) Illuminated -

DTCs P0171, P0172, P0174, P0175 may be stored in memory

OBDII DTCs

^ P0171, P0174 (Fuel system lean, Bank 1 or 2)

^ P0172, P0175, (Fuel system rich, Bank 1 or 2)

^ P1130, P1131, P1132, (HO2S11 lack of switching, Bank 1)

^ P1150, P1151, P1152, (HO2S21 lack of switching, Bank 2)

OBDI DTCs

^ 181, 189 (Fuel system lean, Bank 1 or 2)

^ 179, 188 (Fuel system rich, Bank 1 or 2)

^ 171, 172, 173 (HO2S11 lack of switching, Bank 1)

^ 175, 176, 177 (HO2S21 lack of switching, Bank 2)

^ 184, 185 (MAF higher/lower than expected)

^ 186, 187 (Injector pulse width higher/lower than expected)

NOTE:

DO NOT DISCONNECT THE BATTERY. IT WILL ERASE KEEP ALIVE MEMORY AND RESET LONG TERM FUEL TRIM AND BARO TO THEIR STARTING/BASE VALUES. THE BARO PARAMETER IDENTIFICATION DISPLAY (PID) IS USED FOR THIS DIAGNOSTIC PROCEDURE. ALL OBDII APPLICATIONS HAVE THIS PID AVAILABLE. THERE ARE SOME OBDI VEHICLES THAT DO NOT HAVE THE BARO PID, FOR THESE VEHICLES OMIT THE BARO CHECK AND REFER ONLY TO STEPS 2, 3, AND 4 IN THE DIAGNOSTIC PROCEDURE.

BAROMETRIC PRESSURE REFERENCE

Barometric Pressure (in. Hg.)	Barometric Pressure (kPa)	BARO/MAP PID (Hz)	Altitude above sea level (ft)
3.5	11.8	89.3	
5	16.9	92.8	
10	33.8	104.6

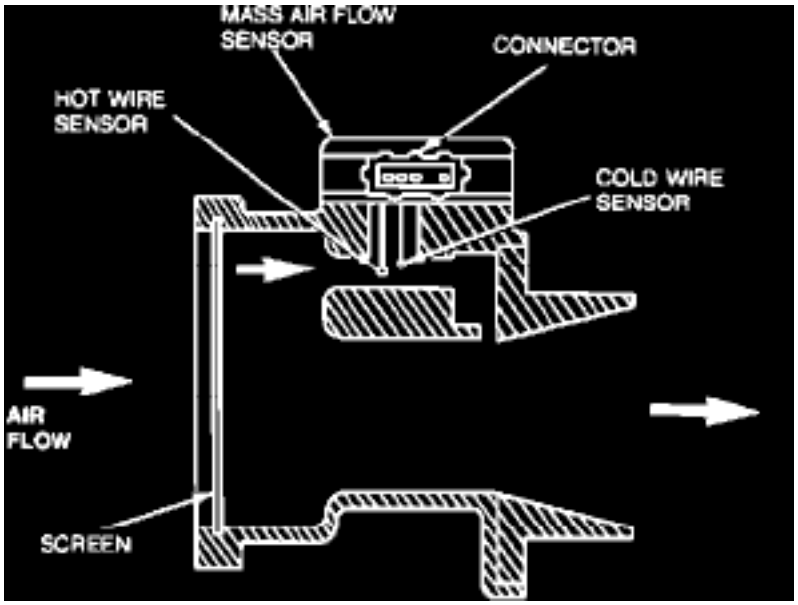
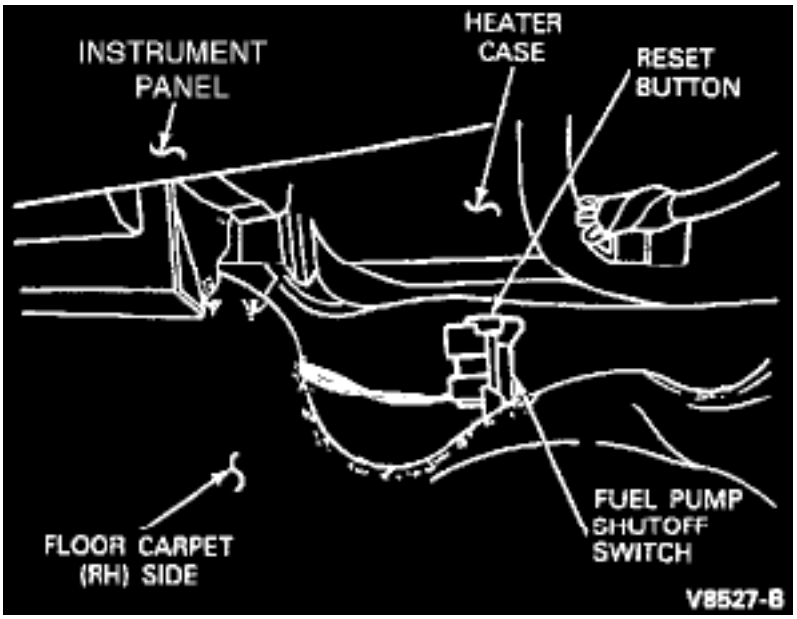
Mass Air Flow (MAF) Sensor



Mass Air Flow (MAF) Sensor: Description and Operation

Mass Air Flow Sensor

The Mass AirFlow (MAF) sensor, located between the air filter and the throttle body, is used to measure the mass of the air entering the engine due to volumetric displacement. The MAF sensor operates on the principle that if a mass is maintained at a constant temperature above the ambient environment, then the thermal loss is proportional to the mass flow of the cooling medium it is subjected to. The electronic module of the MAF sensor heats a wire element to 392°F (200°C) above ambient temperature. As air passes through the sensor, the air cools the wire element. The MAF sensor supplies more power to the wire to keep it at a constant temperature difference. When a drop in power useage occurs, the MAF sends a signal to the Engine Control Assembly (ECA) indicating the drop. The signal increases with the airflow into the engine.



Fuel Pump Inertia Switch: Locations

Inertia Switch

The inertia switch is located below the instrument panel, to the right of the transmission hump.

Fuel Pump Inertia Switch: Description and Operation

Typical Inertia Fuel Shut-Off Switch

The inertia switch is used to open the power circuit to the fuel pump, or the control circuit to the fuel pump relay, in case of an accident. The inertia switch must be manually reset by pushing the reset button located on top of the inertia switch.

Operation of the inertia switch is as follows:

A steel ball is held in place by a magnet. When a sharp impact occurs, the ball breaks loose from the magnet, rolls up a conical ramp and strikes a target plate, which opens the electrical contacts.

Fuel Pump Inertia Switch: Service and Repair

TO RESET SWITCH 1.

Turn ignition switch to OFF.

2. Check for leaking fuel in the engine compartment, fuel lines and tank(s).

3. If no fuel leak is apparent, reset the switch by pushing the reset button on the top of the switch.

4. Turn ignition switch to START for a few seconds, then to OFF.

5. Again, check for leaking fuel.

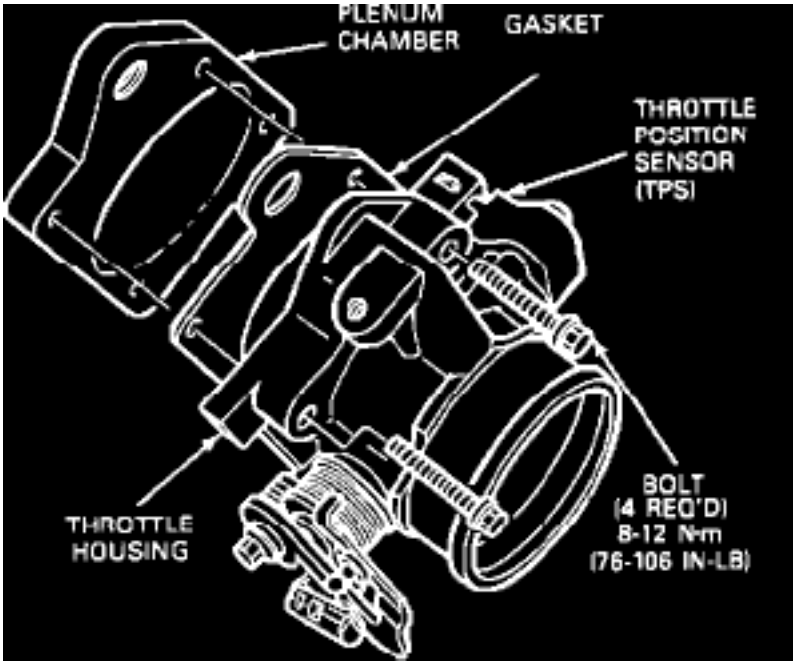
Throttle Position Sensor: Locations

Engine Compartment Components.

Top LH Front Of Engine

Applicable to: 4.0L/V6-244



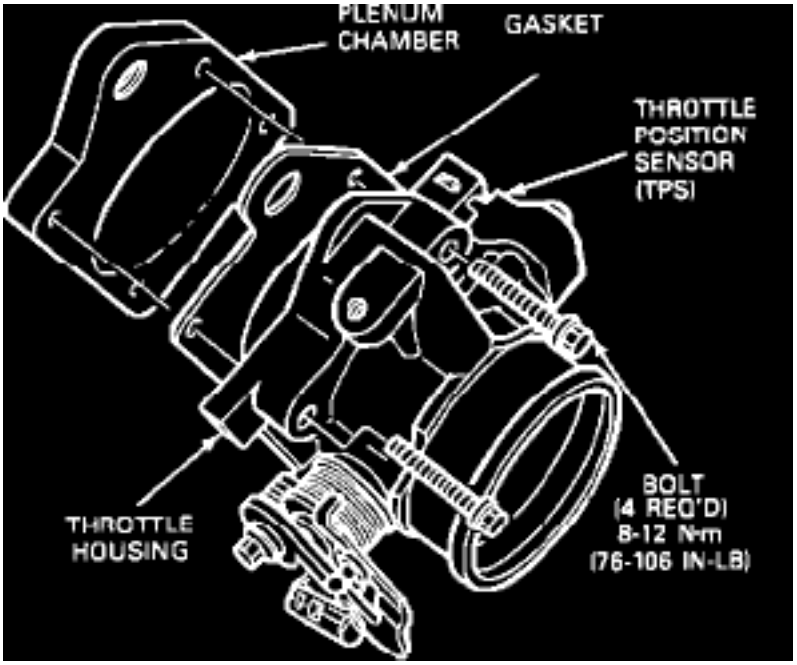
Throttle Position Sensor: Description and Operation

Throttle Body Assembly

The Throttle Position (TP) sensor, mounted on the throttle body, is a potentiometer that monitors throttle plate angle and sends a signal to the Engine Control Assembly (ECA). The TP sensor contains a pivot arm that moves along a curved resistor. One of the sensor leads supplies a five (5) volt reference signal (sent by the ECA) to the resistor. The second lead is used to ground the resistor. The third lead is for the voltage signal to the ECA. As the throttle plates move, the pivot arm moves along the curved resistor and receives a varying voltage signal. The ECA reads this signal and converts it into throttle plate angle. The voltage signal ranges from approximately one (1) volt at idle to approximately five (5) volts at wide open throttle. The TP sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

Throttle Position Sensor: Adjustments

The Throttle Position (TP) sensor is non-adjustable. If the voltage readings are out of range, the sensor must be replaced.



Throttle Position Sensor: Service and Repair

Throttle Body Assembly

1. Disconnect the Throttle Position (TP) sensor from the wiring harness.

2. If reinstalling the same TP sensor, mark the position of the TP sensor by scribing a mark on the sensor and throttle body.

3. Remove the TP sensor retaining screws, then remove the TP sensor and gasket.

4. Install a new gasket and the TP sensor, positioning the throttle position sensor so that the connector is facing rearward. Rotate the TP sensor clockwise to align the scribe mark (from step 2).

5. Install the TP sensor retaining screws, tightening to 11-16 lb. in. (1.2-1.8 N-m).

6. Connect the TP sensor electrical connector.

NOTE: The TP sensor is not adjustable.

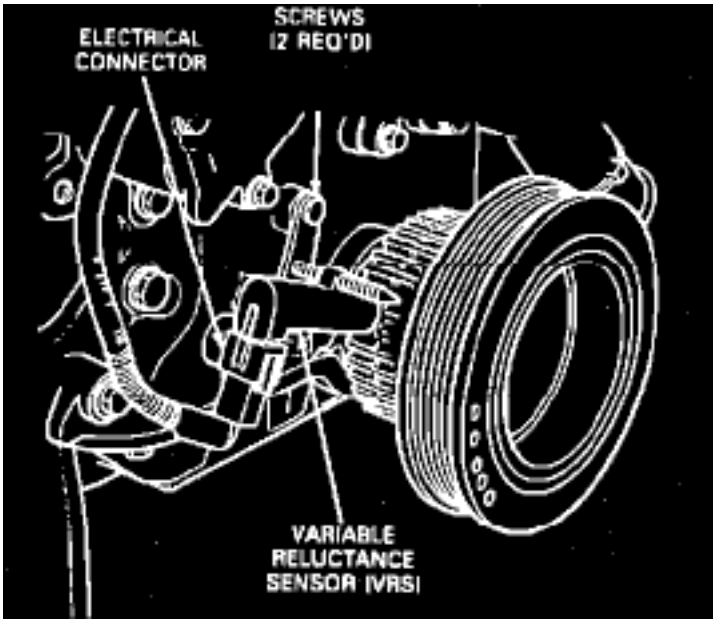
Crankshaft Position Sensor: Description and Operation

Crankshaft Timing Sensor

The crankshaft timing sensor is a variable reluctance type sensor. It is triggered by a 35 tooth trigger wheel tooth configuration machined into the rear of the crankshaft dampener. The signal generated by this sensor is called a Variable Reluctance Sensor (VRS) signal. The VRS signal provides the base timing and rpm information to the EDIS module. Base timing is set at 10° and is not adjustable.



Crankshaft Position Sensor: Service and Repair

Variable Reluctance (Crankshaft Position) Sensor

REMOVAL:

1. Disconnect the negative battery cable.

2. Disconnect the sensor electrical connector from the wiring harness.

3. Remove the Variable Reluctance (Crankshaft Position) Sensor mounting bolts and remove the sensor.

INSTALLATION:

1. Position the Variable Reluctance (Crankshaft Position) Sensor assembly on the engine.

2. Install the two sensor attaching bolts and tighten to specified torque. (SEE SPECIFICATIONS/MECHANICAL)

3. Route the sensor wiring harness and connect the electrical connector to the sensor.

4. Connect the negative battery cable.

ISSUE: The instrument cluster warning light(s) may be dimly lit or there may be a malfunction of the four pin low oil relay on vehicles so equipped. This could be due to the ignition switch.

ACTION:

If the vehicle displays the subject symptoms and meets the following conditions, replace the ignition switch. Refer to the appropriate Car or Light Truck Service Manual (Section 13-04 for 1983-1990 Cars, Section 11-04 for 1991-1993 Cars and Section 13-05 for 1983-1990 Light Trucks, Section 11-05 for 1991-1993 Light Trucks) for removal and installation procedures. Refer to the Parts Block in this article for correct parts usage.

CONDITIONS

^ The vehicle has 14401 wiring attached to the P2 terminal of the ignition switch. Refer to the wiring schematic and/or Electrical And Vacuum Troubleshooting Manual (EVTM) for the concern vehicle.

Ignition Switch: Customer Interest Engine - Hard Start/No Start When Cold

Article No. 91-13-9

06/26/91

^ HARD START - 4.0L - COLD ENGINE

^ NO START - 4.0L - COLD ENGINE

^ IGNITION SWITCH BOUNCE - HARD OR NO START - 4.0L COLD ENGINE

LIGHT TRUCK: 1990-91 RANGER 1991 EXPLORER

ISSUE: A hard start or no start condition may occur when the engine is cold. The engine may not start without cycling the key to the OFF position and back to START. Ignition switch bounce (loss of electrical continuity between contacts) may cause the EDIS module to recycle several times or to lock-up and not allow a start at all.

ACTION: Install a new ignition switch containing synthetic lubricant which reduces the amount of bounce. Also, install a new wiring connector containing a new material that is compatible with the new synthetic lubricant. Refer to the following procedure for service details.

REMOVAL

1. Disconnect the battery power.

2. Remove the trim panel. Refer to the 1990-91 Ranger/Explorer Shop Manual, Section 11-04B, for removal procedure.

3. Turn the lock cylinder to the RUN position.

4. Remove the two (2) nuts on the ignition switch.

5. Separate the connector from ignition switch by gently prying on the ears of the connector and pulling apart firmly.

6. Disengage the terminals from the existing connector. Discard the connector.

Figure 1

7. Insert terminal into proper locations in new connector (F2TZ-14489-A), Figure 1.

INSTALLATION

1. Remove the spring clip from the new switch (F2TZ-11572-A). This clip keeps the switch in the correct position during shipment.

2. Press the new connector (F2TZ-14489-A) onto the terminals of the ignition switch. Be sure the tabs lock securely.

3. Locate the switch on the weld studs on the steering column.

NOTE: THE END OF THE ACTUATOR ROD MUST FIT IN THE HOLE ON THE SLIDER.

4. Install the nuts on the weld stud. Tighten to 4.45-7.24 N-m (39-64 lb.in.).

5. Connect the battery terminal.

6. Check the switch operation. If necessary, adjust it. Refer to the 1990-91 Aerostar, Explorer, Ranger Truck Shop Manual, Section 11-04B, for adjustment procedure.

7. Install the trim panel.

ISSUE: The instrument cluster warning light(s) may be dimly lit or there may be a malfunction of the four pin low oil relay on vehicles so equipped. This could be due to the ignition switch.

ACTION:

If the vehicle displays the subject symptoms and meets the following conditions, replace the ignition switch. Refer to the appropriate Car or Light Truck Service Manual (Section 13-04 for 1983-1990 Cars, Section 11-04 for 1991-1993 Cars and Section 13-05 for 1983-1990 Light Trucks, Section 11-05 for 1991-1993 Light Trucks) for removal and installation procedures. Refer to the Parts Block in this article for correct parts usage.

CONDITIONS

^ The vehicle has 14401 wiring attached to the P2 terminal of the ignition switch. Refer to the wiring schematic and/or Electrical And Vacuum Troubleshooting Manual (EVTM) for the concern vehicle.

Brake And Clutch Switches

Clutch Pedal Position Switch: Testing and Inspection

This switch functions magnetically. Do not use magnetized tools near this switch.

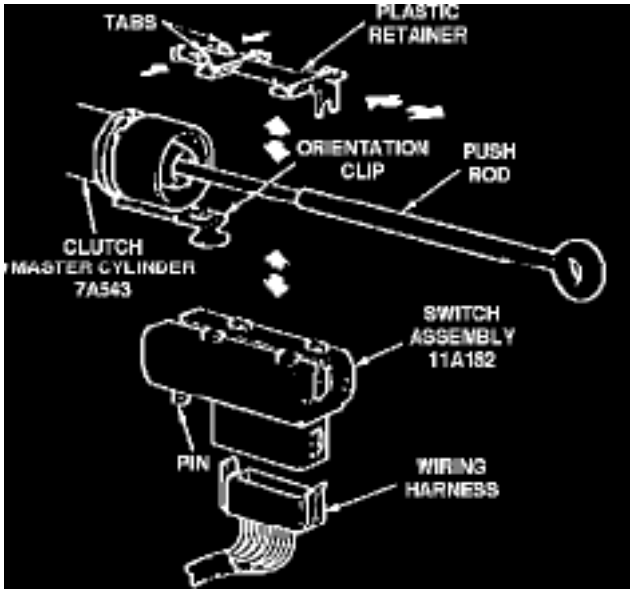
1. If the switch is open when the clutch pedal is released, speed control will not operate. This must be corrected before making any other tests. Use only a multimeter of 5000 ohm/volt rating or higher when performing the clutch switch test.

2. On all except 1990-91 Aerostar, Bronco II, Explorer and Ranger and 1992 Bronco & F150-350 models, disconnect switch pigtail connector from speed control harness connector and connect an ohmmeter to the two switch connector terminals.

3. On all 1990-91 Aerostar, Bronco II, Explorer and Ranger and 1992 Bronco & F150-350 models, connect suitable ohmmeter between two middle switch connector terminals.

4. On all models, with clutch pedal in the fully released position, the resistance should be less than 5 ohms. With clutch pedal fully depressed, the circuit should be open.

5. If switch does not function as described, remove and replace switch.



Clutch Pedal Position Switch: Service and Repair

Fig. 8 Clutch Interlock 3-way Switch

REMOVAL

1. Disconnect electrical connector from switch located on clutch master cylinder push rod, Fig. 8.

2. Pull orientation clip away from switch to separate pin, then rotate switch to expose plastic retainer.

3. Push tabs together to allow retainer to slide rearward and separate from switch.

4. Remove switch from push rod.

INSTALLATION

1. Install switch onto master cylinder push rod, ensuring that switch is properly seated.

2. Install plastic retainer, then rotate switch into position and attach orientation clip.

3. Connect electrical connector.

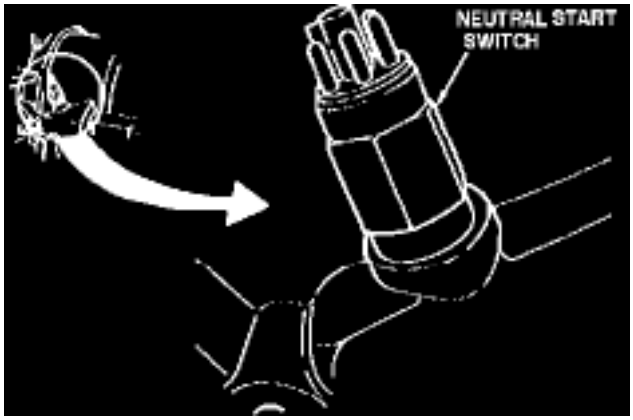
LH Side Of Transmission



Neutral Safety Switch: Service and Repair

Fig. 9 Neutral Start Switch

REMOVAL

1. Disconnect battery ground cable, then raise and support vehicle.

2. Disconnect electrical connector from switch, Fig. 9, then remove switch and O-ring using neutral start switch socket T74P-77247-A or equivalent. Neutral start switch socket is a thin wall socket, other types of sockets could puncture walls of switch.

INSTALLATION

1. Install neutral start switch using socket and torque to 7-10 ft. lbs.

2. Connect electrical connector to switch, then lower vehicle.

3. Connect battery ground cable, then check operation of switch with parking brake engaged. Engine should start with selector lever in N or P only, and back-up lamps should illuminate with selector lever in R only.

Wire Color Code Identification

NOTE: Whenever a wire is labeled with two colors; the first color listed is the basic color of the wire, and the second color is the tracer marking of the wire. If the second color is followed by by a D, the tracer is dots. If the second color is followed by an H, the tracer is hash marks.

For example: BR/O is a brown wire with an orange stripe, R/Y D is a red wire with yellow dots and BK/W H is a black wire with white hash marks.

Body Components

Top Front Of Transfer Case

4 X 4 Indicator Switch: Description and Operation

The shift position sensor is an integral component of the electronic shift motor. The sensor inputs shift position of the transfer case to the electronic control module.

Speed Sensor: Description and Operation

The speed sensor information to the electronic control module verifies the proper speed to allow range shifts (in or out of 4-Low) to occur.

Wiper Switch: Testing and Inspection

Fig. 5 Wiper Switch Continuity Test. 1988 Bronco II & Ranger

Fig. 6 Wiper Switch Continuity Test. Except 88 Bronco II & Ranger

1. Check continuity between switch terminals, Figs 5 and 6.

2. To detect marginal operation of switch, move switch lever while each reading is being taken.

3. If switch does not show continuity or if poor continuity exists at any switch position, replace switch.

Wiper Switch: Service and Repair Rear Wiper Switch

1. Disconnect battery ground cable, then remove ashtray and instrument cluster trim panel.

2. Remove switch mounting bezel containing switches, then disconnect switch electrical connector and remove switch.

3. Reverse procedure to install, checking wiper operation.

Wiper Switch: Service and Repair Windshield Wiper Switch

REMOVAL

1. Disconnect battery ground cable (two ground cables on diesel engines).

2. On models with tilt steering, remove upper extension shroud by squeezing at six and twelve o'clock positions and popping free of retaining plate at three o'clock position.

3. On all models, remove steering column shroud halves.

4. Remove turn signal switch lever by grasping and using a twisting and pulling motion while pulling lever straight out from switch.

5. Peel back foam shield from switch, then disconnect electrical connectors.

6. Remove two switch attaching screws, then the switch.

INSTALLATION

1. Align switch mounting holes with holes in lock cylinder housing, then install screws and torque to 18-26 inch lbs.

2. Adhere foam shield to switch, then install switch lever by aligning key on lever with keyway in switch and pushing lever in until fully engaged.

3. Connect electrical connectors, then install steering column shroud halves.

4. On models with tilt steering, install upper extension shroud.

5.

On all models, connect battery ground cable.

Technical Service Bulletin # 98-5A-22 Date: 980318

Vehicle - Pull Or Drift Diagnostics/Service Procedures

Article No. 98-5A-22

03/18/98

^ BRAKES - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

^ STEERING - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

LIGHT TRUCK: 1988-94 RANGER 1991-94 EXPLORER

ISSUE: A comprehensive pull and drift diagnostic procedure has been developed to assist technicians with vehicle service.

ACTION: Use the following Service Procedure to resolve drift and pull concerns.

Proceed with the Pull and Drift Diagnostic Procedure it the pull or drift is not significantly reduced or where there is a case of steady state drift (no braking).

A Diagnostic Check List has been provided at the end of this article to use with this procedure.

NOTE:

THIS TSB ARTICLE SHOULD BE READ COMPLETELY BEFORE PERFORMING DIAGNOSTICS OR REPAIRS.

PART NUMBER PART NAME

ROAD TEST - FRONT W6

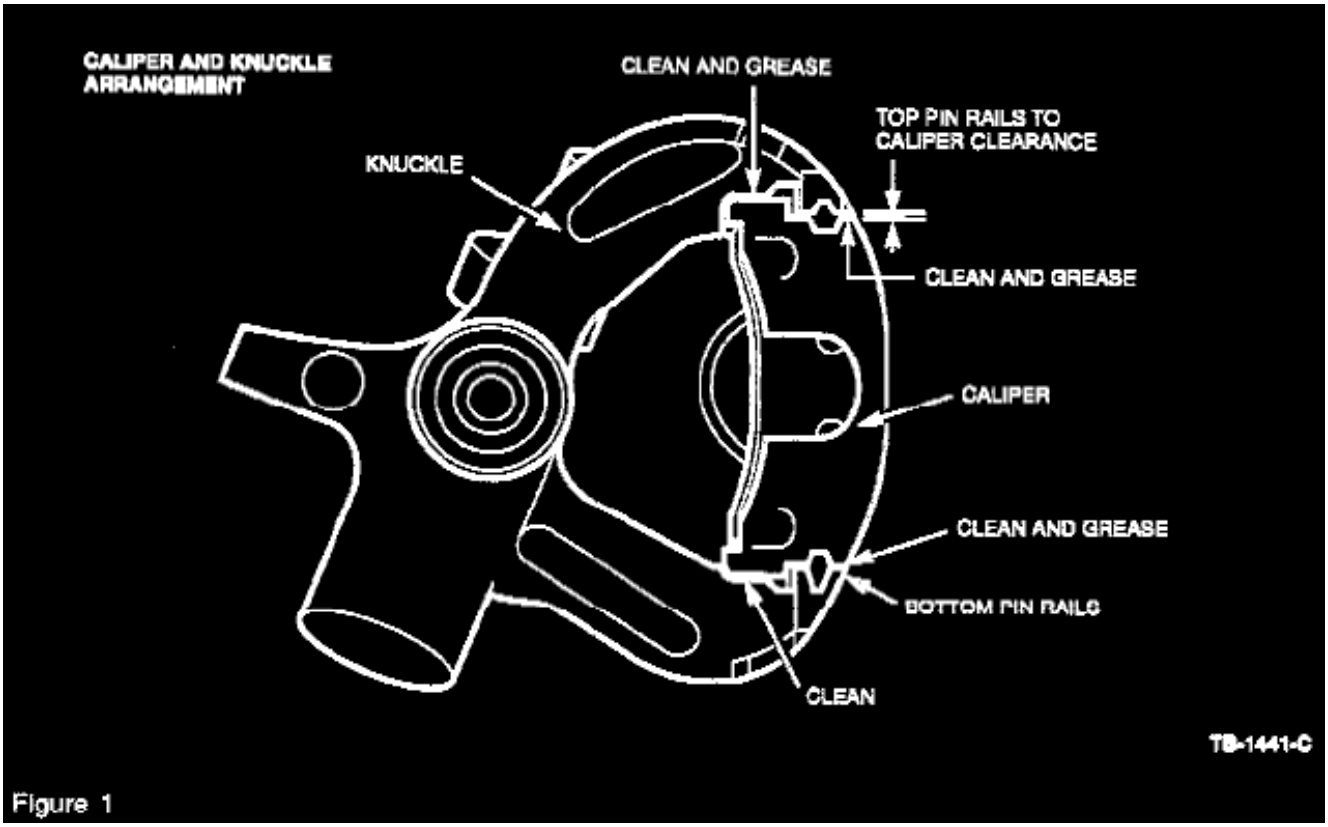

Figure 1

OASIS CODES: 301000, 303000

Service Procedure

1. Check and adjust brake pad clearances and caliper knuckle clearances as follows:

a. Remove the pins from the caliper.

b. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails. Clearance should be a minimum of 0.3B mm (0.015").

c. If the clearance is insufficient, replace the caliper and measure again. If clearance concern still exists, replace the knuckle.

NOTE:

CHECK THE CLEARANCE ON THE NEW KNUCKLE BEFORE INSTALLATION.

d. After measuring the caliper/knuckle for proper clearances, remove both calipers and inner pad assemblies.

e. Remove the anti-rattle clip from the inner pad.

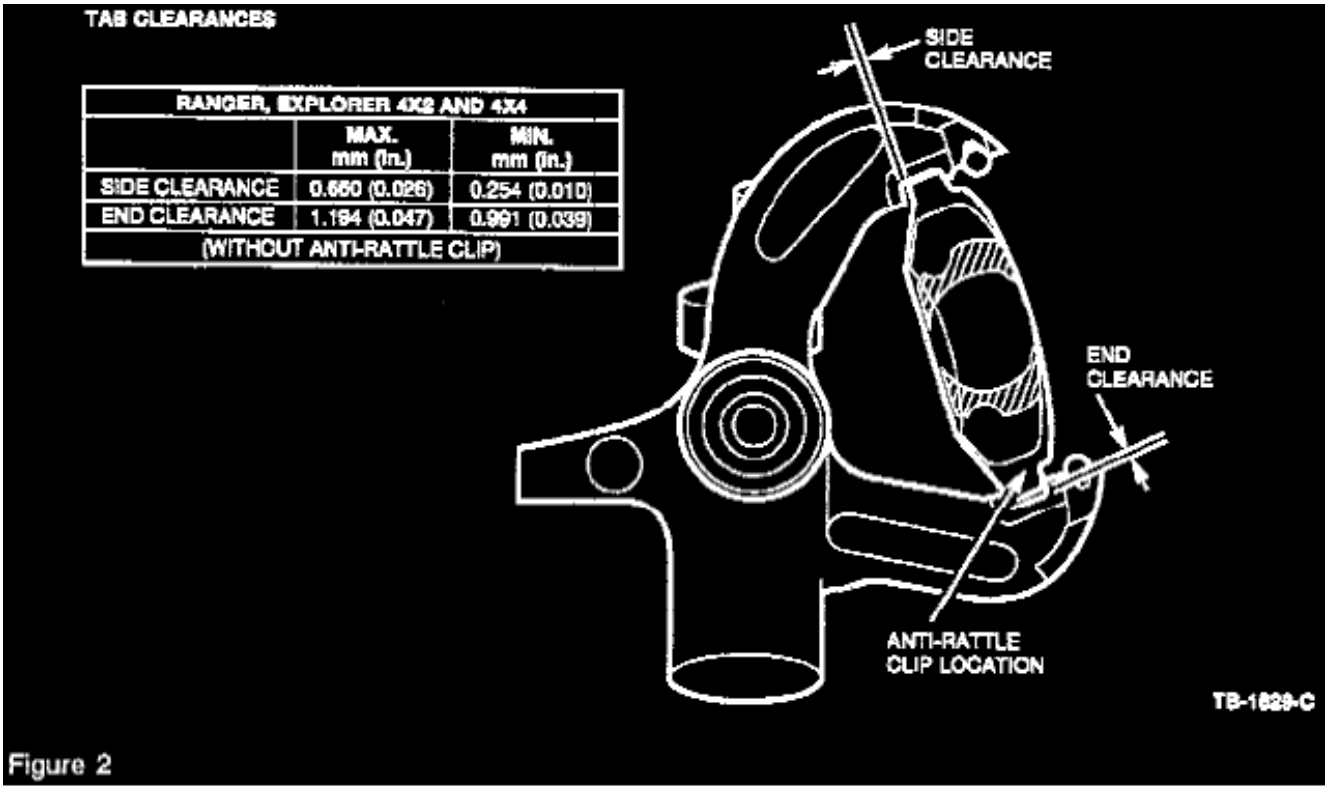

Figure 2

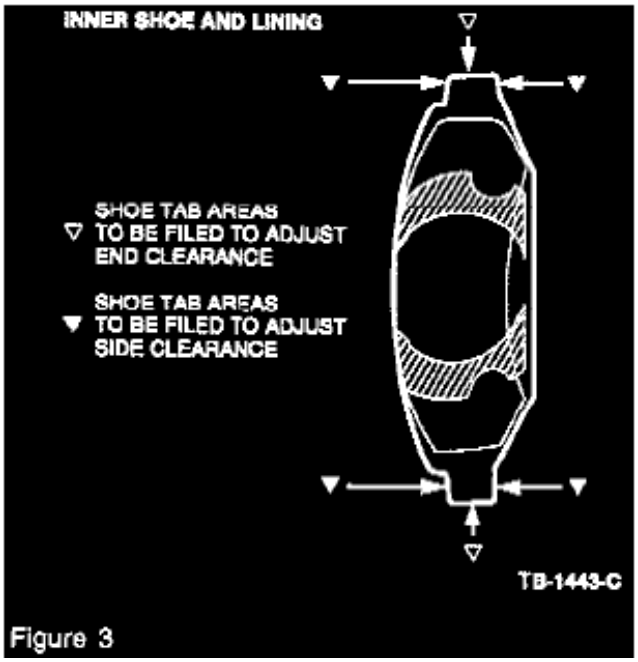

Figure 3

f. Reinstall pad and check the side and end clearances with a feeler gauge (Figure 2).

g. If the pad clearances are within specification, go to Step 1h. If the pad clearances are not to the required dimensions, file the steel backing plate. File material at ends of shoes, removing equal amounts from both sides or ends (Figure 3).

CAUTION:

DO NOT GRIND THE STEEL BACKING PLATE. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

h. Check the tab clearances and install anti-rattle clip on the lower pad tab (Figure 2).

CAUTION:

MAKE SURE THE LUBRICANT DOES NOT GET ON THE ROTORS, LININGS, OR ON THE CALIPER PISTON BOOTS.

2. During reassembly:

^ Clean the caliper slide surfaces of corrosion, contamination, and burrs with a wire brush or portable wire wheel

^ Polish with crocus cloth

^ Lubricate and corrosion protect by applying a light coat of Silicone Brake Caliper Grease and Dielectric Compound (D7AZ-19A331-A), or equivalent meeting Ford specification ESE-M1C171-A, to the inner knuckle top and bottom pad groove and caliper rails (Figure 1)

^ Replace the caliper pins with new Caliper Pins (F2TZ-2C150-A)

NOTE:

THE EXPLORER IS ALREADY EQUIPPED WITH THE NEW RADIUS ARM BUSHINGS.

3. Inspect the right and left side radius arm bushings for cracking, splitting, or wear. Replace the right and left side arm bushings with new Radius Arm Bushings (F1TZ-3B203-B), medium brown color, if necessary. Refer to the appropriate Service Manual, Section 04-01C, for service details.

Pull/Drift Diagnostic Procedure

The Pull/Drift Diagnostic Procedure should be used if the pull or drift is not significantly reduced with the service procedure or in cases of a steady state drift (no braking).

Test drive the vehicle with the customer to understand his/her pull or drift concern. Many customers will call a clear vision concern a pull or drift because the steering wheel is not straight.

Pull or drifts come from various sources, each with a particular set of symptoms. Careful road test evaluation usually will pinpoint which cause (or causes) is present.

Road Test

It is important to test drive the vehicle with the customer to UNDERSTAND HIS OR HER CONCERN.

Complete the road test before beginning any repairs since you may have multiple causes that need to be identified.

^ The road test should be done on a flat, straight road and should be done in both directions to account for wind

^ Tire pressure should be checked and adjusted, if necessary

^ A second person in the vehicle during the road test is helpful. Unless otherwise directed, the second person must remain in the front RH passenger location

^ On vehicles with automatic locking hubs, it is necessary to drive 6 meters (20 feet) forward and then backward to unlock the hubs

ROAD TEST	RESULT	ACTION
Maintain a steady speed of 80-89 km/h (50-55 mph). **DO NOT BRAKE.**	Is there a steady state pull? If no, go to the next Step.	**See Diagnostic Procedure 1** - Tire mismatch or tire pressure concern.
While stopped, have second person move to the LH rear passenger location. Maintain 80-89 km/h (50-55 mph).	Any change in pull? If no change, go to next Step.	**See Diagnostic Procedure 2** - Caster split.
Make sure front hubs are unlocked (if equipped). Accelerate the vehicle - decelerate the vehicle using **engine braking only.**	Any changes in the pull? Does it pull one way on acceleration and another way on deceleration? If no, go to next Step.	**See Diagnostic Procedure 3** - Possible limited slip rear axle and tire circumference.
Maintain a steady speed of 80-89 km/h (50-55 mph). Put the vehicle in Neutral and shut off the engine.	Does the pull go away? If no, go to the next Step.	**See Diagnostic Procedure 4** - Steering gear valve off center.
Stop the vehicle along the highway. Rotate the wheel full left. Proceed with road test.	Does the pull get better or worse? Stop the vehicle; rotate the wheel full right. Does the pull change - better or worse? If no, go to next Step.	**See Diagnostic Procedure 5** - Possible Rubber Ball Socket (RBS) memory steer.
In a safe clear area, while firmly holding the steering wheel, apply the brakes moderately hard, but not to the point of engaging Rear Anti-lock Brake System (RABS).	Does the vehicle's heading change during brake application? If no, go to next Step.	**See Diagnostic Procedure 6** - Possible brake imbalance.
Disconnect the fluid level sensor (disable RABS). Brake the vehicle from 80 km/h (50 mph).	Does the vehicle pull with anti-lock disconnected? If no, go to next Step.	**See Diagnostic Procedure 6** - Possible inadequate rear brake application.
Brake the vehicle hard, to the point of lock-up (RABS disabled).	Do both rears lock? Do both wheels lock at the same time?	**See Diagnostic Procedure 6** - Possible unequal rear brake application.

NOTE:

IT IS POSSIBLE THAT THE VEHICLE MAY HAVE MULTIPLE SYMPTOMS. A ROAD TEST/CAUSE CHART.

NOTE:

RECONNECT THE FLUID LEVEL SENSOR AFTER ROAD TEST.

Diagnostic Procedure # 1 - Tire Mismatch

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the Diagnostic Procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to Regular Production Option (RPO) list and set tire psi to the correct value

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only

Set tire pressure to value on the certification label.

1. Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Tire Pull - Swap the front tires from side-to-side and road test. If the concern is not corrected, continue with next Step.

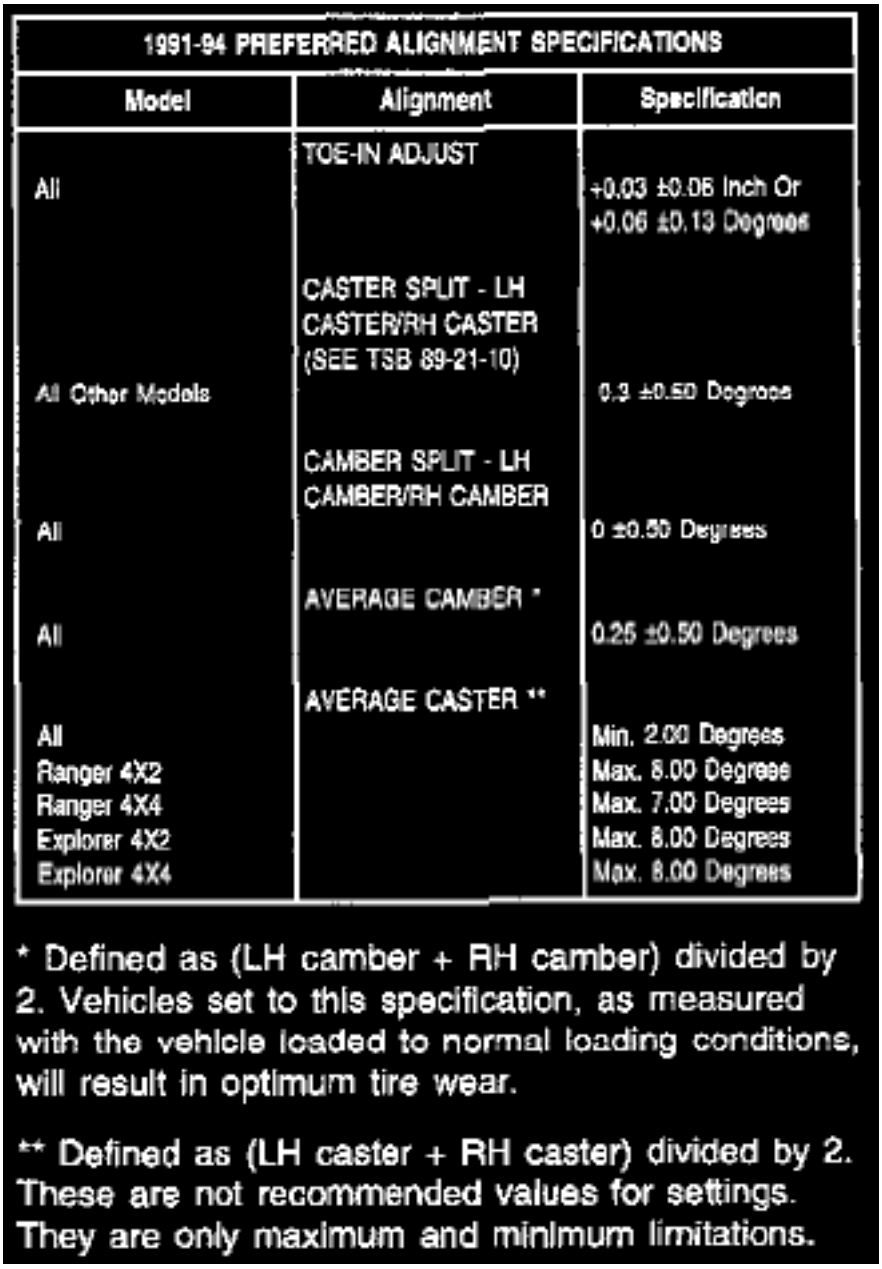
3. Tire Pull - Swap rear tires from side-to-side and road test. If the concern is not corrected, continue with next Step.

4. Tire Pull - Swap front tires from front to rear. Set the tire pressure to the required pressure for the new front and rear positions, then road test.

NOTE:

ON REAR LIMITED SLIP AXLE (FRONT HUB UNLOCKED) DRIFT CONCERNS, IT MAY BE NECESSARY TO MEASURE TIRE CIRCUMFERENCE AND PLACE A MATCHED SET OF TIRES ON THE REAR AXLE.

Diagnostic Procedure # 2 - Alignment



1991-94 PREFERRED ALIGNMENT SPECIFICATIONS

Model	Alignment	Specification
All	TOE-IN ADJUST	+0.03 ±0.06 Inch Or +0.06 ±0.13 Degrees
All Other Models	CASTER SPLIT - LH CASTER/RH CASTER (SEE TSB 89-21-10)	0.3 ±0.50 Degrees
All	CAMBER SPLIT - LH CAMBER/RH CAMBER	0 ±0.50 Degrees
All	AVERAGE CAMBER *	0.25 ±0.50 Degrees
All	AVERAGE CASTER **	Min. 2.00 Degrees
Ranger 4X2		Max. 8.00 Degrees
Ranger 4X4		Max. 7.00 Degrees
Explorer 4X2		Max. 8.00 Degrees
Explorer 4X4		Max. 8.00 Degrees

* Defined as (LH camber + RH camber) divided by 2. Vehicles set to this specification, as measured with the vehicle loaded to normal loading conditions, will result in optimum tire wear.

** Defined as (LH caster + RH caster) divided by 2. These are not recommended values for settings. They are only maximum and minimum limitations.

Wheel Alignment - Measure the front wheel alignment. For out-of-specification vehicles, align to the "1991-94 Preferred Alignment Specifications" stated in this article.

^ Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels

^ Do not adjust wheel alignment to correct for brake pull if the vehicle does not have pull during non-brake applications

^ Set the tire pressure to the specification on the certification label

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the Diagnostic Procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to RPO list and set tire pressure to the correct value

^ IF THE TIRES AND WHEELS DO NOT MATCH CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only

Drive vehicle after alignment is performed.

^ Vehicles which exceed the maximum average caster value shown above may result in shimmy concerns

^ Vehicles operated below the minimum average caster value shown can result in wander and poor steering returnability concerns

If the vehicle is not within these minimum and maximum average caster values, or if the vehicle has experienced any of these listed steering/handling concerns, the average caster should be set in accordance with ride height/caster chart in the Service Manual.

Diagnostic Procedure # 3 - Tires

1. Spin the front tires to be sure that the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Measure tire circumference of all four (4) tires; put the two (2) closest circumference tires on the rear axle. Tire pressure must be equal on all tires.

Diagnostic Procedure # 4 - Steering Gear Valve Off Center

Rotary Valve Centering Check: To confirm that you are looking at a steering gear valve concern, lift the front wheels off the ground.

^ The vehicle should be raised so that there is no interference with the steering linkage

^ The front wheels should also spin freely

With the wheels in a straight ahead position, start the engine and observe any steering wheel or linkage movement when the engine is started. If any movement is observed, continue with the rotary valve centering check.

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Install a 0-13,790 kPa (0-2000 psi) pressure gauge (Rotunda 014-00207, Power Steering Analyzer) in the pressure line between the power steering pump outlet port 1 and the integral steering gear inlet port. Make sure the valve on the gauge is fully open.

3. Check the fluid level in the reservoir. Add Premium Power Steering Fluid F7AZ-3F823-AA or equivalent meeting Ford specification ESW-M2C33-F, if necessary.

4. Start the engine and turn the steering wheel from stop-to-stop to bring the steering lubricant to normal operating temperature. Turn off the engine and recheck the fluid level. Add Premium Power Steering Fluid F7AZ-3F823-AA or equivalent meeting Ford specification ESW-M2C33-F, if necessary.

5. With the engine running at approximately 1000 rpm and the steering wheel centered, attach a b-in torque wrench to the steering wheel nut. Apply sufficient torque in each direction to get a gauge reading of 1723 kPa (250 psi).

6. The torque wrench readings should be the same in both directions at 1723 kPa (250 psi). If the difference between the readings exceeds 0.68 N.m (6 lb-in), remove the steering gear and replace the shaft and control assembly.

7. Remove the pressure gauge installed in Step 2.

Diagnostic Procedure # 5 - RBS Linkage

If the RBS linkage is determined to have wind up or memory steer, replace RBS linkage with greaseable steel linkage.

NOTE:

ALL SERVICE PART STEERING LINKAGE IS THE GREASEABLE STEEL SOCKET TYPE

Diagnostic Procedure # 6 - Brake Imbalance

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Check for front wheel rotational drag with warm/hot brakes.

a. Make a series of 10 stops from speeds of 48 km/h (30 mph).

b. Make the 10 stops with no more than 30 second intervals between stops. This generally will induce a maximum pull if there is a drift/pull concern.

c. Raise the front end of the vehicle so that both tires are off the ground.

d. Rotate the front wheels by hand.

NOTE:

FOR ALL 4-WHEEL-DRIVE VEHICLES, MAKE SURE THE HUBS ARE DISENGAGED.

Both tires should rotate about the same amount, with little brake drag occuring. Some brake drag will naturally be present for each size of vehicle.

3. If the vehicle has excess brake drag, proceed as follows:

a. Open the bleed screw on the affected wheel to check for residual pressure in the brake lines. If there is a squirt of brake fluid out of the bleeder screw and the drag is reduced or eliminated, the master cylinder may not be allowing the brake fluid to return to the reservoir.

b. Check the master cylinder push rod adjustment. Refer to the appropriate Service Manual, Section 06-06, for service details.

c. Check the brake pedal to determine if it is fully returning.

4. Remove both calipers and check piston retraction using a C-clamp and wooden block. The piston should easily move back into the bore under the force of the clamp. Rebuild or replace as needed.

5. If Steps 1 through 4 have not determined the concern, swap rotors and linings from side-to-side.

NOTE:

SHOE TAB CLEARANCES SHOULD BE CHECKED AND MODIFIED IF NEEDED. REFER TO FIGURE 2.

6. Test drive the vehicle with 10 or more stops from 64 km/h (40 mph) before evaluating for brake drift. If there is no change in drift while braking, it may be assumed the concern is not the result of the front brakes.

7. Check the rear brakes. Remove the rear wheels and brake drums.

a. Check for contaminants (i.e., grease, axle lube, leaking brake fluid, etc.).

b. Check for broken components, frozen parking brake cables or improperly installed parts.

c. Check the cage diameter using the Brake Shoe Adjustment Gauge (D81L-1103-A). If either side is out-of-specification, check for proper function of the adjusting mechanism and repair or replace as required.

d. Check the rear wheel cylinders by the following method.

^ Replace one of the brake drums

^ Have another person apply the brakes and watch for movement of one of the brake shoes on the other wheel

^ Reapply the brakes while holding in place the shoe that moved. The opposite shoe should now move. If no movement is observed, repair or replace the wheel cylinder

^ Reinstall the drum and repeat the procedure for the other rear brake

8. If the condition still exists, swap rear shoes from side-to-side and drive the vehicle. If the drift is significantly reduced, replace the rear linings. If the pull/drift is not significantly reduced, go to Service Procedure # 7.

Diagnostic Procedure # 7 - Miscellaneous

Check for loose, damaged or excessively worn parts. Visually inspect the front suspension for loose or worn components (i.e., ball joints, radius arm bushings, radius arm attachments at the axle and frame, alignment adjusters, steering linkage, etc.). Repair or replace as required.

Diagnostic Check List

NOTE:

THE FOLLOWING CHECK LIST SHOULD BE COMPLETED AFTER EACH STEP OF THE DIAGNOSTIC WHERE APPLICABLE.

SERVICE PROCEDURE

1. Checking clearances

___ Caliper-to-knuckle clearance.

___ Inner shoe side and end clearance.

2. Lubrication of components

___ Lubrication of the caliper rails and inner knuckle pad grooves.

3. Radius arm bushings

___ Replacement of right and left side radius arm bushings.

DIAGNOSTIC PROCEDURE

1. Tire mismatch

____ Unlocked hubs check.

____ Front tires swapped side-to-side.

____ Rear tires swapped side-to-side.

____ Front-to-rear tire swap.

2. Alignment

____ Unlocked hubs check.

____ Toe changed to ____.

___ Caster changed and split is ____.

___ Camber changed and split is ____.

3. Tire circumference

____ Unlocked hubs check.

___ Tire circumference checked and two (2) closest circumference tires swapped to rear axle.

4. Steering gear valve

____ Unlocked hubs check.

____ Install pressure gauge.

____ Check fluid level with engine off and on.

___ Apply torque to the steering wheel nut and check gauge readings.

___ Replaced the shaft and control assembly.

____ Removed the pressure gauge.

5. RABS linkage

____ Replaced the RBS linkage.

6. Brake imbalance

____ Unlocked hubs check.

____ Front wheel rotational drag check.

____ Master cylinder check.

____ Piston retraction check.

____ Rotors and linings swapped from side-to-side.

____ Rear brakes checked.

___ Rear drums and shoes swapped from side-to-side.

7. Miscellaneous

___ Check for loose, damaged or worn parts.

Technical Service Bulletin # 98-5A-22 Date: 980318

Vehicle - Pull Or Drift Diagnostics/Service Procedures

Article No. 98-5A-22

03/18/98

^ BRAKES - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

^ STEERING - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

LIGHT TRUCK: 1988-94 RANGER 1991-94 EXPLORER

ISSUE: A comprehensive pull and drift diagnostic procedure has been developed to assist technicians with vehicle service.

ACTION: Use the following Service Procedure to resolve drift and pull concerns.

Proceed with the Pull and Drift Diagnostic Procedure it the pull or drift is not significantly reduced or where there is a case of steady state drift (no braking).

A Diagnostic Check List has been provided at the end of this article to use with this procedure.

NOTE:

THIS TSB ARTICLE SHOULD BE READ COMPLETELY BEFORE PERFORMING DIAGNOSTICS OR REPAIRS.

PART NUMBER PART NAME

F7AZ-3F823-A Premium Power Steering Fluid

D7AZ-19A331-A Silicone Brake caliper Grease And Dielectric Compound

PROCEDURE 2 - FRONT W6

PROCEDURE 3 - TIRE 07

PROCEDURE 4 - 3524 07

PROCEDURE 5 - FRONT W6

PROCEDURE 6 - 2005 42

PROCEDURE 7 - FRONT W6

ROAD TEST - FRONT W6

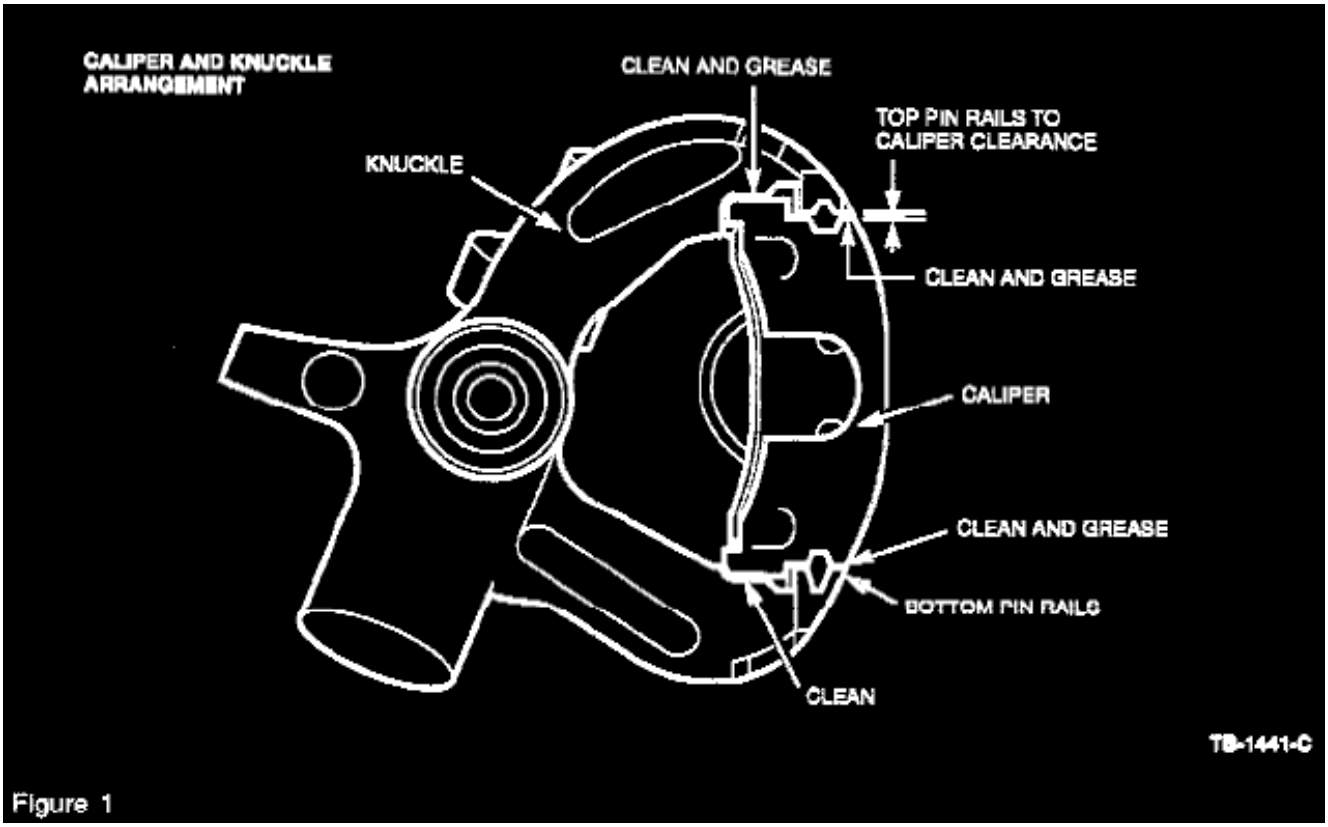

Figure 1

OASIS CODES: 301000, 303000

Service Procedure

1. Check and adjust brake pad clearances and caliper knuckle clearances as follows:

a. Remove the pins from the caliper.

b. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails. Clearance should be a minimum of 0.3B mm (0.015").

c. If the clearance is insufficient, replace the caliper and measure again. If clearance concern still exists, replace the knuckle.

NOTE:

CHECK THE CLEARANCE ON THE NEW KNUCKLE BEFORE INSTALLATION.

d. After measuring the caliper/knuckle for proper clearances, remove both calipers and inner pad assemblies.

e. Remove the anti-rattle clip from the inner pad.

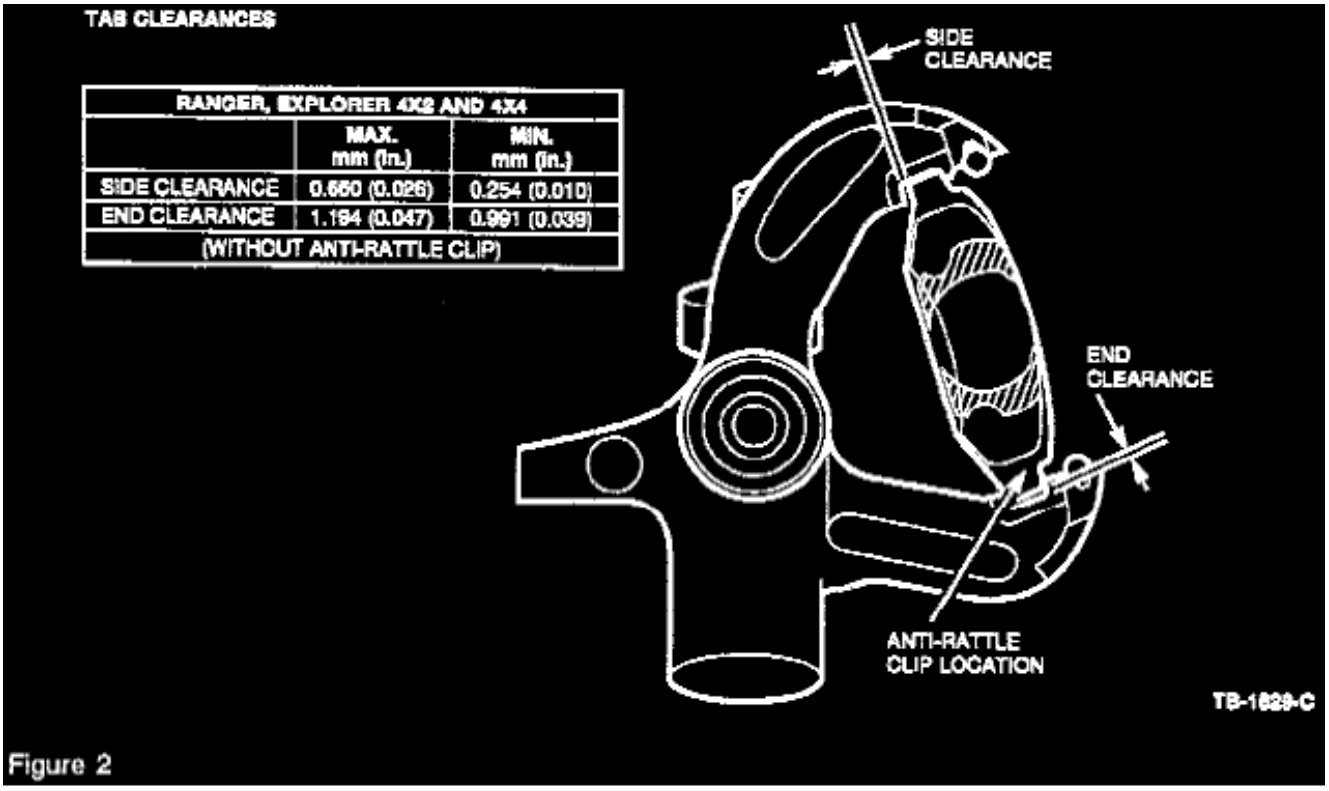

Figure 2

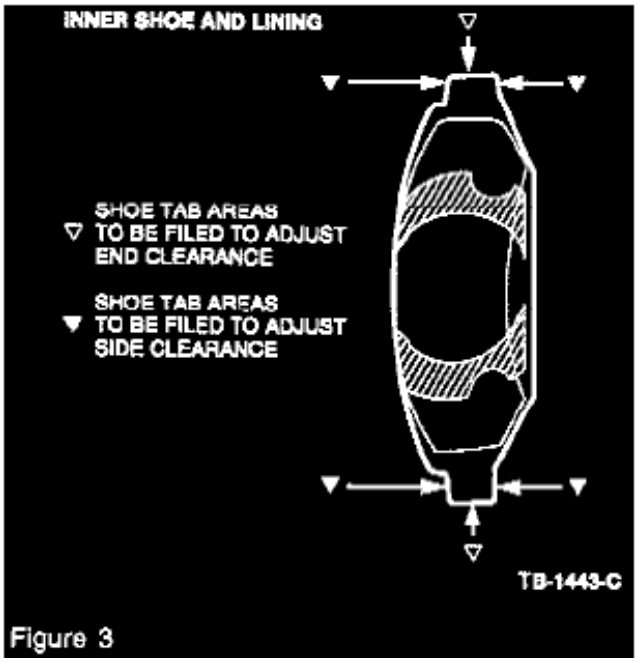

Figure 3

f. Reinstall pad and check the side and end clearances with a feeler gauge (Figure 2).

g. If the pad clearances are within specification, go to Step 1h. If the pad clearances are not to the required dimensions, file the steel backing plate. File material at ends of shoes, removing equal amounts from both sides or ends (Figure 3).

CAUTION:

DO NOT GRIND THE STEEL BACKING PLATE. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

h. Check the tab clearances and install anti-rattle clip on the lower pad tab (Figure 2).

CAUTION:

MAKE SURE THE LUBRICANT DOES NOT GET ON THE ROTORS, LININGS, OR ON THE CALIPER PISTON BOOTS.

2. During reassembly:

^ Clean the caliper slide surfaces of corrosion, contamination, and burrs with a wire brush or portable wire wheel

^ Polish with crocus cloth

^ Lubricate and corrosion protect by applying a light coat of Silicone Brake Caliper Grease and Dielectric Compound (D7AZ-19A331-A), or equivalent meeting Ford specification ESE-M1C171-A, to the inner knuckle top and bottom pad groove and caliper rails (Figure 1)

^ Replace the caliper pins with new Caliper Pins (F2TZ-2C150-A)

NOTE:

THE EXPLORER IS ALREADY EQUIPPED WITH THE NEW RADIUS ARM BUSHINGS.

3. Inspect the right and left side radius arm bushings for cracking, splitting, or wear. Replace the right and left side arm bushings with new Radius Arm Bushings (F1TZ-3B203-B), medium brown color, if necessary. Refer to the appropriate Service Manual, Section 04-01C, for service details.

Pull/Drift Diagnostic Procedure

The Pull/Drift Diagnostic Procedure should be used if the pull or drift is not significantly reduced with the service procedure or in cases of a steady state drift (no braking).

Test drive the vehicle with the customer to understand his/her pull or drift concern. Many customers will call a clear vision concern a pull or drift because the steering wheel is not straight.

Pull or drifts come from various sources, each with a particular set of symptoms. Careful road test evaluation usually will pinpoint which cause (or causes) is present.

Road Test

It is important to test drive the vehicle with the customer to UNDERSTAND HIS OR HER CONCERN.

Complete the road test before beginning any repairs since you may have multiple causes that need to be identified.

^ The road test should be done on a flat, straight road and should be done in both directions to account for wind

^ Tire pressure should be checked and adjusted, if necessary

^ A second person in the vehicle during the road test is helpful. Unless otherwise directed, the second person must remain in the front RH passenger location

^ On vehicles with automatic locking hubs, it is necessary to drive 6 meters (20 feet) forward and then backward to unlock the hubs

ROAD TEST	RESULT	ACTION
Maintain a steady speed of 80-89 km/h (50-55 mph). **DO NOT BRAKE.**	Is there a steady state pull? If no, go to the next Step.	**See Diagnostic Procedure 1** - Tire mismatch or tire pressure concern.
While stopped, have second person move to the LH rear passenger location. Maintain 80-89 km/h (50-55 mph).	Any change in pull? If no change, go to next Step.	**See Diagnostic Procedure 2** - Caster split.
Make sure front hubs are unlocked (if equipped). Accelerate the vehicle - decelerate the vehicle using **engine braking only.**	Any changes in the pull? Does it pull one way on acceleration and another way on deceleration? If no, go to next Step.	**See Diagnostic Procedure 3** - Possible limited slip rear axle and tire circumference.
Maintain a steady speed of 80-89 km/h (50-55 mph). Put the vehicle in Neutral and shut off the engine.	Does the pull go away? If no, go to the next Step.	**See Diagnostic Procedure 4** - Steering gear valve off center.
Stop the vehicle along the highway. Rotate the wheel full left. Proceed with road test.	Does the pull get better or worse? Stop the vehicle; rotate the wheel full right. Does the pull change - better or worse? If no, go to next Step.	**See Diagnostic Procedure 5** - Possible Rubber Ball Socket (RBS) memory steer.
In a safe clear area, while firmly holding the steering wheel, apply the brakes moderately hard, but not to the point of engaging Rear Anti-lock Brake System (RABS).	Does the vehicle's heading change during brake application? If no, go to next Step.	**See Diagnostic Procedure 6** - Possible brake imbalance.
Disconnect the fluid level sensor (disable RABS). Brake the vehicle from 80 km/h (50 mph).	Does the vehicle pull with anti-lock disconnected? If no, go to next Step.	**See Diagnostic Procedure 6** - Possible inadequate rear brake application.
Brake the vehicle hard, to the point of lock-up (RABS disabled).	Do both rears lock? Do both wheels lock at the same time?	**See Diagnostic Procedure 6** - Possible unequal rear brake application.

NOTE:

IT IS POSSIBLE THAT THE VEHICLE MAY HAVE MULTIPLE SYMPTOMS. A ROAD TEST/CAUSE CHART.

NOTE:

RECONNECT THE FLUID LEVEL SENSOR AFTER ROAD TEST.

Diagnostic Procedure # 1 - Tire Mismatch

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the Diagnostic Procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to Regular Production Option (RPO) list and set tire psi to the correct value

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only

Set tire pressure to value on the certification label.

1. Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Tire Pull - Swap the front tires from side-to-side and road test. If the concern is not corrected, continue with next Step.

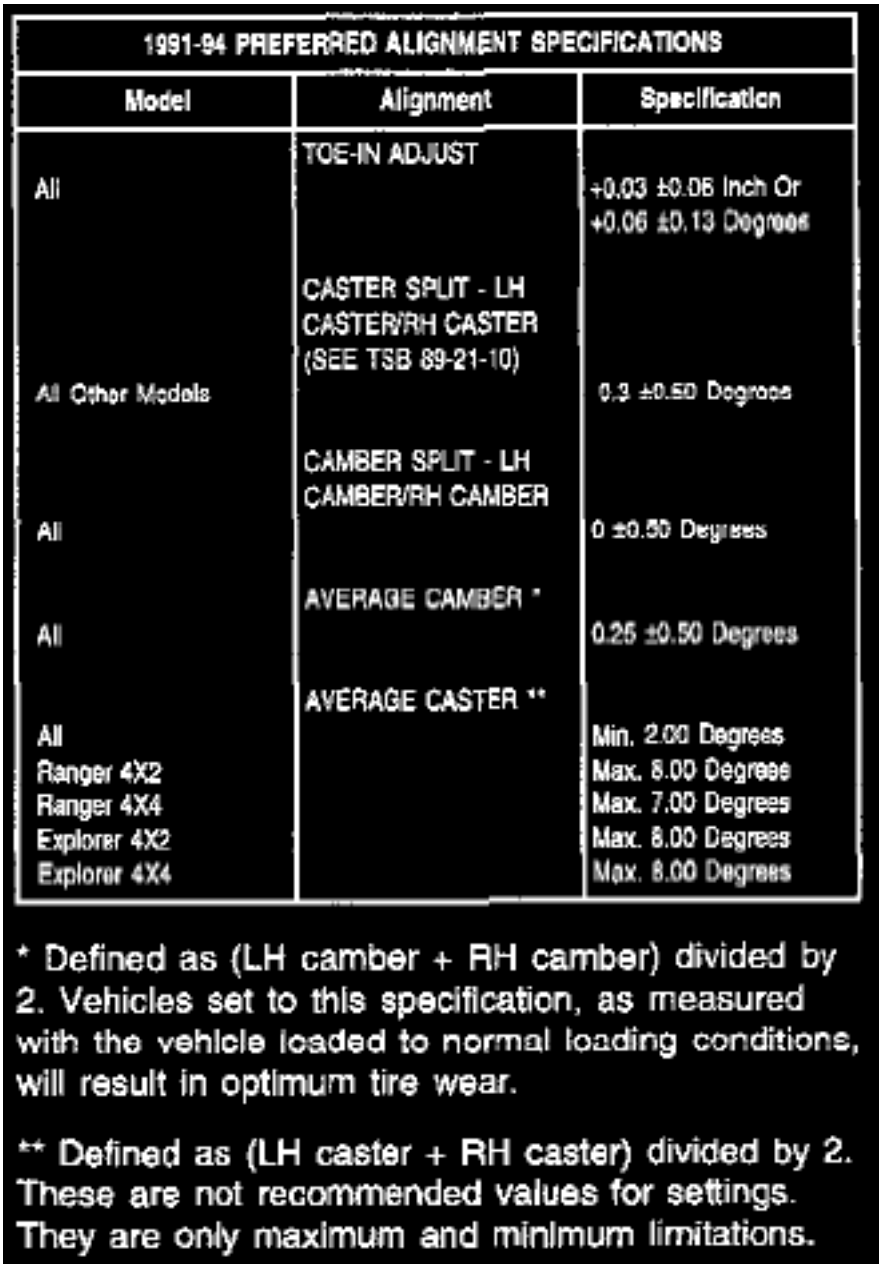
3. Tire Pull - Swap rear tires from side-to-side and road test. If the concern is not corrected, continue with next Step.

4. Tire Pull - Swap front tires from front to rear. Set the tire pressure to the required pressure for the new front and rear positions, then road test.

NOTE:

ON REAR LIMITED SLIP AXLE (FRONT HUB UNLOCKED) DRIFT CONCERNS, IT MAY BE NECESSARY TO MEASURE TIRE CIRCUMFERENCE AND PLACE A MATCHED SET OF TIRES ON THE REAR AXLE.

Diagnostic Procedure # 2 - Alignment



1991-94 PREFERRED ALIGNMENT SPECIFICATIONS		
Model	Alignment	Specification
All	TOE-IN ADJUST	+0.03 ±0.06 Inch Or +0.06 ±0.13 Degrees
All Other Models	CASTER SPLIT - LH CASTER/RH CASTER (SEE TSB 89-21-10)	0.3 ±0.50 Degrees
All	CAMBER SPLIT - LH CAMBER/RH CAMBER	0 ±0.50 Degrees
All	AVERAGE CAMBER *	0.25 ±0.50 Degrees
All Ranger 4X2 Ranger 4X4 Explorer 4X2 Explorer 4X4	AVERAGE CASTER **	Min. 2.00 Degrees Max. 8.00 Degrees Max. 7.00 Degrees Max. 8.00 Degrees Max. 8.00 Degrees

* Defined as (LH camber + RH camber) divided by 2. Vehicles set to this specification, as measured with the vehicle loaded to normal loading conditions, will result in optimum tire wear.

** Defined as (LH caster + RH caster) divided by 2. These are not recommended values for settings. They are only maximum and minimum limitations.

Wheel Alignment - Measure the front wheel alignment. For out-of-specification vehicles, align to the "1991-94 Preferred Alignment Specifications" stated in this article.

^ Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels

^ Do not adjust wheel alignment to correct for brake pull if the vehicle does not have pull during non-brake applications

^ Set the tire pressure to the specification on the certification label

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the Diagnostic Procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to RPO list and set tire pressure to the correct value

^ IF THE TIRES AND WHEELS DO NOT MATCH CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only

Drive vehicle after alignment is performed.

^ Vehicles which exceed the maximum average caster value shown above may result in shimmy concerns

^ Vehicles operated below the minimum average caster value shown can result in wander and poor steering returnability concerns

If the vehicle is not within these minimum and maximum average caster values, or if the vehicle has experienced any of these listed steering/handling concerns, the average caster should be set in accordance with ride height/caster chart in the Service Manual.

Diagnostic Procedure # 3 - Tires

1. Spin the front tires to be sure that the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Measure tire circumference of all four (4) tires; put the two (2) closest circumference tires on the rear axle. Tire pressure must be equal on all tires.

Diagnostic Procedure # 4 - Steering Gear Valve Off Center

Rotary Valve Centering Check: To confirm that you are looking at a steering gear valve concern, lift the front wheels off the ground.

^ The vehicle should be raised so that there is no interference with the steering linkage

^ The front wheels should also spin freely

With the wheels in a straight ahead position, start the engine and observe any steering wheel or linkage movement when the engine is started. If any movement is observed, continue with the rotary valve centering check.

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Install a 0-13,790 kPa (0-2000 psi) pressure gauge (Rotunda 014-00207, Power Steering Analyzer) in the pressure line between the power steering pump outlet port 1 and the integral steering gear inlet port. Make sure the valve on the gauge is fully open.

3. Check the fluid level in the reservoir. Add Premium Power Steering Fluid F7AZ-3F823-AA or equivalent meeting Ford specification ESW-M2C33-F, if necessary.

4. Start the engine and turn the steering wheel from stop-to-stop to bring the steering lubricant to normal operating temperature. Turn off the engine and recheck the fluid level. Add Premium Power Steering Fluid F7AZ-3F823-AA or equivalent meeting Ford specification ESW-M2C33-F, if necessary.

5. With the engine running at approximately 1000 rpm and the steering wheel centered, attach a b-in torque wrench to the steering wheel nut. Apply sufficient torque in each direction to get a gauge reading of 1723 kPa (250 psi).

6. The torque wrench readings should be the same in both directions at 1723 kPa (250 psi). If the difference between the readings exceeds 0.68 N.m (6 lb-in), remove the steering gear and replace the shaft and control assembly.

7. Remove the pressure gauge installed in Step 2.

Diagnostic Procedure # 5 - RBS Linkage

If the RBS linkage is determined to have wind up or memory steer, replace RBS linkage with greaseable steel linkage.

NOTE:

ALL SERVICE PART STEERING LINKAGE IS THE GREASEABLE STEEL SOCKET TYPE

Diagnostic Procedure # 6 - Brake Imbalance

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Check for front wheel rotational drag with warm/hot brakes.

a. Make a series of 10 stops from speeds of 48 km/h (30 mph).

b. Make the 10 stops with no more than 30 second intervals between stops. This generally will induce a maximum pull if there is a drift/pull concern.

c. Raise the front end of the vehicle so that both tires are off the ground.

d. Rotate the front wheels by hand.

NOTE:

FOR ALL 4-WHEEL-DRIVE VEHICLES, MAKE SURE THE HUBS ARE DISENGAGED.

Both tires should rotate about the same amount, with little brake drag occuring. Some brake drag will naturally be present for each size of vehicle.

3. If the vehicle has excess brake drag, proceed as follows:

a. Open the bleed screw on the affected wheel to check for residual pressure in the brake lines. If there is a squirt of brake fluid out of the bleeder screw and the drag is reduced or eliminated, the master cylinder may not be allowing the brake fluid to return to the reservoir.

b. Check the master cylinder push rod adjustment. Refer to the appropriate Service Manual, Section 06-06, for service details.

c. Check the brake pedal to determine if it is fully returning.

4. Remove both calipers and check piston retraction using a C-clamp and wooden block. The piston should easily move back into the bore under the force of the clamp. Rebuild or replace as needed.

5. If Steps 1 through 4 have not determined the concern, swap rotors and linings from side-to-side.

NOTE:

SHOE TAB CLEARANCES SHOULD BE CHECKED AND MODIFIED IF NEEDED. REFER TO FIGURE 2.

6. Test drive the vehicle with 10 or more stops from 64 km/h (40 mph) before evaluating for brake drift. If there is no change in drift while braking, it may be assumed the concern is not the result of the front brakes.

7. Check the rear brakes. Remove the rear wheels and brake drums.

a. Check for contaminants (i.e., grease, axle lube, leaking brake fluid, etc.).

b. Check for broken components, frozen parking brake cables or improperly installed parts.

c. Check the cage diameter using the Brake Shoe Adjustment Gauge (D81L-1103-A). If either side is out-of-specification, check for proper function of the adjusting mechanism and repair or replace as required.

d. Check the rear wheel cylinders by the following method.

^ Replace one of the brake drums

^ Have another person apply the brakes and watch for movement of one of the brake shoes on the other wheel

^ Reapply the brakes while holding in place the shoe that moved. The opposite shoe should now move. If no movement is observed, repair or replace the wheel cylinder

^ Reinstall the drum and repeat the procedure for the other rear brake

8. If the condition still exists, swap rear shoes from side-to-side and drive the vehicle. If the drift is significantly reduced, replace the rear linings. If the pull/drift is not significantly reduced, go to Service Procedure # 7.

Diagnostic Procedure # 7 - Miscellaneous

Check for loose, damaged or excessively worn parts. Visually inspect the front suspension for loose or worn components (i.e., ball joints, radius arm bushings, radius arm attachments at the axle and frame, alignment adjusters, steering linkage, etc.). Repair or replace as required.

Diagnostic Check List

NOTE:

THE FOLLOWING CHECK LIST SHOULD BE COMPLETED AFTER EACH STEP OF THE DIAGNOSTIC WHERE APPLICABLE.

SERVICE PROCEDURE

1. Checking clearances

___ Caliper-to-knuckle clearance.

___ Inner shoe side and end clearance.

2. Lubrication of components

___ Lubrication of the caliper rails and inner knuckle pad grooves.

3. Radius arm bushings

___ Replacement of right and left side radius arm bushings.

DIAGNOSTIC PROCEDURE

1. Tire mismatch

____ Unlocked hubs check.

____ Front tires swapped side-to-side.

____ Rear tires swapped side-to-side.

____ Front-to-rear tire swap.

2. Alignment

____ Unlocked hubs check.

____ Toe changed to ____.

___ Caster changed and split is ____.

___ Camber changed and split is ____.

3. Tire circumference

____ Unlocked hubs check.

___ Tire circumference checked and two (2) closest circumference tires swapped to rear axle.

4. Steering gear valve

____ Unlocked hubs check.

____ Install pressure gauge.

____ Check fluid level with engine off and on.

___ Apply torque to the steering wheel nut and check gauge readings.

___ Replaced the shaft and control assembly.

____ Removed the pressure gauge.

5. RABS linkage

____ Replaced the RBS linkage.

6. Brake imbalance

____ Unlocked hubs check.

____ Front wheel rotational drag check.

____ Master cylinder check.

____ Piston retraction check.

____ Rotors and linings swapped from side-to-side.

____ Rear brakes checked.

___ Rear drums and shoes swapped from side-to-side.

7. Miscellaneous

___ Check for loose, damaged or worn parts.

Alignment: By Symptom

ROAD TEST - FRONT W6

OASIS CODES: 301000, 303000

Service Procedure

1. Check and adjust brake pad clearances and caliper knuckle clearances as follows:

a. Remove the pins from the caliper.

b. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails. Clearance should be a minimum of 0.3B mm (0.015").

c. If the clearance is insufficient, replace the caliper and measure again. If clearance concern still exists, replace the knuckle.

NOTE:

CHECK THE CLEARANCE ON THE NEW KNUCKLE BEFORE INSTALLATION.

d. After measuring the caliper/knuckle for proper clearances, remove both calipers and inner pad assemblies.

e. Remove the anti-rattle clip from the inner pad.

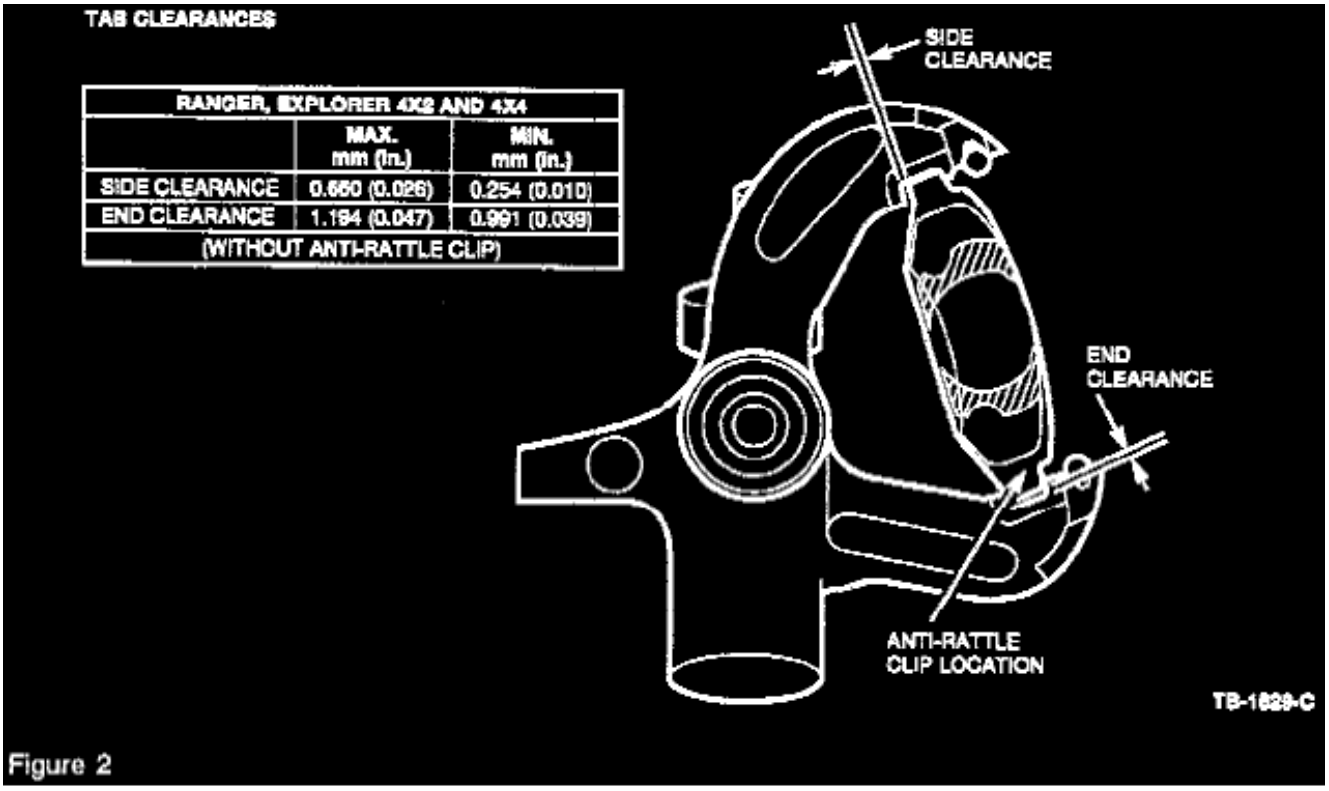

Figure 2

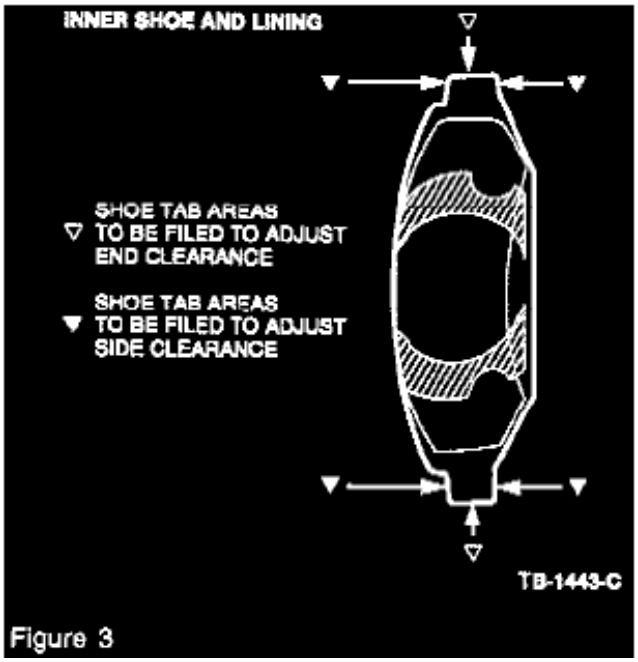

Figure 3

f. Reinstall pad and check the side and end clearances with a feeler gauge (Figure 2).

g. If the pad clearances are within specification, go to Step 1h. If the pad clearances are not to the required dimensions, file the steel backing plate. File material at ends of shoes, removing equal amounts from both sides or ends (Figure 3).

CAUTION:

DO NOT GRIND THE STEEL BACKING PLATE. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

h. Check the tab clearances and install anti-rattle clip on the lower pad tab (Figure 2).

CAUTION:

MAKE SURE THE LUBRICANT DOES NOT GET ON THE ROTORS, LININGS, OR ON THE CALIPER PISTON BOOTS.

2. During reassembly:

^ Clean the caliper slide surfaces of corrosion, contamination, and burrs with a wire brush or portable wire wheel

^ Polish with crocus cloth

^ Lubricate and corrosion protect by applying a light coat of Silicone Brake Caliper Grease and Dielectric Compound (D7AZ-19A331-A), or equivalent meeting Ford specification ESE-M1C171-A, to the inner knuckle top and bottom pad groove and caliper rails (Figure 1)

^ Replace the caliper pins with new Caliper Pins (F2TZ-2C150-A)

NOTE:

THE EXPLORER IS ALREADY EQUIPPED WITH THE NEW RADIUS ARM BUSHINGS.

3. Inspect the right and left side radius arm bushings for cracking, splitting, or wear. Replace the right and left side arm bushings with new Radius Arm Bushings (F1TZ-3B203-B), medium brown color, if necessary. Refer to the appropriate Service Manual, Section 04-01C, for service details.

Pull/Drift Diagnostic Procedure

The Pull/Drift Diagnostic Procedure should be used if the pull or drift is not significantly reduced with the service procedure or in cases of a steady state drift (no braking).

Test drive the vehicle with the customer to understand his/her pull or drift concern. Many customers will call a clear vision concern a pull or drift because the steering wheel is not straight.

Pull or drifts come from various sources, each with a particular set of symptoms. Careful road test evaluation usually will pinpoint which cause (or causes) is present.

Road Test

It is important to test drive the vehicle with the customer to UNDERSTAND HIS OR HER CONCERN.

Complete the road test before beginning any repairs since you may have multiple causes that need to be identified.

^ The road test should be done on a flat, straight road and should be done in both directions to account for wind

^ Tire pressure should be checked and adjusted, if necessary

^ A second person in the vehicle during the road test is helpful. Unless otherwise directed, the second person must remain in the front RH passenger location

^ On vehicles with automatic locking hubs, it is necessary to drive 6 meters (20 feet) forward and then backward to unlock the hubs

ROAD TEST	RESULT	ACTION
Maintain a steady speed of 80-89 km/h (50-55 mph). **DO NOT BRAKE.**	Is there a steady state pull? If no, go to the next Step.	**See Diagnostic Procedure 1** - Tire mismatch or tire pressure concern.
While stopped, have second person move to the LH rear passenger location. Maintain 80-89 km/h (50-55 mph).	Any change in pull? If no change, go to next Step.	**See Diagnostic Procedure 2** - Caster split.
Make sure front hubs are unlocked (if equipped). Accelerate the vehicle - decelerate the vehicle using **engine braking only.**	Any changes in the pull? Does it pull one way on acceleration and another way on deceleration? If no, go to next Step.	**See Diagnostic Procedure 3** - Possible limited slip rear axle and tire circumference.
Maintain a steady speed of 80-89 km/h (50-55 mph). Put the vehicle in Neutral and shut off the engine.	Does the pull go away? If no, go to the next Step.	**See Diagnostic Procedure 4** - Steering gear valve off center.
Stop the vehicle along the highway. Rotate the wheel full left. Proceed with road test.	Does the pull get better or worse? Stop the vehicle; rotate the wheel full right. Does the pull change - better or worse? If no, go to next Step.	**See Diagnostic Procedure 5** - Possible Rubber Ball Socket (RBS) memory steer.
In a safe clear area, while firmly holding the steering wheel, apply the brakes moderately hard, but not to the point of engaging Rear Anti-lock Brake System (RABS).	Does the vehicle's heading change during brake application? If no, go to next Step.	**See Diagnostic Procedure 6** - Possible brake imbalance.
Disconnect the fluid level sensor (disable RABS). Brake the vehicle from 80 km/h (50 mph).	Does the vehicle pull with anti-lock disconnected? If no, go to next Step.	**See Diagnostic Procedure 6** - Possible inadequate rear brake application.
Brake the vehicle hard, to the point of lock-up (RABS disabled).	Do both rears lock? Do both wheels lock at the same time?	**See Diagnostic Procedure 6** - Possible unequal rear brake application.

NOTE:

IT IS POSSIBLE THAT THE VEHICLE MAY HAVE MULTIPLE SYMPTOMS. A ROAD TEST/CAUSE CHART.

NOTE:

RECONNECT THE FLUID LEVEL SENSOR AFTER ROAD TEST.

Diagnostic Procedure # 1 - Tire Mismatch

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the Diagnostic Procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to Regular Production Option (RPO) list and set tire psi to the correct value

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only

Set tire pressure to value on the certification label.

1. Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Tire Pull - Swap the front tires from side-to-side and road test. If the concern is not corrected, continue with next Step.

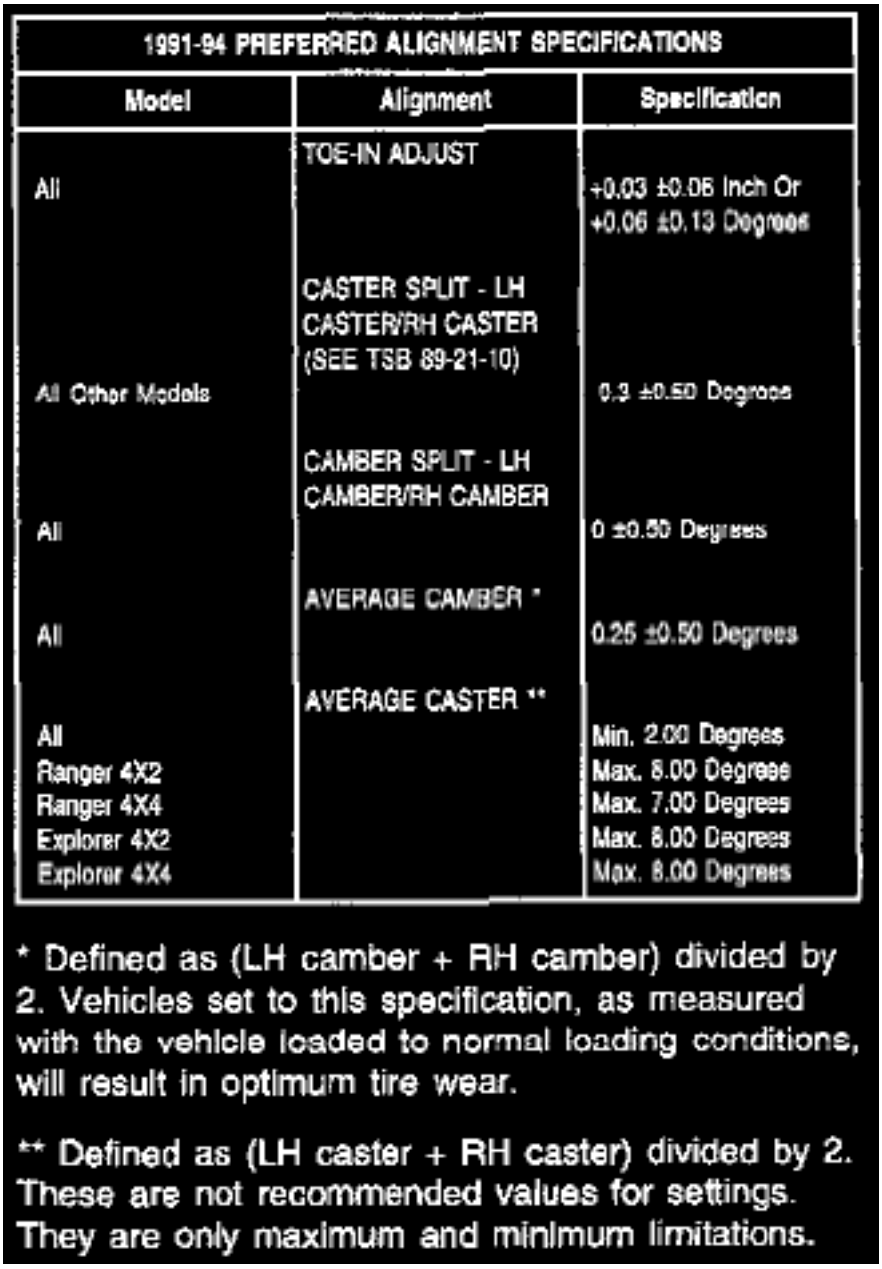
3. Tire Pull - Swap rear tires from side-to-side and road test. If the concern is not corrected, continue with next Step.

4. Tire Pull - Swap front tires from front to rear. Set the tire pressure to the required pressure for the new front and rear positions, then road test.

NOTE:

ON REAR LIMITED SLIP AXLE (FRONT HUB UNLOCKED) DRIFT CONCERNS, IT MAY BE NECESSARY TO MEASURE TIRE CIRCUMFERENCE AND PLACE A MATCHED SET OF TIRES ON THE REAR AXLE.

Diagnostic Procedure # 2 - Alignment



1991-94 PREFERRED ALIGNMENT SPECIFICATIONS		
Model	Alignment	Specification
All	TOE-IN ADJUST	+0.03 ±0.06 Inch Or +0.06 ±0.13 Degree
All Other Models	CASTER SPLIT - LH CASTER/RH CASTER (SEE TSB 89-21-10)	0.3 ±0.50 Degree
All	CAMBER SPLIT - LH CAMBER/RH CAMBER	0 ±0.50 Degrees
All	AVERAGE CAMBER *	0.25 ±0.50 Degrees
All Ranger 4X2 Ranger 4X4 Explorer 4X2 Explorer 4X4	AVERAGE CASTER **	Min. 2.00 Degrees Max. 8.00 Degree Max. 7.00 Degrees Max. 8.00 Degrees Max. 8.00 Degrees

* Defined as (LH camber + RH camber) divided by 2. Vehicles set to this specification, as measured with the vehicle loaded to normal loading conditions, will result in optimum tire wear.

** Defined as (LH caster + RH caster) divided by 2. These are not recommended values for settings. They are only maximum and minimum limitations.

Wheel Alignment - Measure the front wheel alignment. For out-of-specification vehicles, align to the "1991-94 Preferred Alignment Specifications" stated in this article.

^ Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels

^ Do not adjust wheel alignment to correct for brake pull if the vehicle does not have pull during non-brake applications

^ Set the tire pressure to the specification on the certification label

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the Diagnostic Procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to RPO list and set tire pressure to the correct value

^ IF THE TIRES AND WHEELS DO NOT MATCH CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only

Drive vehicle after alignment is performed.

^ Vehicles which exceed the maximum average caster value shown above may result in shimmy concerns

^ Vehicles operated below the minimum average caster value shown can result in wander and poor steering returnability concerns

If the vehicle is not within these minimum and maximum average caster values, or if the vehicle has experienced any of these listed steering/handling concerns, the average caster should be set in accordance with ride height/caster chart in the Service Manual.

Diagnostic Procedure # 3 - Tires

1. Spin the front tires to be sure that the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Measure tire circumference of all four (4) tires; put the two (2) closest circumference tires on the rear axle. Tire pressure must be equal on all tires.

Diagnostic Procedure # 4 - Steering Gear Valve Off Center

Rotary Valve Centering Check: To confirm that you are looking at a steering gear valve concern, lift the front wheels off the ground.

^ The vehicle should be raised so that there is no interference with the steering linkage

^ The front wheels should also spin freely

With the wheels in a straight ahead position, start the engine and observe any steering wheel or linkage movement when the engine is started. If any movement is observed, continue with the rotary valve centering check.

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Install a 0-13,790 kPa (0-2000 psi) pressure gauge (Rotunda 014-00207, Power Steering Analyzer) in the pressure line between the power steering pump outlet port 1 and the integral steering gear inlet port. Make sure the valve on the gauge is fully open.

3. Check the fluid level in the reservoir. Add Premium Power Steering Fluid F7AZ-3F823-AA or equivalent meeting Ford specification ESW-M2C33-F, if necessary.

4. Start the engine and turn the steering wheel from stop-to-stop to bring the steering lubricant to normal operating temperature. Turn off the engine and recheck the fluid level. Add Premium Power Steering Fluid F7AZ-3F823-AA or equivalent meeting Ford specification ESW-M2C33-F, if necessary.

5. With the engine running at approximately 1000 rpm and the steering wheel centered, attach a b-in torque wrench to the steering wheel nut. Apply sufficient torque in each direction to get a gauge reading of 1723 kPa (250 psi).

6. The torque wrench readings should be the same in both directions at 1723 kPa (250 psi). If the difference between the readings exceeds 0.68 N.m (6 lb-in), remove the steering gear and replace the shaft and control assembly.

7. Remove the pressure gauge installed in Step 2.

Diagnostic Procedure # 5 - RBS Linkage

If the RBS linkage is determined to have wind up or memory steer, replace RBS linkage with greaseable steel linkage.

NOTE:

ALL SERVICE PART STEERING LINKAGE IS THE GREASEABLE STEEL SOCKET TYPE

Diagnostic Procedure # 6 - Brake Imbalance

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Check for front wheel rotational drag with warm/hot brakes.

a. Make a series of 10 stops from speeds of 48 km/h (30 mph).

b. Make the 10 stops with no more than 30 second intervals between stops. This generally will induce a maximum pull if there is a drift/pull concern.

c. Raise the front end of the vehicle so that both tires are off the ground.

d. Rotate the front wheels by hand.

NOTE:

FOR ALL 4-WHEEL-DRIVE VEHICLES, MAKE SURE THE HUBS ARE DISENGAGED.

Both tires should rotate about the same amount, with little brake drag occuring. Some brake drag will naturally be present for each size of vehicle.

3. If the vehicle has excess brake drag, proceed as follows:

a. Open the bleed screw on the affected wheel to check for residual pressure in the brake lines. If there is a squirt of brake fluid out of the bleeder screw and the drag is reduced or eliminated, the master cylinder may not be allowing the brake fluid to return to the reservoir.

b. Check the master cylinder push rod adjustment. Refer to the appropriate Service Manual, Section 06-06, for service details.

c. Check the brake pedal to determine if it is fully returning.

4. Remove both calipers and check piston retraction using a C-clamp and wooden block. The piston should easily move back into the bore under the force of the clamp. Rebuild or replace as needed.

5. If Steps 1 through 4 have not determined the concern, swap rotors and linings from side-to-side.

NOTE:

SHOE TAB CLEARANCES SHOULD BE CHECKED AND MODIFIED IF NEEDED. REFER TO FIGURE 2.

6. Test drive the vehicle with 10 or more stops from 64 km/h (40 mph) before evaluating for brake drift. If there is no change in drift while braking, it may be assumed the concern is not the result of the front brakes.

7. Check the rear brakes. Remove the rear wheels and brake drums.

a. Check for contaminants (i.e., grease, axle lube, leaking brake fluid, etc.).

b. Check for broken components, frozen parking brake cables or improperly installed parts.

c. Check the cage diameter using the Brake Shoe Adjustment Gauge (D81L-1103-A). If either side is out-of-specification, check for proper function of the adjusting mechanism and repair or replace as required.

d. Check the rear wheel cylinders by the following method.

^ Replace one of the brake drums

^ Have another person apply the brakes and watch for movement of one of the brake shoes on the other wheel

^ Reapply the brakes while holding in place the shoe that moved. The opposite shoe should now move. If no movement is observed, repair or replace the wheel cylinder

^ Reinstall the drum and repeat the procedure for the other rear brake

8. If the condition still exists, swap rear shoes from side-to-side and drive the vehicle. If the drift is significantly reduced, replace the rear linings. If the pull/drift is not significantly reduced, go to Service Procedure # 7.

Diagnostic Procedure # 7 - Miscellaneous

Check for loose, damaged or excessively worn parts. Visually inspect the front suspension for loose or worn components (i.e., ball joints, radius arm bushings, radius arm attachments at the axle and frame, alignment adjusters, steering linkage, etc.). Repair or replace as required.

Diagnostic Check List

NOTE:

THE FOLLOWING CHECK LIST SHOULD BE COMPLETED AFTER EACH STEP OF THE DIAGNOSTIC WHERE APPLICABLE.

SERVICE PROCEDURE

1. Checking clearances

___ Caliper-to-knuckle clearance.

___ Inner shoe side and end clearance.

2. Lubrication of components

___ Lubrication of the caliper rails and inner knuckle pad grooves.

3. Radius arm bushings

___ Replacement of right and left side radius arm bushings.

DIAGNOSTIC PROCEDURE

1. Tire mismatch

____ Unlocked hubs check.

____ Front tires swapped side-to-side.

____ Rear tires swapped side-to-side.

____ Front-to-rear tire swap.

2. Alignment

____ Unlocked hubs check.

____ Toe changed to ____.

___ Caster changed and split is ____.

___ Camber changed and split is ____.

3. Tire circumference

____ Unlocked hubs check.

___ Tire circumference checked and two (2) closest circumference tires swapped to rear axle.

4. Steering gear valve

____ Unlocked hubs check.

____ Install pressure gauge.

____ Check fluid level with engine off and on.

___ Apply torque to the steering wheel nut and check gauge readings.

___ Replaced the shaft and control assembly.

____ Removed the pressure gauge.

5. RABS linkage

____ Replaced the RBS linkage.

6. Brake imbalance

____ Unlocked hubs check.

____ Front wheel rotational drag check.

____ Master cylinder check.

____ Piston retraction check.

____ Rotors and linings swapped from side-to-side.

____ Rear brakes checked.

___ Rear drums and shoes swapped from side-to-side.

7. Miscellaneous

___ Check for loose, damaged or worn parts.

Technical Service Bulletin # 98-5A-22 Date: 980318

Vehicle - Pull Or Drift Diagnostics/Service Procedures

Article No. 98-5A-22

03/18/98

^ BRAKES - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

^ STEERING - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

LIGHT TRUCK: 1988-94 RANGER

1991-94 EXPLORER

ISSUE: A comprehensive pull and drift diagnostic procedure has been developed to assist technicians with vehicle service.

ACTION: Use the following Service Procedure to resolve drift and pull concerns.

Proceed with the Pull and Drift Diagnostic Procedure it the pull or drift is not significantly reduced or where there is a case of steady state drift (no braking).

A Diagnostic Check List has been provided at the end of this article to use with this procedure.

NOTE:

THIS TSB ARTICLE SHOULD BE READ COMPLETELY BEFORE PERFORMING DIAGNOSTICS OR REPAIRS.

PART NUMBER PART NAME

F7AZ-3F823-A Premium Power Steering Fluid

D7AZ-19A331-A Silicone Brake caliper Grease And Dielectric Compound

F1TZ-3B203-B Radius Arm Bushing (2 Req'd.)

F2TZ-2C15O-A Caliper Pin (4 Req'd.)

OTHER APPLICABLE ARTICLES: 90-7-16, 89-21-10 SUPERSEDES:98-1-16 WARRANTY STATUS: Eligible Under The Provisions Of Bumper To Bumper Warranty Coverage For 1992-94 Model Year Vehicles, Basic Warranty Coverage For All Other Model Years

PROCEDURE 5 - FRONT W6

PROCEDURE 6 - 2005 42

PROCEDURE 7 - FRONT W6

ROAD TEST - FRONT W6

OASIS CODES: 301000, 303000

Service Procedure

1. Check and adjust brake pad clearances and caliper knuckle clearances as follows:

a. Remove the pins from the caliper.

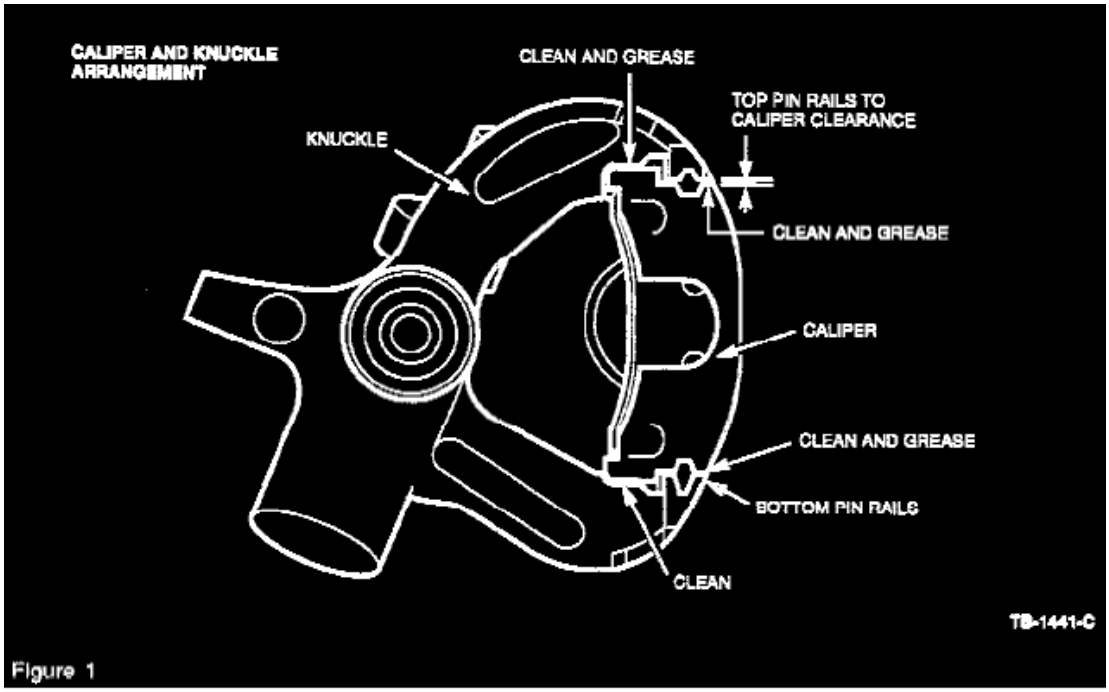

Figure 1

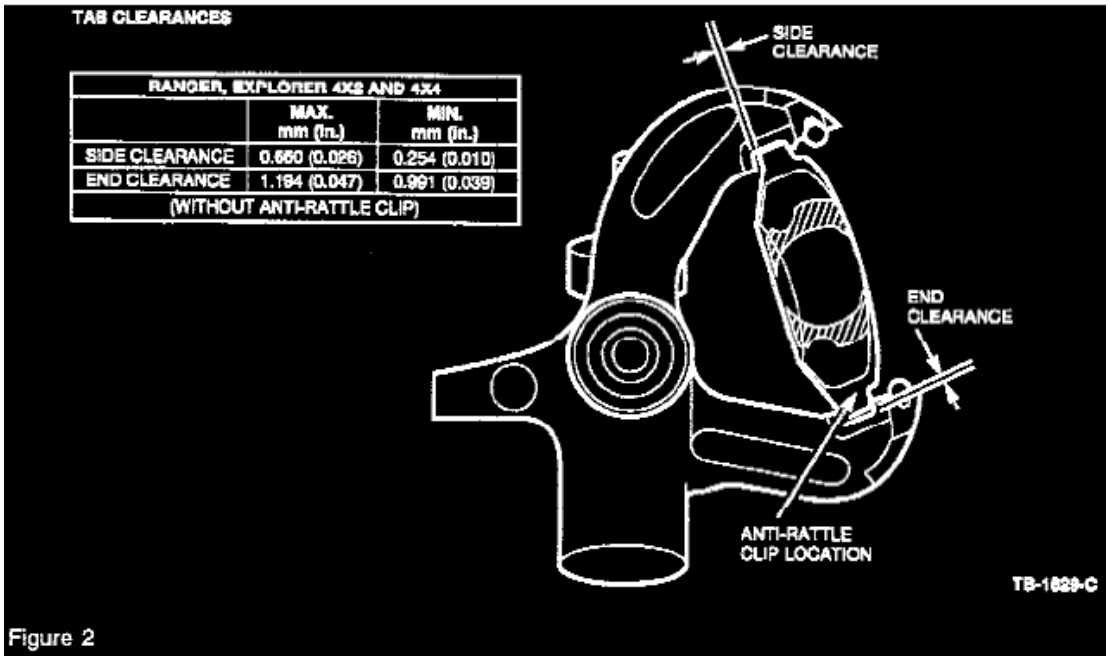

Figure 2

b. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails. Clearance should be a minimum of 0.3B mm (0.015").

c. If the clearance is insufficient, replace the caliper and measure again. If clearance concern still exists, replace the knuckle.

NOTE:

CHECK THE CLEARANCE ON THE NEW KNUCKLE BEFORE INSTALLATION.

d. After measuring the caliper/knuckle for proper clearances, remove both calipers and inner pad assemblies.

e. Remove the anti-rattle clip from the inner pad.

f. Reinstall pad and check the side and end clearances with a feeler gauge (Figure 2).

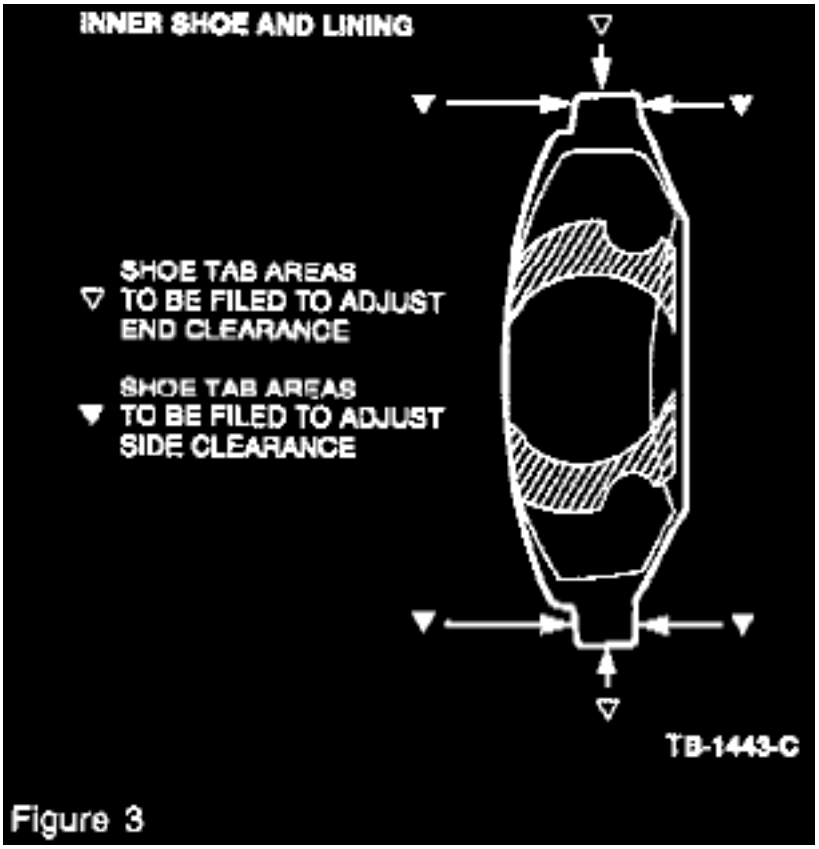

Figure 3

g. If the pad clearances are within specification, go to Step 1h. If the pad clearances are not to the required dimensions, file the steel backing plate. File material at ends of shoes, removing equal amounts from both sides or ends (Figure 3).

CAUTION:

DO NOT GRIND THE STEEL BACKING PLATE. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

h. Check the tab clearances and install anti-rattle clip on the lower pad tab (Figure 2).

CAUTION:

MAKE SURE THE LUBRICANT DOES NOT GET ON THE ROTORS, LININGS, OR ON THE CALIPER PISTON BOOTS.

2. During reassembly:

^ Clean the caliper slide surfaces of corrosion, contamination, and burrs with a wire brush or portable wire wheel

^ Polish with crocus cloth

^ Lubricate and corrosion protect by applying a light coat of Silicone Brake Caliper Grease and Dielectric Compound (D7AZ-19A331-A), or equivalent meeting Ford specification ESE-M1C171-A, to the inner knuckle top and bottom pad groove and caliper rails (Figure 1)

^ Replace the caliper pins with new Caliper Pins (F2TZ-2C150-A)

NOTE:

THE EXPLORER IS ALREADY EQUIPPED WITH THE NEW RADIUS ARM BUSHINGS.

3. Inspect the right and left side radius arm bushings for cracking, splitting, or wear. Replace the right and left side arm bushings with new Radius Arm Bushings (F1TZ-3B203-B), medium brown color, if necessary. Refer to the appropriate Service Manual, Section 04-01C, for service details.

Pull/Drift Diagnostic Procedure

The Pull/Drift Diagnostic Procedure should be used if the pull or drift is not significantly reduced with the service procedure or in cases of a steady state drift (no braking).

Test drive the vehicle with the customer to understand his/her pull or drift concern. Many customers will call a clear vision concern a pull or drift because the steering wheel is not straight.

Pull or drifts come from various sources, each with a particular set of symptoms. Careful road test evaluation usually will pinpoint which cause (or causes) is present.

Road Test

It is important to test drive the vehicle with the customer to UNDERSTAND HIS OR HER CONCERN.

Complete the road test before beginning any repairs since you may have multiple causes that need to be identified.

^ The road test should be done on a flat, straight road and should be done in both directions to account for wind

^ Tire pressure should be checked and adjusted, if necessary

ROAD TEST	RESULT	ACTION
Maintain a steady speed of 80-89 km/h (50-55 mph). **DO NOT BRAKE.**	Is there a steady state pull? If no, go to the next Step.	**See Diagnostic Procedure 1** - Tire mismatch or tire pressure concern.
While stopped, have second person move to the LH rear passenger location. Maintain 80-89 km/h (50-55 mph).	Any change in pull? If no change, go to next Step.	**See Diagnostic Procedure 2** - Caster split.
Make sure front hubs are unlocked (if equipped). Accelerate the vehicle - decelerate the vehicle using **engine braking only.**	Any changes in the pull? Does it pull one way on acceleration and another way on deceleration? If no, go to next Step.	**See Diagnostic Procedure 3** - Possible limited slip rear axle and tire circumference.
Maintain a steady speed of 80-89 km/h (50-55 mph). Put the vehicle in Neutral and shut off the engine.	Does the pull go away? If no, go to the next Step.	**See Diagnostic Procedure 4** - Steering gear valve off center.
Stop the vehicle along the highway. Rotate the wheel full left. Proceed with road test.	Does the pull get better or worse? Stop the vehicle; rotate the wheel full right. Does the pull change - better or worse? If no, go to next Step.	**See Diagnostic Procedure 5** - Possible Rubber Ball Socket (RBS) memory steer.
In a safe clear area, while firmly holding the steering wheel, apply the brakes moderately hard, but not to the point of engaging Rear Anti-lock Brake System (RABS).	Does the vehicle's heading change during brake application? If no, go to next Step.	**See Diagnostic Procedure 6** - Possible brake imbalance.
Disconnect the fluid level sensor (disable RABS). Brake the vehicle from 80 km/h (50 mph).	Does the vehicle pull with anti-lock disconnected? If no, go to next Step.	**See Diagnostic Procedure 6** - Possible inadequate rear brake application
Brake the vehicle hard, to the point of lock-up (RABS disabled).	Do both rears lock? Do both wheels lock at the same time?	**See Diagnostic Procedure 6** - Possible unequal rear brake application.

^ A second person in the vehicle during the road test is helpful. Unless otherwise directed, the second person must remain in the front RH passenger location

^ On vehicles with automatic locking hubs, it is necessary to drive 6 meters (20 feet) forward and then backward to unlock the hubs

NOTE:

IT IS POSSIBLE THAT THE VEHICLE MAY HAVE MULTIPLE SYMPTOMS. A ROAD TEST/CAUSE CHART.

NOTE:

RECONNECT THE FLUID LEVEL SENSOR AFTER ROAD TEST.

Diagnostic Procedure # 1 - Tire Mismatch

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the Diagnostic Procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to Regular Production Option (RPO) list and set tire psi to the correct value

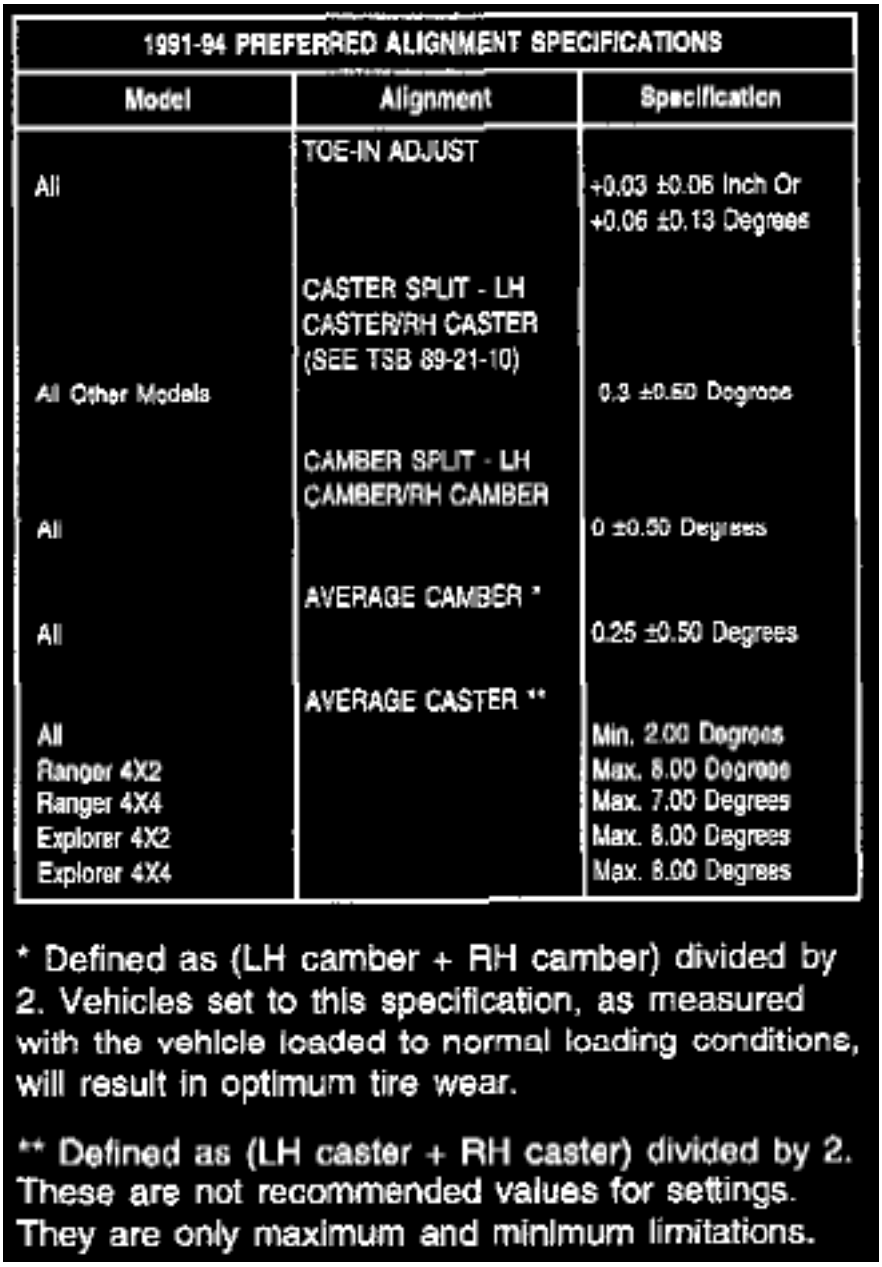
^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only

Set tire pressure to value on the certification label.

1. Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Tire Pull - Swap the front tires from side-to-side and road test. If the concern is not corrected, continue with next Step.

3. Tire Pull - Swap rear tires from side-to-side and road test. If the concern is not corrected, continue with next Step.



1991-94 PREFERRED ALIGNMENT SPECIFICATIONS

Model	Alignment	Specification
All	TOE-IN ADJUST	+0.03 ±0.06 Inch Or +0.06 ±0.13 Degrees
All Other Models	CASTER SPLIT - LH CASTER/RH CASTER (SEE TSB 89-21-10)	0.3 ±0.50 Degrees
All	CAMBER SPLIT - LH CAMBER/RH CAMBER	0 ±0.50 Degrees
All	AVERAGE CAMBER *	0.25 ±0.50 Degrees
All Ranger 4X2 Ranger 4X4 Explorer 4X2 Explorer 4X4	AVERAGE CASTER **	Min. 2.00 Degrees Max. 8.00 Degrees Max. 7.00 Degrees Max. 8.00 Degrees Max. 8.00 Degrees

* Defined as (LH camber + RH camber) divided by 2. Vehicles set to this specification, as measured with the vehicle loaded to normal loading conditions, will result in optimum tire wear.

** Defined as (LH caster + RH caster) divided by 2. These are not recommended values for settings. They are only maximum and minimum limitations.

4. Tire Pull - Swap front tires from front to rear. Set the tire pressure to the required pressure for the new front and rear positions, then road test.

NOTE:

ON REAR LIMITED SLIP AXLE (FRONT HUB UNLOCKED) DRIFT CONCERNS, IT MAY BE NECESSARY TO MEASURE TIRE CIRCUMFERENCE AND PLACE A MATCHED SET OF TIRES ON THE REAR AXLE.

Diagnostic Procedure # 2 - Alignment

Wheel Alignment - Measure the front wheel alignment. For out-of-specification vehicles, align to the "1991-94 Preferred Alignment Specifications" stated in this article.

^ Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels

^ Do not adjust wheel alignment to correct for brake pull if the vehicle does not have pull during non-brake applications

^ Set the tire pressure to the specification on the certification label

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the Diagnostic Procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to RPO list and set tire pressure to the correct value

^ IF THE TIRES AND WHEELS DO NOT MATCH CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only

Drive vehicle after alignment is performed.

^ Vehicles which exceed the maximum average caster value shown above may result in shimmy concerns

^ Vehicles operated below the minimum average caster value shown can result in wander and poor steering returnability concerns

If the vehicle is not within these minimum and maximum average caster values, or if the vehicle has experienced any of these listed steering/handling concerns, the average caster should be set in accordance with ride height/caster chart in the Service Manual.

Diagnostic Procedure # 3 - Tires

1. Spin the front tires to be sure that the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Measure tire circumference of all four (4) tires; put the two (2) closest circumference tires on the rear axle. Tire pressure must be equal on all tires.

Diagnostic Procedure # 4 - Steering Gear Valve Off Center

Rotary Valve Centering Check: To confirm that you are looking at a steering gear valve concern, lift the front wheels off the ground.

^ The vehicle should be raised so that there is no interference with the steering linkage

^ The front wheels should also spin freely

With the wheels in a straight ahead position, start the engine and observe any steering wheel or linkage movement when the engine is started. If any movement is observed, continue with the rotary valve centering check.

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Install a 0-13,790 kPa (0-2000 psi) pressure gauge (Rotunda 014-00207, Power Steering Analyzer) in the pressure line between the power steering pump outlet port 1 and the integral steering gear inlet port. Make sure the valve on the gauge is fully open.

3. Check the fluid level in the reservoir. Add Premium Power Steering Fluid F7AZ-3F823-AA or equivalent meeting Ford specification ESW-M2C33-F, if necessary.

4. Start the engine and turn the steering wheel from stop-to-stop to bring the steering lubricant to normal operating temperature. Turn off the engine and recheck the fluid level. Add Premium Power Steering Fluid F7AZ-3F823-AA or equivalent meeting Ford specification ESW-M2C33-F, if necessary.

5. With the engine running at approximately 1000 rpm and the steering wheel centered, attach a b-in torque wrench to the steering wheel nut. Apply sufficient torque in each direction to get a gauge reading of 1723 kPa (250 psi).

6. The torque wrench readings should be the same in both directions at 1723 kPa (250 psi). If the difference between the readings exceeds 0.68 N.m (6 lb-in), remove the steering gear and replace the shaft and control assembly.

7. Remove the pressure gauge installed in Step 2.

Diagnostic Procedure # 5 - RBS Linkage

If the RBS linkage is determined to have wind up or memory steer, replace RBS linkage with greaseable steel linkage.

NOTE:

ALL SERVICE PART STEERING LINKAGE IS THE GREASEABLE STEEL SOCKET TYPE

Diagnostic Procedure # 6 - Brake Imbalance

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Check for front wheel rotational drag with warm/hot brakes.

a. Make a series of 10 stops from speeds of 48 km/h (30 mph).

b. Make the 10 stops with no more than 30 second intervals between stops. This generally will induce a maximum pull if there is a drift/pull concern.

c. Raise the front end of the vehicle so that both tires are off the ground.

d. Rotate the front wheels by hand.

NOTE:

FOR ALL 4-WHEEL-DRIVE VEHICLES, MAKE SURE THE HUBS ARE DISENGAGED.

Both tires should rotate about the same amount, with little brake drag occuring. Some brake drag will naturally be present for each size of vehicle.

3. If the vehicle has excess brake drag, proceed as follows:

a. Open the bleed screw on the affected wheel to check for residual pressure in the brake lines. If there is a squirt of brake fluid out of the bleeder screw and the drag is reduced or eliminated, the master cylinder may not be allowing the brake fluid to return to the reservoir.

b. Check the master cylinder push rod adjustment. Refer to the appropriate Service Manual, Section 06-06, for service details.

c. Check the brake pedal to determine if it is fully returning.

4. Remove both calipers and check piston retraction using a C-clamp and wooden block. The piston should easily move back into the bore under the force of the clamp. Rebuild or replace as needed.

5. If Steps 1 through 4 have not determined the concern, swap rotors and linings from side-to-side.

NOTE:

SHOE TAB CLEARANCES SHOULD BE CHECKED AND MODIFIED IF NEEDED. REFER TO FIGURE 2.

6. Test drive the vehicle with 10 or more stops from 64 km/h (40 mph) before evaluating for brake drift. If there is no change in drift while braking, it may be assumed the concern is not the result of the front brakes.

7. Check the rear brakes. Remove the rear wheels and brake drums.

a. Check for contaminants (i.e., grease, axle lube, leaking brake fluid, etc.).

b. Check for broken components, frozen parking brake cables or improperly installed parts.

c. Check the cage diameter using the Brake Shoe Adjustment Gauge (D81L-1103-A). If either side is out-of-specification, check for proper function of the adjusting mechanism and repair or replace as required.

d. Check the rear wheel cylinders by the following method.

^ Replace one of the brake drums

^ Have another person apply the brakes and watch for movement of one of the brake shoes on the other wheel

^ Reapply the brakes while holding in place the shoe that moved. The opposite shoe should now move. If no movement is observed, repair or replace the wheel cylinder

^ Reinstall the drum and repeat the procedure for the other rear brake

8. If the condition still exists, swap rear shoes from side-to-side and drive the vehicle. If the drift is significantly reduced, replace the rear linings. If the pull/drift is not significantly reduced, go to Service Procedure # 7.

Diagnostic Procedure # 7 - Miscellaneous

Check for loose, damaged or excessively worn parts. Visually inspect the front suspension for loose or worn components (i.e., ball joints, radius arm bushings, radius arm attachments at the axle and frame, alignment adjusters, steering linkage, etc.). Repair or replace as required.

Diagnostic Check List

NOTE:

THE FOLLOWING CHECK LIST SHOULD BE COMPLETED AFTER EACH STEP OF THE DIAGNOSTIC WHERE APPLICABLE.

SERVICE PROCEDURE

1. Checking clearances

___ Caliper-to-knuckle clearance.

___ Inner shoe side and end clearance.

2. Lubrication of components

___ Lubrication of the caliper rails and inner knuckle pad grooves.

3. Radius arm bushings

___ Replacement of right and left side radius arm bushings.

DIAGNOSTIC PROCEDURE

1. Tire mismatch

____ Unlocked hubs check.

____ Front tires swapped side-to-side.

____ Rear tires swapped side-to-side.

____ Front-to-rear tire swap.

2. Alignment

____ Unlocked hubs check.

____ Toe changed to ____.

___ Caster changed and split is ____.

___ Camber changed and split is ____.

3. Tire circumference

____ Unlocked hubs check.

___ Tire circumference checked and two (2) closest circumference tires swapped to rear axle.

4. Steering gear valve

____ Unlocked hubs check.

____ Install pressure gauge.

____ Check fluid level with engine off and on.

___ Apply torque to the steering wheel nut and check gauge readings.

___ Replaced the shaft and control assembly.

____ Removed the pressure gauge.

5. RABS linkage

____ Replaced the RBS linkage.

6. Brake imbalance

____ Unlocked hubs check.

____ Front wheel rotational drag check.

____ Master cylinder check.

____ Piston retraction check.

____ Rotors and linings swapped from side-to-side.

____ Rear brakes checked.

___ Rear drums and shoes swapped from side-to-side.

7. Miscellaneous

___ Check for loose, damaged or worn parts.

TOP VIEW OF CAMBER/CASTER ADJUSTER
(POSITION SLOT IN AXLE TO OBTAIN DESIRED ALIGNMENT)

Alignment: Service and Repair Camber

Fig. 2 Caster/Camber Variation Chart.

Caster and camber adjustment is possible with adjusters available in 1/2°, 1° and 1-1/2° increments. One adjuster is used to adjust both caster and camber.

1. Measure caster and camber, noting difference between specification and actual measurement.

2. Select correct service adjuster, Fig. 2. Select adjuster that will bring alignment to specifications with the smallest side to side variation.

3. Remove front wheel and tire assembly.

4. On 4 x 4 models equipped with Dana 35 axle, remove caster/camber adjuster snap ring.

5. On all models, Remove upper ball joint pinch bolt, then using removal tool No. T64P-3590-F or D81T-3010-B or equivalent, remove adjuster.

6. Install new adjuster, then using suitable 1-1/2 inch socket rotate adjuster to specified position.

7. Install ball joint pinch bolt torquing to 48-65 ft. lbs., install snap ring.

8. Install front wheel and tire assembly, then recheck alignment.

Service Adjuster Type (Degrees)	Position Slot in Axle (Degrees)	LH Axle		RH Axle	
		Camber Change (Degrees)	Caster Change (Degrees)	Camber Change (Degrees)	Caster Change (Degrees)

Alignment: Service and Repair Caster

Fig. 2 Caster/Camber Variation Chart.

Caster and camber adjustment is possible with adjusters available in 1/2°, 1° and 1-1/2° increments. One adjuster is used to adjust both caster and camber.

1. Measure caster and camber, noting difference between specification and actual measurement.

2. Select correct service adjuster, Fig. 2. Select adjuster that will bring alignment to specifications with the smallest side to side variation.

3. Remove front wheel and tire assembly.

4. On 4 x 4 models equipped with Dana 35 axle, remove caster/camber adjuster snap ring.

5. On all models, Remove upper ball joint pinch bolt, then using removal tool No. T64P-3590-F or D81T-3010-B or equivalent, remove adjuster.

6. Install new adjuster, then using suitable 1 1/2 inch socket rotate adjuster to specified position.

7. Install ball joint pinch bolt torquing to 48-65 ft. lbs., install snap ring.

8. Install front wheel and tire assembly, then recheck alignment.

Alignment: Service and Repair Preliminary Inspection

Inspect the following components, adjust, repair or replace as required prior to performing front wheel alignment.

1. Inflate tires to cold specifications.

2. Ensure front tires are of same size, ply rating and load rating.

3. Inspect for excessive wheel bearing endplay.

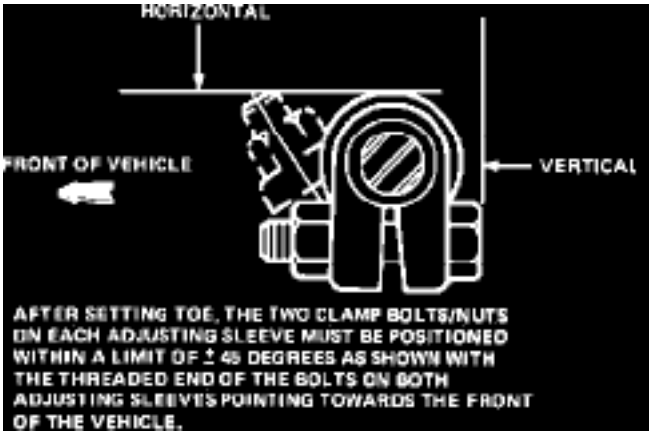
4. Inspect for worn or damaged spindle ball joints.

5. Inspect steering gear mounting bolts for proper torque.

6. Inspect radius arm or bent or damaged condition.

7. Inspect radius arm to frame bushings for looseness or wear.

8. Inspect suspension components for wear or damage.



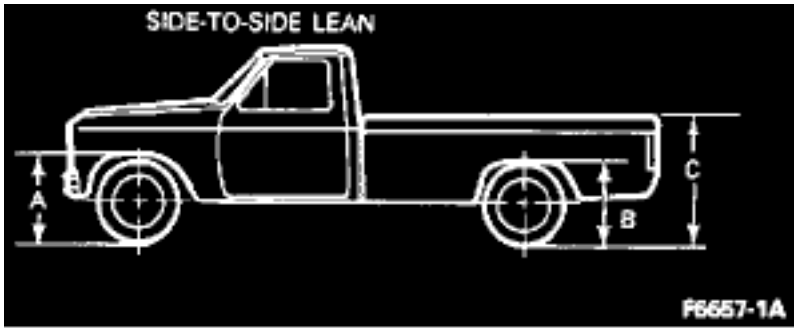
Alignment: Service and Repair Toe

Fig. 4 Toe-In Adjustment

1. Loosen clamp bolts at each end of spindle connecting rod tube, then rotate the sleeve until correct toe alignment of {1/32} inch is obtained.

2. Center clamps between adjustment sleeve nibs, then position bolts horizontally with clamps nuts positioned as shown in Fig. 4.

3. Recheck toe-in adjustment, then check that steering wheel spokes are properly positioned and adjust as necessary.



EXAMPLES

Ranger 4x2 Vehicle	Ranger 4x4 and Explorer Vehicle
Measured LH Ride Height 4-1/2"	Measured LH Ride Height 4-1/2"
Measured RH Ride Height 4"	Measured RH Ride Height 4-5/8"
Revised RH Ride Height 4-1/4"	—
Side to Side Difference 1/4"	Side to Side Difference 1/8"
Since the difference is larger than 1/8", one suspension shim would be added to the low right shim.	Since the difference does not exceed 1/8", no shim is to be used on the front suspension. The front lean may be caused by a rear lean condition.

CF3559-C

Alignment: Service and Repair Vehicle Lean Correction

Front Lean

Measure the left and right front ride heights as shown in the illustration.

Compute the difference between left and right ride heights as shown with the examples. If the difference exceeds 3-9 mm (1/8-3/8 inch) and is LESS than 19 mm (3/4 inch), measured at the wheel house opening to ground, add one shim to the side of the vehicle that is low. The shim is to be placed under the lower spring seat; service shim (part number 389117-S2) can be used without a front stabilizer bar. If there is a computed side-to-side difference of 19 mm (3/4 inch) or MORE in the left/right wheel house openings, remove the high side spring from the vehicle and compare it with a service replacement part having the same part number.

If the free height of the original equipment spring exceeds the free height of the service part by 13 mm (1/2 inch), install the service part in this location. If the free height is less than 13 mm (1/2 inch), remove the low side spring. Compare the service spring to both of the original springs and select the two springs most evenly matched. Install the higher spring at the low side.

NOTE: Changing front ride height by adding the service shim also affects caster angles. Adding the 4.5 mm thick shim (Part 389117-S2 or equivalent) may reduce caster by up to 0.40 degrees on the side the shim is added.

Rear Lean

A side-to-side lean at the rear of the vehicle can be adjusted by approximately 6 mm (1/4 inch) by installing a shim between the rear spring and axle on the low side of the vehicle. A "low at the rear" vehicle can be raised approximately 6 mm (1/4 inch) by installation of one shim on each side. Use the following procedure to install the shim (E37A-5742-AA). 1. Raise the vehicle until the weight is off the rear springs but with the tires still touching the floor. 2. Loosen the spring U-bolts to allow the axle to separate from the spring approximately 13 mm (1/2 inch). 3. Position the shim (E37A-5742-AA) between the spring and the spring seat with the tie bolt head through the hole in the shim.

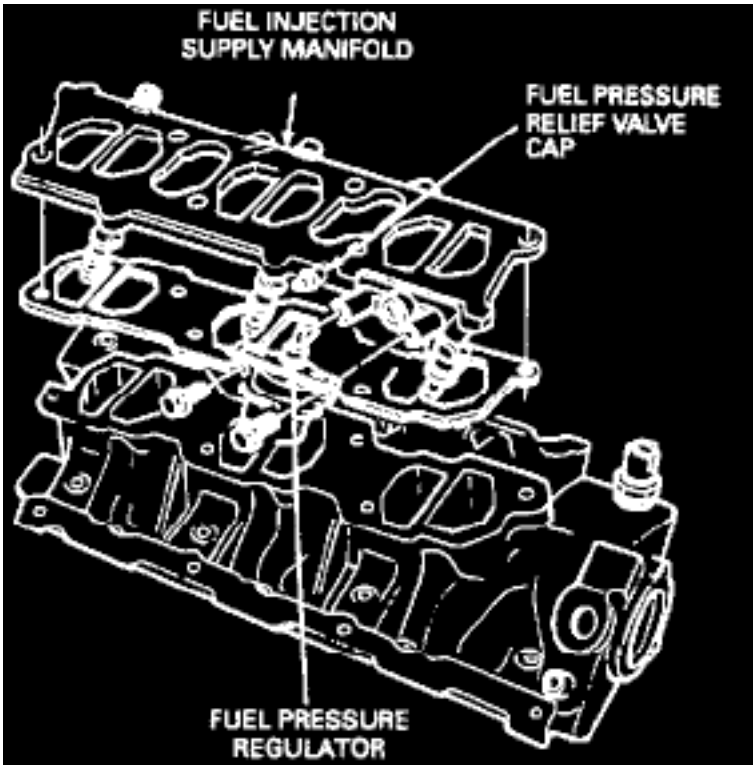
Position the shim between the rear spring and axle spacer. Tape may be used to hold the shim in position.

4. Make sure the spring leaves are properly aligned and the spring U-bolts contact the edges of the spring assembly or axle seat. 5. Tighten the spring U-bolt sufficiently and make sure the spring bolt head extends through shim into axle seat hole. 6. Tighten the U-bolt nuts to 88-102 N.m (65-75 ft-lb).

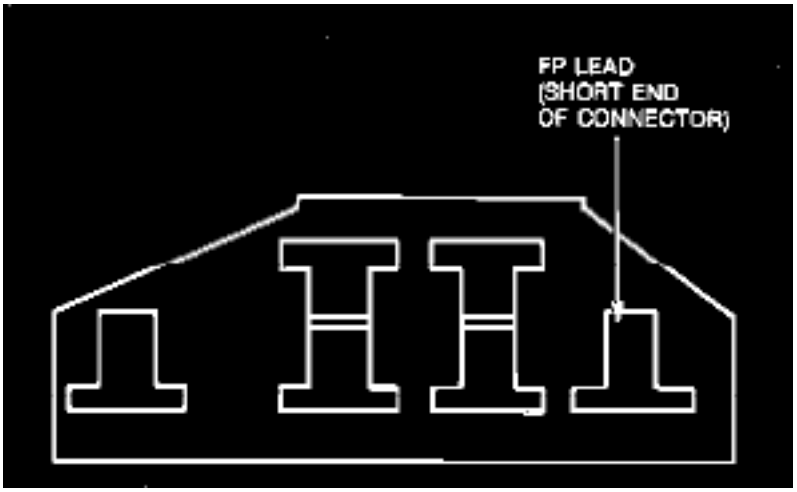
Fuel Pressure: Specifications

Key On Engine Off 35 - 45 psi

Key On Engine Running 30 - 40 psi



Fuel Injection Supply Manifold



Fuel Pressure: Testing and Inspection

STO Connector

STATIC PRESSURE TEST

1. Check for adequate fuel supply. 2. Turn key OFF 3. Install fuel pressure gauge to test port on fuel rail. 4. Install test lead to fuel pump lead of STO test connector. 5. Turn Key On Engine Off (KOEO). 6. Ground test lead to run fuel pump. 7. Check to determine if fuel pressure is within acceptable limits. Refer to SPECIFICATIONS.

a. If pressure is low but greater than 3 psi (indicates fuel pump is running but not enough pressure) check for:

^ Plugged fuel filter

^ Kinked fuel line

^ Low voltage to pump (should be within 0.5 volts of battery voltage at connector).

^ Disconnect the fuel return line and note if fuel is being returned during this low pressure condition. If fuel is being returned, replace the fuel pressure regulator. Reconnect the fuel return line.

b. If pressure is less than 3 psi (pump not running) check for:

^ Defective fuse link

^ Inertia switch open

^ Wiring at fuel pump/tank connector loose or open

^ Fuel pump ground connection at chassis loose or defective

^ Improper fuel pump relay operation

If fuel supply and return lines are OK, and electrical supply and ground are OK, and fuel pressure is still low, replace fuel pump.

DYNAMIC PRESSURE TEST

1. Disconnect and plug the vacuum line to the pressure regulator.

2. Start engine and run at idle. Check to determine if fuel pressure is within acceptable limits.

a. If pressure is low check for:

^ Plugged fuel filter ^ Restricted fuel line ^ Low voltage to pump (should be within 0.5 volts of battery voltage at connector).

3. Reconnect the vacuum line to the regulator.

If fuel supply and return lines are OK, and electrical supply and ground is OK, and fuel pressure is still low, replace fuel pump.

LEAKAGE TEST

1. Momentarily activate fuel pump by grounding test lead. Raise pressure to approximate operating pressure. 2. Remove ground from test lead and note pressure on gauge. Pressure should remain within 2 psi for 3 minutes after lead is ungrounded.

a. If pressure is not maintained check for leaking fuel

^ Lines ^ Connectors ^ Injectors

b. Disconnect fuel return line and plug engine side. Momentarily activate fuel pump by grounding test lead. Raise pressure to approximate

operating pressure. If pressure holds replace regulator and retest. Reconnect the fuel return line.

If pressure is not maintained replace fuel pump.

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

SERVICE KIT -9F939-

TB-2432-A

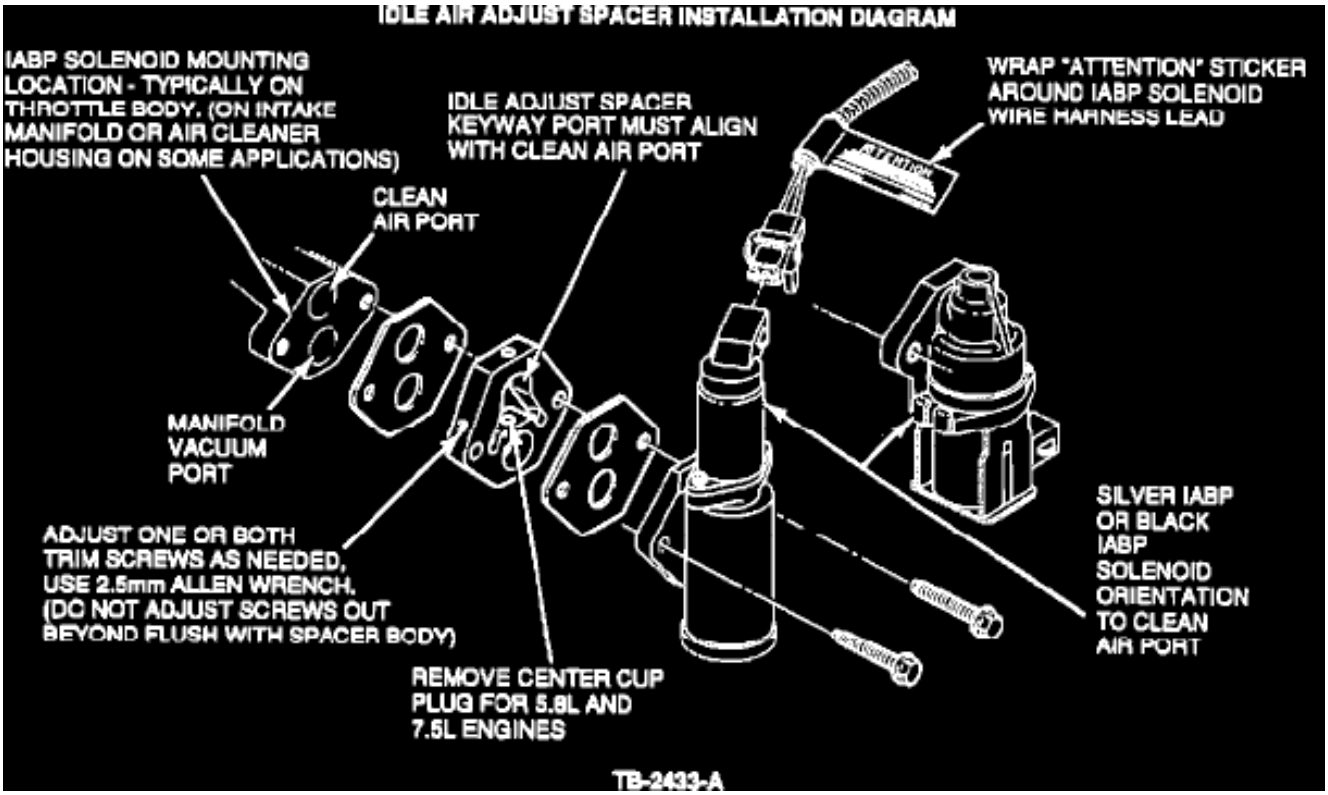
Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.

The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets



^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for

cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

TB-2432-A

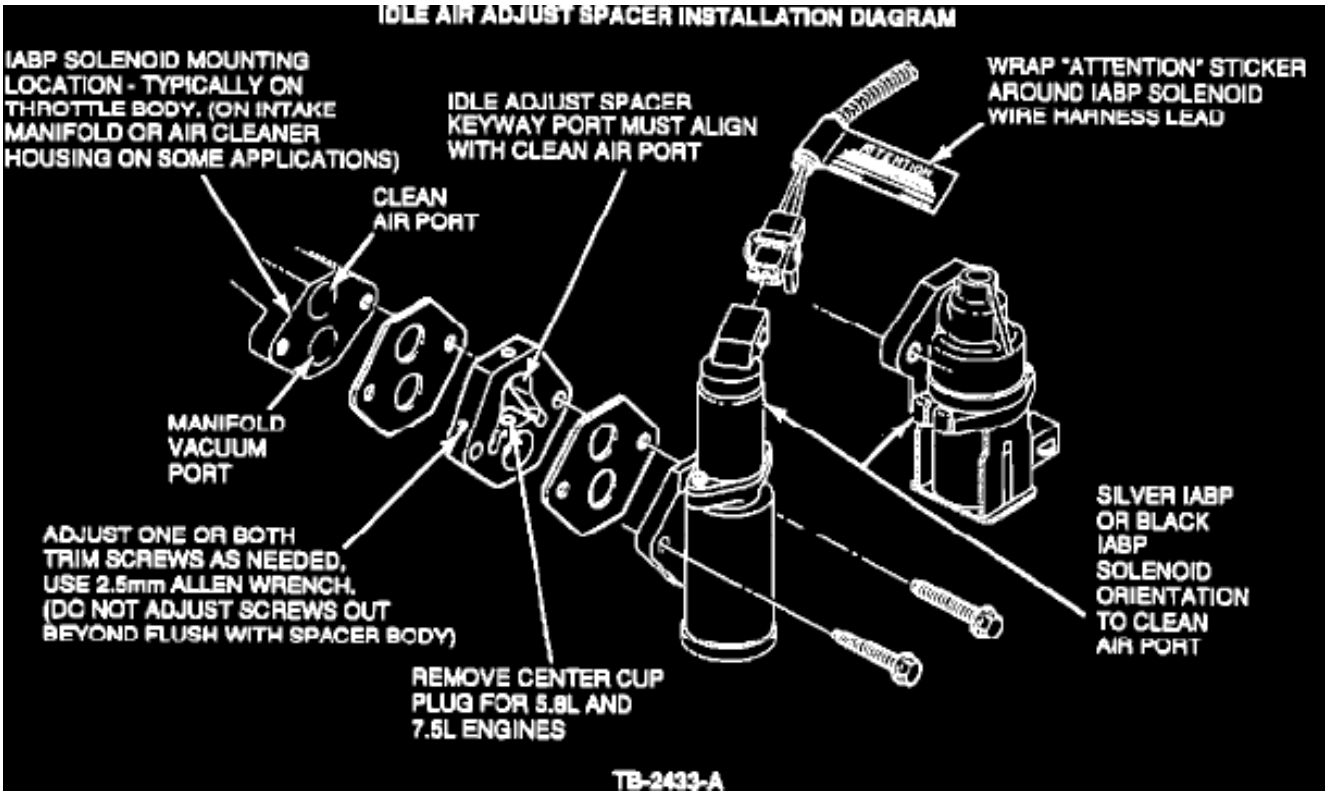
Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.

The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets



^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for

cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

Engine Idle Adjustment Procedures - Revision

ENGINE/EMISSIONS DIAGNOSIS SHOP MANUAL - 1991 - SECTION 9 - IDLE ADJUST PROCEDURES REVISED FOR APPLICATIONS WITHOUT SLUDGE TOLERANT THROTTLE BODY Article No. 90-25B-2 FORD:

1991 PROBE

LIGHT TRUCK: 1991 AEROSTAR, EXPLORER, RANGER

ISSUE: The Idle Adjust Procedures in the 1991 Engine/Emissions Diagnosis Shop Manual have been revised to cover applications that do not have the sludge tolerant throttle body. These are 1991 Aerostar, Explorer, and Ranger trucks with 4.0L engines. The 3.0L Probe has a sludge tolerant throttle body.

ACTION: Refer to the pages following this TSB article for the revised procedures.

NOTE: A SLUDGE TOLERANT THROTTLE BODY IS IDENTIFIED BY A 91TF-AA PREFIX AND SUFFIX IN THE PART NUMBER.

OTHER APPLICABLE ARTICLES: None WARRANTY STATUS: INFORMATION ONLY

Component Descriptions

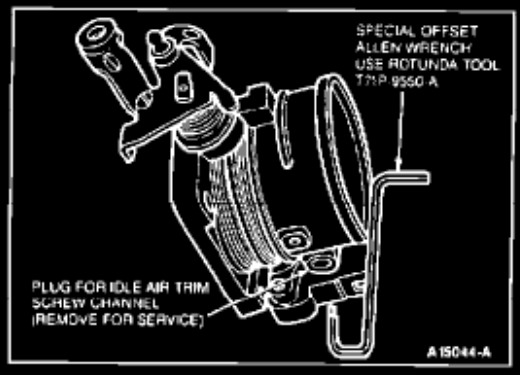

Figure 6

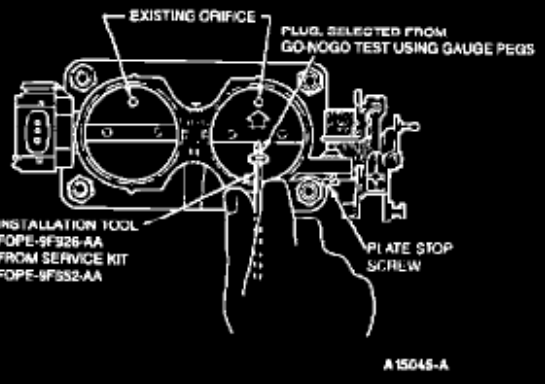

1. Remove air inlet tube(s) from throttle body.
2. Select the proper color plug by using the Go/NoGo gauge pegs included with the service kit FOPE-9F852-AA.
3. Starting with the largest diameter gauge peg, attempt to insert it through the throttle plate orifice.
4. If the gauge peg goes through the orifice, use the corresponding color plug.
   If it does not go through, proceed with the next smaller gauge peg for Go/NoGo Test.

NOTE: It is important that the largest Go/NoGo combination is used to determine the proper plug size.

5. If the smallest gauge peg does not go through the orifice, use the reamer bit and handle included with the service kit to enlarge the plate orifice. Wipe bearing grease on both sides of the plate orifice and on the reamer bit to hold the brass chips. After reaming, wipe the plate clean and then return to Step 3 to determine the proper plug size.
6. Using the installation tool from the service kit, push the plug into the orifice until bottoming out at the throttle plate.
7. Open and snap shut the throttle several times to verify proper plug retention.
8. Reconnect air inlet tube(s).
9. Reset idle rpm per engine requirement using the throttle plate stop screw.

Figure 7

Idle Airflow Adjust Procedure For All EFI and SEFI Systems

- Cooling system filled
- Engine at operating temperature
- Proper fuel pressure and no exhaust smoke
- Heater, A/C, and other accessories OFF
- Correct/clean PCV system if required
- Ignition timing set to specification
- EEC-IV diagnostics have been performed and vehicle malfunction indicated Service output codes have been resolved

Procedure

Choose procedure A, B, C or D from the table below for the engine being serviced. (The applications with self-test idle speed check provisions use procedure 'A' or 'C' and those without use procedure 'B' or 'D' depending on car or truck). An asterisk (*) below shows only applications without sludge tolerant throttle body design.

CAR			TRUCK		
ENGINE CID	VEHICLE LINES	PROCEDURE	ENGINE CID	VEHICLE LINES	PROCEDURE

DELETION

2 - Procedure 'D' for 1991 except F-250 with 0-64K calibration and procedure C for 1991 E-250 with 0-64K calibration and for all 1991 1/2

3 - Sludge tolerant throttle body introduced 1991 1/2

See Fig. 4 for typical plate atop screw location referred to in the attached procedure.

See Fig. 5 and 6 for air trim screw location referred to in the attached procedure A.

See Fig. 7 for plug installation (in the plate orifice) procedure referred to in the attached procedures.

Procedure 'A' for Passenger Cars with Self-Test Idle Speed Check Provisions

DELETION

(USE ONLY STEPS MARKED 'X' FOR THE ENGINE BEING SERVICED)	2.5L	3.0L	3.8L	3.8L SC	4.6L 2V	5.0L HO THUNDERBIRD COUGAR
1 Activate engine running self-test	X	X	X	X	X	X
2 After Service Code 11 or 111 has been displayed, wait 4 seconds then quickly unlatch and within 4 seconds latch the STI button	X	X	X	X	X	X
3 A single pulse code indicates the entry mode, then observe the Self-Test Output (STO) of the STAR Tester in Item 4. If adjustment is required in Item 4, refer to possible causes listed in previous section and correct them as required and then continue with this procedure if necessary.	X	X	X	X	X	X
4 (A) Constant tone, solid light or "STO LO" readout means base idle rpm is within range. To exit test, unlatch STI button, then wait four seconds for reinitialization (after 10 minutes it will exit by itself).	X	X	X	X	X	X
(B) Beeping tone, flashing light, or "STO LO" readout at (8 Hz) indicates TP sensor is out of range due to over adjustment; adjustment may be required.	X	X	X	X	X	X
(C) Beeping tone, flashing light, or "STO LO" readout at (4 Hz) indicates base idle rpm is too fast, adjustment is required, go to Step 6.	X	X	X	X	X	X
(D) Beeping tone, flashing light, or "STO LO" readout at (1 Hz) indicates base idle rpm is too slow, adjustment is required, go to Step 5.	X	X	X	X	X	X
5 If rpm is too slow, follow applicable procedure for the engine being serviced.	X	X	X	X	X	X
A. Do not clean the throttle body, turn the air trim screw counter-clockwise until conditions in Step 4(A) are satisfied for air trim location. (See Figure 5 or 6).				X	X	X
B. Do not clean the throttle body. Check for the plate orifice plug. If there is no plug turn screw clockwise until conditions in Step 4(A) are satisfied. If there is a plug from previous service remove plug and then adjust screw in either direction as required. Screw must be in contact with the lever pad after adjustment.	X	X	X			
6 If rpm is too high, follow applicable procedure for the engine being serviced	X	X	X	X	X	X
A. Do not clean the throttle body, turn the air trim screw clockwise until conditions in Step 4(A) are satisfied for air trim screw location (see Figure 5 or 6).				X	X	X
B Turn engine OFF	X	X	X			
a. Block off the orifice in the throttle plate temporarily with tape. If the orifice already has a plug from previous service, go to Step (C)	X	X	X			
b. Restart the engine and check idle speed using Self-Test (mass air packages require air intake hose to be reattached first). If engine stalled, crack open the plate with plate stop screw. (Figure 4)	X	X	X			
c. If rpm continues to be fast, perform test in Step 7 if TPS output code is within range, remove tape, go to Section 2 for other causes. If out of range adjust screw for proper TPS code (lever pad must be in contact with screw after adjustment). If rpm is still fast, terminate this procedure and - go to Section 2 for other possible causes.	X	X	X			
d. However, if rpm drops to or below the desired level, as indicated by Self-Test Output tone, turn the engine off disconnect air cleaner hose, remove the tape.	X	X	X			
e. Install the plug with proper color code depending on throttle plate orifice size - see Fig. 7 for installation procedure.	X	X	X			
f. Reconnect the air cleaner hose - start the engine turn the plate stop screw clockwise (do not turn it counter-clockwise as this may cause the throttle plate to stick at idle) until conditions in Step 4A are satisfied.	X	X	X			
7 Run KOEO Self-Test for proper TPS output code.	X	X	X			
8 Verify the throttle is not stuck in the bore and linkage is not preventing throttle from closing.	X	X	X			
9 On automatic overdrive transmission (AOD) applications check TV pressure adjustment		X	X

Procedure 'D' for Trucks with No Self-Test Idle Speed Check Provisions (Continued)

USE ONLY STEPS MARKED "X" FOR THE ENGINE BEING SERVICED (Continued)	2.3L EFI OHC	2.9L EFI	3.0L EFI	4.0L EFI WITH 81TF-AA THROTTLE BODY	4.0L EFI WITH 90TF-AA THROTTLE BODY	5.0L EFI (NON-E4OD)	5.8L EFI D/8500 ALL 1991 EXCEPT F-250 D-64K 3/ CALIBRATION	7.5L EFI 1991	7.5L EFI 1991 1/2
i. Reconnect the air cleaner hose — start the engine. Check idle rpm using a tachometer. Turn the plate stop screw clockwise (do not turn it counter-clockwise as this may cause the throttle plate to stick at idle) to the nominal rpm ±25 rpm shown in Step 9.	X		X	X		X	X		X
10 Shut engine off and repeat Steps 7, 8 and 9 if necessary.	X	X	X	X	X				
11 Run KOEO Self Test for proper TPS output code.	X	X	X	X	X	X	X	X	X
12 Shut engine off and disconnect battery for 5 minutes minimum.	X	X	X	X	X	X	X		
13 Remove feeler gauge from throttle plate stop screw and throttle lever pad.						X	X		
14 Reconnect SPOUT line.	X					X	X		
15 Engine off (reconnect idle speed control-air bypass solenoid. Verify that the throttle is not stuck in the bore and linkage is not preventing throttle from closing.	X	X	X	X	X	X	X	X	X
16 Start engine and stabilize for two minutes, then goose engine and let it return to idle, lightly depress and release the accelerator. Let engine idle, if idle problem still exists go to Section 2 for other possible causes.	X	X	X	X	X	X 2/	X 2/	X	X
17 On Automatic Overdrive Transmission (AOD) applications, check TV pressure adjustment.						X			

NOTE 1: On 5.0L and 5.8L, only in Step 9. If you must turn the plate stop screw in, shut engine off, make estimated adjustment. Start engine, repeat Steps 7,8,9.

2/ In Step 16, engine rpm oscillation may be caused by the throttle plate open far enough to expose the canister purge ports. To verify this, disconnect purge port and plug. If the problem is resolved, close the throttle plate just enough to eliminate oscillations.

3/ For 1991 1/2 use procedure 'C'.

Engine Idle Adjustment Procedures - Revision

ENGINE/EMISSIONS DIAGNOSIS SHOP MANUAL - 1991 - SECTION 9 - IDLE ADJUST PROCEDURES REVISED FOR APPLICATIONS WITHOUT SLUDGE TOLERANT THROTTLE BODY Article No. 90-25B-2 FORD:

1991 PROBE

LIGHT TRUCK: 1991 AEROSTAR, EXPLORER, RANGER

ISSUE: The Idle Adjust Procedures in the 1991 Engine/Emissions Diagnosis Shop Manual have been revised to cover applications that do not have the sludge tolerant throttle body. These are 1991 Aerostar, Explorer, and Ranger trucks with 4.0L engines. The 3.0L Probe has a sludge tolerant throttle body.

ACTION: Refer to the pages following this TSB article for the revised procedures.

NOTE: A SLUDGE TOLERANT THROTTLE BODY IS IDENTIFIED BY A 91TF-AA PREFIX AND SUFFIX IN THE PART NUMBER.

OTHER APPLICABLE ARTICLES: None WARRANTY STATUS: INFORMATION ONLY

Component Descriptions

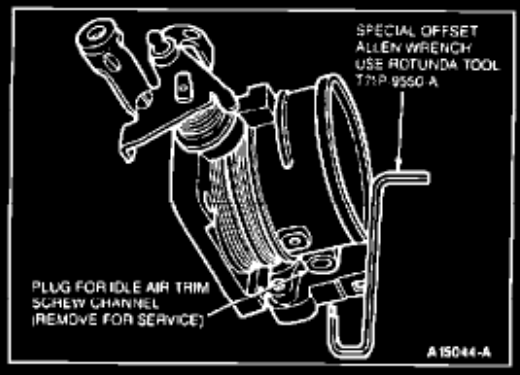

Figure 6

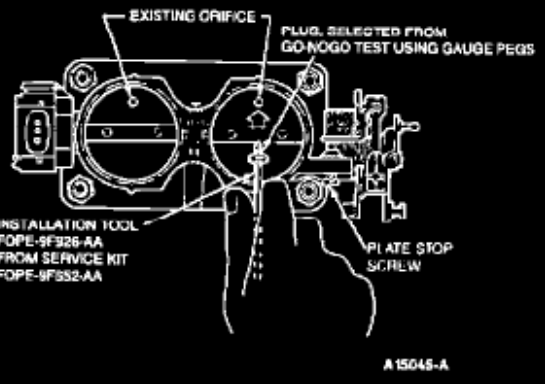

1. Remove air inlet tube(s) from throttle body.
2. Select the proper color plug by using the Go/NoGo gauge pegs included with the service kit FOPE-9F852-AA.
3. Starting with the largest diameter gauge peg, attempt to insert it through the throttle plate orifice.
4. If the gauge peg goes through the orifice, use the corresponding color plug.
   If it does not go through, proceed with the next smaller gauge peg for Go/NoGo Test.

NOTE: It is important that the largest Go/NoGo combination is used to determine the proper plug size.

5. If the smallest gauge peg does not go through the orifice, use the reamer bit and handle included with the service kit to enlarge the plate orifice. Wipe bearing grease on both sides of the plate orifice and on the reamer bit to hold the brass chips. After reaming, wipe the plate clean and then return to Step 3 to determine the proper plug size.
6. Using the installation tool from the service kit, push the plug into the orifice until bottoming out at the throttle plate.
7. Open and snap shut the throttle several times to verify proper plug retention.
8. Reconnect air inlet tube(s).
9. Reset idle rpm per engine requirement using the throttle plate stop screw.

Figure 7

Idle Airflow Adjust Procedure For All EFI and SEFI Systems

Procedure 'D' for Trucks with No Self-Test Idle Speed Check Provisions

USE ONLY STEPS MARKED "X" FOR THE ENGINE BEING SERVICED	2.3L EFI OHC	2.9L EFI	3.0L EFI	4.0L EFI WITH 9ITF-AA THROTTLE BODY	4.0L EFI WITH 9ITF-AA THROTTLE BODY	5.0L EFI (NON-E4OD)	5.8L EFI O/8500 ALL 1991 EXCEPT E-250 B-64K CALIBRATION	7.5L EFI 1991	7.5L EFI 1991 1/2
1 Engine off, disconnect the negative (-) terminal of the battery for five minutes, then reconnect it.	X	X	X	X	X	X	X	X	X
2 Start engine and stabilize for two minutes. Then goose engine and let it return to idle, lightly depress and release the accelerator and let engine idle. Does engine idle properly?	X	X	X	X	X	X	X	X	X
3 If engine does not idle properly proceed with this procedure	X	X	X	X	X	X	X	X	X
4 With engine off, install specified feeler gauge between the throttle plate stop screw and throttle lever.						A.050 M.030	A.050 M.030		
5 Unplug SPOUT line and verify ignition timing is base ±2 deg BTDC (refer to decal)	X					X	X		
6 Disconnect the idle speed control air bypas solenoid	X	X	X	X	X	X	X	X	X
7 Start engine and run at rpm for the duration of.....	2500 30 SEC	2500 30 SEC	2500 30 SEC	2500 30 SEC	2500 30 SEC	IDLE 120 SEC	IDLE 120 SEC	2500 30 SEC	2500 30 SEC
8 Place automatic transmission in ..... Manual transmission in NEUTRAL	PARK	PARK	PARK	PARK	PARK	PARK	PARK	PARK	PARK
9 Check idle rpm to the range using a tachometer - see Note 1 below	550 +25/ -75	725 +0/ -125	600 +75/ -50	675 +50/ -120	675 +50/ 125	A 675 M 700 ±150	C6 700 M&E4OD 730 ±150	650±150	650±150
A. If rpm is too low	X	X	X	X	X	X	X	X	X
a. Turn the plate stop screw to the value shown in Step 9 ±25 rpm (during engine break-in reduce the rpm by 100)		X			X			X	
b. Do not clean the throttle body, check for the plate orifice plug. If there is no plug turn screw clockwise to the desired rpm. If there is plug from previous service, remove plug and then adjust screw in either direction as required. Screw must be in contact with the lever pad after adjustment.	X		X	X		X	X		X
B. If rpm is too high.....	X	X	X	X	X	X	X	X	X
a. Turn the plate stop screw to the value shown in Step 9 ±25 rpm		X			X			X	
b. Turn engine off.	X		X	X		X	X		X
c. Disconnect air cleaner hose.	X		X	X		X	X		X
d. Block off the orifice in the throttle plate temporarily with tape. If the orifice already has a plug from previous service, go to Step f.	X		X	X		X	X		X
e. Restart the engine and check idle speed using a tachometer (mass air applications will require air cleaner hose to be reattached before rpm check. If engine stalled, crack open the plate with stop screw. Do not over adjust.	X		X	X		X	X		X
f. If rpm continues to be last, perform test in Step 11. If TPS output code is within range, remove tape, go to Section 2 for other causes. If out of range, adjust screw for proper TPS code. Lever pad must be in contact with the screw. If rpm is still last, terminate this procedure and go to Section 2 for other possible casuses.	X		X	X		X	X		X
g. If rpm drops to value in Step 9 or below or engine stalls, turn engine off, disconnect air cleaner hose, remove tip tape.	X		X	X		X	X		X
h. Install the plug with proper color code depending on throttle plate orifice size — See Figure 7 for installation procedure.	X		X	X		X	X		X

Continued

Procedure 'D' for Trucks with No Self-Test Idle Speed Check Provisions (Continued)

USE ONLY STEPS MARKED "X" FOR THE ENGINE BEING SERVICED (Continued)	2.3L EFI OHC	2.9L EFI	3.0L EFI	4.0L EFI WITH 81TF-AA THROTTLE BODY	4.0L EFI WITH 90TF-AA THROTTLE BODY	5.0L EFI (NON-E4OD)	5.8L EFI D/8500 ALL 1991 EXCEPT F-250 D-64K CALIBRATION 3/	7.5L EFI 1991	7.5L EFI 1991 1/2
i. Reconnect the air cleaner hose — start the engine. Check idle rpm using a tachometer. Turn the plate stop screw clockwise (do not turn it counter-clockwise as this may cause the throttle plate to stick at idle) to the nominal rpm ±25 rpm shown in Step 9.	X		X	X		X	X		X
10 Shut engine off and repeat Steps 7, 8 and 9 if necessary.	X	X	X	X	X				
11 Run KOEO Self Test for proper TPS output code.	X	X	X	X	X	X	X	X	X
12 Shut engine off and disconnect battery for 5 minutes minimum.	X	X	X	X	X	X	X		
13 Remove feeler gauge from throttle plate stop screw and throttle lever pad.						X	X		
14 Reconnect SPOUT line.	X					X	X		
15 Engine off reconnect idle speed control-air bypass solenoid. Verify that the throttle is not stuck in the bore and linkage is not preventing throttle from closing.	X	X	X	X	X	X	X	X	X
16 Start engine and stabilize for two minutes, then goose engine and let it return to idle, lightly depress and release the accelerator. Let engine idle, if idle problem still exists go to Section 2 for other possible causes.	X	X	X	X	X	X 2/	X 2/	X	X
17 On Automatic Overdrive Transmission (AOD) applications, check TV pressure adjustment.						X			

NOTE 1: On 5.0L and 5.8L, only in Step 9. If you must turn the plate stop screw in, shut engine off, make estimated adjustment. Start engine, repeat Steps 7,8,9.

2/ In Step 16, engine rpm oscillation may be caused by the throttle plate open far enough to expose the canister purge ports. To verify this, disconnect purge port and plug. If the problem is resolved, close the throttle plate just enough to eliminate oscillations.

3/ For 1991 1/2 use procedure 'C'.

Revised 12/90

Idle Speed: By Symptom

Technical Service Bulletin # 91257 Date: 911213

Engine - Hard Cold Starts/Hesitation/Stalls On Start-Up

Article No. 91-25-7

12/13/91

^ HARD COLD START - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

^ HESITATION/STALLS - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

FORD: 1983-87 EXP 1983-91 ESCORT 1984-90 MUSTANG, THUNDERBIRD 1986-90 TAURUS 1986-91 CROWN VICTORIA 1988-90 TEMPO

LIGHT TRUCK: 1985-90 BRONCO II, BRONCO 1985-91 ECONOLINE, F-150-350 SERIES 1985-92 RANGER 1986-91 AEROSTAR 1991 EXPLORER

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

SERVICE KIT -9F939-

TB-2432-A

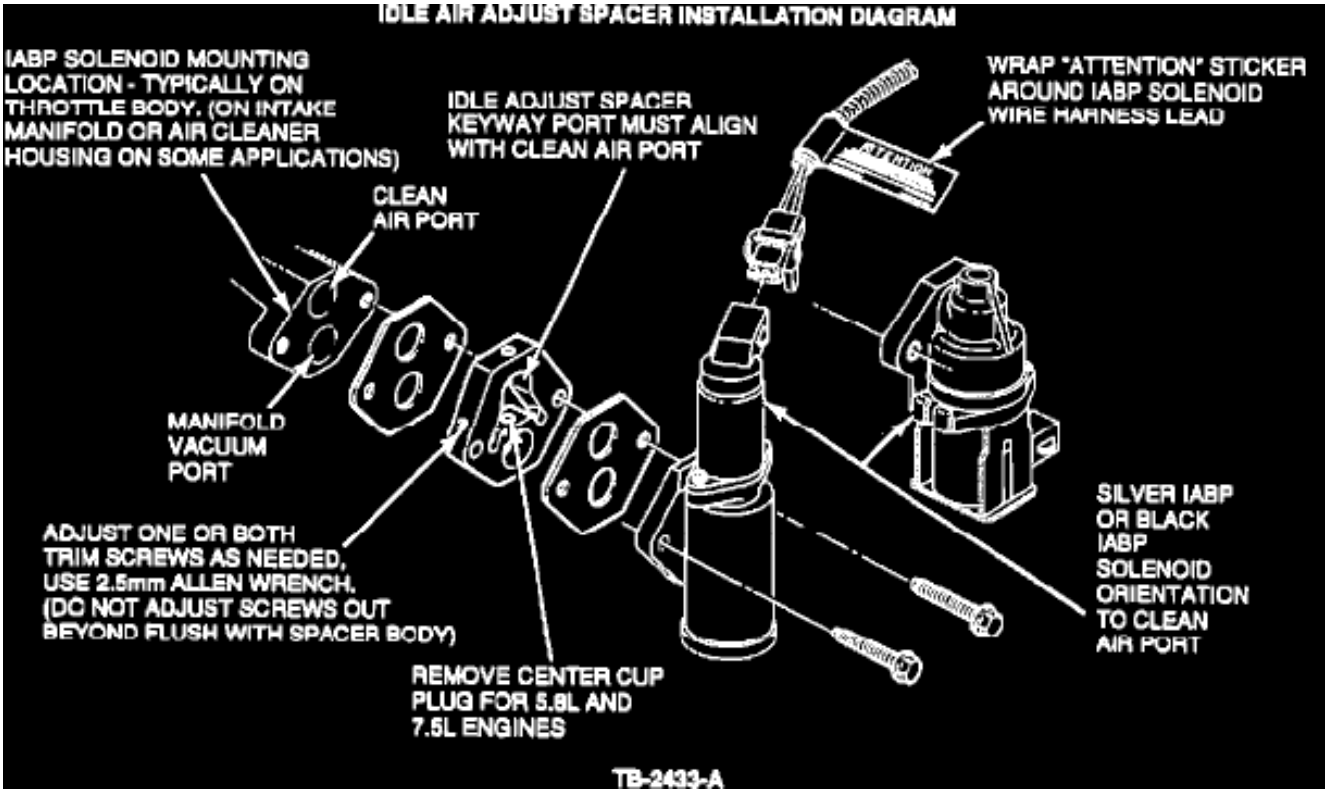
Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.

The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets



^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

Figure 11

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

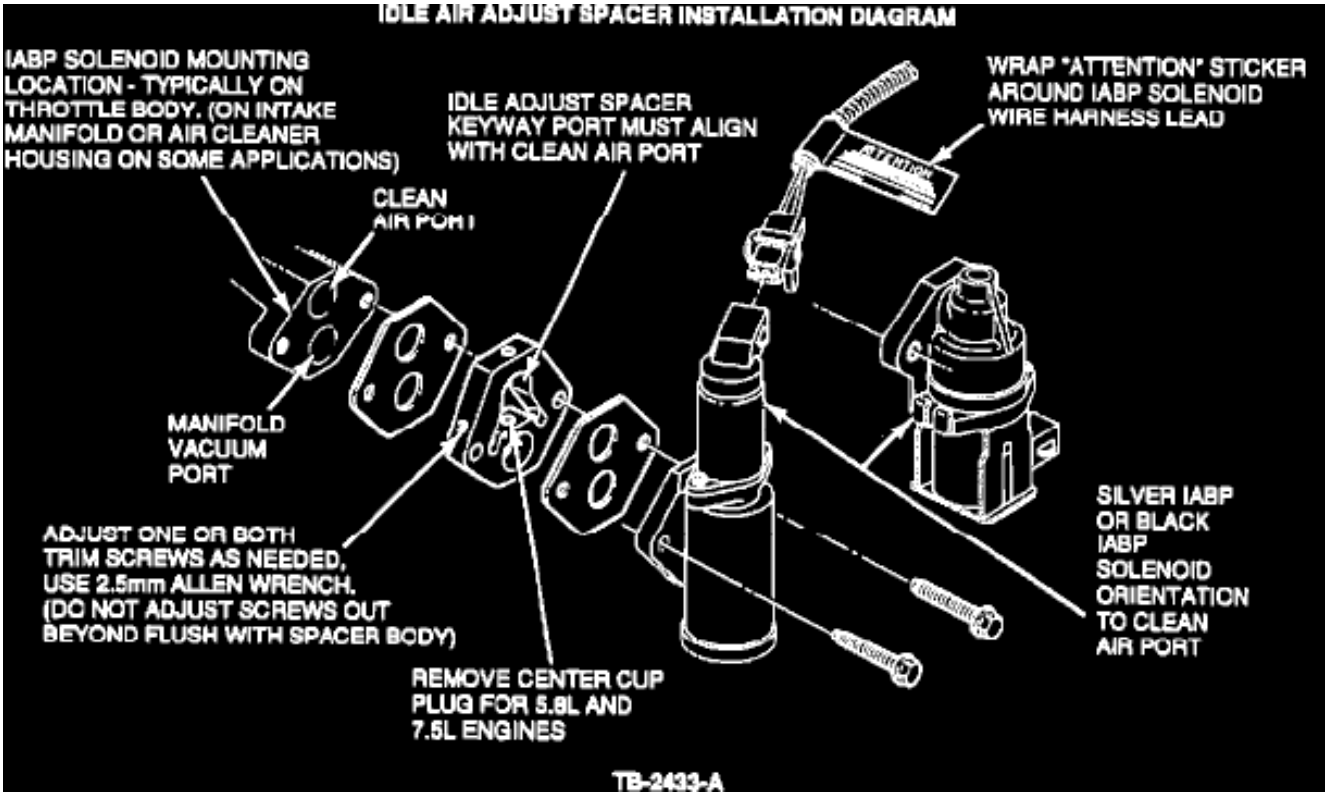
TB-2432-A

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.



The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets

^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

Figure 5

The EFI throttle body idle speed adjustment procedures for the various model year passenger cars and light trucks are outlined in step-by-step procedures featured in Figures 3, 4 and 5. Select the appropriate procedure for the vehicle involved and adjust the throttle body idle RPM accordingly, after service kit installation.

Figure 11

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

Idle Speed: Adjustments With 90TF-AA Throttle Body

*** UPDATED BY TSB 9111B4, 6/14/91; TSB 9025B2, 12/90

NOTE: The curb and fast idle speeds are controlled by the Engine Control Assembly (ECA) and the Idle Speed Control Bypass Air Valve (ISC-BPA). The ISC-BPA valve is not adjustable. A large increase or decrease in closed plate airflow from the calibrated level will not allow this device to control the speed.

REMEMBER

A change in idle airflow can occur not only at the throttle body, but other areas as well. You should enter the idle speed procedure only after other possible causes in the following areas are eliminated.

^ Contamination within the idle speed control device

^ Lack of fuel system control (excessively rich or lean)

^ Throttle sticking or binding

^ Engine not reaching operating temperature

^ Incorrect ignition timing

^ Incorrect or clogged PCV system

^ Vacuum leaks (intake manifold, vacuum hoses, vacuum reservoirs, power brake booster etc.

VERIFY

^ Transmission is in PARK (A/T), or NEUTRAL (M/T)

^ Parking brake is applied (automatic brake disconnected where applicable)

^ Wheels blocked

^ Engine at operating temperature

^ Proper fuel pressure and no exhaust smoke

^ Correct and clean PCV system

^ Heater, A/C, and other accessories OFF

^ Ignition timing is set to specification

^ EEC-IV diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved.

STEP 1

With the engine OFF, connect a tachometer, according to manufacturer's instructions. Disconnect the negative (-) terminal of the battery for 5 minutes, then reconnect it.

STEP 2

START the engine and let stabilize for two minutes. Goose the accelerator and let the engine return to idle. Lightly depress and release the accelerator, then let engine idle.

STEP 3

If the engine is not idling properly, turn the engine OFF, and disconnect Idle Speed Control Air Bypass Solenoid.

STEP 4

START and RUN the engine at 2500 rpm for 30 seconds.

STEP 5

Place the transmission is in PARK (A/T), or NEUTRAL (M/T).

STEP 6

Using a tachometer, verify idle rpm is 675 +50/-125 rpm.

RPM TOO LOW a.

Turn the plate stop screw to reach an idle speed of 675 +/- 25 rpm.

NOTE: During engine break-in reduce the idle rpm by 100 rpm. RPM TOO HIGH a.

Turn the plate stop screw clockwise until 675 +/- 25 rpm is achieved.

STEP 7

Turn the engine OFF, and repeat Steps 4, 5, and 6, if necessary.

STEP 8

Run the KOEO Self-Test for proper TPS code output.

STEP 9

Turn the engine OFF, and disconnect the battery for at least 5 minutes.

STEP 10

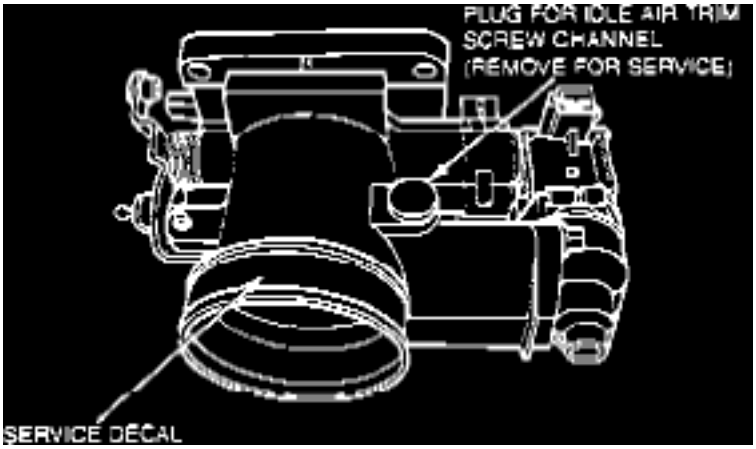
Reconnect the Idle Speed Control Air Bypass Solenoid. Verify the throttle plate is not stuck in the bore, and the linkage is not preventing throttle from closing.

STEP 11

START the engine and idle for two minutes. Goose the accelerator and let the engine return to idle. Lightly depress and release the accelerator, then let engine idle. ^

If idle problem still exists, proceed to DIAGNOSIS AND TESTING PROCEDURES/TESTING PROCEDURES/QUICK TEST AND

DIAGNOSTIC AIDS/VISUAL INSPECTION for other possible causes.



Idle Speed: Adjustments With 91TF-AA Throttle Body

*** UPDATED BY TSB 91-11B-4 6/14/91

NOTE: The curb and fast idle speeds are controlled by the Engine Control Assembly (ECA) and the Idle Speed Control Bypass Air Valve (ISC-BPA). The ISC-BPA valve is not adjustable. A large increase or decrease in closed plate airflow from the calibrated level will not allow this device to control the speed. The idle speed setting procedure has been revised considerably to reflect the expanded application of the Self-Test idle speed options and because the throttle body incorporates an orifice in the throttle plate to control idle airflow as part of the sludge tolerant design.

Air Trim Screw Channel Cover

Throttle bodies with sludge tolerant design (introduced 1991 1/2 model vehicles) are clearly identified with a Yellow/Black decal. This decal warns that the throttle plate stop screw must not be adjusted counterclockwise (backed off), as this will not reduce the engine speed but may cause the throttle plate to stick in the bore. Backing out the screw may be required if the throttle body has been previously serviced (a plug in the throttle plate orifice may be present) or the plate stop screw tampered with (TPS Self-Test output out of range). The decal also warns that the throttle body must NOT be cleaned inside the bore, as this cleaning will impair the sensitive coating. The sludge accumulation will not affect the idle air flow. The cleaning procedure for the ISC-BPA still applies.

REMEMBER

A change in idle airflow can occur not only at the throttle body, but other areas as well. You should enter the idle speed procedure only after other possible causes in the following areas are eliminated.

^ Contamination within the idle speed control device

^ Lack of fuel system control (excessively rich or lean)

^ Throttle sticking or binding

^ Engine not reaching operating temperature

^ Incorrect ignition timing

^ Incorrect or clogged PCV system

^ Vacuum leaks (intake manifold, vacuum hoses, vacuum reservoirs, power brake booster etc.

VERIFY

^ Transmission is in PARK (A/T), or NEUTRAL (M/T)

^ Parking brake is applied (automatic brake disconnected where applicable)

^ Wheels blocked

^ Engine at operating temperature

^ Proper fuel pressure and no exhaust smoke

^ Correct and clean PCV system

^ Heater, A/C, and other accessories OFF

^ Ignition timing is set to specification

^ EEC-IV diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved.

STEP 1

With the engine OFF, connect a tachometer, according to manufacturer's instructions. Disconnect the negative (-) terminal of the battery for 5 minutes, then reconnect it.

STEP 2

START the engine and let stabilize for two minutes. Goose the accelerator and let the engine return to idle. Lightly depress and release the accelerator, then let engine idle.

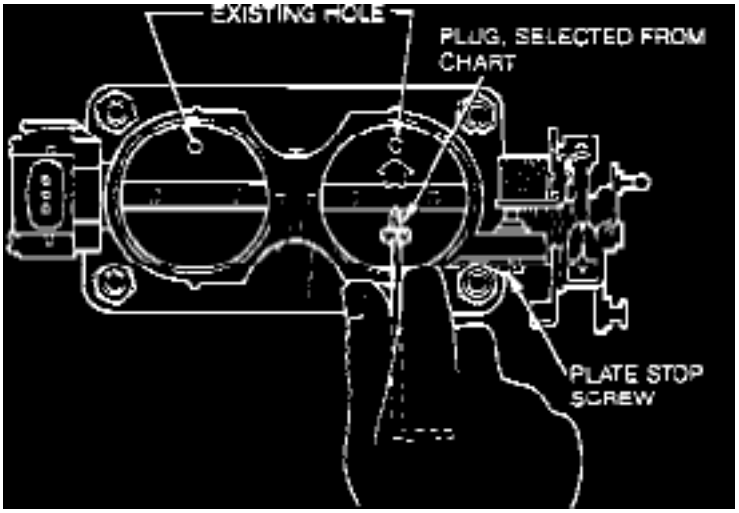
STEP 3

If the engine is not idling properly, turn the engine OFF, and disconnect Idle Speed Control Air Bypass Solenoid.

STEP 4

START and RUN the engine at 2500 rpm for 30 seconds.

STEP 5



Place the transmission is in PARK (A/T), or NEUTRAL (M/T).

STEP 6

Using a tachometer, verify idle rpm is 675 +50/-120 rpm.

Throttle Plate Orifice Plug

NOTE: A plug in the throttle body orifice will decrease idle rpm. Where as an orifice without a plug will increase idle rpm. Orifice plugs and installation tools are available in service kit # FOPZ-9F652-A.

RPM TOO LOW a.

Do not clean the throttle body, check for the plate orifice plug. ^

If there is no plug, turn the screw clockwise to the desired rpm.

^ If there is a plug from previous service, remove the plug, and adjust the screw in either direction as required. NOTE: Screw must be in contact with the lever pad after adjustment.

RPM TOO HIGH a.

Turn the engine OFF.

b. Disconnect air cleaner hose.

c. Temporarily block the orifice in the throttle plate with tape. If the orifice already has a plug from previous service proceed to Step (e).

d. RESTART the engine, and check the idle speed, using a tachometer. NOTE: On vehicles with Mass Air Flow Sensors, reconnect the air intake duct hose before checking rpm. If the engine stalls, crack open the plate stop screw, but DO NOT over adjust.

e. If rpm continues to be fast, perform KOEO Self-Test. ^

If TPS output code is within range, remove tape from throttle plate, and check for other possible causes.

^ If TPS output is out of range, adjust screw for proper TPS code. Lever must be in contact with the screw.

^ If rpm is still fast, terminate this procedure, then check for other possible causes.

f. If rpm drops to 675 or lower, or engine stalls, turn the engine OFF, disconnect the air cleaner hose, and remove tape from throttle plate.

g. Install the plug with proper color code depending on throttle plate orifice size.

h. Reconnect the air cleaner hose. START the engine, and check the idle rpm using a tachometer. Turn the plate stop screw clockwise until 675 +/- 25 rpm is achieved. NOTE: Do not turn the plate stop screw counterclockwise. This may cause the throttle plate to stick at idle.

STEP 7

Turn the engine OFF, and repeat Steps 4, 5, and 6.

STEP 8

Run the KOEO Self-Test for proper TPS code output.

STEP 9

Turn the engine OFF, and disconnect the battery for at least 5 minutes.

STEP 10

Reconnect the Idle Speed Control Air Bypass Solenoid. Verify the throttle plate is not stuck in the bore, and the linkage is not preventing throttle from closing.

STEP 11

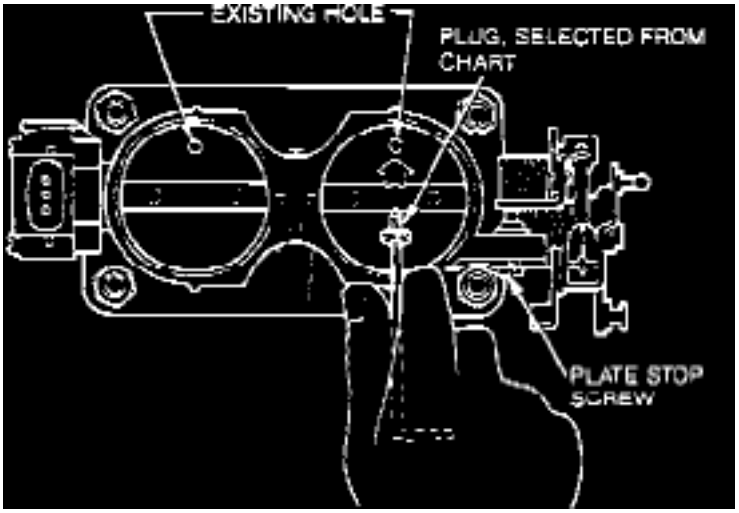
START the engine and idle for two minutes. Goose the accelerator and let the engine return to idle. Lightly depress and release the accelerator, then let engine idle. ^

If idle problem still exists, proceed to DIAGNOSIS AND TESTING PROCEDURES/TESTING PROCEDURES/QUICK TEST AND DIAGNOSTIC AIDS/VISUAL INSPECTION for other possible causes.

PROCEDURES FOR PLUG INSTALLATION

STEP 1

Remove air inlet tube(s) from throttle body.



Throttle Plate Orifice Plug

STEP 2

Select the proper color plug by using the Go/No-Go gauge pegs, included in the service kit (FOPZ-9F652-A).

STEP 3

Starting with the largest diameter gauge peg, attempt to insert through the throttle plate orifice.

STEP 4

If the gauge peg goes through the orifice, use the corresponding color plug. If the gauge peg does not go through, proceed with the next smaller gauge peg for Go/No-Go Test. NOTE: It is important that the largest Go/No-Go combination is used to determine the proper plug size.

STEP 5

If the smallest gauge peg does not go through the orifice, use the reamer bit and handle included with the service kit to enlarge the plate orifice. Wipe bearing grease on both sides of the plate orifice and on the reamer bit to hold the brass chips. After reaming, wipe plate clean and then return to Step 3 to determine the proper plug size.

STEP 6

Using the installation tool from the service kit, push the plug into the orifice until bottoming out at the throttle plate.

STEP 7

Open and snap closed the throttle several times to verify proper plug retention.

STEP 8

Reconnect the air inlet tube(s).

STEP 9

Reset idle rpm per engine requirement using the throttle plate stop screw.

Air Cleaner Fresh Air Duct/Hose: Technical Service Bulletins Engine - Water Entry Through Air Intake System

Article No. 94-3-8

02/09/94

^ AIR INTAKE - 2.9L, 3.0L, 4.0L EFI ENGINES - WATER ENTRY THROUGH AIR INTAKE SYSTEM

^ ENGINE - 2.9L, 3.0L, 4.0L EFI - POSSIBLE INTERNAL DAMAGE FROM WATER ENTRY THROUGH AIR INTAKE SYSTEM

LIGHT TRUCK: 1986-90 BRONCO II 1986-94 RANGER 1991-94 EXPLORER

This article is being republished in its entirety to add 1993-94 4.0L Ranger, 1993-94 3.0L Ranger and 1993-94 4.0L Explorer vehicles.

ISSUE: Reports have been received of internal engine damage caused by water entering the engine through the air intake system. This condition may occur when the vehicle is driven in normal wet conditions, such as water splash/spray from other vehicles, or when driven through shallow water. Improvements were made to the EFI engine air intake systems that have greatly reduced the number of reported incidences.

ACTION: Dealers should be assured that warranty repairs will be covered unless there Is evidence of owner misuse. This warranty repair policy will remain effective unless you are notified that a waterproof air intake system has been released.

OTHER APPLICABLE ARTICLES: NONE SUPERSEDES: 91-21-10 WARRANTY STATUS: INFORMATION ONLY OASIS CODES: 497000, 499000

Fuel Pressure Release: Service and Repair

CAUTION: FUEL SUPPLY LINES ON EFI ENGINES WILL REMAIN PRESSURIZED FOR SOME PERIOD OF TIME AFTER THE ENGINE IS SHUT OFF. THIS PRESSURE MUST BE RELIEVED BEFORE SERVICING OF THE FUEL SYSTEM IS BEGUN.

FUEL SYSTEM PRESSURE RELIEF - EFI ENGINES

Before opening the fuel system on vehicles with EFI engines, relieve fuel pressure as follows: 1. Locate and disconnect the electrical connection to either the fuel pump relay, the inertia switch or the in-line high pressure fuel pump.

2. Crank engine for approximately ten seconds.

Note: Engine may start and run for a short time. If so, crank engine an additional 5 seconds after engine stalls.

3. Re-connect the electrical connector that was disconnected in step 1 and disconnect battery ground cable.

Alternative Method

Some EFI vehicles have a port (fitting) on the fuel rail used for measuring fuel pressure. If so equipped, use the following method: -

Install fuel pressure relief tool No. T80L-9974-B or equivalent to measuring port on engine fuel rail.

- Position drain hose in suitable container, then depress relief button.

Octane Adjust	Pinpoint Test	KP

Note

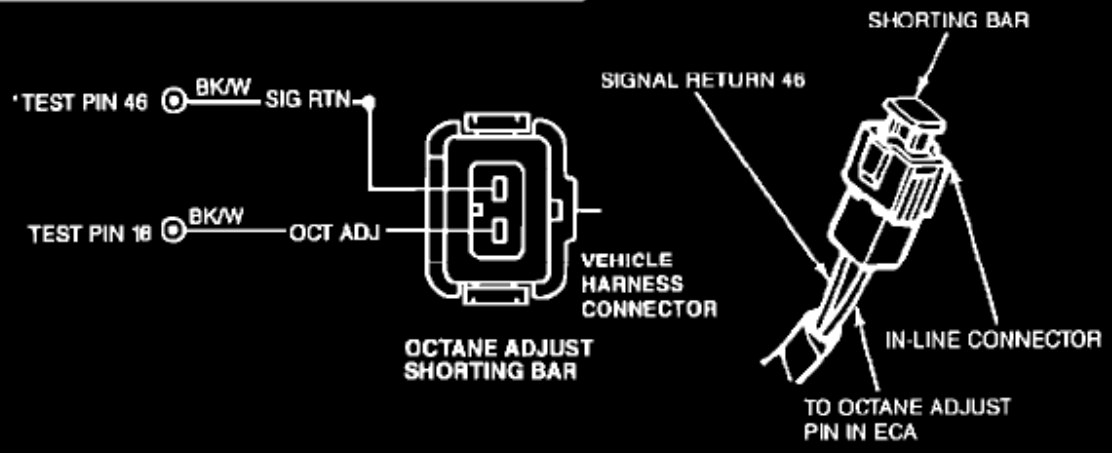
You should enter this Pinpoint Test only when directed here from Quick Test Step 7.0.

Remember

This Pinpoint Test is intended to diagnose only the following:

- Harness circuits: Signal Return, Octane Adjust
- Octane shorting bar connector

Pinpoint Test Schematic



OCTANE ADJUST SHORTING BAR LOCATIONS

APPLICATION	LOCATION
2.3L EFI Truck	Passenger side of fender apron, taped to the self-test connector.
3.0L SEFI SHO	Driver side of engine, tie wrapped to a bracket above the transmission.
3.8L SEFI SC	Passenger side of engine between shock tower mount and firewall next to self-test connector.

*TEST PINS LOCATED ON BREAKOUT BOX.
ALL HARNESS CONNECTORS VIEWED INTO MATING SURFACE.

A9686-D

NOTE: Use a higher octane grade of fuel to address the spark knock concern.
DO NOT remove the Octane Adjust shorting bar unless you have been directed by an application specific Technical Service Bulletin.

Octane Adjust

Pinpoint Test **KP**

Octane Adjust Shorting Bar Locations

Application	Location
1.9L MA SEFI	Near EEC-IV power relay, fuel pump relay and processor in passenger compartment.
2.3L EFI Truck	Passenger side of fender apron, taped to the Self-Test connector.
3.0L SEFI SHO	Driver side of engine, tie wrapped to a bracket above the transmission.
3.8L SEFI SC	Passenger side of engine between shock tower mount and firewall next to Self-Test connector.
4.0L MA EFI Aerostar	Driver side, engine cowl near windshield wiper motor take-out (alongside MAP take-out).
4.0L MA EFI Ranger/ Bronco II	Passenger side of fender apron, taped to the Self-Test connector.

DELETION

Revised 5/91

Octane Adjust

Pinpoint Test **KP**

TEST STEP	RESULT ▶	ACTION TO TAKE
KP1 VISUALLY INSPECT OCTANE ADJUST IN-LINE CONNECTOR SERVICE CODE 57/341		
Service Code 57/341 indicates Octane Adjust shorting bar is not in or the OCT ADJ circuit is open. • Key off. • Visually inspect Octane Adjust in-line connector. • **Is the shorting bar removed?**	Yes ▶ No ▶	GO to KP2. GO to KP4.
KP2 CHECK FOR MODIFICATION DECAL		
• Is there a modification decal attached to the vehicle indicating that the Octane Adjust shorting bar was removed?	Yes ▶ No ▶	Testing complete. If vehicle has spark knock concern, GO to Section 2. GO to KP3.
KP3 CHECK FOR SERVICE CODE 57/341		
• Replace Octane Adjust shorting bar. • Key off. • Activate self-test. • **Is service code 57/341 present?**	Yes ▶ No ▶	GO to KP4. Testing complete. EEC system OK.
KP4 CHECK CONTINUITY OF OCTANE ADJUST CIRCUIT		
NOTE: There should be continuity from OCT ADJ circuit thru the in-line connector and shorting bar to SIG RTN circuit. • Key off. • Disconnect processor 60 pin connector. Inspect for damaged or pushed out pins, corrosion, loose wires, etc. Service as necessary. • Install breakout box, leave processor disconnected. • Measure resistance between Test Pin 46 and OCT ADJ Test Pin at the breakout box (see schematic for appropriate OCT ADJ circuit test pin). • **Is the resistance less than 5 ohms?**	Yes ▶ No ▶	REPLACE processor. REMOVE breakout box. RERUN Quick Test. SERVICE open OCT ADJ circuit or shorting bar or SIG RTN circuit. REMOVE breakout box. RERUN Quick Test.

Octane Adjust

Pinpoint Test **KP**

TEST STEP	RESULT	ACTION TO TAKE
KP5 CHECK FOR SERVICE CODE 11 • Start engine and idle vehicle at operating temperature. • Key off. • Activate self-test. • Key on, engine off. • **Is service code 11 or 111 present?**	Yes ▶ No ▶	GO to KP6. **For service code 57/341:** GO to KP1. **For all other codes:** RETURN to Quick Test.
KP6 VERIFY IN-LINE CONNECTOR SHORTING BAR IS INSTALLED • Key off. • Visually inspect Octane Adjust in-line connector. • **Is shorting bar installed?**	Yes ▶ No ▶	GO to KP8. GO to KP7.
KP7 CHECK FOR MODIFICATION DECAL • Is there a modification decal attached to the vehicle indicating that the Octane Adjust shorting bar was removed?	Yes ▶ No ▶	GO to KP10. REPLACE shorting bar. GO to Section 2 to address spark knock concern.
KP8 CHECK FOR TSB • Is there a Technical Service Bulletin (TSB) authorizing the removal of the Octane Adjust shorting bar?	Yes ▶ No ▶	GO to KP9. GO to Section 2 to address spark knock concern.
KP9 REMOVE SHORTING BAR • Remove shorting bar only if there is a TSB authorization. • Drive vehicle to verify spark knock. • **Is spark knock present?**	Yes ▶ No ▶	GO to KP10. Testing complete. EEC system OK.

Octane Adjust	Pinpoint Test	KP

TEST STEP	RESULT ▶	ACTION TO TAKE
KP10 CHECK OCTANE ADJUST CIRCUIT FOR A SHORT TO GROUND • Key off. • Breakout box installed, processor disconnected. • Measure resistance between OCT ADJ circuit at the in-line connector and Test Pin 40/60 at the breakout box. • **Is each resistance greater than 10,000 ohms?**	Yes ▶	GO to KP11.
	No ▶	SERVICE short circuit. REMOVE breakout box. If spark knock is still present, GO to Section 2.
KP11 CHECK PROCESSOR INTEGRITY • Key off. • Shorting bar removed because of TSB authorization. • Breakout box installed, processor connected. • Key on. • Measure voltage between Octane Adjust circuit and Test Pin 40/60 at the breakout box. • **Is voltage greater than 4.0 volts?**	Yes ▶	REMOVE breakout box. If spark knoock is still present, GO to Section 2.
	No ▶	REPLACE processor. REMOVE breakout box. If spark knock is still present, GO to Section 2.

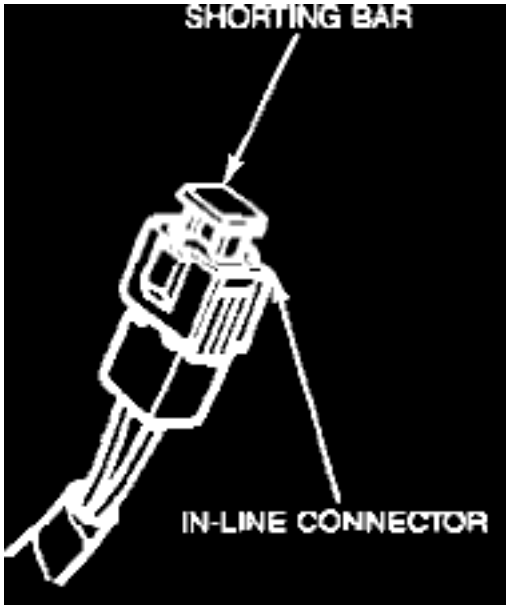
Ignition Timing Connector: Locations

Component Location

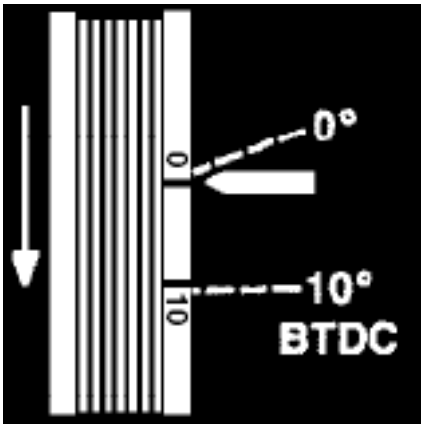
The SPOUT connector (SAW check connector C127) is located at the RH front of the engine compartment in front of the battery.



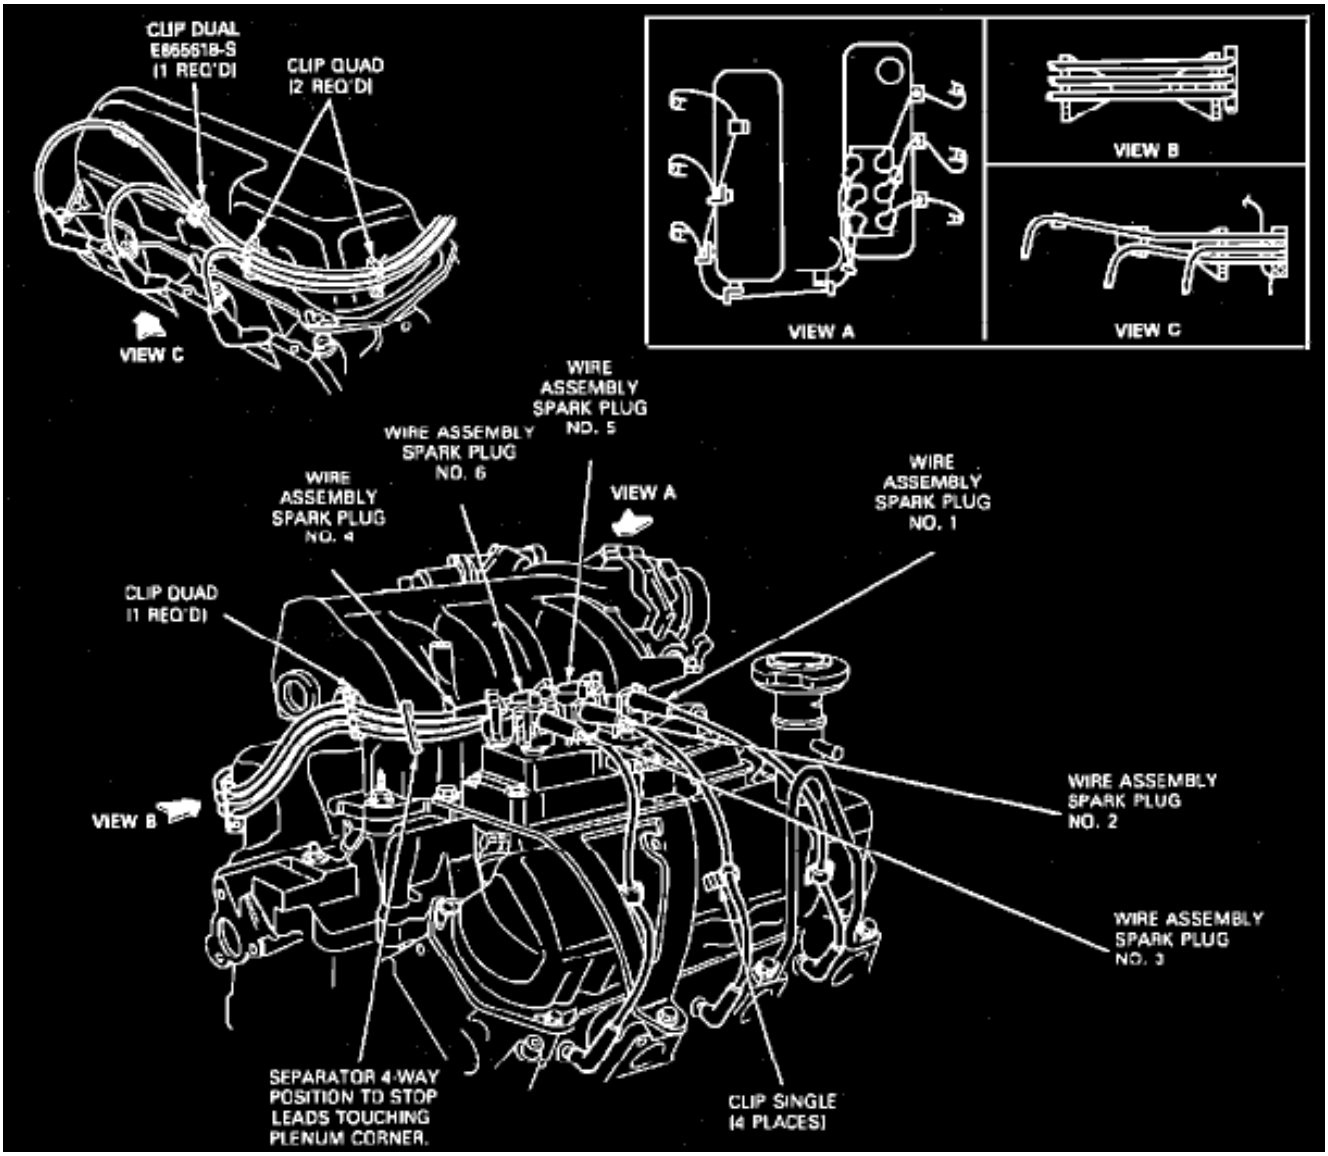
Ignition Timing Connector: Description and Operation

In-line Connector With Shorting Bar

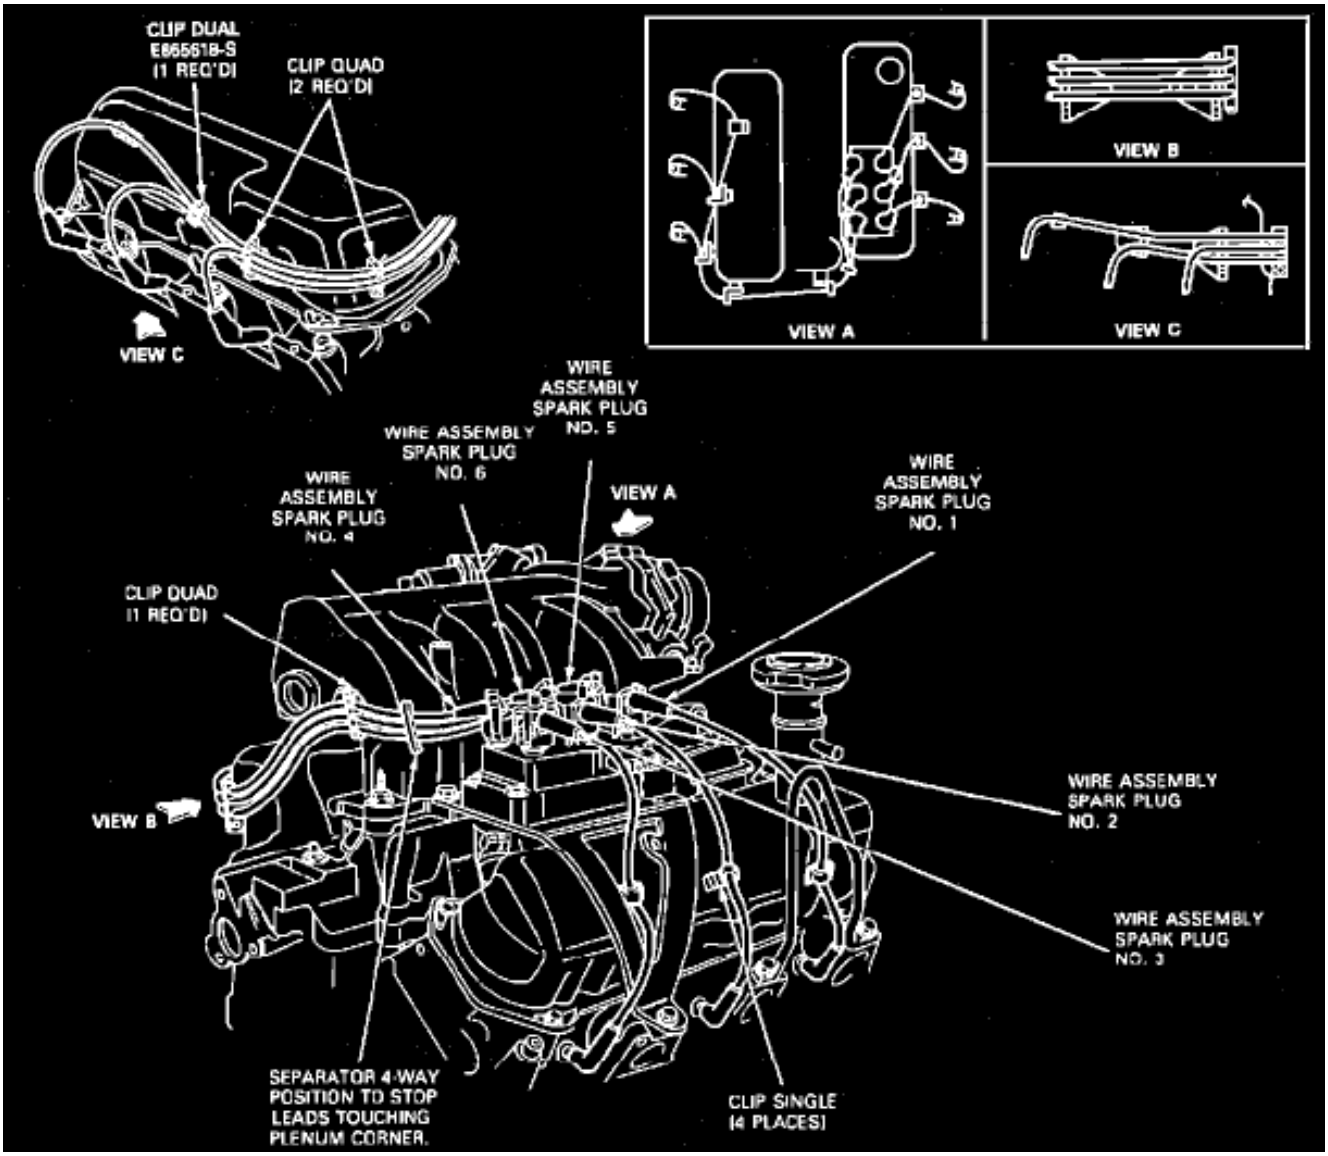
The octane adjustment switch is used to retard the ignition timing three to four degrees. When the switch jumper is INSTALLED, the timing is normal. With the jumper REMOVED, the timing is retarded. This is done to allow for optimum spark advance for effective combustion of the air/fuel mixture.



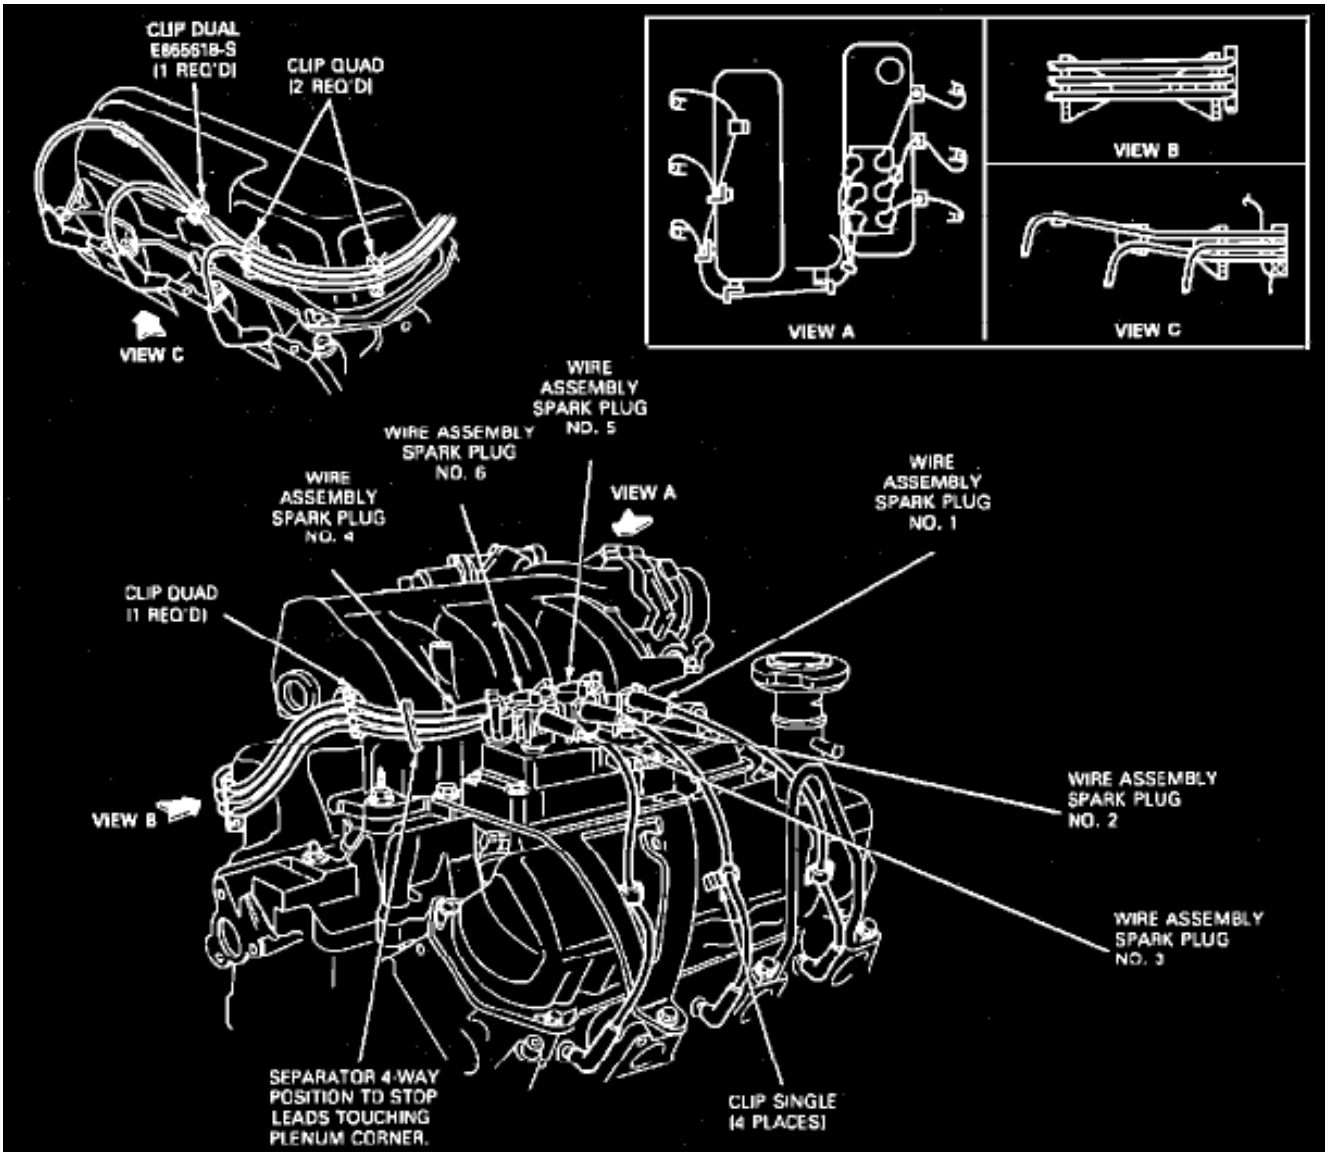
Timing Marks



Spark Plug Wire Assembly



Spark Plug Wire Assembly



Ignition Cable: Service and Repair

Spark Plug Wire Assembly

Removal:

1. When removing spark plug wires from the spark plugs, use the spark plug wire remover T74P-6666-A or equivalent. Grasp and twist the boot back and forth on the plug insulator to free the boot.

2. Use the special tool or equivalent to pull the boot from the plug. Do not pull on the wire directly, as it may become separated from the connector inside the boot.

3. To remove the wires from the coil pack, squeeze the locking tabs of the coil wire retainer and remove using a twisting and pulling motion. Do not pull on the wire.

INSTALLATION:

CAUTION: Proper installation of spark plug wires is critical to vehicle operation. If one spark plug wire is not properly installed on the spark plug or ignition coil, both spark plugs connected to that coil may not fire under load.

1. Whenever a high tension wire is removed for any reason from a spark plug or ignition coil, or a new high tension wire is installed, Silicone Dielectric Compound D7AZ-19A331-A or equivalent must be applied to the boot prior to installation. Using a small tool, coat the entire interior surface of the boot.

2. Install each wire on the proper ignition coil terminal. The terminal cylinder numbers are identified on the ignition coil pack. Ensure that both coil boot retainer locking tabs have engaged.

3. Remove the wire retaining brackets from the old wiring set and install the brackets on the new wires in the same position. Install the wires and retaining brackets on the engine.

4. Connect the wires to the proper Spark plugs.

Spark Plug: Customer Interest Engine - Loss of Power At High Engine Speeds

Article No. 92-3-8

01/29/92

LOSS OF POWER - 4.0L - AT HIGH ENGINE SPEEDS BETWEEN 3800 AND 4700 RPM - CANADIAN VEHICLES

LIGHT TRUCK: 1990-92 RANGER 1991-92 EXPLORER

ISSUE: A loss of power may occur at engine speeds between 3800 and 4700 RPM under wide open throttle. After several months use, this can be caused by an interaction between MMT (octane enhancer additive in Canadian fuel) contaminated spark plugs and the EDIS (Electronic Distributorless Ignition System) module. A check engine light concern may be present with Self-Test Codes 18 (212 three digit code) and 45 in continuous memory.

ACTION: If service is required, confirm the concern and, if necessary, replace the EDIS module and spark plugs. Refer to the following procedure for service details.

1. Confirm the customer concern by accelerating the vehicle at wide open throttle from 3000 RPM to 4700 RPM with the transmission in second gear.

^ If the vehicle exhibits a loss of power (caused by fuel shutoff of one of the fuel banks) in this RPM range, follow Steps 2 and 3.

^ Otherwise, follow the Powertrain Control/Emissions Diagnosis Manual's diagnostic procedures.

NOTE:

FUEL SHUTOFF (REV. LIMITER) AT 4850 RPM FOR AUTOMATICS AND 5200 RPM FOR MANUAL TRANSMISSIONS IS NORMAL AND SHOULD NOT BE CONFUSED WITH THIS CONCERN.

2. Replace all the spark plugs.

3. Replace the EDIS module (F1TZ-12KO72-B).

NOTE:

THIS MODULE WILL ELIMINATE THE PREMATURE FUEL SHUTOFF CONCERN. THE RED DEPOSITS ON THE SPARK PLUGS WILL STILL OCCUR AFTER TIME. THIS IS CONSIDERED NORMAL FOR THIS TYPE OF FUEL.

LOSS OF POWER - 4.0L - AT HIGH ENGINE SPEEDS BETWEEN 3800 AND 4700 RPM - CANADIAN VEHICLES

LIGHT TRUCK: 1990-92 RANGER 1991-92 EXPLORER

ISSUE: A loss of power may occur at engine speeds between 3800 and 4700 RPM under wide open throttle. After several months use, this can be caused by an interaction between MMT (octane enhancer additive in Canadian fuel) contaminated spark plugs and the EDIS (Electronic Distributorless Ignition System) module. A check engine light concern may be present with Self-Test Codes 18 (212 three digit code) and 45 in continuous memory.

ACTION: If service is required, confirm the concern and, if necessary, replace the EDIS module and spark plugs. Refer to the following procedure for service details.

1. Confirm the customer concern by accelerating the vehicle at wide open throttle from 3000 RPM to 4700 RPM with the transmission in second gear.

^ If the vehicle exhibits a loss of power (caused by fuel shutoff of one of the fuel banks) in this RPM range, follow Steps 2 and 3.

^ Otherwise, follow the Powertrain Control/Emissions Diagnosis Manual's diagnostic procedures.

NOTE:

FUEL SHUTOFF (REV. LIMITER) AT 4850 RPM FOR AUTOMATICS AND 5200 RPM FOR MANUAL TRANSMISSIONS IS NORMAL AND SHOULD NOT BE CONFUSED WITH THIS CONCERN.

2. Replace all the spark plugs.

3. Replace the EDIS module (F1TZ-12KO72-B).

NOTE:

THIS MODULE WILL ELIMINATE THE PREMATURE FUEL SHUTOFF CONCERN. THE RED DEPOSITS ON THE SPARK PLUGS WILL STILL OCCUR AFTER TIME. THIS IS CONSIDERED NORMAL FOR THIS TYPE OF FUEL.

Drive Belt Routing

Drive Belt: Adjustments

Drive belt adjustment is accomplished by repositioning one of the belt driven components (alternator, air pump, or power steering pump). For belt routing information, refer to Engine/Drive Belts, Mounts, Brackets and Accessories/Drive Belt/Specifications/Mechanical.

1. Verify all drive pulleys and mounting bolts are tight.

2. Using a Belt Tension Gauge (Tool T63L-8620-A or equivalent), check the tension of the drive belts.

3. If adjustment is necessary, loosen accessory adjustment bolts.

4. Tighten the pivot enough to remove all freeplay from pivot area but not enough to prevent the accessory from rotating to allow belt tensioning.

5. ALL BELTS EXCEPT ALTERNATOR BELT - Insert a square drive ratchet wrench or breaker bar into the square hole in accessory bracket. Tighten belt to correct tension. ALTERNATOR BELT - Place a "C" clamp over the end of the adjusting arm and the adjusting bolt boss, and tighten the belt to the correct tension. Refer to SPECIFICATIONS/MECHANICAL. NOTE: Be sure to use the "New Belt Tension" specifications for new drive belts, and the "Used Belt Tension" specifications for used belts. A used belt is a belt with more than 5 minutes of engine operation.

6. While maintaining belt tension, tighten adjustment bolt to specification. Refer to SPECIFICATIONS/MECHANICAL.

7. Remove square driver tool or "C" clamp.

8. Tighten pivot bolt to specification. Refer to SPECIFICATIONS/MECHANICAL.

9. Check belt tension(s) and readjust if necessary.

10. START the engine, idle for 5 minutes, then recheck belt tension(s). NOTE: If tension is less than the "Minimum Tension" after 5 minutes of operation, then reset the belt tension(s) to within "Used Belt Tension specifications. START engine, idle for 5 minutes, then recheck belt tension(s). Make adjustments if necessary.

CAUTION: If using a pry bar, DO NOT use any of the driven components (alternator, air pump, power steering pump, or a/c compressor) as a leverage point. Damage to the component housing may result.

Air Cleaner Fresh Air Duct/Hose: Technical Service Bulletins Engine - Water Entry Through Air Intake System

Article No. 94-3-8

02/09/94

^ AIR INTAKE - 2.9L, 3.0L, 4.0L EFI ENGINES - WATER ENTRY THROUGH AIR INTAKE SYSTEM

^ ENGINE - 2.9L, 3.0L, 4.0L EFI - POSSIBLE INTERNAL DAMAGE FROM WATER ENTRY THROUGH AIR INTAKE SYSTEM

LIGHT TRUCK: 1986-90 BRONCO II 1986-94 RANGER 1991-94 EXPLORER

This article is being republished in its entirety to add 1993-94 4.0L Ranger, 1993-94 3.0L Ranger and 1993-94 4.0L Explorer vehicles.

ISSUE: Reports have been received of internal engine damage caused by water entering the engine through the air intake system. This condition may occur when the vehicle is driven in normal wet conditions, such as water splash/spray from other vehicles, or when driven through shallow water. Improvements were made to the EFI engine air intake systems that have greatly reduced the number of reported incidences.

ACTION: Dealers should be assured that warranty repairs will be covered unless there Is evidence of owner misuse. This warranty repair policy will remain effective unless you are notified that a waterproof air intake system has been released.

OTHER APPLICABLE ARTICLES: NONE SUPERSEDES: 91-21-10 WARRANTY STATUS: INFORMATION ONLY OASIS CODES: 497000, 499000

Fuel Pressure Release: Service and Repair

CAUTION: FUEL SUPPLY LINES ON EFI ENGINES WILL REMAIN PRESSURIZED FOR SOME PERIOD OF TIME AFTER THE ENGINE IS SHUT OFF. THIS PRESSURE MUST BE RELIEVED BEFORE SERVICING OF THE FUEL SYSTEM IS BEGUN.

FUEL SYSTEM PRESSURE RELIEF - EFI ENGINES

Before opening the fuel system on vehicles with EFI engines, relieve fuel pressure as follows: 1. Locate and disconnect the electrical connection to either the fuel pump relay, the inertia switch or the in-line high pressure fuel pump.

2. Crank engine for approximately ten seconds.

Note: Engine may start and run for a short time. If so, crank engine an additional 5 seconds after engine stalls.

3. Re-connect the electrical connector that was disconnected in step 1 and disconnect battery ground cable.

Alternative Method

Some EFI vehicles have a port (fitting) on the fuel rail used for measuring fuel pressure. If so equipped, use the following method: -

Install fuel pressure relief tool No. T80L-9974-B or equivalent to measuring port on engine fuel rail.

- Position drain hose in suitable container, then depress relief button.

Service Procedure

THIS PROCEDURE IS OPTIONAL IF THE SYSTEM IS FLUSHED USING THE ROTUNDA A/C FLUSHER.

CAUTION

THIS FILTERING PROCEDURE MAY BE USED FOR EITHER R-12 OR R-134a REFRIGERANT SYSTEMS. BECAUSE THE TWO (2) SYSTEMS USE DIFFERENT REFRIGERANT OILS AND BECAUSE THE COMPRESSOR COULD BE DAMAGED IF THE WRONG OIL IS USED, SYSTEM IDENTIFICATION IS VERY IMPORTANT. BE SURE SYSTEM IS CORRECTLY IDENTIFIED BEFORE STARTING THE FILTERING PROCEDURE.

Each Service Filter Kit includes the following items:

^ One (1) Pancake Filter (to be installed in the liquid line between the condenser and the orifice tube)

^ One (1) Instruction Sheet

NOTE

ON 1993-94 RANGER/EXPLORER VEHICLES, TECHNICIANS MAY EXPERIENCE DIFFICULTY WHEN CONNECTING THE PANCAKE FILTER HOSE FITTINGS TO THE EVAPORATOR INLET WITH THE ORIFICE TUBE INSTALLED. REMOVE THE OFFICE TUBE AND RUN THE SYSTEM FOR 1 HOUR AS DESCRIBED IN THE FILTERING PROCEDURE. REINSTALL THE ORIFICE TUBE AFTER FILTERING IS COMPLETE.

CAUTION

FOLLOW ALL REFRIGERANT SYSTEM SAFETY AND SERVICE PRECAUTIONS OUTLINED IN THE APPROPRIATE SERVICE OR WORKSHOP MANUAL.

1. Before removing any refrigerant system components, recover the refrigerant from the system following the recycling methods outlined In the appropriate Service/Workshop Manual.

2. Remove the suction accumulator/drier assembly and drain the oil into a calibrated container.

3. Install a new suction accumulator/drier and add new refrigerant oil to replace the old oil. The quantity of the new oil to be added is the amount to match that drained from the old accumulator plus 60 mL (2 oz). Refer to the Dealer Master Parts Catalog for the correct suction accumulator/drier part number.

CAUTION

REMEMBER TO USE MOTORCRAFT YN-9-A REFRIGERANT COMPRESSOR OIL WITH R-12 SYSTEMS AND MOTORCRAFT YN-12-C REFRIGERANT COMPRESSOR OIL WITH R-134a SYSTEMS. FAILURE TO USE THE CORRECT REFRIGERANT OIL MAY RESULT IN DAMAGE TO SYSTEM COMPONENTS.

4. Install a new orifice tube. Refer to the Dealer Master Parts Catalog for the correct orifice tube part number. If the orifice tube in the vehicle is located in the liquid line between the condenser and the evaporator, replace the liquid line assembly.

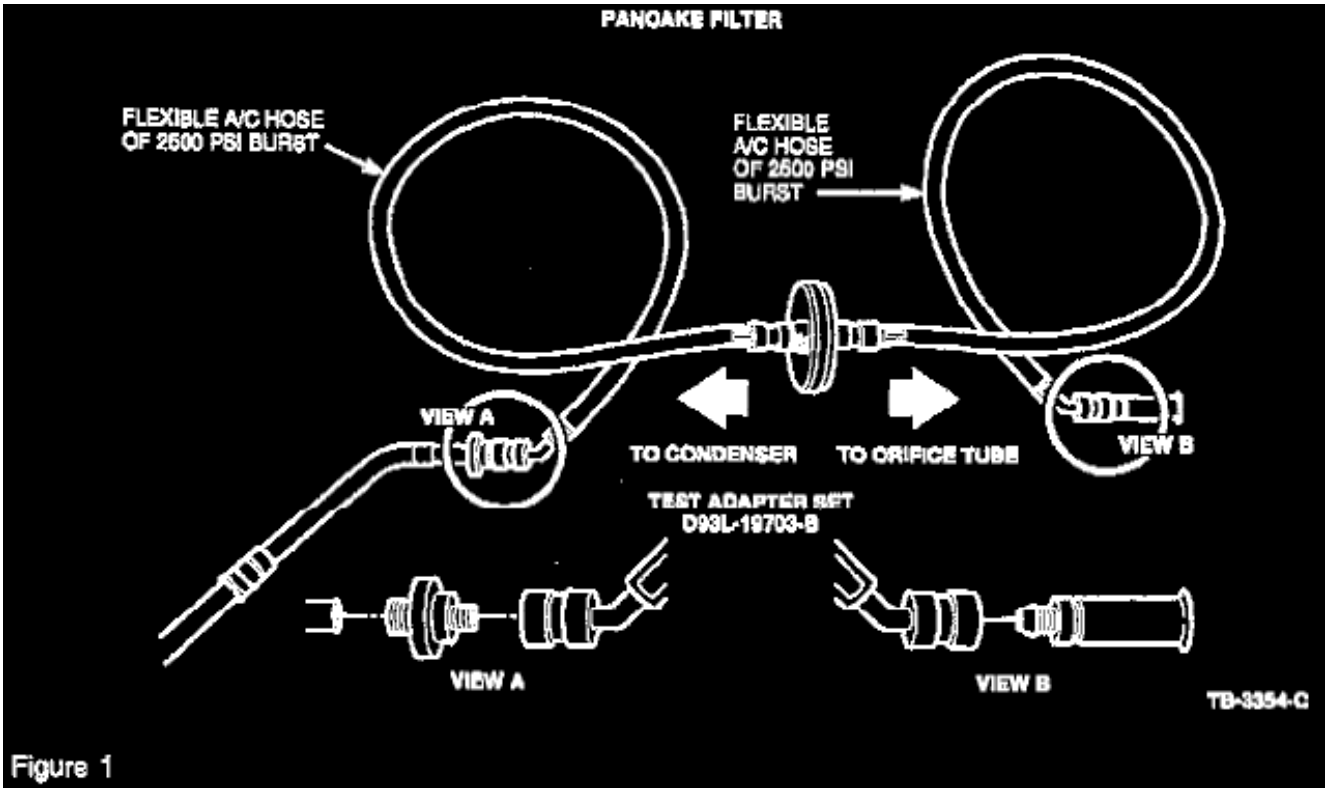

Figure 1

5. Install pancake filter in the liquid line between the condenser and the orifice tube, Figure 1.

a. Be sure orifice inlet is toward the condenser.

b. Connections can be made using Test Adapter Set D93L-19703-B, or equivalent, and flexible refrigerant hose of 2500 psi burst rating. Individual fittings are also available.

6. Remove the old compressor following Service/Workshop Manual procedures. Drain the oil into a calibrated container.

7. Drain the oil from the replacement compressor into a clean calibrated container.

NOTE:

IT WILL BE NECESSARY TO TRANSFER THE MAGNET CLUTCH FROM THE OLD COMPRESSOR TO THE REPLACEMENT COMPRESSOR. FOLLOW SERVICE/WORKSHOP MANUAL PROCEDURES.

8. A new FX-15 service compressor contains 207 mL (7 oz.) of R-12 refrigerant oil. A new FS-10 service compressor does not contain any oil and can be used with an R-12 or an R-134a system.

CAUTION

REMEMBER TO USE YN-9-A (MINERAL) OIL WITH R-12 SYSTEMS AND YN-12-C (PAG) OIL WITH R-134a SYSTEMS. FAILURE TO USE THE CORRECT REFRIGERANT OIL MAY RESULT IN DAMAGE TO SYSTEM COMPONENTS.

^ If the amount of oil drained from the removed compressor is between 90 and 148 mL (3-5 oz), pour the same amount of clean refrigerant oil into the new compressor.

^ If the amount of oil drained from the old compressor is greater than 90 mL (3 oz), pour 90 mL (3 oz) of clean refrigerant oil into the new compressor.

9. Install the new compressor following Service/Workshop Manual procedures. Make sure all mounting bolts are tightened properly. Check the tension of the compressor drive belt. Adjust if necessary.

10. Evacuate, charge and leak test the system, following Service/Workshop Manual procedures.

11. Check all refrigerant system hoses, lines and the position of the newly-installed filters to make sure they do not interfere with other engine compartment components. If necessary, use tie straps to make adjustments.

12. Set the A/C control on Max A/C, high blower and temperature control at full cold.

a. Start engine and let idle briefly.

b. Be sure A/C system is operating properly.

13. Gradually bring the engine up to 1200 rpm by running it at lower rpms for short periods (first at 800 rpm, then at 1000 rpm). Set the engine at 1200 rpm and run it for an hour with the A/C system operating.

14. Stop the engine.

NOTE:

IT WILL BE NECESSARY TO RECOVER THE SYSTEM REFRIGERANT CHARGE BEFORE PROCEEDING.

15. Allow the engine to cool sufficiently to remove the fittings, flexible hoses and pancake filter from the liquid line.

16. Discard the filter. It can be used one (1) tie only.

17. Reconnect the liquid line back into the system.

18. Evacuate, charge and leak test the system. Make any necessary adjustments.

19. Check the operation of the system in all models.

F7AZ-19589-DA Refrigerant Oil - Motorcraft YN-12-C (PAG-Type Oil For R-134a Refrigerant Systems Only)

NOTE

THE TOTAL REPAIR TIME IS FOR INSTALLING SERVICE FILTER KIT PER INSTRUCTIONS THIS INCLUDES INSTALLATION OF AND DISCARD OF FILTER. REFER TO SERVICE LABOR TIME STANDARDS MANUALS IF ADDITIONAL LABOR OPERATIONS ARE REQUIRED.

Hoses: Service Precautions

SERVICE PRECAUTIONS

To prevent vehicle damage, always observe the following precautions: -

After servicing a hose, check for leaks before and after test driving the vehicle.

- Always use the correct size hose. Do not use standard sized hose in place of metric hose or vice versa.

-

Always use the correct type of hose. Never use vacuum hose in place of fuel hose. Never use heater hose in place of PCV hose.

- When replacing hoses which are attached to the engine on one end and the frame or body on the other end, always leave sufficient length to compensate for engine movement (from torque).

MERKUR: 1989 SCORPIO, XR4TI

This article is being republished in its entirety to update the model year coverage.

ISSUE This TSB article describes Ford Motor Company's position on the use of propylene glycol-based engine coolants.

ACTION

Ford Motor Company does not recommend nor endorse the use of engine coolants made with propylene glycol in Ford vehicles. Ford Motor Company currently recommends the use of ethylene glycol-based engine coolants.

Published information suggests that engine coolants made with propylene glycol may provide engine cooling performance equivalent to engine coolants made with ethylene glycol. However, different brands of engine coolant provide varying corrosion protection for the cooling system. Ford does not have performance data for the multitude of engine coolants available in the aftermarket and therefore cannot recommend the use of any coolant except those sold by Ford Customer Service Division. Consult the vehicle's Owner's Guide to determine the appropriate Ford Customer Service Division coolant for the vehicle.

Furthermore, claims of toxicological and environmental advantages of propylene glycol over ethylene glycol may be misleading. When significant new information is developed, Ford will review this policy.

Ford Motor Company specifications recommend that vehicles be maintained using certain ethylene glycol-based engine coolants. Those specifications do not refer to engine coolants made with propylene glycol. Although the Ford New Vehicle Limited Warranty is not automatically voided upon the use of a coolant made with propylene glycol, if such use results in damage to the vehicle or its components, the cost of repairing the damage would not be covered by the Ford New Vehicle Limited Warranty.

This TSB is being republished in its entirety to include warranty information when using recycled coolant

ISSUE: Ford Motor Company authorizes the use of recycled engine coolant that, when properly processed and reinhibited, meets Ford specification ESE-M97B44-A. At this time, the Rotunda Coolant Recycler (181-00003) process is the only approved coolant recycling method available through Ford that is capable of producing recycled engine coolant that meets Ford specification ESE-M97B44-A.

ACTION: Refer to the following Service Procedure for coolant processing and reinhibiting using Rotunda Coolant Recycler (181-00003).

NOTE:

WHILE TESTING SHOWS THAT RECYCLED ENGINE COOLANT CAN PROVIDE ACCEPTABLE PERFORMANCE, THE COOLANT PRODUCED FROM ROTUNDA EQUIPMENT IS INTENDED FOR USE WITHIN DEALERSHIPS ON WARRANTY AND CUSTOMER PAY REPAIRS ONLY AND NOT INTENDED FOR RETAIL SALE. THERE ARE REGULATORY, PACKAGING AND LABELING CONCERNS

ASSOCIATED WITH THE RETAIL SALE OF CHEMICAL PRODUCTS.

CAUTION:

THE REINHIBITOR CHEMICALS PROVIDED WITH THIS EQUIPMENT ARE NOT APPROPRIATE FOR USE ON MEDIUM/HEAVY TRUCK APPLICATIONS.

WARNING:

ROTUNDA PREMIUM COOLANT REINHIBITORS # 1 AND # 2 HAVE BEEN SPECIFICALLY FORMULATED TO WORK WITH ROTUNDA COOLANT RECYCLER (181-00003).

USE OF ANY OTHER CHEMICAL ADDITIVES WITH THIS SYSTEM WILL VOID ALL WARRANTIES FOR THE EQUIPMENT AND FOR THE FINAL COOLANT PRODUCT.

SERVICE PROCEDURE

DIRECTIONS FOR PROCESSING USED ENGINE COOLANT WITH ROTUNDA COOLANT RECYCLER

1. Close the drain valve on the unit.

2. Open the fill valve.

3. Pour used engine coolant into the funnel on the side of the unit.

NOTE:

MAXIMUM CAPACITY 15 25 GALLONS (95 L).

4. Insert the outlet hoses of the recycler into clean, properly labeled containers. One (1) container is for the outlet process water and the other container is for distilled ethylene glycol.

5. Push the "ON" switch on the front to start the operation. The unit will process 1 gallon (3.8 L) per hour of operation and will automatically shut off when cycle is complete.

6. Add reinhibitor following the directions in this article.

7. Open the drain valve to drain the residue from the distillation vessel. Dispose of residue in accordance with all local. state and federal regulations.

ADDING REINHIBITOR CHEMICALS

1. Process the coolant according to the directions listed in this article

2. Thoroughly mix 4 fl oz (118 ml) of Reinhibitor # 1 to each gallon of distilled ethylene glycol.

3. Thoroughly mix 4 fl oz (118 ml) of Reinhibitor # 2 to each gallon of distilled ethylene glycol.

4. Mix well.

5. Check the pH level of the coolant. The pH level must be between 9 and 11.

6. Add enough water to the concentrated coolant to produce a 50/50 mixture of coolant and water.

NOTE:

THE CONCENTRATED COOLANT MUST BE MIXED WITH WATER TO MEET THE NECESSARY ENGINE FREEZE PROTECTION.

7. Check the coolant freeze point of the 50% coolant solution. Freeze point should be -34°F (-37°C).

Consult the Rotunda Coolant Recycler Manual for more detailed operating instructions. Call 1-800-ROTUNDA, 8 AM to 8 PM EST, for inquiries regarding the Rotunda Coolant Recycler and to order the Reinhibitor (187-R0001).

PART NUMBER PART NAME

Rotunda # 187-R0001 Rotunda Premium Coolant Reinhibitor

WARRANTY CLAIMS: Dealer can claim recycled engine coolant by Ford approved process via a warranty repair on an 1863 claim as follows:

Part Number: RECCOOL (not a valid part number, but it is recognized on an 1863 claim).

Quantity: Indicate the number of QUARTS of recycled coolant used.

Coolant: Technical Service Bulletins Cooling System - Proper Fluid Concentrations

Article No. 93-1-10

01/05/93

COOLING SYSTEM - PROPER FLUID CONCENTRATIONS

FORD: 1988 EXP 1988-93 CROWN VICTORIA, ESCORT, FESTIVA, MUSTANG, TAURUS, TEMPO, THUNDERBIRD 1989-93 PROBE

LINCOLN-MERCURY: 1988-89 TRACER 1988-92 MARK VII 1988-93 CONTINENTAL, COUGAR, GRAND MARQUIS, SABLE, TOPAZ, TOWN CAR 1991-93 CAPRI, TRACER 1993 MARK VIII

MERKUR: 1988-89 XR4TI 1988-90 SCORPIO

LIGHT TRUCK: 1988-90 BRONCO II 1988-93 AEROSTAR, BRONCO, ECONOLINE, F SUPER DUTY, F-150-350 SERIES, RANGER 1991-93 EXPLORER 1993 VILLAGER

ISSUE: It is important to confirm the coolant fluid concentration during any repair of a vehicle's cooling system. A 50/50 concentration of Ford cooling system fluid, or an equivalent solution meeting Ford specifications, and water is best for all normal operating conditions.

ACTION: Check the coolant fluid concentration and use a 50/50 solution concentration for optimum results.

CAUTION: IF THE CONCENTRATION IS ALLOWED TO VARY TO ANY LARGE EXTENT EITHER WAY, COOLING SYSTEM CONCERNS CAN RESULT. IF THE COOLING SYSTEM FLUID LEVEL IS BELOW THE 50/50 CONCENTRATION, OVERHEATING CAN OCCUR. CONCENTRATIONS ABOVE 50/50 CAN CONTRIBUTE TO EXCESSIVE AND EVEN PREMATURE FAILURE OF THE WATER PUMP (MORE IS NOT BETTER).

1. Obtain a balanced mixture ratio of 50/50 cooling system fluid to water. Premix the two fluids in a separate container by adding equal volumes of coolant and water.

2. Be aware that overfilling of the coolant system is just as bad as not maintaining the proper coolant concentration level. If the coolant system is overfilled, and the system is allowed to expand dropping the excess coolant past the expansion tank, many of the vital coolant additives will be lost out the overflow pipe. This reduces the protection to the engine.

3. Pour in only enough coolant as specified for the system, and top off as necessary.

NOTE: TOP OFF ONLY WITH A PREMIXED 50/50 SOLUTION.

4. Check the coolant concentration, once the coolant system has been properly filled, to be sure that it is truly within the allowed tolerance range.

a. Use only a hand held refractometer such as a Rotunda Optical Antifreeze/Battery Tester # 021-00046 or equivalent to verify results. The acceptable coolant/water concentration range is: Minimum (45/55); Maximum (60/40).

b. If the coolant system is found to be low on coolant, top off only from a premixed solution.

c. If a weak concentration is found, add straight coolant sparingly until concentration readings are within acceptable levels.

d. If too strong a concentration is found, remove a small volume of coolant, and add water sparingly until coolant readings again fall within the specified levels.

NOTE: MAKE SURE THE COOLANT IS THOROUGHLY MIXED BEFORE TAKING READINGS.

A cooling system is only as effective as the condition of the system coolant.

^ USE ONLY FORD COOLING SYSTEM FLUID OR AN EQUIVALENT SOLUTION MEETING FORD SPECIFICATIONS.

^ FOR ADDITIONAL INFORMATION, SEE THE APPROPRIATE VEHICLE SERVICE MANUAL OR OWNER GUIDE.

MERKUR: 1985-1989 XR4TI

This article supersedes TSB 01-15-7 to update the vehicle application chart.

ISSUE MERCON(R) Automatic Transmission Fluid is being replaced by MERCON(R) V as a service fluid.

ACTION Beginning immediately all automatic transmission / transaxle applications requiring MERCON(R) can now be serviced using MERCON(R) V or MERCON(R) Automatic Transmission Fluid or dual usage fluids labeled MERCON(R) / MERCON(R) V. After July 1, 2007, MERCON(R) Automatic Transmission Fluid will no longer be manufactured, therefore, availability of this fluid will only continue for however long it takes to deplete what remains in inventory.

SERVICE PROCEDURE

AUTOMATIC TRANSMISSION FLUID CHART

TRANSMISSIONS

TRANSAXLES

Specific service fluids (listed to the right) are called for depending on the type of transmisson and the year the transmission was built. It is important to use the correct fluid, each fluid exhibits different properties and should be used only in the transmisson for which they were designed. The vehicle owner or rebuilder should use the type of fluid printed in the owners guide or on the automatic transmission fluid level indicator. Refer to your scheduled maintenance guide to determine the correct service interval. Failure to use the recommended fluid may affect transmisson performance and durability.

CAUTION:
DO NOT USE SUPPLEMENTAL TRANSMISSION FLUID ADDITIVES, TREATMENTS OR CLEANING AGENTS. The use of these materials may affect transmission operation and result in damage to internal transmission components.

CAUTION:
MERCON® SP, Motorcraft® Premium Automatic Transmission Fluid and Motorcraft® M5 ATF's are unique fluids and MUST be used in applications recommending that particular fluid. Use of any other fluid may cause reduced functionality or transmission damage.

CAUTION:
The functional characteristics of fluids for the CVT transmissions are very different than those of other ATF's. Use of a fluid other than Motorcraft® Continuously Variable Chain Type Transmission Fluid or one labeled as meeting MERCON® C may cause severe transmission damage.

FAILURE TO USE RECOMMENDED FLUID WILL AFFECT TRANSMISSION PERFORMANCE. REFER TO OWNERS MANUAL AND/OR FLUID LEVEL INDICATOR FOR PROPER FLUID TYPE.

V **MERCON® V**
- Part number XT-5-QM (Quarts) and XT-5-DM (55 Gallon Drum) Ford Specification is MERCON® V.

NOTE: AUTOMATIC TRANSMISSIONS REQUIRING MERCON® V SHOULD ONLY BE SERVICED WITH MERCON® V, OR FLUID FROM A CONTAINER THAT IS SPECIFIED AS A DUAL USAGE FLUID: MERCON®/MERCON®V.

SP **MERCON® SP**
- Part number XT-6-QSP (Quarts) and XT-6-DSP (55 Gallon Drum) Ford Specification is MERCON® SP.

CVT **CONTINUOUSLY VARIABLE CHAIN TYPE**
- Part number XT-7-QCFT (Quarts)

P **PREMIUM AUTOMATIC TRANSMISSION FLUID**
- Part number XT-8-QAW.

M5 **MAZDA SPECIFIC FLUID**
- Part number XT-9-QMM5.

V M **MERCON® - Part number XT-2-QDX (Quarts) and XT-2-DDX (55 Gallon Drum) or,**
MERCON® V - Part number XT-5-QM (Quarts) and XT-5-DM (55 Gallon Drum)
NOTE: AUTOMATIC TRANSMISSIONS REQUIRING MERCON® CAN NOW BE SERVICED WITH MERCON®, MERCON® V, OR, DUAL USAGE FLUIDS LABELED MERCON®/MERCON®V.

TB-8592-D

Figure 1

Service automatic transmissions requiring MERCON(R) with MERCON(R) V or MERCON(R) Automatic Transmission Fluid or dual usage fluids labeled MERCON(R) / MERCON(R) V

For proper fluid application on current and past model vehicles equipped with automatic transmissions I transaxles refer to the fluid usage chart. (Figure 1)

CAUTION

AUTOMATIC TRANSMISSIONS / TRANSAXLES THAT REQUIRE MERCON® V SHOULD STILL ONLY USE MERCON(R) V OR DUAL USAGE FLUID LABELED MERCON(R) / MERCON(R) V.

PART NUMBER	PART NAME
XT-2-QDX	MERCON® (Quart)
XT-2-DDX	MERCON® (55 Gal. Drum)
XT-5-QM	MERCON® V (Quart)
XT-5-DM	MERCON® V (55 Gal. Drum)

NOTE: The information in Technical Service Bulletins is intended for use by trained, professional technicians with the knowledge, tools, and equipment to do the job properly and safely. It informs these technicians of conditions that may occur on some vehicles, or provides information that could assist in proper vehicle service. The procedures should not be performed by "do-it-yourselfers". Do not assume that a condition described affects your car or truck. Contact a Ford, Lincoln, or Mercury dealership to determine whether the Bulletin applies to your vehicle.

CAUTION

MERCON(R) SP, MOTORCRAFT PREMIUM AUTOMATIC TRANSMISSION FLUID AND MOTORCRAFT M5 ATFS ARE UNIQUE FLUIDS AND MUST BE USED IN APPLICATIONS RECOMMENDING THAT PARTICULAR FLUID.

USE OF ANY OTHER FLUID MAY CAUSE REDUCED FUNCTIONALITY OR TRANSMISSION DAMAGE.

CAUTION

THE FUNCTIONAL CHARACTERISTICS OF FLUIDS FOR CVT TRANSMISSIONS ARE VERY DIFFERENT THAN THOSE OF OTHER AUTOMATIC TRANSMISSION FLUIDS (ATFS).

USE OF A FLUID OTHER THAN MOTORCRAFT CONTINUOUSLY VARIABLE CHAIN TYPE TRANSMISSION FLUID OR ONE LABELED AS MEETING MERCON(R) C WILL CAUSE FUNCTIONALITY CONCERNS AND INTERNAL TRANSMISSION DAMAGE.

CAUTION

DO NOT USE AUTOMATIC TRANSMISSION FLUID SUPPLEMENTS, ADDITIVES, TREATMENTS OR CLEANING AGENTS.

Fluid - A/T: Specifications

TYPE MA

CAPACITY, Initial Refill*: C-6 (shallow pan) 5.0 qt (US)

With the engine at operating temperature, shift

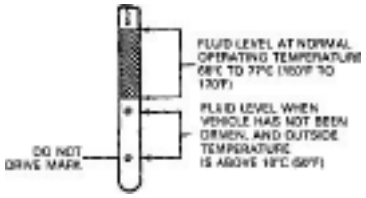
transmission through all gears. Check fluid level in PARK

and add fluid as needed

C-6 (deep pan) 6.0 qt (US)

E40D 8.5 qt (US)

Others 3.0 qt (US)



Fluid - A/T: Testing and Inspection Fluid Level Check

CHECKING OIL LEVEL

1. With transmission in Park, engine at curb idle RPM, foot brakes applied, and vehicle on a level surface, move transmission selector lever through

each range. Allow time in each range for transmission to engage, then return to Park and apply parking brake fully.

NOTE: If vehicle has been operated for an extended period at high speed, in city traffic during hot weather, or pulling a trailer, the vehicle should be turned off for about 30 minutes to allow the fluid to cool before checking.

NOTE: Vehicles equipped with 4X4 applications must have the 4X4 shift selector in any position other than neutral.

CAUTION: Your vehicle should not be driven if the fluid level is below the bottom hole on the dipstick and outside temperatures are above 10°C (50°F).

2. Clean all dirt from transmission dipstick cap. 3. Pull dipstick out of filler tube, wipe clean, and push dipstick back all the way into the filler tube, ensuring it is full seated. 4. Pull dipstick out of tube again and check fluid level as follows:

a. With transmission at operating temperature, 150° F-170° F, fluid level should be within the cross hatched area. b. With transmission at room temperature, 70° F-95° F, fluid should be between middle and top holes.

5. If it is necessary to add fluid, use only Dexron II or equivalent.

CAUTION: The use of fluid other than that specified could result in transmission malfunction and/or failure.

6. Install dipstick, ensuring it is fully seated in tube.

Adding Fluid

1. The fluid type is stamped on the dipstick. Before adding any fluid, be sure that the correct type will be used. 2. Add fluid in .25L (1/2 pint) increments through the filler tube to bring the level to the correct area on the dipstick. If an overfill occurs, excess

fluid should be removed.

Overfill can cause the fluid to foam and spill out through the transmission vent resulting in a transmission malfunction.

Undertill can result in transmission loss of engagement or slipping. This condition is most evident in cold weather or when the vehicle is parked or being driven on a hill.

If the transmission fluid level is checked when the fluid is at room temperature the dipstick could indicate that fluid should be added if the dipstick is misread. If fluid is added at this time, an overfill condition could result when the fluid reaches operating temperatures of 66° C-77°C (150°F-170°F) (dipstick hot to touch).

Fluid - A/T: Testing and Inspection Transaxle Fluid Cooler Flow Test

TRANSMISSION FLUID COOLER CHECK

1. Ensure linkage is properly adjusted and fluid level and control pressure are within specifications. 2. Remove transmission dipstick from filler tube and insert funnel in tube. 3. Raise and support vehicle. 4. Remove cooler return line from its fitting in the case, attach a hose to cooler return line and fasten free end of hose in funnel installed in filler tube. 5. Start engine and set idle at 1,000 RPM with transmission in Neutral. 6. Observe fluid flow at funnel. When flow is constant, it should be liberal. If there is not a liberal flow at 1,000 RPM in Neutral, low pump capacity,

main circuit system leakage, stuck converter charge relief valve, or cooler system restriction is indicated.

7. To separate transmission trouble from cooler system trouble, observe flow at transmission case converter-out fitting.

Fluid - A/T: Testing and Inspection Transmission Fluid Cooler Check

TRANSMISSION FLUID COOLER CHECK

1. Ensure linkage is properly adjusted and fluid level and control pressure are within specifications. 2. Remove transmission dipstick from filler tube and insert funnel in tube. 3. Raise and support vehicle. 4. Remove cooler return line from its fitting in the case, attach a hose to cooler return line and fasten free end of hose in funnel installed in filler tube. 5. Start engine and set idle at 1,000 RPM with transmission in Neutral. 6. Observe fluid flow at funnel. When flow is constant, it should be liberal. If there is not a liberal flow at 1,000 RPM in Neutral, low pump capacity,

main circuit system leakage, stuck converter charge relief valve, or cooler system restriction is indicated.

Fluid - A/T: Service and Repair

DRAIN AND REFILL

CAUTION: Normal maintenance and lubrication requirements do not necessitate periodic fluid changes. If a major failure has occurred in the transmission, it will have to be removed for service. At that time the converter, transmission cooler, and cooler lines must be flushed to remove any dirt. If vehicle accumulates 5,000 or more miles per month or is used in continuous stop and go service, change fluid every 30,000 miles as described.

NOTE: When filling a dry transmission and converter, approximate refill capacity is 9 quarts. Make final check using room temperature checking procedures. Procedures for partial drain and refill, due to in-vehicle service operation, are as follows:

1. Loosen pan attaching bolts and drain fluid. 2. Remove and thoroughly clean pan screen, discarding pan gasket. 3. Place new gasket on pan and install pan on transmission. 4. Add 3 quarts of fluid to transmission through filler tube. 5. Check fluid level following room temperature checking procedures.

Fluid - M/T: Technical Service Bulletins M/T - Mercon(R) V ATF Usage Information

TSB 06-26-1

01/08/07

MERCON ATF IS BEING REPLACED BY MERCON V AS A SERVICE FLUID FOR SOME MANUAL TRANSMISSIONS

FORD: 1981-2003 Escort 1984-1995 Thunderbird 1985-2007 Mustang 1985-1996 Bronco 1985-2007 Ranger 1986-1997 Aerostar 1991-2004 Explorer 1995-2007 F-150 1996-2007 F-Super Duty 2001-2003 Explorer Sport Trac, Explorer Sport

ISSUE Ford Motor Company now recommends SAE 5W-30 viscosity grade for servicing any Ford gasoline-powered vehicle regardless of model year.

ACTION When servicing any Ford gasoline-powered vehicle, use SAE 5W-30 viscosity grade motor oil. Refer to the following text for further details.

Both SAE 10W-30 and SAE 5W-30 viscosity grade motor oils have been recommended in the past depending on vehicle model and model year.

Tests have proven SAE 5W-30 viscosity grade motor oil provides the optimum protection and benefits for Ford gasoline engines. At both high and low ambient temperature conditions, SAE 5W-30 provides the best overall protection. It allows faster starts under cold ambient temperatures.

SAE 5W-30 also provides approximately 1/2% increase in fuel economy over SAE 10W-30.

SAE 5W-30 viscosity grade motor oils certified for gasoline engines by the American Petroleum Institute (API) should be used for all service procedures requiring replacement of the motor oil.

This TSB article is being republished in its entirety to add model year vehicles

ISSUE A number of non-approved/alternate refrigerants have entered the marketplace and are being advertised as "drop-in replacements" for R-12 and R-134a. The use of non-approved refrigerants such as R-22, hydrocarbons, and other refrigerant blends could cause safety, durability, and performance concerns if they are installed in Ford A/C systems. Identification of the type of refrigerant contained in vehicle A/C systems, before servicing, is necessary to prevent dealer service equipment and refrigerant supplies from being contaminated with non-approved refrigerants.

ACTION Refrigerant identification must be performed prior to recovering the refrigerant into a recovery machine to prevent cross-contamination of the recovery machine and other A/C systems being serviced with that recovery machine. Refer to the following text.

A/C Refrigerant Analyzer Function

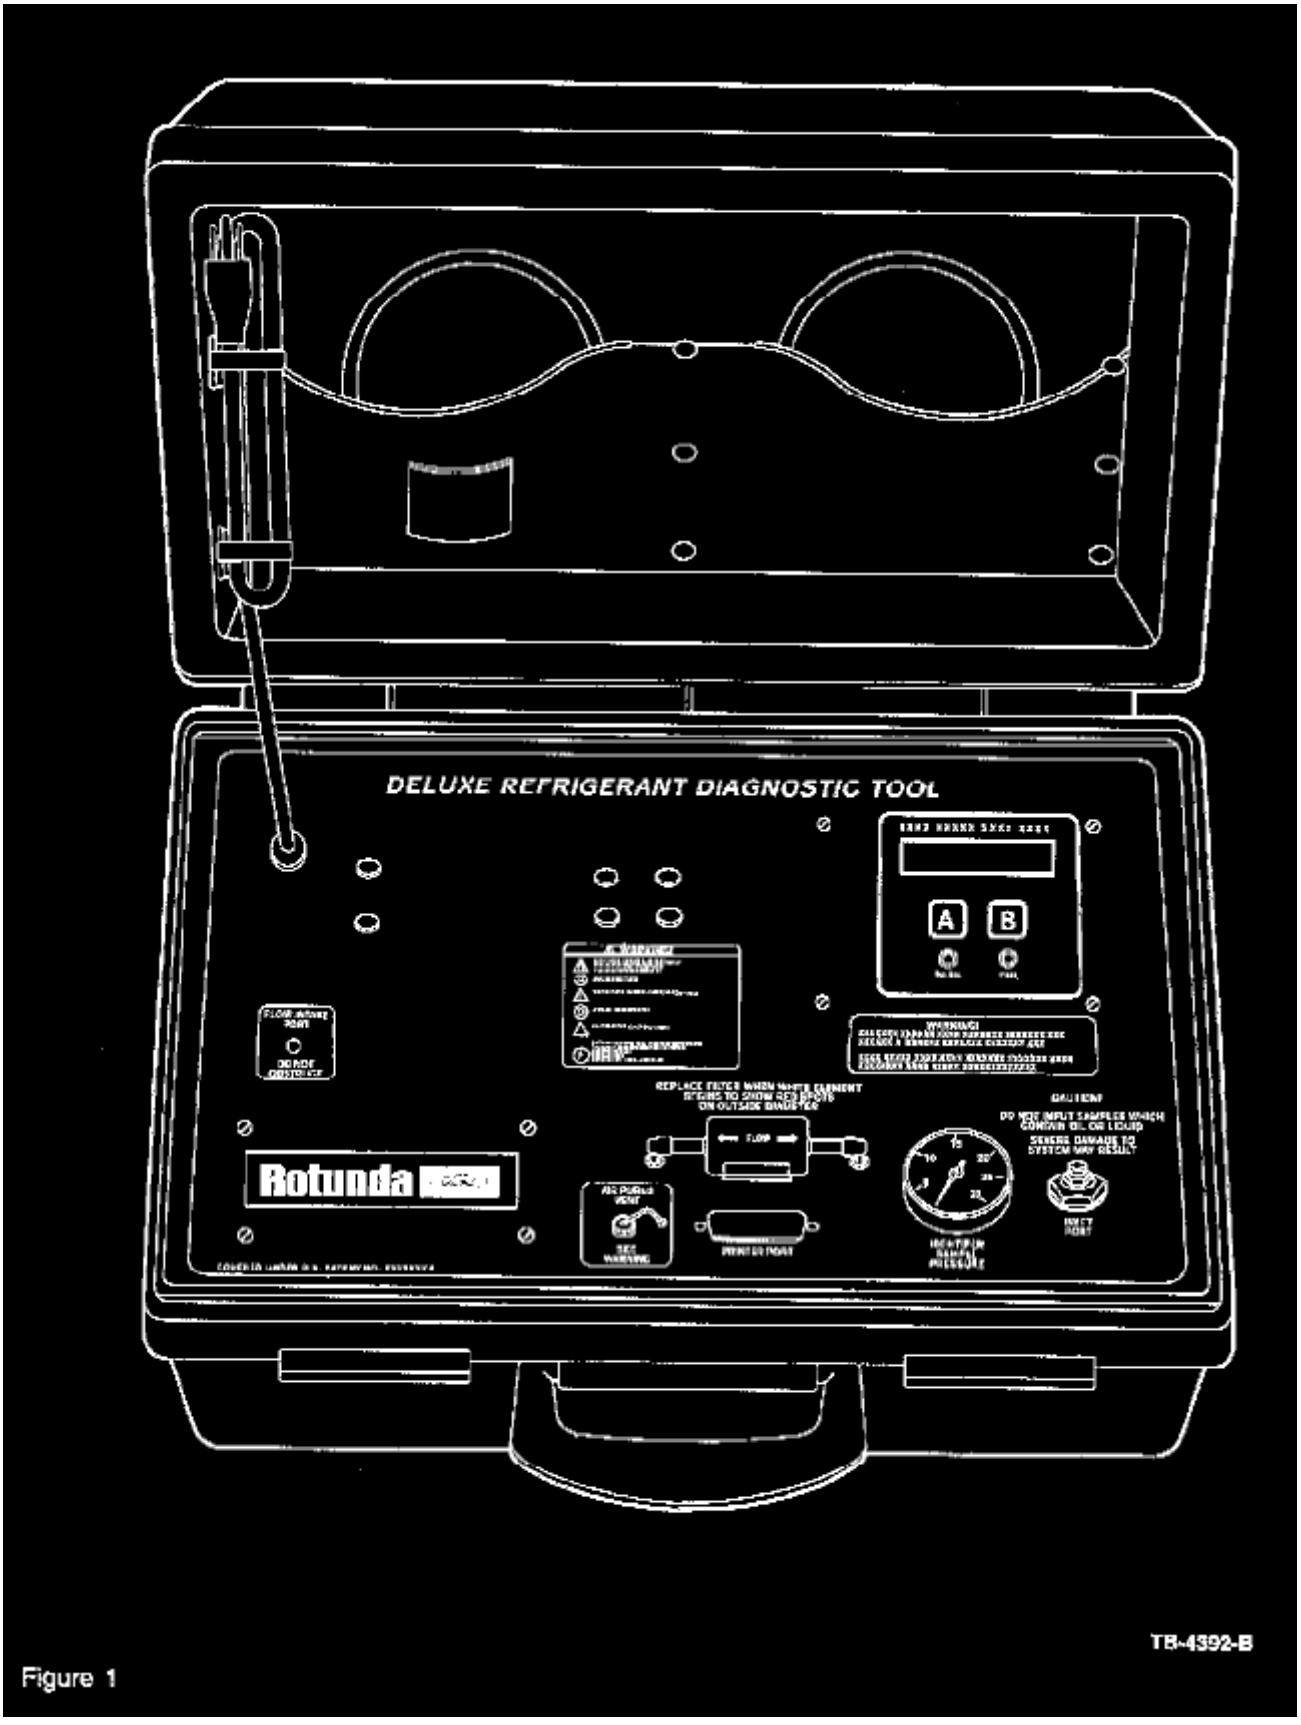

Figure 1

Ford Motor Company has approved the Rotunda Deluxe A/C Refrigerant Analyzer (198-00003) for use on Ford and Lincoln-Mercury vehicles (Figure 1). The analyzer provides the technician with a quick and easy way to identify the type and percentage of refrigerant (R-134a, R-12, R-22, or flammable hydrocarbon). The analyzer can also provide the percentage of air in the A/C system and automatically purge air from the system.

The A/C Refrigerant Analyzer is designed to identify vapor gas samples taken directly from automotive air conditioning systems or refrigerant storage cylinders. Refrigerant vapor passes through the multiple sensor Non-Dispersive Infra-Red (NDIR) sensing unit. The microprocessor calculates each refrigerant type and purity percentage which is displayed on the analyzer's Liquid Crystal Display (LCD).

The analyzer identifies the purity percentage of R-134a, R-12, R-22, hydrocarbon; and air in the sample. If the purity percentage of the R-134a or R-12 is 98% or greater by weight, a green "PASS" Light Emitting Diode (LED) will light. If refrigerants R-134a or R-12 do not meet 98% purity levels, the red "FAIL" LED will light. Levels of R-22 and flammable hydrocarbons above 2% will light the red "FAIL" light. If a hydrocarbon is detected above 5%, both the "FAIL" light and "HYDROCARBON" light will illuminate and a horn will sound alerting the user of potential hazards.

The percent of air contained in the sample will be displayed if the R-134a or R-12 content is 98% or above. The analyzer eliminates the effect of air

when determining the refrigerant sample content because air is not considered a contaminant although air can affect A/C system performance. Air will automatically be purged until a pure refrigerant with a less than 2% by weight air measurement is reached.

Recovery of Contaminated Refrigerant

If contaminated refrigerant is detected, DO NOT recover the refrigerant into your R-134a or R-12 recovery/recycling equipment. Take the following actions:

1. Repeat the test to verify contaminated refrigerant is present.

2. Advise the customer of the contaminated A/C system and any additional cost to repair the system. The customer may wish to return to the service facility which performed the last A/C service.

3. Recover the contaminated refrigerant using suitable recovery-only equipment designed for capturing and storing contaminated refrigerant. This equipment must only be used to recover contaminated refrigerant to prevent the spread to other vehicles. As an alternative, contact an A/C service facility in your area which has the proper equipment for refrigerant recovery.

Repairing A Contaminated A/C System

Once the contaminated refrigerant is removed from the system it will be necessary to repair the system. Ford recommends that you do the following to be sure a quality repair is made:

1. Determine the cause of the failure.

2. Determine which parts will need to be replaced.

3. Flush the heat exchangers to remove any oil that may be degraded due to the contaminated refrigerant.

4. Install a new suction/accumulator.

5. Properly oil match the system to verify that the correct amount of clean refrigerant oil is present in the system.

6. Evacuate the system for 45 minutes.

7. Recharge the system, verify proper operation, and leak test.

Disposal of Contaminated Refrigerant

Disposal of contaminated refrigerant is a new process to the automotive industry Listed below are companies that will assist with disposal of contaminated refrigerant. Ford Motor Company has not evaluated the processes of the listed refrigerant disposal companies and is not endorsing or promoting their companies Business transactions are between the dealership and disposal companies. Disposal costs will vary between $3.00 and $5.00 per pound, plus the cost of round trip cylinder shipping.

This TSB article is being republished in its entirety to revise the Service Procedure and to update the model years.

ISSUE Vehicles that have and inoperative A/C compressor, due to internal causes, MUST have the refrigerant system cleaned to remove any debris or contaminants that may be present to prevent damage to the replacement compressor.

ACTION

Install a Service Filter Kit in the refrigerant system prior to installing the replacement compressor. Refer to the following Service Procedure for details.

OASIS CODES: 208000, 208999

Service Procedure

THIS PROCEDURE IS OPTIONAL IF THE SYSTEM IS FLUSHED USING THE ROTUNDA A/C FLUSHER.

CAUTION

THIS FILTERING PROCEDURE MAY BE USED FOR EITHER R-12 OR R-134a REFRIGERANT SYSTEMS. BECAUSE THE TWO (2) SYSTEMS USE DIFFERENT REFRIGERANT OILS AND BECAUSE THE COMPRESSOR COULD BE DAMAGED IF THE WRONG OIL IS USED, SYSTEM IDENTIFICATION IS VERY IMPORTANT. BE SURE SYSTEM IS CORRECTLY IDENTIFIED BEFORE STARTING THE FILTERING PROCEDURE.

Each Service Filter Kit includes the following items:

^ One (1) Pancake Filter (to be installed in the liquid line between the condenser and the orifice tube)

^ One (1) Instruction Sheet

NOTE

ON 1993-94 RANGER/EXPLORER VEHICLES, TECHNICIANS MAY EXPERIENCE DIFFICULTY WHEN CONNECTING THE PANCAKE FILTER HOSE FITTINGS TO THE EVAPORATOR INLET WITH THE ORIFICE TUBE INSTALLED. REMOVE THE OFFICE TUBE AND RUN THE SYSTEM FOR 1 HOUR AS DESCRIBED IN THE FILTERING PROCEDURE. REINSTALL THE ORIFICE TUBE AFTER FILTERING IS COMPLETE.

CAUTION

FOLLOW ALL REFRIGERANT SYSTEM SAFETY AND SERVICE PRECAUTIONS OUTLINED IN THE APPROPRIATE SERVICE OR WORKSHOP MANUAL.

1. Before removing any refrigerant system components, recover the refrigerant from the system following the recycling methods outlined In the appropriate Service/Workshop Manual.

2. Remove the suction accumulator/drier assembly and drain the oil into a calibrated container.

3. Install a new suction accumulator/drier and add new refrigerant oil to replace the old oil. The quantity of the new oil to be added is the amount to match that drained from the old accumulator plus 60 mL (2 oz). Refer to the Dealer Master Parts Catalog for the correct suction accumulator/drier part number.

CAUTION

REMEMBER TO USE MOTORCRAFT YN-9-A REFRIGERANT COMPRESSOR OIL WITH R-12 SYSTEMS AND MOTORCRAFT YN-12-C REFRIGERANT COMPRESSOR OIL WITH R-134a SYSTEMS. FAILURE TO USE THE CORRECT REFRIGERANT OIL MAY RESULT IN DAMAGE TO SYSTEM COMPONENTS.

4. Install a new orifice tube. Refer to the Dealer Master Parts Catalog for the correct orifice tube part number. If the orifice tube in the vehicle is located in the liquid line between the condenser and the evaporator, replace the liquid line assembly.

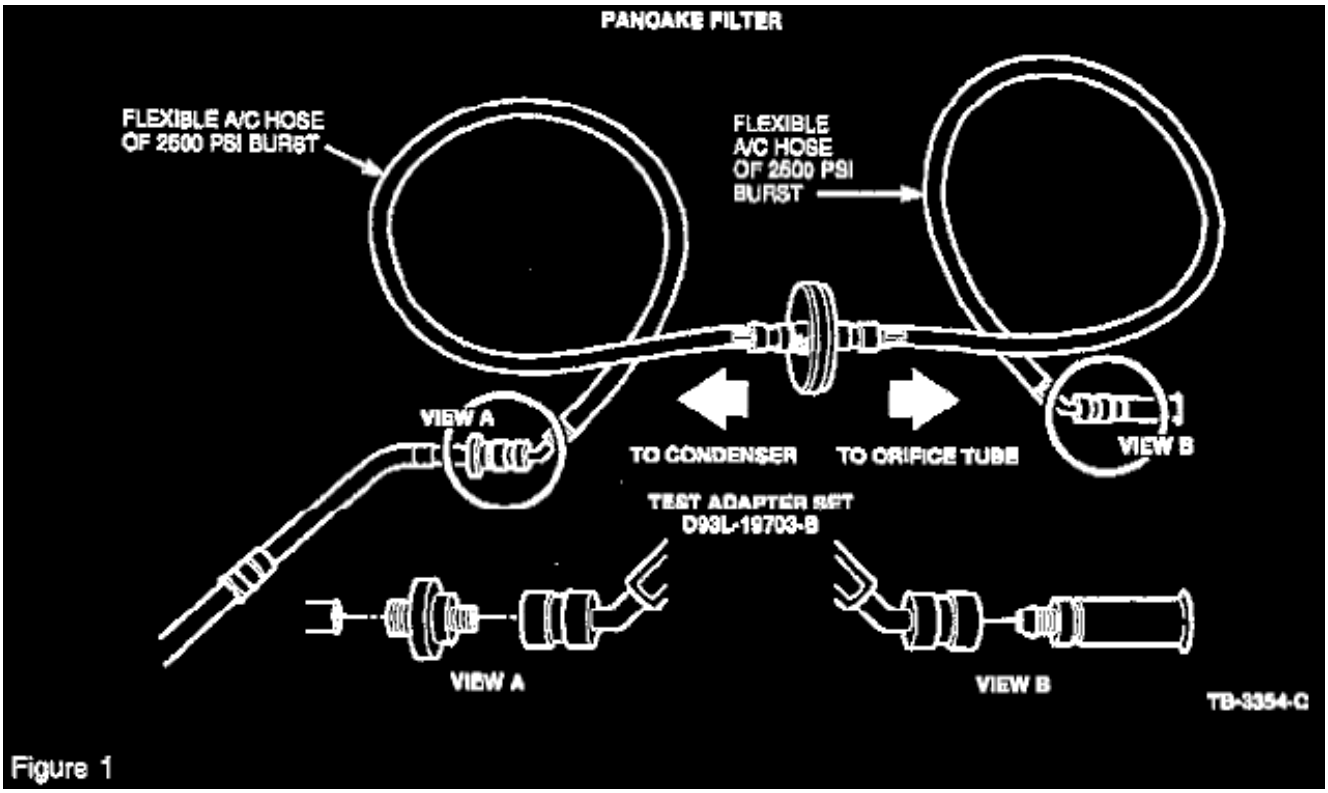

Figure 1

5. Install pancake filter in the liquid line between the condenser and the orifice tube, Figure 1.

a. Be sure orifice inlet is toward the condenser.

b. Connections can be made using Test Adapter Set D93L-19703-B, or equivalent, and flexible refrigerant hose of 2500 psi burst rating. Individual fittings are also available.

6. Remove the old compressor following Service/Workshop Manual procedures. Drain the oil into a calibrated container.

7. Drain the oil from the replacement compressor into a clean calibrated container.

NOTE:

IT WILL BE NECESSARY TO TRANSFER THE MAGNET CLUTCH FROM THE OLD COMPRESSOR TO THE REPLACEMENT COMPRESSOR. FOLLOW SERVICE/WORKSHOP MANUAL PROCEDURES.

8. A new FX-15 service compressor contains 207 mL (7 oz.) of R-12 refrigerant oil. A new FS-10 service compressor does not contain any oil and can be used with an R-12 or an R-134a system.

CAUTION

REMEMBER TO USE YN-9-A (MINERAL) OIL WITH R-12 SYSTEMS AND YN-12-C (PAG) OIL WITH R-134a SYSTEMS. FAILURE TO USE THE CORRECT REFRIGERANT OIL MAY RESULT IN DAMAGE TO SYSTEM COMPONENTS.

^ If the amount of oil drained from the removed compressor is between 90 and 148 mL (3-5 oz), pour the same amount of clean refrigerant oil into the new compressor.

^ If the amount of oil drained from the old compressor is greater than 90 mL (3 oz), pour 90 mL (3 oz) of clean refrigerant oil into the new compressor.

9. Install the new compressor following Service/Workshop Manual procedures. Make sure all mounting bolts are tightened properly. Check the tension of the compressor drive belt. Adjust if necessary.

10. Evacuate, charge and leak test the system, following Service/Workshop Manual procedures.

11. Check all refrigerant system hoses, lines and the position of the newly-installed filters to make sure they do not interfere with other engine compartment components. If necessary, use tie straps to make adjustments.

12. Set the A/C control on Max A/C, high blower and temperature control at full cold.

a. Start engine and let idle briefly.

b. Be sure A/C system is operating properly.

13. Gradually bring the engine up to 1200 rpm by running it at lower rpms for short periods (first at 800 rpm, then at 1000 rpm). Set the engine at 1200 rpm and run it for an hour with the A/C system

operating.

14. Stop the engine.

NOTE:

IT WILL BE NECESSARY TO RECOVER THE SYSTEM REFRIGERANT CHARGE BEFORE PROCEEDING.

15. Allow the engine to cool sufficiently to remove the fittings, flexible hoses and pancake filter from the liquid line.

16. Discard the filter. It can be used one (1) tie only.

17. Reconnect the liquid line back into the system.

18. Evacuate, charge and leak test the system. Make any necessary adjustments.

19. Check the operation of the system in all models.

This TSB article is being republished in its entirety to list Environmental Protection Agency (EPA) reviewed NC substitutes for R-12 refrigerant.

ISSUE: A number of manufacturers are producing refrigerant products which are described as being direct replacements for refrigerant R-12.

ACTION: If service is required, use only new or of known quality recycled refrigerant R-12. Ford Motor Company has approved R-134a as the only refrigerant substitute for R-12.

CAUTION:

USING ANY UNAUTHORIZED SUBSTITUTE REFRIGERANT FOR R-12 MAY RESULT IN SEVERE DAMAGE TO THE A/C SYSTEM COMPONENTS.

INFORMATION FROM THE EPA

				Components Percentage							
Brand Name (1)	Ford Approved	Status (2)	Date	HCFC 22	HCFC 124	HCFC 142b	HFC 134a	HFC 152a	Propane (R-290)	Butane (R-600)	Iso-butane (R-600a)
HFC-134a	Yes	ASU	3/18/94				100%				
R-401C	No	ASU	3/18/94	33%	52%			15%			
FRIGC FR-12	No	ASU	6/13/95		39%		59%			2%	
Freezone (3)	No	ASU	5/22/96			19%	70%				
R-406A / GHG / McCool (4)	No	P	5/22/96	55%		41%					4%
GHG-X4 / Autofrost / Chill-It (4)	No	P	5/22/96	51%	28.5%	16.5%					4%
Hot Shot / Kar Kool (4)	No	P	5/22/96	50%	39%	9.5%					1.5%
GHG-HP (4)	No	P	5/22/96	65%		31%					4%
FREEZ-12	No	Under Review				20%	80%				

(1) R-401A (made by DuPont), R-401B (DuPont), R-409A (Elf Atochem), Care 30 (Calor Gas), Adak-29/Adak-12 (TACIP International) and ES-12R (Interveet) have not been submitted for review in motor vehicle air conditioning, and it is therefore illegal to use them in such systems.

(2) See article for details on legality of use according to Status:
- ASU = acceptable subject to fittings, labeling, and no drop-in use conditions
- P = proposed acceptable subject to use conditions; open to public comment so decision is not final
- UNA = unacceptable; illegal for use as CFC-12 substitutes in motor vehicle air conditioners

(3) Freezone contains 2% of a lubricant

(4) Additional use condition: MUST BE USED WITH BARRIER HOSES

This information has been taken from EPA documents to address Ford specific applications and recommendations. Further EPA information on ozone-depleting substances and regulations regarding its handling can be found on the Internet at World Wide Web site: http://www.epa.gov/ozone/

In 1994, EPA established the Significant New Alternatives Policy (SNAP) program to review alternatives to ozone-depleting substances like R-12. EPA examines new substitutes for their ozone depleting, global warming, flammability, and toxicity characteristics. The SNAP process does not test these substitutes for A/C system compatibility, reliability, durability, or performance.

Under the SNAP rule, each new refrigerant must be used in accordance with the following conditions:

1. Unique Fittings - Each new refrigerant must be used with a unique set of fittings to prevent the accidental mixing of different refrigerants.

2. Unique Equipment - Each refrigerant must have dedicated recovery/recycling equipment for that refrigerant.

3. Labels - Whether a vehicle is originally designed to use a new refrigerant or is retrofitted, the technician must apply a detailed label giving specific information about the alternative. This label covers up information about the old refrigerant and provides valuable details on the alternative and how it was used. The technician is required to fill in their name, company performing the retrofit, address and the date retrofitted.

4. Remove Original Refrigerant - The original R-12 must be removed from the system prior to charging with the new refrigerant. This will guarantee that the largest amount of clean R-12 is available for use in vehicles that still need it.

				Reason Unacceptable
Brand Name (1)	Ford Approved	Status (2)	Date	HCFC 22, HCFC 124, HCFC 142b, HFC 134a, HFC 152a, Propane (R-290), Butane (R-600), Iso-butane (R-600a)
Ikon-12	No	ASU	5/22/96	Composition claimed as confidential business information
OZ-12	No	UNA	3/18/94	Flammable blend of hydrocarbons; insufficient data to demonstrate safety
R-176	No	UNA	3/18/94	Contains CFC-12, which is inappropriate in a CFC-12 substitute
HC-12a	No	UNA	6/13/95	Flammable blend of hydrocarbons; insufficient data to demonstrate safety
R-405A	No	UNA	6/13/95	Contains a perfluorocarbon, which has extremely high global warming potential and lifetime

(1) R-401A (made by DuPont), R-401B (DuPont), R-409A (Elf Atochem), Care 30 (Calor Gas), Adak-29/Adak-12 (TACIP International) and ES-12H (Intervest) have not been submitted for review in motor vehicle air conditioning, and it is therefore illegal to use them in such systems.

(2) See article for details on legality of use according to Status:

- ASU = acceptable subject to fittings, labeling, and no drop-in use conditions
- P = proposed acceptable subject to use conditions; open to public comment so decision is not final
- UNA = unacceptable; illegal for use as CFC-12 substitutes in motor vehicle air conditioners

(3) Freezone contains 2% of a lubricant

(4) Additional use condition; MUST BE USED WITH BARRIER HOSES

A summary of the refrigerants reviewed under EPA's SNAP program for use in motor vehicle air conditioning systems is in the table.

This TSB article is being republished in its entirety to revise the Service Procedure and to update the model years.

ISSUE Vehicles that have and inoperative A/C compressor, due to internal causes, MUST have the refrigerant system cleaned to remove any debris or contaminants that may be present to prevent damage to the replacement compressor.

ACTION

Install a Service Filter Kit in the refrigerant system prior to installing the replacement compressor. Refer to the following Service Procedure for details.

Service Procedure

THIS PROCEDURE IS OPTIONAL IF THE SYSTEM IS FLUSHED USING THE ROTUNDA A/C FLUSHER.

CAUTION

THIS FILTERING PROCEDURE MAY BE USED FOR EITHER R-12 OR R-134a REFRIGERANT SYSTEMS. BECAUSE THE TWO (2) SYSTEMS USE DIFFERENT REFRIGERANT OILS AND BECAUSE THE COMPRESSOR COULD BE DAMAGED IF THE WRONG OIL IS USED, SYSTEM IDENTIFICATION IS VERY IMPORTANT. BE SURE SYSTEM IS CORRECTLY IDENTIFIED BEFORE STARTING THE FILTERING PROCEDURE.

Each Service Filter Kit includes the following items:

^ One (1) Pancake Filter (to be installed in the liquid line between the condenser and the orifice tube)

^ One (1) Instruction Sheet

NOTE

ON 1993-94 RANGER/EXPLORER VEHICLES, TECHNICIANS MAY EXPERIENCE DIFFICULTY WHEN CONNECTING THE PANCAKE FILTER HOSE FITTINGS TO THE EVAPORATOR INLET WITH THE ORIFICE TUBE INSTALLED. REMOVE THE OFFICE TUBE AND RUN THE SYSTEM FOR 1 HOUR AS DESCRIBED IN THE FILTERING PROCEDURE. REINSTALL THE ORIFICE TUBE AFTER FILTERING IS COMPLETE.

CAUTION

FOLLOW ALL REFRIGERANT SYSTEM SAFETY AND SERVICE PRECAUTIONS OUTLINED IN THE APPROPRIATE SERVICE OR WORKSHOP MANUAL.

1. Before removing any refrigerant system components, recover the refrigerant from the system following the recycling methods outlined In the appropriate Service/Workshop Manual.

2. Remove the suction accumulator/drier assembly and drain the oil into a calibrated container.

3. Install a new suction accumulator/drier and add new refrigerant oil to replace the old oil. The quantity of the new oil to be added is the amount to match that drained from the old accumulator plus 60 mL (2 oz). Refer to the Dealer Master Parts Catalog for the correct suction accumulator/drier part number.

CAUTION

REMEMBER TO USE MOTORCRAFT YN-9-A REFRIGERANT COMPRESSOR OIL WITH R-12 SYSTEMS AND MOTORCRAFT YN-12-C REFRIGERANT COMPRESSOR OIL WITH R-134a SYSTEMS. FAILURE TO USE THE CORRECT REFRIGERANT OIL MAY RESULT IN DAMAGE TO SYSTEM COMPONENTS.

4. Install a new orifice tube. Refer to the Dealer Master Parts Catalog for the correct orifice tube part number. If the orifice tube in the vehicle is located in the liquid line between the condenser and the evaporator, replace the liquid line assembly.

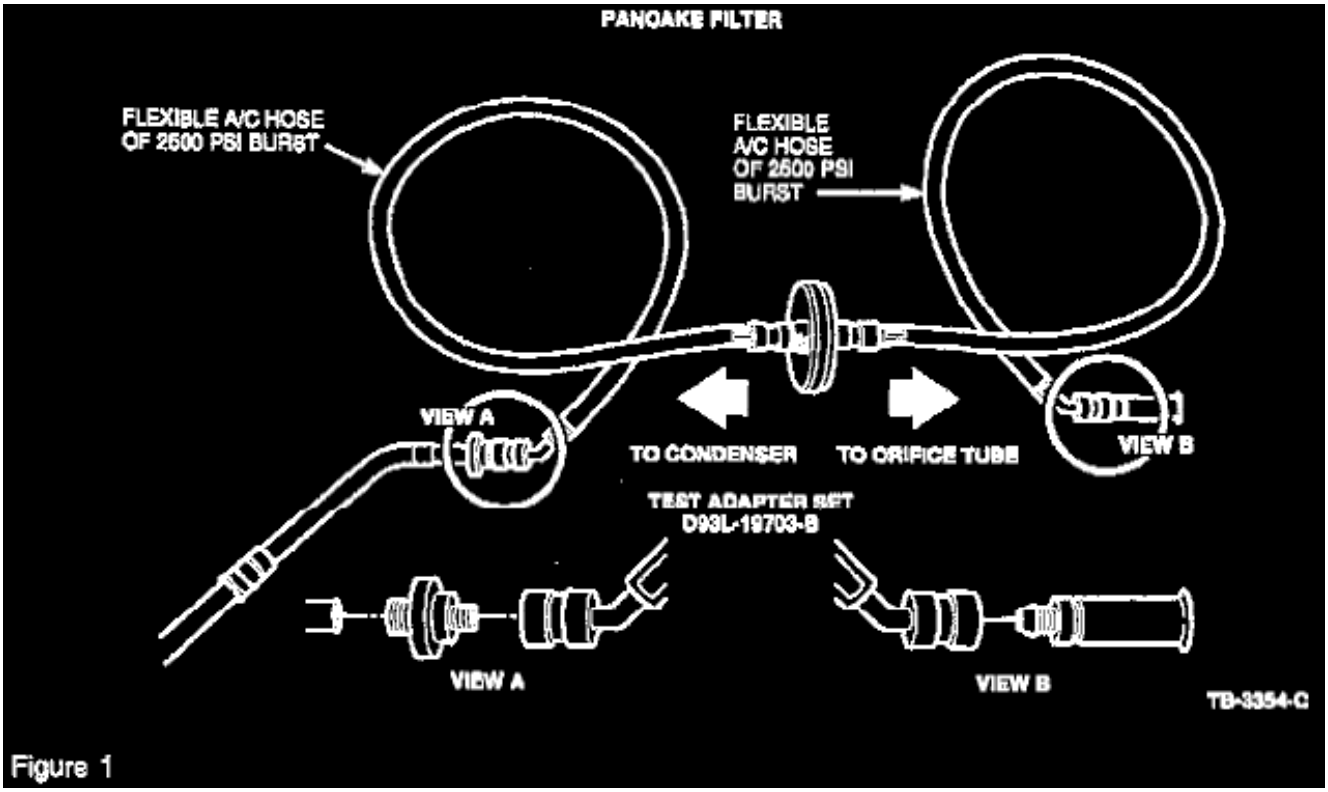

Figure 1

5. Install pancake filter in the liquid line between the condenser and the orifice tube, Figure 1.

a. Be sure orifice inlet is toward the condenser.

b. Connections can be made using Test Adapter Set D93L-19703-B, or equivalent, and flexible refrigerant hose of 2500 psi burst rating. Individual fittings are also available.

6. Remove the old compressor following Service/Workshop Manual procedures. Drain the oil into a calibrated container.

7. Drain the oil from the replacement compressor into a clean calibrated container.

NOTE:

IT WILL BE NECESSARY TO TRANSFER THE MAGNET CLUTCH FROM THE OLD COMPRESSOR TO THE REPLACEMENT COMPRESSOR. FOLLOW SERVICE/WORKSHOP MANUAL PROCEDURES.

8. A new FX-15 service compressor contains 207 mL (7 oz.) of R-12 refrigerant oil. A new FS-10 service compressor does not contain any oil and can be used with an R-12 or an R-134a system.

CAUTION

REMEMBER TO USE YN-9-A (MINERAL) OIL WITH R-12 SYSTEMS AND YN-12-C (PAG) OIL WITH R-134a SYSTEMS. FAILURE TO USE THE CORRECT REFRIGERANT OIL MAY RESULT IN DAMAGE TO SYSTEM COMPONENTS.

^ If the amount of oil drained from the removed compressor is between 90 and 148 mL (3-5 oz), pour the same amount of clean refrigerant oil into the new compressor.

^ If the amount of oil drained from the old compressor is greater than 90 mL (3 oz), pour 90 mL (3 oz) of clean refrigerant oil into the new compressor.

9. Install the new compressor following Service/Workshop Manual procedures. Make sure all mounting bolts are tightened properly. Check the tension of the compressor drive belt. Adjust if necessary.

10. Evacuate, charge and leak test the system, following Service/Workshop Manual procedures.

11. Check all refrigerant system hoses, lines and the position of the newly-installed filters to make sure they do not interfere with other engine compartment components. If necessary, use tie straps to make adjustments.

12. Set the A/C control on Max A/C, high blower and temperature control at full cold.

a. Start engine and let idle briefly.

b. Be sure A/C system is operating properly.

13. Gradually bring the engine up to 1200 rpm by running it at lower rpms for short periods (first at 800 rpm, then at 1000 rpm). Set the engine at 1200 rpm and run it for an hour with the A/C system operating.

14. Stop the engine.

NOTE:

IT WILL BE NECESSARY TO RECOVER THE SYSTEM REFRIGERANT CHARGE BEFORE PROCEEDING.

15. Allow the engine to cool sufficiently to remove the fittings, flexible hoses and pancake filter from the liquid line.

16. Discard the filter. It can be used one (1) tie only.

17. Reconnect the liquid line back into the system.

18. Evacuate, charge and leak test the system. Make any necessary adjustments.

19. Check the operation of the system in all models.

PART NUMBER PART NAME

F8VZ-19E773-AA Filter Kit

ISSUE: FS-10 service compressors built between 1/1/93 and 9/30/93 were built with 7 oz. of oil. These compressors have a white label and are labeled to be compatible with either R-12 or R-134a. These compressors contain either PAG oil or Mineral oil and should be used only in the proper systems.

ACTION: Refer to the chart to determine the type of oil that is in each service compressor.

NOTE:

BE SURE TO CHOOSE THE COMPRESSOR THAT HAS THE CORRECT OIL FOR THE SYSTEM BEING SERVICED.

NOTE:

FS-10 COMPRESSORS BUILT AFTER 9/30/93 ARE NOT FILLED WITH OIL AND HAVE A YELLOW LABEL. THESE COMPRESSORS REQUIRE THE CORRECT AMOUNT OF EITHER MINERAL OIL OR PAG OIL DEPENDING ON THE SYSTEM BEING SERVICED.

NOTE:

FX-15 SERVICE COMPRESSORS BUILT BEFORE 1/1/93 ARE FILLED WITH MINERAL OIL AND ARE ONLY COMPATIBLE WITH R-12 SYSTEMS.

This article is being republished in its entirety to clarify the information about removing oil from both the "old" and "new" compressors.

ISSUE: When replacing the FX-15 Compressor it is very important to accurately match the amount of oil being replaced. Some dealerships have indicated that they are unable to properly match the amounts of oil being replaced.

ACTION: Replace the amount of oil being drained from the FX-15 compressor with an equal amount of new oil to assure proper compressor operation. Refer to the following service procedure for service details.

SERVICE - PROCEDURE

1. With both "OLD" and "NEW" compressors, remove as much oil as possible. On both compressors, the shaft should be rotated about six to eight revolutions while pouring the oil from the ports. This effectively empties the compressor of oil.

a. Obtain a clean container that can also be used as a measuring device.

b. Place the disc and hub assembly on the compressor shaft so the shaft can be rotated.

c. Rotate the shaft by hand (6) six to (8) eight revolutions, collecting the oil in a clean measuring device.

NOTE: SERVICE COMPRESSORS COME PRE-CHARGED WITH 7 OUNCES OF OIL

2. If the amount of oil drained from the old compressor is between (3) three and (5) five fluid ounces (85 and 142 cc), pour the same amount of clean Motorcraft YN-9 refrigerant oil into the new compressor.

3. If the amount of oil that was removed from the old compressor is greater than (5) fluid ounces (142 cc), pour five ounces of clean Motorcraft YN-9 refrigerant oil into the new compressor.

4. If the amount of refrigerant oil that was removed from the old compressor is less than (3) three fluid ounces (85 cc), pour three fluid ounces of clean Motorcraft YN-9 refrigerant oil into the new compressor.

NOTE: THE SUCTION/ACCUMULATOR-DRYER AND ORIFICE TUBE MUST BE REPLACED WHENEVER THE COMPRESSOR IS REPLACED.

ISSUE: When replacing the FX-15 compressor it is very important to accurately match the amount of oil being replaced. Some dealerships have indicated that they are unable to properly match the amounts of oil being replaced.

ACTION: Replace the amount of oil being drained from the FX-15 compressor with an equal amount of new oil, to assure proper compressor operation. Refer to the following service procedure for service details.

SERVICE - PROCEDURE

1. Remove as much oil as possible from the compressor. The compressor shaft should be rotated about six to eight revolutions allowing the oil to drain from the compressor ports.

a. Obtain a clean container that can be also used as a measuring device.

b. Place the disc and hub assembly on the compressor shaft so the shaft can be rotated.

c. Rotate the shaft by hand (6) six to (8) eight revolutions allowing the oil to drain from the ports, while collecting the oil in the clean measuring device.

NOTE: SERVICE COMPRESSORS COME PRE-CHARGED WITH 7 OUNCES OF OIL

2. If the amount of oil drained from the old compressor is between (3) three and (5) five fluid ounces, pour the same amount of clean Motorcraft YN-9 refrigerant oil into the new compressor.

3. If the amount of oil that was removed from the old compressor is greater than (5) fluid ounces, pour five ounces of clean Motorcraft YN-9 refrigerant oil into the new compressor.

4. If the amount of refrigerant oil that was removed from the old compressor is less than (3) three fluid ounces, pour three fluid ounces of clean Motorcraft YN-9 refrigerant oil into the new compressor.

NOTE: THE SUCTION/ACCUMULATOR-DRYER AND ORIFICE TUBE MUST BE REPLACED WHENEVER THE COMPRESSOR IS REPLACED.

ISSUE: Current repair procedures do not advise on the addition of refrigerant oil to the A/C system when a minor repair is made.

ACTION: Add 0.06 L (2 oz) of the proper type new refrigerant oil to the system,. before recharging, when servicing concerns that do not require major component replacement. Repairs considered minor are: O-ring leaks, charge port leaks, Pressure Relief Valve (PRV) leaks, compressor shaft seal leaks, hose leaks, etc. Remember to use polyalkylene glycol (PAG) oil with R-134a systems and mineral oil with R-12 systems.

Brake Bleeding: Service and Repair Manual Bleeding

Bleed the primary and secondary hydraulic brake systems separately.

NOTICE: Do not allow the reservoir to run dry during the bleeding operation. Keep the master cylinder reservoirs filled with the specified brake fluid. Never reuse the fluid that has been drained from the hydraulic system.

1. Loosen the master cylinder to hydraulic line nut. 2. Wrap a shop cloth around the tubing below the fitting to absorb escaping brake fluid. 3. Push the brake pedal down slowly by hand to the floor of the cab. This will force air trapped in the master cylinder to escape at the fitting. 4. Hold the pedal down and tighten the fitting. Release the brake pedal.

NOTICE: Do not release the brake pedal until the fitting is tightened or air will re-enter the master cylinder.

5. Repeat this procedure until air ceases to excape at the fitting and the brake pedal is firm. 6. Place a box wrench on the bleeder fitting on the Rear Antilock Brake System (RABS) valve. Attach a rubber drain tube to the bleeder fitting

making sure the end of the tube fits snugly around the bleeder fitting.

7. Submerge the free end of the tube in a container partially filled with clean brake fluid. Loosen the bleeder fitting approximately three-quarters of a

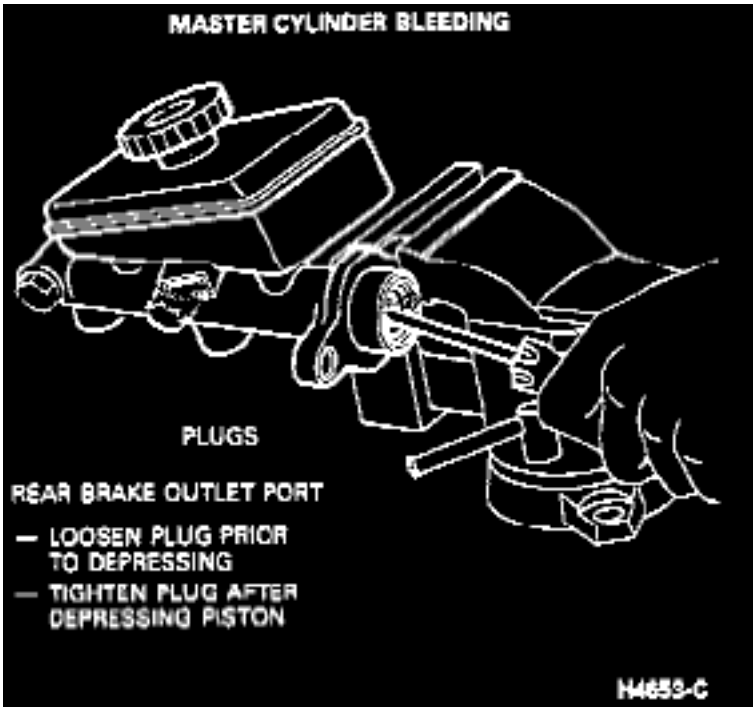
turn.

8. Slowly press the brake pedal all the way down. Close the bleeder fitting, and return the pedal to the fully released position. Repeat this operation

until air bubbles no longer appear at the submerged end of the bleeder tube.

9. When the fluid is completely free of air bubbles, close the bleeder fitting and remove the bleeder tube.

10. Repeat this procedure at the RR, LR, RF and LF wheels. 11. When the bleeding procedure is complete, fill the master cylinder to the maximum level line of the master cylinder reservoir.



Brake Bleeding: Service and Repair Master Cylinder Bleeding

Bench Bleeding Master Cylinder

1. Support the master cylinder body in a vise, and fill both fluid reservoirs with heavy duty DOT 3 brake fluid. 2. Install plugs in the front and rear brake outlet ports. Bleed the rear brake outlet system first. 3. Loosen the plug in the rear brake outlet port. Depress the primary piston slowly to force the air out of the master cylinder. Tighten plug while

piston is depressed or air will enter the master cylinder.

4. Repeat this procedure until air ceases to exit at the outlet port. 5. Repeat steps 3 and 4 for the front brake outlet port with the rear brake outlet plugged. 6. Tighten the plugs and try to depress the piston. Depressing the piston should be harder after all air is expelled. 7. Install the cover and diaphragm assembly making sure the cover retainer is tightened securely. Remove the plugs.

For additional information see Bench Bleeding Notes.

Brake Bleeding: Service and Repair Pressure Bleeding

Be sure the bleeder tank contains enough of the specified brake fluid to complete the bleeding operation. Charge the tank with approximately 69-206 kPa (10-30 psi). Never exceed 345 kPa (50 psi). Never use brake fluid that has been drained from the hydraulic system. Bleed the longest lines first.

1. Clean all dirt from the master cylinder reservoir cap. 2. Remove the master cylinder reservoir cap and fill the master cylinder reservoir with the specified brake fluid. Install the pressure bleeder adapter

tool on the master cylinder, and attach the bleeder tank hose to the fitting on the adapter.

NOTE: Master cylinder pressure bleeder adapter tools are available from the manufacturers of pressure bleeding equipment. Follow the manufacturer's instructions when installing the adapter.

3. Place a 3/8 inch box wrench on the bleeder fitting on the right rear brake wheel cylinder. Attach a bleeder tube snugly to the bleeder fitting. 4. Open the valve on the bleeder tank and admit pressurized brake fluid to the master cylinder reservoir. 5. Submerge the free end of the tube in a container partially filled with clean brake fluid, and loosen the bleeder fitting. 6. When air bubbles no longer appear in the fluid at the submerged end of the bleeder tube, close the bleeder fitting and remove the tube. 7. Repeat Steps 3 through 6 at the opposite wheel cylinder. On front brakes, bleed the right front caliper first. 8. When the bleeding operation is completed, close the bleeder tank valve and remove the tank hose from the adapter fitting. 9. Remove the pressure bleeder adapter tool. Fill the master cylinder reservoirs with the specified brake fluid to within 3 mm (1/8 in) from the top of

the filler neck. Install the master cylinder cover.

Circuit Breaker: Testing and Inspection

The 6 amp circuit breaker is located in the fuse panel. Two separate tests are necessary to check for correct circuit breaker operation. Remove circuit breaker from fuse panel and connect tester leads to circuit breaker.

TEST 1

1. Short tester leads together and adjust current draw until it equals circuit breaker rating.

2. Connect circuit breaker to tester.

3. Leave circuit breaker connected to tester for ten minutes, holding current reading on tester at rated current. If circuit breaker opens before ten minutes has elapsed, replace circuit breaker.

TEST 2

1. Short tester leads together and adjust current draw until it is twice the rated current.

2. Connect circuit breaker to tester, holding current reading on tester at twice the rated current.

3. If tester reading does not drop to zero within 30 seconds, replace circuit breaker.

Power Distribution

The alternator is connected to maxi-fuses within the power distribution box which is then connected together with the Battery at the starter relay hot terminal. Circuits and components are protected by maxi-fuses. Low power circuits are also protected by fuses.

The Ignition Switch and Main Light Switch are powered at all times, as are Fuses 1, 4, 8, 10 and Circuit Breaker 12 in the Fuse Panel. The other fuses are powered through the Ignition Switch or the Main Light Switch.

Position 3 is not used and is covered by Circuit Breaker 2.

Wire Color Code Identification

NOTE: Whenever a wire is labeled with two colors; the first color listed is the basic color of the wire, and the second color is the tracer marking of the wire. If the second color is followed by by a D, the tracer is dots. If the second color is followed by an H, the tracer is hash marks.

For example: BR/O is a brown wire with an orange stripe, R/Y D is a red wire with yellow dots and BK/W H is a black wire with white hash marks.

FORD: 1991-94 ESCORT 1992-94 CROWN VICTORIA 1993-94 TAURUS 1994 MUSTANG, THUNDERBIRD

LINCOLN-MERCURY: 1990-94 TOWN CAR 1991-94 TRACER 1992-94 GRAND MARQUIS 1993-94 MARK VIII 1994 COUGAR

LIGHT TRUCK: 1990-94 AEROSTAR, RANGER 1991-94 EXPLORER

ISSUE: Some vehicles may have a disconnect of the Ignition Control Module (ICM) connector or moisture buildup within the connector. This can cause hard to start/no start, rough idle, or "check engine light" illumination concerns. The improved gasket and connector retainer that are currently used in production are now available for service of prior model distributorless ignition systems.

ACTION: Install new Connector Sleeve Retainer Clip and a current production seal (gasket). The clip assembles in between the connector beams and the ICM which will prevent accidental disconnects. The new seal is a "solid silicone" gasket that provides improved resistance to moisture entry into the connector. Refer to the ICM Connector Harness Wire Service kit (F5CZ-14A411-AA) for service details (I.S. 6621).

ISSUE: The instrument cluster warning light(s) may be dimly lit or there may be a malfunction of the four pin low oil relay on vehicles so equipped. This could be due to the ignition switch.

ACTION:

If the vehicle displays the subject symptoms and meets the following conditions, replace the ignition switch. Refer to the appropriate Car or Light Truck Service Manual (Section 13-04 for 1983-1990 Cars, Section 11-04 for 1991-1993 Cars and Section 13-05 for 1983-1990 Light Trucks, Section 11-05 for 1991-1993 Light Trucks) for removal and installation procedures. Refer to the Parts Block in this article for correct parts usage.

CONDITIONS

^ The vehicle has 14401 wiring attached to the P2 terminal of the ignition switch. Refer to the wiring schematic and/or Electrical And Vacuum Troubleshooting Manual (EVTM) for the concern vehicle.

Oil Level Warning Indicator: Description and Operation

The oil pressure warning light should go on when the ignition is turned on. If it does not light, disconnect the wire from the engine unit and ground the wire to the frame or cylinder block. Then if the warning light still does not go on with the ignition switch on, replace the bulb. If the warning light goes on when the wire is grounded to the frame or cylinder block, the engine unit should be checked for being loose or poorly grounded. If the unit is found to be tight and properly grounded, it should be removed and a new one installed. (The presence of sealing compound on the threads of the engine unit will cause a poor ground). If the warning light remains lit when it normally should be out, replace the engine unit before proceeding further to determine the cause for a low pressure indication. The warning light will sometimes light up or flicker when engine is idling, even though oil pressure is adequate. However, light should go out when engine speed is increased.

Oil Level Warning Indicator: Testing and Inspection

With oil level at FULL mark on oil dipstick and engine oil warm to assure that oil drains properly from oil sensor, turn ignition on and start engine. Warning lamp should come on briefly in Start for bulb test, then go out. Turn engine off. Drain 2 quarts of oil from engine. Wait approximately 5 minutes, then restart engine. Warning lamp should come on and stay on. If warning lamp does not come on check fuse, low oil level relay, low oil level sensor and lamp.

Ford Motor Company

October 2001

TO: All Ford and Lincoln Mercury Dealers

SUBJECT: **Owner Notification Program 01B77 Supplement 7:** 10/12/01 Updated Information

REFERENCE: **Owner Notification Program 01B77 – Ford Wilderness AT Program:** Replacement of Wilderness AT tires

PROGRESS TO DATE

- To date we have replaced close to 7 million tires or 55% of the total tires needed
- Ford and Mercury dealers are currently handling over 70% of all Wilderness AT replacements
- All tire sizes are now readily available, though certain brands may not be available

The following information has been updated for ONP 01B77:

CHANGES MADE TO THE ALL DEALER LETTER

- ONP 01B77 – Ford Wilderness AT program will expire on March 31, 2002
- Tires purchased by customers after November 15, 2001 will not be eligible for a refund
- All customers who have not had their tires replaced will receive a follow-up letter by the end of October, 2001 announcing these program changes and encouraging them to visit a Ford Motor Company dealership for tire replacement
- 1995 and 1996 F-150 customers, which were added to the program on August 17, 2001, will receive their first notification letter by the end of October, 2001, which includes the following:
  - The customer must have their tires replaced at a Ford Motor Company dealer
  - They will only be eligible for refunds if they purchased their tires between August 1, 2000 through October 31, 2001

    NOTE: Refunded at actual cost and no DOT sections required, since these customers were never notified of the DOT requirements and maximum dollar limit.
- Effective immediately all tire refund requests are to be processed through the dealer (Online Refund Form should no longer be used)

CHANGES TO ATTACHMENT I

- Tires purchased by customers after November 15, 2001 will not be eligible for a refund
- The Online Refund Form used for refunds before May 22, 2001 is no longer posted on the web

CHANGES TO ATTACHMENT II

- Wait List Survey link added
- A procedure has been added to handle customers who purchase tires after November 15, 2001 and are seeking a refund

All revisions since Supplement 6 are in *red italics* and revised pages have been marked "*Revised10/12/01.*"

Sincerely,

Ann O'Neill
Director
Vehicle Service and Programs

Technical Service Bulletin # 01B77 Date: 011001

Ford Motor Company

May 2001
Revised 10/12/01

TO: All Ford and Lincoln Mercury Dealers

SUBJECT: **Owner Notification Program 01B77-S7 – Ford Firestone Wilderness AT Program:** Replacement of Firestone Wilderness AT tires.

OASIS: Yes
OWNER LIST: Yes
PARTS RETURN: No
PROGRAM TERMS: This program will expire *March 31, 2002* and has no mileage limit.

WHAT WE ARE DOING AND WHY

On August 9, 2000 Firestone initiated a voluntary recall of 6.5 million tires, including 3.8 million P235 75R15 Radial ATX tires manufactured since 1990 at all North American Firestone plants. Also, Firestone recalled about 2.7 million P235 75R15 Wilderness AT tires made at its Decatur, Illinois plant. The recall included both original equipment and replacement tires. As of January 22, 2001 more than 6.1 million tires have been replaced – the recall is more than 94% complete.

Under this new owner notification, Ford will replace 13 million Firestone Wilderness AT tires on Ford and Mercury SUVs and pickup trucks listed below under "affected tires and vehicles." This is a voluntary precautionary measure. Ford made the decision to take this action after extensive examination of field data as well as laboratory and track testing in close collaboration with NHTSA. The field data, along with our testing and statistical analysis, shows a directional trend toward elevated failure rates, that differs based upon where the tires were manufactured. Ford does not have sufficient confidence in the future performance of these tires, so we are acting in the interest of our customers to ensure their continued trust and confidence.

To date we have replaced close to 7 million tires or 55% of the total tires needed for this program. Ford and Mercury dealers are currently handling over 70% of the Wilderness AT tire replacements. Also, with the increased availability of all 15-, 16-, and 17-inch tires at the dealers, Ford is changing the expiration date of the program to March 31, 2002 to encourage customers to have their tires replaced as soon as possible.

NOTE: Certain brands of tires may have limited availability.

AFFECTED TIRES AND VEHICLES

This program affects 15-, 16-, and 17-inch Firestone Wilderness AT tires and Ford and Mercury vehicles with these tires on them. The vehicles listed below may have been originally equipped with Firestone Wilderness AT tires or may have had Wilderness AT tires installed during the Firestone recall launched in August, 2000.

- Certain 1991 through 2002 Ford Explorer
- Certain 2001 through 2002 Explorer Sport, and Sport Trac
- Certain 1997 through 2002 Mercury Mountaineer
- Certain 1991 through 2001 Ranger
- Certain 1999 through 2001 Expedition
- Certain 1991 through 1997 F-Series
- Certain 1991 through 1994 Bronco

NOTE: Both original equipment (OE) and replacement tires are affected.

IMPORTANT FACTS

- *Ford Wilderness AT tire program will expire on March 31, 2002.*
- *Tires purchased by customers after November 15, 2001 will no longer be eligible for a refund.*
- *A follow-up owner letter announcing program changes will be mailed beginning the week of October 17, 2001.*
- *1995 and 1996 F-150 owners, which were added to the program on August 17, 2001, will be notified by the end of October 2001.*
- All 15-, 16-, and 17-inch Firestone Wilderness AT tires (regardless of series number) that are mounted on Ford or Mercury vehicles are eligible for replacement.
- All other Firestone Wilderness AT tire sizes are not included in this program.
- AtW/Ford Tire Program dealers are to stop the sale of Firestone Wilderness AT tires in their parts inventory effective immediately.
- Ford Motor Company has notified customers of this owner notification program via first class mail.
- Customer refunds will be handled differently based on whether the tires were purchased before or after May 22, 2001.
- *Effective immediately all refunds will be processed through the dealer for customers who purchased their tires from August 1, 2000 through November 15, 2001, (Online Refund Form should no longer be used).*
- *1995 and 1996 F-150 owners will only be eligible for refunds for tires purchased between August 1, 2000 and October 31, 2001, (no DOT sections required).*
- A list of Ford-approved replacement tires is posted on QCDealer. Only these tires may be used as replacement tires for vehicles that were originally equipped with 15-, 16-, and 17-inch Firestone Wilderness AT tires under this program.
- There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.
- **Vehicles with branded titles** - although normally excluded from Owner Notification Programs are included as part of this program.
- Affected vehicles sold in Canada can be serviced by U.S. dealers, and affected vehicles sold in the U.S. can be serviced by Canadian dealers.

STOP SALE OF FIRESTONE WILDERNESS AT TIRES IN DEALER STOCK

Firestone Wilderness AT tires in stock at Ford and Lincoln Mercury dealers enrolled in the Around the Wheel or Ford Tire Program (Certified Tire Dealers) should not be sold. Dealers that purchased these tires through the Ford program and have them in stock should complete the *Unsold Wilderness AT Credit Form* located on QCDealer.com. If you have questions, call the Ford Tire Hotline at 1-888-353-3251 for disposal and credit information.

NON-AtW DEALERS SERVICING IN-STOCK UNITS OR CUSTOMER VEHICLES

Non-Certified Tire (AtW or Ford Tire Program) Dealers who have vehicles in stock, or customer vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires must send the vehicle to a Certified Tire Dealer (AtW or Ford Tire Program) or an approved tire retailer participating in the program to have the tire replacement performed. The non-Certified Tire Dealer (AtW or Ford Tire Program) will submit a 01B77 ONP claim using the miscellaneous expense code of "**SCHP**" (with a dollar value of $15.00 to cover administrative costs). Do not claim the "Admin" labor operation.

SERVICE PROCEDURE

All 15-, 16-, and 17-inch Firestone Wilderness AT (regardless of series number) tires installed on Ford and Mercury vehicles must be replaced under this owner notification program. Original equipment (OE) and replacement tires are included.

Spare Tires

Firestone Wilderness AT (regardless of series number) spare tires are affected and should be replaced. The Firestone P235 75R15 ATX temporary spare tire used on Ranger vehicles is not included in this program.

Note: Spare tires should always be replaced with the exact same size tire; otherwise the spare tire may not store in the proper position on the vehicle.

Note: When processing refunds for customers, inspect the spare tire; if the spare tire is a Firestone Wilderness AT (with the Ranger exception noted previously) replace the spare tire using the information provided on Attachment II.

Does Current Tire Condition Affect Replacement Procedure?

All affected tires should be replaced regardless of the mileage or the remaining tread on the tire. If the customer caused damage to the tires, i.e. hit a curb, accident, under inflation, alignment issues, the tire should still be replaced. If the tire is worn out, it should still be replaced.

What if the Vehicle has a Mix of Affected and Non-Affected Tires?

- If the spare tire is the only Wilderness AT, then only the spare should be replaced (see exception on temporary spares above).
- In most cases an owner's vehicle will have all 15-, 16-, or 17–inch Firestone Wilderness AT tires installed and require replacement of all tires. In cases where a vehicle has a mix of tire brands/sizes installed, replace all Firestone Wilderness AT tires and the remaining tires to match the tire brand and size by axle.

For example, if a vehicle has a Wilderness AT on the left front, a Wilderness AT on the right rear, a Wilderness AT for a spare, and the other two tires are not Wilderness AT; the spare and the left front and right rear should be replaced and the new tires should be installed on the same axle. The customer should also be advised that all tires should be the same size especially on 4 X 4 models.

What replacement tires may be used for vehicles originally equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tires?

Replacement tire(s) must be on the list of tires approved by Ford <link to approved tire list>. Any deviation from this approved list may change the vehicles handling, ride, vibration, and noise characteristics and cannot be claimed through Ford.

If customers are seeking reimbursement for tires purchased outside of a Ford Certified Tire Dealer, refer to Attachment I for reimbursement guidelines and claiming procedures. *Customers who purchase tires after November 15, 2001 are not eligible for a refund.*

Note: There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.

Note: "Blemished" tires may not be used as replacement tires under this program.

FORD AND LINCOLN MERCURY DEALER TIRE DISPOSAL PROCESS

- Tires that are removed from vehicles must immediately be made unusable by either cutting the bead through the DOT code with bolt cutters, or drilling a one-inch diameter hole (directly on the DOT code to make the code unreadable) in the sidewall. Defacing the DOT code will prevent the tire from being used for an additional refund request. Marking the last 6 characters of the VIN on the removed tire(s) is no longer required.
- The tires will be disposed of by using the "National Tire Recovery and Recycle Program".

Regional FCSD and independent personnel will be randomly auditing dealers for proper tire scrapping and claiming procedures. Any infractions will result in prior approval for tire owner notification claims.

Note: Make removed tires unusable during tire replacement. Do not stack tires and disable them at a later time.

DEALERSHIPS ELIGIBLE TO REPLACE TIRES UNDER THIS PROGRAM

All Ford and Lincoln Mercury dealers enrolled on the Around the Wheel or Ford Tire Program (Certified Tire Dealers) are eligible to complete tire replacements under this program.

Ford dealers interested in joining the Ford Tire Program may call the Ford Tire Hotline 1-888-353-3251 for enrollment and program details.

APPROVED RETAILERS PARTICIPATION IN PROGRAM

We have developed a program to authorize Goodyear, Michelin, Continental, and General tire retailers to perform tire replacements at no cost to customers. These eligible retailers will use only tires from the Ford Approved Tire List when performing no cost replacements. This was done to reduce customer inconvenience by:

- Eliminating customer out of pocket expense
- Maximize the number of customers whose replacement tires are those on the Ford Approved tire list
- Expedite the completion of this program
- Reduce administrative burden on our Ford and Lincoln Mercury dealers
- Reduce dealer tire disposal responsibility
- Allow dealers to continue with their normal day to day service business

Attachment I - Administrative Information

OASIS

OASIS must be used to determine vehicle eligibility.

IMPORTANT:

When an eligible vehicle is at the dealership for service, OASIS must be contacted to determine if Owner Notification Program 01B77 is open. If 01B77 is listed in OASIS as open, it is important that the vehicle is inspected for eligible tires. If the eligible vehicle is not equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tires a claim must be submitted using labor operation 01B77A to close the program. If an affected vehicle does not have 01B77 open, this may indicate that a refund

or tire replacement has already been processed on this vehicle.

Some Ford and Lincoln Mercury vehicles not listed in the AFFECTED TIRES AND VEHICLES list may have 15-, 16-, or 17-inch Firestone Wilderness AT tires installed. These vehicles are covered under this program, but will not be active in OASIS. Contact the Special Service Support Center at 1-800-325-5621 to obtain prior approval before performing the repair or issuing a refund. This will insure that a previous repair/refund has not been performed on the vehicle.

CLAIMS PREPARATION AND SUBMISSION

^ Enter claims using DWE.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Enter information on a Recall/ONP claim type. DO NOT use a Warranty Claim type.

^ Program code 01B77.

^ Enter the full part number of the replacement tire with the quantity of tires replaced. Tires will be reimbursed at AtW Dealer cost + 25% (wheel weights and valve stems incl.).

^ Use the appropriate labor operation(s) from Attachment II.

^ Freight is reimbursable at actual cost in the miscellaneous expense area of the claim.

NOTE:

Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier. Dealers are encouraged to arrange for shipment of 4 or more tires at a time.

^ Dealers can no longer claim tire disposal for ONP 01B77. See the "National Tire Recovery and Recycle Program". You may still claim any applicable local waste tax - enter OTHER in the expense area of the claim with the actual cost.

^ Enter each unique (complete 10 or 11 digit) DOT codes of the replaced tires on the diagnostic code entry screen in the field marked "other". If the DOT codes cannot be completely entered in the space provided in the diagnostic code area, use the technician comment area to complete the data entry.

RELATED DAMAGE

Vehicle damage caused by a tire related failure is not covered by this program. Refer to the Warranty and Policy Manual for proper claiming procedure for vehicles covered by the Ford Bumper-to-Bumper Tire Warranty (model years 2001 and 2002). All other pre-2001 model year vehicles with alleged tire related vehicle damage should be handled through the Firestone claims process, or by referring the customers to their insurance company.

Damage related to replacement of tires should be handled as described in the Warranty and Policy Manual.

OWNER REFUND

With the increased availability of replacement tires, it will no longer be necessary for customers to pay out-of-pocket expenses for tires. Therefore, refund requests for tires purchased after November 15, 2001 will no longer be granted. Owners will be notified of the refund expiration date and will be directed to a Ford or Mercury dealer They are directed to an authorized retailer only if the Ford or Mercury dealer cannot meet their scheduling needs or tires are not in stock. All Ford and Mercury dealers (AtW and non-AtW dealers) are required to process refunds for customers who purchase tires prior to November 15, 2001.

The following rules apply to refunds for tires purchased from August 1, 2001 through November 15, 2001:

Refunds will be processed for vehicles listed under "AFFECTED TIRES AND VEHICLES", and for other Ford and Lincoln Mercury vehicles that have 15-. 16-, or 17-inch Wilderness AT tires installed.

^ The customer must provide the original paid receipt (a copy of their paid receipt is acceptable on an exception basis in instances where the owner requires the original for another purpose (e.g. extended tire warranty or purchase rebate). The dealer will attach the receipt to the dealer file copy of the refund claim (see claim instructions below).

^ Dealers will be reimbursed to immediately disable tires returned for a refund (see claiming instructions for refunds and Attachment II for labor operations).

^ The tires must be purchased August 1, 2000 through November 15, 2001 to be eligible for a refund (through October 31, 2001 for 1995 and 1996 F-150 owners).

^ Customers requesting refunds for tire replacement May 22, 2001 through November 15, 2001 must provide either:

NOTE:

This does not apply to 1995 and 1996 F-150 customers.

^ The Firestone Wilderness AT tires that were replaced. Returned tire(s) are to be disabled by the dealership. Ford will reimburse the dealer to disable (see claim instructions below and use labor operation 01B77G). If tires are brought in for refund with the DOT codes missing dealers should not process the refund.

^ A section of the old tire(s) containing the DOT codes from each of the Firestone Wilderness AT tires that were replaced (To be cut from the Wilderness AT tires that were replaced by the outside repair facility) (use labor operation 01B77L). Dealers should deface (cut in pieces or make code unreadable) the DOT sections of the tire so they cannot be used to obtain another refund. If sections are brought in for refund with the DOT code defaced dealers should not process the refund.

NOTE:

The DOT Code Identification Guide has been developed to help dealers determine if the DOT sections returned to the dealership are from 15-, 16-,

Purchase Date Range	Refund Guidelines
August 1, 2000 through May 22, 2001	• The actual cost as stated on the paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes • *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
1995 and 1996 F-150 vehicles only *August 1, 2000 through October 31, 2001*	• *The actual cost as stated on the paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes (no DOT required)* • *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
May 23, 2001 through November 15, 2001	• 15 inch tires - $110 (includes mounting, balancing, stems, disposal, and taxes) • 16 and 17 inch tires - $130 (includes mounting, balancing, stems, disposal, and taxes) • Dealers process refunds
After November 15, 2001	• *No refunds accepted for tires purchased after November 15, 2001*

Refund Questions	What is the owner qualified to receive?
Example: On December 21, 2000 the customer paid to have (4) Firestone Wilderness AT tires replaced on an affected vehicle.	o August 1, 2000 through May 22, 2001 (October 31, 2001 for 1995 and 1996 F-150) full refund with paid receipt o Customer does not need old tire(s) o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
Example: On January 15, 2001 the customer paid to have (2) Wilderness AT tires replaced on a 1988 F-Series truck. The other tires are non-Firestone Wilderness AT.	o August 1, 2000 through May 22, 2001 – full refund with paid receipt o Dealer contacts Special Service Support Center at 1-800-325-5621 for approval code o Customer does not need old tire(s) o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*

or 17-inch Firestone Wilderness AT tires. Use the DOT Code Identification Guide in conjunction with the bulletin section "What if the Vehicle has a Mix of Affected and Non-Affected Tires" to determine how many tires are eligible for refund.

NOTE:

Ford will allow customers to file for a refund (with or without tires) for tires purchased after May 22 through June 30, 2001 because customers may not have tires to turn in. Customers must provide a paid receipt indicating tire replacement before July 1, 2001 in order to process a refund without tires or DOT sections. Customers who purchase tires after June 30, 2001 must provide tires or DOT sections.

Ford will reimburse customers the following amounts:

^ Tires purchased from August 1, 2000 through May 22, 2001, the actual cost as stated on their paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes.

^ (1995 and 1996 F-150 vehicle only) Tires purchased from August 1, 2000 through October 31, 2001, the actual cost as stated on their paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes. No DOT section required.

^ Tires purchased May 23, 2001 through November 15, 2001, the actual cost as stated on the receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes up to a maximum of $110 per tire for 15 inch, and $130 per tire for 16 and 17 inch tires.

^ Refunds will not be granted for tires purchased after November 15, 2001.

Note:

If an owner pays for the replacement of their tires after November 15, 2001, the dealer may handle on a case by case basis following the procedure in Attachment II.

Refund Questions	What is the owner qualified to receive?
Example: On May 27, 2001 the customer took their 1998 Explorer to an outside tire retailer and had (5) Firestone Wilderness AT 16 inch tires replaced.	o After May 22, 2001 refund tire replacement with paid receipt up to: o 15 inch = $110 (maximum per tire) o 16 and 17 inch = $130 (maximum per tire) o With a paid receipt this customer would be entitled to (5) tires x $130 (16 inch maximum per tire) = $650 refund (includes mounting, balancing, stems, disposal, and taxes) o Dealer will be eligible to claim for refund allowance using labor operation 01B77L o If the customer returns the old tires to the dealer o The dealer will disable the old tires and dispose of them using the *"National Tire Recovery and Recycle Program"* using labor operation 01B77G (disable) in conjunction with 01B77L (refund allowance) o Customer does not need old tire(s) *since tires purchased prior to July 1, 2001* (After June 30, 2001 customer will need old tires or removed DOT codes from replaced tires to qualify)
Example: On December 2, 2000 the owner replaced their (5) Firestone Wilderness AT tires with another set of Wilderness AT tires.	o The owner is not eligible for refund o The owner is eligible for tire replacement only o Use only tires from the "Ford Approved Tire List"
Example: *On November 16, 2001 the owner purchases tires from a tire retailer.*	o *No refund will be granted after November 15, 2001* o *Dealers may handle on a case-by-case (See Attachment II)*
Example: *On October 10, 2001 a 1995 F-150 owner purchases tires from a tire retailer.*	o *August 1, 2000 through October 31, 2001 – full refund with paid receipt* o *Customer does not need old tire(s) or DOT section(s)* o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*

CLAIMS PREPARATION FOR REFUNDS (USE THIS PROCEDURE FOR ALL REFUND REQUESTS)

NOTE:

Tires must be purchased prior to November 15, 2001

^ Enter claims using DWE.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Enter information on a Recall/ONP claim type. DO NOT use a Warranty Claim type.

^ Program code 01B77.

^ When a customer brings in their old tires and is seeking a refund, use labor operation 01B77G (disable) and 01B77L (refund administration allowance) from Attachment II.

^ If a customer brings in the old DOT codes removed from the old tires - use labor operation 01B77L only.

^ The Miscellaneous Expense Code "ADMIN" will not be accepted under this program. A labor operation 01B77L has been provided to cover administrative costs.

^ Enter REFUND in the miscellaneous area of the claim.

^ Dealers will no longer be able to claim tire disposal for ONP 01B77. See the "National Tire Recovery and Recycle Program" You may still claim any applicable local waste tax - enter OTHER

in the expense area of the claim with the actual cost.

^ Enter each unique (complete 10 or 11 digit) DOT codes of the replaced tires in the diagnostic code entry screen in the field marked "other". If the DOT codes cannot be completely entered in the space provided in the diagnostic code area, use the technician comment area to complete the data entry. If the tires were replaced prior to May 23, 2001 (or November 1, 2001 for 1995 and 1996 F150 customers) the DOT may not be available, in this case record the brand, make and size of the tires in the technician comments area of the claim.

RENTAL CARS

TAP allowances have been increased specifically for this owner notification program. Refer to Don Brunner letter.

DOT REGISTRATION OF NEW TIRES

Dealers are required to register the DOT number of every tire sold to meet federal tire registration requirements. Ford has established a partnership with CIMS to assist dealers in registering these DOT codes. Information is available on QCDealer.com under CIMS Tire Registration or by contacting CIMS

Description	Labor Operation	Labor Time
Inspect for non-Wilderness AT tires (used to close 01B77 not for use when processing a refund)	01B77A	0.2 Hours
Replace & balance 1 tire (to be used for spare tire only)	01B77B	0.4 Hours
Replace & balance 2 tires (one axle)	01B77C	0.6 Hours
Replace & balance 3 tires (one axle plus spare)	01B77D	0.8 Hours
Replace & balance 4 tires (both axles)	01B77E	1.0 Hours
Replace & balance 5 tires	01B77F	1.2 Hours
Disable up to five tires (used only for refund claims)	01B77G	0.2 Hours
*Refund administration allowance (to be used when processing a customer refund without tire disposal, if tires are returned to dealership for disposal use in conjunction with operation 01B77G)	01B77L	0.2 Hours
Administrative Allowance for Non-Certified Tire Dealers (AtW or Ford Tire Program) to be used when sending a dealer stock unit, or customer vehicle (for tire replacement) to a Certified Tire Dealer, or tire retailer authorized to perform tire replacement under this program	Misc. Expense use code "SCHP"	$15.00

NOTE: Front-end alignment is not included in this program.

***NOTE:** When processing a refund for four (4) road tires, the non-temporary spare tire should be replaced as part of this program – file a related damage claim to cover the spare tire replacement.

at 330-794-9190.

NON-FORD OR LINCOLN MERCURY VEHICLES WITH FIRESTONE WILDERNESS AT

Non-Ford or Lincoln Mercury vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires installed by a Certified Tire Dealer (AtW or Ford Tire Program) are eligible for replacement. The repair should be submitted using a Warranty/ESP claim type form. The dealer must enter Program Code "P19", this will allow the repair to be submitted without a VIN. The causal part must be TIRE, with the actual part numbers for reimbursement at dealer cost plus 25%, and use actual time for labor reimbursement. These types of claims cannot be submitted as an Owner Notification Repair type.

Attachment II - Parts and Labor Information

LABOR ALLOWANCES

NON-AtW DEALERS SERVICING IN-STOCK UNITS OR CUSTOMER VEHICLES

NOTE:

Non-Certified Tire Dealers (AtW or Ford Tire Program) who have vehicles in stock, or customer vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires must send the vehicle to a Certified Tire Dealer (AtW or Ford Tire Program), or an approved tire retailer participating in the program to have the tire replacement performed. The non-Certified Tire Dealer (AtW or Ford Tire Program) will submit a 01B77 ONP claim using the miscellaneous expense code of "SCHP" (with a dollar value of $15.00 to cover administrative costs). Do not claim the "Admin" labor operation.

PARTS REQUIREMENTS

Tire Ordering Information

^ Dealers are required to install only tires from the Approved Tire List for vehicles originally equipped with 15-, 16-, and 17-inch Firestone Wilderness AT tires. Dealers should immediately order replacement tires for inventory.

^ Certified Tire Dealers will order replacement tires through normal channels.

^ Dealers not authorized for the Around the Wheel Program will not participate in this recall. Dealers may call the Ford Tire Hotline 1-888-353-3251 for enrollment and program details.

TIRE AVAILABILITY:

All dealers should check QCDealer.com daily for updates to the approved tires list. Distributors and tire retailers will allocate tires as best they can on a daily basis. Your dealership should do the following to ensure that you are able to secure your fair allotment of these limited volumes:

^ Contact your Ford authorized facing distributor(s) for each tire manufacturer.

^ Contact your Ford authorized facing tire retailers for each tire manufacturer.

^ Review with these supply points the volume of tires you need to ensure you have tires ready to fill orders with every supply point.

Questions not addressed by above sources should be directed to your market area team.

CUSTOMER WAIT LISTS:

Dealers should create a customer wait list and record: Customer name

^ Address and phone number

^ Vehicle make

^ Model year

^ Mileage

^ Tire size

NOTE:

Customers should be prioritized to replace oldest tires first.

WAIT LIST SURVEY

Please fill out the Firestone Tire Survey in the Management Report Section of QCDealer weekly. It is critical that you answer the questions as accurately as possible as the survey results will be used to help determine the level of production from the tire manufacturers.

DEALER PRICE

For latest prices on replacement tires, refer to the most recent Ford Motor Company Tire Price List.

PROCEDURE FOR CLAIMING REFUNDS FOR TIRES PURCHASED AFTER NOVEMBER 15, 2001

The following procedure applies to tires purchased after November 15, 2001:

1. Determine if the customer should receive special consideration based on owner loyalty, special circumstance cc, etc.

2. If the customer is eligible for special consideration the dealer will call the Special Service Support Center at 1800-325-5621 to request an authorization code.

3. The Special Service Support Center representative will ask for the following:

^ Customer Name

^ VIN

^ Date of repair

^ Original copy of invoice (be prepared to fax)

4. If the customer qualifies for a refund, the Special Service Support Center will provide your dealer with an authorization code.

5. Your dealer will input a claim with the authorization code (authorization code must be included to receive payment).

6. After the dealer receives payment for the claim, the dealer will then send the refund to the customer.

NOTE:

If the Special Service Support Center determines that the customer does not qualify for a refund, no authorization code will be given. Any appeals must be made by the dealer to the appropriate field representative

Attachment III - Technical Information

AFFECTED VEHICLES: REFER TO DEALER LETTER FOR AFFECTED TIRES AND VEHICLES

OVERVIEW

This program details the replacement of 15-, 16-, and 17-inch Firestone Wilderness AT tires regardless of production plant. You will need to perform a DOT code inspection prior to replacing the 15, 16, or 17-inch Wilderness AT tires.

NOTE:

When lowering or raising an under-vehicle spare, DO NOT use power tools. Also make sure that the spare is secure under the vehicle, and not swinging loose. The spare tire winch will ratchet when the tire is completely stowed.

NOTE:

Radial ATX "TEMPORARY USE" spare tires are not included under this program, and should not be replaced as part of this program.

NOTE:

Spare tires should always be replaced with the exact same size tire; otherwise the spare tire may not store in the proper position on the vehicle.

INSPECTION

1. Inspect the vehicle tires (including the spare tire) for the presence of Firestone Wilderness AT tires.

2. If Firestone Wilderness AT tires are present replace them with a suitable replacement from the "Approved Tire List".

Note:

There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.

3. If only one Firestone Wilderness AT road tire is present on the vehicle, you will need to replace the opposing tire on the same axle. However, if one (1) front and one (1) rear tire are Wilderness AT you would not automatically replace all four (4) tires instead, you would replace the two (2) Wilderness AT tires and place them on the same axle.

4. Record the DOT code from each removed tire(s) on the repair order.

5. Tires that are removed from vehicles must immediately be made unusable by either cutting through the bead and DOT code with bolt cutters, or drilling a one-inch diameter hole (directly on the DOT code to make the code unreadable) in the sidewall.

6. Adjust all tires to the proper inflation pressure, and release the vehicle. For specifications, refer to the vehicle Owner's Manual or the vehicle certification label located on the driver's door opening.

NOTE:

Tires that are removed from vehicles under this program, and those in dealer inventory must immediately be made unusable by either cutting the bead with bolt cutters or drilling a 1" diameter hole (directly on the DOT code to make the code unreadable) in the sidewall. Defacing the DOT

code will prevent the tire from being used for an additional refund request.

NOTE:

If the vehicle is a 4X4, and is equipped with non-Firestone Wilderness AT tires on one axle, and the replacement tires for the Firestone equipped axle causes a mismatch with the existing non-Firestone axle, the customer is responsible for the tire mismatch. If the customer refuses to purchase matching tires to correct the mismatch - the dealer should annotate the repair order to reflect the customer's decision.

Ford Motor Company

FIRESTONE TIRE RECALL

September 2000

TO: All Ford and Lincoln Mercury Dealers
SUBJECT: Firestone Tire Recall Supplement #4 9/1/00 - Updated Information
REFERENCE: Firestone Recall - Firestone P235/75 R15 Radial ATX and Certain Wilderness AT tires

Changes for this Supplement:

- The following has been added to Attachment I to clarify the claiming of freight: Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier.
- Additional information is now required in the comments of each claim filed for tire replacement under both Program Codes P17 and P18. The comments must include the entire DOT code from the tire being replaced and under P17 only the part number of the replacement tire. Firestone requires this information for government reporting.

Claims under the Firestone recall for tire replacement filed by Ford and Lincoln Mercury dealers not enrolled in the AtW/Ford Tire Program will not be accepted for payment. Non-AtW/Ford Tire Program dealers will continue to be able to file claims for tire inspection. This is not new information; we have just added the edits to the ACES II system.

The revised letter and attachments have been marked "Revised 9/1/00", and a ( ) symbol appears at the beginning of any text that changed since the last Supplement and the text appears in green when viewed on line. To avoid confusion please discard all previous versions.

Sincerely,

A. R. O'Neill
Director
Vehicle Service and Programs

1999 - 2001	Eddie Bauer and Limited	16"

Firestone Recall - Firestone P235/75 R15 Radial ATX and Certain Wilderness AT tires.

AFFECTED TIRES AND VEHICLES

Bridgestone Firestone Tire Company recently announced a Safety Recall on the following:

- All Firestone P235/75 R15 Radial ATX tires produced excluding tires marked "TEMPORARY" on the sidewall - and -

- P235/75 R15 wilderness AT tires produced only at the Decatur plant.

NOTE:

Decatur built tires have a DOT code of VDHL - see Attachment III for details. All other Wilderness AT tires are not affected.

Both original equipment (OE) and replacement tires are affected.

The following vehicles produced with Firestone P235/75 R15 Radial ATX original equipment tires are affected by this recall:

^ Certain 1991 through 1996 Ford Explorer (see chart)

^ Certain 1997 Mercury Mountaineer vehicles

^ Certain 1991 through 2000 Ranger vehicles

^ Certain 1991 through 1994 Bronco vehicles

^ Certain 1991 through 1994 F-Series vehicles

The following vehicles produced with P235/75 R15 Wilderness AT tires as original equipment are affected by this recall:

Certain 1997 through August 7, 2000 Mountaineer vehicles

^ Certain 1997 through August 7, 2000 Explorer vehicles (see chart)

^ Certain 1997 through June 1, 2000 Ranger vehicles

^ Certain 2001 Explorer Sport Trac and Sport vehicles produced through August 7, 2000

These Explorer vehicles produced with either P235/75 R15 Radial ATX or P235/75 R15 Wilderness AT tires as original equipment are affected as shown.

These Explorer vehicles are NOT affected:

IMPORTANT FACTS

^ This is a FIRESTONE recall.

^ FIRESTONE will notify customers of the recall via first class mail.

^ FIRESTONE will communicate recall information to authorized repair sites including Ford and Lincoln-Mercury Around the wheel/Ford Tire Program dealers.

FORD AND LINCOLN MERCURY DEALER INVOLVEMENT

As this field action will severely impact the availability of Firestone replacement tires, Ford and Lincoln Mercury Around the Wheel (AtW)/Ford Tire Program dealers will be afforded the opportunity to address this recall utilizing Firestone and non-Firestone tires. This is being done to address immediate needs of our customers.

FORD AND LINCOLN MERCURY DEALERS ENROLLED IN AROUND THE WHEEL (AtW)

Dealerships enrolled in the AtW/Ford Tire Program are authorized Firestone outlets. If a customer with affected tires contacts an ATW Ford Tire Program dealer, as an authorized Firestone dealer regarding this safety recall, you will be able to replace that customer's tires with Firestone or "approved" non-Firestone tires. Tires that are approved for use as replacement tires under this recall will be posted in a matrix in the Firestone Tire Center in QCDealer.com. This matrix will be amended to add new tire manufactures and models of tires as they are approved. Claiming for reimbursement of tires is outlined on Attachment I.

If the customer requests a replacement Firestone tire, secure the tire through your normal distribution chain and process reimbursement as outlined in Attachment I.

FORD AND LINCOLN MERCURY DEALERS NOT ENROLLED IN AROUND THE WHEEL (AtW)

Dealers not enrolled in the ATW/Ford Tire Program can inspect customer vehicles (see Attachments I & II for claiming instructions & labor operations). These dealers should make individual arrangements with local Firestone outlets for tire replacement, or refer customers to their local Firestone outlet.

SERVICE PROCEDURE

All Firestone P235/75 R15 tires with Radial ATX on the sidewall (excludes Temporary spare tires identified by "Temporary" on the sidewall) must be replaced under this recall.

Firestone P235/75 R15 tires with Wilderness AT on the sidewall will need to be inspected for a DOT code of VDHL to determine if replacement is required. Refer to Attachment III for details.

This service action applies to original equipment and replacement tires that are installed on Ford and Mercury vehicles.

DEMONSTRATION / DELIVERY HOLD FOR VEHICLES AND TIRES IN DEALER INVENTORY

Do not demonstrate or deliver any of the affected vehicles prior to completing the Firestone recall. In addition, Ford and Lincoln Mercury Around the Wheel (AtW)/Ford Tire Program dealers may have affected tires in inventory; these tires should not be sold.

Tires Removed from Vehicles

Tires that are removed from vehicles must immediately be made unusable by either cutting the bead with bolt cutters, drilling a one-inch diameter hole in the sidewall, or cutting the tire completely in half The DOT code should not be defaced or removed. The tire should then be disposed of according to local laws refer to the Tire Administration Guide for further information.

NOTE:

AtW/Ford Tire Program dealers will be independently audited for compliance with the above procedure.

New Inventory Tires

All new Radial ATX or Wilderness AT tires with DOT code VDHL tires (never mounted) in AtW/Ford Tire Program dealer inventory must be returned to Firestone. Dealers must call 1-800-668-0345 to obtain a "Returned Goods Authorization (RGA) number. The RGA is a 6-digit number required to return the tires. Only tires affected by the Firestone recall will be accepted. Firestone will pay all freight for the return of these tires.

CONTACTS

Claims Information: 1-800-423-8851

Other (Dealer Only) Recall Questions: 1-800-325-5621

For Around the Wheel/Ford Tire Program 1-888-353-3251

Questions:

Attachment I

OASIS Since this is a Firestone recall, OASIS will not be activated.

PLEASE NOTE

Correct all vehicles in stock before delivery. Federal law requires dealers to complete any outstanding safety recall service before a vehicle is delivered to the buyer or lessee. Violation of this requirement by a dealer could result in a civil penalty of up to $1,100 per vehicle.

CLAIMS PREPARATION AND SUBMISSION

NOTE:

Claims for Firestone tires (P18) may be entered for payment beginning with repairs dated August 28, 2000 and later.

Claims for non-Firestone tires

Enter claims in ACES II for non-Firestone tires using DWE with the following information:

^ Enter information on a warranty claim. DO NOT use a recall claim.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Program Code - P17. Enter P17TIRE as the causal part with condition code 82.

^ On the same line as PI7TIRE enter the total value of the tires from the "Suggested List Price" column of the latest Ford Motor Company Tire Selling Guide.

^ Use the appropriate labor operation(s) from Attachment II.

^ Freight is reimbursable at actual cost in the miscellaneous expense area of the claim.

NOTE:

Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier.

^ Tire disposal and applicable local waste tax will be reimbursed - enter OTHER in the miscellaneous expense area of the claim with the actual cost.

^ Enter the entire DOT code and the part number of the replacement tire being used in the comments area of the claim.

Claims for Firestone tires

Enter claims in ACES II for Firestone tires using the following information:

^ Enter information on a warranty claim. DO NOT use a recall claim type.

^ Program Code - P18.

^ Enter "P18TIRE" as the causal part, no material cost should be entered on this line.

Description	Labor Operation	Labor Time
Inspect 5 tires applies only to P235/75 R15 Wilderness AT tires) - VEHICLE NOT AFFECTED (Non VDHL DOT Code)	00V01G	0.2 Hours
Inspect 5 tires (applies only to P235/75 R15 Wilderness AT tires) - VEHICLE AFFECTED - Customer must return at a later date due to unavailability of replacement tires. This may be claimed only one time per vehicle per dealer.	00V01A	0.2 Hours
Replace & balance 1 tire (No longer includes inspect) May be used with labor op 00V01A only	00V01B	0.4 Hours
Replace & balance 2 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01C	0.6 Hours
Replace & balance 3 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01D	0.8 Hours
Replace & balance 4 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01E	1.0 Hours
Replace & balance 5 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01F	1.2 Hour

^ Condition code "82".

^ Use Customer Concern Code "A99".

^ Enter the full published tire part number with the quantity of tires replaced, the payment system will price the tire at Dealer Net multiplied by the quantity for the total value of the replaced tires.

^ Use Miscellaneous Expense Code "TIREMU" to claim the $20.00 difference per tire7 a maximum of $100.00.

^ The Firestone warranty claim form must be filled out and attached to the hard copy of the claim and retained in the service file. The entire DOT code from the replacement tire(s) must be recorded on this form.

^ The DOT code must also be entered in the comments area of the claim.

^ No labor operations will be allowed when claiming P18.

OWNER REFUND

Ford and Lincoln Mercury dealers, including AtW/Ford tire dealers; will not be involved in processing refunds for customers included in the Firestone recall. Customers inquiring about a refund should be provided copies of the Firestone refund request form. Refer to the Firestone website for the refund forms and for further details.

RENTAL CARS

TAP allowances have been increased specifically for the Firestone recall refer to M.J. Lombardi's Letter.

Attachment II

LABOR ALLOWANCES

NOTE:

Front-end alignment is not included in this recall.

NOTE:

These labor operations and revised times will begin paying with claims submitted on August 18, 2000; Claims in process at dealerships will need to use these new operations.

PARTS REQUIREMENTS

Tire Ordering Information

FIRESTONE TIRE INSPECTION

AFFECTED VEHICLES: **REFER TO DEALER LETTER FOR AFFECTED TIRES AND VEHICLES**

OVERVIEW

This procedure outlines how to check the DOT code on the tires and determine if they must be replaced.

NOTE: All Firestone P235/75R15 tires that say "RADIAL ATX" on the sidewall are being recalled and no further inspection is necessary.

NOTE: All tires including the spare must be inspected if they are "WILDERNESS AT" P235/75R15.

NOTE: When lowering or raising an under-vehicle spare, **DO NOT** use power tools. Also make sure that the spare is secure under the vehicle, and not swinging loose. The spare tire winch will ratchet when the tire is completely stowed.

INSPECTION

1. Raise vehicle on a hoist.
2. Locate the DOT code on the inboard sidewall of all tires including the spare. On F-Series and Bronco models, the spare tire must be lowered to view the DOT code. Clean the area if necessary in order to accurately read the code.
3. If the DOT code is **VDHL**, the tire must be replaced. See the matrix (part of the dealer bulletin) to determine the correct replacement tires. See Figure 1.

NOTE: Recall tires that are removed from vehicles and in dealer inventory must immediately be made unusable by either cutting the bead with bolt cutters or drilling a 1" diameter hole in the sidewall.

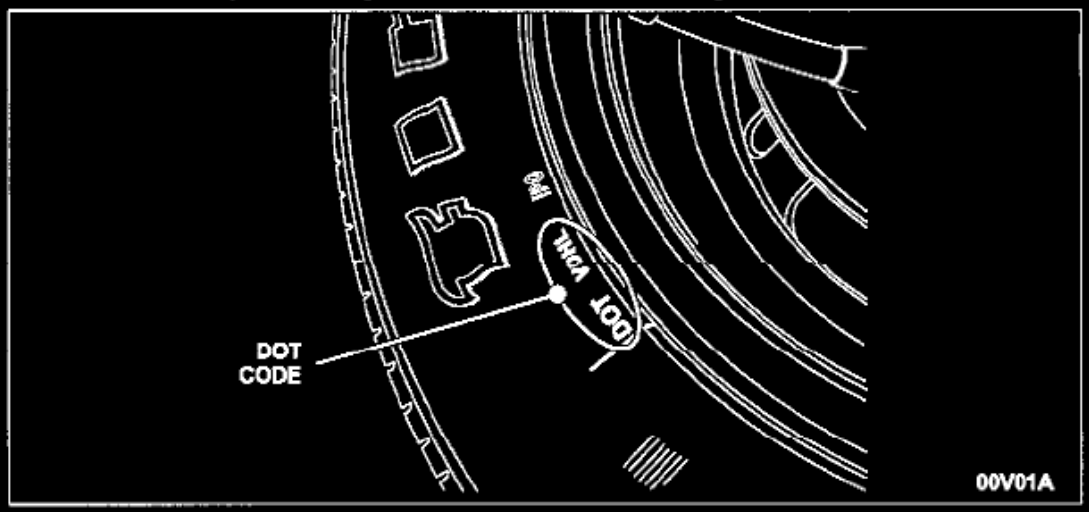

FIGURE 1

4. If the code is anything other than **VDHL**, release the vehicle to the owner.

CPR© 2000 FORD MOTOR COMPANY
DEARBORN, MICHIGAN 48121
08/00

Authorized Around the Wheel (ATW)/Ford Tire Program dealers will order replacement tires through normal channels. Dealers not authorized for the Around the Wheel Program will not participate in the Firestone recall. Dealers may call the Ford Tire Hotline 1-888-353-3251 for enrollment and program details.

DEALER PRICE

For latest prices on replacement tires refer to the most recent Ford Motor Company Tire Selling Guide.

Tires: Customer Interest Transfer Case - Unable to Disengage 4WD Into 2WD

Article No. 91-20-17

10/02/91

TRANSFER CASE - 4X4 - UNABLE TO DISENGAGE

LIGHT TRUCK: 1990-91 RANGER 1991 EXPLORER

ISSUE: The vehicle may remain in 4 Wheel Drive after the transfer case has been shifted back into 2WD. This may occur because of uneven tire wear, the front axle hubs not disengaging, or the return spring force not being sufficient to move the lock-up fork back to the 2WD position.

ACTION: Inspect the vehicle tires for wear and, if necessary, replace the return spring, sleeve spring and lock-up fork in the transfer case.

INITIAL CHECKS

1. Rotate the tires and check for evidence of an uneven wear band or spots.

2. Set the tire pressure as specified on the safety compliance certification label.

3. Confirm that the tires are matched in design, size and manufacture.

4. Confirm by hand rotation that the front axle automatic and manual locking hubs are disengaging correctly.

NOTE: IF THE VEHICLE WAS PREVIOUSLY REPAIRED PER TSB 91-15-10, THE TRANSFER CASE WAS UPDATED WITH THE PARTS

INCLUDED IN THIS TSB. IF THE UPDATED TRANSFER CASE STILL WILL NOT DISENGAGE AFTER FOLLOWING THE INITIAL CHECKS, THEN THE CAUSE COULD BE THAT THE DRIVER IS NOT ALLOWING SUFFICIENT TIME FOR THE 4WD SYSTEM TO DISENGAGE.

VERIFICATION

Drive the vehicle. If the transfer case still will not disengage after performing the initial checks, proceed as follows:

1. Shift the vehicle with lever operated or electric shift transfer case to 4WD high.

2. Hand rotate the front axle manual locking hubs to the lock position, if so equipped.

3. Drive the vehicle slowly in a tight turn on dry hard pavement until you feel the front wheel power hop/skip which indicates that the 4WD system is engaged.

4. Drive the vehicle on a frame hoist...

a. Shift the automatic or manual transmission to neutral.

b. Shift the transfer case to 2WD.

c. Turn the ignition key to the OFF position.

5. Raise the vehicle on the frame hoist, making sure all tires are free to rotate.

6. Using gloves, hand rotate the rear driveshaft while viewing the front driveshaft for rotation.

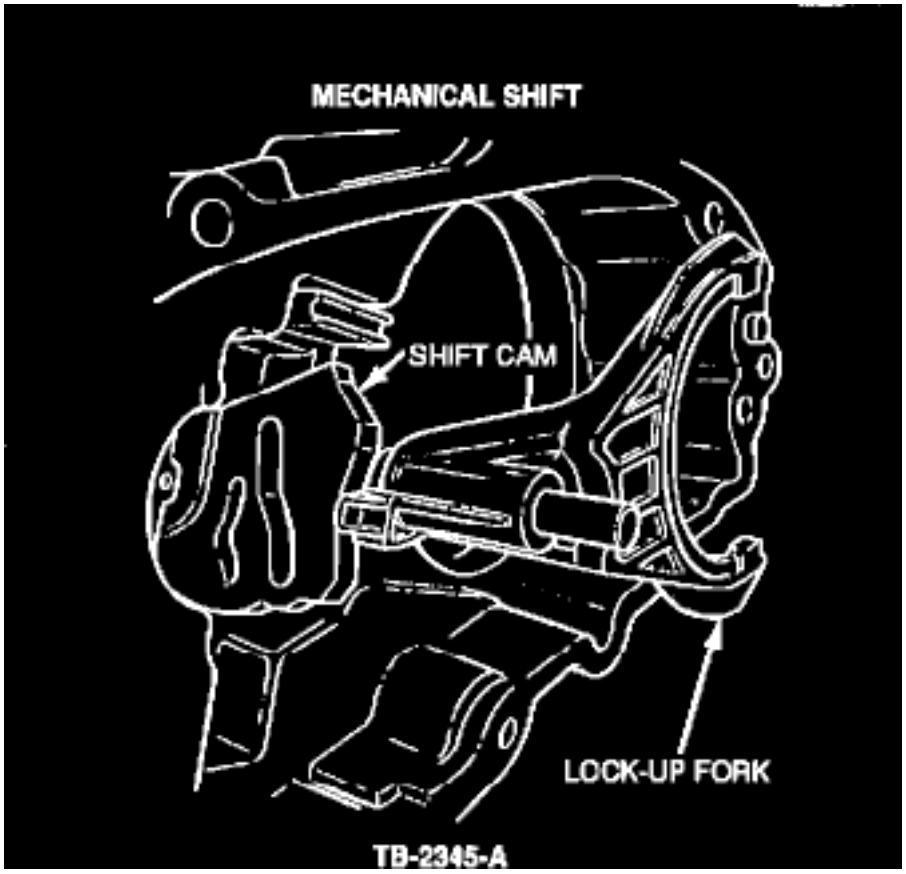
^ If the front driveshaft does not rotate, this indicates that the transfer case has disengaged and is functioning correctly.

^ If the front driveshaft rotates while turning the rear driveshaft, this indicates that the transfer case has not disengaged and must be repaired.

7. Before starting the repair, repeat the above procedure a second time to confirm that the transfer case will not disengage.

ELECTRIC SHIFT TRANSFER CASE

If the above procedure is not conclusive, for an electric shift transfer case system, proceed as follows:



1. Remove the 7K470 speed sensor/wiring harness bracket and 7F293 speed sensor assembly from the transfer case.

2. With the use of a light and looking into the speed sensor opening...

a. Locate the white or black 7289 lock-up fork.

b. Using a straight tool, push it forward toward the front of the vehicle.

^ If the lock-up fork does not move, this indicates that the lock-up assembly has moved back to the 2WD position and the transfer case is functioning correctly.

^ If the lock-up fork moves about 3/8" (9.525 mm), this indicates that the lock-up assembly remained in the 4WD position or did not disengage and must be repaired.

TRANSFER CASE REPAIR

Refer to the 1991 Ranger and Explorer Service Manual, Sections 07-07E and 07-07D, for procedures to remove and dissemble the transfer case. Install and reassemble the following components:

^ One (1) Return Spring (F1TZ-7219-A)

^ One (1) Sleeve Spring (E6TZ-7D126-A), with large end installed first into bore of 7106 lock-up collar.

^ One (1) Lock-Up Fork (F1TZ-7289-D, bone white color).

Figure 1

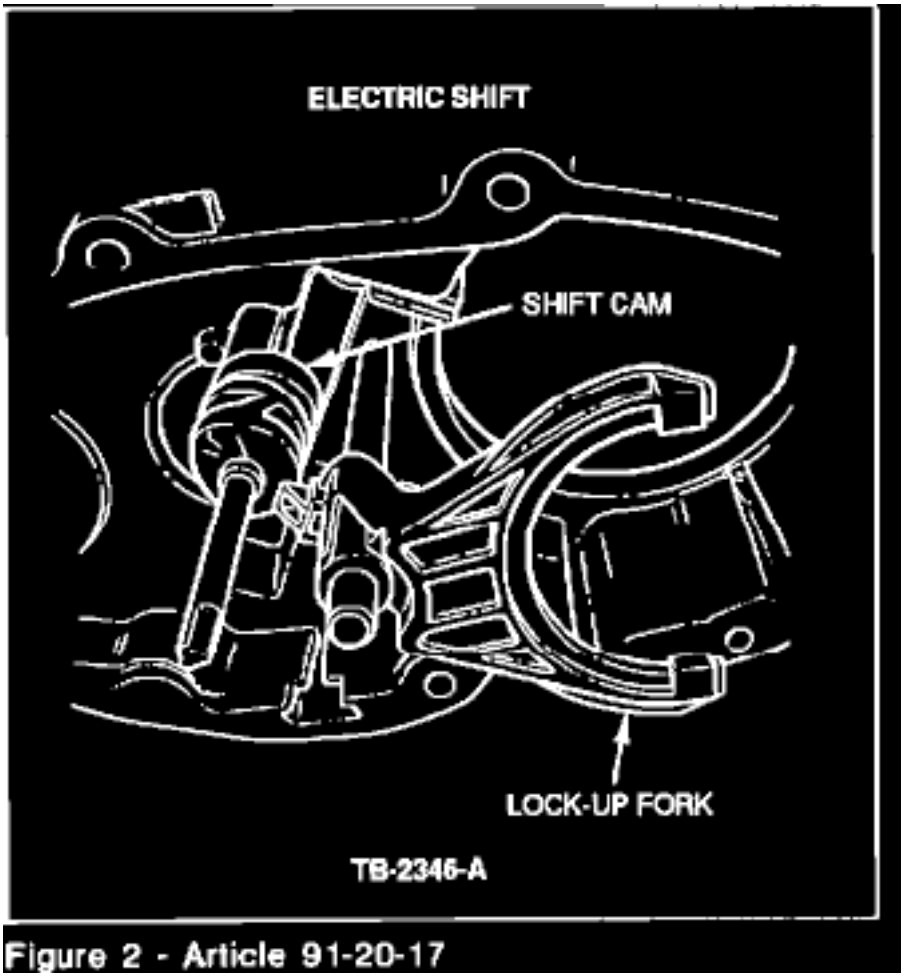


Figure 2 - Article 91-20-17

Figure 2

NOTE: WHEN INSTALLING THE 7289 LOCK-UP FORK, MAKE SURE THAT THE 7235 LOCK-UP FORK ROLLER BUSHING IS

POSITIONED ON THE TOP OR END SURFACE OF THE 7F063 SHIFT CAM AND NOT INTO AN INSIDE CAM TRACK, FIGURES 1 AND 2.

Reinstall the transfer case in the vehicle and check for shift function including engagement and disengagement.

Ford Motor Company

October 2001

TO: All Ford and Lincoln Mercury Dealers

SUBJECT: **Owner Notification Program 01B77 Supplement 7:** 10/12/01 Updated Information

REFERENCE: **Owner Notification Program 01B77 – Ford Wilderness AT Program:** Replacement of Wilderness AT tires

PROGRESS TO DATE

- To date we have replaced close to 7 million tires or 55% of the total tires needed
- Ford and Mercury dealers are currently handling over 70% of all Wilderness AT replacements
- All tire sizes are now readily available, though certain brands may not be available

The following information has been updated for ONP 01B77:

CHANGES MADE TO THE ALL DEALER LETTER

- ONP 01B77 – Ford Wilderness AT program will expire on March 31, 2002
- Tires purchased by customers after November 15, 2001 will not be eligible for a refund
- All customers who have not had their tires replaced will receive a follow-up letter by the end of October, 2001 announcing these program changes and encouraging them to visit a Ford Motor Company dealership for tire replacement
- 1995 and 1996 F-150 customers, which were added to the program on August 17, 2001, will receive their first notification letter by the end of October, 2001, which includes the following:
  - The customer must have their tires replaced at a Ford Motor Company dealer
  - They will only be eligible for refunds if they purchased their tires between August 1, 2000 through October 31, 2001

    NOTE: Refunded at actual cost and no DOT sections required, since these customers were never notified of the DOT requirements and maximum dollar limit.
- Effective immediately all tire refund requests are to be processed through the dealer (Online Refund Form should no longer be used)

CHANGES TO ATTACHMENT I

- Tires purchased by customers after November 15, 2001 will not be eligible for a refund
- The Online Refund Form used for refunds before May 22, 2001 is no longer posted on the web

CHANGES TO ATTACHMENT II

- Wait List Survey link added
- A procedure has been added to handle customers who purchase tires after November 15, 2001 and are seeking a refund

All revisions since Supplement 6 are in *red italics* and revised pages have been marked "*Revised10/12/01.*"

Sincerely,

Ann O'Neill
Director
Vehicle Service and Programs

Technical Service Bulletin # 01B77 Date: 011001

Ford Motor Company

May 2001
Revised 10/12/01

TO: All Ford and Lincoln Mercury Dealers

SUBJECT: **Owner Notification Program 01B77-S7 – Ford Firestone Wilderness AT Program:** Replacement of Firestone Wilderness AT tires.

OASIS: Yes
OWNER LIST: Yes
PARTS RETURN: No
PROGRAM TERMS: This program will expire *March 31, 2002* and has no mileage limit.

WHAT WE ARE DOING AND WHY

On August 9, 2000 Firestone initiated a voluntary recall of 6.5 million tires, including 3.8 million P235 75R15 Radial ATX tires manufactured since 1990 at all North American Firestone plants. Also, Firestone recalled about 2.7 million P235 75R15 Wilderness AT tires made at its Decatur, Illinois plant. The recall included both original equipment and replacement tires. As of January 22, 2001 more than 6.1 million tires have been replaced – the recall is more than 94% complete.

Under this new owner notification, Ford will replace 13 million Firestone Wilderness AT tires on Ford and Mercury SUVs and pickup trucks listed below under "affected tires and vehicles." This is a voluntary precautionary measure. Ford made the decision to take this action after extensive examination of field data as well as laboratory and track testing in close collaboration with NHTSA. The field data, along with our testing and statistical analysis, shows a directional trend toward elevated failure rates, that differs based upon where the tires were manufactured. Ford does not have sufficient confidence in the future performance of these tires, so we are acting in the interest of our customers to ensure their continued trust and confidence.

To date we have replaced close to 7 million tires or 55% of the total tires needed for this program. Ford and Mercury dealers are currently handling over 70% of the Wilderness AT tire replacements. Also, with the increased availability of all 15-, 16-, and 17-inch tires at the dealers, Ford is changing the expiration date of the program to March 31, 2002 to encourage customers to have their tires replaced as soon as possible.

NOTE: Certain brands of tires may have limited availability.

AFFECTED TIRES AND VEHICLES

This program affects 15-, 16-, and 17-inch Firestone Wilderness AT tires and Ford and Mercury vehicles with these tires on them. The vehicles listed below may have been originally equipped with Firestone Wilderness AT tires or may have had Wilderness AT tires installed during the Firestone recall launched in August, 2000.

- Certain 1991 through 2002 Ford Explorer
- Certain 2001 through 2002 Explorer Sport, and Sport Trac
- Certain 1997 through 2002 Mercury Mountaineer
- Certain 1991 through 2001 Ranger
- Certain 1999 through 2001 Expedition
- Certain 1991 through 1997 F-Series
- Certain 1991 through 1994 Bronco

NOTE: Both original equipment (OE) and replacement tires are affected.

IMPORTANT FACTS

- *Ford Wilderness AT tire program will expire on March 31, 2002.*
- *Tires purchased by customers after November 15, 2001 will no longer be eligible for a refund.*
- *A follow-up owner letter announcing program changes will be mailed beginning the week of October 17, 2001.*
- *1995 and 1996 F-150 owners, which were added to the program on August 17, 2001, will be notified by the end of October 2001.*
- All 15-, 16-, and 17-inch Firestone Wilderness AT tires (regardless of series number) that are mounted on Ford or Mercury vehicles are eligible for replacement.
- All other Firestone Wilderness AT tire sizes are not included in this program.
- AtW/Ford Tire Program dealers are to stop the sale of Firestone Wilderness AT tires in their parts inventory effective immediately.
- Ford Motor Company has notified customers of this owner notification program via first class mail.
- Customer refunds will be handled differently based on whether the tires were purchased before or after May 22, 2001.
- *Effective immediately all refunds will be processed through the dealer for customers who purchased their tires from August 1, 2000 through November 15, 2001, (Online Refund Form should no longer be used).*
- *1995 and 1996 F-150 owners will only be eligible for refunds for tires purchased between August 1, 2000 and October 31, 2001, (no DOT sections required).*
- A list of Ford-approved replacement tires is posted on QCDealer. Only these tires may be used as replacement tires for vehicles that were originally equipped with 15-, 16-, and 17-inch Firestone Wilderness AT tires under this program.
- There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.
- **Vehicles with branded titles** - although normally excluded from Owner Notification Programs are included as part of this program.
- Affected vehicles sold in Canada can be serviced by U.S. dealers, and affected vehicles sold in the U.S. can be serviced by Canadian dealers.

STOP SALE OF FIRESTONE WILDERNESS AT TIRES IN DEALER STOCK

Firestone Wilderness AT tires in stock at Ford and Lincoln Mercury dealers enrolled in the Around the Wheel or Ford Tire Program (Certified Tire Dealers) should not be sold. Dealers that purchased these tires through the Ford program and have them in stock should complete the *Unsold Wilderness AT Credit Form* located on QCDealer.com. If you have questions, call the Ford Tire Hotline at 1-888-353-3251 for disposal and credit information.

NON-AtW DEALERS SERVICING IN-STOCK UNITS OR CUSTOMER VEHICLES

Non-Certified Tire (AtW or Ford Tire Program) Dealers who have vehicles in stock, or customer vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires must send the vehicle to a Certified Tire Dealer (AtW or Ford Tire Program) or an approved tire retailer participating in the program to have the tire replacement performed. The non-Certified Tire Dealer (AtW or Ford Tire Program) will submit a 01B77 ONP claim using the miscellaneous expense code of "**SCHP**" (with a dollar value of $15.00 to cover administrative costs). Do not claim the "Admin" labor operation.

SERVICE PROCEDURE

All 15-, 16-, and 17-inch Firestone Wilderness AT (regardless of series number) tires installed on Ford and Mercury vehicles must be replaced under this owner notification program. Original equipment (OE) and replacement tires are included.

Spare Tires

Firestone Wilderness AT (regardless of series number) spare tires are affected and should be replaced. The Firestone P235 75R15 ATX temporary spare tire used on Ranger vehicles is not included in this program.

Note: Spare tires should always be replaced with the exact same size tire; otherwise the spare tire may not store in the proper position on the vehicle.

Note: When processing refunds for customers, inspect the spare tire; if the spare tire is a Firestone Wilderness AT (with the Ranger exception noted previously) replace the spare tire using the information provided on Attachment II.

Does Current Tire Condition Affect Replacement Procedure?

All affected tires should be replaced regardless of the mileage or the remaining tread on the tire. If the customer caused damage to the tires, i.e. hit a curb, accident, under inflation, alignment issues, the tire should still be replaced. If the tire is worn out, it should still be replaced.

What if the Vehicle has a Mix of Affected and Non-Affected Tires?

- If the spare tire is the only Wilderness AT, then only the spare should be replaced (see exception on temporary spares above).
- In most cases an owner's vehicle will have all 15-, 16-, or 17–inch Firestone Wilderness AT tires installed and require replacement of all tires. In cases where a vehicle has a mix of tire brands/sizes installed, replace all Firestone Wilderness AT tires and the remaining tires to match the tire brand and size by axle.

For example, if a vehicle has a Wilderness AT on the left front, a Wilderness AT on the right rear, a Wilderness AT for a spare, and the other two tires are not Wilderness AT; the spare and the left front and right rear should be replaced and the new tires should be installed on the same axle. The customer should also be advised that all tires should be the same size especially on 4 X 4 models.

What replacement tires may be used for vehicles originally equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tires?

Replacement tire(s) must be on the list of tires approved by Ford <link to approved tire list>. Any deviation from this approved list may change the vehicles handling, ride, vibration, and noise characteristics and cannot be claimed through Ford.

If customers are seeking reimbursement for tires purchased outside of a Ford Certified Tire Dealer, refer to Attachment I for reimbursement guidelines and claiming procedures. *Customers who purchase tires after November 15, 2001 are not eligible for a refund.*

Note: There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.

Note: "Blemished" tires may not be used as replacement tires under this program.

FORD AND LINCOLN MERCURY DEALER TIRE DISPOSAL PROCESS

- Tires that are removed from vehicles must immediately be made unusable by either cutting the bead through the DOT code with bolt cutters, or drilling a one-inch diameter hole (directly on the DOT code to make the code unreadable) in the sidewall. Defacing the DOT code will prevent the tire from being used for an additional refund request. Marking the last 6 characters of the VIN on the removed tire(s) is no longer required.
- The tires will be disposed of by using the "National Tire Recovery and Recycle Program".

Regional FCSD and independent personnel will be randomly auditing dealers for proper tire scrapping and claiming procedures. Any infractions will result in prior approval for tire owner notification claims.

Note: Make removed tires unusable during tire replacement. Do not stack tires and disable them at a later time.

DEALERSHIPS ELIGIBLE TO REPLACE TIRES UNDER THIS PROGRAM

All Ford and Lincoln Mercury dealers enrolled on the Around the Wheel or Ford Tire Program (Certified Tire Dealers) are eligible to complete tire replacements under this program.

Ford dealers interested in joining the Ford Tire Program may call the Ford Tire Hotline 1-888-353-3251 for enrollment and program details.

APPROVED RETAILERS PARTICIPATION IN PROGRAM

We have developed a program to authorize Goodyear, Michelin, Continental, and General tire retailers to perform tire replacements at no cost to customers. These eligible retailers will use only tires from the Ford Approved Tire List when performing no cost replacements. This was done to reduce customer inconvenience by:

- Eliminating customer out of pocket expense
- Maximize the number of customers whose replacement tires are those on the Ford Approved tire list
- Expedite the completion of this program
- Reduce administrative burden on our Ford and Lincoln Mercury dealers
- Reduce dealer tire disposal responsibility
- Allow dealers to continue with their normal day to day service business

Attachment I - Administrative Information

OASIS

OASIS must be used to determine vehicle eligibility.

IMPORTANT:

When an eligible vehicle is at the dealership for service, OASIS must be contacted to determine if Owner Notification Program 01B77 is open. If 01B77 is listed in OASIS as open, it is important that the vehicle is inspected for eligible tires. If the eligible vehicle is not equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tires a claim must be submitted using labor operation 01B77A to close the program. If an affected vehicle does not have 01B77 open, this may indicate that a refund

or tire replacement has already been processed on this vehicle.

Some Ford and Lincoln Mercury vehicles not listed in the AFFECTED TIRES AND VEHICLES list may have 15-, 16-, or 17-inch Firestone Wilderness AT tires installed. These vehicles are covered under this program, but will not be active in OASIS. Contact the Special Service Support Center at 1-800-325-5621 to obtain prior approval before performing the repair or issuing a refund. This will insure that a previous repair/refund has not been performed on the vehicle.

CLAIMS PREPARATION AND SUBMISSION

^ Enter claims using DWE.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Enter information on a Recall/ONP claim type. DO NOT use a Warranty Claim type.

^ Program code 01B77.

^ Enter the full part number of the replacement tire with the quantity of tires replaced. Tires will be reimbursed at AtW Dealer cost + 25% (wheel weights and valve stems incl.).

^ Use the appropriate labor operation(s) from Attachment II.

^ Freight is reimbursable at actual cost in the miscellaneous expense area of the claim.

NOTE:

Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier. Dealers are encouraged to arrange for shipment of 4 or more tires at a time.

^ Dealers can no longer claim tire disposal for ONP 01B77. See the "National Tire Recovery and Recycle Program". You may still claim any applicable local waste tax - enter OTHER in the expense area of the claim with the actual cost.

^ Enter each unique (complete 10 or 11 digit) DOT codes of the replaced tires on the diagnostic code entry screen in the field marked "other". If the DOT codes cannot be completely entered in the space provided in the diagnostic code area, use the technician comment area to complete the data entry.

RELATED DAMAGE

Vehicle damage caused by a tire related failure is not covered by this program. Refer to the Warranty and Policy Manual for proper claiming procedure for vehicles covered by the Ford Bumper-to-Bumper Tire Warranty (model years 2001 and 2002). All other pre-2001 model year vehicles with alleged tire related vehicle damage should be handled through the Firestone claims process, or by referring the customers to their insurance company.

Damage related to replacement of tires should be handled as described in the Warranty and Policy Manual.

OWNER REFUND

With the increased availability of replacement tires, it will no longer be necessary for customers to pay out-of-pocket expenses for tires. Therefore, refund requests for tires purchased after November 15, 2001 will no longer be granted. Owners will be notified of the refund expiration date and will be directed to a Ford or Mercury dealer They are directed to an authorized retailer only if the Ford or Mercury dealer cannot meet their scheduling needs or tires are not in stock. All Ford and Mercury dealers (AtW and non-AtW dealers) are required to process refunds for customers who purchase tires prior to November 15, 2001.

The following rules apply to refunds for tires purchased from August 1, 2001 through November 15, 2001:

Refunds will be processed for vehicles listed under "AFFECTED TIRES AND VEHICLES", and for other Ford and Lincoln Mercury vehicles that have 15-. 16-, or 17-inch Wilderness AT tires installed.

^ The customer must provide the original paid receipt (a copy of their paid receipt is acceptable on an exception basis in instances where the owner requires the original for another purpose (e.g. extended tire warranty or purchase rebate). The dealer will attach the receipt to the dealer file copy of the refund claim (see claim instructions below).

^ Dealers will be reimbursed to immediately disable tires returned for a refund (see claiming instructions for refunds and Attachment II for labor operations).

^ The tires must be purchased August 1, 2000 through November 15, 2001 to be eligible for a refund (through October 31, 2001 for 1995 and 1996 F-150 owners).

^ Customers requesting refunds for tire replacement May 22, 2001 through November 15, 2001 must provide either:

NOTE:

This does not apply to 1995 and 1996 F-150 customers.

^ The Firestone Wilderness AT tires that were replaced. Returned tire(s) are to be disabled by the dealership. Ford will reimburse the dealer to disable (see claim instructions below and use labor operation 01B77G). If tires are brought in for refund with the DOT codes missing dealers should not process the refund.

^ A section of the old tire(s) containing the DOT codes from each of the Firestone Wilderness AT tires that were replaced (To be cut from the Wilderness AT tires that were replaced by the outside repair facility) (use labor operation 01B77L). Dealers should deface (cut in pieces or make code unreadable) the DOT sections of the tire so they cannot be used to obtain another refund. If sections are brought in for refund with the DOT code defaced dealers should not process the refund.

NOTE:

The DOT Code Identification Guide has been developed to help dealers determine if the DOT sections returned to the dealership are from 15-, 16-,

Purchase Date Range	Refund Guidelines
August 1, 2000 through May 22, 2001	• The actual cost as stated on the paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes • *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
1995 and 1996 F-150 vehicles only *August 1, 2000 through October 31, 2001*	• *The actual cost as stated on the paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes (no DOT required)* • *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
May 23, 2001 through November 15, 2001	• 15 inch tires - $110 (includes mounting, balancing, stems, disposal, and taxes) • 16 and 17 inch tires - $130 (includes mounting, balancing, stems, disposal, and taxes) • Dealers process refunds
After November 15, 2001	• *No refunds accepted for tires purchased after November 15, 2001*

Refund Questions	What is the owner qualified to receive?
Example: On December 21, 2000 the customer paid to have (4) Firestone Wilderness AT tires replaced on an affected vehicle.	o August 1, 2000 through May 22, 2001 (October 31, 2001 for 1995 and 1996 F-150) full refund with paid receipt o Customer does not need old tire(s) o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
Example: On January 15, 2001 the customer paid to have (2) Wilderness AT tires replaced on a 1988 F-Series truck. The other tires are non-Firestone Wilderness AT.	o August 1, 2000 through May 22, 2001 – full refund with paid receipt o Dealer contacts Special Service Support Center at 1-800-325-5621 for approval code o Customer does not need old tire(s) o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*

or 17-inch Firestone Wilderness AT tires. Use the DOT Code Identification Guide in conjunction with the bulletin section "What if the Vehicle has a Mix of Affected and Non-Affected Tires" to determine how many tires are eligible for refund.

NOTE:

Ford will allow customers to file for a refund (with or without tires) for tires purchased after May 22 through June 30, 2001 because customers may not have tires to turn in. Customers must provide a paid receipt indicating tire replacement before July 1, 2001 in order to process a refund without tires or DOT sections. Customers who purchase tires after June 30, 2001 must provide tires or DOT sections.

Ford will reimburse customers the following amounts:

^ Tires purchased from August 1, 2000 through May 22, 2001, the actual cost as stated on their paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes.

^ (1995 and 1996 F-150 vehicle only) Tires purchased from August 1, 2000 through October 31, 2001, the actual cost as stated on their paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes. No DOT section required.

^ Tires purchased May 23, 2001 through November 15, 2001, the actual cost as stated on the receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes up to a maximum of $110 per tire for 15 inch, and $130 per tire for 16 and 17 inch tires.

^ Refunds will not be granted for tires purchased after November 15, 2001.

Note:

If an owner pays for the replacement of their tires after November 15, 2001, the dealer may handle on a case by case basis following the procedure in Attachment II.

Refund Questions	What is the owner qualified to receive?
Example: On May 27, 2001 the customer took their 1998 Explorer to an outside tire retailer and had (5) Firestone Wilderness AT 16 inch tires replaced.	o After May 22, 2001 refund tire replacement with paid receipt up to: o 15 inch = $110 (maximum per tire) o 16 and 17 inch = $130 (maximum per tire) o With a paid receipt this customer would be entitled to (5) tires x $130 (16 inch maximum per tire) = $650 refund (includes mounting, balancing, stems, disposal, and taxes) o Dealer will be eligible to claim for refund allowance using labor operation 01B77L o If the customer returns the old tires to the dealer o The dealer will disable the old tires and dispose of them using the *"National Tire Recovery and Recycle Program"* using labor operation 01B77G (disable) in conjunction with 01B77L (refund allowance) o Customer does not need old tire(s) *since tires purchased prior to July 1, 2001* (After June 30, 2001 customer will need old tires or removed DOT codes from replaced tires to qualify)
Example: On December 2, 2000 the owner replaced their (5) Firestone Wilderness AT tires with another set of Wilderness AT tires.	o The owner is not eligible for refund o The owner is eligible for tire replacement only o Use only tires from the "Ford Approved Tire List"
Example: *On November 16, 2001 the owner purchases tires from a tire retailer.*	o *No refund will be granted after November 15, 2001* o *Dealers may handle on a case-by-case (See Attachment II)*
Example: *On October 10, 2001 a 1995 F-150 owner purchases tires from a tire retailer.*	o *August 1, 2000 through October 31, 2001 – full refund with paid receipt* o *Customer does not need old tire(s) or DOT section(s)* o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*

CLAIMS PREPARATION FOR REFUNDS (USE THIS PROCEDURE FOR ALL REFUND REQUESTS)

NOTE:

Tires must be purchased prior to November 15, 2001

^ Enter claims using DWE.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Enter information on a Recall/ONP claim type. DO NOT use a Warranty Claim type.

^ Program code 01B77.

^ When a customer brings in their old tires and is seeking a refund, use labor operation 01B77G (disable) and 01B77L (refund administration allowance) from Attachment II.

^ If a customer brings in the old DOT codes removed from the old tires - use labor operation 01B77L only.

^ The Miscellaneous Expense Code "ADMIN" will not be accepted under this program. A labor operation 01B77L has been provided to cover administrative costs.

^ Enter REFUND in the miscellaneous area of the claim.

^ Dealers will no longer be able to claim tire disposal for ONP 01B77. See the "National Tire Recovery and Recycle Program" You may still claim any applicable local waste tax - enter OTHER

in the expense area of the claim with the actual cost.

^ Enter each unique (complete 10 or 11 digit) DOT codes of the replaced tires in the diagnostic code entry screen in the field marked "other". If the DOT codes cannot be completely entered in the space provided in the diagnostic code area, use the technician comment area to complete the data entry. If the tires were replaced prior to May 23, 2001 (or November 1, 2001 for 1995 and 1996 F150 customers) the DOT may not be available, in this case record the brand, make and size of the tires in the technician comments area of the claim.

RENTAL CARS

TAP allowances have been increased specifically for this owner notification program. Refer to Don Brunner letter.

DOT REGISTRATION OF NEW TIRES

Dealers are required to register the DOT number of every tire sold to meet federal tire registration requirements. Ford has established a partnership with CIMS to assist dealers in registering these DOT codes. Information is available on QCDealer.com under CIMS Tire Registration or by contacting CIMS

Description	Labor Operation	Labor Time
Inspect for non-Wilderness AT tires (used to close 01B77 not for use when processing a refund)	01B77A	0.2 Hours
Replace & balance 1 tire (to be used for spare tire only)	01B77B	0.4 Hours
Replace & balance 2 tires (one axle)	01B77C	0.6 Hours
Replace & balance 3 tires (one axle plus spare)	01B77D	0.8 Hours
Replace & balance 4 tires (both axles)	01B77E	1.0 Hours
Replace & balance 5 tires	01B77F	1.2 Hours
Disable up to five tires (used only for refund claims)	01B77G	0.2 Hours
*Refund administration allowance (to be used when processing a customer refund without tire disposal, if tires are returned to dealership for disposal use in conjunction with operation 01B77G)	01B77L	0.2 Hours
Administrative Allowance for Non-Certified Tire Dealers (AtW or Ford Tire Program) to be used when sending a dealer stock unit, or customer vehicle (for tire replacement) to a Certified Tire Dealer, or tire retailer authorized to perform tire replacement under this program	Misc. Expense use code "SCHP"	$15.00

NOTE: Front-end alignment is not included in this program.

***NOTE:** When processing a refund for four (4) road tires, the non-temporary spare tire should be replaced as part of this program – file a related damage claim to cover the spare tire replacement.

at 330-794-9190.

NON-FORD OR LINCOLN MERCURY VEHICLES WITH FIRESTONE WILDERNESS AT

Non-Ford or Lincoln Mercury vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires installed by a Certified Tire Dealer (AtW or Ford Tire Program) are eligible for replacement. The repair should be submitted using a Warranty/ESP claim type form. The dealer must enter Program Code "P19", this will allow the repair to be submitted without a VIN. The causal part must be TIRE, with the actual part numbers for reimbursement at dealer cost plus 25%, and use actual time for labor reimbursement. These types of claims cannot be submitted as an Owner Notification Repair type.

Attachment II - Parts and Labor Information

LABOR ALLOWANCES

NON-AtW DEALERS SERVICING IN-STOCK UNITS OR CUSTOMER VEHICLES

NOTE:

Non-Certified Tire Dealers (AtW or Ford Tire Program) who have vehicles in stock, or customer vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires must send the vehicle to a Certified Tire Dealer (AtW or Ford Tire Program), or an approved tire retailer participating in the program to have the tire replacement performed. The non-Certified Tire Dealer (AtW or Ford Tire Program) will submit a 01B77 ONP claim using the miscellaneous expense code of "SCHP" (with a dollar value of $15.00 to cover administrative costs). Do not claim the "Admin" labor operation.

PARTS REQUIREMENTS

Tire Ordering Information

^ Dealers are required to install only tires from the Approved Tire List for vehicles originally equipped with 15-, 16-, and 17-inch Firestone Wilderness AT tires. Dealers should immediately order replacement tires for inventory.

^ Certified Tire Dealers will order replacement tires through normal channels.

^ Dealers not authorized for the Around the Wheel Program will not participate in this recall. Dealers may call the Ford Tire Hotline 1-888-353-3251 for enrollment and program details.

TIRE AVAILABILITY:

All dealers should check QCDealer.com daily for updates to the approved tires list. Distributors and tire retailers will allocate tires as best they can on a daily basis. Your dealership should do the following to ensure that you are able to secure your fair allotment of these limited volumes:

^ Contact your Ford authorized facing distributor(s) for each tire manufacturer.

^ Contact your Ford authorized facing tire retailers for each tire manufacturer.

^ Review with these supply points the volume of tires you need to ensure you have tires ready to fill orders with every supply point.

Questions not addressed by above sources should be directed to your market area team.

CUSTOMER WAIT LISTS:

Dealers should create a customer wait list and record: Customer name

^ Address and phone number

^ Vehicle make

^ Model year

^ Mileage

^ Tire size

NOTE:

Customers should be prioritized to replace oldest tires first.

WAIT LIST SURVEY

Please fill out the Firestone Tire Survey in the Management Report Section of QCDealer weekly. It is critical that you answer the questions as accurately as possible as the survey results will be used to help determine the level of production from the tire manufacturers.

DEALER PRICE

For latest prices on replacement tires, refer to the most recent Ford Motor Company Tire Price List.

PROCEDURE FOR CLAIMING REFUNDS FOR TIRES PURCHASED AFTER NOVEMBER 15, 2001

The following procedure applies to tires purchased after November 15, 2001:

1. Determine if the customer should receive special consideration based on owner loyalty, special circumstance cc, etc.

2. If the customer is eligible for special consideration the dealer will call the Special Service Support Center at 1800-325-5621 to request an authorization code.

3. The Special Service Support Center representative will ask for the following:

^ Customer Name

^ VIN

^ Date of repair

^ Original copy of invoice (be prepared to fax)

4. If the customer qualifies for a refund, the Special Service Support Center will provide your dealer with an authorization code.

5. Your dealer will input a claim with the authorization code (authorization code must be included to receive payment).

6. After the dealer receives payment for the claim, the dealer will then send the refund to the customer.

NOTE:

If the Special Service Support Center determines that the customer does not qualify for a refund, no authorization code will be given. Any appeals must be made by the dealer to the appropriate field representative

Attachment III - Technical Information

AFFECTED VEHICLES: REFER TO DEALER LETTER FOR AFFECTED TIRES AND VEHICLES

OVERVIEW

This program details the replacement of 15-, 16-, and 17-inch Firestone Wilderness AT tires regardless of production plant. You will need to perform a DOT code inspection prior to replacing the 15, 16, or 17-inch Wilderness AT tires.

NOTE:

When lowering or raising an under-vehicle spare, DO NOT use power tools. Also make sure that the spare is secure under the vehicle, and not swinging loose. The spare tire winch will ratchet when the tire is completely stowed.

NOTE:

Radial ATX "TEMPORARY USE" spare tires are not included under this program, and should not be replaced as part of this program.

NOTE:

Spare tires should always be replaced with the exact same size tire; otherwise the spare tire may not store in the proper position on the vehicle.

INSPECTION

1. Inspect the vehicle tires (including the spare tire) for the presence of Firestone Wilderness AT tires.

2. If Firestone Wilderness AT tires are present replace them with a suitable replacement from the "Approved Tire List".

Note:

There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.

3. If only one Firestone Wilderness AT road tire is present on the vehicle, you will need to replace the opposing tire on the same axle. However, if one (1) front and one (1) rear tire are Wilderness AT you would not automatically replace all four (4) tires instead, you would replace the two (2) Wilderness AT tires and place them on the same axle.

4. Record the DOT code from each removed tire(s) on the repair order.

5. Tires that are removed from vehicles must immediately be made unusable by either cutting through the bead and DOT code with bolt cutters, or drilling a one-inch diameter hole (directly on the DOT code to make the code unreadable) in the sidewall.

6. Adjust all tires to the proper inflation pressure, and release the vehicle. For specifications, refer to the vehicle Owner's Manual or the vehicle certification label located on the driver's door opening.

NOTE:

Tires that are removed from vehicles under this program, and those in dealer inventory must immediately be made unusable by either cutting the bead with bolt cutters or drilling a 1" diameter hole (directly on the DOT code to make the code unreadable) in the sidewall. Defacing the DOT

code will prevent the tire from being used for an additional refund request.

NOTE:

If the vehicle is a 4X4, and is equipped with non-Firestone Wilderness AT tires on one axle, and the replacement tires for the Firestone equipped axle causes a mismatch with the existing non-Firestone axle, the customer is responsible for the tire mismatch. If the customer refuses to purchase matching tires to correct the mismatch - the dealer should annotate the repair order to reflect the customer's decision.

Ford Motor Company

FIRESTONE TIRE RECALL

September 2000

TO: All Ford and Lincoln Mercury Dealers
SUBJECT: Firestone Tire Recall Supplement #4 9/1/00 - Updated Information
REFERENCE: Firestone Recall - Firestone P235/75 R15 Radial ATX and Certain Wilderness AT tires

Changes for this Supplement:

- The following has been added to Attachment I to clarify the claiming of freight: Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier.
- Additional information is now required in the comments of each claim filed for tire replacement under both Program Codes P17 and P18. The comments must include the entire DOT code from the tire being replaced and under P17 only the part number of the replacement tire. Firestone requires this information for government reporting.

Claims under the Firestone recall for tire replacement filed by Ford and Lincoln Mercury dealers not enrolled in the AtW/Ford Tire Program will not be accepted for payment. Non-AtW/Ford Tire Program dealers will continue to be able to file claims for tire inspection. This is not new information; we have just added the edits to the ACES II system.

The revised letter and attachments have been marked "Revised 9/1/00", and a ( ) symbol appears at the beginning of any text that changed since the last Supplement and the text appears in green when viewed on line. To avoid confusion please discard all previous versions.

Sincerely,

A. R. O'Neill
Director
Vehicle Service and Programs

Firestone Recall - Firestone P235/75 R15 Radial ATX and Certain Wilderness AT tires.

AFFECTED TIRES AND VEHICLES

Bridgestone Firestone Tire Company recently announced a Safety Recall on the following:

- All Firestone P235/75 R15 Radial ATX tires produced excluding tires marked "TEMPORARY" on the sidewall - and -

- P235/75 R15 wilderness AT tires produced only at the Decatur plant.

NOTE:

Decatur built tires have a DOT code of VDHL - see Attachment III for details. All other Wilderness AT tires are not affected.

Both original equipment (OE) and replacement tires are affected.

The following vehicles produced with Firestone P235/75 R15 Radial ATX original equipment tires are affected by this recall:

^ Certain 1991 through 1996 Ford Explorer (see chart)

^ Certain 1997 Mercury Mountaineer vehicles

^ Certain 1991 through 2000 Ranger vehicles

^ Certain 1991 through 1994 Bronco vehicles

^ Certain 1991 through 1994 F-Series vehicles

The following vehicles produced with P235/75 R15 Wilderness AT tires as original equipment are affected by this recall:

Certain 1997 through August 7, 2000 Mountaineer vehicles

^ Certain 1997 through August 7, 2000 Explorer vehicles (see chart)

^ Certain 1997 through June 1, 2000 Ranger vehicles

^ Certain 2001 Explorer Sport Trac and Sport vehicles produced through August 7, 2000

These Explorer vehicles produced with either P235/75 R15 Radial ATX or P235/75 R15 Wilderness AT tires as original equipment are affected as shown.

These Explorer vehicles are NOT affected:

IMPORTANT FACTS

^ This is a FIRESTONE recall.

^ FIRESTONE will notify customers of the recall via first class mail.

^ FIRESTONE will communicate recall information to authorized repair sites including Ford and Lincoln-Mercury Around the wheel/Ford Tire Program dealers.

FORD AND LINCOLN MERCURY DEALER INVOLVEMENT

As this field action will severely impact the availability of Firestone replacement tires, Ford and Lincoln Mercury Around the Wheel (AtW)/Ford Tire Program dealers will be afforded the opportunity to address this recall utilizing Firestone and non-Firestone tires. This is being done to address immediate needs of our customers.

FORD AND LINCOLN MERCURY DEALERS ENROLLED IN AROUND THE WHEEL (AtW)

Dealerships enrolled in the AtW/Ford Tire Program are authorized Firestone outlets. If a customer with affected tires contacts an ATW Ford Tire Program dealer, as an authorized Firestone dealer regarding this safety recall, you will be able to replace that customer's tires with Firestone or "approved" non-Firestone tires. Tires that are approved for use as replacement tires under this recall will be posted in a matrix in the Firestone Tire Center in QCDealer.com. This matrix will be amended to add new tire manufactures and models of tires as they are approved. Claiming for reimbursement of tires is outlined on Attachment I.

If the customer requests a replacement Firestone tire, secure the tire through your normal distribution chain and process reimbursement as outlined in Attachment I.

FORD AND LINCOLN MERCURY DEALERS NOT ENROLLED IN AROUND THE WHEEL (AtW)

Dealers not enrolled in the ATW/Ford Tire Program can inspect customer vehicles (see Attachments I & II for claiming instructions & labor operations). These dealers should make individual arrangements with local Firestone outlets for tire replacement, or refer customers to their local Firestone outlet.

SERVICE PROCEDURE

All Firestone P235/75 R15 tires with Radial ATX on the sidewall (excludes Temporary spare tires identified by "Temporary" on the sidewall) must be replaced under this recall.

Firestone P235/75 R15 tires with Wilderness AT on the sidewall will need to be inspected for a DOT code of VDHL to determine if replacement is required. Refer to Attachment III for details.

This service action applies to original equipment and replacement tires that are installed on Ford and Mercury vehicles.

DEMONSTRATION / DELIVERY HOLD FOR VEHICLES AND TIRES IN DEALER INVENTORY

Do not demonstrate or deliver any of the affected vehicles prior to completing the Firestone recall. In addition, Ford and Lincoln Mercury Around the Wheel (AtW)/Ford Tire Program dealers may have affected tires in inventory; these tires should not be sold.

Tires Removed from Vehicles

Tires that are removed from vehicles must immediately be made unusable by either cutting the bead with bolt cutters, drilling a one-inch diameter hole in the sidewall, or cutting the tire completely in half The DOT code should not be defaced or removed. The tire should then be disposed of according to local laws refer to the Tire Administration Guide for further information.

NOTE:

AtW/Ford Tire Program dealers will be independently audited for compliance with the above procedure.

New Inventory Tires

All new Radial ATX or Wilderness AT tires with DOT code VDHL tires (never mounted) in AtW/Ford Tire Program dealer inventory must be returned to Firestone. Dealers must call 1-800-668-0345 to obtain a "Returned Goods Authorization (RGA) number. The RGA is a 6-digit number required to return the tires. Only tires affected by the Firestone recall will be accepted. Firestone will pay all freight for the return of these tires.

CONTACTS

Claims Information: 1-800-423-8851

Other (Dealer Only) Recall Questions: 1-800-325-5621

For Around the Wheel/Ford Tire Program 1-888-353-3251

Questions:

Attachment I

OASIS Since this is a Firestone recall, OASIS will not be activated.

PLEASE NOTE

Correct all vehicles in stock before delivery. Federal law requires dealers to complete any outstanding safety recall service before a vehicle is delivered to the buyer or lessee. Violation of this requirement by a dealer could result in a civil penalty of up to $1,100 per vehicle.

CLAIMS PREPARATION AND SUBMISSION

NOTE:

Claims for Firestone tires (P18) may be entered for payment beginning with repairs dated August 28, 2000 and later.

Claims for non-Firestone tires

Enter claims in ACES II for non-Firestone tires using DWE with the following information:

^ Enter information on a warranty claim. DO NOT use a recall claim.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Program Code - P17. Enter P17TIRE as the causal part with condition code 82.

^ On the same line as PI7TIRE enter the total value of the tires from the "Suggested List Price" column of the latest Ford Motor Company Tire Selling Guide.

^ Use the appropriate labor operation(s) from Attachment II.

^ Freight is reimbursable at actual cost in the miscellaneous expense area of the claim.

NOTE:

Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier.

^ Tire disposal and applicable local waste tax will be reimbursed - enter OTHER in the miscellaneous expense area of the claim with the actual cost.

^ Enter the entire DOT code and the part number of the replacement tire being used in the comments area of the claim.

Claims for Firestone tires

Enter claims in ACES II for Firestone tires using the following information:

^ Enter information on a warranty claim. DO NOT use a recall claim type.

^ Program Code - P18.

^ Enter "P18TIRE" as the causal part, no material cost should be entered on this line.

Description	Labor Operation	Labor Time
Inspect 5 tires applies only to P235/75 R15 Wilderness AT tires) - VEHICLE NOT AFFECTED (Non VDHL DOT Code)	00V01G	0.2 Hours
Inspect 5 tires (applies only to P235/75 R15 Wilderness AT tires) - VEHICLE AFFECTED - Customer must return at a later date due to unavailability of replacement tires. This may be claimed only one time per vehicle per dealer.	00V01A	0.2 Hours
Replace & balance 1 tire (No longer includes inspect) May be used with labor op 00V01A only	00V01B	0.4 Hours
Replace & balance 2 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01C	0.6 Hours
Replace & balance 3 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01D	0.8 Hours
Replace & balance 4 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01E	1.0 Hours
Replace & balance 5 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01F	1.2 Hour

^ Condition code "82".

^ Use Customer Concern Code "A99".

^ Enter the full published tire part number with the quantity of tires replaced, the payment system will price the tire at Dealer Net multiplied by the quantity for the total value of the replaced tires.

^ Use Miscellaneous Expense Code "TIREMU" to claim the $20.00 difference per tire7 a maximum of $100.00.

^ The Firestone warranty claim form must be filled out and attached to the hard copy of the claim and retained in the service file. The entire DOT code from the replacement tire(s) must be recorded on this form.

^ The DOT code must also be entered in the comments area of the claim.

^ No labor operations will be allowed when claiming P18.

OWNER REFUND

Ford and Lincoln Mercury dealers, including AtW/Ford tire dealers; will not be involved in processing refunds for customers included in the Firestone recall. Customers inquiring about a refund should be provided copies of the Firestone refund request form. Refer to the Firestone website for the refund forms and for further details.

RENTAL CARS

TAP allowances have been increased specifically for the Firestone recall refer to M.J. Lombardi's Letter.

Attachment II

LABOR ALLOWANCES

NOTE:

Front-end alignment is not included in this recall.

NOTE:

These labor operations and revised times will begin paying with claims submitted on August 18, 2000; Claims in process at dealerships will need to use these new operations.

PARTS REQUIREMENTS

Tire Ordering Information

FIRESTONE TIRE INSPECTION

AFFECTED VEHICLES: **REFER TO DEALER LETTER FOR AFFECTED TIRES AND VEHICLES**

OVERVIEW

This procedure outlines how to check the DOT code on the tires and determine if they must be replaced.

NOTE: All Firestone P235/75R15 tires that say "RADIAL ATX" on the sidewall are being recalled and no further inspection is necessary.

NOTE: All tires including the spare must be inspected if they are "WILDERNESS AT" P235/75R15.

NOTE: When lowering or raising an under-vehicle spare, **DO NOT** use power tools. Also make sure that the spare is secure under the vehicle, and not swinging loose. The spare tire winch will ratchet when the tire is completely stowed.

INSPECTION

1. Raise vehicle on a hoist.
2. Locate the DOT code on the inboard sidewall of all tires including the spare. On F-Series and Bronco models, the spare tire must be lowered to view the DOT code. Clean the area if necessary in order to accurately read the code.
3. If the DOT code is **VDHL**, the tire must be replaced. See the matrix (part of the dealer bulletin) to determine the correct replacement tires. See Figure 1.

NOTE: Recall tires that are removed from vehicles and in dealer inventory must immediately be made unusable by either cutting the bead with bolt cutters or drilling a 1" diameter hole in the sidewall.

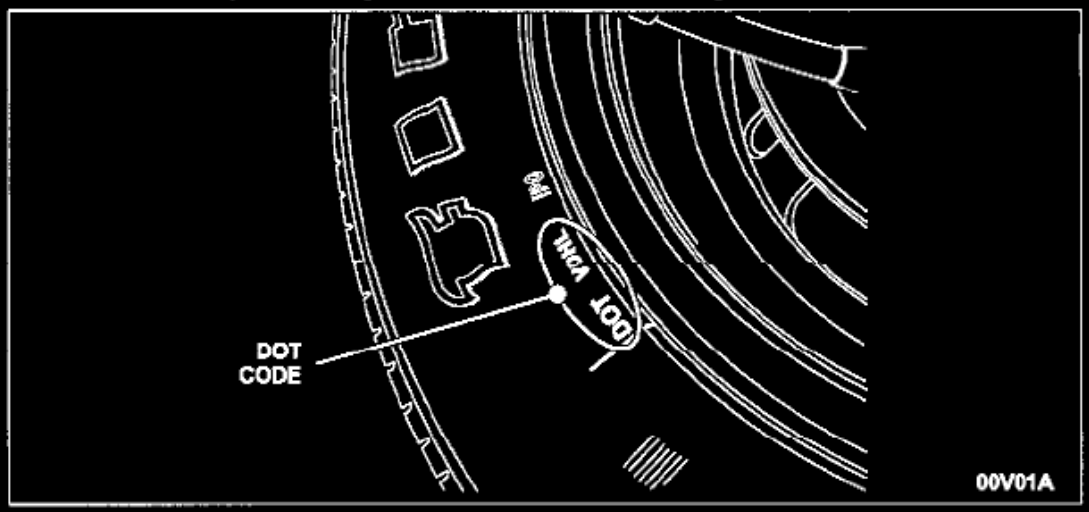

FIGURE 1

4. If the code is anything other than **VDHL**, release the vehicle to the owner.

CPR© 2000 FORD MOTOR COMPANY
DEARBORN, MICHIGAN 48121
08/00

Authorized Around the Wheel (ATW)/Ford Tire Program dealers will order replacement tires through normal channels. Dealers not authorized for the Around the Wheel Program will not participate in the Firestone recall. Dealers may call the Ford Tire Hotline 1-888-353-3251 for enrollment and program details.

DEALER PRICE

For latest prices on replacement tires refer to the most recent Ford Motor Company Tire Selling Guide.

Tires: All Technical Service Bulletins Transfer Case - Unable to Disengage 4WD Into 2WD

Article No. 91-20-17

10/02/91

TRANSFER CASE - 4X4 - UNABLE TO DISENGAGE

LIGHT TRUCK: 1990-91 RANGER 1991 EXPLORER

ISSUE: The vehicle may remain in 4 Wheel Drive after the transfer case has been shifted back into 2WD. This may occur because of uneven tire wear, the front axle hubs not disengaging, or the return spring force not being sufficient to move the lock-up fork back to the 2WD position.

ACTION: Inspect the vehicle tires for wear and, if necessary, replace the return spring, sleeve spring and lock-up fork in the transfer case.

INITIAL CHECKS

1. Rotate the tires and check for evidence of an uneven wear band or spots.

2. Set the tire pressure as specified on the safety compliance certification label.

3. Confirm that the tires are matched in design, size and manufacture.

4. Confirm by hand rotation that the front axle automatic and manual locking hubs are disengaging correctly.

NOTE: IF THE VEHICLE WAS PREVIOUSLY REPAIRED PER TSB 91-15-10, THE TRANSFER CASE WAS UPDATED WITH THE PARTS

INCLUDED IN THIS TSB. IF THE UPDATED TRANSFER CASE STILL WILL NOT DISENGAGE AFTER FOLLOWING THE INITIAL CHECKS, THEN THE CAUSE COULD BE THAT THE DRIVER IS NOT ALLOWING SUFFICIENT TIME FOR THE 4WD SYSTEM TO DISENGAGE.

VERIFICATION

Drive the vehicle. If the transfer case still will not disengage after performing the initial checks, proceed as follows:

1. Shift the vehicle with lever operated or electric shift transfer case to 4WD high.

2. Hand rotate the front axle manual locking hubs to the lock position, if so equipped.

3. Drive the vehicle slowly in a tight turn on dry hard pavement until you feel the front wheel power hop/skip which indicates that the 4WD system is engaged.

4. Drive the vehicle on a frame hoist...

a. Shift the automatic or manual transmission to neutral.

b. Shift the transfer case to 2WD.

c. Turn the ignition key to the OFF position.

5. Raise the vehicle on the frame hoist, making sure all tires are free to rotate.

6. Using gloves, hand rotate the rear driveshaft while viewing the front driveshaft for rotation.

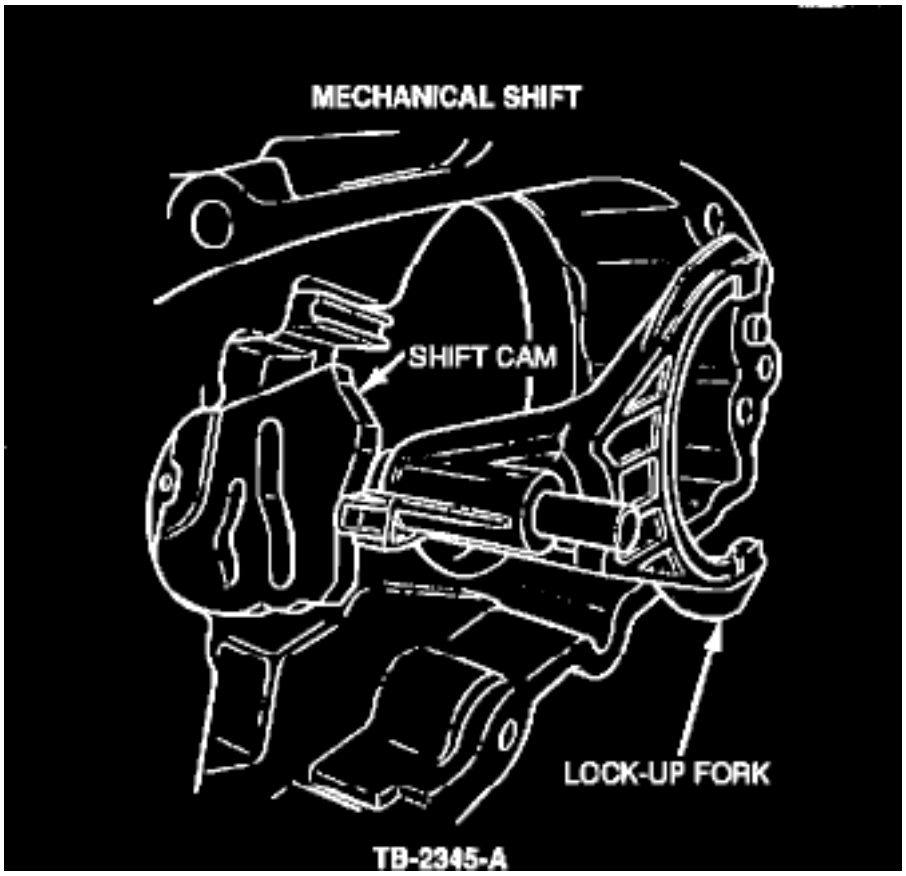
^ If the front driveshaft does not rotate, this indicates that the transfer case has disengaged and is functioning correctly.

^ If the front driveshaft rotates while turning the rear driveshaft, this indicates that the transfer case has not disengaged and must be repaired.

7. Before starting the repair, repeat the above procedure a second time to confirm that the transfer case will not disengage.

ELECTRIC SHIFT TRANSFER CASE

If the above procedure is not conclusive, for an electric shift transfer case system, proceed as follows:



1. Remove the 7K470 speed sensor/wiring harness bracket and 7F293 speed sensor assembly from the transfer case.

2. With the use of a light and looking into the speed sensor opening...

a. Locate the white or black 7289 lock-up fork.

b. Using a straight tool, push it forward toward the front of the vehicle.

^ If the lock-up fork does not move, this indicates that the lock-up assembly has moved back to the 2WD position and the transfer case is functioning correctly.

^ If the lock-up fork moves about 3/8" (9.525 mm), this indicates that the lock-up assembly remained in the 4WD position or did not disengage and must be repaired.

TRANSFER CASE REPAIR

Refer to the 1991 Ranger and Explorer Service Manual, Sections 07-07E and 07-07D, for procedures to remove and dissemble the transfer case. Install and reassemble the following components:

^ One (1) Return Spring (F1TZ-7219-A)

^ One (1) Sleeve Spring (E6TZ-7D126-A), with large end installed first into bore of 7106 lock-up collar.

^ One (1) Lock-Up Fork (F1TZ-7289-D, bone white color).

Figure 1

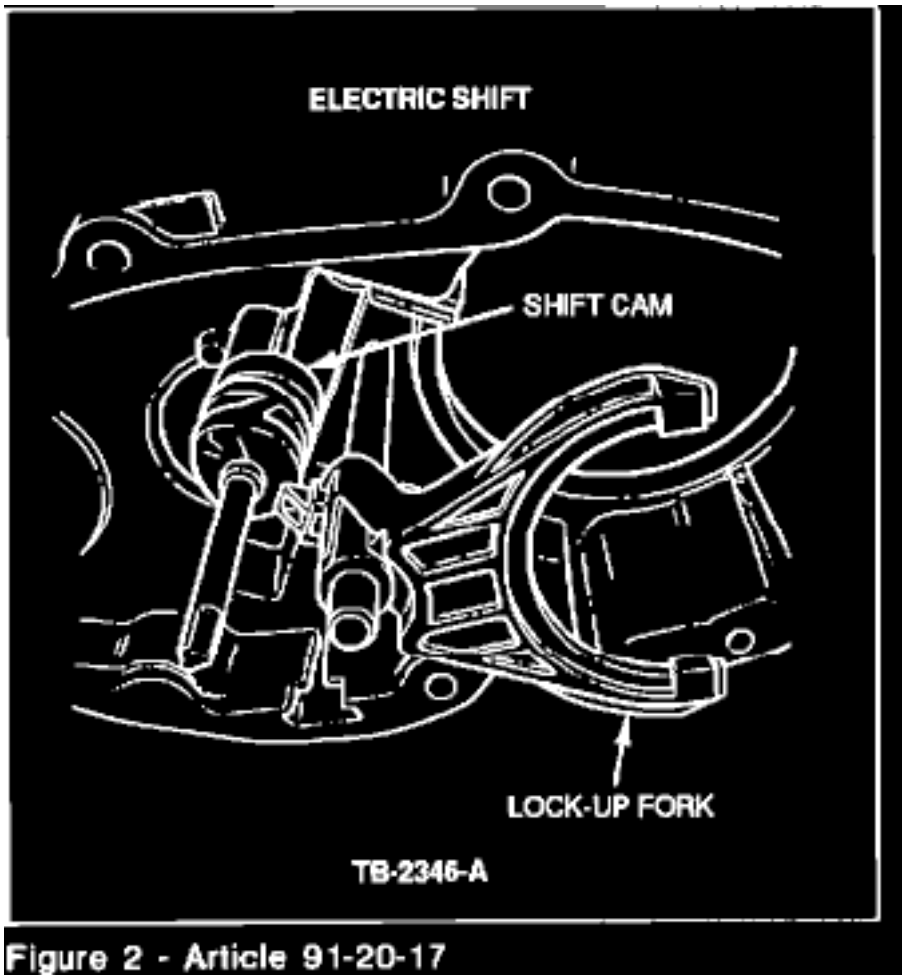


Figure 2 - Article 91-20-17

Figure 2

NOTE: WHEN INSTALLING THE 7289 LOCK-UP FORK, MAKE SURE THAT THE 7235 LOCK-UP FORK ROLLER BUSHING IS

POSITIONED ON THE TOP OR END SURFACE OF THE 7F063 SHIFT CAM AND NOT INTO AN INSIDE CAM TRACK, FIGURES 1 AND 2.

Reinstall the transfer case in the vehicle and check for shift function including engagement and disengagement.

6. Using gloves, hand rotate the rear driveshaft while viewing the front driveshaft for rotation.

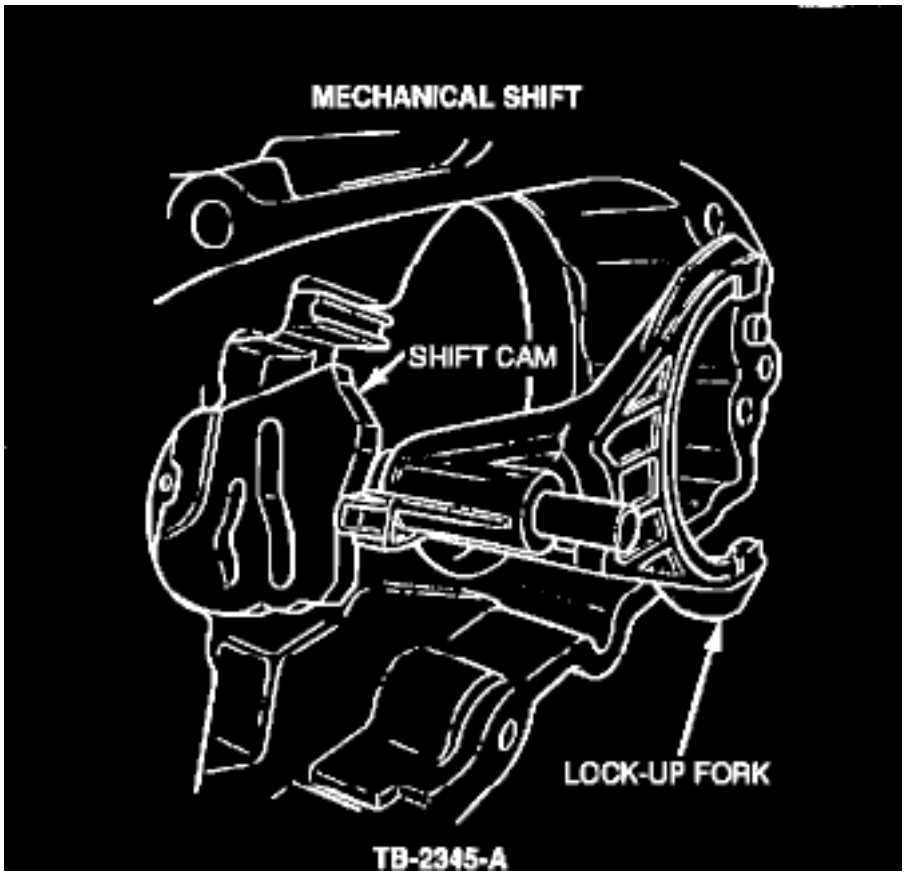
^ If the front driveshaft does not rotate, this indicates that the transfer case has disengaged and is functioning correctly.

^ If the front driveshaft rotates while turning the rear driveshaft, this indicates that the transfer case has not disengaged and must be repaired.

7. Before starting the repair, repeat the above procedure a second time to confirm that the transfer case will not disengage.

ELECTRIC SHIFT TRANSFER CASE

If the above procedure is not conclusive, for an electric shift transfer case system, proceed as follows:



1. Remove the 7K470 speed sensor/wiring harness bracket and 7F293 speed sensor assembly from the transfer case.

2. With the use of a light and looking into the speed sensor opening...

a. Locate the white or black 7289 lock-up fork.

b. Using a straight tool, push it forward toward the front of the vehicle.

^ If the lock-up fork does not move, this indicates that the lock-up assembly has moved back to the 2WD position and the transfer case is functioning correctly.

^ If the lock-up fork moves about 3/8" (9.525 mm), this indicates that the lock-up assembly remained in the 4WD position or did not disengage and must be repaired.

TRANSFER CASE REPAIR

Refer to the 1991 Ranger and Explorer Service Manual, Sections 07-07E and 07-07D, for procedures to remove and dissemble the transfer case. Install and reassemble the following components:

^ One (1) Return Spring (F1TZ-7219-A)

^ One (1) Sleeve Spring (E6TZ-7D126-A), with large end installed first into bore of 7106 lock-up collar.

^ One (1) Lock-Up Fork (F1TZ-7289-D, bone white color).

Figure 1

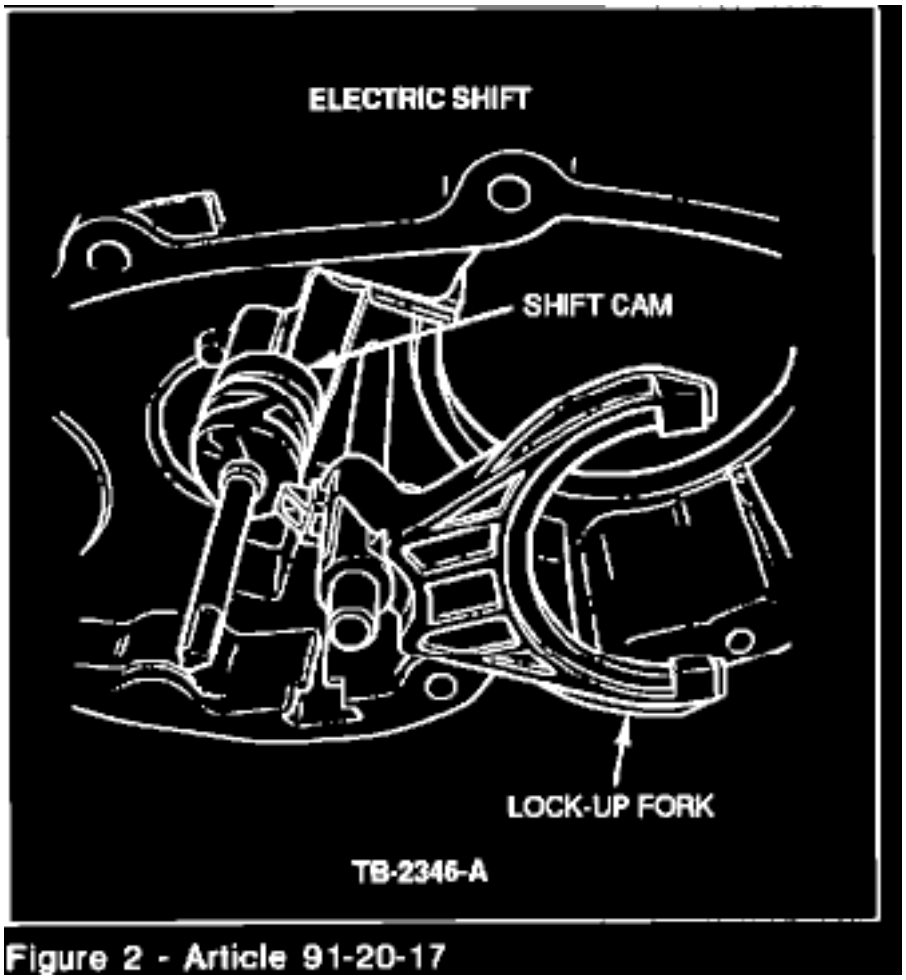


Figure 2 - Article 91-20-17

Figure 2

NOTE: WHEN INSTALLING THE 7289 LOCK-UP FORK, MAKE SURE THAT THE 7235 LOCK-UP FORK ROLLER BUSHING IS

POSITIONED ON THE TOP OR END SURFACE OF THE 7F063 SHIFT CAM AND NOT INTO AN INSIDE CAM TRACK, FIGURES 1 AND 2.

Reinstall the transfer case in the vehicle and check for shift function including engagement and disengagement.

Ford Motor Company

October 2001

TO: All Ford and Lincoln Mercury Dealers

SUBJECT: **Owner Notification Program 01B77 Supplement 7:** 10/12/01 Updated Information

REFERENCE: **Owner Notification Program 01B77 – Ford Wilderness AT Program:** Replacement of Wilderness AT tires

PROGRESS TO DATE

- To date we have replaced close to 7 million tires or 55% of the total tires needed
- Ford and Mercury dealers are currently handling over 70% of all Wilderness AT replacements
- All tire sizes are now readily available, though certain brands may not be available

The following information has been updated for ONP 01B77:

CHANGES MADE TO THE ALL DEALER LETTER

- ONP 01B77 – Ford Wilderness AT program will expire on March 31, 2002
- Tires purchased by customers after November 15, 2001 will not be eligible for a refund
- All customers who have not had their tires replaced will receive a follow-up letter by the end of October, 2001 announcing these program changes and encouraging them to visit a Ford Motor Company dealership for tire replacement
- 1995 and 1996 F-150 customers, which were added to the program on August 17, 2001, will receive their first notification letter by the end of October, 2001, which includes the following:
  - The customer must have their tires replaced at a Ford Motor Company dealer
  - They will only be eligible for refunds if they purchased their tires between August 1, 2000 through October 31, 2001

    NOTE: Refunded at actual cost and no DOT sections required, since these customers were never notified of the DOT requirements and maximum dollar limit.
- Effective immediately all tire refund requests are to be processed through the dealer (Online Refund Form should no longer be used)

CHANGES TO ATTACHMENT I

- Tires purchased by customers after November 15, 2001 will not be eligible for a refund
- The Online Refund Form used for refunds before May 22, 2001 is no longer posted on the web

CHANGES TO ATTACHMENT II

- Wait List Survey link added
- A procedure has been added to handle customers who purchase tires after November 15, 2001 and are seeking a refund

All revisions since Supplement 6 are in *red italics* and revised pages have been marked "*Revised10/12/01.*"

Sincerely,

Ann O'Neill
Director
Vehicle Service and Programs

Technical Service Bulletin # 01B77 Date: 011001

Ford Motor Company

May 2001
Revised 10/12/01

TO: All Ford and Lincoln Mercury Dealers

SUBJECT: **Owner Notification Program 01B77-S7 – Ford Firestone Wilderness AT Program:** Replacement of Firestone Wilderness AT tires.

OASIS: Yes
OWNER LIST: Yes
PARTS RETURN: No
PROGRAM TERMS: This program will expire *March 31, 2002* and has no mileage limit.

WHAT WE ARE DOING AND WHY

On August 9, 2000 Firestone initiated a voluntary recall of 6.5 million tires, including 3.8 million P235 75R15 Radial ATX tires manufactured since 1990 at all North American Firestone plants. Also, Firestone recalled about 2.7 million P235 75R15 Wilderness AT tires made at its Decatur, Illinois plant. The recall included both original equipment and replacement tires. As of January 22, 2001 more than 6.1 million tires have been replaced – the recall is more than 94% complete.

Under this new owner notification, Ford will replace 13 million Firestone Wilderness AT tires on Ford and Mercury SUVs and pickup trucks listed below under "affected tires and vehicles." This is a voluntary precautionary measure. Ford made the decision to take this action after extensive examination of field data as well as laboratory and track testing in close collaboration with NHTSA. The field data, along with our testing and statistical analysis, shows a directional trend toward elevated failure rates, that differs based upon where the tires were manufactured. Ford does not have sufficient confidence in the future performance of these tires, so we are acting in the interest of our customers to ensure their continued trust and confidence.

To date we have replaced close to 7 million tires or 55% of the total tires needed for this program. Ford and Mercury dealers are currently handling over 70% of the Wilderness AT tire replacements. Also, with the increased availability of all 15-, 16-, and 17-inch tires at the dealers, Ford is changing the expiration date of the program to March 31, 2002 to encourage customers to have their tires replaced as soon as possible.

NOTE: Certain brands of tires may have limited availability.

AFFECTED TIRES AND VEHICLES

This program affects 15-, 16-, and 17-inch Firestone Wilderness AT tires and Ford and Mercury vehicles with these tires on them. The vehicles listed below may have been originally equipped with Firestone Wilderness AT tires or may have had Wilderness AT tires installed during the Firestone recall launched in August, 2000.

- Certain 1991 through 2002 Ford Explorer
- Certain 2001 through 2002 Explorer Sport, and Sport Trac
- Certain 1997 through 2002 Mercury Mountaineer
- Certain 1991 through 2001 Ranger
- Certain 1999 through 2001 Expedition
- Certain 1991 through 1997 F-Series
- Certain 1991 through 1994 Bronco

NOTE: Both original equipment (OE) and replacement tires are affected.

IMPORTANT FACTS

- *Ford Wilderness AT tire program will expire on March 31, 2002.*
- *Tires purchased by customers after November 15, 2001 will no longer be eligible for a refund.*
- *A follow-up owner letter announcing program changes will be mailed beginning the week of October 17, 2001.*
- *1995 and 1996 F-150 owners, which were added to the program on August 17, 2001, will be notified by the end of October 2001.*
- All 15-, 16-, and 17-inch Firestone Wilderness AT tires (regardless of series number) that are mounted on Ford or Mercury vehicles are eligible for replacement.
- All other Firestone Wilderness AT tire sizes are not included in this program.
- AtW/Ford Tire Program dealers are to stop the sale of Firestone Wilderness AT tires in their parts inventory effective immediately.
- Ford Motor Company has notified customers of this owner notification program via first class mail.
- Customer refunds will be handled differently based on whether the tires were purchased before or after May 22, 2001.
- *Effective immediately all refunds will be processed through the dealer for customers who purchased their tires from August 1, 2000 through November 15, 2001, (Online Refund Form should no longer be used).*
- *1995 and 1996 F-150 owners will only be eligible for refunds for tires purchased between August 1, 2000 and October 31, 2001, (no DOT sections required).*
- A list of Ford-approved replacement tires is posted on QCDealer. Only these tires may be used as replacement tires for vehicles that were originally equipped with 15-, 16-, and 17-inch Firestone Wilderness AT tires under this program.
- There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.
- **Vehicles with branded titles** - although normally excluded from Owner Notification Programs are included as part of this program.
- Affected vehicles sold in Canada can be serviced by U.S. dealers, and affected vehicles sold in the U.S. can be serviced by Canadian dealers.

STOP SALE OF FIRESTONE WILDERNESS AT TIRES IN DEALER STOCK

Firestone Wilderness AT tires in stock at Ford and Lincoln Mercury dealers enrolled in the Around the Wheel or Ford Tire Program (Certified Tire Dealers) should not be sold. Dealers that purchased these tires through the Ford program and have them in stock should complete the *Unsold Wilderness AT Credit Form* located on QCDealer.com. If you have questions, call the Ford Tire Hotline at 1-888-353-3251 for disposal and credit information.

NON-AtW DEALERS SERVICING IN-STOCK UNITS OR CUSTOMER VEHICLES

Non-Certified Tire (AtW or Ford Tire Program) Dealers who have vehicles in stock, or customer vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires must send the vehicle to a Certified Tire Dealer (AtW or Ford Tire Program) or an approved tire retailer participating in the program to have the tire replacement performed. The non-Certified Tire Dealer (AtW or Ford Tire Program) will submit a 01B77 ONP claim using the miscellaneous expense code of "**SCHP**" (with a dollar value of $15.00 to cover administrative costs). Do not claim the "Admin" labor operation.

SERVICE PROCEDURE

All 15-, 16-, and 17-inch Firestone Wilderness AT (regardless of series number) tires installed on Ford and Mercury vehicles must be replaced under this owner notification program. Original equipment (OE) and replacement tires are included.

Spare Tires

Firestone Wilderness AT (regardless of series number) spare tires are affected and should be replaced. The Firestone P235 75R15 ATX temporary spare tire used on Ranger vehicles is not included in this program.

Note: Spare tires should always be replaced with the exact same size tire; otherwise the spare tire may not store in the proper position on the vehicle.

Note: When processing refunds for customers, inspect the spare tire; if the spare tire is a Firestone Wilderness AT (with the Ranger exception noted previously) replace the spare tire using the information provided on Attachment II.

Does Current Tire Condition Affect Replacement Procedure?

All affected tires should be replaced regardless of the mileage or the remaining tread on the tire. If the customer caused damage to the tires, i.e. hit a curb, accident, under inflation, alignment issues, the tire should still be replaced. If the tire is worn out, it should still be replaced.

What if the Vehicle has a Mix of Affected and Non-Affected Tires?

- If the spare tire is the only Wilderness AT, then only the spare should be replaced (see exception on temporary spares above).
- In most cases an owner's vehicle will have all 15-, 16-, or 17–inch Firestone Wilderness AT tires installed and require replacement of all tires. In cases where a vehicle has a mix of tire brands/sizes installed, replace all Firestone Wilderness AT tires and the remaining tires to match the tire brand and size by axle.

For example, if a vehicle has a Wilderness AT on the left front, a Wilderness AT on the right rear, a Wilderness AT for a spare, and the other two tires are not Wilderness AT; the spare and the left front and right rear should be replaced and the new tires should be installed on the same axle. The customer should also be advised that all tires should be the same size especially on 4 X 4 models.

What replacement tires may be used for vehicles originally equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tires?

Replacement tire(s) must be on the list of tires approved by Ford <link to approved tire list>. Any deviation from this approved list may change the vehicles handling, ride, vibration, and noise characteristics and cannot be claimed through Ford.

If customers are seeking reimbursement for tires purchased outside of a Ford Certified Tire Dealer, refer to Attachment I for reimbursement guidelines and claiming procedures. *Customers who purchase tires after November 15, 2001 are not eligible for a refund.*

Note: There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.

Note: "Blemished" tires may not be used as replacement tires under this program.

FORD AND LINCOLN MERCURY DEALER TIRE DISPOSAL PROCESS

- Tires that are removed from vehicles must immediately be made unusable by either cutting the bead through the DOT code with bolt cutters, or drilling a one-inch diameter hole (directly on the DOT code to make the code unreadable) in the sidewall. Defacing the DOT code will prevent the tire from being used for an additional refund request. Marking the last 6 characters of the VIN on the removed tire(s) is no longer required.
- The tires will be disposed of by using the "National Tire Recovery and Recycle Program".

Regional FCSD and independent personnel will be randomly auditing dealers for proper tire scrapping and claiming procedures. Any infractions will result in prior approval for tire owner notification claims.

Note: Make removed tires unusable during tire replacement. Do not stack tires and disable them at a later time.

DEALERSHIPS ELIGIBLE TO REPLACE TIRES UNDER THIS PROGRAM

All Ford and Lincoln Mercury dealers enrolled on the Around the Wheel or Ford Tire Program (Certified Tire Dealers) are eligible to complete tire replacements under this program.

Ford dealers interested in joining the Ford Tire Program may call the Ford Tire Hotline 1-888-353-3251 for enrollment and program details.

APPROVED RETAILERS PARTICIPATION IN PROGRAM

We have developed a program to authorize Goodyear, Michelin, Continental, and General tire retailers to perform tire replacements at no cost to customers. These eligible retailers will use only tires from the Ford Approved Tire List when performing no cost replacements. This was done to reduce customer inconvenience by:

- Eliminating customer out of pocket expense
- Maximize the number of customers whose replacement tires are those on the Ford Approved tire list
- Expedite the completion of this program
- Reduce administrative burden on our Ford and Lincoln Mercury dealers
- Reduce dealer tire disposal responsibility
- Allow dealers to continue with their normal day to day service business

Attachment I - Administrative Information

OASIS

OASIS must be used to determine vehicle eligibility.

IMPORTANT:

When an eligible vehicle is at the dealership for service, OASIS must be contacted to determine if Owner Notification Program 01B77 is open. If 01B77 is listed in OASIS as open, it is important that the vehicle is inspected for eligible tires. If the eligible vehicle is not equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tires a claim must be submitted using labor operation 01B77A to close the program. If an affected vehicle does not have 01B77 open, this may indicate that a refund

or tire replacement has already been processed on this vehicle.

Some Ford and Lincoln Mercury vehicles not listed in the AFFECTED TIRES AND VEHICLES list may have 15-, 16-, or 17-inch Firestone Wilderness AT tires installed. These vehicles are covered under this program, but will not be active in OASIS. Contact the Special Service Support Center at 1-800-325-5621 to obtain prior approval before performing the repair or issuing a refund. This will insure that a previous repair/refund has not been performed on the vehicle.

CLAIMS PREPARATION AND SUBMISSION

^ Enter claims using DWE.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Enter information on a Recall/ONP claim type. DO NOT use a Warranty Claim type.

^ Program code 01B77.

^ Enter the full part number of the replacement tire with the quantity of tires replaced. Tires will be reimbursed at AtW Dealer cost + 25% (wheel weights and valve stems incl.).

^ Use the appropriate labor operation(s) from Attachment II.

^ Freight is reimbursable at actual cost in the miscellaneous expense area of the claim.

NOTE:

Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier. Dealers are encouraged to arrange for shipment of 4 or more tires at a time.

^ Dealers can no longer claim tire disposal for ONP 01B77. See the "National Tire Recovery and Recycle Program". You may still claim any applicable local waste tax - enter OTHER in the expense area of the claim with the actual cost.

^ Enter each unique (complete 10 or 11 digit) DOT codes of the replaced tires on the diagnostic code entry screen in the field marked "other". If the DOT codes cannot be completely entered in the space provided in the diagnostic code area, use the technician comment area to complete the data entry.

RELATED DAMAGE

Vehicle damage caused by a tire related failure is not covered by this program. Refer to the Warranty and Policy Manual for proper claiming procedure for vehicles covered by the Ford Bumper-to-Bumper Tire Warranty (model years 2001 and 2002). All other pre-2001 model year vehicles with alleged tire related vehicle damage should be handled through the Firestone claims process, or by referring the customers to their insurance company.

Damage related to replacement of tires should be handled as described in the Warranty and Policy Manual.

OWNER REFUND

With the increased availability of replacement tires, it will no longer be necessary for customers to pay out-of-pocket expenses for tires. Therefore, refund requests for tires purchased after November 15, 2001 will no longer be granted. Owners will be notified of the refund expiration date and will be directed to a Ford or Mercury dealer They are directed to an authorized retailer only if the Ford or Mercury dealer cannot meet their scheduling needs or tires are not in stock. All Ford and Mercury dealers (AtW and non-AtW dealers) are required to process refunds for customers who purchase tires prior to November 15, 2001.

The following rules apply to refunds for tires purchased from August 1, 2001 through November 15, 2001:

Refunds will be processed for vehicles listed under "AFFECTED TIRES AND VEHICLES", and for other Ford and Lincoln Mercury vehicles that have 15-. 16-, or 17-inch Wilderness AT tires installed.

^ The customer must provide the original paid receipt (a copy of their paid receipt is acceptable on an exception basis in instances where the owner requires the original for another purpose (e.g. extended tire warranty or purchase rebate). The dealer will attach the receipt to the dealer file copy of the refund claim (see claim instructions below).

^ Dealers will be reimbursed to immediately disable tires returned for a refund (see claiming instructions for refunds and Attachment II for labor operations).

^ The tires must be purchased August 1, 2000 through November 15, 2001 to be eligible for a refund (through October 31, 2001 for 1995 and 1996 F-150 owners).

^ Customers requesting refunds for tire replacement May 22, 2001 through November 15, 2001 must provide either:

NOTE:

This does not apply to 1995 and 1996 F-150 customers.

^ The Firestone Wilderness AT tires that were replaced. Returned tire(s) are to be disabled by the dealership. Ford will reimburse the dealer to disable (see claim instructions below and use labor operation 01B77G). If tires are brought in for refund with the DOT codes missing dealers should not process the refund.

^ A section of the old tire(s) containing the DOT codes from each of the Firestone Wilderness AT tires that were replaced (To be cut from the Wilderness AT tires that were replaced by the outside repair facility) (use labor operation 01B77L). Dealers should deface (cut in pieces or make code unreadable) the DOT sections of the tire so they cannot be used to obtain another refund. If sections are brought in for refund with the DOT code defaced dealers should not process the refund.

NOTE:

The DOT Code Identification Guide has been developed to help dealers determine if the DOT sections returned to the dealership are from 15-, 16-,

Purchase Date Range	Refund Guidelines
August 1, 2000 through May 22, 2001	• The actual cost as stated on the paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes • *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
1995 and 1996 F-150 vehicles only *August 1, 2000 through October 31, 2001*	• *The actual cost as stated on the paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes (no DOT required)* • *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
May 23, 2001 through November 15, 2001	• 15 inch tires - $110 (includes mounting, balancing, stems, disposal, and taxes) • 16 and 17 inch tires - $130 (includes mounting, balancing, stems, disposal, and taxes) • Dealers process refunds
After November 15, 2001	• *No refunds accepted for tires purchased after November 15, 2001*

Refund Questions	What is the owner qualified to receive?
Example: On December 21, 2000 the customer paid to have (4) Firestone Wilderness AT tires replaced on an affected vehicle.	o August 1, 2000 through May 22, 2001 (October 31, 2001 for 1995 and 1996 F-150) full refund with paid receipt o Customer does not need old tire(s) o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
Example: On January 15, 2001 the customer paid to have (2) Wilderness AT tires replaced on a 1988 F-Series truck. The other tires are non-Firestone Wilderness AT.	o August 1, 2000 through May 22, 2001 – full refund with paid receipt o Dealer contacts Special Service Support Center at 1-800-325-5621 for approval code o Customer does not need old tire(s) o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*

or 17-inch Firestone Wilderness AT tires. Use the DOT Code Identification Guide in conjunction with the bulletin section "What if the Vehicle has a Mix of Affected and Non-Affected Tires" to determine how many tires are eligible for refund.

NOTE:

Ford will allow customers to file for a refund (with or without tires) for tires purchased after May 22 through June 30, 2001 because customers may not have tires to turn in. Customers must provide a paid receipt indicating tire replacement before July 1, 2001 in order to process a refund without tires or DOT sections. Customers who purchase tires after June 30, 2001 must provide tires or DOT sections.

Ford will reimburse customers the following amounts:

^ Tires purchased from August 1, 2000 through May 22, 2001, the actual cost as stated on their paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes.

^ (1995 and 1996 F-150 vehicle only) Tires purchased from August 1, 2000 through October 31, 2001, the actual cost as stated on their paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes. No DOT section required.

^ Tires purchased May 23, 2001 through November 15, 2001, the actual cost as stated on the receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes up to a maximum of $110 per tire for 15 inch, and $130 per tire for 16 and 17 inch tires.

^ Refunds will not be granted for tires purchased after November 15, 2001.

Note:

If an owner pays for the replacement of their tires after November 15, 2001, the dealer may handle on a case by case basis following the procedure in Attachment II.

Refund Questions	What is the owner qualified to receive?
Example: On May 27, 2001 the customer took their 1998 Explorer to an outside tire retailer and had (5) Firestone Wilderness AT 16 inch tires replaced.	o After May 22, 2001 refund tire replacement with paid receipt up to: o 15 inch = $110 (maximum per tire) o 16 and 17 inch = $130 (maximum per tire) o With a paid receipt this customer would be entitled to (5) tires x $130 (16 inch maximum per tire) = $650 refund (includes mounting, balancing, stems, disposal, and taxes) o Dealer will be eligible to claim for refund allowance using labor operation 01B77L o If the customer returns the old tires to the dealer o The dealer will disable the old tires and dispose of them using the *"National Tire Recovery and Recycle Program"* using labor operation 01B77G (disable) in conjunction with 01B77L (refund allowance) o Customer does not need old tire(s) *since tires purchased prior to July 1, 2001* (After June 30, 2001 customer will need old tires or removed DOT codes from replaced tires to qualify)
Example: On December 2, 2000 the owner replaced their (5) Firestone Wilderness AT tires with another set of Wilderness AT tires.	o The owner is not eligible for refund o The owner is eligible for tire replacement only o Use only tires from the "Ford Approved Tire List"
Example: *On November 16, 2001 the owner purchases tires from a tire retailer.*	o *No refund will be granted after November 15, 2001* o *Dealers may handle on a case-by-case (See Attachment II)*
Example: *On October 10, 2001 a 1995 F-150 owner purchases tires from a tire retailer.*	o *August 1, 2000 through October 31, 2001 – full refund with paid receipt* o *Customer does not need old tire(s) or DOT section(s)* o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*

CLAIMS PREPARATION FOR REFUNDS (USE THIS PROCEDURE FOR ALL REFUND REQUESTS)

NOTE:

Tires must be purchased prior to November 15, 2001

^ Enter claims using DWE.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Enter information on a Recall/ONP claim type. DO NOT use a Warranty Claim type.

^ Program code 01B77.

^ When a customer brings in their old tires and is seeking a refund, use labor operation 01B77G (disable) and 01B77L (refund administration allowance) from Attachment II.

^ If a customer brings in the old DOT codes removed from the old tires - use labor operation 01B77L only.

^ The Miscellaneous Expense Code "ADMIN" will not be accepted under this program. A labor operation 01B77L has been provided to cover administrative costs.

^ Enter REFUND in the miscellaneous area of the claim.

^ Dealers will no longer be able to claim tire disposal for ONP 01B77. See the "National Tire Recovery and Recycle Program" You may still claim any applicable local waste tax - enter OTHER

in the expense area of the claim with the actual cost.

^ Enter each unique (complete 10 or 11 digit) DOT codes of the replaced tires in the diagnostic code entry screen in the field marked "other". If the DOT codes cannot be completely entered in the space provided in the diagnostic code area, use the technician comment area to complete the data entry. If the tires were replaced prior to May 23, 2001 (or November 1, 2001 for 1995 and 1996 F150 customers) the DOT may not be available, in this case record the brand, make and size of the tires in the technician comments area of the claim.

RENTAL CARS

TAP allowances have been increased specifically for this owner notification program. Refer to Don Brunner letter.

DOT REGISTRATION OF NEW TIRES

Dealers are required to register the DOT number of every tire sold to meet federal tire registration requirements. Ford has established a partnership with CIMS to assist dealers in registering these DOT codes. Information is available on QCDealer.com under CIMS Tire Registration or by contacting CIMS

Description	Labor Operation	Labor Time
Inspect for non-Wilderness AT tires (used to close 01B77 not for use when processing a refund)	01B77A	0.2 Hours
Replace & balance 1 tire (to be used for spare tire only)	01B77B	0.4 Hours
Replace & balance 2 tires (one axle)	01B77C	0.6 Hours
Replace & balance 3 tires (one axle plus spare)	01B77D	0.8 Hours
Replace & balance 4 tires (both axles)	01B77E	1.0 Hours
Replace & balance 5 tires	01B77F	1.2 Hours
Disable up to five tires (used only for refund claims)	01B77G	0.2 Hours
*Refund administration allowance (to be used when processing a customer refund without tire disposal, if tires are returned to dealership for disposal use in conjunction with operation 01B77G)	01B77L	0.2 Hours
Administrative Allowance for Non-Certified Tire Dealers (AtW or Ford Tire Program) to be used when sending a dealer stock unit, or customer vehicle (for tire replacement) to a Certified Tire Dealer, or tire retailer authorized to perform tire replacement under this program	Misc. Expense use code "SCHP"	$15.00

NOTE: Front-end alignment is not included in this program.

***NOTE:** When processing a refund for four (4) road tires, the non-temporary spare tire should be replaced as part of this program – file a related damage claim to cover the spare tire replacement.

at 330-794-9190.

NON-FORD OR LINCOLN MERCURY VEHICLES WITH FIRESTONE WILDERNESS AT

Non-Ford or Lincoln Mercury vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires installed by a Certified Tire Dealer (AtW or Ford Tire Program) are eligible for replacement. The repair should be submitted using a Warranty/ESP claim type form. The dealer must enter Program Code "P19", this will allow the repair to be submitted without a VIN. The causal part must be TIRE, with the actual part numbers for reimbursement at dealer cost plus 25%, and use actual time for labor reimbursement. These types of claims cannot be submitted as an Owner Notification Repair type.

Attachment II - Parts and Labor Information

LABOR ALLOWANCES

NON-AtW DEALERS SERVICING IN-STOCK UNITS OR CUSTOMER VEHICLES

NOTE:

Non-Certified Tire Dealers (AtW or Ford Tire Program) who have vehicles in stock, or customer vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires must send the vehicle to a Certified Tire Dealer (AtW or Ford Tire Program), or an approved tire retailer participating in the program to have the tire replacement performed. The non-Certified Tire Dealer (AtW or Ford Tire Program) will submit a 01B77 ONP claim using the miscellaneous expense code of "SCHP" (with a dollar value of $15.00 to cover administrative costs). Do not claim the "Admin" labor operation.

PARTS REQUIREMENTS

Tire Ordering Information

^ Dealers are required to install only tires from the Approved Tire List for vehicles originally equipped with 15-, 16-, and 17-inch Firestone Wilderness AT tires. Dealers should immediately order replacement tires for inventory.

^ Certified Tire Dealers will order replacement tires through normal channels.

^ Dealers not authorized for the Around the Wheel Program will not participate in this recall. Dealers may call the Ford Tire Hotline 1-888-353-3251 for enrollment and program details.

TIRE AVAILABILITY:

All dealers should check QCDealer.com daily for updates to the approved tires list. Distributors and tire retailers will allocate tires as best they can on a daily basis. Your dealership should do the following to ensure that you are able to secure your fair allotment of these limited volumes:

^ Contact your Ford authorized facing distributor(s) for each tire manufacturer.

^ Contact your Ford authorized facing tire retailers for each tire manufacturer.

^ Review with these supply points the volume of tires you need to ensure you have tires ready to fill orders with every supply point.

Questions not addressed by above sources should be directed to your market area team.

CUSTOMER WAIT LISTS:

Dealers should create a customer wait list and record: Customer name

^ Address and phone number

^ Vehicle make

^ Model year

^ Mileage

^ Tire size

NOTE:

Customers should be prioritized to replace oldest tires first.

WAIT LIST SURVEY

Please fill out the Firestone Tire Survey in the Management Report Section of QCDealer weekly. It is critical that you answer the questions as accurately as possible as the survey results will be used to help determine the level of production from the tire manufacturers.

DEALER PRICE

For latest prices on replacement tires, refer to the most recent Ford Motor Company Tire Price List.

PROCEDURE FOR CLAIMING REFUNDS FOR TIRES PURCHASED AFTER NOVEMBER 15, 2001

The following procedure applies to tires purchased after November 15, 2001:

1. Determine if the customer should receive special consideration based on owner loyalty, special circumstance cc, etc.

2. If the customer is eligible for special consideration the dealer will call the Special Service Support Center at 1800-325-5621 to request an authorization code.

3. The Special Service Support Center representative will ask for the following:

^ Customer Name

^ VIN

^ Date of repair

^ Original copy of invoice (be prepared to fax)

4. If the customer qualifies for a refund, the Special Service Support Center will provide your dealer with an authorization code.

5. Your dealer will input a claim with the authorization code (authorization code must be included to receive payment).

6. After the dealer receives payment for the claim, the dealer will then send the refund to the customer.

NOTE:

If the Special Service Support Center determines that the customer does not qualify for a refund, no authorization code will be given. Any appeals must be made by the dealer to the appropriate field representative

Attachment III - Technical Information

AFFECTED VEHICLES: REFER TO DEALER LETTER FOR AFFECTED TIRES AND VEHICLES

OVERVIEW

This program details the replacement of 15-, 16-, and 17-inch Firestone Wilderness AT tires regardless of production plant. You will need to perform a DOT code inspection prior to replacing the 15, 16, or 17-inch Wilderness AT tires.

NOTE:

When lowering or raising an under-vehicle spare, DO NOT use power tools. Also make sure that the spare is secure under the vehicle, and not swinging loose. The spare tire winch will ratchet when the tire is completely stowed.

NOTE:

Radial ATX "TEMPORARY USE" spare tires are not included under this program, and should not be replaced as part of this program.

NOTE:

Spare tires should always be replaced with the exact same size tire; otherwise the spare tire may not store in the proper position on the vehicle.

INSPECTION

1. Inspect the vehicle tires (including the spare tire) for the presence of Firestone Wilderness AT tires.

2. If Firestone Wilderness AT tires are present replace them with a suitable replacement from the "Approved Tire List".

Note:

There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.

3. If only one Firestone Wilderness AT road tire is present on the vehicle, you will need to replace the opposing tire on the same axle. However, if one (1) front and one (1) rear tire are Wilderness AT you would not automatically replace all four (4) tires instead, you would replace the two (2) Wilderness AT tires and place them on the same axle.

4. Record the DOT code from each removed tire(s) on the repair order.

5. Tires that are removed from vehicles must immediately be made unusable by either cutting through the bead and DOT code with bolt cutters, or drilling a one-inch diameter hole (directly on the DOT code to make the code unreadable) in the sidewall.

6. Adjust all tires to the proper inflation pressure, and release the vehicle. For specifications, refer to the vehicle Owner's Manual or the vehicle certification label located on the driver's door opening.

NOTE:

Tires that are removed from vehicles under this program, and those in dealer inventory must immediately be made unusable by either cutting the bead with bolt cutters or drilling a 1" diameter hole (directly on the DOT code to make the code unreadable) in the sidewall. Defacing the DOT

code will prevent the tire from being used for an additional refund request.

NOTE:

If the vehicle is a 4X4, and is equipped with non-Firestone Wilderness AT tires on one axle, and the replacement tires for the Firestone equipped axle causes a mismatch with the existing non-Firestone axle, the customer is responsible for the tire mismatch. If the customer refuses to purchase matching tires to correct the mismatch - the dealer should annotate the repair order to reflect the customer's decision.

Ford Motor Company

FIRESTONE TIRE RECALL

September 2000

TO: All Ford and Lincoln Mercury Dealers

SUBJECT: Firestone Tire Recall Supplement #4 9/1/00 - Updated Information

REFERENCE: Firestone Recall - Firestone P235/75 R15 Radial ATX and Certain Wilderness AT tires

Changes for this Supplement:

- The following has been added to Attachment I to clarify the claiming of freight: Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier.
- Additional information is now required in the comments of each claim filed for tire replacement under both Program Codes P17 and P18. The comments must include the entire DOT code from the tire being replaced and under P17 only the part number of the replacement tire. Firestone requires this information for government reporting.

Claims under the Firestone recall for tire replacement filed by Ford and Lincoln Mercury dealers not enrolled in the AtW/Ford Tire Program will not be accepted for payment. Non-AtW/Ford Tire Program dealers will continue to be able to file claims for tire inspection. This is not new information; we have just added the edits to the ACES II system.

The revised letter and attachments have been marked "Revised 9/1/00", and a ( ) symbol appears at the beginning of any text that changed since the last Supplement and the text appears in green when viewed on line. To avoid confusion please discard all previous versions.

Sincerely,

A. R. O'Neill
Director
Vehicle Service and Programs

Firestone Recall - Firestone P235/75 R15 Radial ATX and Certain Wilderness AT tires.

AFFECTED TIRES AND VEHICLES

Bridgestone Firestone Tire Company recently announced a Safety Recall on the following:

- All Firestone P235/75 R15 Radial ATX tires produced excluding tires marked "TEMPORARY" on the sidewall - and -

- P235/75 R15 wilderness AT tires produced only at the Decatur plant.

NOTE:

Decatur built tires have a DOT code of VDHL - see Attachment III for details. All other Wilderness AT tires are not affected.

Both original equipment (OE) and replacement tires are affected.

The following vehicles produced with Firestone P235/75 R15 Radial ATX original equipment tires are affected by this recall:

^ Certain 1991 through 1996 Ford Explorer (see chart)

^ Certain 1997 Mercury Mountaineer vehicles

^ Certain 1991 through 2000 Ranger vehicles

^ Certain 1991 through 1994 Bronco vehicles

^ Certain 1991 through 1994 F-Series vehicles

The following vehicles produced with P235/75 R15 Wilderness AT tires as original equipment are affected by this recall:

Certain 1997 through August 7, 2000 Mountaineer vehicles

^ Certain 1997 through August 7, 2000 Explorer vehicles (see chart)

^ Certain 1997 through June 1, 2000 Ranger vehicles

^ Certain 2001 Explorer Sport Trac and Sport vehicles produced through August 7, 2000

These Explorer vehicles produced with either P235/75 R15 Radial ATX or P235/75 R15 Wilderness AT tires as original equipment are affected as shown.

These Explorer vehicles are NOT affected:

IMPORTANT FACTS

^ This is a FIRESTONE recall.

^ FIRESTONE will notify customers of the recall via first class mail.

^ FIRESTONE will communicate recall information to authorized repair sites including Ford and Lincoln-Mercury Around the wheel/Ford Tire Program dealers.

FORD AND LINCOLN MERCURY DEALER INVOLVEMENT

As this field action will severely impact the availability of Firestone replacement tires, Ford and Lincoln Mercury Around the Wheel (AtW)/Ford Tire Program dealers will be afforded the opportunity to address this recall utilizing Firestone and non-Firestone tires. This is being done to address immediate needs of our customers.

FORD AND LINCOLN MERCURY DEALERS ENROLLED IN AROUND THE WHEEL (AtW)

Dealerships enrolled in the AtW/Ford Tire Program are authorized Firestone outlets. If a customer with affected tires contacts an ATW Ford Tire Program dealer, as an authorized Firestone dealer regarding this safety recall, you will be able to replace that customer's tires with Firestone or "approved" non-Firestone tires. Tires that are approved for use as replacement tires under this recall will be posted in a matrix in the Firestone Tire Center in QCDealer.com. This matrix will be amended to add new tire manufactures and models of tires as they are approved. Claiming for reimbursement of tires is outlined on Attachment I.

If the customer requests a replacement Firestone tire, secure the tire through your normal distribution chain and process reimbursement as outlined in Attachment I.

FORD AND LINCOLN MERCURY DEALERS NOT ENROLLED IN AROUND THE WHEEL (AtW)

Dealers not enrolled in the ATW/Ford Tire Program can inspect customer vehicles (see Attachments I & II for claiming instructions & labor operations). These dealers should make individual arrangements with local Firestone outlets for tire replacement, or refer customers to their local Firestone outlet.

SERVICE PROCEDURE

All Firestone P235/75 R15 tires with Radial ATX on the sidewall (excludes Temporary spare tires identified by "Temporary" on the sidewall) must be replaced under this recall.

Firestone P235/75 R15 tires with Wilderness AT on the sidewall will need to be inspected for a DOT code of VDHL to determine if replacement is required. Refer to Attachment III for details.

This service action applies to original equipment and replacement tires that are installed on Ford and Mercury vehicles.

DEMONSTRATION / DELIVERY HOLD FOR VEHICLES AND TIRES IN DEALER INVENTORY

Do not demonstrate or deliver any of the affected vehicles prior to completing the Firestone recall. In addition, Ford and Lincoln Mercury Around the Wheel (AtW)/Ford Tire Program dealers may have affected tires in inventory; these tires should not be sold.

Tires Removed from Vehicles

Tires that are removed from vehicles must immediately be made unusable by either cutting the bead with bolt cutters, drilling a one-inch diameter hole in the sidewall, or cutting the tire completely in half The DOT code should not be defaced or removed. The tire should then be disposed of according to local laws refer to the Tire Administration Guide for further information.

NOTE:

AtW/Ford Tire Program dealers will be independently audited for compliance with the above procedure.

New Inventory Tires

All new Radial ATX or Wilderness AT tires with DOT code VDHL tires (never mounted) in AtW/Ford Tire Program dealer inventory must be returned to Firestone. Dealers must call 1-800-668-0345 to obtain a "Returned Goods Authorization (RGA) number. The RGA is a 6-digit number required to return the tires. Only tires affected by the Firestone recall will be accepted. Firestone will pay all freight for the return of these tires.

CONTACTS

Claims Information: 1-800-423-8851

Other (Dealer Only) Recall Questions: 1-800-325-5621

For Around the Wheel/Ford Tire Program 1-888-353-3251

Questions:

Attachment I

OASIS Since this is a Firestone recall, OASIS will not be activated.

PLEASE NOTE

Correct all vehicles in stock before delivery. Federal law requires dealers to complete any outstanding safety recall service before a vehicle is delivered to the buyer or lessee. Violation of this requirement by a dealer could result in a civil penalty of up to $1,100 per vehicle.

CLAIMS PREPARATION AND SUBMISSION

NOTE:

Claims for Firestone tires (P18) may be entered for payment beginning with repairs dated August 28, 2000 and later.

Claims for non-Firestone tires

Enter claims in ACES II for non-Firestone tires using DWE with the following information:

^ Enter information on a warranty claim. DO NOT use a recall claim.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Program Code - P17. Enter P17TIRE as the causal part with condition code 82.

^ On the same line as PI7TIRE enter the total value of the tires from the "Suggested List Price" column of the latest Ford Motor Company Tire Selling Guide.

^ Use the appropriate labor operation(s) from Attachment II.

^ Freight is reimbursable at actual cost in the miscellaneous expense area of the claim.

NOTE:

Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier.

^ Tire disposal and applicable local waste tax will be reimbursed - enter OTHER in the miscellaneous expense area of the claim with the actual cost.

^ Enter the entire DOT code and the part number of the replacement tire being used in the comments area of the claim.

Claims for Firestone tires

Enter claims in ACES II for Firestone tires using the following information:

^ Enter information on a warranty claim. DO NOT use a recall claim type.

^ Program Code - P18.

^ Enter "P18TIRE" as the causal part, no material cost should be entered on this line.

Description	Labor Operation	Labor Time
Inspect 5 tires applies only to P235/75 R15 Wilderness AT tires) - VEHICLE NOT AFFECTED (Non VDHL DOT Code)	00V01G	0.2 Hours
Inspect 5 tires (applies only to P235/75 R15 Wilderness AT tires) - VEHICLE AFFECTED - Customer must return at a later date due to unavailability of replacement tires. This may be claimed only one time per vehicle per dealer.	00V01A	0.2 Hours
Replace & balance 1 tire (No longer includes inspect) May be used with labor op 00V01A only	00V01B	0.4 Hours
Replace & balance 2 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01C	0.6 Hours
Replace & balance 3 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01D	0.8 Hours
Replace & balance 4 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01E	1.0 Hours
Replace & balance 5 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01F	1.2 Hour

^ Condition code "82".

^ Use Customer Concern Code "A99".

^ Enter the full published tire part number with the quantity of tires replaced, the payment system will price the tire at Dealer Net multiplied by the quantity for the total value of the replaced tires.

^ Use Miscellaneous Expense Code "TIREMU" to claim the $20.00 difference per tire7 a maximum of $100.00.

^ The Firestone warranty claim form must be filled out and attached to the hard copy of the claim and retained in the service file. The entire DOT code from the replacement tire(s) must be recorded on this form.

^ The DOT code must also be entered in the comments area of the claim.

^ No labor operations will be allowed when claiming P18.

OWNER REFUND

Ford and Lincoln Mercury dealers, including AtW/Ford tire dealers; will not be involved in processing refunds for customers included in the Firestone recall. Customers inquiring about a refund should be provided copies of the Firestone refund request form. Refer to the Firestone website for the refund forms and for further details.

RENTAL CARS

TAP allowances have been increased specifically for the Firestone recall refer to M.J. Lombardi's Letter.

Attachment II

LABOR ALLOWANCES

NOTE:

Front-end alignment is not included in this recall.

NOTE:

These labor operations and revised times will begin paying with claims submitted on August 18, 2000; Claims in process at dealerships will need to use these new operations.

PARTS REQUIREMENTS

Tire Ordering Information

FIRESTONE TIRE INSPECTION

AFFECTED VEHICLES: **REFER TO DEALER LETTER FOR AFFECTED TIRES AND VEHICLES**

OVERVIEW

This procedure outlines how to check the DOT code on the tires and determine if they must be replaced.

NOTE: All Firestone P235/75R15 tires that say "RADIAL ATX" on the sidewall are being recalled and no further inspection is necessary.

NOTE: All tires including the spare must be inspected if they are "WILDERNESS AT" P235/75R15.

NOTE: When lowering or raising an under-vehicle spare, **DO NOT** use power tools. Also make sure that the spare is secure under the vehicle, and not swinging loose. The spare tire winch will ratchet when the tire is completely stowed.

INSPECTION

1. Raise vehicle on a hoist.
2. Locate the DOT code on the inboard sidewall of all tires including the spare. On F-Series and Bronco models, the spare tire must be lowered to view the DOT code. Clean the area if necessary in order to accurately read the code.
3. If the DOT code is **VDHL**, the tire must be replaced. See the matrix (part of the dealer bulletin) to determine the correct replacement tires. See Figure 1.

NOTE: Recall tires that are removed from vehicles and in dealer inventory must immediately be made unusable by either cutting the bead with bolt cutters or drilling a 1" diameter hole in the sidewall.

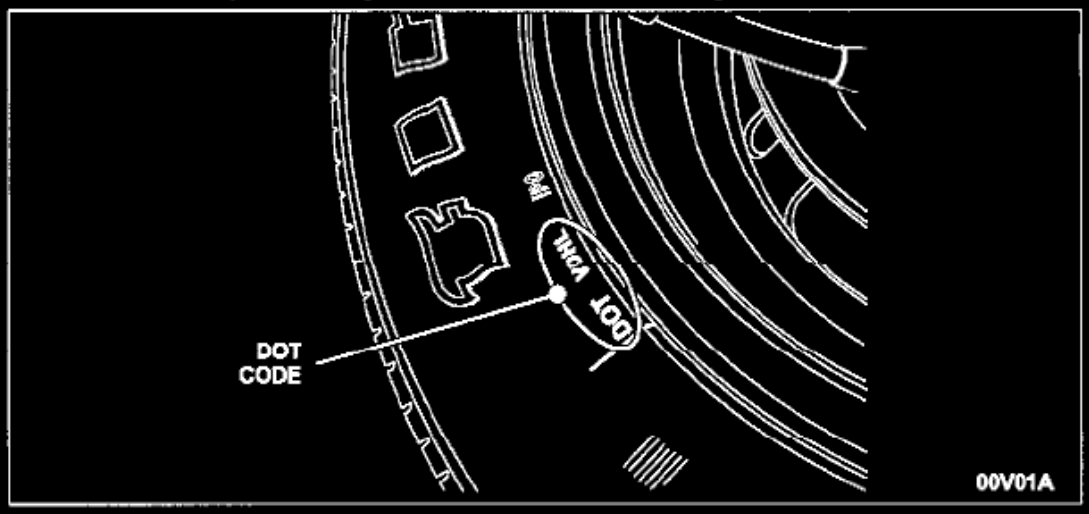

FIGURE 1

4. If the code is anything other than **VDHL**, release the vehicle to the owner.

CPR© 2000 FORD MOTOR COMPANY
DEARBORN, MICHIGAN 48121

ISSUE: The use of a power impact wrench to install wheel nuts provides minimal torque control. Undertightening may allow the lug nuts to loosen, and can result in the wheel separating from the vehicle. Overtightening of wheel nuts may cause brake rotor distortion that could result in a brake shudder. Overtightening may cause distortion of the wheel. This can result in a change in the diameter of the center (axle) hole and make it difficult to remove from the axle it is mounted on or difficult or impossible to install on another axle with a smaller center hole diameter.

ACTION: Use a manual torque wrench to tighten wheel nuts. Refer to the approriate Shop Manual for specific torque values.

OTHER APPLICABLE ARTICLES: None WARRANTY STATUS: INFORMATION ONLY OASIS CODES:

Wheel Bearing: Adjustments With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

1. Raise the vehicle and install safety stands. 2. Remove the wheel lugnuts and the wheel and tire assembly. 3. Remove the retainer washers from the lugnut studs. Remove the automatic locking hub assembly from the spindle. 4. Remove the snap ring from the end of the spindle shaft.

Axle Shaft Spacer

5. Remove the axle shaft spacer. 6. Pull cam assembly off the wheel bearing adjusting nut and remove the two plastic thrust spacers from the adjusting nut.

CAUTION: Do not pry on the plastic cam or thrust spacers during removal. Prying may damage the cam or spacers.

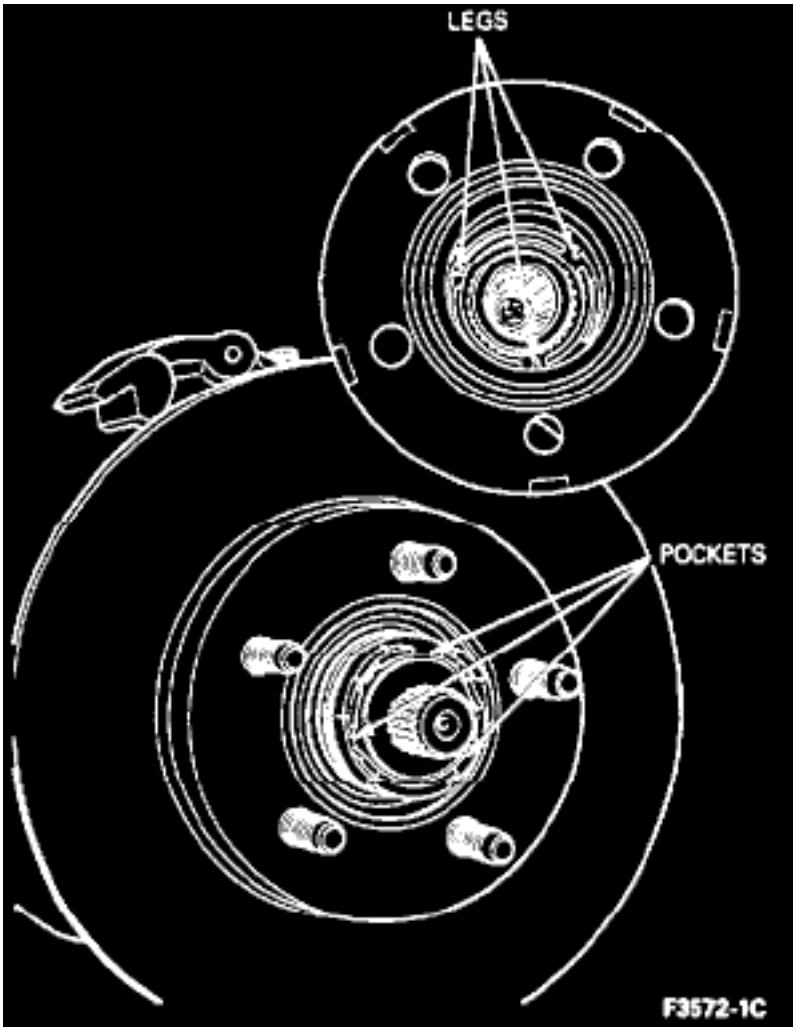
Cam Assembly And Locking Key

7. Using a magnet, remove the locking key.

NOTICE: If required, rotate the adjusting nut slightly to relieve pressure against the locking key, before the key can be removed.

CAUTION: To prevent damage to the spindle threads, look into the spindle keyway under the adjusting nut and remove the separate locking key before removing the adjusting nut.

8. Loosen the wheel bearing adjusting nut from the spindle using a 2-3/8 inch hex locknut wrench.



9. While rotating the hub and rotor assembly, tighten the wheel bearing adjusting nut to 47 Nm (35 ft lb) to seat the bearings. Spin the rotor and back

off the nut one-quarter turn (90 degrees).

10. Retighten the adjusting nut to 1.8 Nm (16 in lb) using a torque wrench. 11. Make sure the final end play of the wheel on the spindle is 0.00-0.08mm (0.000-0.003 inch). 12. Align the closest lug in the wheel bearing adjusting nut with the center of the spindle keyway slot. Advance the nut to the next lug if required.

Install the separate locking key in the spindle keyway under the adjusting nut.

WARNING: Extreme care must be taken when aligning the spindle nut adjustment lug with the center of the spindle keyway slot to prevent damage to the separate locking key. the wheel and tire assembly may come off while the vehicle is in motion if the key is damaged.

13. Install the two thrust spacers and push or press the cam assembly onto the locknut by lining up the key in the fixed cam with the spindle keyway.

CAUTION: Extreme care must be taken when aligning the fixed cam key with the spindle keyway to prevent damage to the fixed cam.

14. Install the axle shaft spacer. 15. Clip the snap ring onto the end of the spindle shaft.

Automatic Locking Hub Installation

16. Install the automatic locking hub assembly over the spindle. Align three hub assembly legs with three pockets in cam assembly. Install the retainer

washers.

17. Install the wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb).

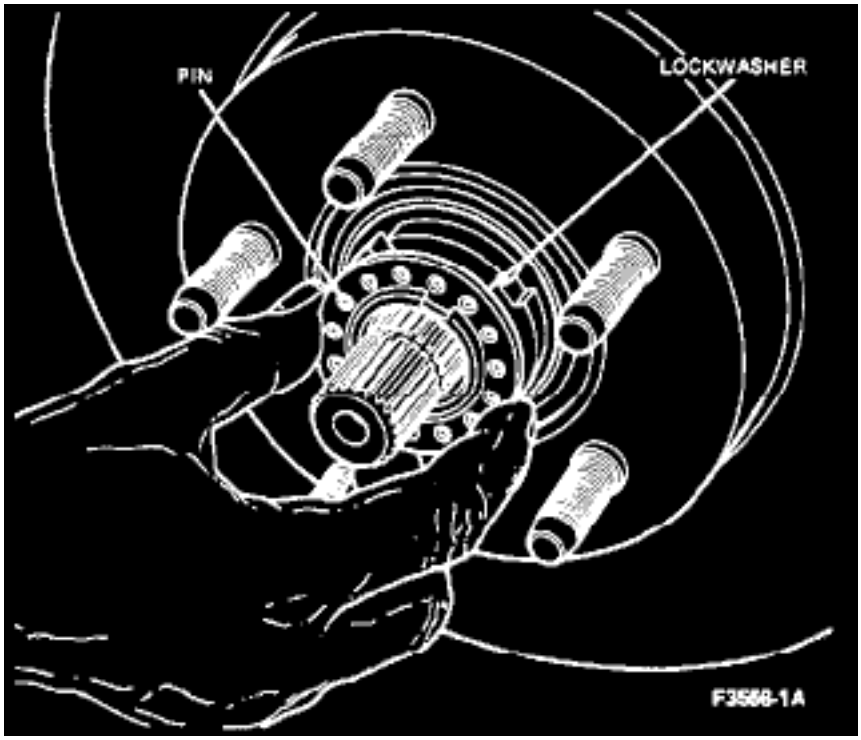
1. Raise the vehicle and install safety stands. 2. Remove the wheel and tire assembly. 3. Remove the retainer washers from the lugnut studs and the manual locking hub assembly from the spindle. 4. Remove the snap ring from the end of the spindle shaft.

Axle Shaft Spacer

5. Remove the axle shaft spacer.

Locknut Wrench

6. Remove the outer wheel bearing locknut from the spindle using a hub locknut wrench. Engage tool tabs into locknut slots.



Locknut Washer

7. Remove locknut washer from spindle. 8. Tighten the inner locknut to 47 Nm (35 ft lb) while turning the rotor in the opposite direction to seat bearings. 9. Spin the rotor and back off the inner locknut one-quarter turn. Retighten the inner locknut to 1.8 Nm (16 in lb).

10. Install the lockwasher on the spindle. 11. Install the outer wheel bearing locknut using locknut wrench. Tighten locknut to 203 Nm (150 ft lb). 12. Check the end play of the wheel and tire assembly on the spindle. Final end play should be 0.02-0.08 mm (0.001-0.003 inch). 13. Install the axle shaft spacer. 14. Clip the snap ring onto the end of the spindle shaft. 15. Install the manual hub assembly over the spindle. Install the retainer washers. 16. Install the wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb).

ISSUE: The use of a power impact wrench to install wheel nuts provides minimal torque control. Undertightening may allow the lug nuts to loosen, and can result in the wheel separating from the vehicle. Overtightening of wheel nuts may cause brake rotor distortion that could result in a brake shudder. Overtightening may cause distortion of the wheel. This can result in a change in the diameter of the center (axle) hole and make it difficult to remove from the axle it is mounted on or difficult or impossible to install on another axle with a smaller center hole diameter.

ACTION: Use a manual torque wrench to tighten wheel nuts. Refer to the approriate Shop Manual for specific torque values.

Wheel Hub: Service and Repair Removal

With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

1. Raise the vehicle and install safety stands. 2. Remove the wheel lugnuts and the wheel and tire assembly. 3. Remove the brake caliper and secure to the underbody to prevent damage to the brake hose. It is not necessary to disconnect the hose from the

caliper. Do not let the caliper hang with its weight on the brake hose or the hose may become stretched, twisted or ruptured.

4. Remove the retainer washers from the lugnut studs. Remove the automatic locking hub assembly from the spindle. 5. Remove the snap ring from the end of the spindle shaft.

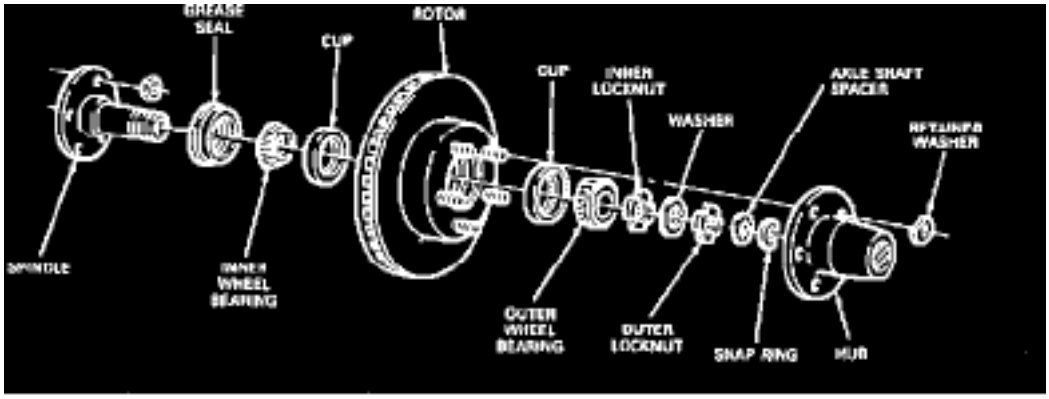
Axle Shaft Spacer

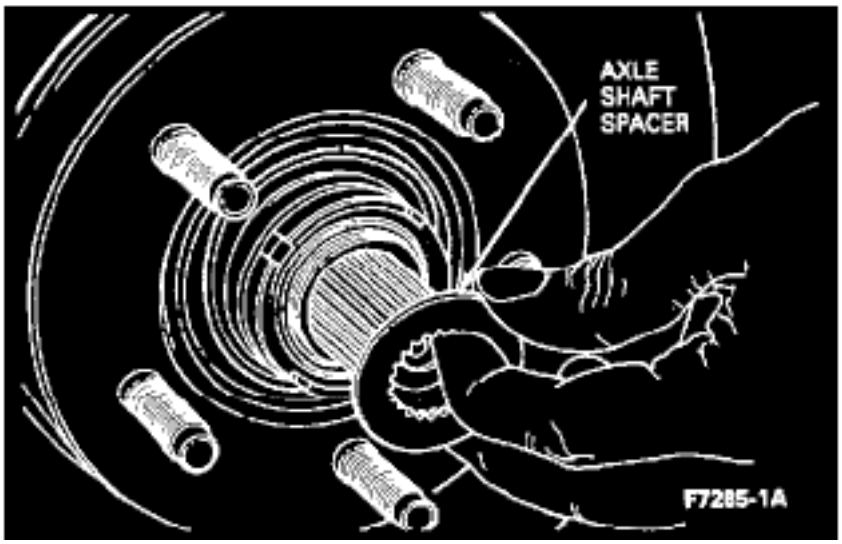
6. Remove the axle shaft spacer. 7. Pull cam assembly off the wheel bearing adjusting nut and remove the two plastic thrust spacers from the adjusting nut.

CAUTION: Do not pry on the plastic cam or thrust spacers during removal. Prying may damage the cam or spacers.

Cam Assembly And Locking Key

8. Using a magnet, remove the locking key.





NOTICE: If required, rotate the adjusting nut slightly to relieve pressure against the locking key, before the key can be removed.

CAUTION: To prevent damage to the spindle threads, look into the spindle keyway under the adjusting nut and remove the separate locking key before removing the adjusting nut.

9. Remove the wheel bearing adjusting nut from the spindle using a 2-3/8 inch Hex Locknut Wrench.

10. Remove the inner locknut and slide hub/rotor off spindle being careful to catch the outer wheel bearing.

With Manual Locking Hubs

Fig. 5 Manual Locking Hub

1. Raise the vehicle until the tire clears the floor and remove the wheel and tire assembly. 2. Remove the brake caliper and secure to the underbody to prevent damage to the brake hose. It is not necessary to disconnect the hose from the

caliper.

CAUTION: Do not let the caliper hang with its weight on the brake hose or the hose may become stretched, twisted or ruptured.

3. Remove the retainer washers from the lugnut studs and the manual locking hub assembly from the spindle. 4. Remove the snap ring from the end of the spindle shaft.

Axle Shaft Spacer

5. Remove the axle shaft spacer.

Wheel Hub: Service and Repair Installation

With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

CAUTION: Wheel bearing lubricant is a lithium-base grease. Sodium-base grease is not compatible with lithium-base grease and should not be intermixed. Therefore, do not lubricate front wheel bearings without first identifying the type of original wheel bearing lubricant. Usage of incompatible bearing lubricants may result in premature lubricant breakdown.

Installing Bearing Cups (Typical)

1. If inner or outer bearing cups were removed, install replacement inner and outer bearing cups in the hub with the appropriate bearing cup replacer

tool. Be sure to seat the cups properly in the hub. The cups will be properly seated when they are fully bottomed. Replace grease retainers. Polish grease retainer journal on spindle with 400 grit sandpaper. Clean with clean cloth.

2. Pack the inside of the hub with lithium-base grease or equivalent. Fill the hub until the grease is flush with the inside diameters of both bearing

cups. Pack the bearing cones and rollers with wheel bearing grease. Use a bearing packer for this operation. If a packer is not available, work as much lubricant as possible between the rollers and cages. Lubricate the cone surfaces with grease.

Installing Grease Seal (Typical)

3. Place the inner bearing in the inner cup and install the new grease seal. Be sure that the seal is fully seated. 4. Install the hub/rotor on the wheel spindle. Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads. 5. Place the outer bearing in the outer cup. 6. Install the wheel bearing adjustment nut. 7. While rotating the hub and rotor assembly, tighten the wheel bearing adjusting nut to 47 Nm (35 ft lb) to seat the bearings. Spin the rotor and back

off the nut one-quarter turn (90 degrees).

8. Retighten the adjusting nut to 1.8 Nm (16 in lb) using a torque wrench. 9. Make sure the final end play of the wheel on the spindle is 0.00-0.08 mm (0.000-0.003 in). the maximum torque to rotate the hub is 2.8 Nm (25 in

lb).

10. Align the closest lug in the wheel bearing adjusting nut with the center of the spindle keyway slot. Advance the nut to the next lug if required.

Install the separate locking key in the spindle keyway under the adjusting nut.

WARNING: Extreme care must be taken when aligning the spindle nut adjustment lug with the center of the spindle keyway slot to prevent damage to the separate locking key. The wheel and tire assembly may come off while the vehicle is in motion if the key is damaged.

11. Install the two thrust spacers and push or press the cam assembly onto the locknut by lining up the key in the fixed cam with the spindle keyway.

CAUTION: Extreme care must be taken when aligning the fixed cam key with the spindle keyway to prevent damage to the fixed cam.

12. Install the axle shaft spacer. 13. Clip the snap ring onto the end of the spindle shaft. 14. Install the automatic locking hub assembly over the spindle. Align three hub assembly legs with three pockets in cam assembly. Install the retainer

washers.

15. Install the caliper. 16. Install the wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb).

With Manual Locking Hubs

Fig. 5 Manual Locking Hub

CAUTION: Wheel bearing lubricant is a lithium-base grease. Sodium-base grease is not compatible with lithium-base grease and should not be intermixed. Therefore, do not lubricate front wheel bearings without first identifying the type of original wheel bearing lubricant. Usage of incompatible bearing lubricants may result in premature lubricant breakdown.

Installing Bearing Cups (Typical)

1. If inner or outer bearing cups were removed, install replacement inner and outer bearing cups in the hub with the appropriate bearing cup replacer

tool. Be sure to seat the cups properly in the hub. The cups will be properly seated when they are fully bottomed. Polish grease retainer journal on spindle with 400 grit sandpaper. Clean with clean cloth. Replace grease retainers.

2. Pack the inside of the hub with lithium-base grease or equivalent. Fill the hub until the grease is flush with the inside diameters of both bearing

cups. Pack the bearing cones and rollers with wheel bearing grease. Use a bearing packer for this operation. If a packer is not available, work as much lubricant as possible between the rollers and cages. Lubricate the cone surfaces with grease.

Installing Grease Seal (Typical)

3. Place the inner bearing in the inner cup and install the new grease seal. Be sure that the seal is fully seated. 4. Install the hub/rotor on the wheel spindle. Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads. 5. Place the outer bearing in the outer cup. 6. Install the inner locknut. 7. Tighten the inner locknut to 47 Nm (35 ft lb) while turning the rotor in the opposite direction to seat bearings. 8. Spin the rotor and back off the inner locknut one-quarter turn. Retighten the inner locknut to 1.8 Nm (16 in lb). 9. Install the lockwasher on the spindle.

NOTICE: If necessary, tighten inner locknut slightly to align the locknut pin with lockwasher hole.

10. Install the outer wheel bearing locknut using locknut wrench. Tighten locknut to 203 Nm (150 ft lb). 11. Check the end play of the wheel and tire assembly on the spindle. Final end play should be 0.00-0.08 mm (0.000-0.003 in). The maximum torque

to rotate the hub is 2.8 Nm (25 in lb).

12. Install the axle shaft spacer. 13. Clip the snap ring onto the end of the spindle shaft.

14. Install the manual hub assembly over the spindle. Install the retainer washers. 15. Install caliper. 16. Install wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb). 17. Lower vehicle. 18. Check brakes for proper operation.

WARNING: Before moving vehicle, pump brake pedal several times to be sure it is firm. Do not move vehicle until a firm pedal is obtained.

Wheel Hub (Locking): Customer Interest Front Hub - (4WD) Noise or Failure

Article No. 91-18-12 09/05/91

^ NOISE-"RATCHETING" SOUND FROM HUBLOCKBRONCO II BUILT AFTER 10/1/89, RANGER BUILT BETWEEN 10/1/89 AND 3/31/91, EXPLORER BUILT UNTIL 3/31/91

^ AXLE-FRONT-AUTOMATIC LOCKING HUBS-ENGAGEMENT OF FRONT DRIVELINE DELAYED OR NO COUPLING OF FRONT WHEELS-BRONCO II BUILT AFTER 10/1/89, RANGER BUILT BETWEEN 10/1/89 AND 3/31/91, EXPLORER BUILT UNTIL 3/31/91

LIGHT TRUCK: 1990 BRONCO II 1990-91 RANGER 1991 EXPLORER

This TSB article is being republished in its entirety to note that the wheel bearing retaining nut is included with the front automatic locking hub assembly.

ISSUE: Engagement of the front driveline on 4x4 models of the subject vehicles with Shift-On-The-Fly and Dana 35 axles may exhibit delayed or no coupling of the front wheels. Both of these conditions may result in a hublock ratcheting noise and sometimes may result in structural damage to the hublock. These concerns are caused by the failure of the transfer case to provide synchronization of the drivetrain during cold weather.

ACTION: Test drive the vehicle to determine if the driveline exhibits delayed or no coupling of the front wheels. If so, use the following procedure to service the vehicle.

NOTE: THESE ACTIONS SHOULD PROVIDE SHIFT-ON-FLY CAPABILITY TO 55 MPH (89 KM/H) AT TEMPERATURES ABOVE 32~F (0~C) AND 45 MPH (72 KM/H) WITH TEMPERATURES FROM 32~F (0~C) TO AS LOW AS -20~F (-29~C).

FRONT AUTOMATIC LOCKING HUB

1. Remove the left and right front automatic locking hubs and camming assemblies and replace with new assemblies (FOTZ-3B396-B). Refer to the appropriate Light Truck Shop Manual, Section 04-01D, for service details.

2. Inspect the wheel bearing retaining nut for damage and presence of foreign material which would diminish wheel bearing life.

3. Replace the wheel bearing retaining nut if damaged. This nut is included with the front automatic locking hub assembly.

FRONT AXLE LUBRICANT

1. Determine if the vehicle was built prior to 12/15/90.

2. If the vehicle was built prior to 12/15/90, replace the front axle lubricant with new lubricant (F1TZ-19580-A).

a. Extract the old lubricant using a suction gun.

NOTE: BREAKING THE CARRIER SEAL IS NOT A RECOMMENDED METHOD OF EXTRACTING THE LUBRICANT.

b. Refill the front axle with 56 ounces of lubricant (F1TZ-19580-A) using a suction gun.

TRANSFER CASE

1. Remove the following old transfer case parts and replace them with the following new parts. Refer to the appropriate Light Truck Shop Manual, Section 07-07E, for service details.

^ Clutch Coil Assembly (F1TZ-7G361-B)

^ Clutch Housing (F1TZ-7G362-A)

^ Lock-Up Collar (F1TZ-7106-B)

^ Lock-Up Fork (FOTZ-7289-A) - (Green paint mark by part number)

^ Return Spring (F1TZ-7219-A)

^ Sleeve Spring (E6TZ-7D126-A)

2. Install the sleeve spring (E6TZ-7D126-A) into the bore of the 7106 lock-up collar large end first.

Article No. 95-5-18

03/13/95

^ LOCK HUBS - 4WD - AUTOMATIC HUBLOCK INFORMATION - SERVICE TIPS

^ FOUR-WHEEL DRIVE (4WD) - AUTOMATIC LOCK HUB DIAGNOSIS

LIGHT TRUCK: 1983-90 BRONCO II 1983-95 RANGER 1991-94 EXPLORER

ISSUE: 4X4 system diagnosis can be difficult at times due to system complexities.

ACTION:

For general system operation and diagnosis: Refer to TSB Article No. 92-1-8.

For specific automatic lock hub diagnosis and service: Refer to this article.

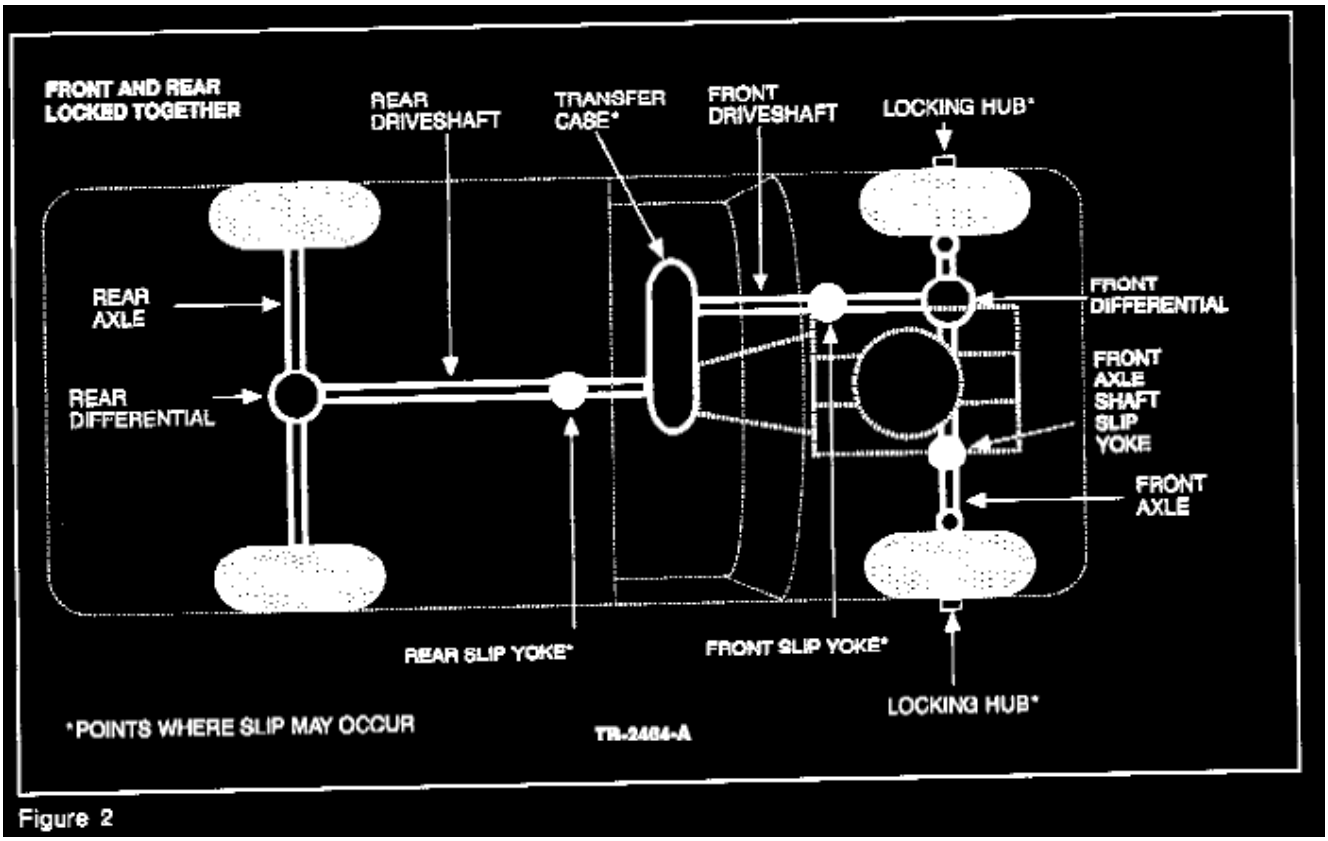

Figure 2

HUBLOCK DIAGNOSTICS

WHEEL END CONTAMINATION:

^ All compact vehicle hublocks have an O-ring seal between the hublock and wheel hub to prevent contamination. Whenever the hublock is removed, the 0-ring seal should be checked for damage.

^ If contamination is found in the wheel end, the path must be determined and corrected. Path possibilities are through the hublock seal, the wheel

bearing seals or the axle spindle seals.

WHEEL END NOISE (BUZZING) IN 4X2, AFTER UNLOCKING HUBS, SHORTLY AFTER FOUR-WHEEL DRIVE USAGE:

^ Noise concerns in two-wheel drive shortly after shifting from four-wheel drive and unlocking hubs, can occur if one of the hublocks fails to disengage. As the vehicle moves forward, the one (1) hublock that has failed to disengage will rotate its axle shaft through the differential and attempt to rotate the other axle shaft in the opposite direction. This is called differential motoring torque. As this torque attempts to turn the other axle shaft through the differential gears, that shaft's hublock will attempt to engage which will result in a ratcheting or buzzing noise.

^ This type of noise concern is usually found on axles that have incorrect front axle differential lubricant or very few 4X4 miles on them.

^ Verify that the front axle differential lubricant is F1TZ-19580-A. If incorrect lubricant is detected, extract the old lubricant using a suction gun.

NOTE:

BREAKING THE CARRIER SEAL IS NOT A RECOMMENDED METHOD OF EXTRACTING THE LUBRICANT.

1. Refill the front axle with 56 oz (1.66 L) of lubricant F1TZ-19580-A using a suction gun.

2. As the front axle accumulates 100-200 miles (161-322 km) of locked hublock operation, the axle will break-in, thus reducing the amount of differential motoring torque significantly.

3. If a front axle requires breaking in, refer to the Front Axle Break-In Procedure in this article.

4. If the front axle has been broken-in and the differential lubricant is F1TZ-19580-A, however, a wheel end noise (buzzing) in 4X2 is still experienced shortly after four-wheel drive usage. It is advised that the hublock which is not ratcheting be replaced as it is not disengaging correctly. When this condition occurs on any 4X4 Ranger, Explorer, or Bronco II, built from 10/89 through model year 1993, it is advised that both hublocks be replaced as the ratcheting hub is likely to become damaged.

FRONT AXLE BREAK-IN PROCEDURE:

^ To break-in the front axle, engage four-wheel drive and then shift out of it without disengaging the hublocks.

^ Thereafter, continue to drive the vehicle with locked hublocks until 100-200 miles (161-322 km) are accumulated. This will break-in the axle. Should the vehicle be backed up during this time

period, the hublocks will disengage and will have to be locked again by repeating the engagement procedure.

WHEEL END NOISE (RATCHETING) IN 4X2 AND HUBS UNLOCKED:

^ This condition could occur during turns or when the suspension is stroked. It is more prevalent in cold weather, with new front axles. It is usually caused by high motoring torque at the axle shafts or by incorrect axle lubrication.

^ Verify that axle lubrication is F1TZ-19580-A. If the front axle is not broken-in, 100-200 4X4 miles (161-322 km), proceed to do so following the outlined front axle break-in procedure in the Hublock Diagnostics section of this TSB article.

WHEEL END NOISE (BUZZING) WHILE ENGAGING 4X4 (TOUCH DRIVE) WHILE MOVING:

^ Refer to TSB Article No. 91-15-10.

POPPING/BANGING SOUND WHILE IN 4X4:

^ If the system slips under load, find what has broken or is slipping. To locate where slip is taking place, put marks at various possible slip points (Figure 1). Test drive the vehicle, then check to see if marks at different points are still in the same relationship to each other. This will help you determine where the slippage is taking place or where to look for broken parts, if any.

^ On vehicles with automatic hubs, find a place where you can do your test, mark the components, then drive without backing up. Stop and check the marks to see if they are in the same relationship to each other. If you back up before checking your marks, the hubs may reindex and not reveal the problem.

^ Reindex component should be serviced.

INSTALLATION PROCEDURE

1. Remove old hublock; remove key from bearing retainer nut and then remove nut.

2. If replacing a manual hublock with an automatic hublock, also remove the three-piece wheel bearing nut assembly.

3. Remove the new wheel bearing retaining nut from the cam assembly and install on the threaded spindle.

4. Using Hex Locknut Wrench (T70T-4252-B), torque the wheel bearing retainer nut to 47 N-m (35 lb.ft.) while rotating the wheel assembly. Back nut off 1/4 turn and retighten to 1.8 N-m (16 lb.in.) of torque.

5. Align scallop of the wheel bearing retaining nut with the center of the spindle keyway by advancing the nut clockwise.

6. Install the retaining key into the spindle keyway. With the garter spring inboard, align the key on the cam assembly with the keyway on the spindle.

7. Firmly press the cam assembly on the wheel bearing retaining nut.

CAUTION:

DO NOT PACK THE HUBLOCK WITH GREASE. TOO MUCH GREASE WILL CAUSE IMPROPER HUBLOCK OPERATION AND MAY DAMAGE THE HUBLOCK.

8. For Ranger and Bronco II, model years 1983-90 (through build date 10/4/89), using the DANA 28 Axle, install the thrust washer set onto the axle:

a. First, the plain steel washer.

b. Second, the needle bearing.

c. Last, the spline washer.

9. For model years 1990-94 (begin build date 10/5/89), DANA 35 Axle, install the one-piece spline washer. Install the "C" clip into the axle groove. It may be necessary to push the axle outboard from the inboard side of the knuckle.

10. For 1995 Ranger, install the thrust washer onto the axle:

a. First, the plain steel thrust washer.

b. Second, the plastic unsplined thrust washer.

AUTOMATIC HUBLOCK IDENTIFICATION CHART

AUTOMATIC HUBLOCK MODEL TYPE	DATE CODE DESCRIPTION	EXAMPLE	PRODUCTION DATE	HUBLOCK BODY COLOR
M350A	Three (3) alphanumeric characters, or in some cases, no code	AB2 or no code	10/89	Argent
M350B	Six (6) numbers	920621	6/92	Argent
M350C	Backward letter "C" or the letter "C" followed by six (6) numbers	" " 931020 or C931021	8/93	Argent

c. Last, the steel spline thrust washer.

CAUTION:

ENSURE THE RETAINING RING OR "C" CLIP IS SEATED PROPERLY IN THE AXLE GROOVE FOR STEPS 8, 9, OR 10.

11. Check to ensure 0-ring seal on the flange face of the hublock body is not damaged and is properly positioned in its groove.

12. Install the hublock body assembly into the vehicle hub and rotor assembly. The hub may have to be rotated to line up the three (3) prongs of the cam follower (found internally to the hublock) with the cam assembly.

13. Install retainer flat nuts on wheel studs.

NOTE:

DO NOT FORCE THE HUBLOCK ASSEMBLY. IF THE BODY ASSEMBLY WILL NOT FIT, RECHECK THE ALIGNMENT OF ALL COMPONENTS. INSTALL SPEEDNUTS ON WHEEL LUGS TO RETAIN HUBLOCK. THEREAFTER, INSTALL THE WHEEL AND TORQUE THE LUG NUTS TO 136 N-m (100 LB.FT.) (FIGURE 2).

HISTORY AND TIMING

The Warn Automatic Hublock (Model M350) was used on the DANA 28 Axle (Bronco II and Ranger) from model years 1983-90 (through build date 10/4/89). The Warn Automatic Hublocks (Models M350A and M350B) were used on the DANA 35 Axle (Bronco II, Explorer and Ranger) for model years 1990-93 (begin build date 10/5/89). Starting with model year 1994 the Warn Automatic Hublock (Model M350C) used on the DANA 35 Axle (Explorer and Ranger) was introduced.

The Model M350 is black and Model M350A, M350B and M350C are argent (white silver) in color. The Model M350 can only be replaced by Model M350 service parts. The M350C service kits should be used as replacements for the following:

^ M350A hublocks released 10/89 as model year 1990 running change.

^ M350B hublocks released 4/92 as model year 1992 late running change.

^ M350C hublocks released 8/93 as model year 1994 Job 1 change.

When automatic hublock servicing is required for any Ranger, Explorer, or Bronco II built from 10/89 through model year 1993, it is advised that both hublocks be replaced.

NOTE:

IF AN M350A OR M350B HUBLOCK REQUIRES SERVICING, ALL THE HUBLOCK COMPONENTS MUST BE REMOVED AND REPLACED WITH SERVICE KIT F3TZ-3B396-B, WHICH ESSENTIALLY IS THE SERVICE KIT FOR THE M350C AUTOMATIC HUBLOCK. THE CAM ASSEMBLY OF THE M350A OR M35OB SHOULD NOT BE USED WITH AN M350C AUTOMATIC HUBLOCK BODY NOR SHOULD AN M350A OR M350B AUTOMATIC HUBLOCK BODY BE USED WITH AN M350C CAM ASSEMBLY.

For model year 1994 (and beyond) 4X4 Rangers or Explorers, replace automatic hublocks in accordance with the automatic hublock Service Manual procedure and additional diagnostics procedure outlined in this TSB.

IDENTIFYING AUTOMATIC HUBLOCK MODELS

A stamped code found on the rear of the automatic hublock flange face can be used to identify the automatic hublock type, in addition to the model year summary described above. Examples of the three (3) different codes which correlate to the automatic hublock model type are outlined in the chart:

PART NUMBER	PART NAME
E3TZ-1K105-B	Hublock Assembly
E3TZ-3N105-A	Nut And Bearing
E3TZ-1K106-B	Seal Kit
E5TZ-3B459-A	Key
E6TZ-3B477-A	Cam

PART NUMBER	PART NAME
F3TZ-3B396-B	Hublock - Automatic (Hublock Assembly, Wheel Retainer, Cam Assembly Key)
F3TZ-3N105-A	Hublock Nut/Key
F3TZ-1K106-A	Hublock Seal/Decal

THE ABOVE PART APPLICATION CHART IS FOR 1983-90 (THROUGH BUILD DATE 10/4/89) BRONCO II, RANGER, DANA 28 AXLE, HUBLOCK MODEL M350:

THE ABOVE PART APPLICATION CHART IS FOR:

^ 1990-95 Ranger (begin build date 10/5/89)

^ 1990 Bronco (begin build date 10/5/89 through end of production)

^ 1991-94 Explorer (through build date 11/18/94, DANA 35 Axle, Hublock Model M350C)

LIGHT TRUCK: 1990 BRONCO II 1990-91 RANGER 1991 EXPLORER

This TSB article is being republished in its entirety to note that the wheel bearing retaining nut is included with the front automatic locking hub assembly.

ISSUE: Engagement of the front driveline on 4x4 models of the subject vehicles with Shift-On-The-Fly and Dana 35 axles may exhibit delayed or no coupling of the front wheels. Both of these conditions may result in a hublock ratcheting noise and sometimes may result in structural damage to the hublock. These concerns are caused by the failure of the transfer case to provide synchronization of the drivetrain during cold weather.

ACTION: Test drive the vehicle to determine if the driveline exhibits delayed or no coupling of the front wheels. If so, use the following procedure to service the vehicle.

NOTE: THESE ACTIONS SHOULD PROVIDE SHIFT-ON-FLY CAPABILITY TO 55 MPH (89 KM/H) AT TEMPERATURES ABOVE 32~F (0~C) AND 45 MPH (72 KM/H) WITH TEMPERATURES FROM 32~F (0~C) TO AS LOW AS -20~F (-29~C).

FRONT AUTOMATIC LOCKING HUB

1. Remove the left and right front automatic locking hubs and camming assemblies and replace with new assemblies (FOTZ-3B396-B). Refer to the appropriate Light Truck Shop Manual, Section 04-01D, for service details.

2. Inspect the wheel bearing retaining nut for damage and presence of foreign material which would diminish wheel bearing life.

3. Replace the wheel bearing retaining nut if damaged. This nut is included with the front automatic locking hub assembly.

FRONT AXLE LUBRICANT

1. Determine if the vehicle was built prior to 12/15/90.

2. If the vehicle was built prior to 12/15/90, replace the front axle lubricant with new lubricant (F1TZ-19580-A).

a. Extract the old lubricant using a suction gun.

NOTE: BREAKING THE CARRIER SEAL IS NOT A RECOMMENDED METHOD OF EXTRACTING THE LUBRICANT.

b. Refill the front axle with 56 ounces of lubricant (F1TZ-19580-A) using a suction gun.

TRANSFER CASE

1. Remove the following old transfer case parts and replace them with the following new parts. Refer to the appropriate Light Truck Shop Manual, Section 07-07E, for service details.

^ Clutch Coil Assembly (F1TZ-7G361-B)

^ Clutch Housing (F1TZ-7G362-A)

^ Lock-Up Collar (F1TZ-7106-B)

^ Lock-Up Fork (FOTZ-7289-A) - (Green paint mark by part number)

^ Return Spring (F1TZ-7219-A)

^ Sleeve Spring (E6TZ-7D126-A)

2. Install the sleeve spring (E6TZ-7D126-A) into the bore of the 7106 lock-up collar large end first.

Article No. 95-5-18

03/13/95

^ LOCK HUBS - 4WD - AUTOMATIC HUBLOCK INFORMATION - SERVICE TIPS

^ FOUR-WHEEL DRIVE (4WD) - AUTOMATIC LOCK HUB DIAGNOSIS

LIGHT TRUCK: 1983-90 BRONCO II 1983-95 RANGER 1991-94 EXPLORER

ISSUE: 4X4 system diagnosis can be difficult at times due to system complexities.

ACTION:

For general system operation and diagnosis: Refer to TSB Article No. 92-1-8.

For specific automatic lock hub diagnosis and service: Refer to this article.

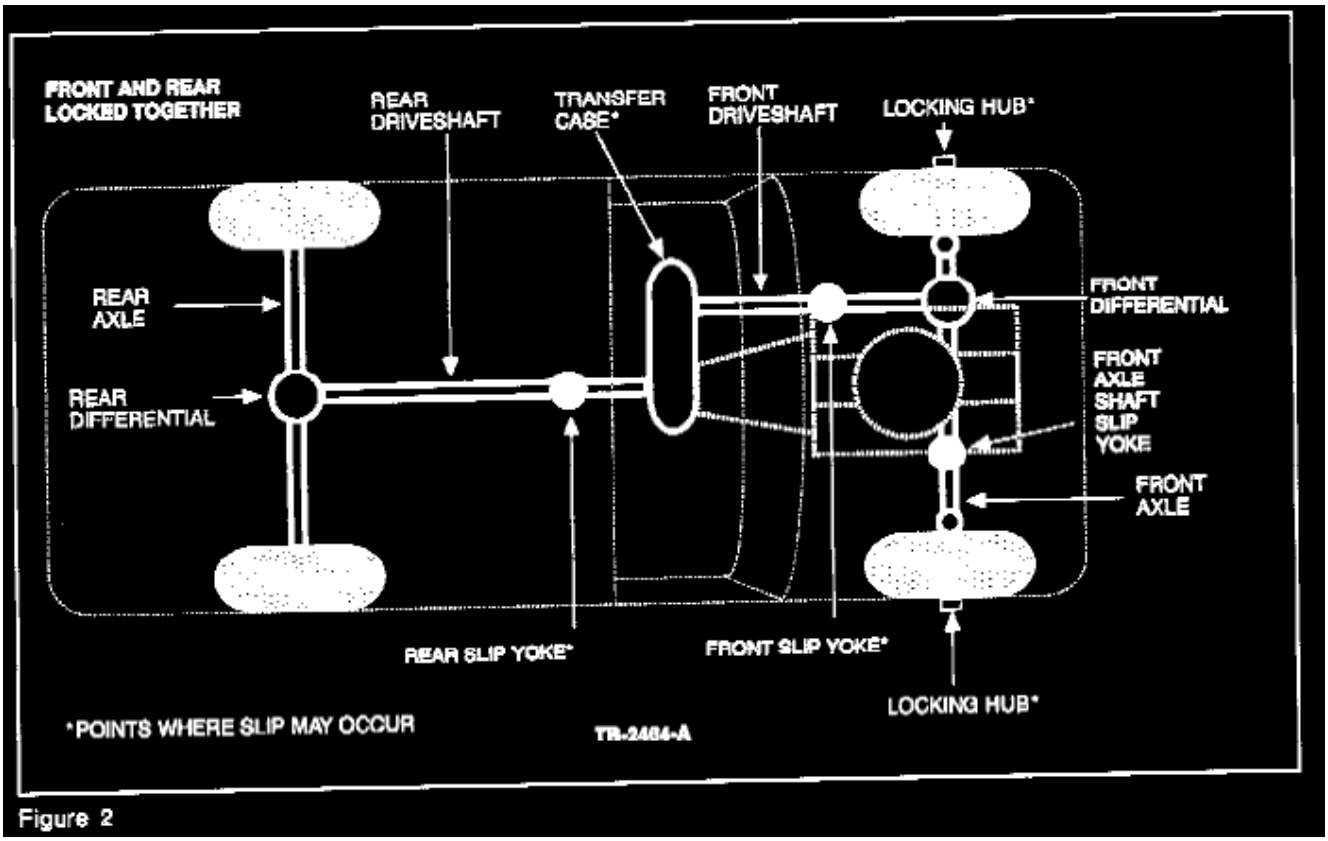

Figure 2

HUBLOCK DIAGNOSTICS

WHEEL END CONTAMINATION:

^ All compact vehicle hublocks have an O-ring seal between the hublock and wheel hub to prevent contamination. Whenever the hublock is removed, the 0-ring seal should be checked for damage.

^ If contamination is found in the wheel end, the path must be determined and corrected. Path possibilities are through the hublock seal, the wheel

bearing seals or the axle spindle seals.

WHEEL END NOISE (BUZZING) IN 4X2, AFTER UNLOCKING HUBS, SHORTLY AFTER FOUR-WHEEL DRIVE USAGE:

^ Noise concerns in two-wheel drive shortly after shifting from four-wheel drive and unlocking hubs, can occur if one of the hublocks fails to disengage. As the vehicle moves forward, the one (1) hublock that has failed to disengage will rotate its axle shaft through the differential and attempt to rotate the other axle shaft in the opposite direction. This is called differential motoring torque. As this torque attempts to turn the other axle shaft through the differential gears, that shaft's hublock will attempt to engage which will result in a ratcheting or buzzing noise.

^ This type of noise concern is usually found on axles that have incorrect front axle differential lubricant or very few 4X4 miles on them.

^ Verify that the front axle differential lubricant is F1TZ-19580-A. If incorrect lubricant is detected, extract the old lubricant using a suction gun.

NOTE:

BREAKING THE CARRIER SEAL IS NOT A RECOMMENDED METHOD OF EXTRACTING THE LUBRICANT.

1. Refill the front axle with 56 oz (1.66 L) of lubricant F1TZ-19580-A using a suction gun.

2. As the front axle accumulates 100-200 miles (161-322 km) of locked hublock operation, the axle will break-in, thus reducing the amount of differential motoring torque significantly.

3. If a front axle requires breaking in, refer to the Front Axle Break-In Procedure in this article.

4. If the front axle has been broken-in and the differential lubricant is F1TZ-19580-A, however, a wheel end noise (buzzing) in 4X2 is still experienced shortly after four-wheel drive usage. It is advised that the hublock which is not ratcheting be replaced as it is not disengaging correctly. When this condition occurs on any 4X4 Ranger, Explorer, or Bronco II, built from 10/89 through model year 1993, it is advised that both hublocks be replaced as the ratcheting hub is likely to become damaged.

FRONT AXLE BREAK-IN PROCEDURE:

^ To break-in the front axle, engage four-wheel drive and then shift out of it without disengaging the hublocks.

^ Thereafter, continue to drive the vehicle with locked hublocks until 100-200 miles (161-322 km) are accumulated. This will break-in the axle. Should the vehicle be backed up during this time

period, the hublocks will disengage and will have to be locked again by repeating the engagement procedure.

WHEEL END NOISE (RATCHETING) IN 4X2 AND HUBS UNLOCKED:

^ This condition could occur during turns or when the suspension is stroked. It is more prevalent in cold weather, with new front axles. It is usually caused by high motoring torque at the axle shafts or by incorrect axle lubrication.

^ Verify that axle lubrication is F1TZ-19580-A. If the front axle is not broken-in, 100-200 4X4 miles (161-322 km), proceed to do so following the outlined front axle break-in procedure in the Hublock Diagnostics section of this TSB article.

WHEEL END NOISE (BUZZING) WHILE ENGAGING 4X4 (TOUCH DRIVE) WHILE MOVING:

^ Refer to TSB Article No. 91-15-10.

POPPING/BANGING SOUND WHILE IN 4X4:

^ If the system slips under load, find what has broken or is slipping. To locate where slip is taking place, put marks at various possible slip points (Figure 1). Test drive the vehicle, then check to see if marks at different points are still in the same relationship to each other. This will help you determine where the slippage is taking place or where to look for broken parts, if any.

^ On vehicles with automatic hubs, find a place where you can do your test, mark the components, then drive without backing up. Stop and check the marks to see if they are in the same relationship to each other. If you back up before checking your marks, the hubs may reindex and not reveal the problem.

^ Reindex component should be serviced.

INSTALLATION PROCEDURE

1. Remove old hublock; remove key from bearing retainer nut and then remove nut.

2. If replacing a manual hublock with an automatic hublock, also remove the three-piece wheel bearing nut assembly.

3. Remove the new wheel bearing retaining nut from the cam assembly and install on the threaded spindle.

4. Using Hex Locknut Wrench (T70T-4252-B), torque the wheel bearing retainer nut to 47 N-m (35 lb.ft.) while rotating the wheel assembly. Back nut off 1/4 turn and retighten to 1.8 N-m (16 lb.in.) of torque.

5. Align scallop of the wheel bearing retaining nut with the center of the spindle keyway by advancing the nut clockwise.

6. Install the retaining key into the spindle keyway. With the garter spring inboard, align the key on the cam assembly with the keyway on the spindle.

7. Firmly press the cam assembly on the wheel bearing retaining nut.

CAUTION:

DO NOT PACK THE HUBLOCK WITH GREASE. TOO MUCH GREASE WILL CAUSE IMPROPER HUBLOCK OPERATION AND MAY DAMAGE THE HUBLOCK.

8. For Ranger and Bronco II, model years 1983-90 (through build date 10/4/89), using the DANA 28 Axle, install the thrust washer set onto the axle:

a. First, the plain steel washer.

b. Second, the needle bearing.

c. Last, the spline washer.

9. For model years 1990-94 (begin build date 10/5/89), DANA 35 Axle, install the one-piece spline washer. Install the "C" clip into the axle groove. It may be necessary to push the axle outboard from the inboard side of the knuckle.

10. For 1995 Ranger, install the thrust washer onto the axle:

a. First, the plain steel thrust washer.

b. Second, the plastic unsplined thrust washer.

AUTOMATIC HUBLOCK IDENTIFICATION CHART				
AUTOMATIC HUBLOCK MODEL TYPE	DATE CODE DESCRIPTION	EXAMPLE	PRODUCTION DATE	HUBLOCK BODY COLOR
M350A	Three (3) alphanumeric characters, or in some cases, no code	AB2 or no code	10/89	Argent
M350B	Six (6) numbers	920621	6/92	Argent
M350C	Backward letter "C" or the letter "C" followed by six (6) numbers	" " 931020 or C931021	8/93	Argent

c. Last, the steel spline thrust washer.

CAUTION:

ENSURE THE RETAINING RING OR "C" CLIP IS SEATED PROPERLY IN THE AXLE GROOVE FOR STEPS 8, 9, OR 10.

11. Check to ensure 0-ring seal on the flange face of the hublock body is not damaged and is properly positioned in its groove.

12. Install the hublock body assembly into the vehicle hub and rotor assembly. The hub may have to be rotated to line up the three (3) prongs of the cam follower (found internally to the hublock) with the cam assembly.

13. Install retainer flat nuts on wheel studs.

NOTE:

DO NOT FORCE THE HUBLOCK ASSEMBLY. IF THE BODY ASSEMBLY WILL NOT FIT, RECHECK THE ALIGNMENT OF ALL COMPONENTS. INSTALL SPEEDNUTS ON WHEEL LUGS TO RETAIN HUBLOCK. THEREAFTER, INSTALL THE WHEEL AND TORQUE THE LUG NUTS TO 136 N-m (100 LB.FT.) (FIGURE 2).

HISTORY AND TIMING

The Warn Automatic Hublock (Model M350) was used on the DANA 28 Axle (Bronco II and Ranger) from model years 1983-90 (through build date 10/4/89). The Warn Automatic Hublocks (Models M350A and M350B) were used on the DANA 35 Axle (Bronco II, Explorer and Ranger) for model years 1990-93 (begin build date 10/5/89). Starting with model year 1994 the Warn Automatic Hublock (Model M350C) used on the DANA 35 Axle (Explorer and Ranger) was introduced.

The Model M350 is black and Model M350A, M350B and M350C are argent (white silver) in color. The Model M350 can only be replaced by Model M350 service parts. The M350C service kits should be used as replacements for the following:

^ M350A hublocks released 10/89 as model year 1990 running change.

^ M350B hublocks released 4/92 as model year 1992 late running change.

^ M350C hublocks released 8/93 as model year 1994 Job 1 change.

When automatic hublock servicing is required for any Ranger, Explorer, or Bronco II built from 10/89 through model year 1993, it is advised that both hublocks be replaced.

NOTE:

IF AN M350A OR M350B HUBLOCK REQUIRES SERVICING, ALL THE HUBLOCK COMPONENTS MUST BE REMOVED AND REPLACED WITH SERVICE KIT F3TZ-3B396-B, WHICH ESSENTIALLY IS THE SERVICE KIT FOR THE M350C AUTOMATIC HUBLOCK. THE CAM ASSEMBLY OF THE M350A OR M35OB SHOULD NOT BE USED WITH AN M350C AUTOMATIC HUBLOCK BODY NOR SHOULD AN M350A OR M350B AUTOMATIC HUBLOCK BODY BE USED WITH AN M350C CAM ASSEMBLY.

For model year 1994 (and beyond) 4X4 Rangers or Explorers, replace automatic hublocks in accordance with the automatic hublock Service Manual procedure and additional diagnostics procedure outlined in this TSB.

IDENTIFYING AUTOMATIC HUBLOCK MODELS

A stamped code found on the rear of the automatic hublock flange face can be used to identify the automatic hublock type, in addition to the model year summary described above. Examples of the three (3) different codes which correlate to the automatic hublock model type are outlined in the chart:

PART NUMBER	PART NAME
E3TZ-1K105-B	Hublock Assembly
E3TZ-3N105-A	Nut And Bearing
E3TZ-1K106-B	Seal Kit
E5TZ-3B459-A	Key
E6TZ-3B477-A	Cam

PART NUMBER	PART NAME
F3TZ-3B396-B	Hublock - Automatic (Hublock Assembly, Wheel Retainer, Cam Assembly Key)
F3TZ-3N105-A	Hublock Nut/Key
F3TZ-1K106-A	Hublock Seal/Decal

THE ABOVE PART APPLICATION CHART IS FOR 1983-90 (THROUGH BUILD DATE 10/4/89) BRONCO II, RANGER, DANA 28 AXLE, HUBLOCK MODEL M350:

THE ABOVE PART APPLICATION CHART IS FOR:

^ 1990-95 Ranger (begin build date 10/5/89)

^ 1990 Bronco (begin build date 10/5/89 through end of production)

^ 1991-94 Explorer (through build date 11/18/94, DANA 35 Axle, Hublock Model M350C)

Wheel Hub (Locking): Service and Repair Removal

With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

1. Raise the vehicle and install safety stands. 2. Remove the wheel lugnuts and the wheel and tire assembly. 3. Remove the brake caliper and secure to the underbody to prevent damage to the brake hose. It is not necessary to disconnect the hose from the

caliper. Do not let the caliper hang with its weight on the brake hose or the hose may become stretched, twisted or ruptured.

4. Remove the retainer washers from the lugnut studs. Remove the automatic locking hub assembly from the spindle. 5. Remove the snap ring from the end of the spindle shaft.

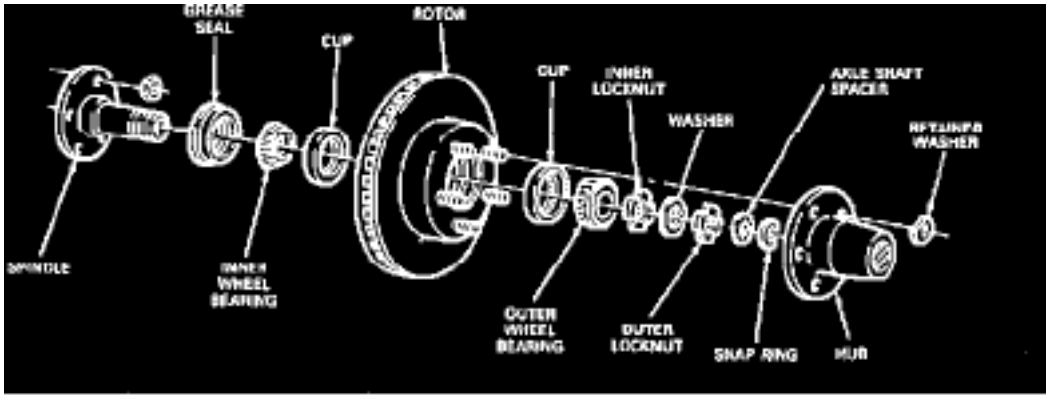
Axle Shaft Spacer

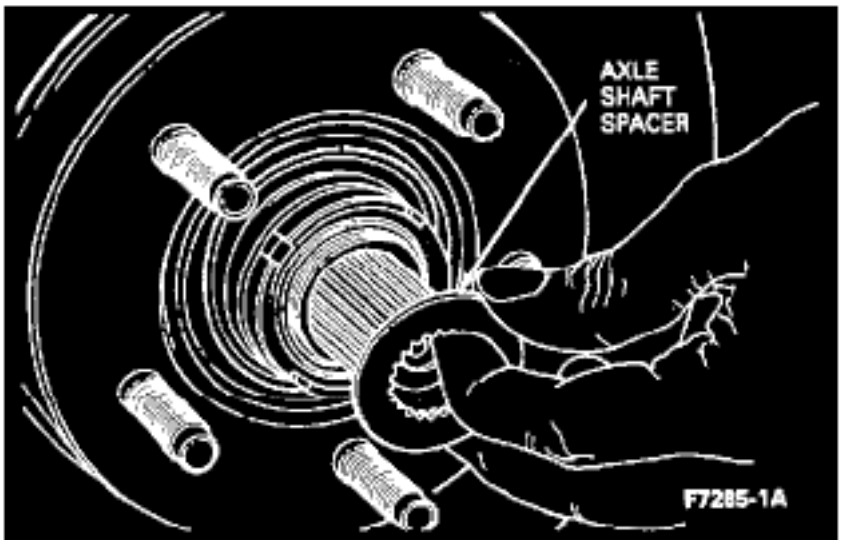
6. Remove the axle shaft spacer. 7. Pull cam assembly off the wheel bearing adjusting nut and remove the two plastic thrust spacers from the adjusting nut.

CAUTION: Do not pry on the plastic cam or thrust spacers during removal. Prying may damage the cam or spacers.

Cam Assembly And Locking Key

8. Using a magnet, remove the locking key.





NOTICE: If required, rotate the adjusting nut slightly to relieve pressure against the locking key, before the key can be removed.

CAUTION: To prevent damage to the spindle threads, look into the spindle keyway under the adjusting nut and remove the separate locking key before removing the adjusting nut.

9. Remove the wheel bearing adjusting nut from the spindle using a 2-3/8 inch Hex Locknut Wrench.

10. Remove the inner locknut and slide hub/rotor off spindle being careful to catch the outer wheel bearing.

With Manual Locking Hubs

Fig. 5 Manual Locking Hub

1. Raise the vehicle until the tire clears the floor and remove the wheel and tire assembly. 2. Remove the brake caliper and secure to the underbody to prevent damage to the brake hose. It is not necessary to disconnect the hose from the

caliper.

CAUTION: Do not let the caliper hang with its weight on the brake hose or the hose may become stretched, twisted or ruptured.

3. Remove the retainer washers from the lugnut studs and the manual locking hub assembly from the spindle. 4. Remove the snap ring from the end of the spindle shaft.

Axle Shaft Spacer

5. Remove the axle shaft spacer.

Wheel Hub (Locking): Service and Repair Installation

With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

CAUTION: Wheel bearing lubricant is a lithium-base grease. Sodium-base grease is not compatible with lithium-base grease and should not be intermixed. Therefore, do not lubricate front wheel bearings without first identifying the type of original wheel bearing lubricant. Usage of incompatible bearing lubricants may result in premature lubricant breakdown.

Installing Bearing Cups (Typical)

1. If inner or outer bearing cups were removed, install replacement inner and outer bearing cups in the hub with the appropriate bearing cup replacer

tool. Be sure to seat the cups properly in the hub. The cups will be properly seated when they are fully bottomed. Replace grease retainers. Polish grease retainer journal on spindle with 400 grit sandpaper. Clean with clean cloth.

2. Pack the inside of the hub with lithium-base grease or equivalent. Fill the hub until the grease is flush with the inside diameters of both bearing

cups. Pack the bearing cones and rollers with wheel bearing grease. Use a bearing packer for this operation. If a packer is not available, work as much lubricant as possible between the rollers and cages. Lubricate the cone surfaces with grease.

Installing Grease Seal (Typical)

3. Place the inner bearing in the inner cup and install the new grease seal. Be sure that the seal is fully seated. 4. Install the hub/rotor on the wheel spindle. Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads. 5. Place the outer bearing in the outer cup. 6. Install the wheel bearing adjustment nut. 7. While rotating the hub and rotor assembly, tighten the wheel bearing adjusting nut to 47 Nm (35 ft lb) to seat the bearings. Spin the rotor and back

off the nut one-quarter turn (90 degrees).

8. Retighten the adjusting nut to 1.8 Nm (16 in lb) using a torque wrench. 9. Make sure the final end play of the wheel on the spindle is 0.00-0.08 mm (0.000-0.003 in). the maximum torque to rotate the hub is 2.8 Nm (25 in

lb).

10. Align the closest lug in the wheel bearing adjusting nut with the center of the spindle keyway slot. Advance the nut to the next lug if required.

Install the separate locking key in the spindle keyway under the adjusting nut.

WARNING: Extreme care must be taken when aligning the spindle nut adjustment lug with the center of the spindle keyway slot to prevent damage to the separate locking key. The wheel and tire assembly may come off while the vehicle is in motion if the key is damaged.

11. Install the two thrust spacers and push or press the cam assembly onto the locknut by lining up the key in the fixed cam with the spindle keyway.

CAUTION: Extreme care must be taken when aligning the fixed cam key with the spindle keyway to prevent damage to the fixed cam.

12. Install the axle shaft spacer. 13. Clip the snap ring onto the end of the spindle shaft. 14. Install the automatic locking hub assembly over the spindle. Align three hub assembly legs with three pockets in cam assembly. Install the retainer

washers.

15. Install the caliper. 16. Install the wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb).

With Manual Locking Hubs

Fig. 5 Manual Locking Hub

CAUTION: Wheel bearing lubricant is a lithium-base grease. Sodium-base grease is not compatible with lithium-base grease and should not be intermixed. Installing Grease Seal (Typical)

3. Place the inner bearing in the inner cup and install the new grease seal. Be sure that the seal is fully seated. 4. Install the hub/rotor on the wheel spindle. Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads. 5. Place the outer bearing in the outer cup. 6. Install the inner locknut. 7. Tighten the inner locknut to 47 Nm (35 ft lb) while turning the rotor in the opposite direction to seat bearings. 8. Spin the rotor and back off the inner locknut one-quarter turn. Retighten the inner locknut to 1.8 Nm (16 in lb). 9. Install the lockwasher on the spindle.

NOTICE: If necessary, tighten inner locknut slightly to align the locknut pin with lockwasher hole.

10. Install the outer wheel bearing locknut using locknut wrench. Tighten locknut to 203 Nm (150 ft lb). 11. Check the end play of the wheel and tire assembly on the spindle. Final end play should be 0.00-0.08 mm (0.000-0.003 in). The maximum torque

to rotate the hub is 2.8 Nm (25 in lb).

12. Install the axle shaft spacer. 13. Clip the snap ring onto the end of the spindle shaft.

14. Install the manual hub assembly over the spindle. Install the retainer washers. 15. Install caliper. 16. Install wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb). 17. Lower vehicle. 18. Check brakes for proper operation.

WARNING: Before moving vehicle, pump brake pedal several times to be sure it is firm. Do not move vehicle until a firm pedal is obtained.

ISSUE: The use of air impact tools to tighten wheel lug nuts can lead to overtightened and/or unevenly tightened wheel lug nuts. Air impact tools typically used for wheel lug nut removal and installation can generate up to 475 N.m (350 lb-ft) of torque. Overtightened and/or unevenly torqued wheel lug nuts may cause:

^ Brake vibration

^ Distortion of the wheel hub

^ Distortion of the brake rotor

TD-4106-B

Figure 1

^ Brake rotor runout

^ Damage to the wheel

^ Damage to the wheel nuts and studs

ACTION: All wheel lug nuts should only be tightened to specification using a torque wrench or by using the Rotunda ACCUTORO 164-R0314 or equivalent on a 1/2" drive air impact tool. The "ACCUTORO" lug nut sockets limit the torque of the air impact tool, preventing overtightening or uneven tightening of the wheel lug nuts. The torque limiting devices (regulators) on air impact tools will not reduce the output torque enough to prevent overtightening of the wheel lug nuts.

NOTE:

REFER TO THE APPROPRIATE SERVICE MANUAL OR THE CHART IN FIGURE 1 FOR THE CORRECT WHEEL LUG NUT TORQUE SPECIFICATION. THE CHART IN FIGURE 1 ALSO PROVIDES THE CORRECT "ACCUTORO" LUG NUT SOCKET TO USE.

The "ACCUTORO" socket is intended for lug nut installation, not removal. When using the "ACCUTORO" socket, the output torque of the air impact tool must be set to 217-339 N.m (160-250 lb-ft), usually this will be the lowest setting on the air impact tool.

The "ACCUTORO" lug nut sockets are available through Rotunda Equipment. The four-piece set (164-R0314) fits most Ford Motor Company cars and light trucks. The tool set consists of four (4) lug nut sockets and a storage case. The set can be ordered by calling Rotunda Equipment at 1-800-ROT-UNDA (768-8632).

CAUTION:

AIR IMPACT TOOLS SHOULD NOT BE USED TO TIGHTEN WHEEL LUG NUTS UNLESS THE "ACCUTORO" LUG NUT SOCKET OF THE CORRECT SPECIFICATION IS USED.

NOTE:

DO NOT USE AIR IMPACT TOOLS ON LOCKING WHEEL LUG NUTS. THEY ARE TO BE HAND-TORQUED ONLY.

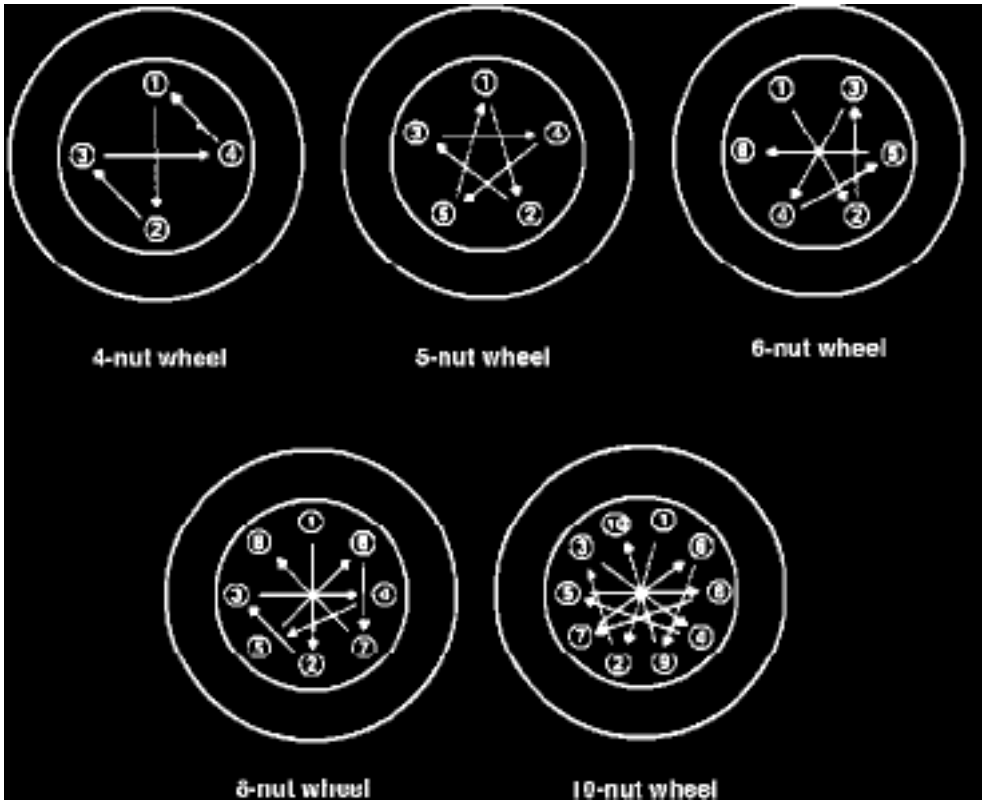
WARRANTY STATUS: INFORMATION ONLY

OASIS CODES: 301000, 303000, 306000



Wheel Fastener: Service and Repair

NOTE: For additional information see Tightening Notes.

Lug Nut Torque Patterns

IMPORTANT

Check all parts, including rims, lug studs, lug nuts, and mating surfaces of hubs and tire rims for rust, damage, or dirt. Clean mating surfaces with a wire brush to remove any foreign material. Replace any damaged parts as needed. Careless installation of tire/rim assemblies in a vehicle is a major cause of tire installation problems. Proper installation, including fastener torque, is essential to economical, safe and trouble free service. Use only the proper sizes and types of fasteners for safe and proper service.

Tighten the fasteners a quarter turn at a time using the tightening sequence diagram as a guide. This is very important to prevent misalignment of the wheel. Continue tightening the fasteners in sequence until the fasteners are tightened to the proper torque. See Specifications See: Wheels/Specifications

CAUTION: Improper torque or tightening sequence can cause distortion, fatigue cracks, or alignment problems. After driving the vehicle for a short distance, recheck the wheel fastener torque. Parts will usually seat naturally, reducing the torque on the fasteners. Retorque all fasteners to the proper torque.

Towing Information: Technical Service Bulletins Vehicle - Towing Behind RVs Guidelines

Article No. 98-5A-12

03/18/98

^ BRAKES - WEIGHT LIMITATIONS FOR TOWING

^ RECREATIONAL VEHICLES - WEIGHT RATINGS FOR UNBRAKED TOWING LESS THAN GROSS COMBINATION WEIGHT RATING (GCWR)

^ TRANSAXLE/TRANSMISSION/TRANSFER CASE - VEHICLES TOWED BEHIND RECREATIONAL VEHICLES - RECOMMENDED TOWING GUIDELINES

FORD: 1988-93 FESTIVA 1988-94 TEMPO 1989-96 PROBE, TAURUS SHO 1991-97 ESCORT 1994-96 ASPIRE

LINCOLN-MERCURY: 1988-94 TOPAZ 1991-94 CAPRI 1991-97 TRACER

LIGHT TRUCK: 1988-96 AEROSTAR, BRONCO, E-350, F SUPER DUTY, F-250, F-350, F-53 MOTORHOME, RANGER 1988-97 F-150 1991-96 EXPLORER 1997 MOUNTAINEER

ISSUE: Many motorhome owners tow a vehicle when traveling. Improper techniques can "overload" the brake system of the tow vehicle or damage the drivetrain of the vehicle being towed.

ACTION: Use the information and charts shown in this TSB article to properly match tow vehicle, towed vehicle and towing method.

TOWING METHODS

1. TRAILER - The vehicle is loaded onto and secured to a trailer and simply acts as "secured" cargo.

2. DOLLY - The vehicle is "partially" loaded and partially towed. Either front or rear wheels are loaded and secured to a "towing dolly" and the other wheels roll on the road.

3. TOW BAR - All of the vehicle wheels roll on the pavement. The towed vehicle's steering column must be unlocked so that it can track correctly behind the tow vehicle.

WEIGHT RATINGS AND BRAKES

^ GVWR (Gross Vehicle Weight Rating) - is the MAXIMUM allowable weight of the towing vehicle, passengers and cargo

^ GCWR (Gross Combined Weight Rating) - is the MAXIMUM allowable weight of the towing vehicle and the weight of the trailer or vehicle being towed, including all passengers and cargo

^ BRAKES - The motorhome brakes are designed and rated for the GVWR of that vehicle and will provide adequate braking for trailers and towing vehicles up to 680 kg (1500 lb)

E-350	YES	NO
MOUNTAINEER 4X2	YES	NO
MOUNTAINEER 4X4	YES	YES**

**Manual transfer case only (not Touch Drive Electric Shift).

CAUTION:

SEPARATE AUXILIARY BRAKES ARE REQUIRED ON TRAILERS OR TOWED VEHICLES OVER 680 KG (1500 LBS). DO NOT CONNECT A TRAILER'S, DOLLY'S OR OTHER TOWED VEHICLE'S BRAKE SYSTEM TO THE TOWING VEHICLE'S BRAKE SYSTEM.

TOWED VEHICLES

1. Trailer-towed - The vehicle should be loaded on the trailer in a manner to:

a. achieve a trailer tongue load of 10-15% of total trailer weight,

b. not exceed the trailer or hitch ratings and

c. be securely tied down.

2. Dolly-towed - For front wheel drive vehicles, towing an automatic transaxle (ATX)-equipped vehicle behind another vehicle, such as a Recreational Vehicle (RV), requires that a front wheel dolly or trailer be used.

NOTE:

TEMPO ALL-WHEEL DRIVE MODELS MUST BE TRAILER-TOWED. DO NOT TOW THESE VEHICLES USING A TWO-WHEEL TOWING DOLLY.

CAUTION:

DO NOT TOW A VEHICLE WITH AN AUTOMATIC (ATX) TRANSAXLE WITH THE DRIVE WHEELS ON THE GROUND. DAMAGE TO THE TRANSAXLE MAY RESULT.

3. Tow Bar-towed - Vehicles which can be successfully towed with a tow bar are listed in the following chart. Additional vehicle-specific information follows the chart.

ALL VEHICLES

NOTE:

DO NOT TOW ANY VEHICLE AT A SPEED FASTER THAN 88 KM/H (55 MPH). THE MAXIMUM TOWING DISTANCE (WHEN TOWED CORRECTLY) IS UNLIMITED.

WARNING:

NEVER USE A TOW BAR THAT ATTACHES ONLY TO THE BUMPER.

MTX-EQUIPPED VEHICLES

Towing a manual transaxle (MTX)-equipped vehicle with the drive wheels on the ground is acceptable only if the vehicle is towed in a forward direction. The parking brake must be released and the gear shift lever must be in Neutral.

^ For Aspire, Festiva, Escort and Tracer, the ignition key must be in the ACO position, the battery must be disconnected to eliminate battery drain, and the steering wheel must be unlocked

^ For Capri, the ignition key must be in the OFF position and the steering wheel unlocked

^ Refer to the specific vehicle Owner Guide for complete details

CAUTION:

TOWING MTX-EQUIPPED VEHICLES INCORRECTLY MAY RESULT IN TRANSAXLE DAMAGE.

TRUCKS

^ The steering wheel must be unlocked by placing the ignition key in the OFF position

^ Manual transmission shift lever must be in Neutral

^ On 4X4 manual shift transfer cases, the shift lever must be in Neutral

^ 4X4 locking hubs (both manual and automatic) must be unlocked

^ Refer to the specific vehicle Owner Guide for complete details

REMOVAL

1. Drain the cooling system and crankcase. Remove the oil pan and radiator. 2. Remove the cylinder front cover and water pump, drive belt and crankshaft damper. 3. Remove the camshaft sprocket retaining bolt and the crankshaft sprocket key. 4. Remove the crankshaft and camshaft sprockets with the timing chain.

Timing Chain, Sprockets And Tensioner

5. Remove the timing chain tensioner and guide.

INSTALLATION

1. Install the timing chain guide to the cylinder block with the pin of the guide inserted into the oil hole in the block. Install the two retaining bolts,

and tighten to 10-12 Nm (7-9 ft lb).

2. Position the camshaft so the timing mark will align with the crankshaft. Position the crankshaft so the timing mark will align with the camshaft. 3. Install the crankshaft sprocket, camshaft sprocket and timing chain together. 4. Install the timing chain tensioner with the clip in place to lock the tensioner in the retracted position. Tighten tensioner bolts to 9-11 Nm (7-8 ft lb)

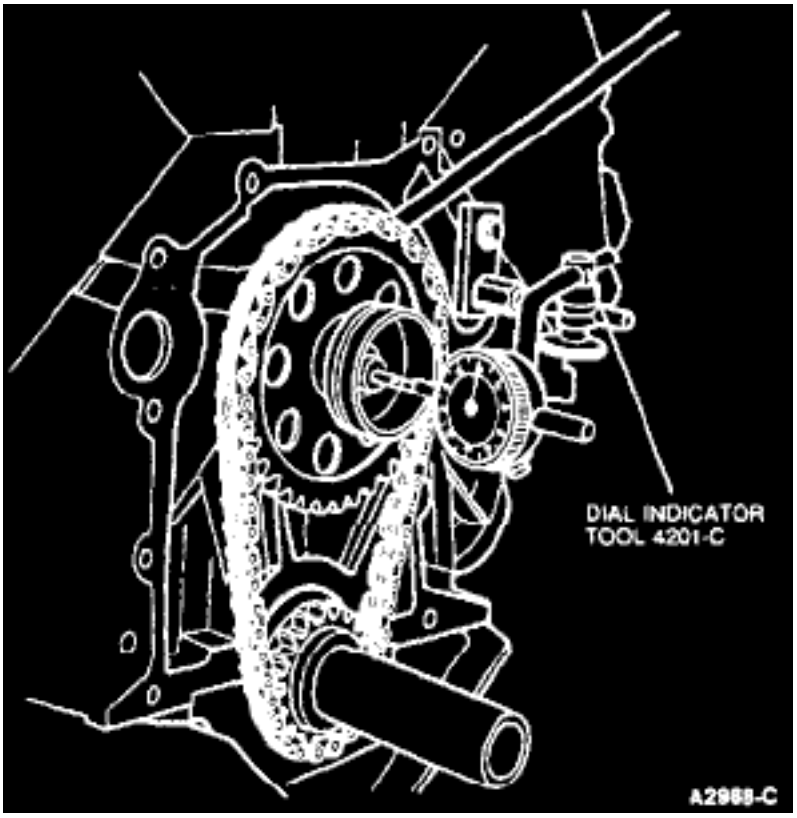
.

Timing Marks

5. Install the crankshaft key and check the timing marks on the crankshaft sprocket and camshaft sprocket for correct alignment.

NOTE: Make sure that the tensioner side of the timing chain is held inward, and that the guide side of the chain is straight and tight.

6. Install the camshaft sprocket retaining bolt, and tighten to 60-68 Nm (44-50 ft lb). 7. Remove the clip from the tensioner assembly.



8. Check the camshaft end play.

Camshaft End Play

CAUTION: Prying against the camshaft gear with the valve train load on the camshaft can break or damage the gear. Therefore, the rocker arm adjusting nuts must be backed off, or the rocker arm and shaft assembly must be loosened sufficiently to free the camshaft. After checking the camshaft end play, adjust the valve clearance.

a. Push camshaft toward rear of engine. Install Dial Indicator TOOL-4201-C or equivalent so indicator point is on camshaft sprocket attaching

screw.

b. Zero dial indicator. Pull camshaft forward and release it. Compare dial indicator reading with specifications. Camshaft end play specification is

0.0203-0.1016 mm (0.0008-0.004 in) and camshaft end play service limit is 0.2286 mm (0.009 in). If end play is excessive, replace camshaft thrust plate.

c. Remove dial indicator. d. After replacing thrust plate, check end play again. If it is still out of specified range, inspect camshaft and cylinder head/cylinder block for

excessive wear.

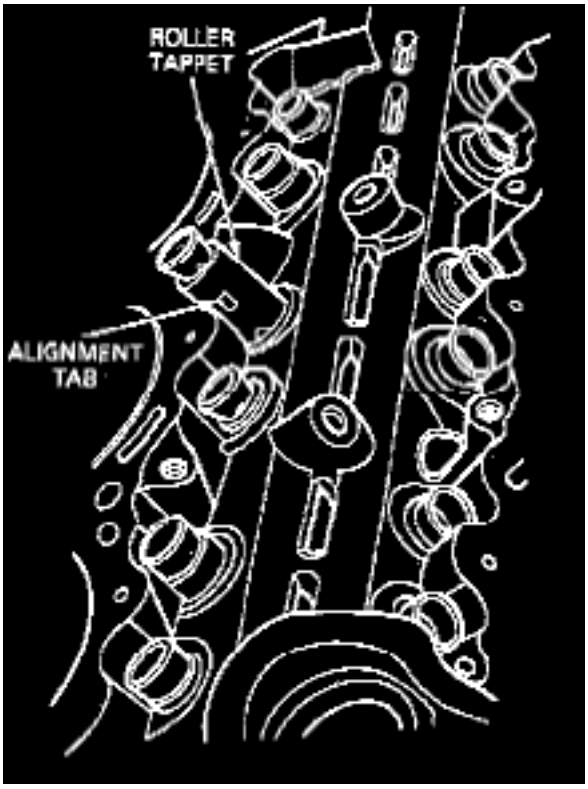
Valve lift should measure .4024 at zero lash.



Lifter / Lash Adjuster: Service and Repair

Note: Before removing a tappet for noisy operating, ensure the noise is not caused by improper valve-to-rocker arm clearance or by worn rocker arms or push rods.

Removal

1. Disconnect the battery ground cable. 2. Drain the coolant. 3. Remove the upper and lower intake manifolds and rocker arm covers. 4. Remove the rocker arm shafts by loosening the rocker arm shaft support bolts two turns at a time until the shaft can be removed.

Caution: If the rocker arm shafts are not loosened gradually, the shaft may become bent or damaged during removal.

5. Remove the pushrods, and note the location of each for reassembly. 6. Remove the tappets. Note the location of each tappet so each tappet can be installed in the original position.

Installtion

Note: Lightly oil all bolt and stud threads before installation, except those specifying special sealant. Using solvent, clean the intake manifold, cylinder head and valve rocker arm cover sealing surfaces.

1. Lubricate each tappet and bore with oil conditioner D9AZ-19579-CA (ESR-M99C80-A) or equivalent heavy engine oil.

2. Install each tappet in the bore from which it was removed with the alignment tab in the locating groove of the bore. If new tappet(s) is being

installed, check the new tappet for free fit in the bore.

3. Dip each push rod end in oil conditioner D9AZ-19579-CA (ESR-M99C80-A) or equivalent heavy engine oil. Install push rods in their original

position.

4. Lubricate all rocker arm assemblies with oil conditioner D9AZ-19579-CA (ESR-M99C80-A) or equivalent. 5. Install the rocker arm shaft assemblies and draw the shaft support bolts down evenly, two turns at a time until the rocker shaft assemblies are fully

down. Tighten shaft support bolts to 62-70 Nm (46-52 ft-lb).

6. Install the lower intake manifold assembly. 7. Install the valve rocker arm covers. 8. Install the upper intake manifold and tighten the nuts to 20-25 Nm (15-18 ft-lb). 9. Fill and bleed the cooling system. Refer to cooling system

10. Connect the battery ground cable. 11. Start the engine and check for coolant and oil leaks.

REMOVAL

1. Drain the cooling system and crankcase. Remove the oil pan and radiator. 2. Remove the cylinder front cover and water pump, drive belt and crankshaft damper. 3. Remove the camshaft sprocket retaining bolt and the crankshaft sprocket key. 4. Remove the crankshaft and camshaft sprockets with the timing chain.

Timing Chain, Sprockets And Tensioner

5. Remove the timing chain tensioner and guide.

INSTALLATION

1. Install the timing chain guide to the cylinder block with the pin of the guide inserted into the oil hole in the block. Install the two retaining bolts,

and tighten to 10-12 Nm (7-9 ft lb).

2. Position the camshaft so the timing mark will align with the crankshaft. Position the crankshaft so the timing mark will align with the camshaft. 3. Install the crankshaft sprocket, camshaft sprocket and timing chain together. 4. Install the timing chain tensioner with the clip in place to lock the tensioner in the retracted position. Tighten tensioner bolts to 9-11 Nm (7-8 ft lb)

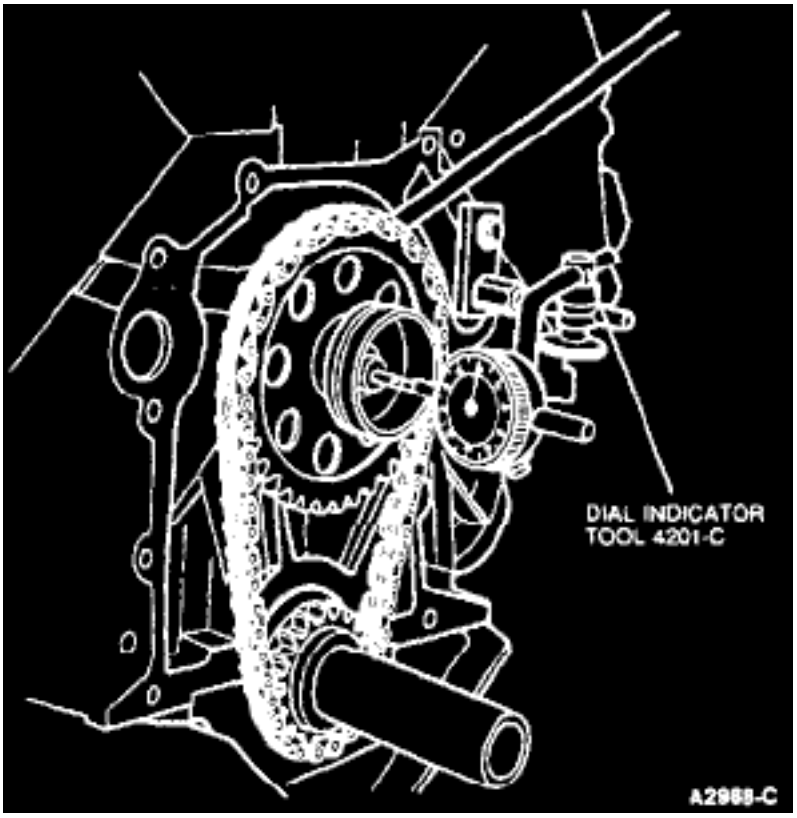
.

Timing Marks

5. Install the crankshaft key and check the timing marks on the crankshaft sprocket and camshaft sprocket for correct alignment.

NOTE: Make sure that the tensioner side of the timing chain is held inward, and that the guide side of the chain is straight and tight.

6. Install the camshaft sprocket retaining bolt, and tighten to 60-68 Nm (44-50 ft lb). 7. Remove the clip from the tensioner assembly.



8. Check the camshaft end play.

Camshaft End Play

CAUTION: Prying against the camshaft gear with the valve train load on the camshaft can break or damage the gear. Therefore, the rocker arm adjusting nuts must be backed off, or the rocker arm and shaft assembly must be loosened sufficiently to free the camshaft. After checking the camshaft end play, adjust the valve clearance.

a. Push camshaft toward rear of engine. Install Dial Indicator TOOL-4201-C or equivalent so indicator point is on camshaft sprocket attaching

screw.

b. Zero dial indicator. Pull camshaft forward and release it. Compare dial indicator reading with specifications. Camshaft end play specification is

0.0203-0.1016 mm (0.0008-0.004 in) and camshaft end play service limit is 0.2286 mm (0.009 in). If end play is excessive, replace camshaft thrust plate.

c. Remove dial indicator. d. After replacing thrust plate, check end play again. If it is still out of specified range, inspect camshaft and cylinder head/cylinder block for

excessive wear.

The hydraulic roller tappets have non-adjustable rocker arms. The tappets are not adjustable, and if found to be excessively worn or noisy, should be tested and replaced.

Fuel Pressure Release: Service and Repair

CAUTION: FUEL SUPPLY LINES ON EFI ENGINES WILL REMAIN PRESSURIZED FOR SOME PERIOD OF TIME AFTER THE ENGINE IS SHUT OFF. THIS PRESSURE MUST BE RELIEVED BEFORE SERVICING OF THE FUEL SYSTEM IS BEGUN.

FUEL SYSTEM PRESSURE RELIEF - EFI ENGINES

Before opening the fuel system on vehicles with EFI engines, relieve fuel pressure as follows: 1. Locate and disconnect the electrical connection to either the fuel pump relay, the inertia switch or the in-line high pressure fuel pump.

2. Crank engine for approximately ten seconds.

Note: Engine may start and run for a short time. If so, crank engine an additional 5 seconds after engine stalls.

3. Re-connect the electrical connector that was disconnected in step 1 and disconnect battery ground cable.

Alternative Method

Some EFI vehicles have a port (fitting) on the fuel rail used for measuring fuel pressure. If so equipped, use the following method: -

Install fuel pressure relief tool No. T80L-9974-B or equivalent to measuring port on engine fuel rail.

- Position drain hose in suitable container, then depress relief button.

Rocker Arm Assembly: Specifications Torque

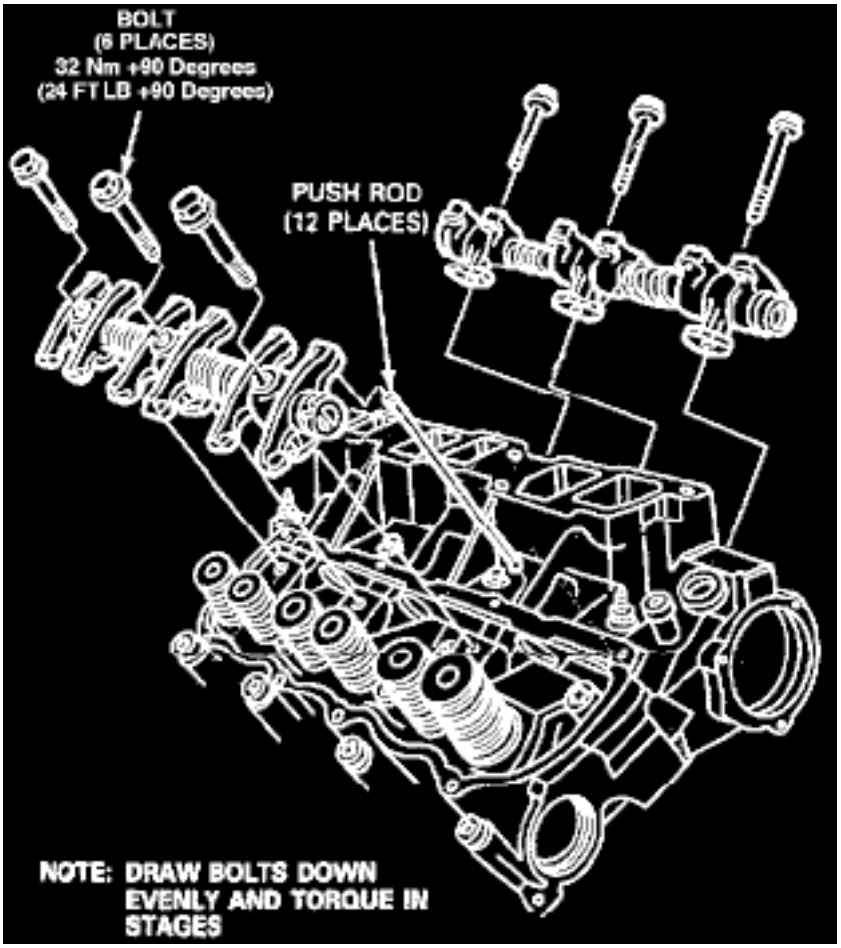
Shaft support bolts ..... 32 Nm +90° (24 ft lb +90°)

Rocker Arm Assembly: Specifications Rebuild

Rocker Arm Shaft Diameter 0.7799-O.7811

Rocker Arm Bore Diameter 0.7830-0.7842

Rocker Arm Ratio 1.46:1



Rocker Arm Assembly: Service and Repair

Valve Push Rod, Rocker Arm, and Shaft Assembly Installation

REMOVAL

1. Remove valve covers.

2. Remove the rocker arm shafts by loosening the rocker arm shaft support bolts 2 turns at a time until the shaft can be removed.

CAUTION: If the rocker arm shafts are not loosened gradually, the shaft may become bent or damaged during removal.

INSTALLATION

1. Lubricate all rocker arm assemblies with Engine Assembly Lubricant (D9AZ-19579 D, or equivalent).

2. Install rocker arm shaft assemblies and draw the shaft support bolts down evenly, two turns at a time, until the rocker shaft assemblies are fully down. Tighten shaft support bolts to 32 Nm +90° (24 ft lb +90°).

3. Install valve covers.

General Information

LIGHT TRUCK: 1990-93 AEROSTAR, RANGER 1991-93 EXPLORER

This TSB is being republished in its entirety to correct the type of cleaner being used in Figures 1, 3, and 6.

ISSUE: The many sources of leaks which typically appear at the lower end, front end, intake manifold valley, and rocker cover rails have led to mis-diagnosis as to the source of the leak and improper repair procedures, repeat repairs, and customer dissatisfaction.

ACTION: This TSB article has been developed to list the latest sealing techniques and associated part numbers for:

^ Oil Pan

^ Rear Main Seal

^ Rocker Covers

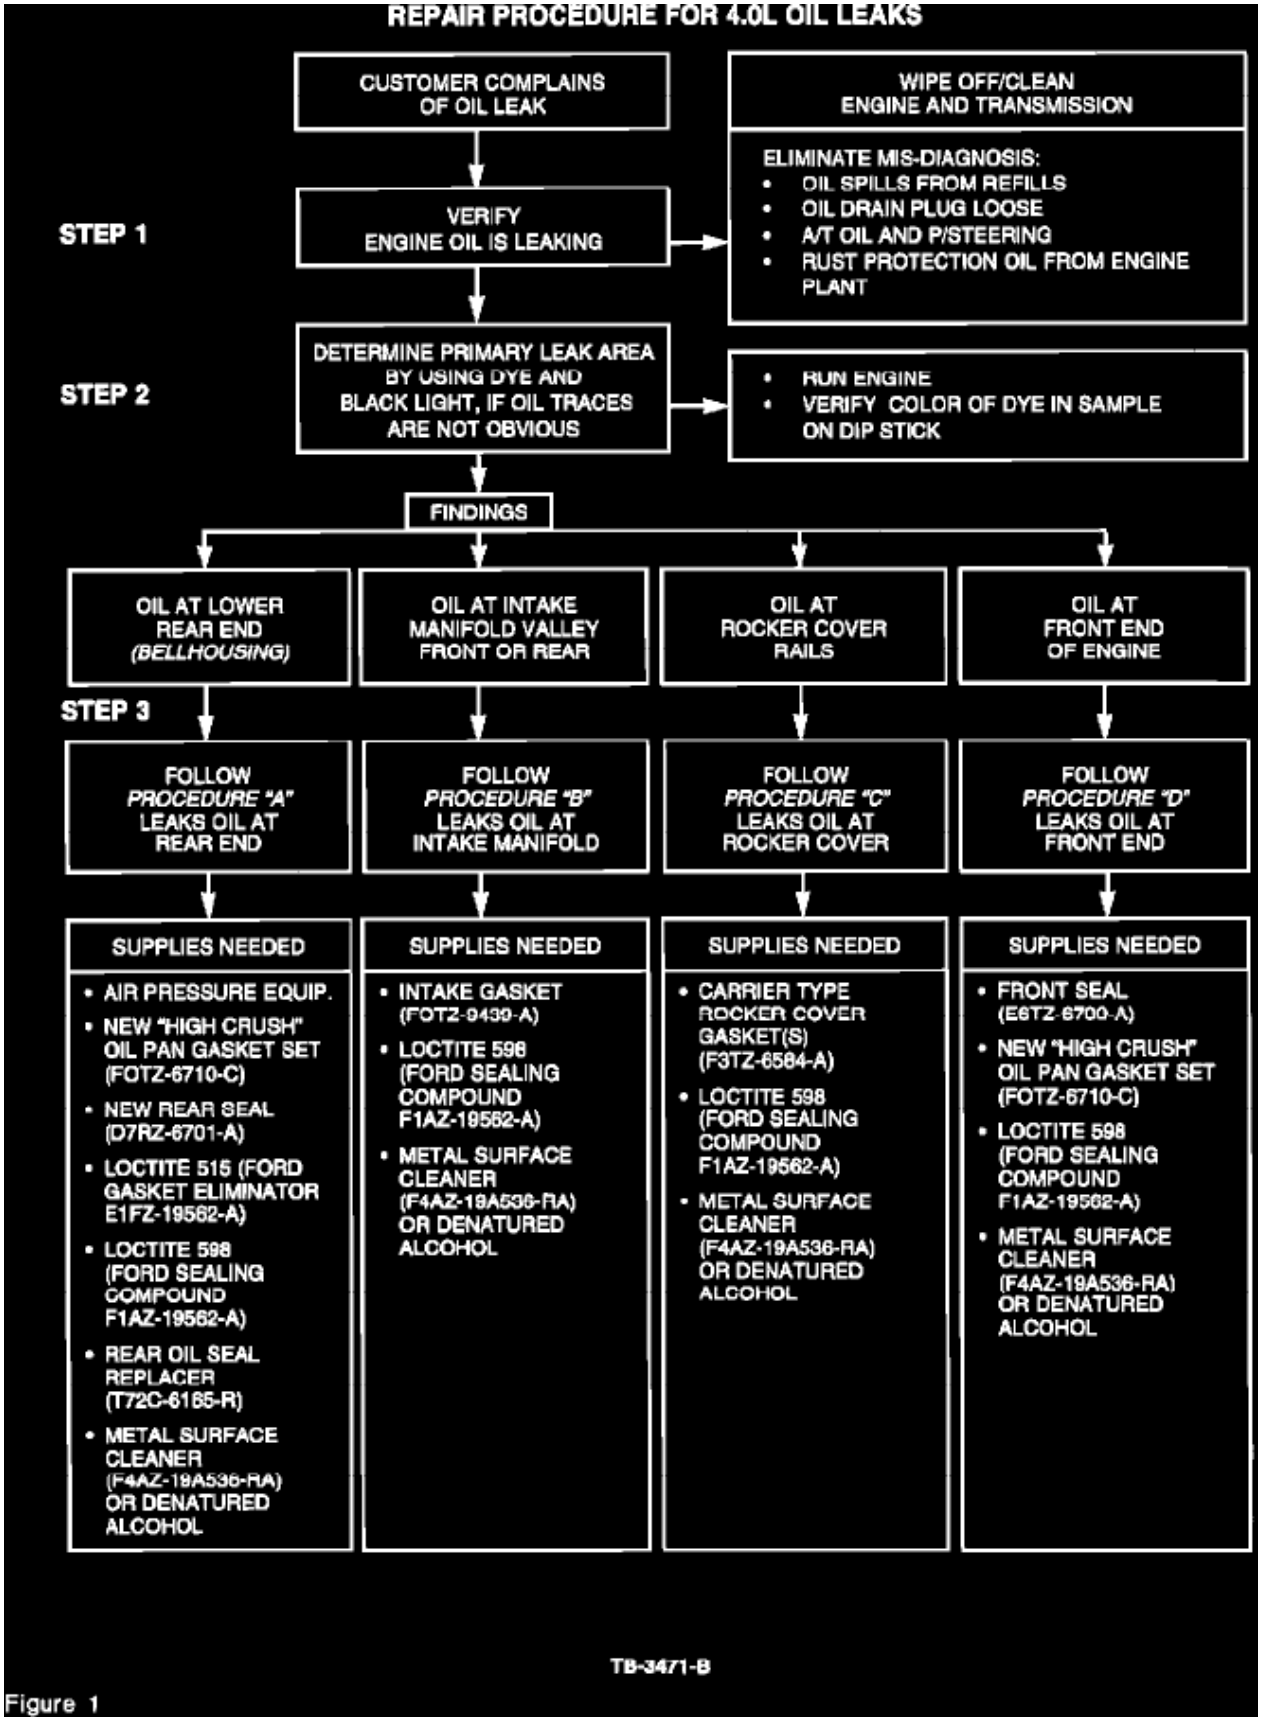

Figure 1

^ Intake Manifold

This article attempts to fully address all issues as one, in order to provide a diagnostic guide which leads to proper diagnosis and repair the first time. Use the following procedures to verify the location of the oil leak and perform the repair.

Service Procedure - Diagnosis

1. Perform Steps 1 and 2 of the block diagram shown in Figure 1. Perform a visual inspection to determine the general area of the oil leak.

2. After determining the "Findings" of Step 2, perform Step 3 by following Procedures A, B, C or D, whichever is appropriate, up to, but not including the air pressure test.

NOTE:

WHEN THE FINDINGS RESULT IN FOLLOWING PROCEDURE "A" FOR "LEAKS OIL AT REAR END", IT IS VERY IMPORTANT TO FOLLOW THE BLOCK DIAGRAM INSTRUCTIONS TO REMOVE THE TRANSMISSION, IF AN AEROSTAR, AND TO REMOVE THE ENGINE, IF AN EXPLORER/RANGER. THE PRACTICE OF REMOVING EXPLORER/RANGER OIL PANS WITH ENGINE IN VEHICLE CAN RESULT IN FAULTY DIAGNOSIS AND/OR REPAIR FOR THE PURPOSES OF THIS TSB.

If the leak has not been located and corrected at this point, then fabricate a device that is capable of applying a constant 1 to 3 psi of air pressure to the engine crankcase. The Rotunda Leak Tester 134-00003, or equivalent, which contains a pressure regulator and gauge capable of a 1 to 3 psi range, may be used.

3. Verify the location of the oil leak by pressurizing the engine crankcase with a constant supply of 3 psi of air pressure and the use of leak detection solution (liquid detergent and water). This process will verify the exact location of the leak. Dye and black light will verify a leak is present, but may not verify the exact location of the leak.

a. Assemble the necessary hose and fittings to connect an air pressure regulator and air pressure gauge to the shop air supply and to the engine crankcase through the dipstick tube.

b. Test the device to make sure 1-3 psi of air pressure can be maintained. Bursts of pressure over 3 psi can damage engine seals.

c. Before starting the test, make sure the regulator valve is completely closed so as not to accidentally apply a big burst of air to the engine when starting the test.

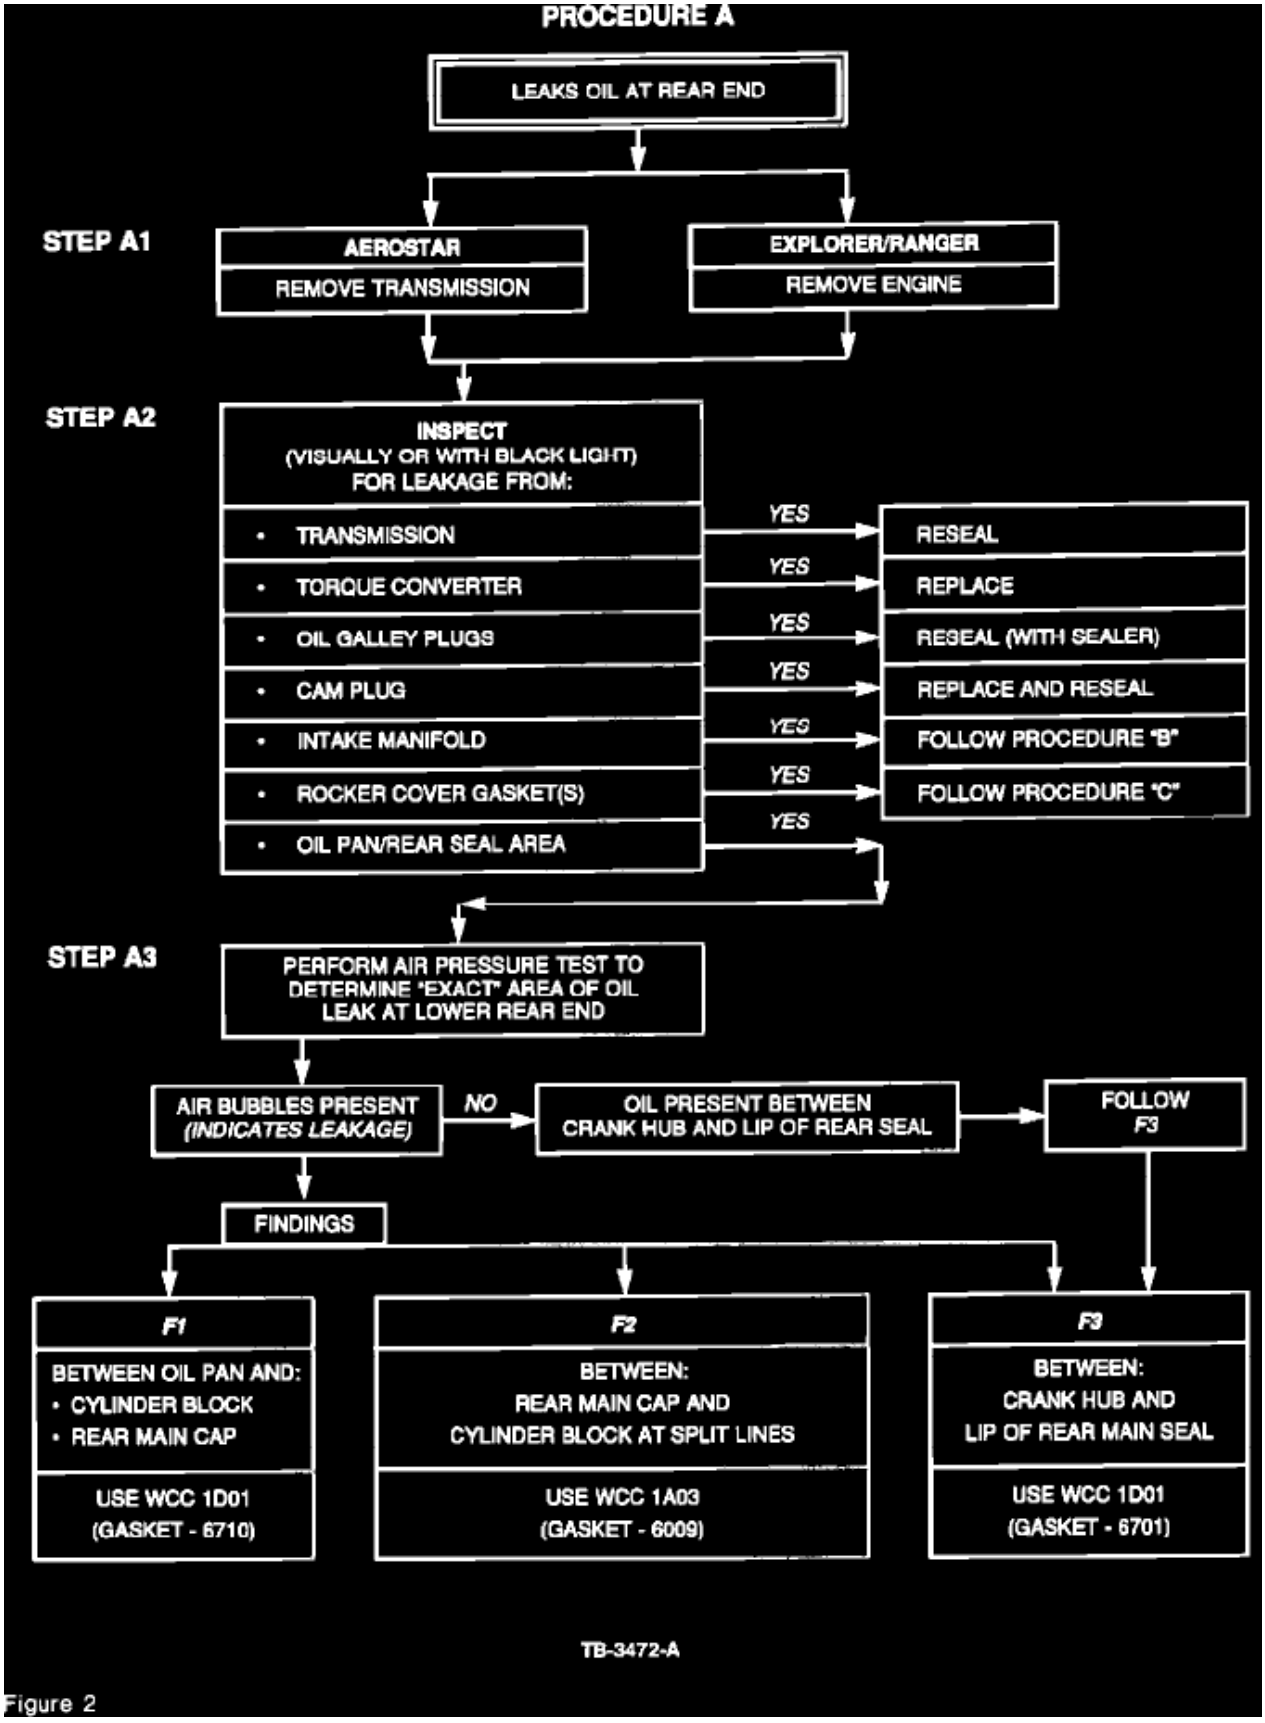
d. Attach the outlet (regulated) hose from the regulator/gauge device to the dipstick.

e. To trap air in the engine, plug any ports and passages (PCV valve, air inlet connection) that will allow air to escape.

f. Slowly open the regulator valve until 1-3 psi of air pressure registers on the gauge.

g. Keeping air pressure applied, brush or squirt a solution of liquid detergent and water or commercially available liquid leak detector (Snoop, Bubbles) to the primary area identified in Step 2 of the block diagram.

^ If the primary area is in the rear seal area, apply the solution to the rear seal, rear cap, rear cap to cylinder block and oil pan gasket areas.



PROCEDURE A
LEAKS OIL AT REAR END
STEP A1
AEROSTAR
REMOVE TRANSMISSION
EXPLORER/RANGER
REMOVE ENGINE
STEP A2
INSPECT
(VISUALLY OR WITH BLACK LIGHT)
FOR LEAKAGE FROM:
• TRANSMISSION
• TORQUE CONVERTER
• OIL GALLEY PLUGS
• CAM PLUG
• INTAKE MANIFOLD
• ROCKER COVER GASKET(S)
• OIL PAN/REAR SEAL AREA
YES
RESEAL
REPLACE
RESEAL (WITH SEALER)
REPLACE AND RESEAL
FOLLOW PROCEDURE "B"
FOLLOW PROCEDURE "C"
STEP A3
PERFORM AIR PRESSURE TEST TO
DETERMINE "EXACT" AREA OF OIL
LEAK AT LOWER REAR END
AIR BUBBLES PRESENT
(INDICATES LEAKAGE)
NO
OIL PRESENT BETWEEN
CRANK HUB AND LIP OF REAR SEAL

Figure 2

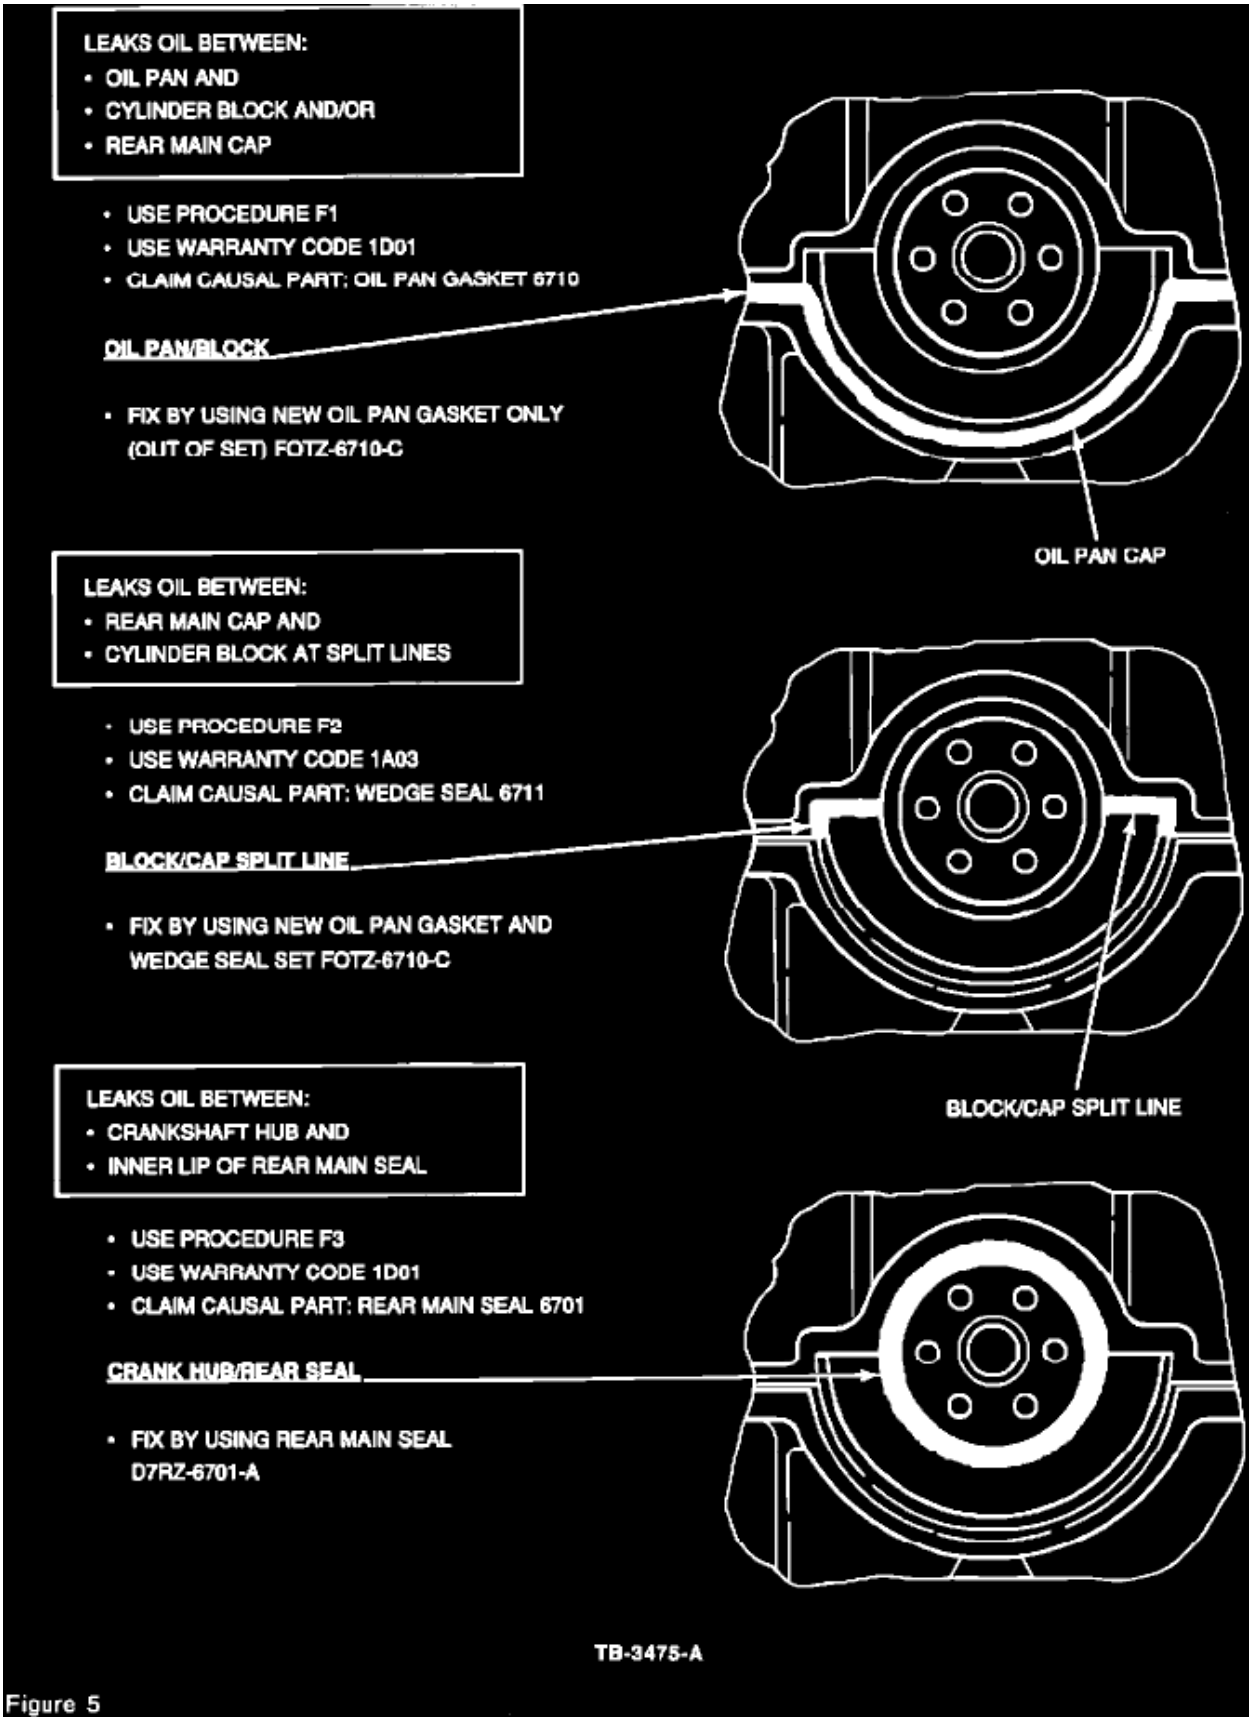

Figure 5

^ If bubbles are detected only at the oil pan gasket, between the oil pan and the cylinder block, or between the oil pan and the rear main cap, only the oil pan gasket needs replacing. Note

Procedure A, Figure 2, Step A3/F1, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A1.

^ If bubbles are detected between the rear main cap and the cylinder block, the rear cap must be removed and resealed. Note Procedure A, Figure 2, Step A3/F2, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A2.

^ If bubbles are detected between the rear seal lip and crank hub, a new rear oil seal will be required. Under certain circumstances, as outlined in the block diagram, it will be necessary to call the 4.OL Hotline. Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A3.

^ If no bubbles are detected, but oil is present in the area between the crank hub and the lip of the rear seal, carefully remove the seal and inspect the crankshaft rear seal journal. (A leak may occur

at the rear seal only when the engine is running.) Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Follow repair procedures outlined on the block diagram.

NOTE:

ANY APPEARANCE OF RUST, PITTING, POROSITY, OR NICKS ON THE REAR SEAL JOURNAL WILL CAUSE A LEAK.

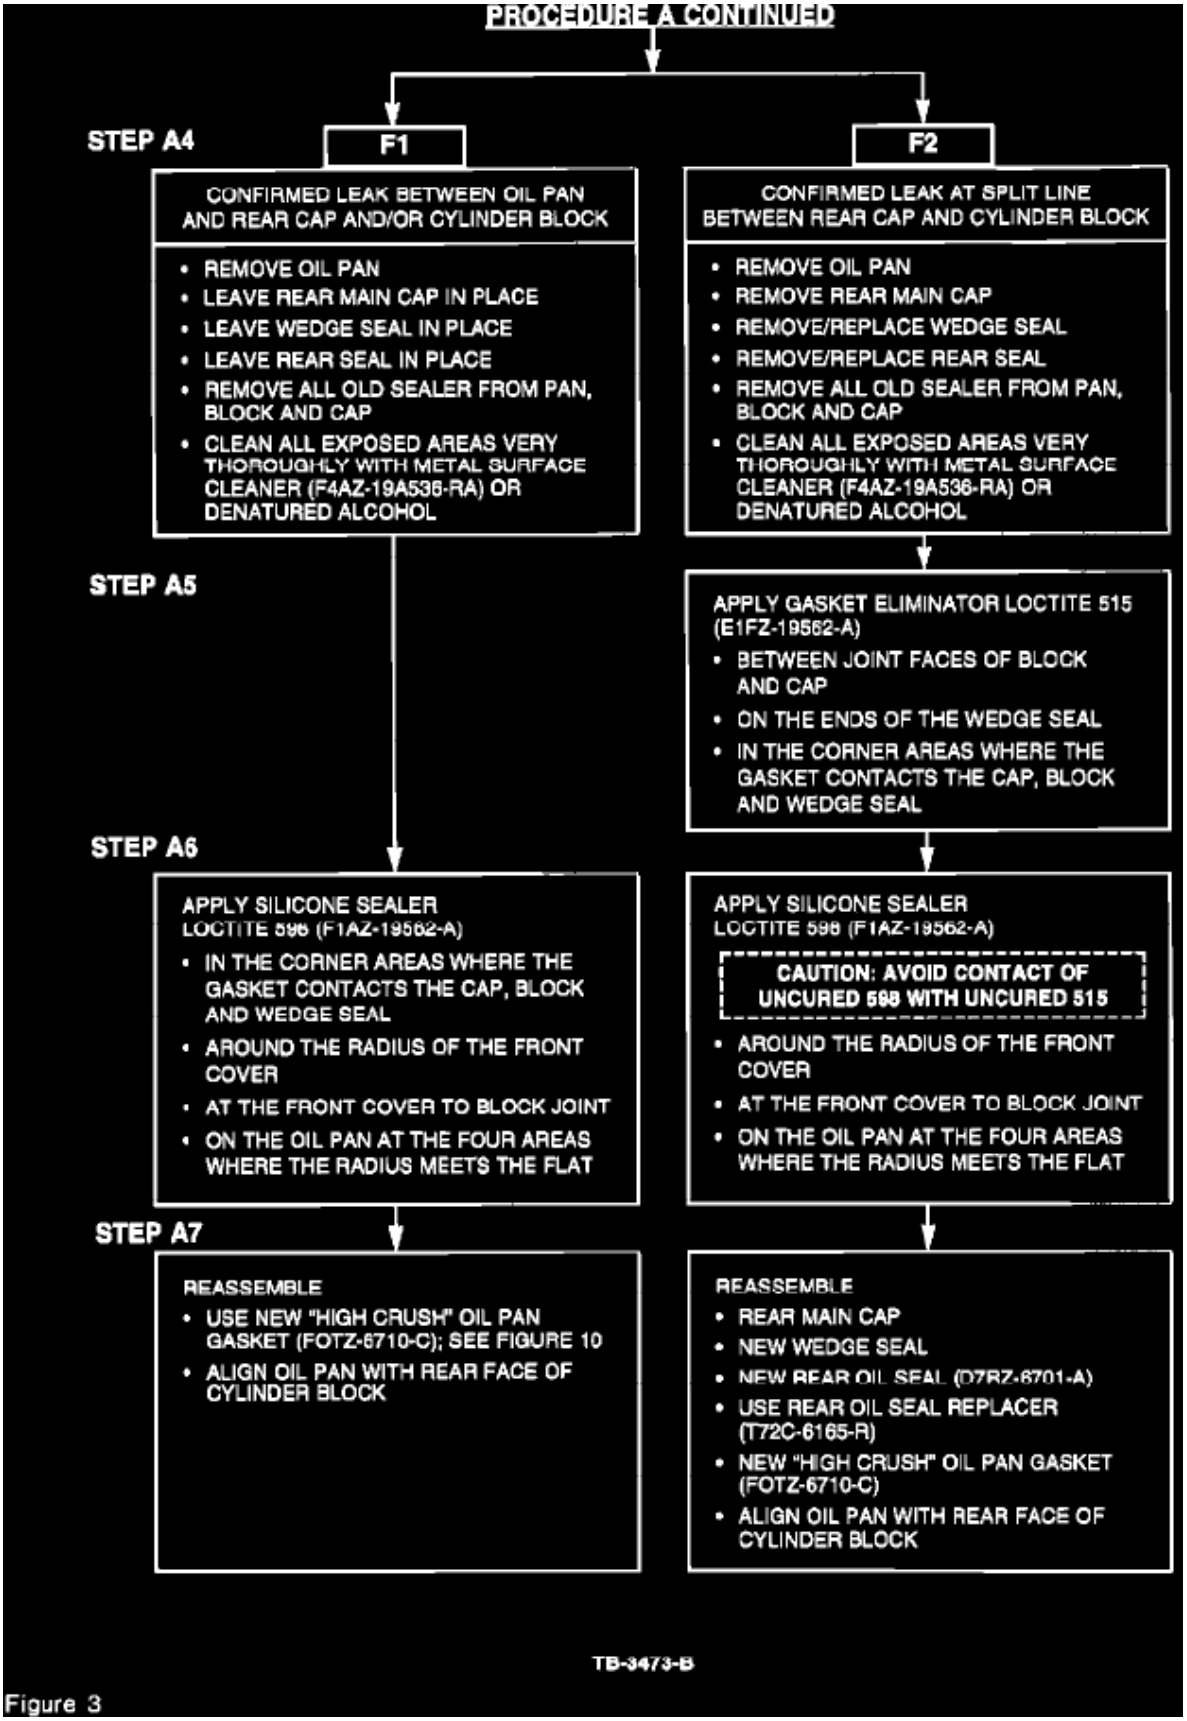
^ If bubbles are detected at the front or rear of the intake manifold gasket, a new intake manifold gasket (FOTZ-9439-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT INTAKE MANIFOLD, PROCEDURE B.

^ If bubbles are detected at the rocker cover rails, new rocker cover gaskets (F3TZ-6584-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT ROCKER COVER RAILS, PROCEDURE C.

^ If bubbles are detected at the front end of the engine, a new front seal (E6TZ-6700-A) or oil pan gasket (FOTZ-6710-C) will be required. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT THE FRONT END, PROCEDURE D.

Service Procedure - Repair

REAR END OIL LEAK - PROCEDURE A



PROCEDURE A CONTINUED
STEP A4
F1
CONFIRMED LEAK BETWEEN OIL PAN AND REAR CAP AND/OR CYLINDER BLOCK
• REMOVE OIL PAN
• LEAVE REAR MAIN CAP IN PLACE
• LEAVE WEDGE SEAL IN PLACE
• LEAVE REAR SEAL IN PLACE
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
F2
CONFIRMED LEAK AT SPLIT LINE BETWEEN REAR CAP AND CYLINDER BLOCK
• REMOVE OIL PAN
• REMOVE REAR MAIN CAP
• REMOVE/REPLACE WEDGE SEAL
• REMOVE/REPLACE REAR SEAL
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
STEP A5
APPLY GASKET ELIMINATOR LOCTITE 515 (E1FZ-19562-A)
• BETWEEN JOINT FACES OF BLOCK AND CAP
• ON THE ENDS OF THE WEDGE SEAL
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
STEP A6
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
CAUTION: AVOID CONTACT OF UNCURED 598 WITH UNCURED 515
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
STEP A7
REASSEMBLE
• USE NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C); SEE FIGURE 10
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
REASSEMBLE
• REAR MAIN CAP
• NEW WEDGE SEAL
• NEW REAR OIL SEAL (D7RZ-6701-A)
• USE REAR OIL SEAL REPLACER (T72C-6165-R)
• NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C)
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
TB-3473-B
Figure 3

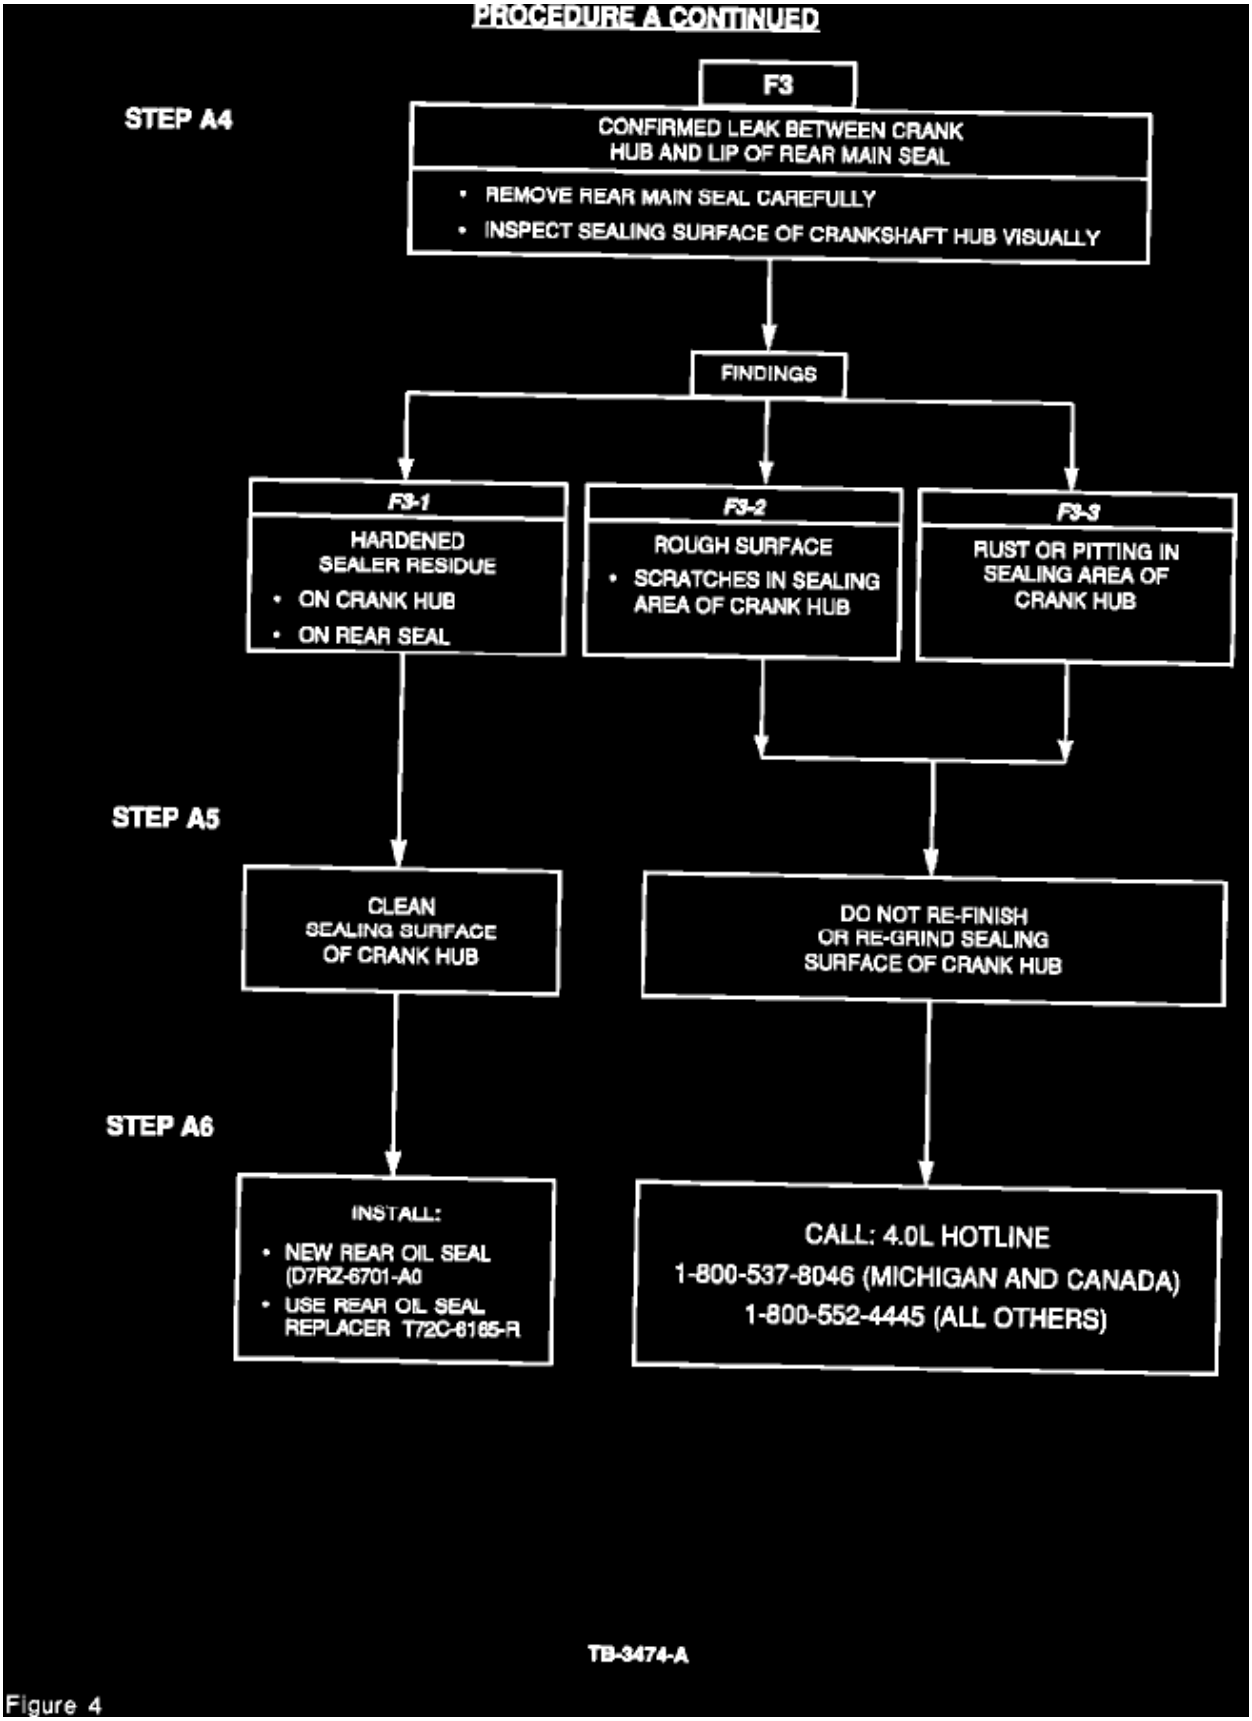


Figure 4

1. Repair procedure for a leak at oil pan gasket between the oil pan and cylinder block, or between the oil pan and the rear main cap. See block diagram Procedure A, Step A4/F1, Figures 3 and 4.

a. Remove the oil pan from the engine and remove the old gasket from the oil pan. Do not remove the rear main cap or wedge seal from the engine.

b. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

c. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap. Take special care to scrape/scratch all the old sealer from the exposed areas of the rear cap, wedge seal and cylinder block. This is a critical sealing area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER BLOCK.

d. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

e. Clean the transmission "BELLHOUSING" area, the rear of the cylinder block and the rear engine plate of ALL oil residue.

f. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corner of the radius areas at the front and rear of the oil pan.

g. Place the oil pan gasket (FOTZ-6710-C) in place in the groove in the oil pan.

h. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the corners where the rear main cap meets the cylinder block, at the corner areas of the radius area on the front cover and the front cover to cylinder block joint.

i. Set the oil pan in place and snug the four (4) pan nuts.

j. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .0100" (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

k. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

2. Repair procedure for a leak between the rear main cap and the cylinder block. See block diagram Procedure A, Step A4/F2.

a. Remove the oil pan, windage tray, oil pump and rear main cap from the engine.

b. Remove the rear main oil seal from the crankshaft and thoroughly inspect the main seal journal of the crankshaft for signs of rust, pitting, nicks or porosity.

c. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

d. Clean ALL the old sealer from the rear main bearing cap USING A SCRAPER AND WIRE WHEEL. The original Loctite sealer used during production assembly becomes extremely hard after it has cured. It is extremely important that ALL the old sealer be removed from the joint faces and grooves.

e. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap joint area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER

BLOCK.

f. Clean ALL the oil and old sealer from the "WEDGE SEAL" that fits around the rear main bearing cap in the oil pan gasket groove. Preferably use a new "WEDGE SEAL".

g. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

h. Clean the transmission "BELLHOUSING AREA", the rear of the cylinder block and the rear engine plate of ALL oil residue.

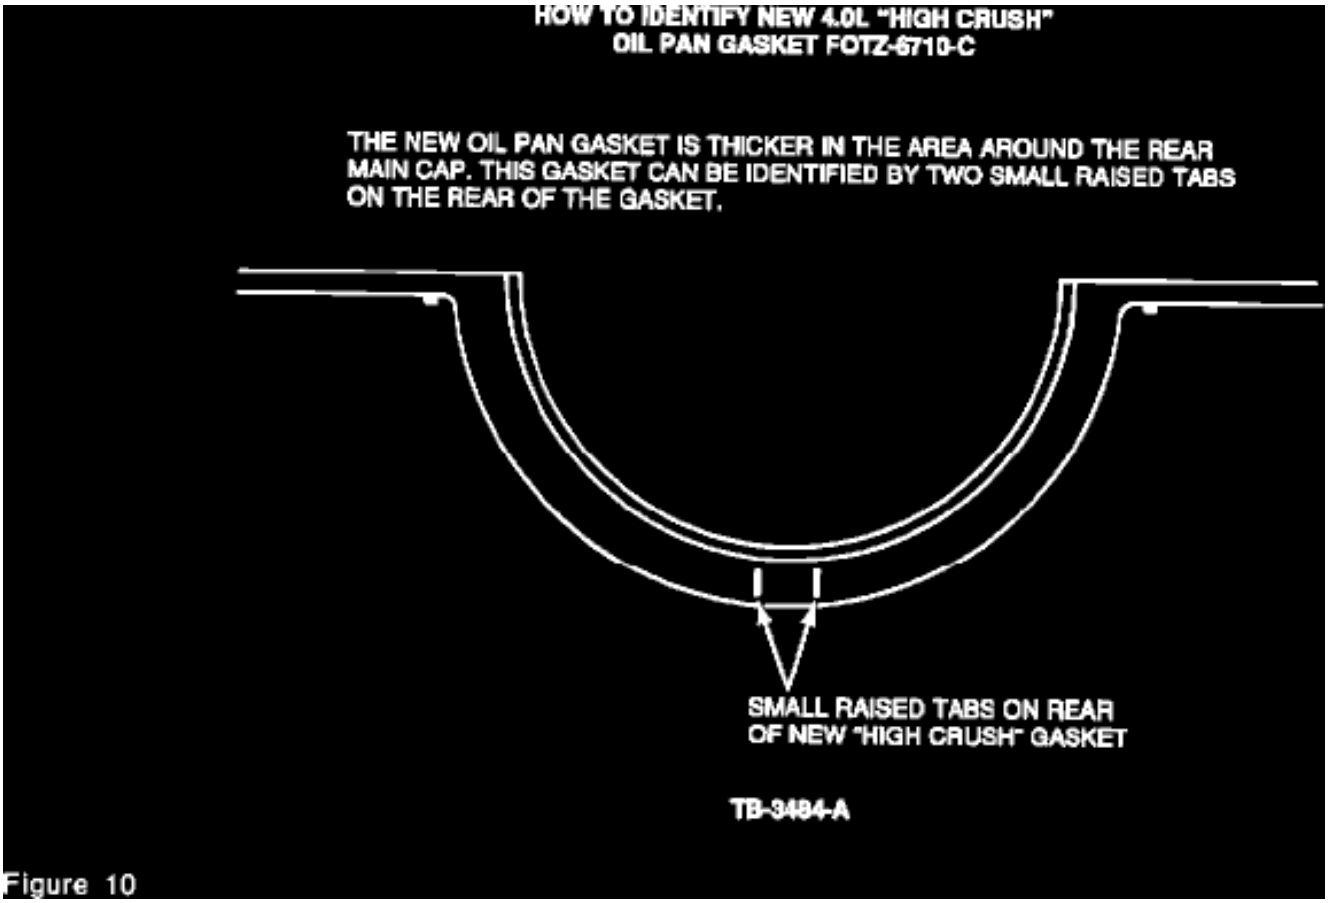

Figure 10

i. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) on the cylinder block along the corners of the rear main bearing cap joint area and on the joint face, approximately 1/2 inch (12.7 mm) from the rear of the block.

j. Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.

k. Align the rear main bearing cap to cylinder block by moving the bearing fore or aft (approx. 1/2 inch (12.7 mm) inward in the rear oil seal bore) so that the rear seal stop of the block and cap line up. This will assure that the rear main oil seal will seat squarely when installed in the bore.

l. Torque the rear main cap bolts to 66-77 lb.ft. (90-104 N-m).

m. Fill the cavities for the "WEDGE SEAL" on both sides of the rear main cap with Ford Gasket Eliminator (E1FZ-19562-A).

n. Place "WEDGE SEAL" in place and use a flat bladed screwdriver to fully seat the "WEDGE SEAL", forcing the excessive sealer out.

o. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) in the corners of the oil pan gasket groove of the rear main cap where the cap meets the cylinder block.

p. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) at the corner areas of the radius area on the front cover and at the front cover to cylinder block joint.

q. Reinstall the oil pump and windage tray. Torque to 13-15 lb.ft. (17-21 N-m).

r. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corners of the radius areas at the front and rear of the oil pan.

s. Place the oil pan gasket (FOTZ-6710-C), Figure 10, in place in the groove in the oil pan.

t. Set the oil pan in place and snug the four (4) oil pan bolts.

u. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .01000 (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

v. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

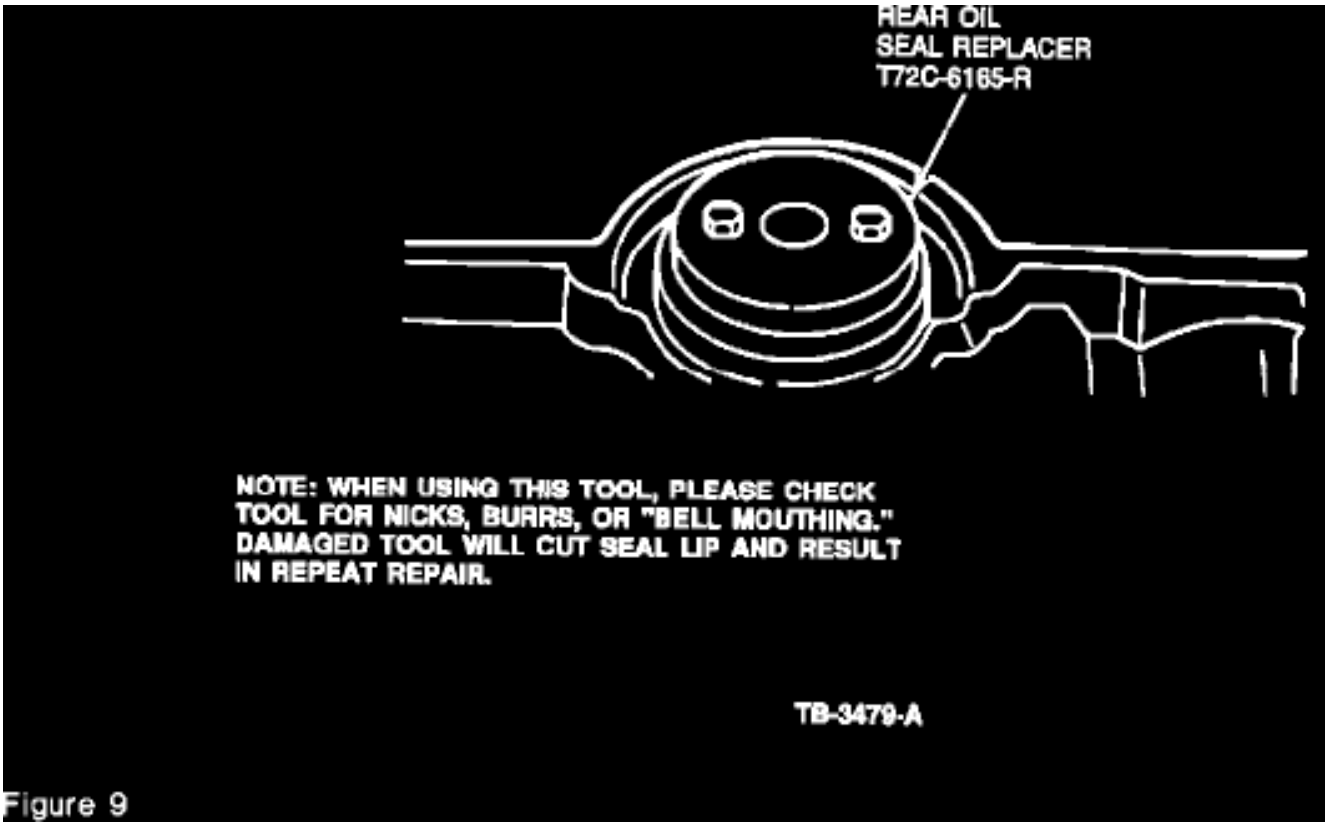

Figure 9

w. Coat the rear main oil seal (D7RZ-6701-A) with oil. Install the rear seal in the seal bore using Rear Oil Seal Replacer T72C-6165-R. This tool uses two flywheel bolts to draw the seal into position. Refer to Figure 9.

CAUTION:

DO NOT USE THE OLD STYLE HAMMER OPERATED TOOL.

3. Repair procedure for a leak between the rear main seal and the crankshaft. See block diagram, Procedure A, Step A4/F3.

a. Any presence of rust on the rear seal journal will cause a leak.

b. Any presence of pitting, porosity or nicks on the rear seal journal will cause a leak.

NOTE:

IF A LEAK IS PRESENT BETWEEN THE REAR MAIN SEAL AND CRANKSHAFT, PLEASE NOTIFY THE 4.0L "HOTLINE" AT (800) 537-8046 OR (800) 552-4445 PRIOR TO ANY ATTEMPT TO REPAIR THIS CONDITION.

Service Procedure - Repair For Oil Leaks At Intake Manifold

PROCEDURE B

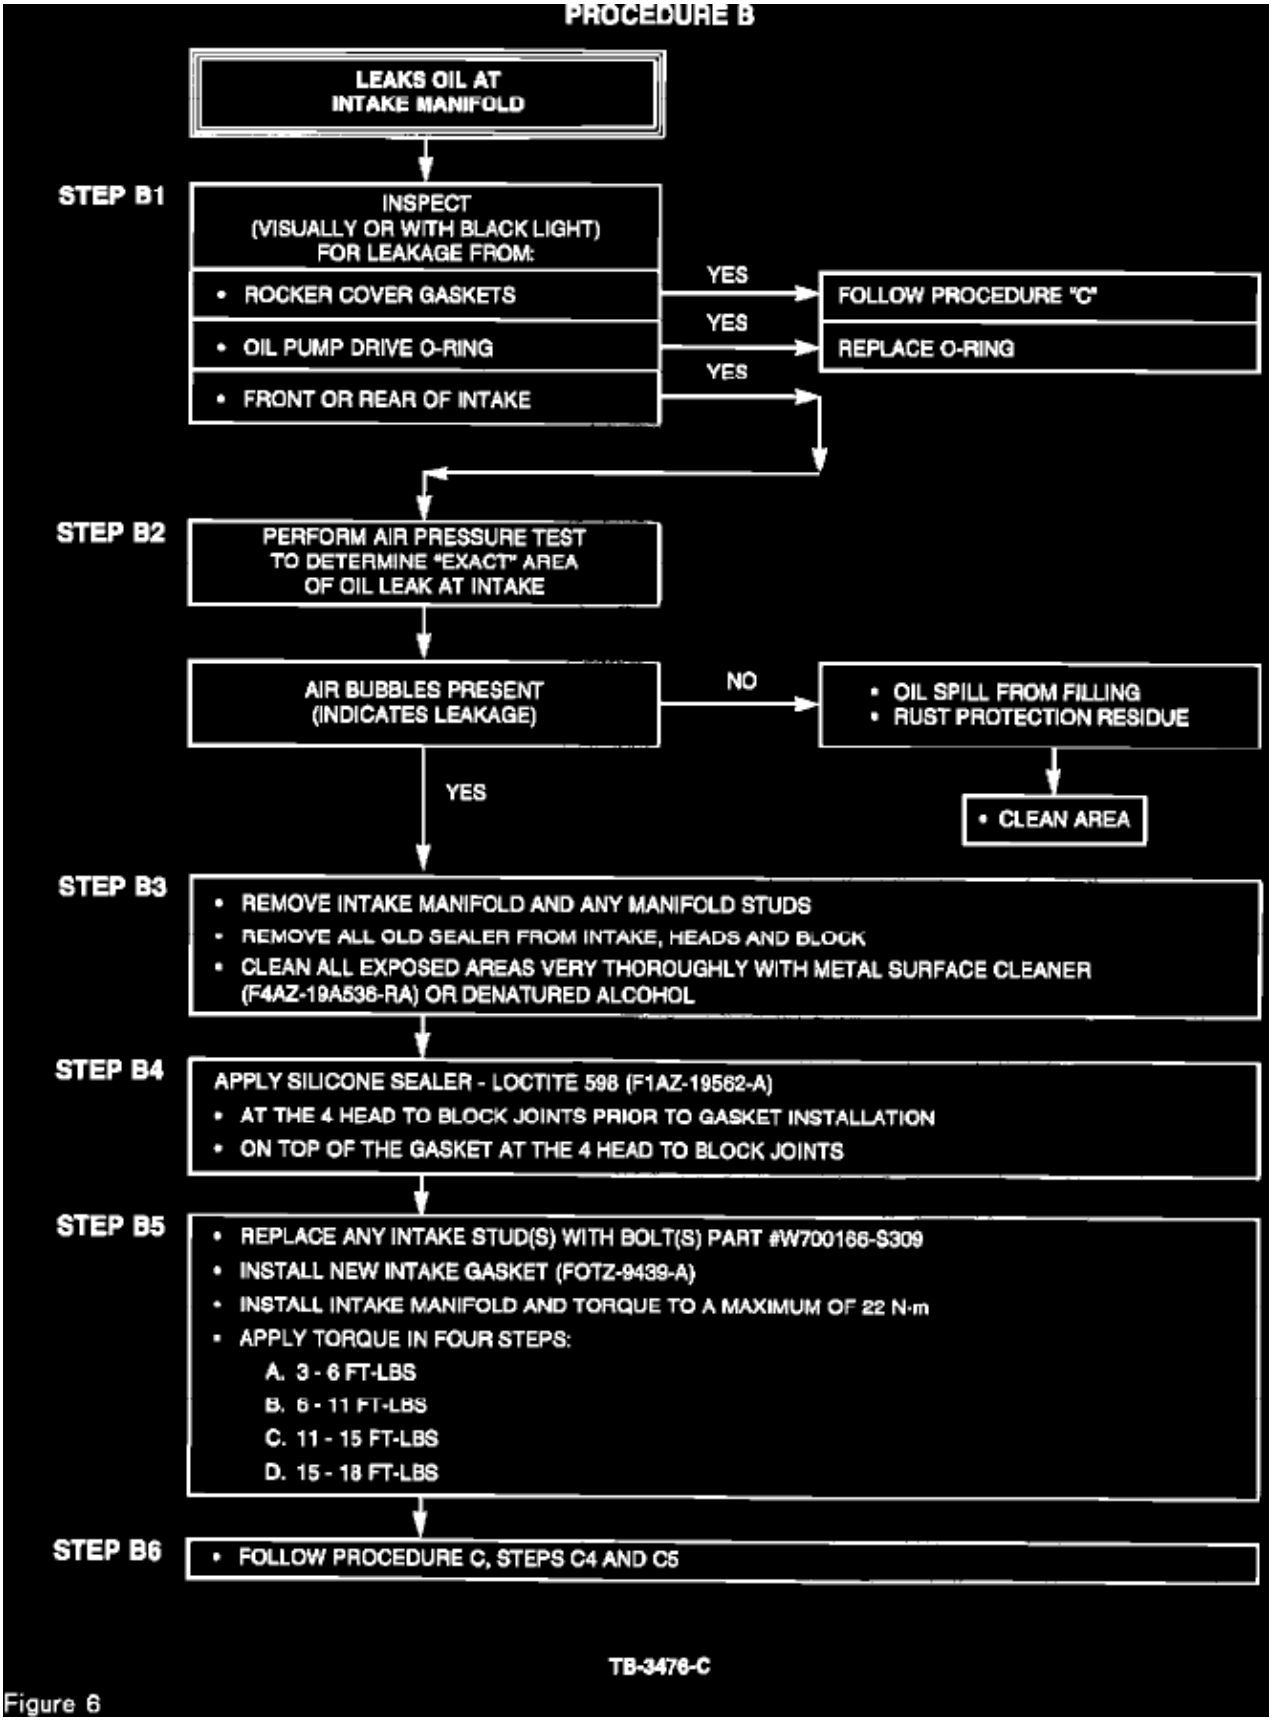

Figure 6

1. If the air pressure test showed no air bubbles, follow Procedure B2 to clean area of oil spill or other contamination.

2. If the air pressure test showed air bubbles present, follow Steps B3 through B6. Refer also to the Service Manual for the applicable year for further information pertinent to removal and installation of the intake manifold.

Service Procedure - Repair For Oil Leaks At Rocker Cover Rails

PROCEDURE C

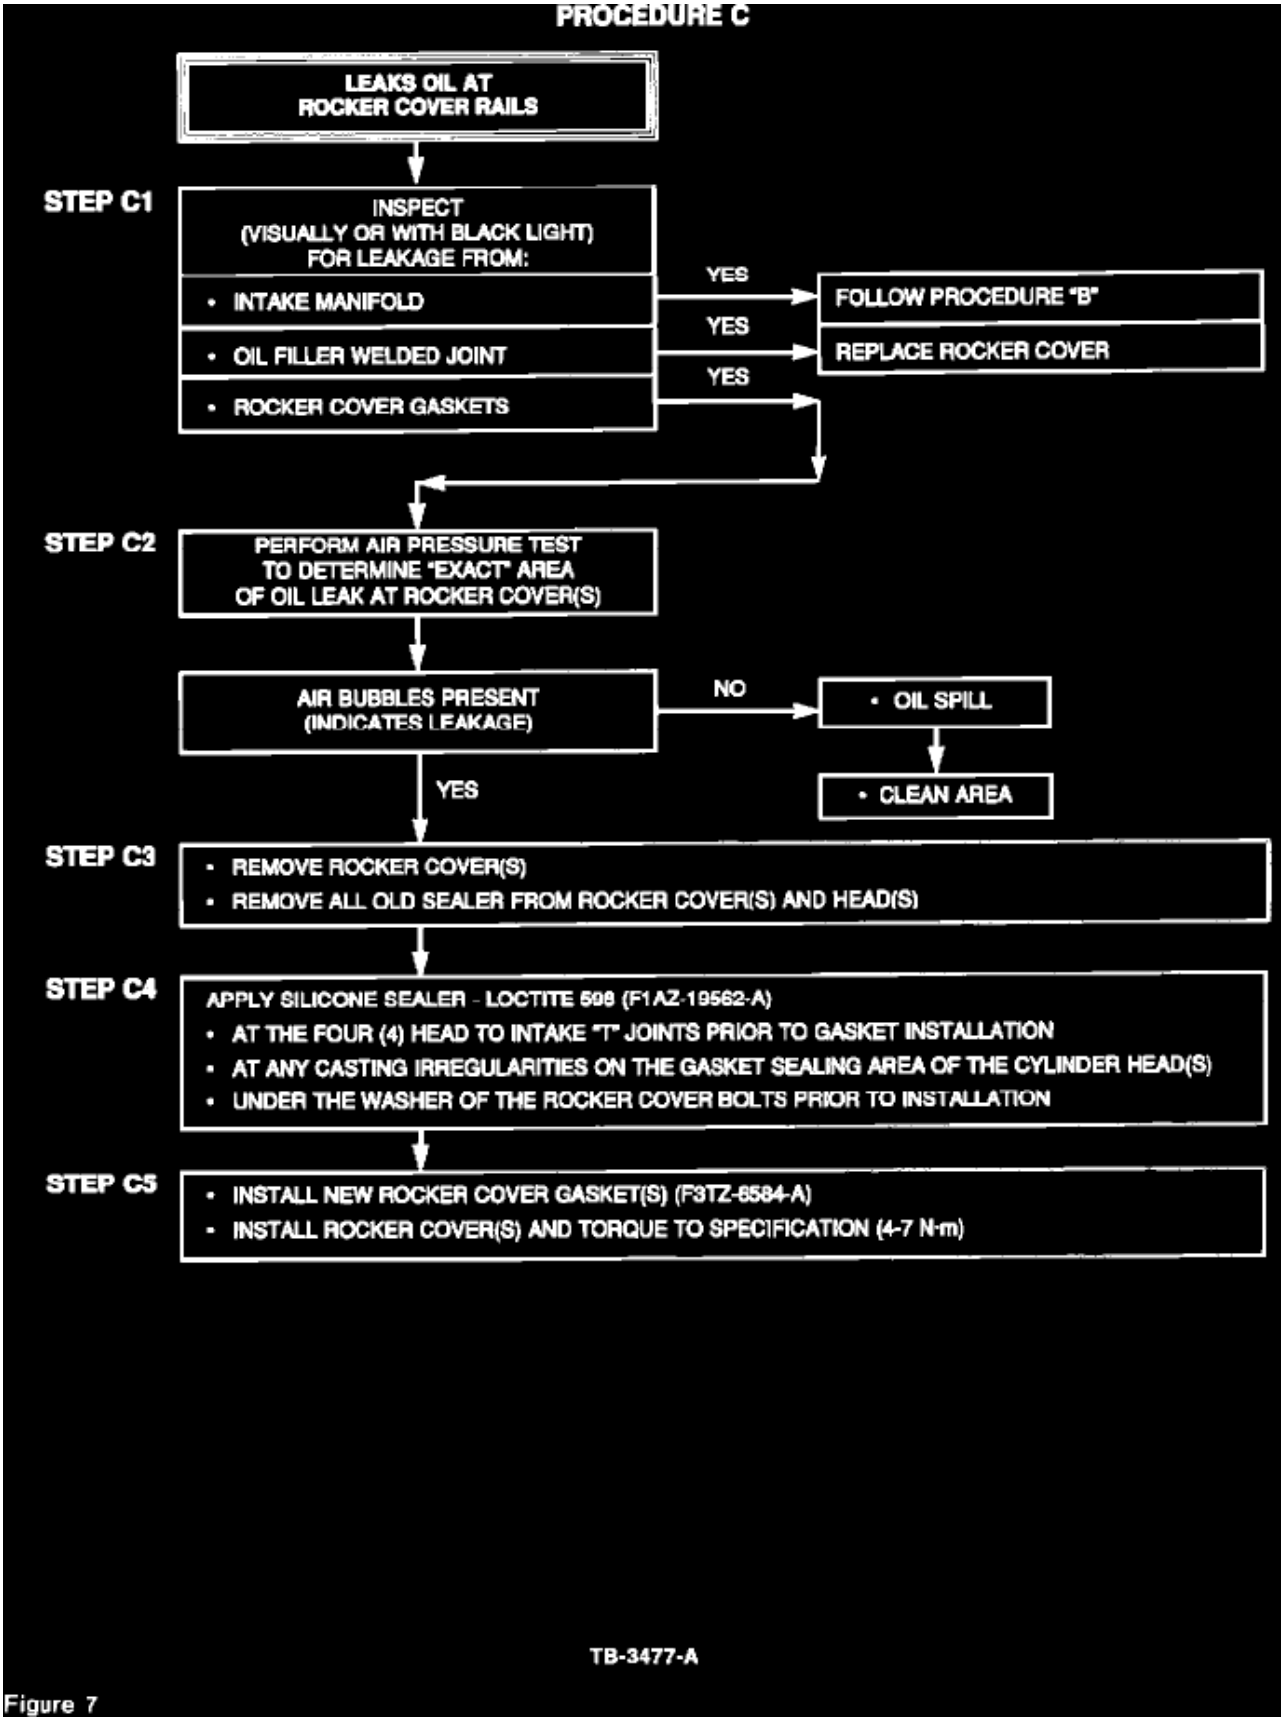

Figure 7

1. If the air pressure test showed no air bubbles, follow Procedure C2 to clean the area of any oil spill.

2. If the air pressure test showed air bubbles present, follow Steps C3 through C5.

Service Procedure - Repair For Oil Leaks At Front End

PROCEDURE D

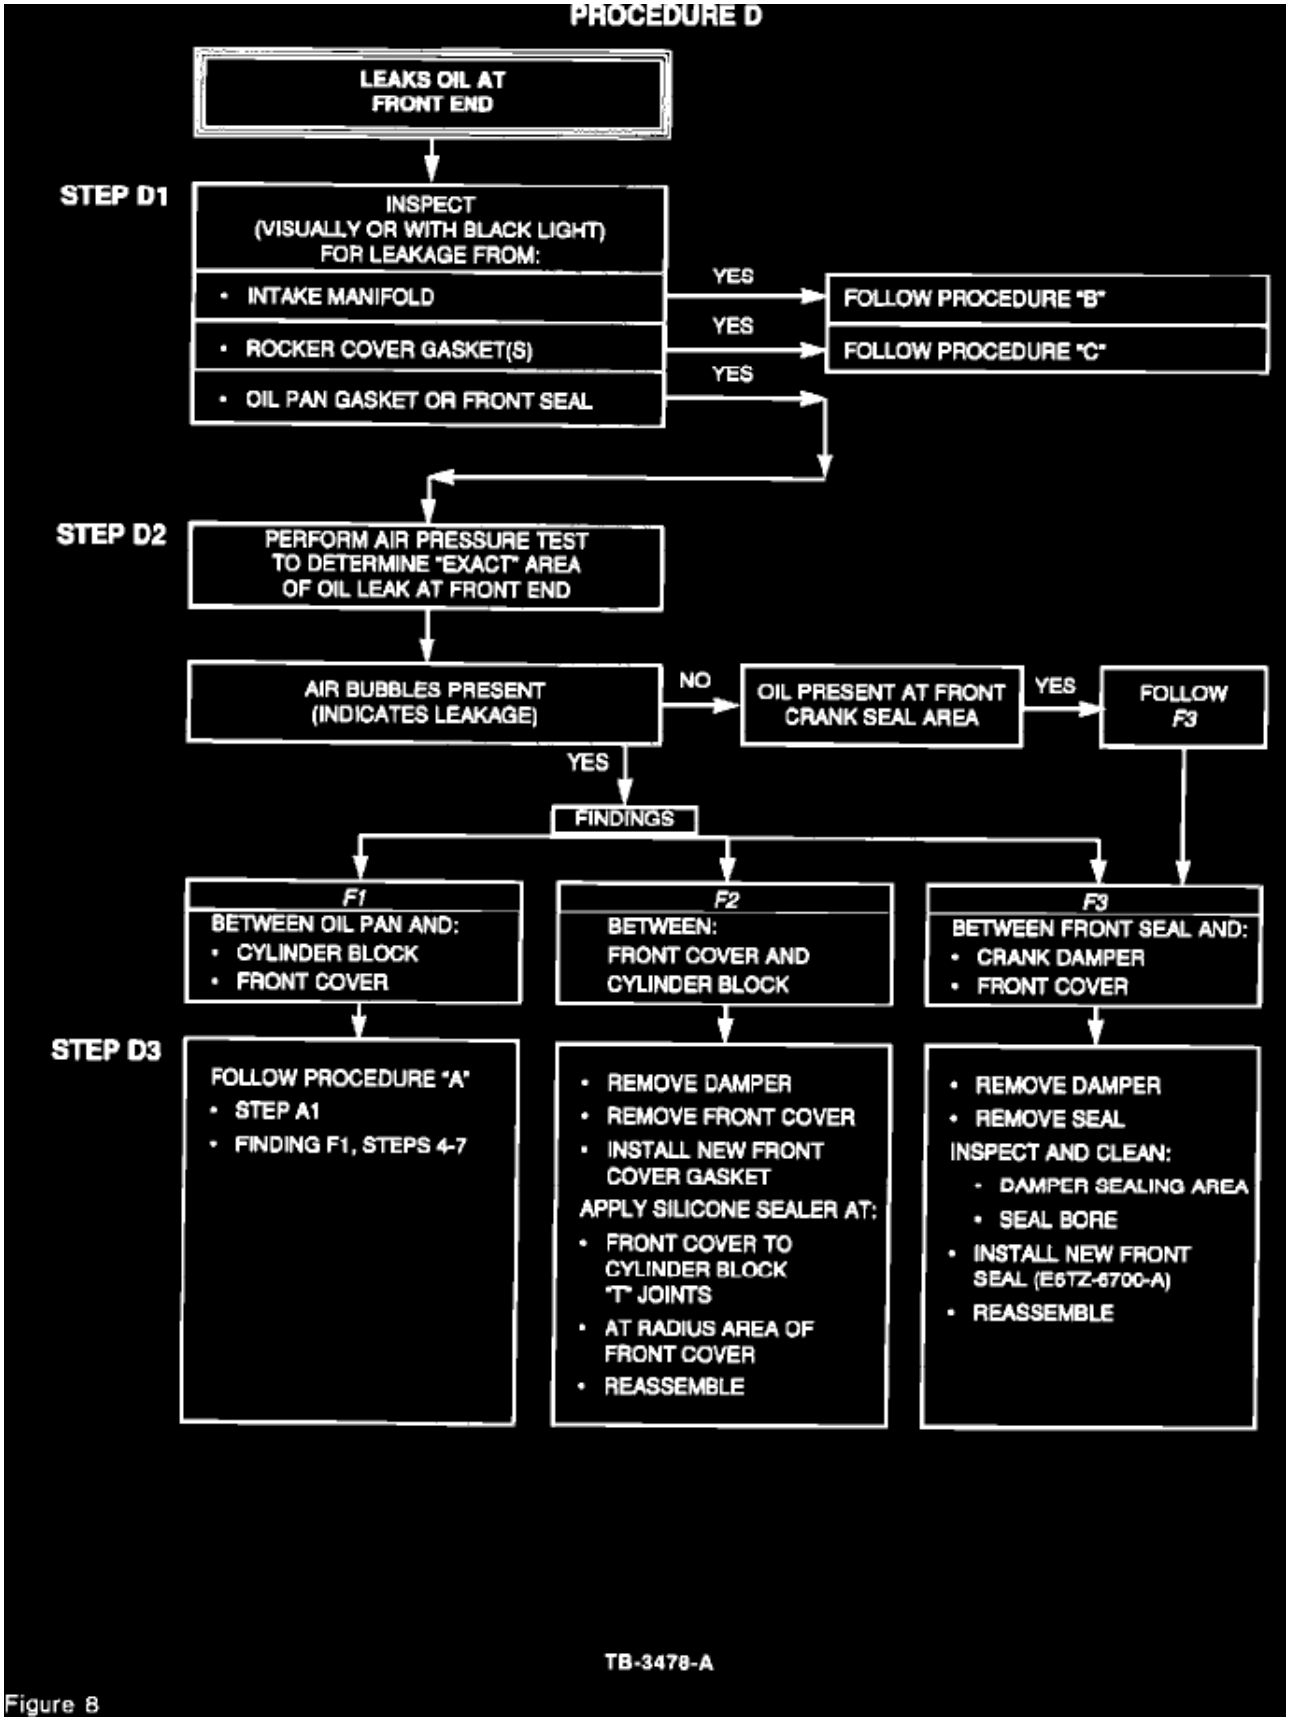

Figure 8

1. If the air pressure test showed no air bubbles, follow Procedure D, F3.

2. If the air pressure test showed air bubbles present, follow Procedure D, F1 or F2 as appropriate.

General Information

LIGHT TRUCK: 1990-93 AEROSTAR, RANGER 1991-93 EXPLORER

This TSB is being republished in its entirety to correct the type of cleaner being used in Figures 1, 3, and 6.

ISSUE: The many sources of leaks which typically appear at the lower end, front end, intake manifold valley, and rocker cover rails have led to mis-diagnosis as to the source of the leak and improper repair procedures, repeat repairs, and customer dissatisfaction.

ACTION: This TSB article has been developed to list the latest sealing techniques and associated part numbers for:

^ Oil Pan

^ Rear Main Seal

^ Rocker Covers

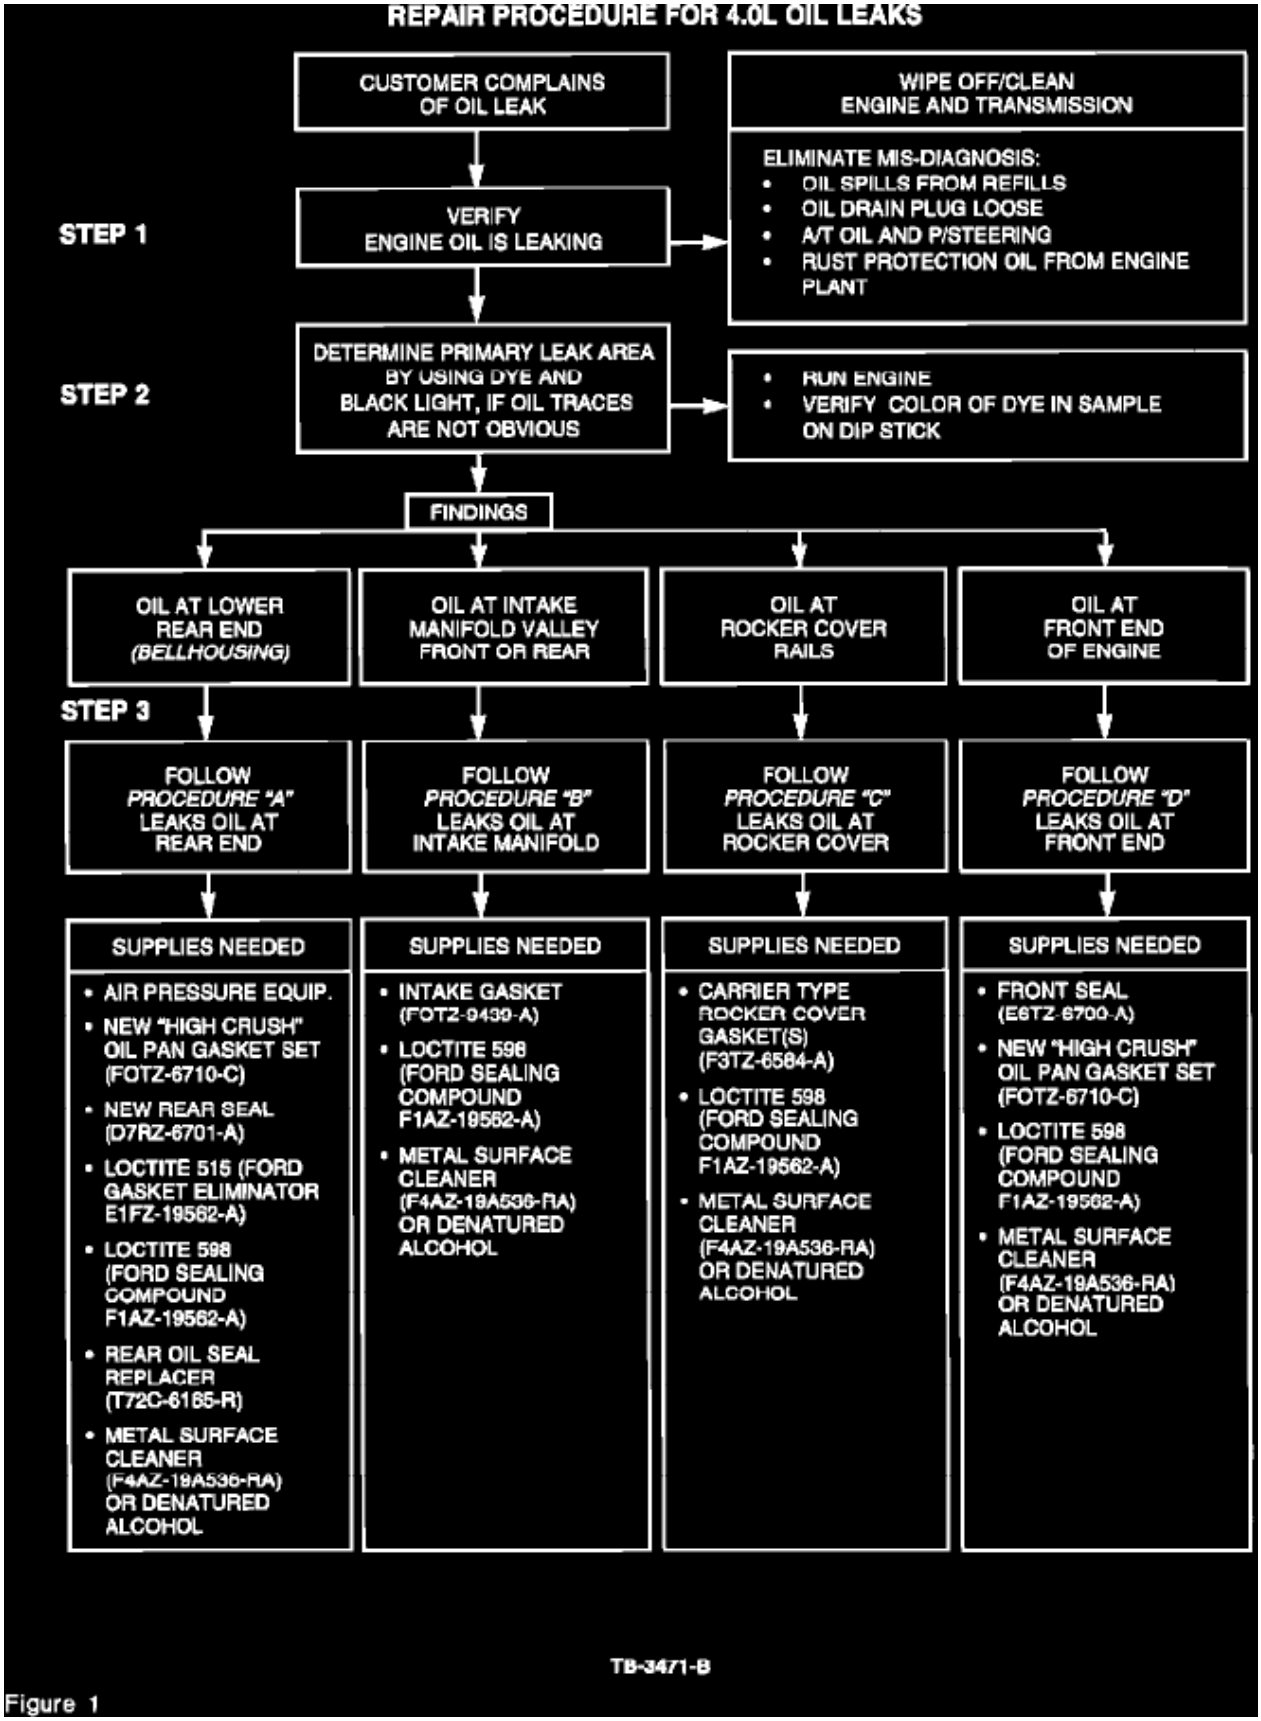

Figure 1

^ Intake Manifold

This article attempts to fully address all issues as one, in order to provide a diagnostic guide which leads to proper diagnosis and repair the first time. Use the following procedures to verify the location of the oil leak and perform the repair.

Service Procedure - Diagnosis

1. Perform Steps 1 and 2 of the block diagram shown in Figure 1. Perform a visual inspection to determine the general area of the oil leak.

2. After determining the "Findings" of Step 2, perform Step 3 by following Procedures A, B, C or D, whichever is appropriate, up to, but not including the air pressure test.

NOTE:

WHEN THE FINDINGS RESULT IN FOLLOWING PROCEDURE "A" FOR "LEAKS OIL AT REAR END", IT IS VERY IMPORTANT TO FOLLOW THE BLOCK DIAGRAM INSTRUCTIONS TO REMOVE THE TRANSMISSION, IF AN AEROSTAR, AND TO REMOVE THE ENGINE, IF AN EXPLORER/RANGER. THE PRACTICE OF REMOVING EXPLORER/RANGER OIL PANS WITH ENGINE IN VEHICLE CAN RESULT IN FAULTY DIAGNOSIS AND/OR REPAIR FOR THE PURPOSES OF THIS TSB.

If the leak has not been located and corrected at this point, then fabricate a device that is capable of applying a constant 1 to 3 psi of air pressure to the engine crankcase. The Rotunda Leak Tester 134-00003, or equivalent, which contains a pressure regulator and gauge capable of a 1 to 3 psi range, may be used.

3. Verify the location of the oil leak by pressurizing the engine crankcase with a constant supply of 3 psi of air pressure and the use of leak detection solution (liquid detergent and water). This process will verify the exact location of the leak. Dye and black light will verify a leak is present, but may not verify the exact location of the leak.

a. Assemble the necessary hose and fittings to connect an air pressure regulator and air pressure gauge to the shop air supply and to the engine crankcase through the dipstick tube.

b. Test the device to make sure 1-3 psi of air pressure can be maintained. Bursts of pressure over 3 psi can damage engine seals.

c. Before starting the test, make sure the regulator valve is completely closed so as not to accidentally apply a big burst of air to the engine when starting the test.

d. Attach the outlet (regulated) hose from the regulator/gauge device to the dipstick.

e. To trap air in the engine, plug any ports and passages (PCV valve, air inlet connection) that will allow air to escape.

f. Slowly open the regulator valve until 1-3 psi of air pressure registers on the gauge.

g. Keeping air pressure applied, brush or squirt a solution of liquid detergent and water or commercially available liquid leak detector (Snoop, Bubbles) to the primary area identified in Step 2 of the block diagram.

^ If the primary area is in the rear seal area, apply the solution to the rear seal, rear cap, rear cap to cylinder block and oil pan gasket areas.

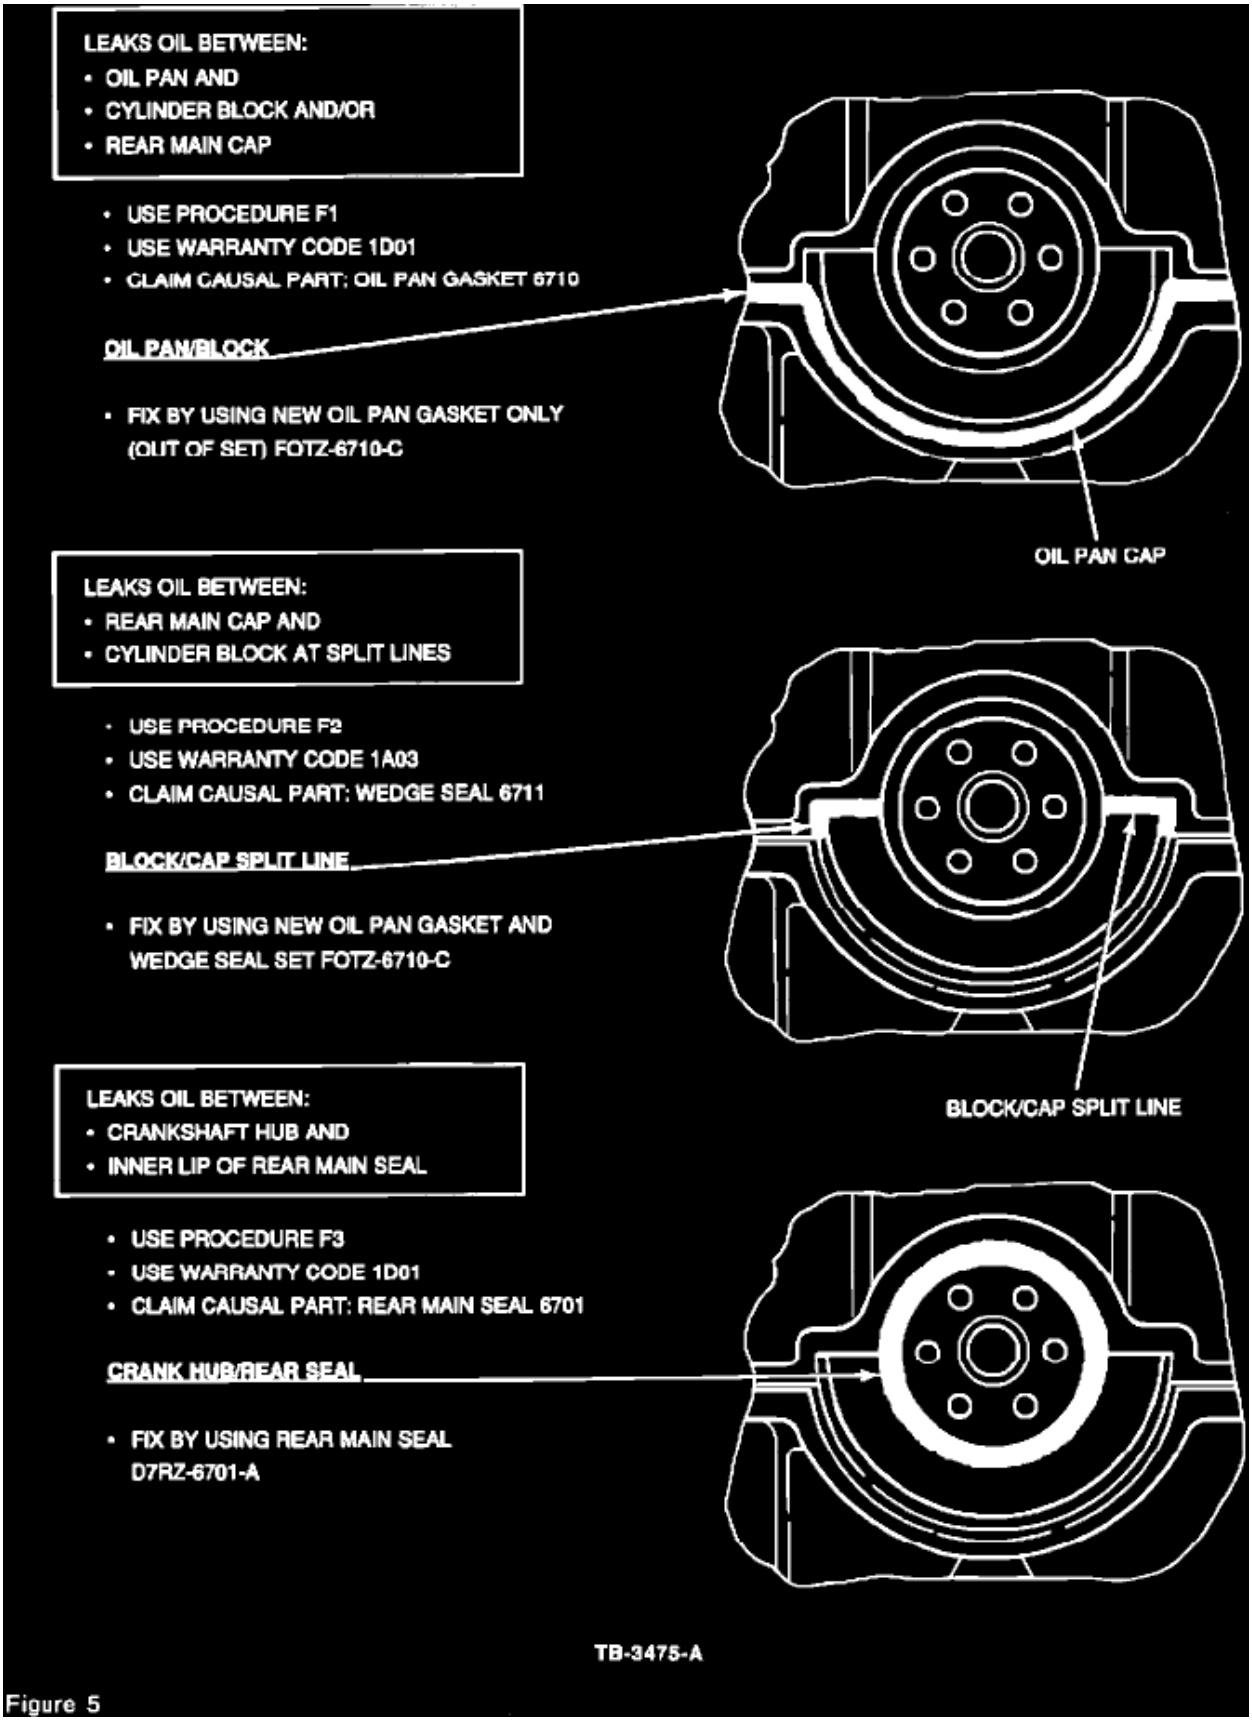

Figure 5

^ If bubbles are detected only at the oil pan gasket, between the oil pan and the cylinder block, or between the oil pan and the rear main cap, only the oil pan gasket needs replacing. Note

Procedure A, Figure 2, Step A3/F1, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A1.

^ If bubbles are detected between the rear main cap and the cylinder block, the rear cap must be removed and resealed. Note Procedure A, Figure 2, Step A3/F2, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A2.

^ If bubbles are detected between the rear seal lip and crank hub, a new rear oil seal will be required. Under certain circumstances, as outlined in the block diagram, it will be necessary to call the 4.OL Hotline. Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A3.

^ If no bubbles are detected, but oil is present in the area between the crank hub and the lip of the rear seal, carefully remove the seal and inspect the crankshaft rear seal journal. (A leak may occur

at the rear seal only when the engine is running.) Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Follow repair procedures outlined on the block diagram.

NOTE:

ANY APPEARANCE OF RUST, PITTING, POROSITY, OR NICKS ON THE REAR SEAL JOURNAL WILL CAUSE A LEAK.

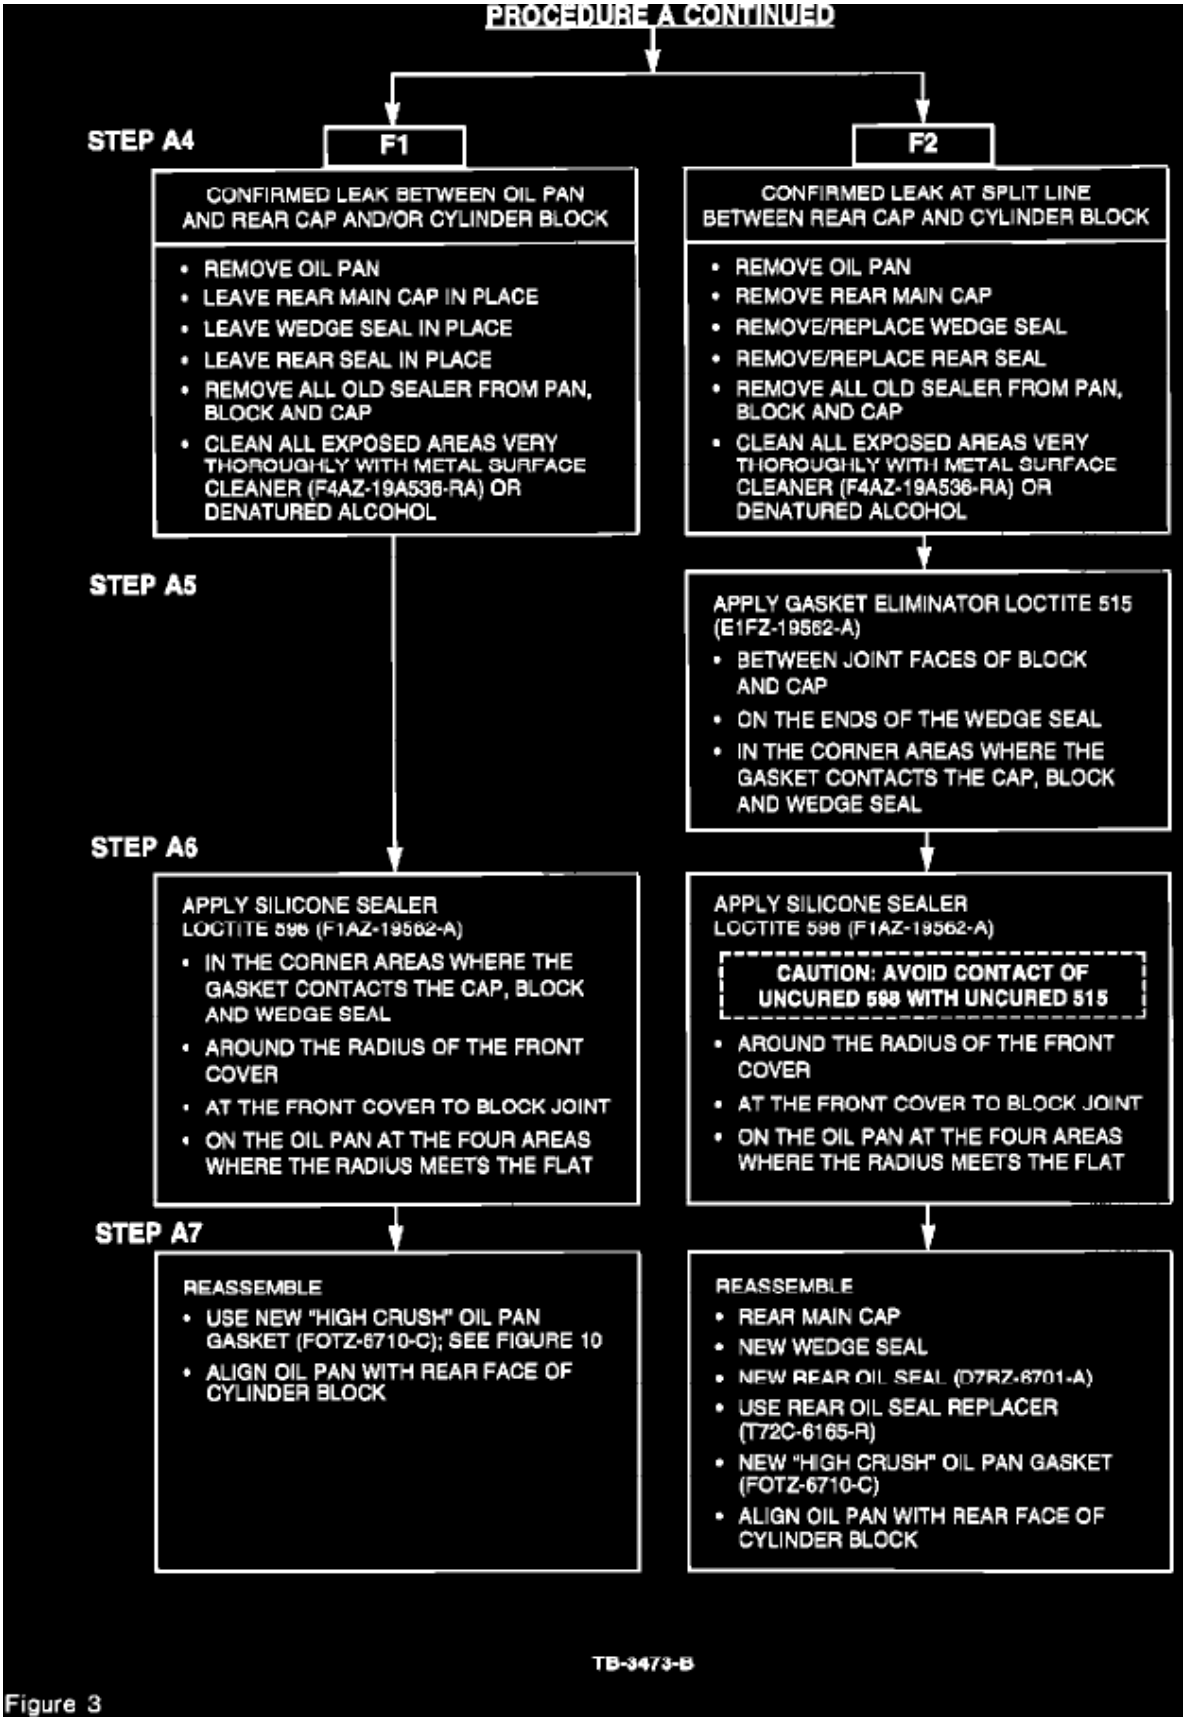
^ If bubbles are detected at the front or rear of the intake manifold gasket, a new intake manifold gasket (FOTZ-9439-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT INTAKE MANIFOLD, PROCEDURE B.

^ If bubbles are detected at the rocker cover rails, new rocker cover gaskets (F3TZ-6584-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT ROCKER COVER RAILS, PROCEDURE C.

^ If bubbles are detected at the front end of the engine, a new front seal (E6TZ-6700-A) or oil pan gasket (FOTZ-6710-C) will be required. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT THE FRONT END, PROCEDURE D.

Service Procedure - Repair

REAR END OIL LEAK - PROCEDURE A



PROCEDURE A CONTINUED
STEP A4
F1
CONFIRMED LEAK BETWEEN OIL PAN AND REAR CAP AND/OR CYLINDER BLOCK
• REMOVE OIL PAN
• LEAVE REAR MAIN CAP IN PLACE
• LEAVE WEDGE SEAL IN PLACE
• LEAVE REAR SEAL IN PLACE
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
F2
CONFIRMED LEAK AT SPLIT LINE BETWEEN REAR CAP AND CYLINDER BLOCK
• REMOVE OIL PAN
• REMOVE REAR MAIN CAP
• REMOVE/REPLACE WEDGE SEAL
• REMOVE/REPLACE REAR SEAL
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
STEP A5
APPLY GASKET ELIMINATOR LOCTITE 515 (E1FZ-19562-A)
• BETWEEN JOINT FACES OF BLOCK AND CAP
• ON THE ENDS OF THE WEDGE SEAL
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
STEP A6
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
CAUTION: AVOID CONTACT OF UNCURED 598 WITH UNCURED 515
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
STEP A7
REASSEMBLE
• USE NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C); SEE FIGURE 10
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
REASSEMBLE
• REAR MAIN CAP
• NEW WEDGE SEAL
• NEW REAR OIL SEAL (D7RZ-6701-A)
• USE REAR OIL SEAL REPLACER (T72C-6165-R)
• NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C)
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
TB-3473-B
Figure 3

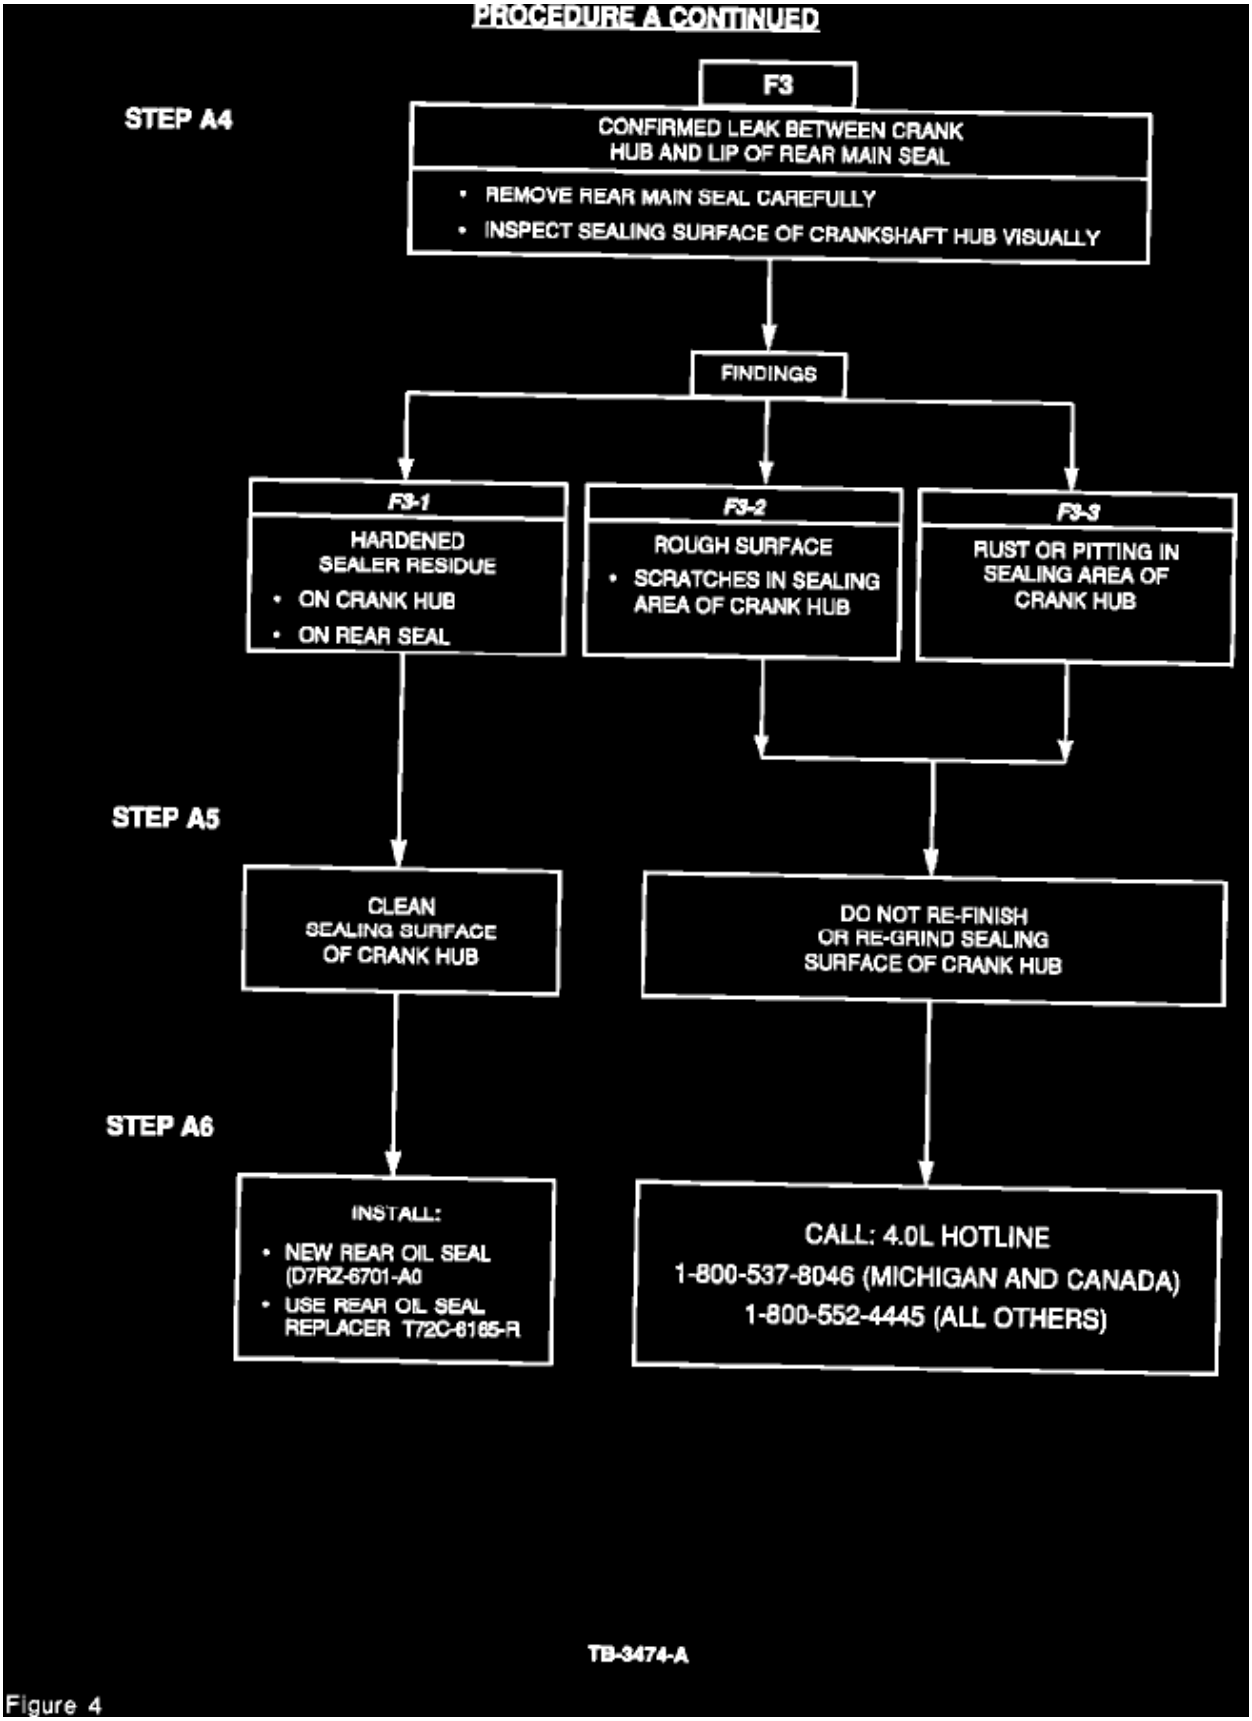


Figure 4

1. Repair procedure for a leak at oil pan gasket between the oil pan and cylinder block, or between the oil pan and the rear main cap. See block diagram Procedure A, Step A4/F1, Figures 3 and 4.

a. Remove the oil pan from the engine and remove the old gasket from the oil pan. Do not remove the rear main cap or wedge seal from the engine.

b. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

c. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap. Take special care to scrape/scratch all the old sealer from the exposed areas of the rear cap, wedge seal and cylinder block. This is a critical sealing area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER BLOCK.

d. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

e. Clean the transmission "BELLHOUSING" area, the rear of the cylinder block and the rear engine plate of ALL oil residue.

f. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corner of the radius areas at the front and rear of the oil pan.

g. Place the oil pan gasket (FOTZ-6710-C) in place in the groove in the oil pan.

h. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the corners where the rear main cap meets the cylinder block, at the corner areas of the radius area on the front cover and the front cover to cylinder block joint.

i. Set the oil pan in place and snug the four (4) pan nuts.

j. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .0100" (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

k. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

2. Repair procedure for a leak between the rear main cap and the cylinder block. See block diagram Procedure A, Step A4/F2.

a. Remove the oil pan, windage tray, oil pump and rear main cap from the engine.

b. Remove the rear main oil seal from the crankshaft and thoroughly inspect the main seal journal of the crankshaft for signs of rust, pitting, nicks or porosity.

c. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

d. Clean ALL the old sealer from the rear main bearing cap USING A SCRAPER AND WIRE WHEEL. The original Loctite sealer used during production assembly becomes extremely hard after it has cured. It is extremely important that ALL the old sealer be removed from the joint faces and grooves.

e. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap joint area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER

BLOCK.

f. Clean ALL the oil and old sealer from the "WEDGE SEAL" that fits around the rear main bearing cap in the oil pan gasket groove. Preferably use a new "WEDGE SEAL".

g. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

h. Clean the transmission "BELLHOUSING AREA", the rear of the cylinder block and the rear engine plate of ALL oil residue.

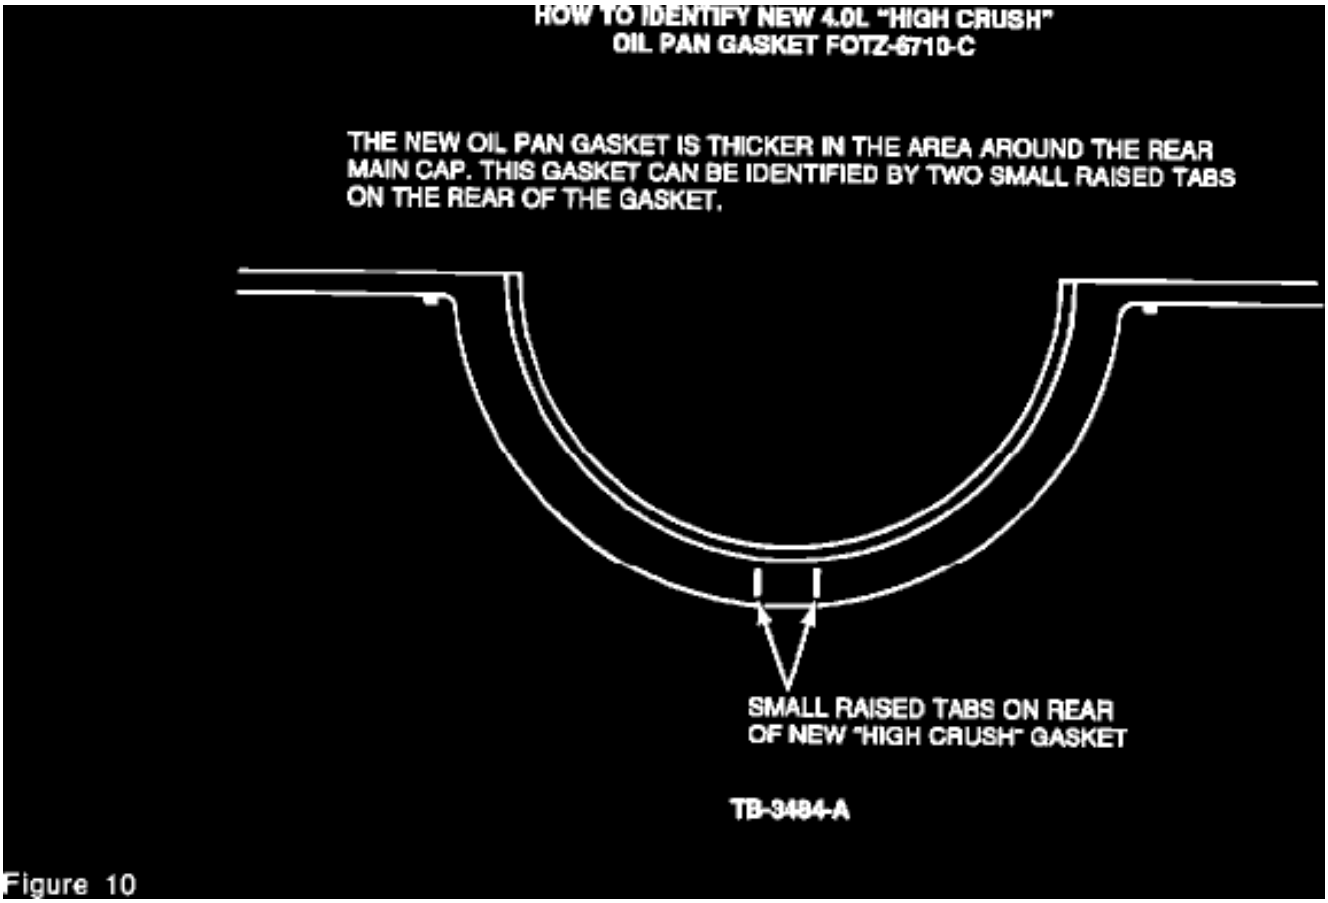

Figure 10

i. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) on the cylinder block along the corners of the rear main bearing cap joint area and on the joint face, approximately 1/2 inch (12.7 mm) from the rear of the block.

j. Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.

k. Align the rear main bearing cap to cylinder block by moving the bearing fore or aft (approx. 1/2 inch (12.7 mm) inward in the rear oil seal bore) so that the rear seal stop of the block and cap line up. This will assure that the rear main oil seal will seat squarely when installed in the bore.

l. Torque the rear main cap bolts to 66-77 lb.ft. (90-104 N-m).

m. Fill the cavities for the "WEDGE SEAL" on both sides of the rear main cap with Ford Gasket Eliminator (E1FZ-19562-A).

n. Place "WEDGE SEAL" in place and use a flat bladed screwdriver to fully seat the "WEDGE SEAL", forcing the excessive sealer out.

o. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) in the corners of the oil pan gasket groove of the rear main cap where the cap meets the cylinder block.

p. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) at the corner areas of the radius area on the front cover and at the front cover to cylinder block joint.

q. Reinstall the oil pump and windage tray. Torque to 13-15 lb.ft. (17-21 N-m).

r. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corners of the radius areas at the front and rear of the oil pan.

s. Place the oil pan gasket (FOTZ-6710-C), Figure 10, in place in the groove in the oil pan.

t. Set the oil pan in place and snug the four (4) oil pan bolts.

u. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .01000 (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

v. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

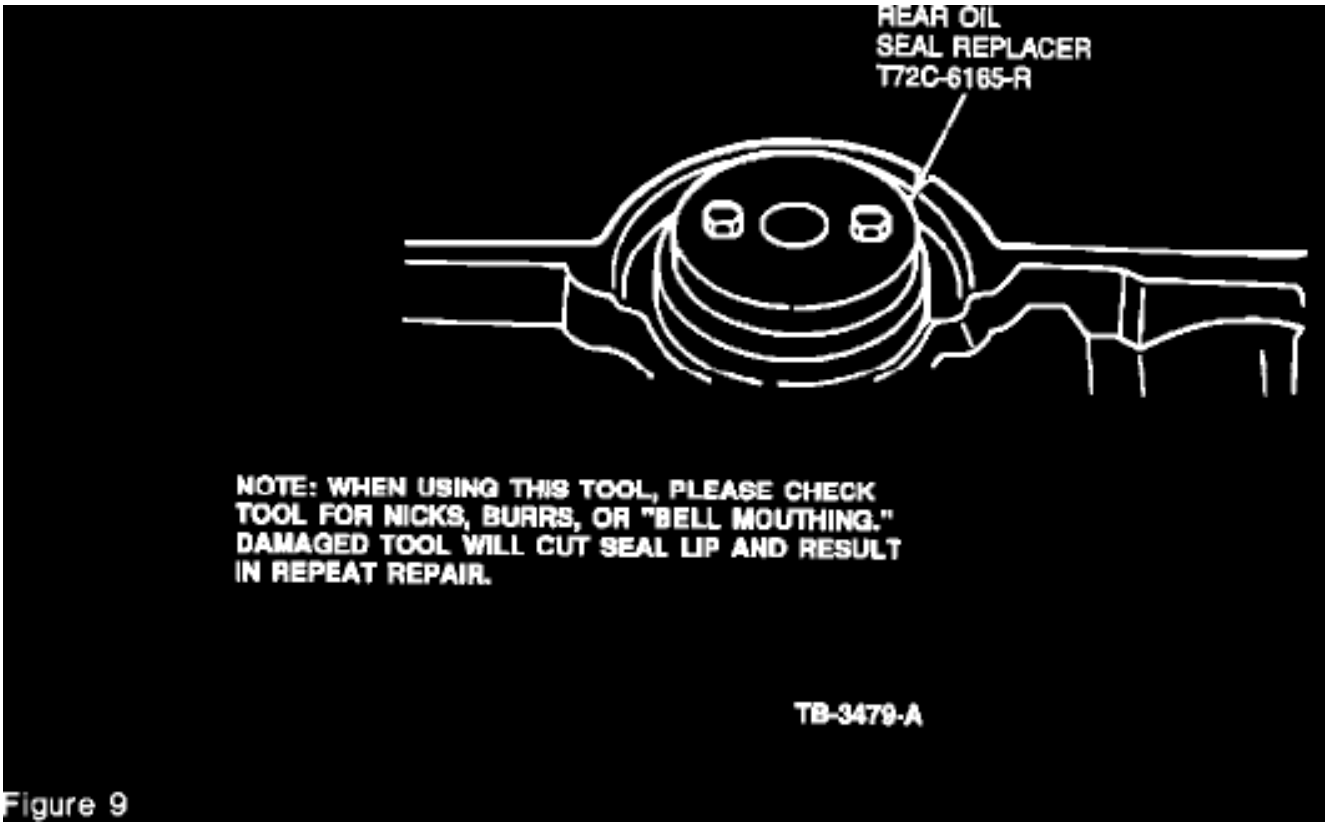

Figure 9

w. Coat the rear main oil seal (D7RZ-6701-A) with oil. Install the rear seal in the seal bore using Rear Oil Seal Replacer T72C-6165-R. This tool uses two flywheel bolts to draw the seal into position. Refer to Figure 9.

CAUTION:

DO NOT USE THE OLD STYLE HAMMER OPERATED TOOL.

3. Repair procedure for a leak between the rear main seal and the crankshaft. See block diagram, Procedure A, Step A4/F3.

a. Any presence of rust on the rear seal journal will cause a leak.

b. Any presence of pitting, porosity or nicks on the rear seal journal will cause a leak.

NOTE:

IF A LEAK IS PRESENT BETWEEN THE REAR MAIN SEAL AND CRANKSHAFT, PLEASE NOTIFY THE 4.0L "HOTLINE" AT (800) 537-8046 OR (800) 552-4445 PRIOR TO ANY ATTEMPT TO REPAIR THIS CONDITION.

Service Procedure - Repair For Oil Leaks At Intake Manifold

PROCEDURE B

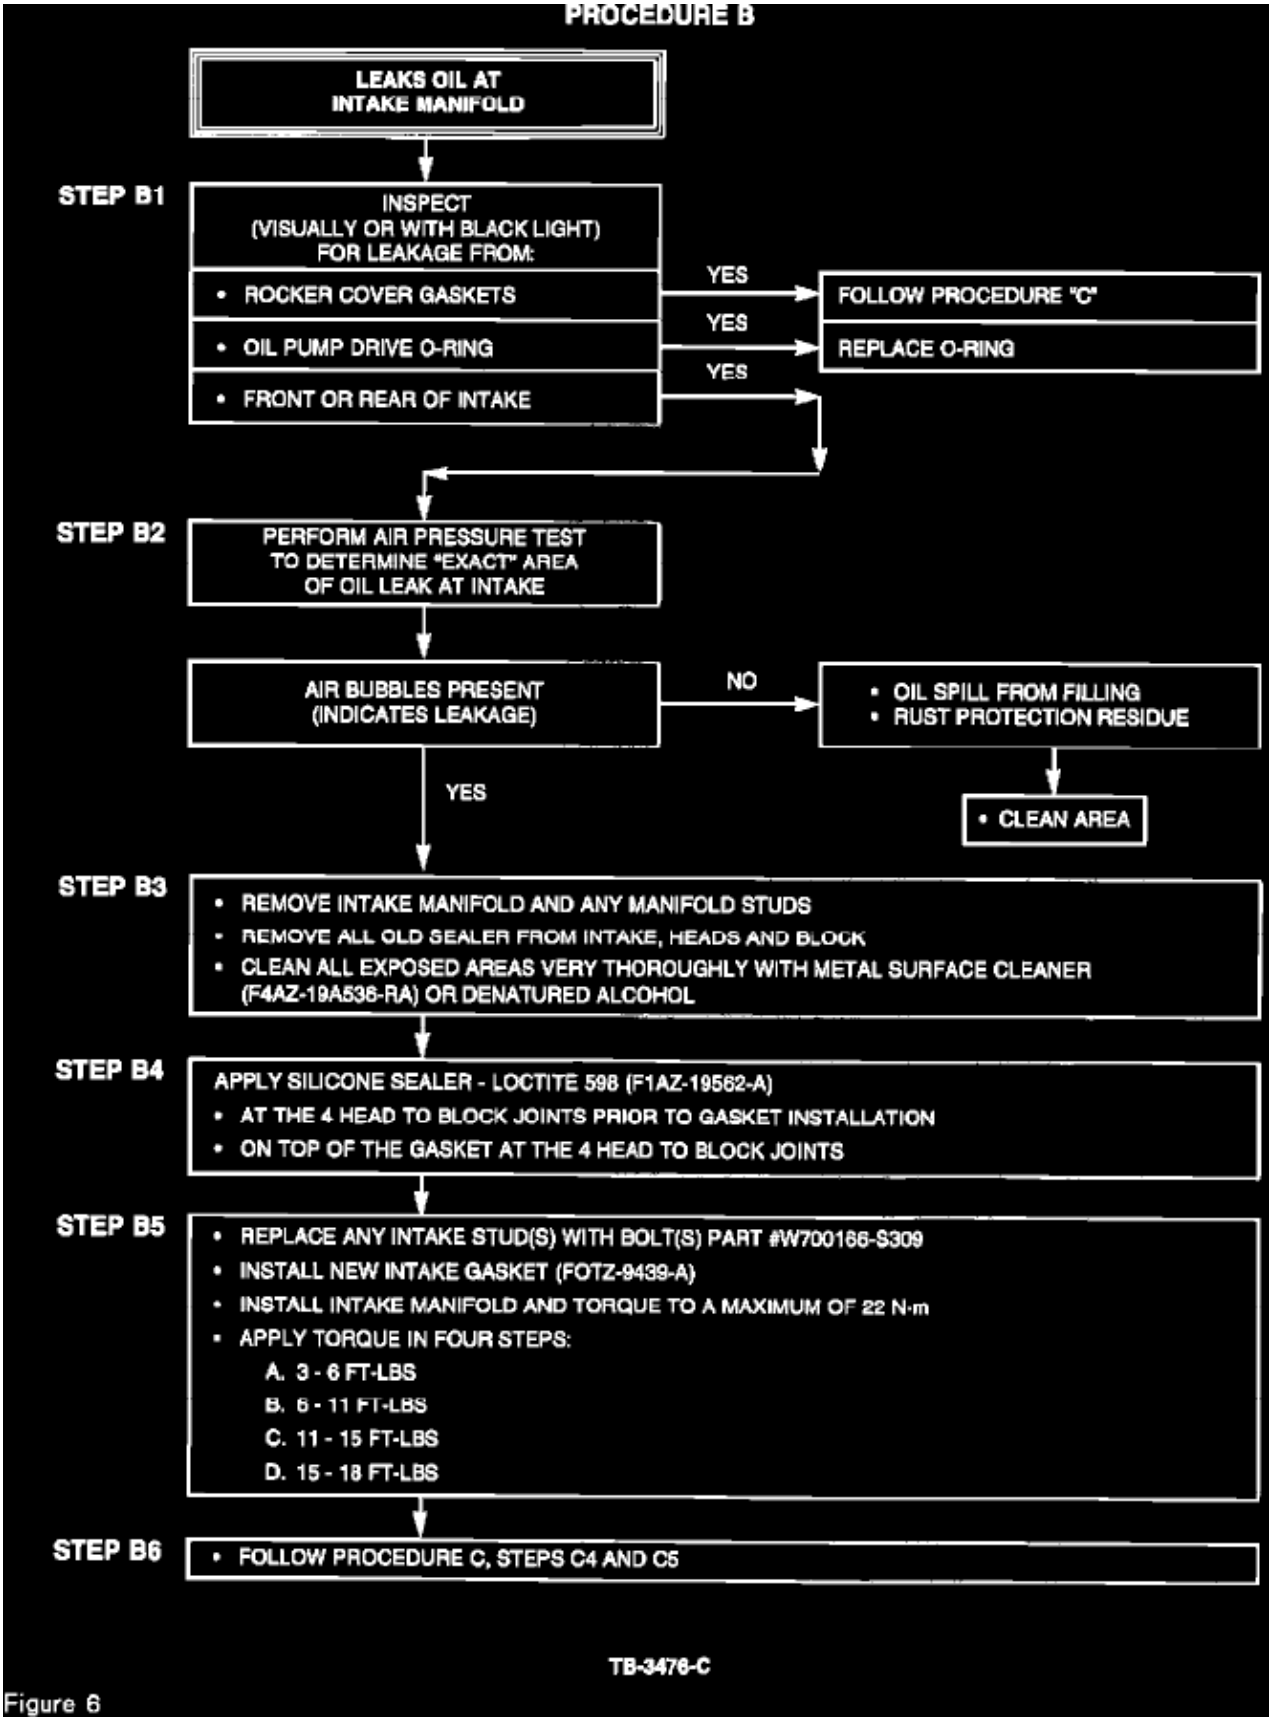

Figure 6

1. If the air pressure test showed no air bubbles, follow Procedure B2 to clean area of oil spill or other contamination.

2. If the air pressure test showed air bubbles present, follow Steps B3 through B6. Refer also to the Service Manual for the applicable year for further information pertinent to removal and installation of the intake manifold.

Service Procedure - Repair For Oil Leaks At Rocker Cover Rails

PROCEDURE C

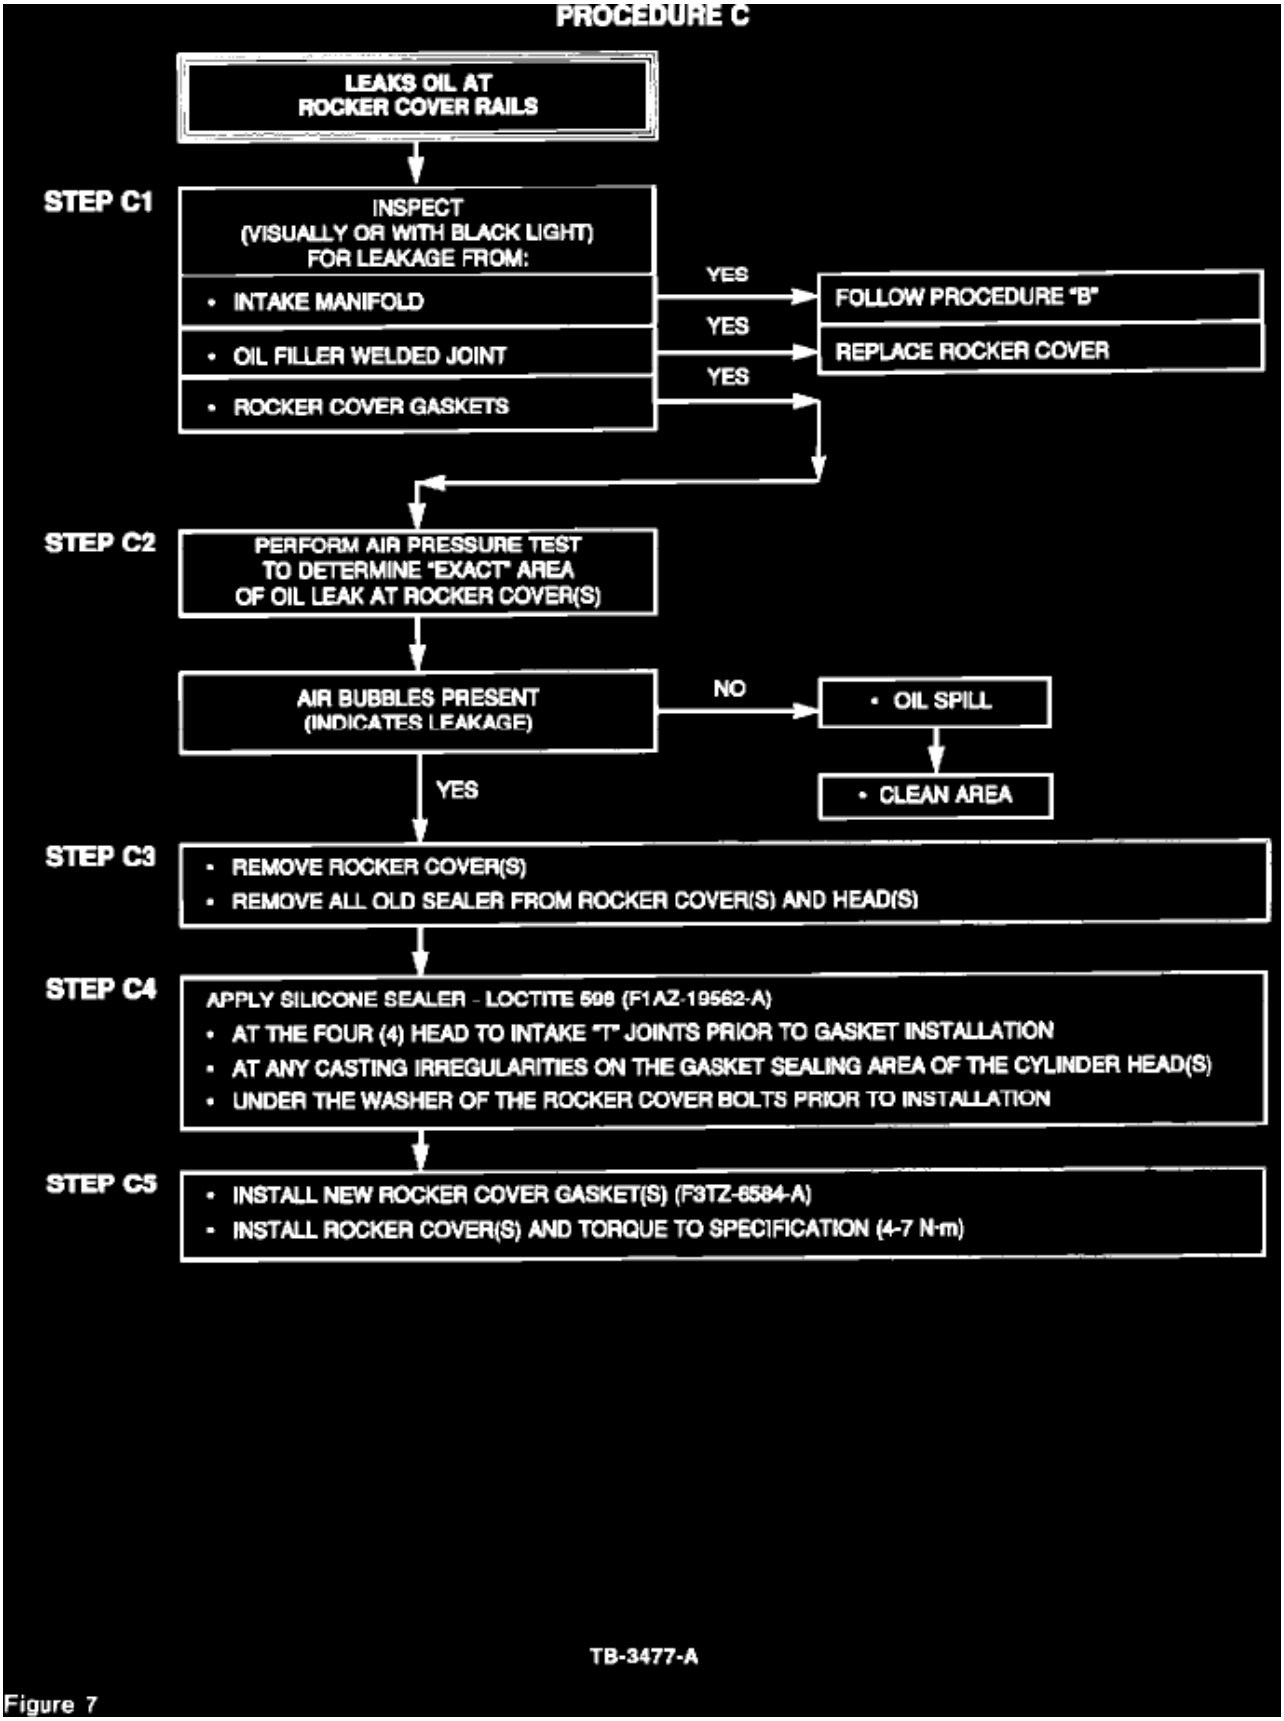

Figure 7

1. If the air pressure test showed no air bubbles, follow Procedure C2 to clean the area of any oil spill.

2. If the air pressure test showed air bubbles present, follow Steps C3 through C5.

Service Procedure - Repair For Oil Leaks At Front End

PROCEDURE D

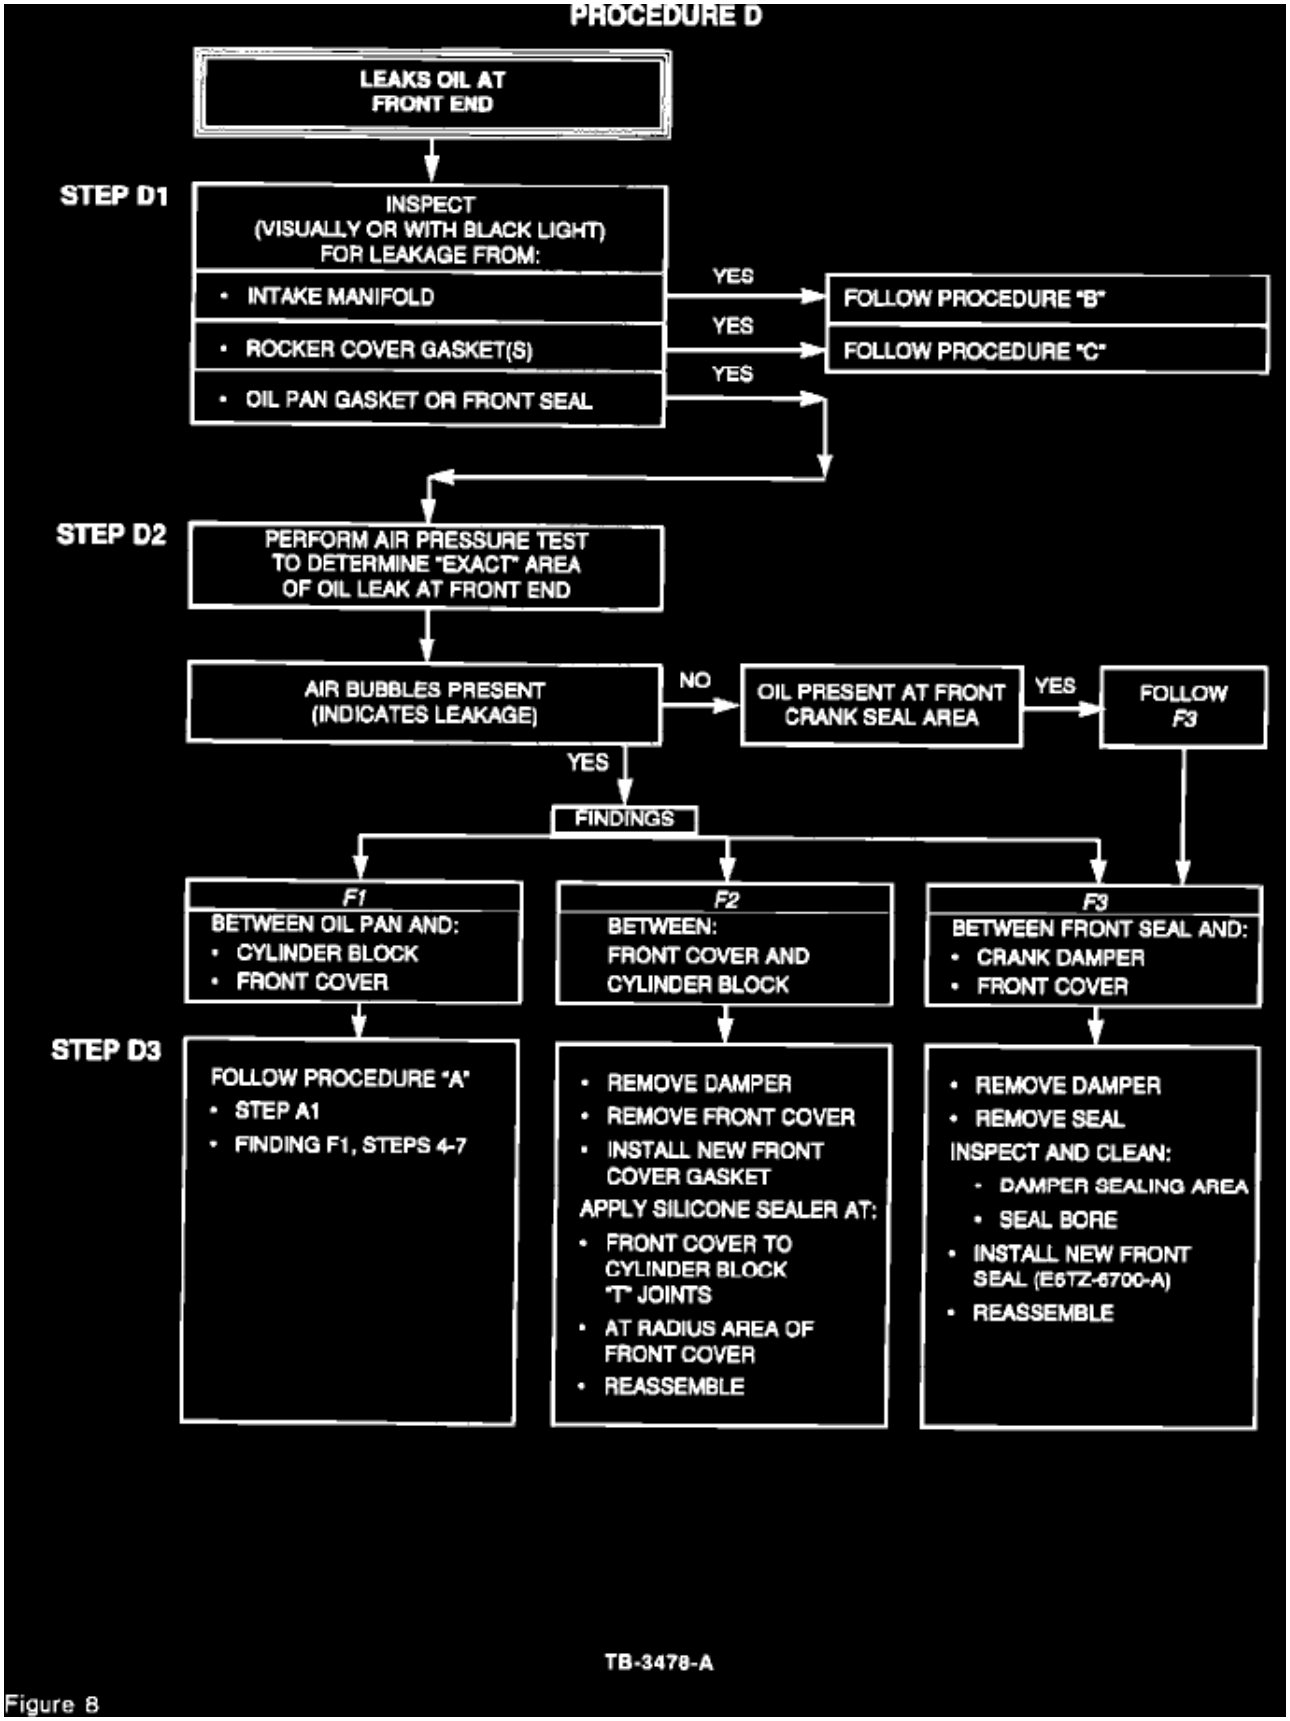

Figure 8

1. If the air pressure test showed no air bubbles, follow Procedure D, F3.

2. If the air pressure test showed air bubbles present, follow Procedure D, F1 or F2 as appropriate.

REMOVAL AND INSTALLATION (Continued)

Valve Rocker Arm Cover and Rocker Arm

Removal

1. Remove spark plug wires using Spark Plug Wire Remover T74P-6666-A or equivalent.
2. Disconnect fuel supply and return lines using Spring Lock Coupling Disconnect Tool T81P-19623-G2, or equivalent and position out of way. Install white "Tell-Tale" rings in male connector to ensure positive indication of proper mating when re-assembling.

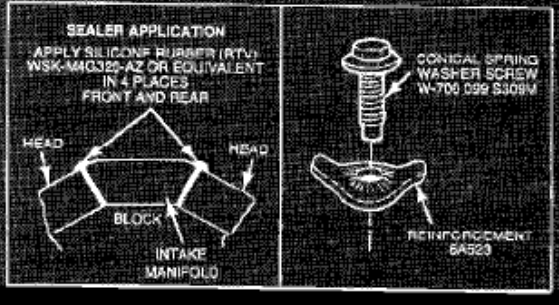
NOTE: Air conditioned vehicles only: Remove dipstick tube and bracket to access LH lifting eye. Remove LH lifting eye.

3. Remove PCV valve hose and breather.
4. Remove rocker arm cover attaching screws and load distribution washers (patch pieces). Ensure the washers are installed in their original position.
5. With a light plastic hammer, tap rocker arm covers to break seal.
6. Remove rocker covers.
7. Remove rocker arm shaft stand attaching bolts by loosening the bolts two turns at a time, in sequence. Lift off rocker arm and shaft assembly and oil baffle.

Removing or Installing Rocker Arm Assembly

Installation

1. Loosen the valve lash adjusting screws a few turns.
2. Apply SF-type engine oil to the assembly to provide initial lubrication.
3. Apply oil baffle and rocker arm shaft assembly to the cylinder head. Guide adjusting screws onto push rods.
4. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
5. Adjust valve lash. Refer to Valve Clearance.
6. Clean all gasket material from cylinder heads, intake manifolds and rocker arm cover gasket surfaces.
7. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head/intake manifold.



REMOVAL AND INSTALLATION (Continued)

8. Install rocker arm covers with new gaskets.
9. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
10. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part # W 700 099 S309M.
11. Tighten screws to a torque of 4.5-5.9 ft. lb. (6-8 N·m).
12. Connect kickdown linkage (automatic transmission only).
13. After ensuring all rocker arm cover load distribution washers (patch pieces) are installed in their original position, tighten rocker arm cover screws to specification.
14. Install spark plug wires.
15. Install PCV valve hose and breather.
16. Position Thermactor air hose and wiring harness in their original places.
17. Connect fuel supply and return lines to fuel rail, ensuring connectors are properly mated by observing white "Tell-Tale" rings displayed when connected.
18. Start engine and check for oil and fuel leaks.

Valve Spring, Retainer and Stem Seal

Broken valve springs or leaking valve stem seals and retainer may be replaced without removing the cylinder head provided damage to the valve or valve seat has not occurred.

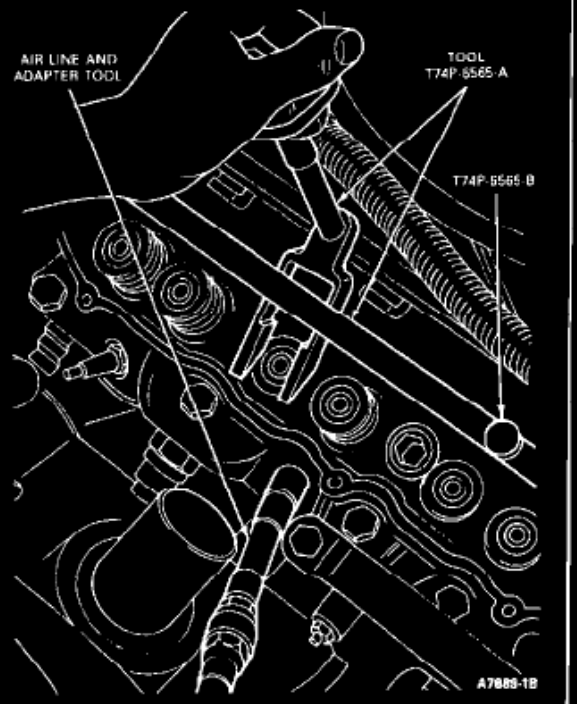
Removal

1. Remove the valve rocker arm cover and valve rocker arm shaft as described under Valve Rocker Arm Cover and Rocker Arm. Remove the applicable spark plug wire and spark plug.
2. Remove both valve push rods of the cylinder to be serviced.
3. Install an air line with an adapter in the spark plug hole.
4. Turn on the air supply. **Air pressure may turn the crankshaft until the piston reaches the bottom of the stroke.**

CAUTION: Engine may turn over when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc.).

Using the Valve Spring Compressor Lever T86P-6565-A and Valve Spring Compressor Bar T74P-6565-B or equivalents, compress the valve spring and remove the valve spring retainer locks, spring retainer and the valve spring. **If air pressure fails to hold the valve in the closed position during this operation, it can be presumed that the valve is not seating or is damaged. If this condition occurs, remove the cylinder head for further inspection.**

Compressing Valve Spring-In Chassis—Typical

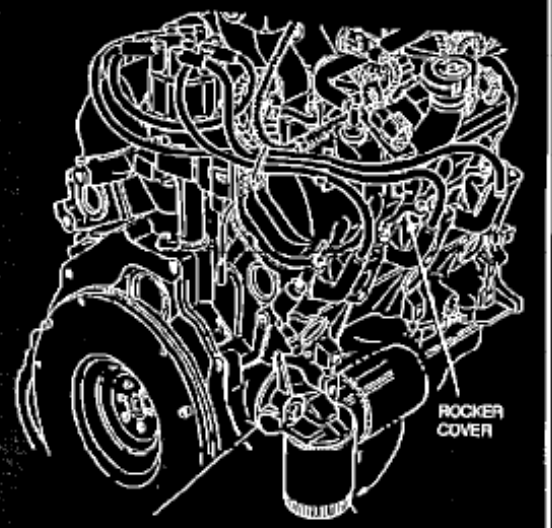


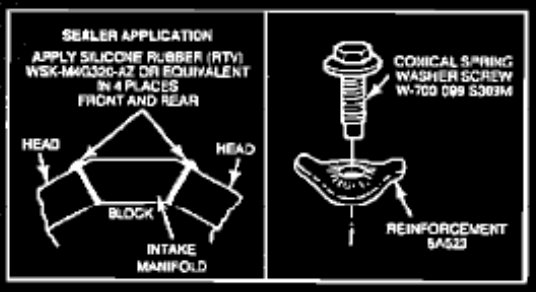
REMOVAL AND INSTALLATION (Continued)

Removing or Installing Rocker Arm Assembly

Installation

1. Loosen the valve lash adjusting screws a few turns.
2. Apply SF-type engine oil to the assembly to provide initial lubrication.
3. Apply oil baffle and rocker arm shaft assembly to the cylinder head. Guide adjusting screws onto push rods.
4. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
5. Adjust valve lash. Refer to Valve Clearance.
6. Clean all gasket material from cylinder heads, intake manifolds and rocker arm cover gasket surfaces.
7. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head/intake manifold.





8. Install rocker arm covers with new gaskets.
9. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
10. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part # W-700 099 S309M.
11. Tighten screws to a torque of 4.5-5.9 ft. lb. (6-8 N·m).
12. Connect kickdown linkage (automatic transmission only).
13. After ensuring all rocker arm cover load distribution washers (patch pieces) are installed in their original position, tighten rocker arm cover screws to specification.
14. Install spark plug wires.
15. Install PCV valve hose and breather.
16. Position Thermactor air hose and wiring harness in their original places.
17. Connect fuel supply and return lines to fuel rail, ensuring connectors are properly mated by observing white "Tell-Tale" rings displayed when connected.
18. Start engine and check for oil and fuel leaks.

Valve Spring, Retainer and Stem Seal

Broken valve springs or leaking valve stem seals and retainer may be replaced without removing the cylinder head provided damage to the valve or valve seat has not occurred.

Removal

1. Remove the valve rocker arm cover and valve rocker arm shaft as described under Valve Rocker Arm Cover and Rocker Arm. Remove the applicable spark plug wire and spark plug.
2. Remove both valve push rods of the cylinder to be serviced.
3. Install an air line with an adapter in the spark plug hole.
4. Turn on the air supply. **Air pressure may turn the crankshaft until the piston reaches the bottom of the stroke.**

CAUTION: Engine may turn over when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc.).

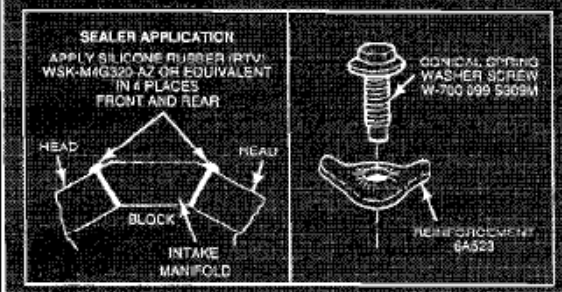
Using the Valve Spring Compressor Lever T86P-6565-A and Valve Spring Compressor Bar T74P-6565-B or equivalents, compress the valve spring and remove the valve spring retainer locks, spring retainer and the valve spring. **If air pressure fails to hold the valve in the closed position during this operation, it can be presumed that the valve is not seating or is damaged. If this condition occurs, remove the cylinder head for further inspection.**

REMOVAL AND INSTALLATION (Continued)

Removing or Installing Rocker Arm Assembly

Installation

1. Loosen the valve lash adjusting screws a few turns.
2. Apply SF-type engine oil to the assembly to provide initial lubrication.
3. Apply oil baffle and rocker arm shaft assembly to the cylinder head. Guide adjusting screws onto push rods.
4. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
5. Adjust valve lash. Refer to Valve Clearance.
6. Clean all gasket material from cylinder heads, intake manifolds and rocker arm cover gasket surfaces.
7. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head/intake manifold.



8. Install rocker arm covers with new gaskets.
9. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
10. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit), Part # W-700 099 S309M.
11. Tighten screws to a torque of 6-8 N·m (4.5-5.9 LB-FT).
12. Connect kickdown linkage (automatic transmission only).
13. After ensuring all rocker arm cover load distribution washers (patch pieces) are installed in their original position, tighten rocker arm cover screws to specification.
14. Install spark plug wires.
15. Install PCV valve hose and breather.
16. Connect the fuel supply quick connect redundant clip over the fuel supply connection. Tighten the fuel return connection specification using care to avoid bending the fuel rail.
17. Start engine and check for oil and fuel leaks.

Valve Spring, Retainer and Stem Seal

Broken valve springs or leaking valve stem seals and retainer may be replaced without removing the cylinder head provided damage to the valve or valve seat has not occurred.

Removal

1. Remove the valve rocker arm cover and valve rocker arm shaft as described under Valve Rocker Arm Cover and Rocker Arm. Remove the applicable spark plug wire and spark plug.
2. Remove both valve push rods of the cylinder to be serviced.
3. Install an air line with an adapter in the spark plug hole.
4. Turn on the air supply. **Air pressure may turn the crankshaft until the piston reaches the bottom of the stroke.**

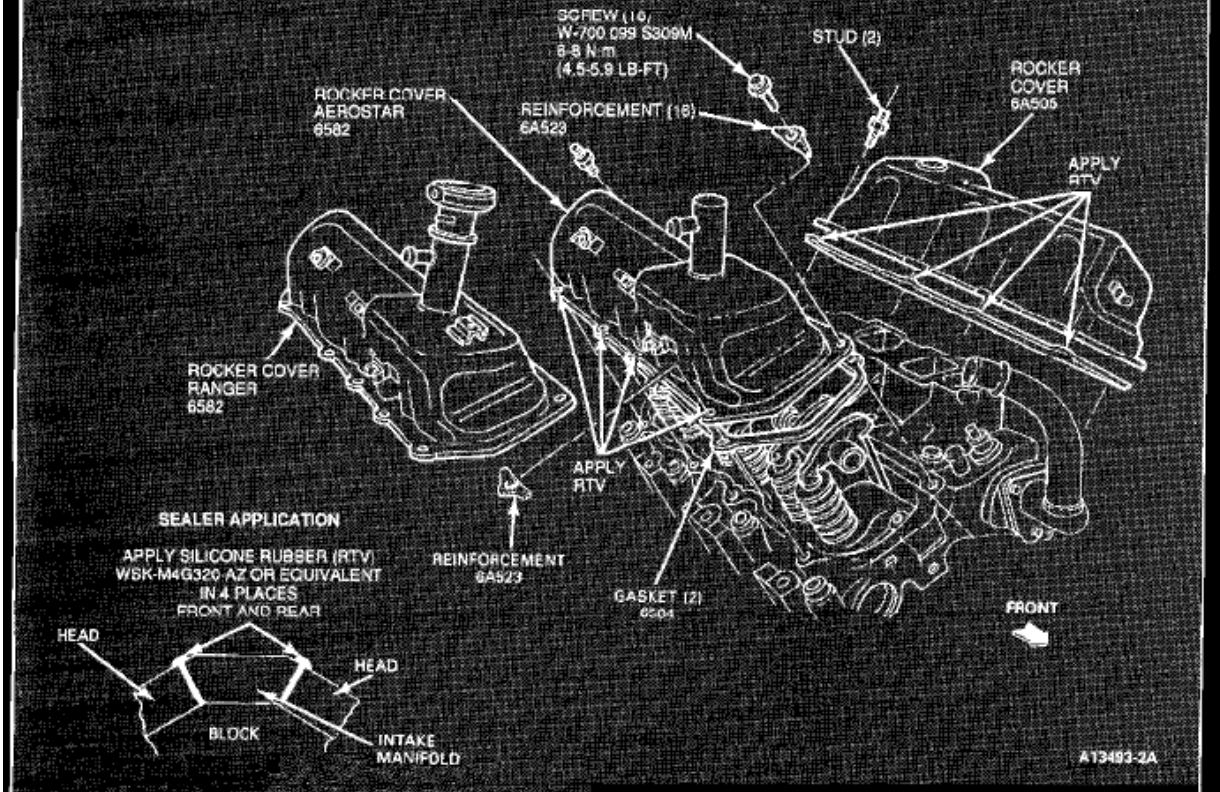
CAUTION: Engine may turn over when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc.).

Using the Valve Spring Compressor Lever T86L-6565-A and Valve Spring Compressor Bar T74P-6565-B or equivalents, compress the valve spring and remove the valve spring retainer locks, spring retainer and the valve spring. **If air pressure fails to hold the valve in the closed position during this operation, it can be presumed that the valve is not seating or is damaged. If this condition occurs, remove the cylinder head for further inspection.**

REMOVAL AND INSTALLATION (Continued)

Installation

1. Apply SF-type engine oil to the valve train assembly to provide initial lubrication.
2. Install rocker arm shaft assembly to the cylinder head. Guide the rocker arms onto push rods.
3. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
4. Clean all gasket material from cylinder heads, intake manifolds, and rocker arm cover gasket surfaces.
5. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head/intake manifold.
6. Install rocker arm covers with new gaskets.
7. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
8. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part #W-700 099 S309M.



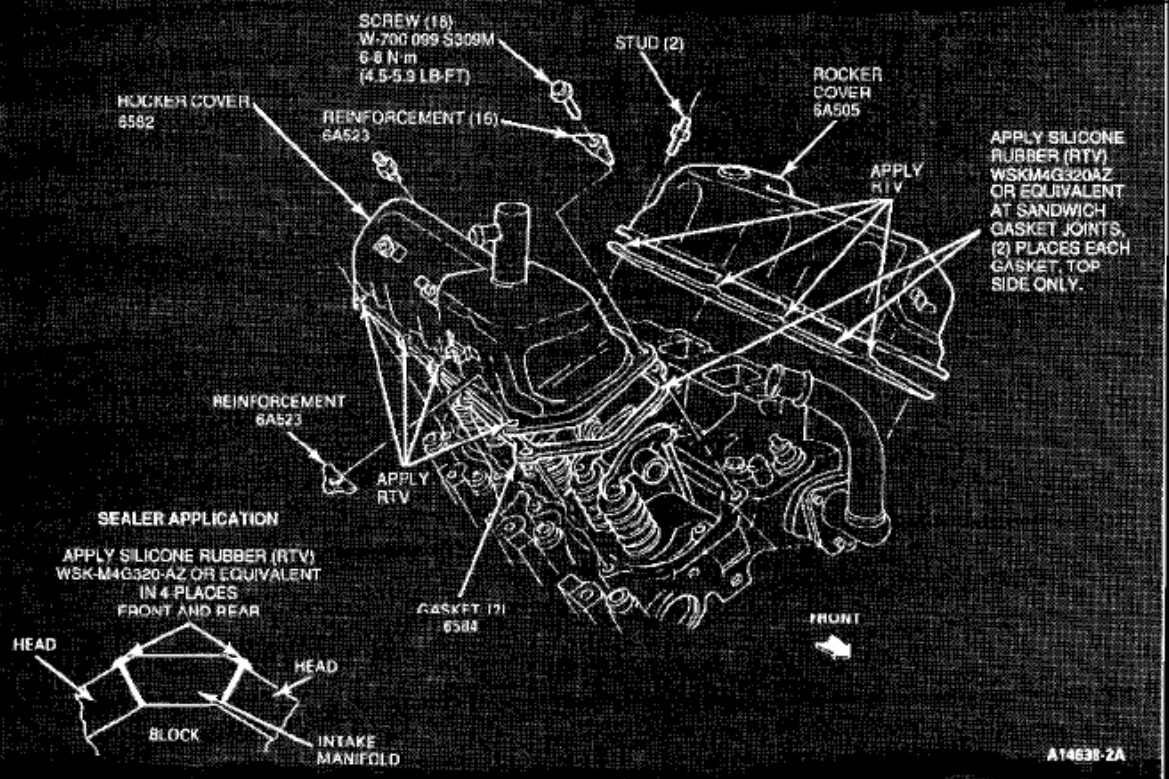
CAUTION: Failure to install a new rocker cover gasket and rocker cover reinforcement pieces will result in oil leaks.

9. Tighten screws to a torque of 6-8 N·m (4.5-5.9 LB-FT).
10. Install upper intake manifold, if removed.
11. On RH side, install the D.I.S. ignition coil and bracket assembly.
12. On RH side, install vacuum hose to the air cleaner and A/C low pressure hose bracket.
13. On RH side, install the upper radiator hose and fill and bleed the cooling system. Refer to section 03-03, Engine Cooling.
14. On RH side, install the alternator and accessory drive belt. Check belt tension. Refer to Section 03-05, Accessory Drive for proper procedure.
15. On RH side, install air inlet duct and oil fill tube hose.
16. Install spark plug wires.
17. Install PCV valve hose and breather.
18. Connect fuel supply and return lines to fuel rail as outlined in Section 03-04D.
19. Start engine and check for oil and fuel leaks.

REMOVAL AND INSTALLATION (Continued)

Installation

1. Apply SF-type engine oil to the valve train assembly to provide initial lubrication.
2. Install rocker arm shaft assembly to the cylinder head. Guide the rocker arms onto push rods.
3. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
4. Clean all gasket material from cylinder heads, intake manifolds, and rocker arm cover gasket surfaces.
5. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T Joints of cylinder head/intake manifold.
6. Install rocker arm covers with new gaskets.
7. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
8. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part # W-700 099 S309M.

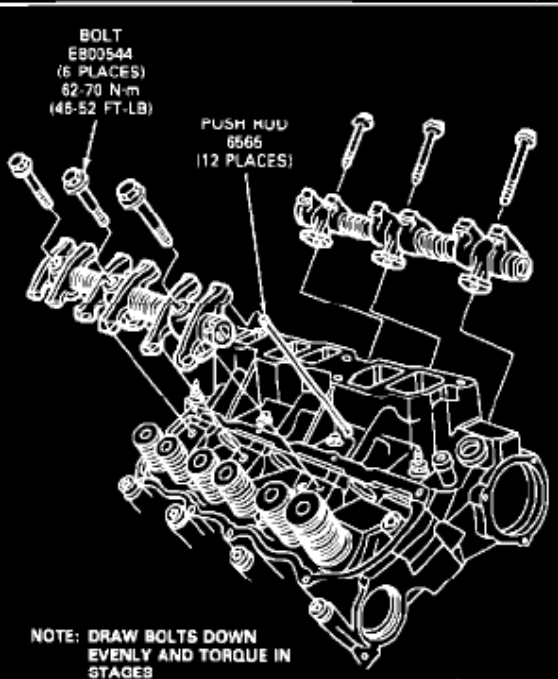


CAUTION: Failure to install a new rocker cover gasket and rocker cover reinforcement pieces will result in oil leaks.

9. Tighten screws to a torque of 6-8 N·m (4.5-5.9 LB-FT).
10. Install upper intake manifold, if removed.
11. On RH side, install the D.I.S. ignition coil and bracket assembly.
12. On RH side, install vacuum hose to the air cleaner and A/C low pressure hose bracket.
13. On RH side, install the upper radiator hose and fill and bleed the cooling system. Refer to section 03-03, Engine Cooling.
14. On RH side, install the alternator and accessory drive belt. Check belt tension. Refer to Section 03-05, Accessory Drive for proper procedure.
15. On RH side, install air inlet duct and oil fill tube hose.
16. Install spark plug wires.
17. Install PCV valve hose and breather.
18. Connect fuel supply and return lines to fuel rail as outlined in Section 03-04D.
19. Start engine and check for oil and fuel leaks.

IN VEHICLE SERVICE (Continued)

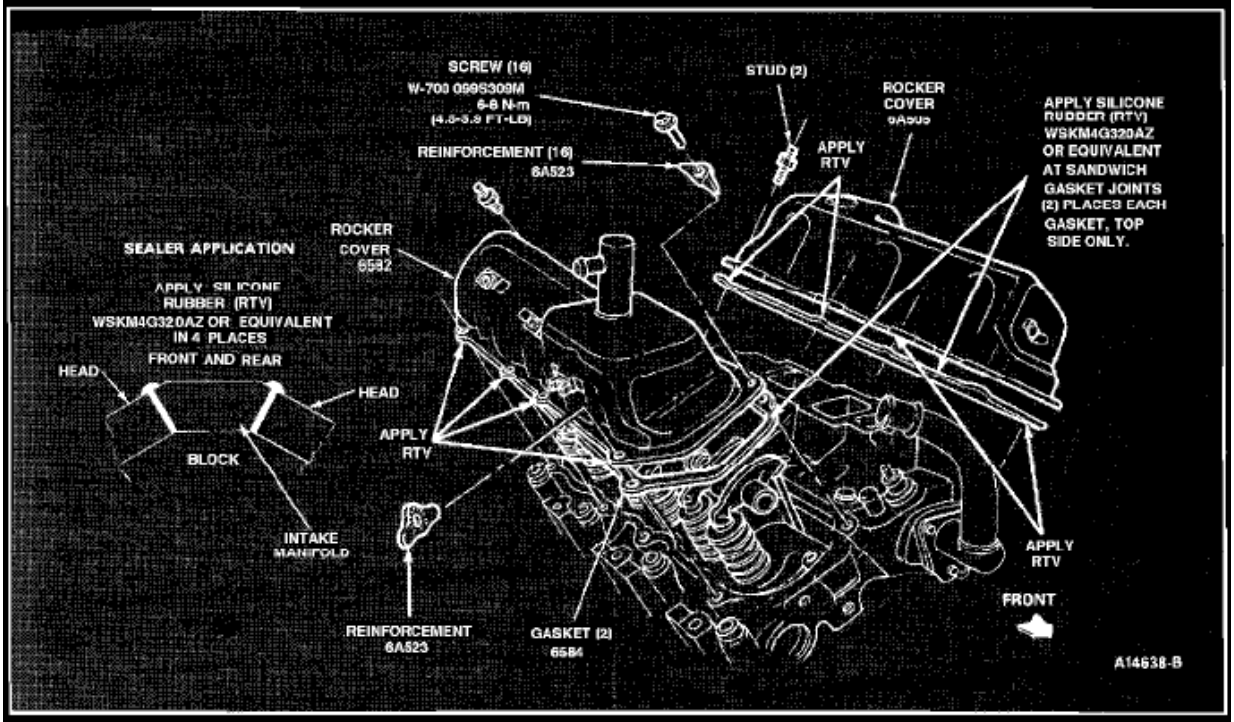
6. Remove the accessory drive belt from the alternator.
7. Remove the alternator from the engine.
8. Drain the cooling system.
9. Remove the upper radiator hose from the engine.
10. Remove the D.I.S. ignition coil and bracket assembly.
11. Remove the low pressure A/C hose bracket from the upper intake (if still installed).
12. Remove vacuum hose from the air cleaner.
13. Remove PCV valve hose and breather.
14. Remove rocker arm cover attaching screws and load distribution washers (patch pieces). Ensure the washers are installed in their original position.
15. With a light plastic hammer, tap rocker arm covers to break seal.
16. Remove rocker covers.
17. Remove rocker arm shaft stand attaching bolts by loosening the bolts two turns at a time, in sequence. Lift off rocker arm and shaft assembly.



Installation

1. Apply SF-type engine oil to the valve train assembly to provide initial lubrication.
2. Install rocker arm shaft assembly to the cylinder head. Guide the rocker arms onto push rods.
3. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
4. Clean all gasket material from cylinder heads, intake manifolds and rocker arm cover gasket surfaces.
5. Peel the plastic film from the gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head / intake manifold.
6. Install rocker arm covers with new gaskets.

IN VEHICLE SERVICE (Continued)



CAUTION: Failure to install a new rocker cover gasket and rocker cover reinforcement pieces will result in oil leaks.

7. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of rocker cover (4 holes each side).
8. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part # W-700-099-S309M.
9. Tighten screws to a torque of 6-8 N·m (4.5-5.9 ft. lb).
10. Install upper intake manifold, if removed.
11. On RH side, install the D.I.S. ignition coil and bracket assembly.
12. On RH side, install vacuum hose to the air cleaner and A / C low pressure hose bracket.
13. On RH side, install the upper radiator hose and fill and bleed the cooling system. Refer to Section 03-03, Engine Cooling.
14. On RH side, install the alternator and accessory drive belt. Check belt tension. Refer to Section 03-05, Accessory Drive for proper procedure.
15. On RH side, install air inlet duct and oil fill tube hose.
16. Install spark plug wires.
17. Install PCV valve hose and breather.
18. Connect fuel supply and return lines to fuel rail as outlined in Section 03-04D.
19. Start engine and check for oil and fuel leaks.

Valve Spring, Retainer and Stem Seal

Broken valve springs or leaking valve stem seals and retainer may be replaced without removing the cylinder head provided damage to the valve or valve seat has not occurred.

Removal

1. Remove the valve rocker arm cover and valve rocker arm shaft as described under Valve Rocker Arm Cover and Rocker Arm. Remove the applicable spark plug wire and spark plug.
2. Remove both valve push rods of the cylinder to be serviced.
3. Install an air line with an adapter in the spark plug hole.

   CAUTION: Engine may turn over when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc.).
4. Turn on the air supply. **Air pressure may turn the crankshaft until the piston reaches the bottom of the stroke.**

REMOVAL AND INSTALLATION (Continued)

Valve Rocker Arm Cover and Rocker Arm

Removal

1. Remove spark plug wires using Spark Plug Wire Remover T74P-6666-A or equivalent.
2. Disconnect fuel supply and return lines using Spring Lock Coupling Disconnect Tool T81P-19623-G2, or equivalent and position out of way. Install white "Tell-Tale" rings in male connector to ensure positive indication of proper mating when re-assembling.

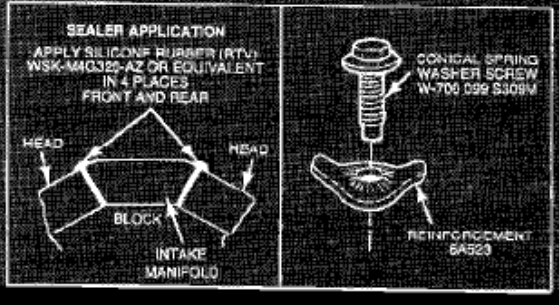
NOTE: Air conditioned vehicles only: Remove dipstick tube and bracket to access LH lifting eye. Remove LH lifting eye.

3. Remove PCV valve hose and breather.
4. Remove rocker arm cover attaching screws and load distribution washers (patch pieces). Ensure the washers are installed in their original position.
5. With a light plastic hammer, tap rocker arm covers to break seal.
6. Remove rocker covers.
7. Remove rocker arm shaft stand attaching bolts by loosening the bolts two turns at a time, in sequence. Lift off rocker arm and shaft assembly and oil baffle.

Removing or Installing Rocker Arm Assembly

Installation

1. Loosen the valve lash adjusting screws a few turns.
2. Apply SF-type engine oil to the assembly to provide initial lubrication.
3. Apply oil baffle and rocker arm shaft assembly to the cylinder head. Guide adjusting screws onto push rods.
4. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
5. Adjust valve lash. Refer to Valve Clearance.
6. Clean all gasket material from cylinder heads, intake manifolds and rocker arm cover gasket surfaces.
7. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head/intake manifold.



REMOVAL AND INSTALLATION (Continued)

8. Install rocker arm covers with new gaskets.
9. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
10. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part # W 700 099 S309M.
11. Tighten screws to a torque of 4.5-5.9 ft. lb. (6-8 N·m).
12. Connect kickdown linkage (automatic transmission only).
13. After ensuring all rocker arm cover load distribution washers (patch pieces) are installed in their original position, tighten rocker arm cover screws to specification.
14. Install spark plug wires.
15. Install PCV valve hose and breather.
16. Position Thermactor air hose and wiring harness in their original places.
17. Connect fuel supply and return lines to fuel rail, ensuring connectors are properly mated by observing white "Tell-Tale" rings displayed when connected.
18. Start engine and check for oil and fuel leaks.

Valve Spring, Retainer and Stem Seal

Broken valve springs or leaking valve stem seals and retainer may be replaced without removing the cylinder head provided damage to the valve or valve seat has not occurred.

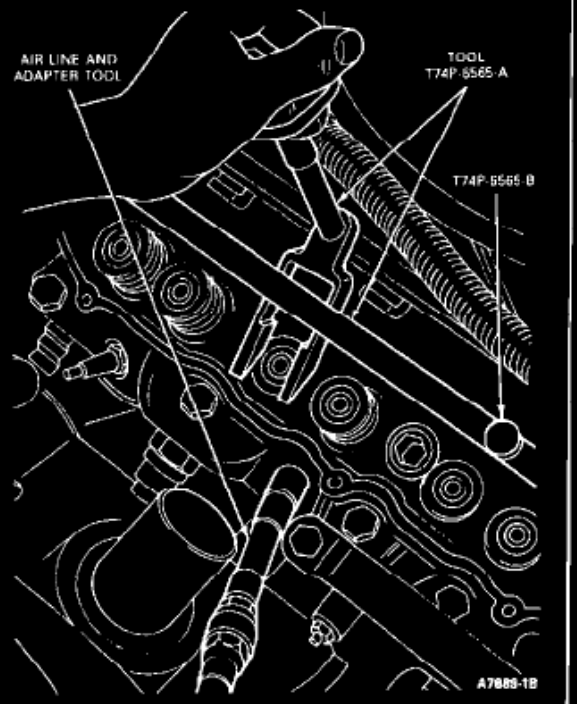
Removal

1. Remove the valve rocker arm cover and valve rocker arm shaft as described under Valve Rocker Arm Cover and Rocker Arm. Remove the applicable spark plug wire and spark plug.
2. Remove both valve push rods of the cylinder to be serviced.
3. Install an air line with an adapter in the spark plug hole.
4. Turn on the air supply. **Air pressure may turn the crankshaft until the piston reaches the bottom of the stroke.**

CAUTION: Engine may turn over when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc.).

Using the Valve Spring Compressor Lever T86P-6565-A and Valve Spring Compressor Bar T74P-6565-B or equivalents, compress the valve spring and remove the valve spring retainer locks, spring retainer and the valve spring. **If air pressure fails to hold the valve in the closed position during this operation, it can be presumed that the valve is not seating or is damaged. If this condition occurs, remove the cylinder head for further inspection.**

Compressing Valve Spring-In Chassis—Typical

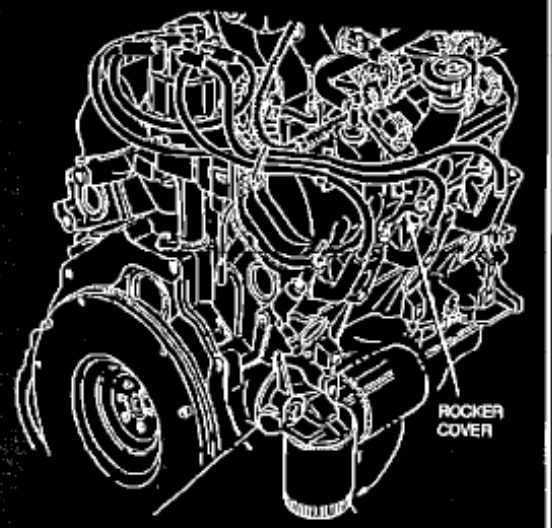


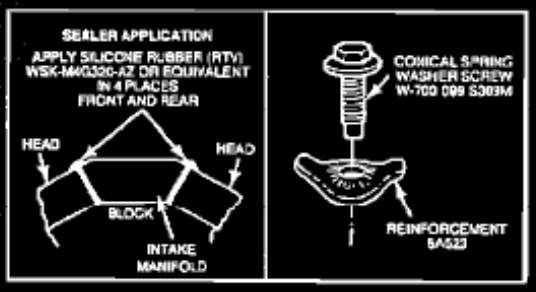
REMOVAL AND INSTALLATION (Continued)

Removing or Installing Rocker Arm Assembly

Installation

1. Loosen the valve lash adjusting screws a few turns.
2. Apply SF-type engine oil to the assembly to provide initial lubrication.
3. Apply oil baffle and rocker arm shaft assembly to the cylinder head. Guide adjusting screws onto push rods.
4. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
5. Adjust valve lash. Refer to Valve Clearance.
6. Clean all gasket material from cylinder heads, intake manifolds and rocker arm cover gasket surfaces.
7. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head/intake manifold.





8. Install rocker arm covers with new gaskets.
9. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
10. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part # W-700 099 S309M.
11. Tighten screws to a torque of 4.5-5.9 ft. lb. (6-8 N·m).
12. Connect kickdown linkage (automatic transmission only).
13. After ensuring all rocker arm cover load distribution washers (patch pieces) are installed in their original position, tighten rocker arm cover screws to specification.
14. Install spark plug wires.
15. Install PCV valve hose and breather.
16. Position Thermactor air hose and wiring harness in their original places.
17. Connect fuel supply and return lines to fuel rail, ensuring connectors are properly mated by observing white "Tell-Tale" rings displayed when connected.
18. Start engine and check for oil and fuel leaks.

Valve Spring, Retainer and Stem Seal

Broken valve springs or leaking valve stem seals and retainer may be replaced without removing the cylinder head provided damage to the valve or valve seat has not occurred.

Removal

1. Remove the valve rocker arm cover and valve rocker arm shaft as described under Valve Rocker Arm Cover and Rocker Arm. Remove the applicable spark plug wire and spark plug.
2. Remove both valve push rods of the cylinder to be serviced.
3. Install an air line with an adapter in the spark plug hole.
4. Turn on the air supply. **Air pressure may turn the crankshaft until the piston reaches the bottom of the stroke.**

CAUTION: Engine may turn over when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc.).

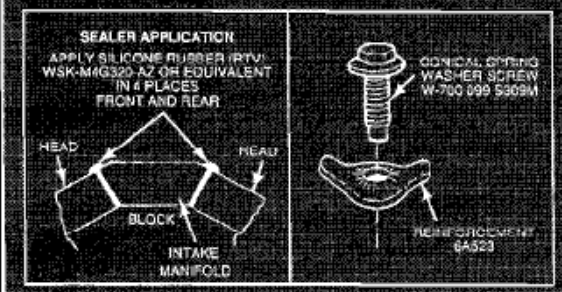
Using the Valve Spring Compressor Lever T86P-6565-A and Valve Spring Compressor Bar T74P-6565-B or equivalents, compress the valve spring and remove the valve spring retainer locks, spring retainer and the valve spring. **If air pressure fails to hold the valve in the closed position during this operation, it can be presumed that the valve is not seating or is damaged. If this condition occurs, remove the cylinder head for further inspection.**

REMOVAL AND INSTALLATION (Continued)

Removing or Installing Rocker Arm Assembly

Installation

1. Loosen the valve lash adjusting screws a few turns.
2. Apply SF-type engine oil to the assembly to provide initial lubrication.
3. Apply oil baffle and rocker arm shaft assembly to the cylinder head. Guide adjusting screws onto push rods.
4. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
5. Adjust valve lash. Refer to Valve Clearance.
6. Clean all gasket material from cylinder heads, intake manifolds and rocker arm cover gasket surfaces.
7. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head/intake manifold.



8. Install rocker arm covers with new gaskets.
9. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
10. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit), Part # W-700 099 S309M.
11. Tighten screws to a torque of 6-8 N·m (4.5-5.9 LB-FT).
12. Connect kickdown linkage (automatic transmission only).
13. After ensuring all rocker arm cover load distribution washers (patch pieces) are installed in their original position, tighten rocker arm cover screws to specification.
14. Install spark plug wires.
15. Install PCV valve hose and breather.
16. Connect the fuel supply quick connect redundant clip over the fuel supply connection. Tighten the fuel return connection specification using care to avoid bending the fuel rail.
17. Start engine and check for oil and fuel leaks.

Valve Spring, Retainer and Stem Seal

Broken valve springs or leaking valve stem seals and retainer may be replaced without removing the cylinder head provided damage to the valve or valve seat has not occurred.

Removal

1. Remove the valve rocker arm cover and valve rocker arm shaft as described under Valve Rocker Arm Cover and Rocker Arm. Remove the applicable spark plug wire and spark plug.
2. Remove both valve push rods of the cylinder to be serviced.
3. Install an air line with an adapter in the spark plug hole.
4. Turn on the air supply. **Air pressure may turn the crankshaft until the piston reaches the bottom of the stroke.**

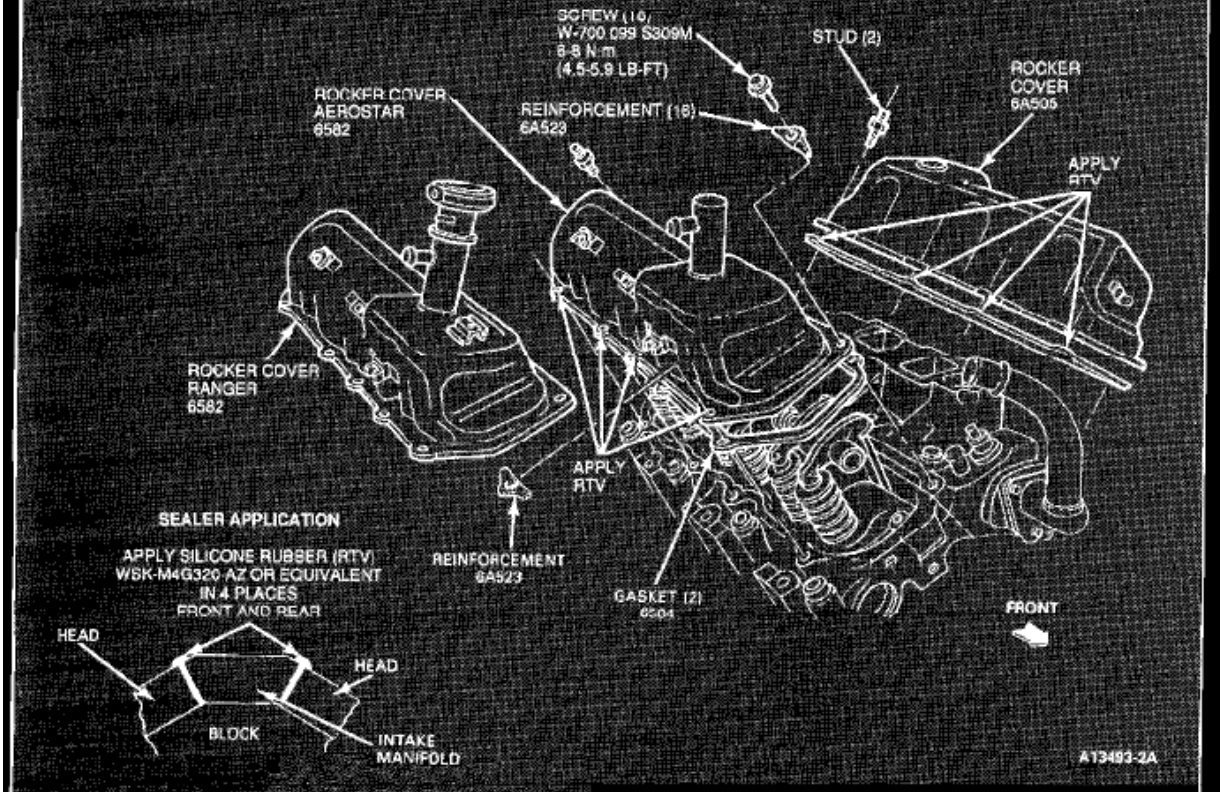
CAUTION: Engine may turn over when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc.).

Using the Valve Spring Compressor Lever T86L-6565-A and Valve Spring Compressor Bar T74P-6565-B or equivalents, compress the valve spring and remove the valve spring retainer locks, spring retainer and the valve spring. **If air pressure fails to hold the valve in the closed position during this operation, it can be presumed that the valve is not seating or is damaged. If this condition occurs, remove the cylinder head for further inspection.**

REMOVAL AND INSTALLATION (Continued)

Installation

1. Apply SF-type engine oil to the valve train assembly to provide initial lubrication.
2. Install rocker arm shaft assembly to the cylinder head. Guide the rocker arms onto push rods.
3. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
4. Clean all gasket material from cylinder heads, intake manifolds, and rocker arm cover gasket surfaces.
5. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head/intake manifold.
6. Install rocker arm covers with new gaskets.
7. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
8. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part #W-700 099 S309M.



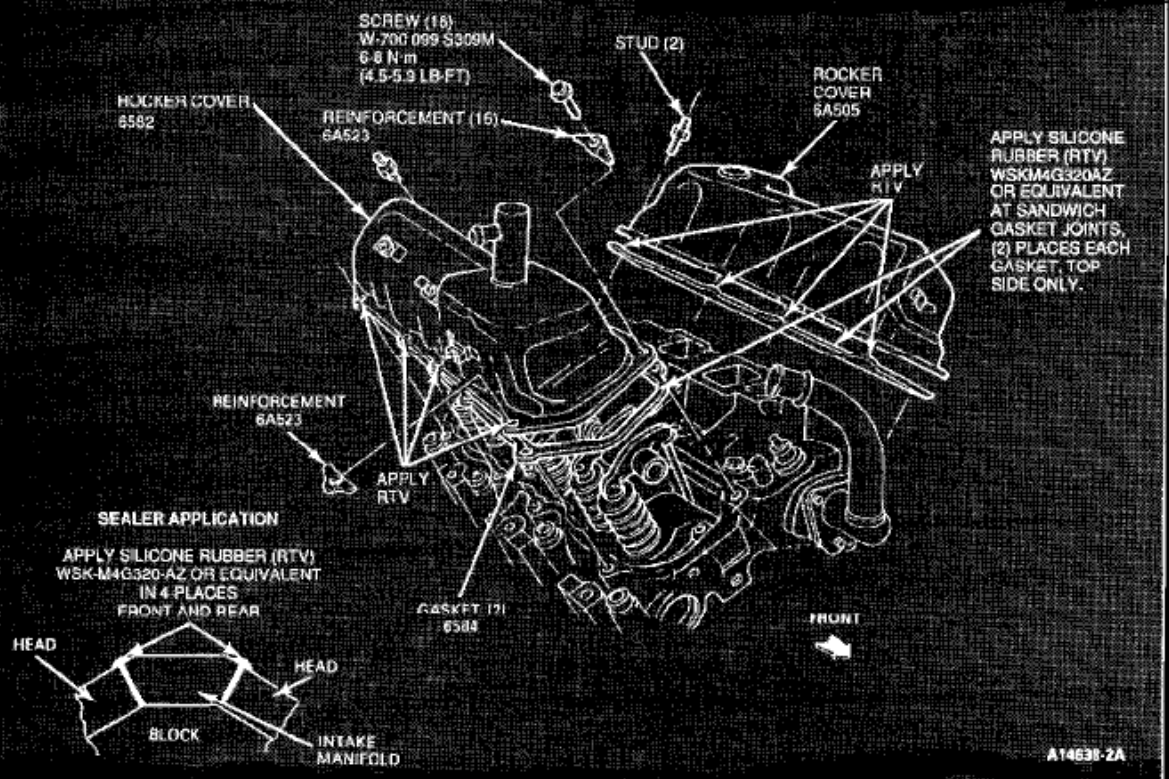
CAUTION: Failure to install a new rocker cover gasket and rocker cover reinforcement pieces will result in oil leaks.

9. Tighten screws to a torque of 6-8 N·m (4.5-5.9 LB-FT).
10. Install upper intake manifold, if removed.
11. On RH side, install the D.I.S. ignition coil and bracket assembly.
12. On RH side, install vacuum hose to the air cleaner and A/C low pressure hose bracket.
13. On RH side, install the upper radiator hose and fill and bleed the cooling system. Refer to section 03-03, Engine Cooling.
14. On RH side, install the alternator and accessory drive belt. Check belt tension. Refer to Section 03-05, Accessory Drive for proper procedure.
15. On RH side, install air inlet duct and oil fill tube hose.
16. Install spark plug wires.
17. Install PCV valve hose and breather.
18. Connect fuel supply and return lines to fuel rail as outlined in Section 03-04D.
19. Start engine and check for oil and fuel leaks.

REMOVAL AND INSTALLATION (Continued)

Installation

1. Apply SF-type engine oil to the valve train assembly to provide initial lubrication.
2. Install rocker arm shaft assembly to the cylinder head. Guide the rocker arms onto push rods.
3. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
4. Clean all gasket material from cylinder heads, intake manifolds, and rocker arm cover gasket surfaces.
5. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T Joints of cylinder head/intake manifold.
6. Install rocker arm covers with new gaskets.
7. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
8. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part # W-700 099 S309M.

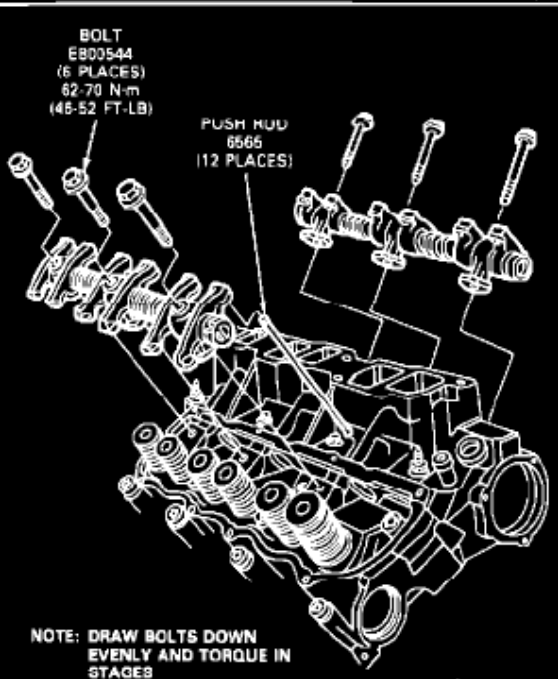


CAUTION: Failure to install a new rocker cover gasket and rocker cover reinforcement pieces will result in oil leaks.

9. Tighten screws to a torque of 6-8 N·m (4.5-5.9 LB-FT).
10. Install upper intake manifold, if removed.
11. On RH side, install the D.I.S. ignition coil and bracket assembly.
12. On RH side, install vacuum hose to the air cleaner and A/C low pressure hose bracket.
13. On RH side, install the upper radiator hose and fill and bleed the cooling system. Refer to section 03-03, Engine Cooling.
14. On RH side, install the alternator and accessory drive belt. Check belt tension. Refer to Section 03-05, Accessory Drive for proper procedure.
15. On RH side, install air inlet duct and oil fill tube hose.
16. Install spark plug wires.
17. Install PCV valve hose and breather.
18. Connect fuel supply and return lines to fuel rail as outlined in Section 03-04D.
19. Start engine and check for oil and fuel leaks.

IN VEHICLE SERVICE (Continued)

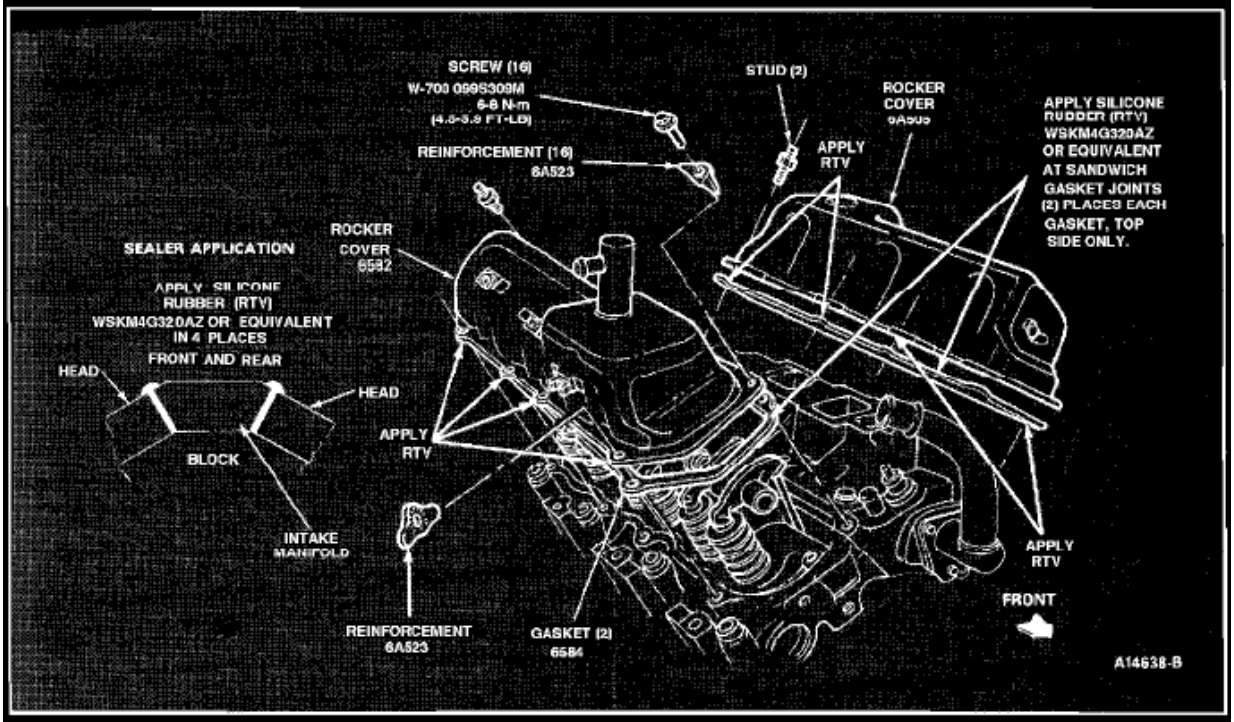
6. Remove the accessory drive belt from the alternator.
7. Remove the alternator from the engine.
8. Drain the cooling system.
9. Remove the upper radiator hose from the engine.
10. Remove the D.I.S. ignition coil and bracket assembly.
11. Remove the low pressure A/C hose bracket from the upper intake (if still installed).
12. Remove vacuum hose from the air cleaner.
13. Remove PCV valve hose and breather.
14. Remove rocker arm cover attaching screws and load distribution washers (patch pieces). Ensure the washers are installed in their original position.
15. With a light plastic hammer, tap rocker arm covers to break seal.
16. Remove rocker covers.
17. Remove rocker arm shaft stand attaching bolts by loosening the bolts two turns at a time, in sequence. Lift off rocker arm and shaft assembly.



Installation

1. Apply SF-type engine oil to the valve train assembly to provide initial lubrication.
2. Install rocker arm shaft assembly to the cylinder head. Guide the rocker arms onto push rods.
3. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
4. Clean all gasket material from cylinder heads, intake manifolds and rocker arm cover gasket surfaces.
5. Peel the plastic film from the gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head / intake manifold.
6. Install rocker arm covers with new gaskets.

IN VEHICLE SERVICE (Continued)



CAUTION: Failure to install a new rocker cover gasket and rocker cover reinforcement pieces will result in oil leaks.

7. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of rocker cover (4 holes each side).
8. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part # W-700-099-S309M.
9. Tighten screws to a torque of 6-8 N·m (4.5-5.9 ft. lb).
10. Install upper intake manifold, if removed.
11. On RH side, install the D.I.S. ignition coil and bracket assembly.
12. On RH side, install vacuum hose to the air cleaner and A / C low pressure hose bracket.
13. On RH side, install the upper radiator hose and fill and bleed the cooling system. Refer to Section 03-03, Engine Cooling.
14. On RH side, install the alternator and accessory drive belt. Check belt tension. Refer to Section 03-05, Accessory Drive for proper procedure.
15. On RH side, install air inlet duct and oil fill tube hose.
16. Install spark plug wires.
17. Install PCV valve hose and breather.
18. Connect fuel supply and return lines to fuel rail as outlined in Section 03-04D.
19. Start engine and check for oil and fuel leaks.

Valve Spring, Retainer and Stem Seal

Broken valve springs or leaking valve stem seals and retainer may be replaced without removing the cylinder head provided damage to the valve or valve seat has not occurred.

Removal

1. Remove the valve rocker arm cover and valve rocker arm shaft as described under Valve Rocker Arm Cover and Rocker Arm. Remove the applicable spark plug wire and spark plug.
2. Remove both valve push rods of the cylinder to be serviced.
3. Install an air line with an adapter in the spark plug hole.

   CAUTION: Engine may turn over when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc.).
4. Turn on the air supply. **Air pressure may turn the crankshaft until the piston reaches the bottom of the stroke.**

Valve Guide: Specifications

Valve Guide Bore Diameter 0.3174.0-0.3184

Valve Guide: Service and Repair

Valve guides consist of holes bored in the cylinder head. For service the guides can be reamed oversize to accommodate valves with oversize stems of .016, .030 and .032 inch.

Valve Seat: Specifications

Intake Valve Seat Width ..... 0.060-0.079 Exhaust Valve Seat Width ..... 0.060-0.079 Valve Seat Angle ..... 45° Valve Seat Runout Limit (T.I.R. Max) 0.0015

Drive Belt Routing

Drive Belt: Adjustments

Drive belt adjustment is accomplished by repositioning one of the belt driven components (alternator, air pump, or power steering pump). For belt routing information, refer to Engine/Drive Belts, Mounts, Brackets and Accessories/Drive Belt/Specifications/Mechanical.

1. Verify all drive pulleys and mounting bolts are tight.

2. Using a Belt Tension Gauge (Tool T63L-8620-A or equivalent), check the tension of the drive belts.

3. If adjustment is necessary, loosen accessory adjustment bolts.

4. Tighten the pivot enough to remove all freeplay from pivot area but not enough to prevent the accessory from rotating to allow belt tensioning.

5. ALL BELTS EXCEPT ALTERNATOR BELT - Insert a square drive ratchet wrench or breaker bar into the square hole in accessory bracket. Tighten belt to correct tension. ALTERNATOR BELT - Place a "C" clamp over the end of the adjusting arm and the adjusting bolt boss, and tighten the belt to the correct tension. Refer to SPECIFICATIONS/MECHANICAL. NOTE: Be sure to use the "New Belt Tension" specifications for new drive belts, and the "Used Belt Tension" specifications for used belts. A used belt is a belt with more than 5 minutes of engine operation.

6. While maintaining belt tension, tighten adjustment bolt to specification. Refer to SPECIFICATIONS/MECHANICAL.

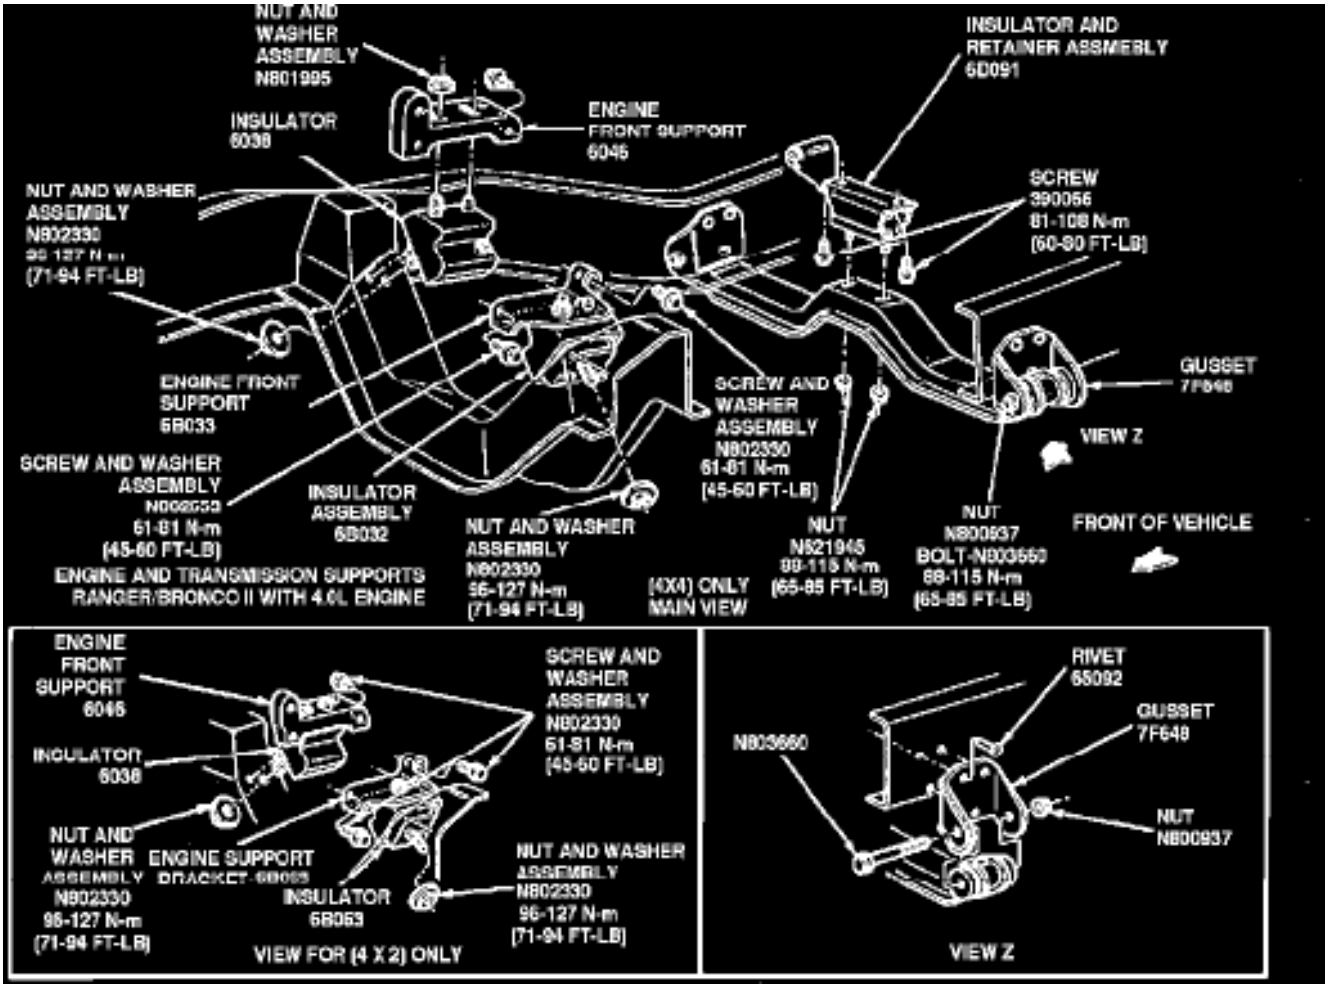
7. Remove square driver tool or "C" clamp.

8. Tighten pivot bolt to specification. Refer to SPECIFICATIONS/MECHANICAL.

9. Check belt tension(s) and readjust if necessary.

10. START the engine, idle for 5 minutes, then recheck belt tension(s). NOTE: If tension is less than the "Minimum Tension" after 5 minutes of operation, then reset the belt tension(s) to within "Used Belt Tension specifications. START engine, idle for 5 minutes, then recheck belt tension(s). Make adjustments if necessary.

CAUTION: If using a pry bar, DO NOT use any of the driven components (alternator, air pump, power steering pump, or a/c compressor) as a leverage point. Damage to the component housing may result.



Engine Mount: Service and Repair

Fig. 1 Engine Mounts

1. Remove fan shroud attaching screws, then support engine using a suitable jack and block of wood under oil pan.

2. Remove insulator to crossmember attaching nuts and washers, then raise engine until insulator stud clears crossmember.

3. Remove fuel pump shield to left side engine bracket attaching bolt, if necessary.

4. Remove mount to cylinder block attaching bolts and the mount, Fig. 1.

5. Reverse procedure to install.

Engine Oil Drain Plug: Specifications

ISSUE Ford Motor Company now recommends SAE 5W-30 viscosity grade for servicing any Ford gasoline-powered vehicle regardless of model year.

ACTION When servicing any Ford gasoline-powered vehicle, use SAE 5W-30 viscosity grade motor oil. Refer to the following text for further details.

Both SAE 10W-30 and SAE 5W-30 viscosity grade motor oils have been recommended in the past depending on vehicle model and model year.

Tests have proven SAE 5W-30 viscosity grade motor oil provides the optimum protection and benefits for Ford gasoline engines. At both high and low ambient temperature conditions, SAE 5W-30 provides the best overall protection. It allows faster starts under cold ambient temperatures.

SAE 5W-30 also provides approximately 1/2% increase in fuel economy over SAE 10W-30.

SAE 5W-30 viscosity grade motor oils certified for gasoline engines by the American Petroleum Institute (API) should be used for all service procedures requiring replacement of the motor oil.

ISSUE: The instrument cluster warning light(s) may be dimly lit or there may be a malfunction of the four pin low oil relay on vehicles so equipped. This could be due to the ignition switch.

ACTION:

If the vehicle displays the subject symptoms and meets the following conditions, replace the ignition switch. Refer to the appropriate Car or Light Truck Service Manual (Section 13-04 for 1983-1990 Cars, Section 11-04 for 1991-1993 Cars and Section 13-05 for 1983-1990 Light Trucks, Section 11-05 for 1991-1993 Light Trucks) for removal and installation procedures. Refer to the Parts Block in this article for correct parts usage.

CONDITIONS

^ The vehicle has 14401 wiring attached to the P2 terminal of the ignition switch. Refer to the wiring schematic and/or Electrical And Vacuum Troubleshooting Manual (EVTM) for the concern vehicle.

Oil Level Warning Indicator: Description and Operation

The oil pressure warning light should go on when the ignition is turned on. If it does not light, disconnect the wire from the engine unit and ground the wire to the frame or cylinder block. Then if the warning light still does not go on with the ignition switch on, replace the bulb. If the warning light goes on when the wire is grounded to the frame or cylinder block, the engine unit should be checked for being loose or poorly grounded. If the unit is found to be tight and properly grounded, it should be removed and a new one installed. (The presence of sealing compound on the threads of the engine unit will cause a poor ground). If the warning light remains lit when it normally should be out, replace the engine unit before proceeding further to determine the cause for a low pressure indication. The warning light will sometimes light up or flicker when engine is idling, even though oil pressure is adequate. However, light should go out when engine speed is increased.

Oil Level Warning Indicator: Testing and Inspection

With oil level at FULL mark on oil dipstick and engine oil warm to assure that oil drains properly from oil sensor, turn ignition on and start engine. Warning lamp should come on briefly in Start for bulb test, then go out. Turn engine off. Drain 2 quarts of oil from engine. Wait approximately 5 minutes, then restart engine. Warning lamp should come on and stay on. If warning lamp does not come on check fuse, low oil level relay, low oil level sensor and lamp.

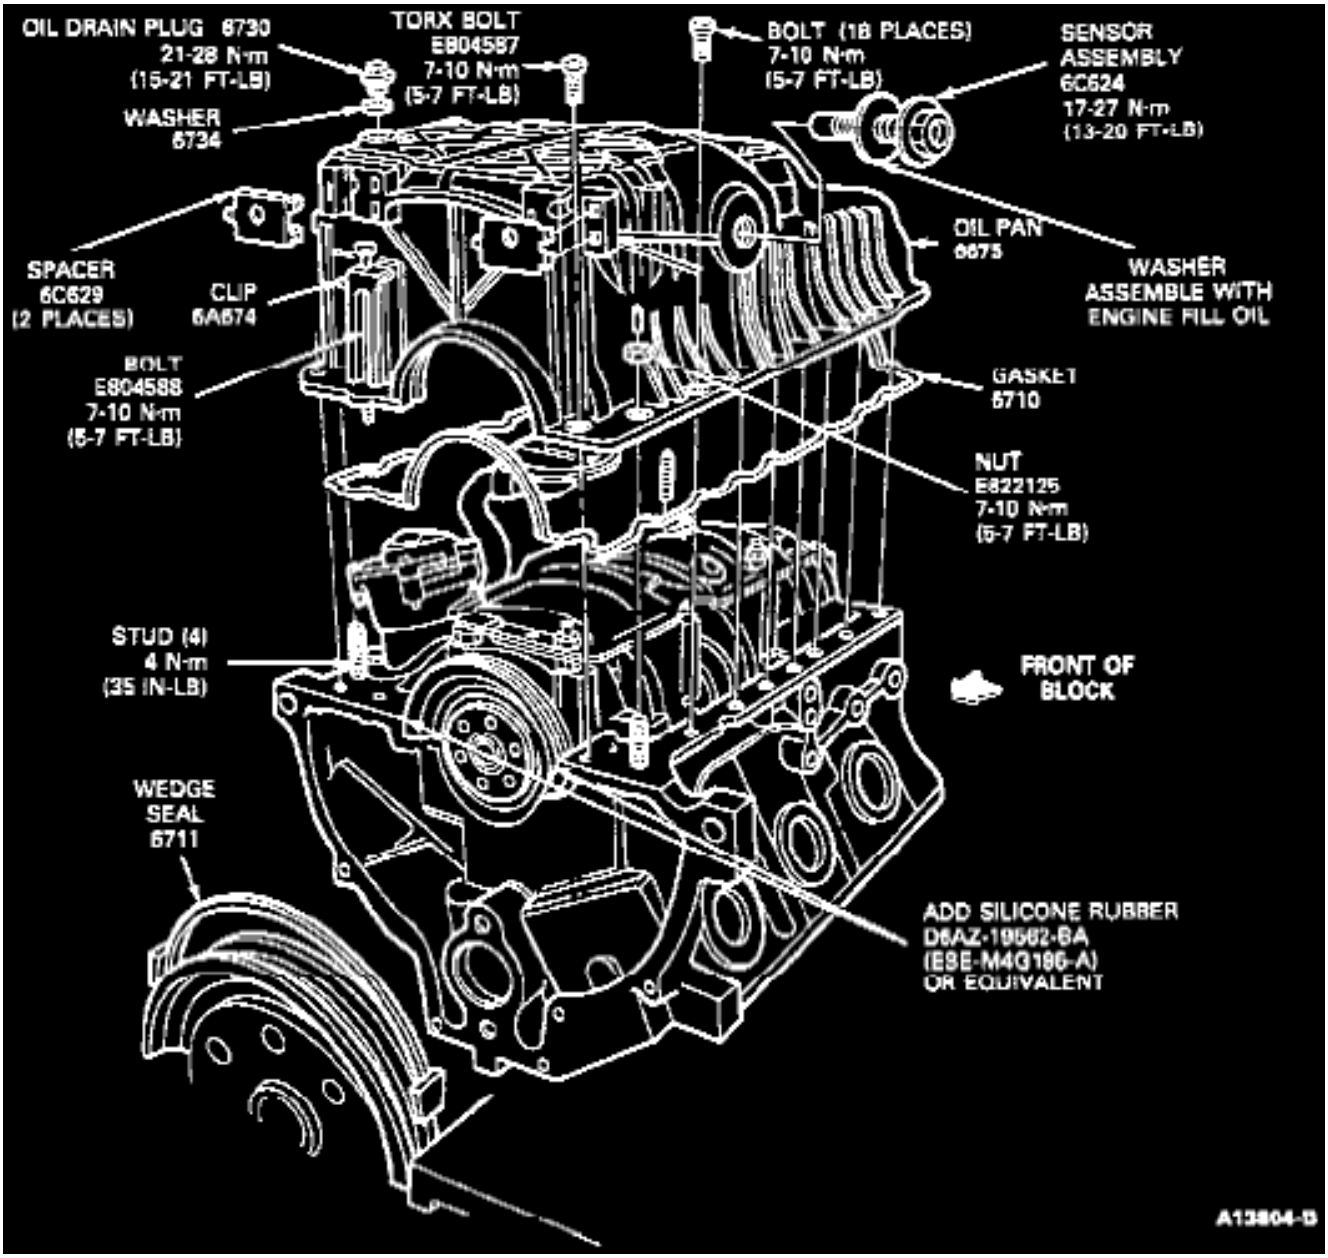
Oil Pan: Specifications

Oil Pan Nuts and Bolts .... 7-10 Nm (7-10 ft lb) Oil Pan To Transmission Bolts ..... 38-51 Nm (28-38 ft lb)



Oil Pan: Service and Repair

*** THIS ARTICLE REFLECTS CHANGES MADE BY TSB 9518 DATED JANUARY 16, 1995

REMOVAL

1. Remove the engine assembly from the vehicle. 2. Mount the engine on a suitable engine stand with the oil pan facing up. 3. Remove the oil pan retaining bolts and remove the oil pan. 4. Remove the oil pan gasket, oil pump, oil baffle, rear main bearing cap and wedge seal. 5. Thoroughly clean the gasket mating surfaces of the engine block, oil pan and the rear main bearing cap.

INSTALLATION

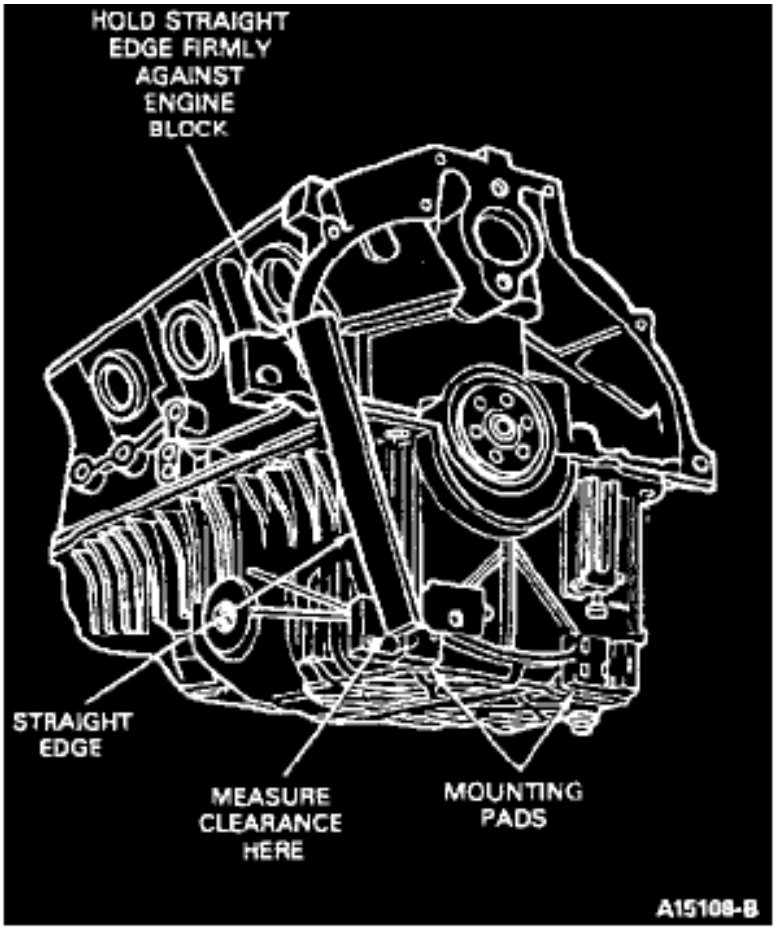
Oil Pan Installation

1. Install a new crankshaft rear main bearing cap wedge seal. The seal should fit snugly into the sides of the rear main bearing cap.

2. position the oil pan gasket to the engine block and place the oil pan in position on the four locating studs.

3. Tighten the retaining nuts and bolts evenly to 7-10 Nm (5-7 ft-lb)

NOTE: The transmission bolts to the engine and oil pan when installed, so it is important to measure the gap between the surface of the rear face of the oil pan (at the spacer locations) and the rear face of the engine block. Refer to the following procedure for checking this dimension.



SPACER SELECTION CHART

Measured Gap		Spacer Required		
mm	Inch	mm	Inch	Shim Color Code
0.0-0.254	0.0-0.010	None	None	—
0.27-0.61	0.011-0.020	0.254	0.010	Yellow
0.52-0.76	0.021-0.029	0.508	0.020	Blue
0.77-1.00	0.030-0.039	0.762	0.030	Pink

TA13805A

Rear View Of Engine

a. With the oil pan installed on the engine, position straightedge D83L-4201-A or equivalent flat on the rear of the engine block (as shown) so

that it extends over one of the oil pan/transmission bolt mounting pads.

Spacer Selection Chart

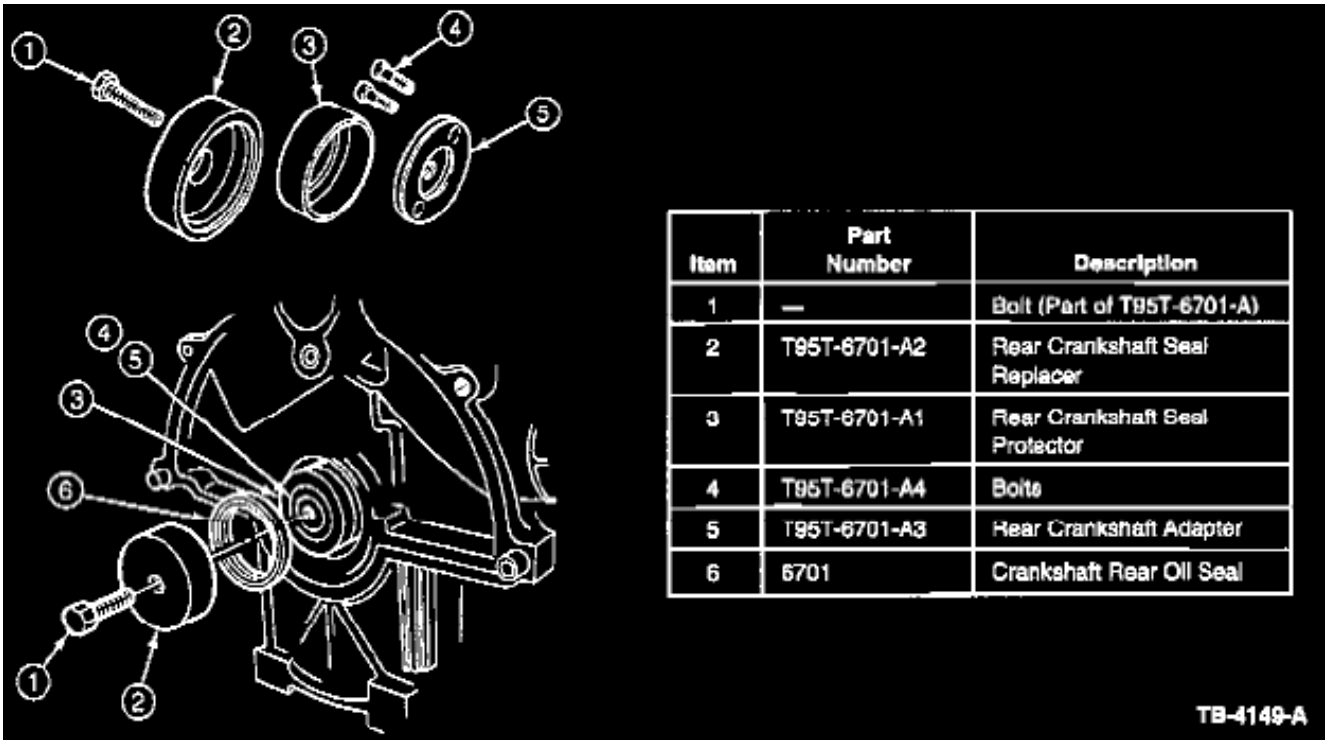
b. Using feeler gauge D81L-4201-A or equivalent, measure the gap between the mounting pad and the straight edge. Repeat the procedure for the

other mounting pad. Select spacers of the required thickness from the chart.

CAUTION: Failure to measure the required spacer thickness will result in insufficient or excessive clearance between the engine oil pan and the transmission when installed in the vehicle. This can result in oil pan damage and/or an oil leak.

c. Install the selected spacers to the mounting pads on the rear of the oil pan before bolting the engine and transmission together.

CAUTION: This installation procedure requires the use of hand tools only. The use of power tools or hammering on the installer can damage the sleeve and seal.



Item	Part Number	Description
1	—	Bolt (Part of T95T-6701-A)
2	T95T-6701-A2	Rear Crankshaft Seal Replacer
3	T95T-6701-A1	Rear Crankshaft Seal Protector
4	T95T-6701-A4	Bolts
5	T95T-6701-A3	Rear Crankshaft Adapter
6	6701	Crankshaft Rear Oil Seal

Rear Main Seal Installation Tool

1. Attach the rear crankshaft adapter to the rear of the crankshaft using the supplied mounting screws.

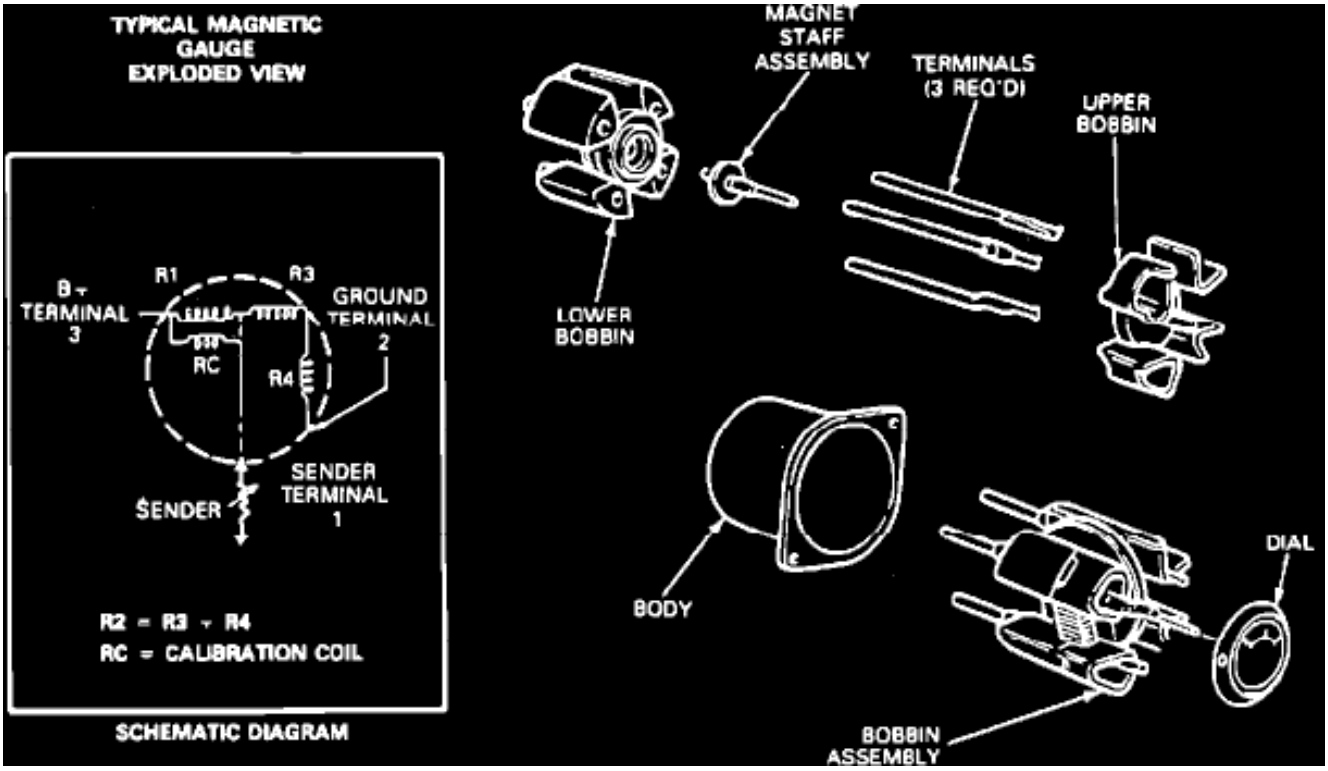
2. Apply a few drops of clean engine oil to the inboard side of the seal/sleeve at the area where the seal contacts the sleeve.

3. Apply a very light film of clean engine oil on the inner diameter of the sleeve and outer diameter of seal.

4. Slide the seal/sleeve over the rear crankshaft seal adapter with flange to the rear of the engine.

NOTE: It is normal for the seal to sit approximately 0.76 mm (0.030 inch) deeper than the sleeve flange. Do not adjust.

5. Use the rear crankshaft seal replacer and supplied bolt to push the rear seal into the cylinder block.



Oil Pressure Gauge: Description and Operation

CONSTANT VOLTAGE REGULATOR GAUGE SYSTEM (CVR)

This oil pressure indicating system incorporates an instrument voltage regulator, electrical oil pressure gauge and a sending unit which are connected in series. The sending unit consists of a diaphragm, contact and a variable resistor. As oil pressure increases or decreases, the diaphragm actuates the contact on the variable resistor, which in turn controls current flow to the gauge. When oil pressure is low, resistance of the variable resistor is high, which restricts current flow to the gauge, indicating low oil pressure. As oil pressure increases, resistance of the variable resistor is lowered, permitting increased current flow to the gauge, which increases the gauge reading.

MAGNETIC GAUGE SYSTEM

Fig. 8 Magnetic Guage

The magnetic gauge movement consists of three primary coils, one of which is wound at a 90° angle to the other two. The coils form a magnetic field which varies in direction according to the variable resistance of the sender unit which is connected between two of them. A primary magnet which is attached to a shaft and pointer rotates to align to this primary field resulting in pointer position. The bobbin/coil assembly is pressed into a metal housing which is attached to the instrument cluster Fig. 8. These gauges require no adjustments, calibrations or maintenance. This gauge system does not use an IVR.

TEST STEP		RESULT ▶	ACTION TO TAKE
A1	TEMPERATURE OR OIL GAUGE INOPERATIVE		
	• Check complaint.	Gauge pointer does not move ▶	GO to Step A2.
		Gauge pointer moves ▶	GO to Step B1.

TEST STEP		RESULT ▶	ACTION TO TAKE
A2	VERIFY POWER TO CLUSTER		
	• With ignition on, observe other gauges and warning lamps for proper operation. If necessary, use voltmeter or test light to verify voltage at B+ terminal of cluster connector.	Other gauges and warning lamps operate correctly: voltage present at cluster ▶	GO to Step B1.
		Other gauges and warning lamps do not operate correctly: no voltage present at cluster ▶	SERVICE wiring to cluster.

TEST STEP		RESULT ▶	ACTION TO TAKE
B1	TESTING SENDER CIRCUIT AT LOW		
	• Insert test box in sender circuit. Disconnect connector at sender and connect test box to cluster side of connector. Set box to LOW (73 ohms).	Temperature gauge reads around the C band ▶	GO to Step B2.
		Oil reads at or below L band ▶	GO to Step B3
		Pointer does not move ▶	GO to Step B4.
B2	TESTING TEMPERATURE SENDER CIRCUIT AT HIGH		
	• TEMPERATURE GAUGE • Set test box to HIGH (9.7 ohms).	Temperature gauge reads around the H grad ▶	REPLACE sender.
		Temperature gauge does not read around the H grad ▶	GO to Step B4.
B3	TESTING ON CABLE SENDER CIRCUIT AT HIGH		
	• OIL GAUGE • Set test box to 0 ohms (short circuit).	Oil gauge reads MID SCALE or slightly above ▶	REPLACE switch.
		Oil gauge does not read MID SCALE or slightly above ▶	GO to Step B4.
B4	CHECK SENDER CIRCUIT WIRING		
	• Check sender circuit wiring and cluster flexible circuit for shorts or open with ohmmeter.	Wiring and flex circuit OK ▶	REPLACE gauge. GO to A1.
		Wiring shorted or open. Flex circuit damaged ▶	REPAIR wiring / flex circuit. GO to A1.

Oil Pressure Gauge: Pinpoint Tests

Fig. 11 Troubleshooting Chart

Fig. 11 Troubleshooting Chart

Fig. 12 Troubleshooting Chart

Oil Pressure Gauge: Component Tests and General Diagnostics

CONSTANT VOLTAGE REGULATOR GAUGE SYSTEM (CVR)

1. Disconnect battery ground cable and remove gauge from vehicle.

2. Connect ohmmeter between gauge terminals and read coil winding resistance.

3. An upward movement of ohmmeter needle from 10 ohms to 14 ohms is normal, as test current of ohmmeter causes a temperature rise in gauge coil windings.

4. If ohmmeter reads below 10 ohms or above 14 ohms, gauge is defective.

MAGNETIC GAUGE SYSTEM

1. Ensure voltage is present at fuse panel and cluster.

2. Install gauge tester tool No. 021-00055 or equivalent, following manufacturer's instructions. This tester can be used on the CVR or Magnetic Gauge systems.

Oil Pressure Gauge: Tools and Equipment

Tester tool No. 021-00055 or equivalent should be used to diagnose these type gauges, following manufacturer's instructions.

Oil Pressure Switch: Locations

Engine Compartment Components.

Lower LH Rear Of Engine

Applicable to: 2.9L/V6-179

Oil Pressure Warning Lamp/Indicator: Description and Operation

Many trucks utilize a warning light on the instrument panel in place of the conventional dash indicating gauge to warn the driver when the oil pressure is dangerously low. The warning light is wired in series with the ignition switch and the engine unit--which is an oil pressure switch. The oil pressure switch contains a diaphragm and a set of contacts. When the ignition switch is turned on, the warning light circuit is energized and the circuit is completed through the closed contacts in the pressure switch. When the engine is started, build-up of oil pressure compresses the diaphragm, opening the contacts, thereby breaking the circuit and putting out the light.

Oil Pressure Warning Lamp/Indicator: Testing and Inspection

The oil pressure warning light should go on when the ignition is turned on. If it does not light, disconnect the wire from the engine unit and ground the wire to the frame or cylinder block. Then if the warning light still does not go on with the ignition switch on, replace the bulb. If the warning light goes on when the wire is grounded to the frame or cylinder block, the engine unit should be checked for being loose or poorly grounded. If the unit is found to be tight and properly grounded, it should be removed and a new one installed. (The presence of sealing compound on the threads of the engine unit will cause a poor ground). If the warning light remains lit when it normally should be out, replace the engine unit before proceeding further to determine the cause for a low pressure indication. The warning light will sometimes light up or flicker when engine is idling, even though oil pressure is adequate. However, light should go out when engine speed is increased.

Oil Pump: Specifications General Specifications

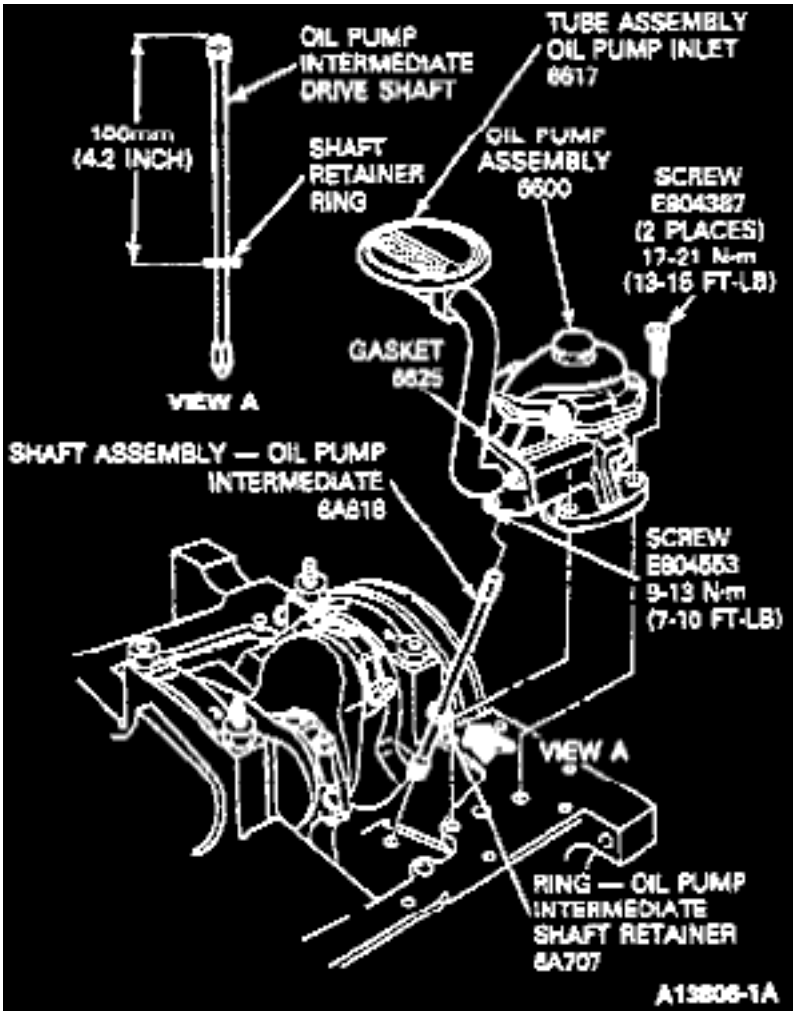
Nm (7-10 ft lb) Oil Pump To engine Block Screws
..... 17-21
Nm (13-15 ft lb)



Oil Pump: Service and Repair

NOTE: The oil pump is only serviced as an assembly.

Removal

1. Remove oil pan. See Oil Pan/Service and Repair. See: Oil Pan/Service and Repair

2. Remove oil pump attaching bolts. Lift off oil pump and withdraw oil pump drive shaft.

Oil Pump Installation

Installation

1. Prime the oil pump by filling either the inlet or outlet port with engine oil XO-5W30-QSP (WSE-M2903-A1) or equivalent SAE 5W-30 Service SG. Rotate the pump shaft to distribute the oil within the pump body.

2. Insert oil pump drive shaft into block with the pointed end facing inward. The pointed end is closest to the pressed-on flange. Place oil pump in position with new gasket and install attaching screws. Tighten screws to 17-21 Nm (13-15 ft lb). Clean and install the oil pump inlet tube and

screen assembly with a new gasket. Tighten the screws to 9-13 Nm (7-10 ft lb).

3. Install oil pan as outlined under Oil Pan/Service and Repair.

4. Operate the engine at fast idle speed and check for oil leaks.

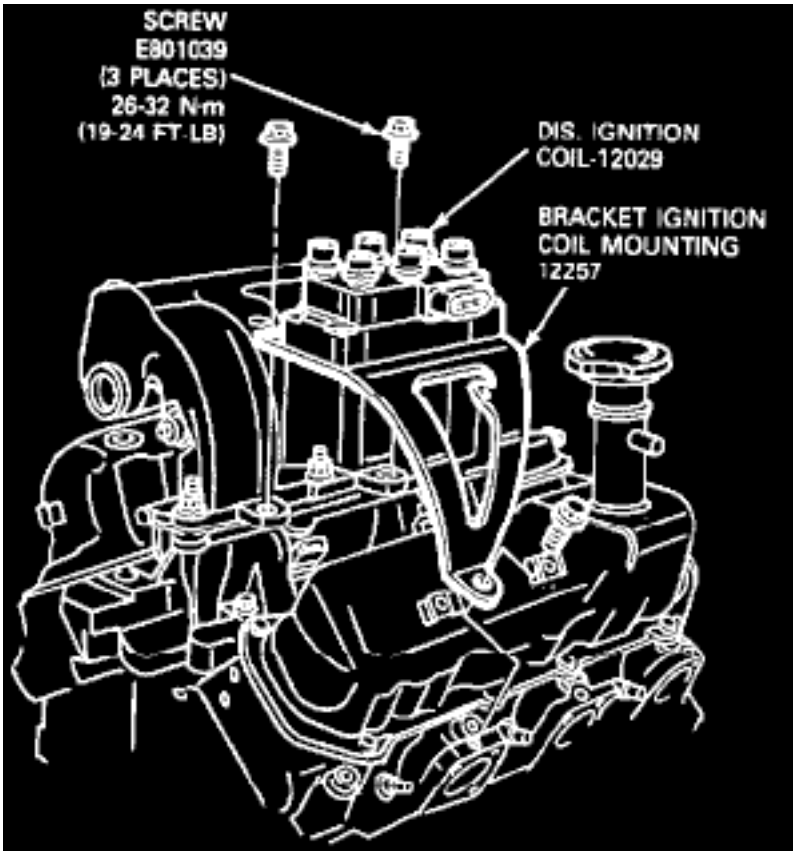
Throttle Body Assembly



Intake Manifold: Service and Repair Lower

*** THIS ARTICLE REFLECTS CHANGES MADE BY TSB #94-18-10, DATED September 07, 1994

REMOVAL

NOTE: The intake manifold is a four piece assembly consisting of the upper intake manifold, the throttle body, the fuel supply manifold and the lower intake manifold.

1. Disconnect the battery ground cable at the battery.

2. Remove the air cleaner air intake duct from the throttle body.

3. Remove the snow/ice shield and disconnect the throttle cable and bracket assembly.

4. Disconnect all vacuum hoses from the fittings on the upper intake manifold.

5. Disconnect the electrical connections at the throttle body, upper intake manifold, lower intake manifold and injectors.

6. Relieve fuel system pressure.

7. Disconnect the fuel supply and return lines at the fuel supply manifold.

E-DIS Coil Pack Mounting

8. Remove the bolts securing the E-DIS coil pack and bracket assembly to the upper intake manifold.

9. Remove the six nuts securing the upper intake manifold and remove the upper manifold.

10. Remove the valve rocker arm covers. See: Cylinder Head Assembly/Valve Cover/Service and Repair

11. Remove the intake manifold attaching bolts and nuts. Tap the intake manifold lightly with a plastic mallet to break the gasket seal, and lift off the intake manifold assembly.

12. Remove all old gasket material, and sealing compound.

Cylinder Head And Block

1. Apply Silicone Sealer (Loctite 598, F1AZ-19562 A, or equivalent) to the block and cylinder head mating surfaces at the four corners shown. Install the intake manifold gaskets and again apply sealer to the four corner locations.

NOTE: Once applied, the silicone sealer will set-up in approximately 15 minutes. The intake manifold must be installed immediately after the sealer is applied.

Lower Intake Manifold Bolt Tightening Sequence

2. Position the intake manifold on the two guide studs and install the nuts and bolts hand tight. Tighten the intake manifold bolts in four stages following the sequence shown.

^ 4-8 Nm (3-6 ft lb)

^ 8-15 Nm (6-11 ft lb)

^ 15-21 Nm (11-15 ft lb)

^ 21-25 Nm (15-18 ft lb)

3. Apply Silicone Sealer (Loctite 598, F1AZ-19562 A, or equivalent) to the four locations at the joint where the intake manifold and cylinder heads meet.

4. Position valve rocker arm cover gasket in each cover and install valve rocker arm covers. Tighten rocker arm cover bolts evenly to 4-7 Nm (3-5 ft lb).

NOTE: Valve rocker arm covers are tightened in 2 steps. Tighten bolts to specification. Two minutes later, tighten bolts to the same specification.

5. Install upper intake manifold and tighten nuts to 20-25 Nm (15-18 ft lb).

6. Install the E-DIS ignition coil and bracket assembly.

7. Connect the fuel supply and return lines at the fuel supply manifold.

8. Connect the electrical connections at the throttle body, upper intake manifold, lower intake manifold and injectors.

9. Connect all vacuum hoses to the fittings on the upper intake manifold.

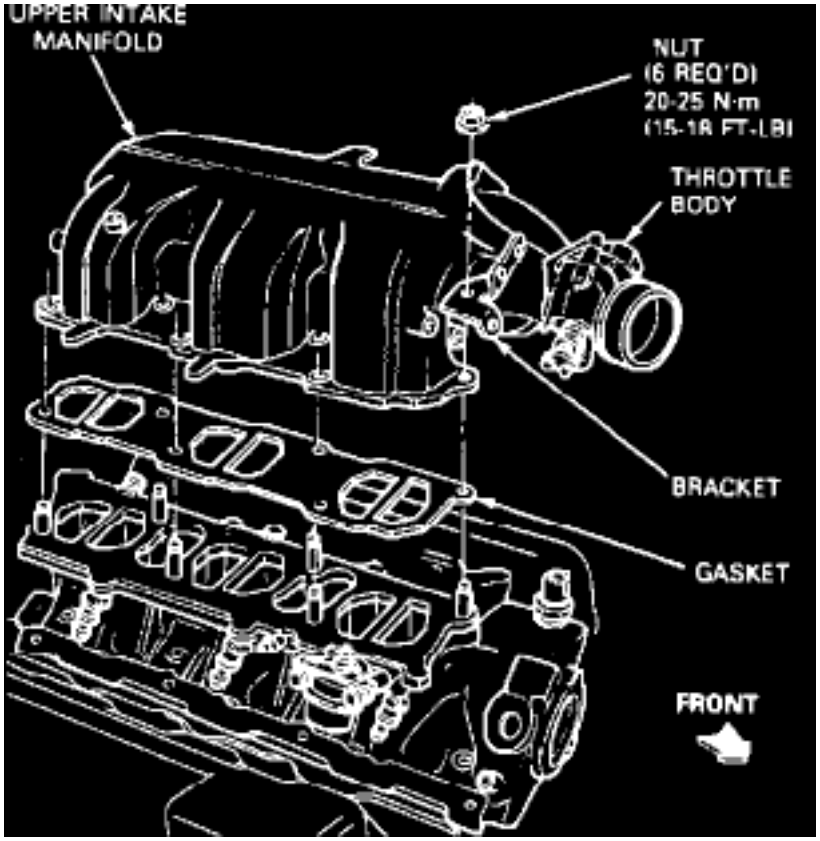
10. Install the throttle cable and bracket assembly and the snow/ice shield to the throttle body.

11. Connect the air cleaner air intake duct to the throttle body.

12. Fill and bleed the cooling system.

13. Connect the battery ground cable at the battery.

14. Check for fuel system and oil leaks.



Intake Manifold: Service and Repair Upper Intake Manifold

Upper Intake Manifold

REMOVAL

1. Disconnect the electrical connectors at the air bypass valve, Throttle Position (TP) sensor and Air Charge Temperature (ACT) sensor.

2. Remove the snow/ice shield to expose the throttle linkage. Remove the throttle cable bracket and disconnect the cable from the ball stud on the

throttle body.

3. Remove the air inlet tube from air cleaner to throttle body.

4. Disconnect the upper intake manifold vacuum connectors.

5. Disconnect the PCV valve from the rocker cover.

6. Disconnect the spark plug wires from the comb at the rear of the manifold.

7. Remove the canister purge line from the fitting in the throttle housing.

8. Remove the bolt retaining the engine oil dipstick tube.

9. Remove the bolt which retains the A/C line at the upper rear of the upper manifold.

10. Remove the six upper intake manifold retaining bolts.

11. Remove the upper intake and throttle body as an assembly from the lower intake and fuel supply manifolds.

INSTALLATION

1. Clean and inspect the mounting faces of the fuel manifold and upper intake manifold.

2. Position a new gasket on the mounting studs.

3. Install the upper intake manifold on the studs.

4. Install six upper intake manifold retaining nuts. Torque to 21-25 Nm (15-18 ft lb).

5. Connect the spark plug wires to the retainer comb at the rear of the intake manifold.

6. Attach the A/C line retainer and automatic transmission vacuum line retainer at the upper intake manifold.

7. Install the canister purge line on the throttle body fitting.

8. Connect vacuum lines to the vacuum tree. Connect the electrical connector at the air bypass valve, TP sensor and ACT sensor.

9. Install the PCV valve in the grommet at the rear of the RH rocker cover.

10. Attach the engine oil dipstick tube to the upper intake manifold.

11. Attach the throttle cable bracket to the upper intake manifold, then connect the throttle cable to the ball stud and install the snow/ice shield.

ISSUE: The instrument cluster warning light(s) may be dimly lit or there may be a malfunction of the four pin low oil relay on vehicles so equipped. This could be due to the ignition switch.

ACTION:

If the vehicle displays the subject symptoms and meets the following conditions, replace the ignition switch. Refer to the appropriate Car or Light Truck Service Manual (Section 13-04 for 1983-1990 Cars, Section 11-04 for 1991-1993 Cars and Section 13-05 for 1983-1990 Light Trucks, Section 11-05 for 1991-1993 Light Trucks) for removal and installation procedures. Refer to the Parts Block in this article for correct parts usage.

CONDITIONS

^ The vehicle has 14401 wiring attached to the P2 terminal of the ignition switch. Refer to the wiring schematic and/or Electrical And Vacuum Troubleshooting Manual (EVTM) for the concern vehicle.

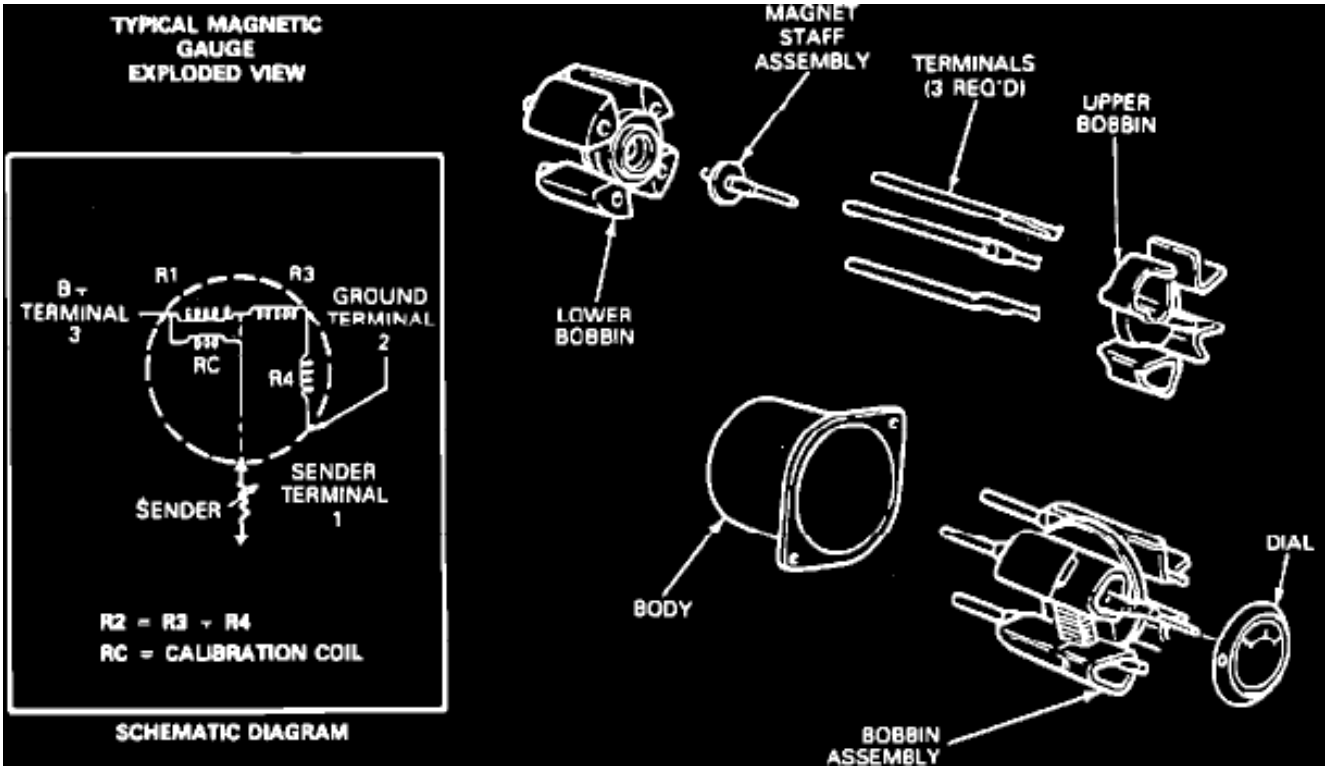
Oil Level Warning Indicator: Description and Operation

The oil pressure warning light should go on when the ignition is turned on. If it does not light, disconnect the wire from the engine unit and ground the wire to the frame or cylinder block. Then if the warning light still does not go on with the ignition switch on, replace the bulb. If the warning light goes on when the wire is grounded to the frame or cylinder block, the engine unit should be checked for being loose or poorly grounded. If the unit is found to be tight and properly grounded, it should be removed and a new one installed. (The presence of sealing compound on the threads of the engine unit will cause a poor ground). If the warning light remains lit when it normally should be out, replace the engine unit before proceeding further to determine the cause for a low pressure indication. The warning light will sometimes light up or flicker when engine is idling, even though oil pressure is adequate. However, light should go out when engine speed is increased.

Oil Level Warning Indicator: Testing and Inspection

With oil level at FULL mark on oil dipstick and engine oil warm to assure that oil drains properly from oil sensor, turn ignition on and start engine. Warning lamp should come on briefly in Start for bulb test, then go out. Turn engine off. Drain 2 quarts of oil from engine. Wait approximately 5 minutes, then restart engine. Warning lamp should come on and stay on. If warning lamp does not come on check fuse, low oil level relay, low oil level sensor and lamp.



Oil Pressure Gauge: Description and Operation

CONSTANT VOLTAGE REGULATOR GAUGE SYSTEM (CVR)

This oil pressure indicating system incorporates an instrument voltage regulator, electrical oil pressure gauge and a sending unit which are connected in series. The sending unit consists of a diaphragm, contact and a variable resistor. As oil pressure increases or decreases, the diaphragm actuates the contact on the variable resistor, which in turn controls current flow to the gauge. When oil pressure is low, resistance of the variable resistor is high, which restricts current flow to the gauge, indicating low oil pressure. As oil pressure increases, resistance of the variable resistor is lowered, permitting increased current flow to the gauge, which increases the gauge reading.

MAGNETIC GAUGE SYSTEM

Fig. 8 Magnetic Guage

The magnetic gauge movement consists of three primary coils, one of which is wound at a 90° angle to the other two. The coils form a magnetic field which varies in direction according to the variable resistance of the sender unit which is connected between two of them. A primary magnet which is attached to a shaft and pointer rotates to align to this primary field resulting in pointer position. The bobbin/coil assembly is pressed into a metal housing which is attached to the instrument cluster Fig. 8. These gauges require no adjustments, calibrations or maintenance. This gauge system does not use an IVR.

TEST STEP		RESULT ▶	ACTION TO TAKE
A1	TEMPERATURE OR OIL GAUGE INOPERATIVE		
	• Check complaint.	Gauge pointer does not move ▶	GO to Step A2.
		Gauge pointer moves ▶	GO to Step B1.

TEST STEP		RESULT ▶	ACTION TO TAKE
A2	VERIFY POWER TO CLUSTER		
	• With ignition on, observe other gauges and warning lamps for proper operation. If necessary, use voltmeter or test light to verify voltage at B+ terminal of cluster connector.	Other gauges and warning lamps operate correctly: voltage present at cluster ▶	GO to Step B1.
		Other gauges and warning lamps do not operate correctly: no voltage present at cluster ▶	SERVICE wiring to cluster.

TEST STEP		RESULT ▶	ACTION TO TAKE
B1	TESTING SENDER CIRCUIT AT LOW		
	• Insert test box in sender circuit. Disconnect connector at sender and connect test box to cluster side of connector. Set box to LOW (73 ohms).	Temperature gauge reads around the C band ▶	GO to Step B2.
		Oil reads at or below L band ▶	GO to Step B3
		Pointer does not move ▶	GO to Step B4.
B2	TESTING TEMPERATURE SENDER CIRCUIT AT HIGH		
	• TEMPERATURE GAUGE • Set test box to HIGH (9.7 ohms).	Temperature gauge reads around the H grad ▶	REPLACE sender.
		Temperature gauge does not read around the H grad ▶	GO to Step B4.
B3	TESTING ON CABLE SENDER CIRCUIT AT HIGH		
	• OIL GAUGE • Set test box to 0 ohms (short circuit).	Oil gauge reads MID SCALE or slightly above ▶	REPLACE switch.
		Oil gauge does not read MID SCALE or slightly above ▶	GO to Step B4.
B4	CHECK SENDER CIRCUIT WIRING		
	• Check sender circuit wiring and cluster flexible circuit for shorts or open with ohmmeter.	Wiring and flex circuit OK ▶	REPLACE gauge. GO to A1.
		Wiring shorted or open. Flex circuit damaged ▶	REPAIR wiring / flex circuit. GO to A1.

Oil Pressure Gauge: Pinpoint Tests

Fig. 11 Troubleshooting Chart

Fig. 11 Troubleshooting Chart

Fig. 12 Troubleshooting Chart

Oil Pressure Gauge: Component Tests and General Diagnostics

CONSTANT VOLTAGE REGULATOR GAUGE SYSTEM (CVR)

1. Disconnect battery ground cable and remove gauge from vehicle.

2. Connect ohmmeter between gauge terminals and read coil winding resistance.

3. An upward movement of ohmmeter needle from 10 ohms to 14 ohms is normal, as test current of ohmmeter causes a temperature rise in gauge coil windings.

4. If ohmmeter reads below 10 ohms or above 14 ohms, gauge is defective.

MAGNETIC GAUGE SYSTEM

1. Ensure voltage is present at fuse panel and cluster.

2. Install gauge tester tool No. 021-00055 or equivalent, following manufacturer's instructions. This tester can be used on the CVR or Magnetic Gauge systems.

Oil Pressure Gauge: Tools and Equipment

Tester tool No. 021-00055 or equivalent should be used to diagnose these type gauges, following manufacturer's instructions.

Oil Pressure Warning Lamp/Indicator: Description and Operation

Many trucks utilize a warning light on the instrument panel in place of the conventional dash indicating gauge to warn the driver when the oil pressure is dangerously low. The warning light is wired in series with the ignition switch and the engine unit--which is an oil pressure switch. The oil pressure switch contains a diaphragm and a set of contacts. When the ignition switch is turned on, the warning light circuit is energized and the circuit is completed through the closed contacts in the pressure switch. When the engine is started, build-up of oil pressure compresses the diaphragm, opening the contacts, thereby breaking the circuit and putting out the light.

Oil Pressure Warning Lamp/Indicator: Testing and Inspection

The oil pressure warning light should go on when the ignition is turned on. If it does not light, disconnect the wire from the engine unit and ground the wire to the frame or cylinder block. Then if the warning light still does not go on with the ignition switch on, replace the bulb. If the warning light goes on when the wire is grounded to the frame or cylinder block, the engine unit should be checked for being loose or poorly grounded. If the unit is found to be tight and properly grounded, it should be removed and a new one installed. (The presence of sealing compound on the threads of the engine unit will cause a poor ground). If the warning light remains lit when it normally should be out, replace the engine unit before proceeding further to determine the cause for a low pressure indication. The warning light will sometimes light up or flicker when engine is idling, even though oil pressure is adequate. However, light should go out when engine speed is increased.

General Information

LIGHT TRUCK: 1990-93 AEROSTAR, RANGER 1991-93 EXPLORER

This TSB is being republished in its entirety to correct the type of cleaner being used in Figures 1, 3, and 6.

ISSUE: The many sources of leaks which typically appear at the lower end, front end, intake manifold valley, and rocker cover rails have led to mis-diagnosis as to the source of the leak and improper repair procedures, repeat repairs, and customer dissatisfaction.

ACTION: This TSB article has been developed to list the latest sealing techniques and associated part numbers for:

^ Oil Pan

^ Rear Main Seal

^ Rocker Covers

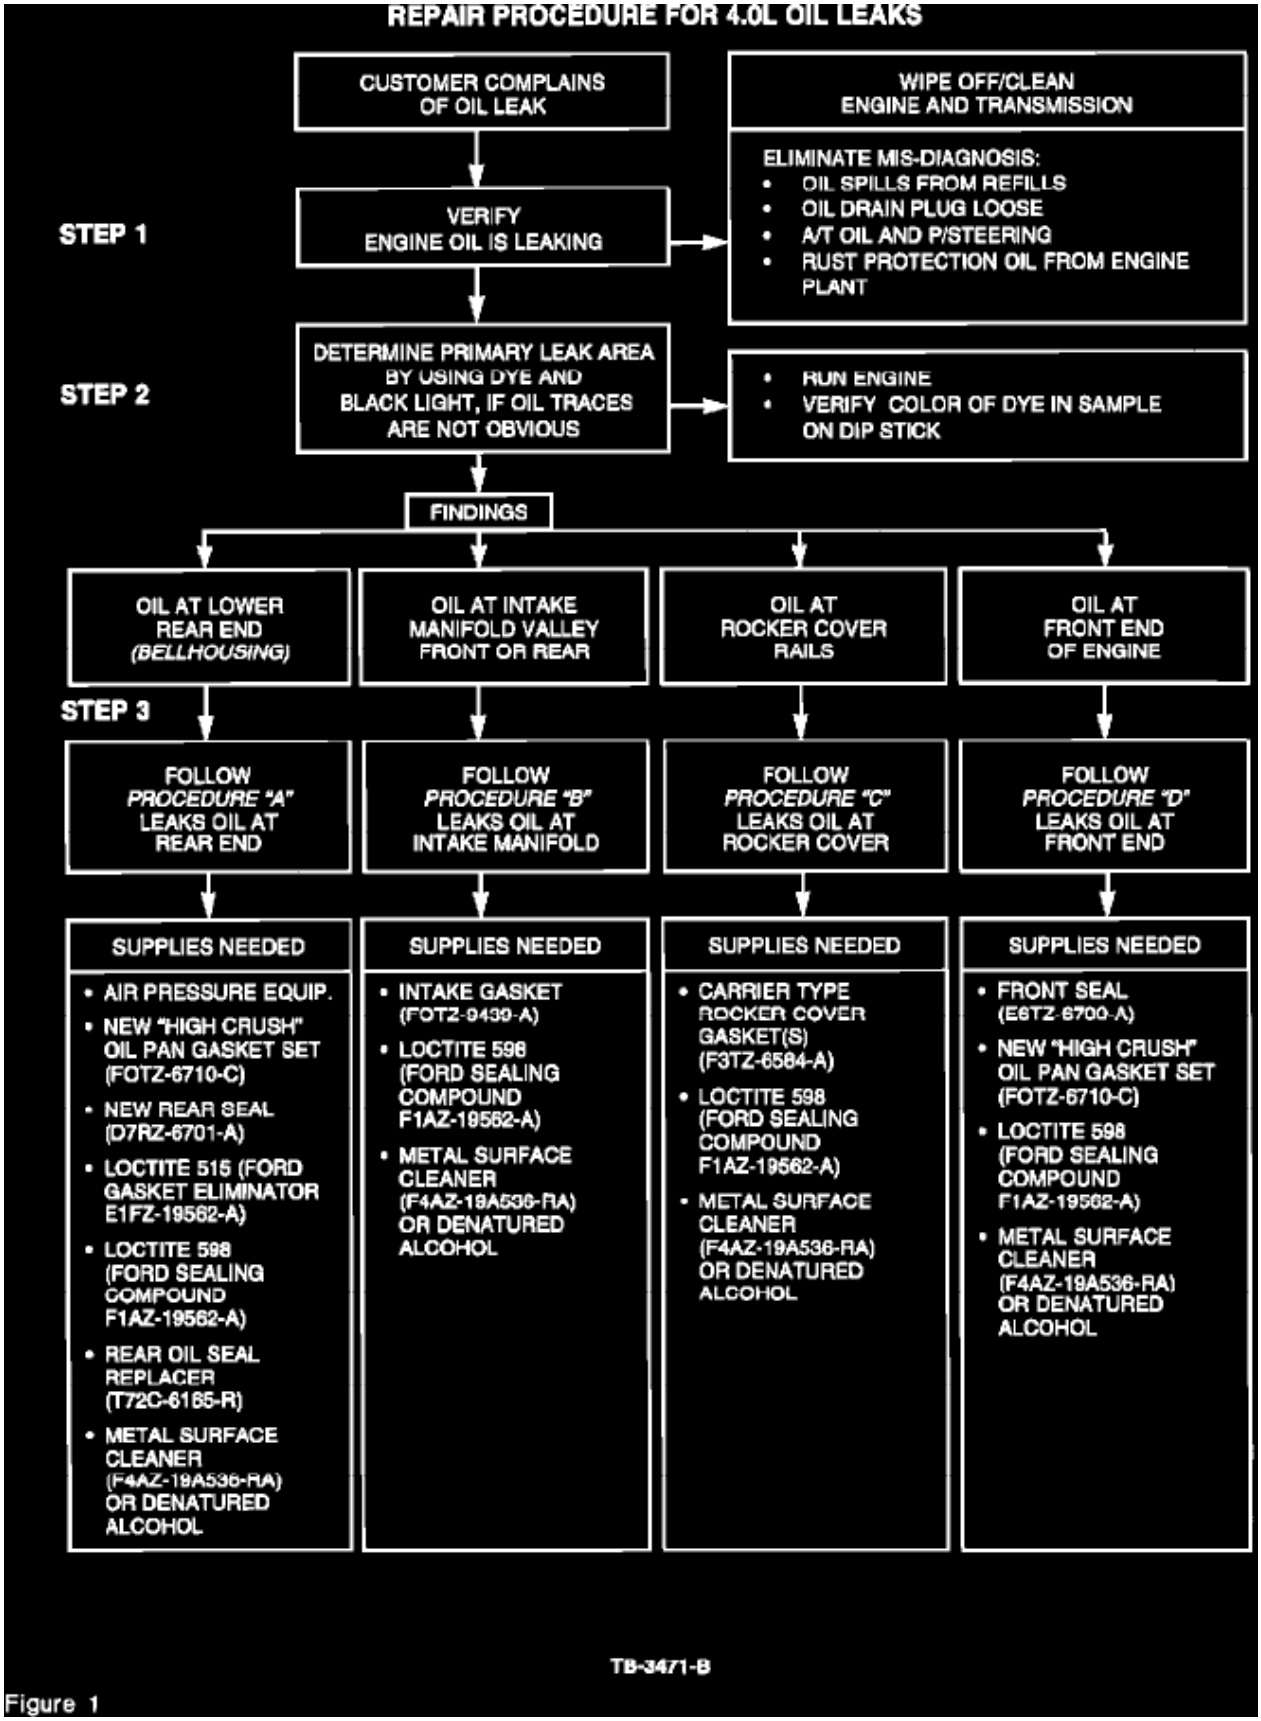

Figure 1

^ Intake Manifold

This article attempts to fully address all issues as one, in order to provide a diagnostic guide which leads to proper diagnosis and repair the first time. Use the following procedures to verify the location of the oil leak and perform the repair.

Service Procedure - Diagnosis

1. Perform Steps 1 and 2 of the block diagram shown in Figure 1. Perform a visual inspection to determine the general area of the oil leak.

2. After determining the "Findings" of Step 2, perform Step 3 by following Procedures A, B, C or D, whichever is appropriate, up to, but not including the air pressure test.

NOTE:

WHEN THE FINDINGS RESULT IN FOLLOWING PROCEDURE "A" FOR "LEAKS OIL AT REAR END", IT IS VERY IMPORTANT TO FOLLOW THE BLOCK DIAGRAM INSTRUCTIONS TO REMOVE THE TRANSMISSION, IF AN AEROSTAR, AND TO REMOVE THE ENGINE, IF AN EXPLORER/RANGER. THE PRACTICE OF REMOVING EXPLORER/RANGER OIL PANS WITH ENGINE IN VEHICLE CAN RESULT IN FAULTY DIAGNOSIS AND/OR REPAIR FOR THE PURPOSES OF THIS TSB.

If the leak has not been located and corrected at this point, then fabricate a device that is capable of applying a constant 1 to 3 psi of air pressure to the engine crankcase. The Rotunda Leak Tester 134-00003, or equivalent, which contains a pressure regulator and gauge capable of a 1 to 3 psi range, may be used.

3. Verify the location of the oil leak by pressurizing the engine crankcase with a constant supply of 3 psi of air pressure and the use of leak detection solution (liquid detergent and water). This process will verify the exact location of the leak. Dye and black light will verify a leak is present, but may not verify the exact location of the leak.

a. Assemble the necessary hose and fittings to connect an air pressure regulator and air pressure gauge to the shop air supply and to the engine crankcase through the dipstick tube.

b. Test the device to make sure 1-3 psi of air pressure can be maintained. Bursts of pressure over 3 psi can damage engine seals.

c. Before starting the test, make sure the regulator valve is completely closed so as not to accidentally apply a big burst of air to the engine when starting the test.

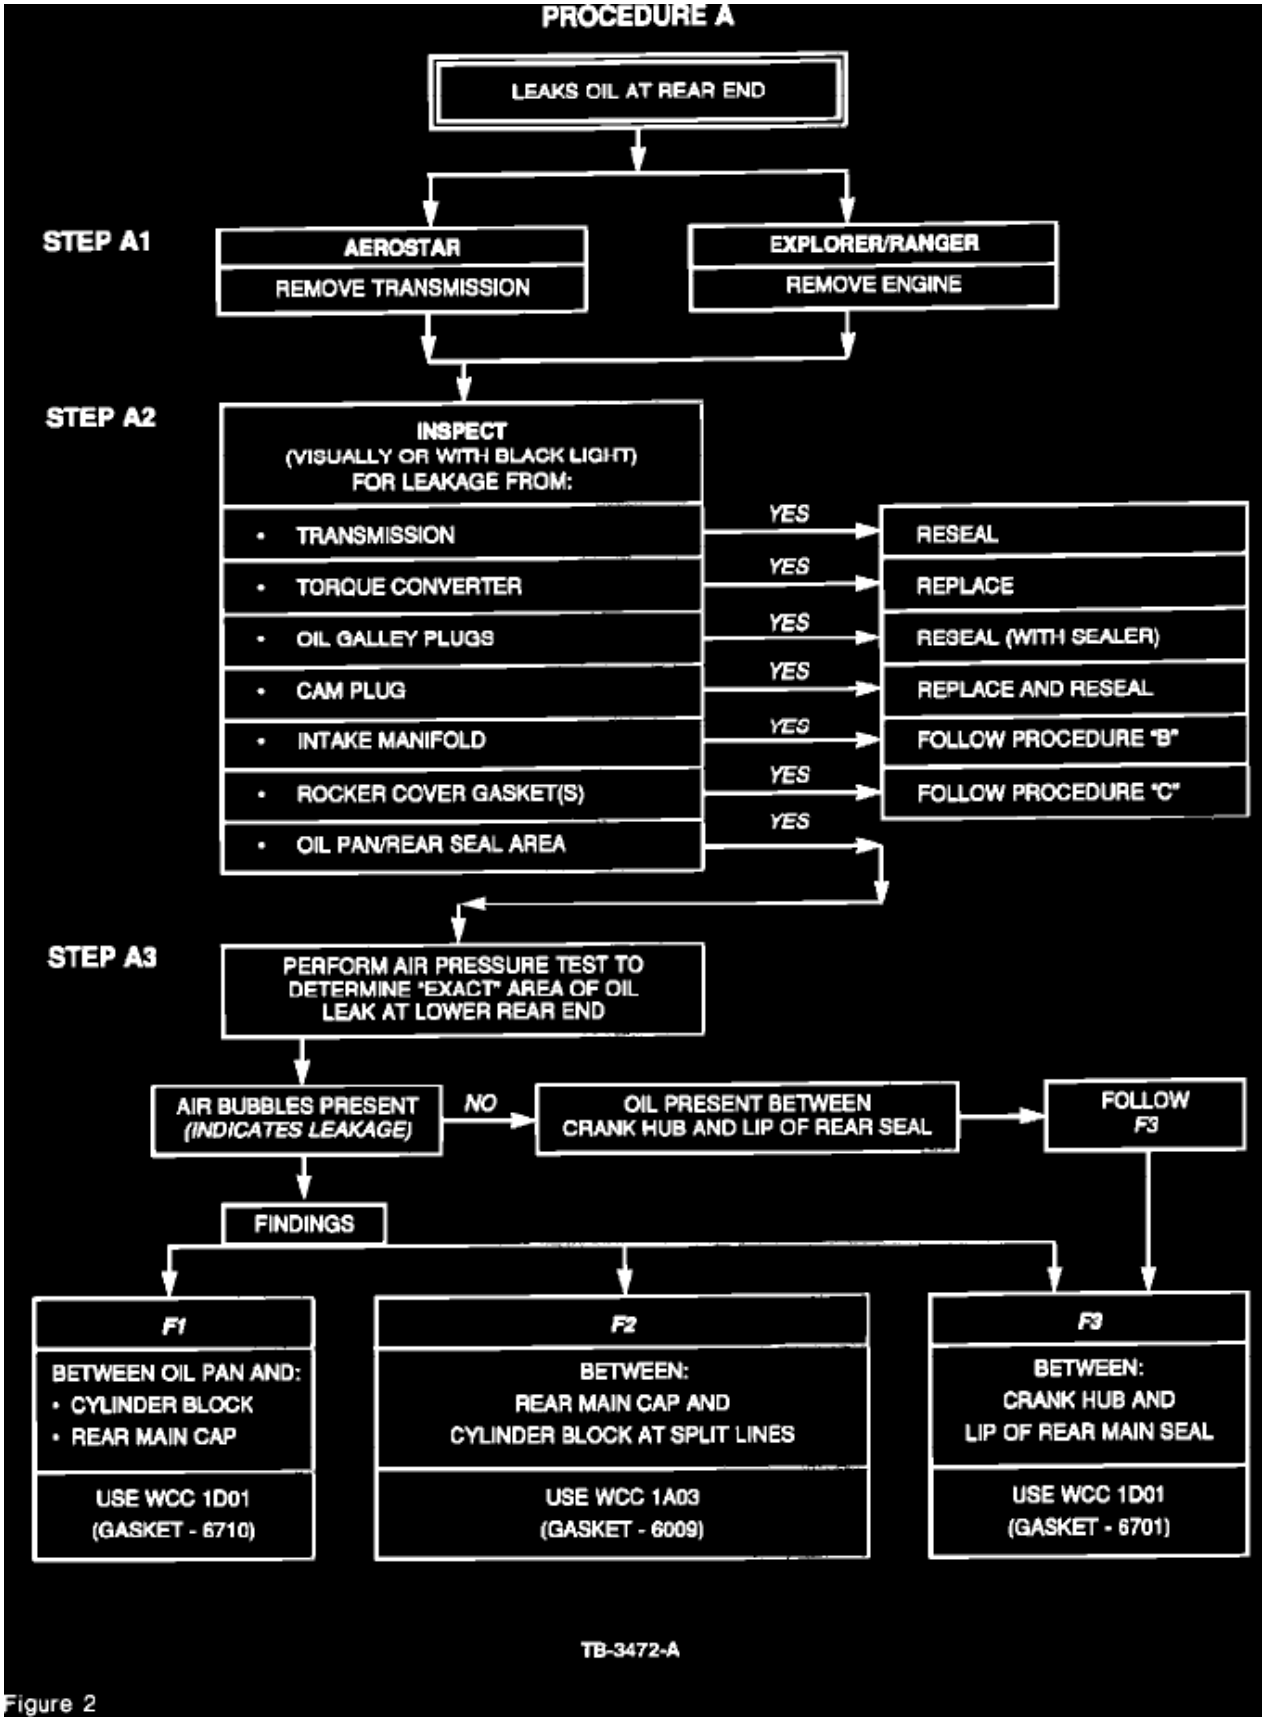
d. Attach the outlet (regulated) hose from the regulator/gauge device to the dipstick.

e. To trap air in the engine, plug any ports and passages (PCV valve, air inlet connection) that will allow air to escape.

f. Slowly open the regulator valve until 1-3 psi of air pressure registers on the gauge.

g. Keeping air pressure applied, brush or squirt a solution of liquid detergent and water or commercially available liquid leak detector (Snoop, Bubbles) to the primary area identified in Step 2 of the block diagram.

^ If the primary area is in the rear seal area, apply the solution to the rear seal, rear cap, rear cap to cylinder block and oil pan gasket areas.



PROCEDURE A

Figure 2

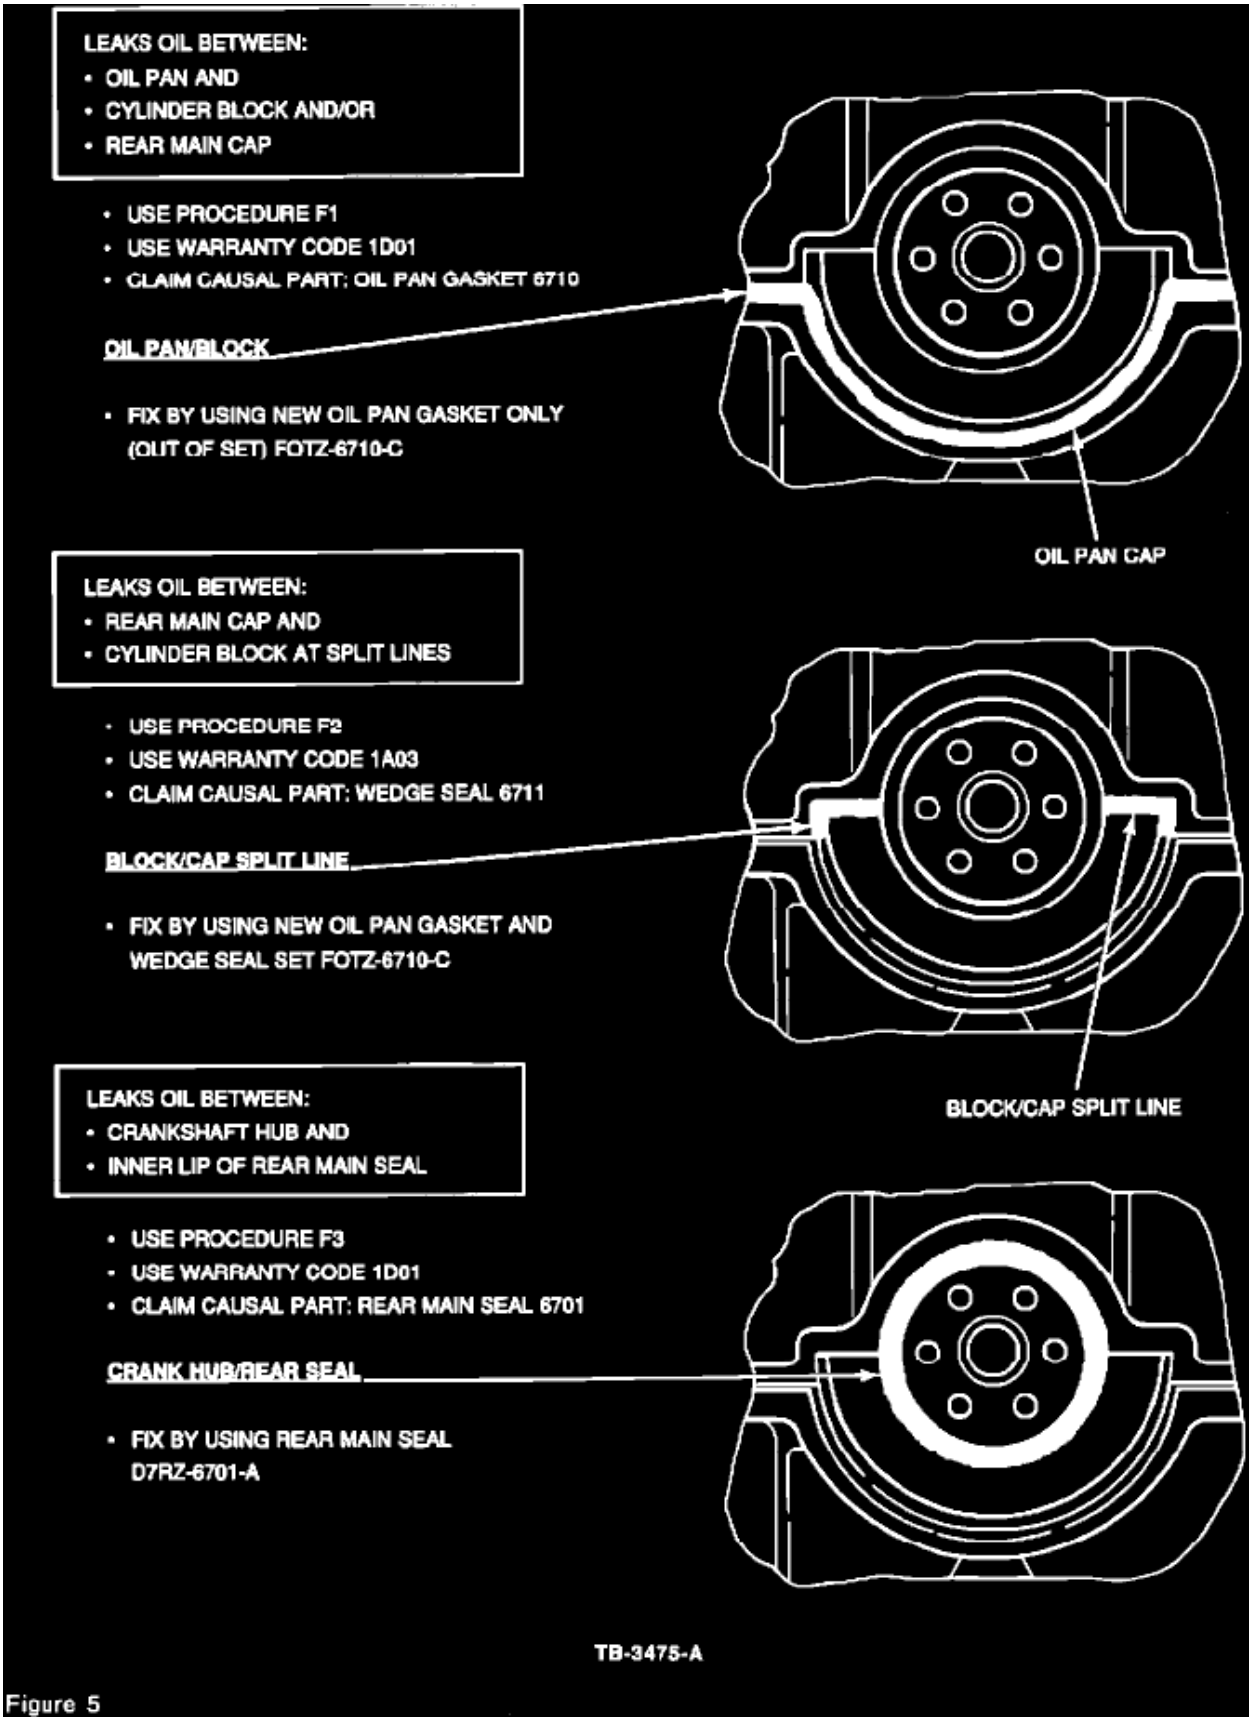

Figure 5

^ If bubbles are detected only at the oil pan gasket, between the oil pan and the cylinder block, or between the oil pan and the rear main cap, only the oil pan gasket needs replacing. Note

Procedure A, Figure 2, Step A3/F1, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A1.

^ If bubbles are detected between the rear main cap and the cylinder block, the rear cap must be removed and resealed. Note Procedure A, Figure 2, Step A3/F2, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A2.

^ If bubbles are detected between the rear seal lip and crank hub, a new rear oil seal will be required. Under certain circumstances, as outlined in the block diagram, it will be necessary to call the 4.OL Hotline. Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A3.

^ If no bubbles are detected, but oil is present in the area between the crank hub and the lip of the rear seal, carefully remove the seal and inspect the crankshaft rear seal journal. (A leak may occur

at the rear seal only when the engine is running.) Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Follow repair procedures outlined on the block diagram.

NOTE:

ANY APPEARANCE OF RUST, PITTING, POROSITY, OR NICKS ON THE REAR SEAL JOURNAL WILL CAUSE A LEAK.

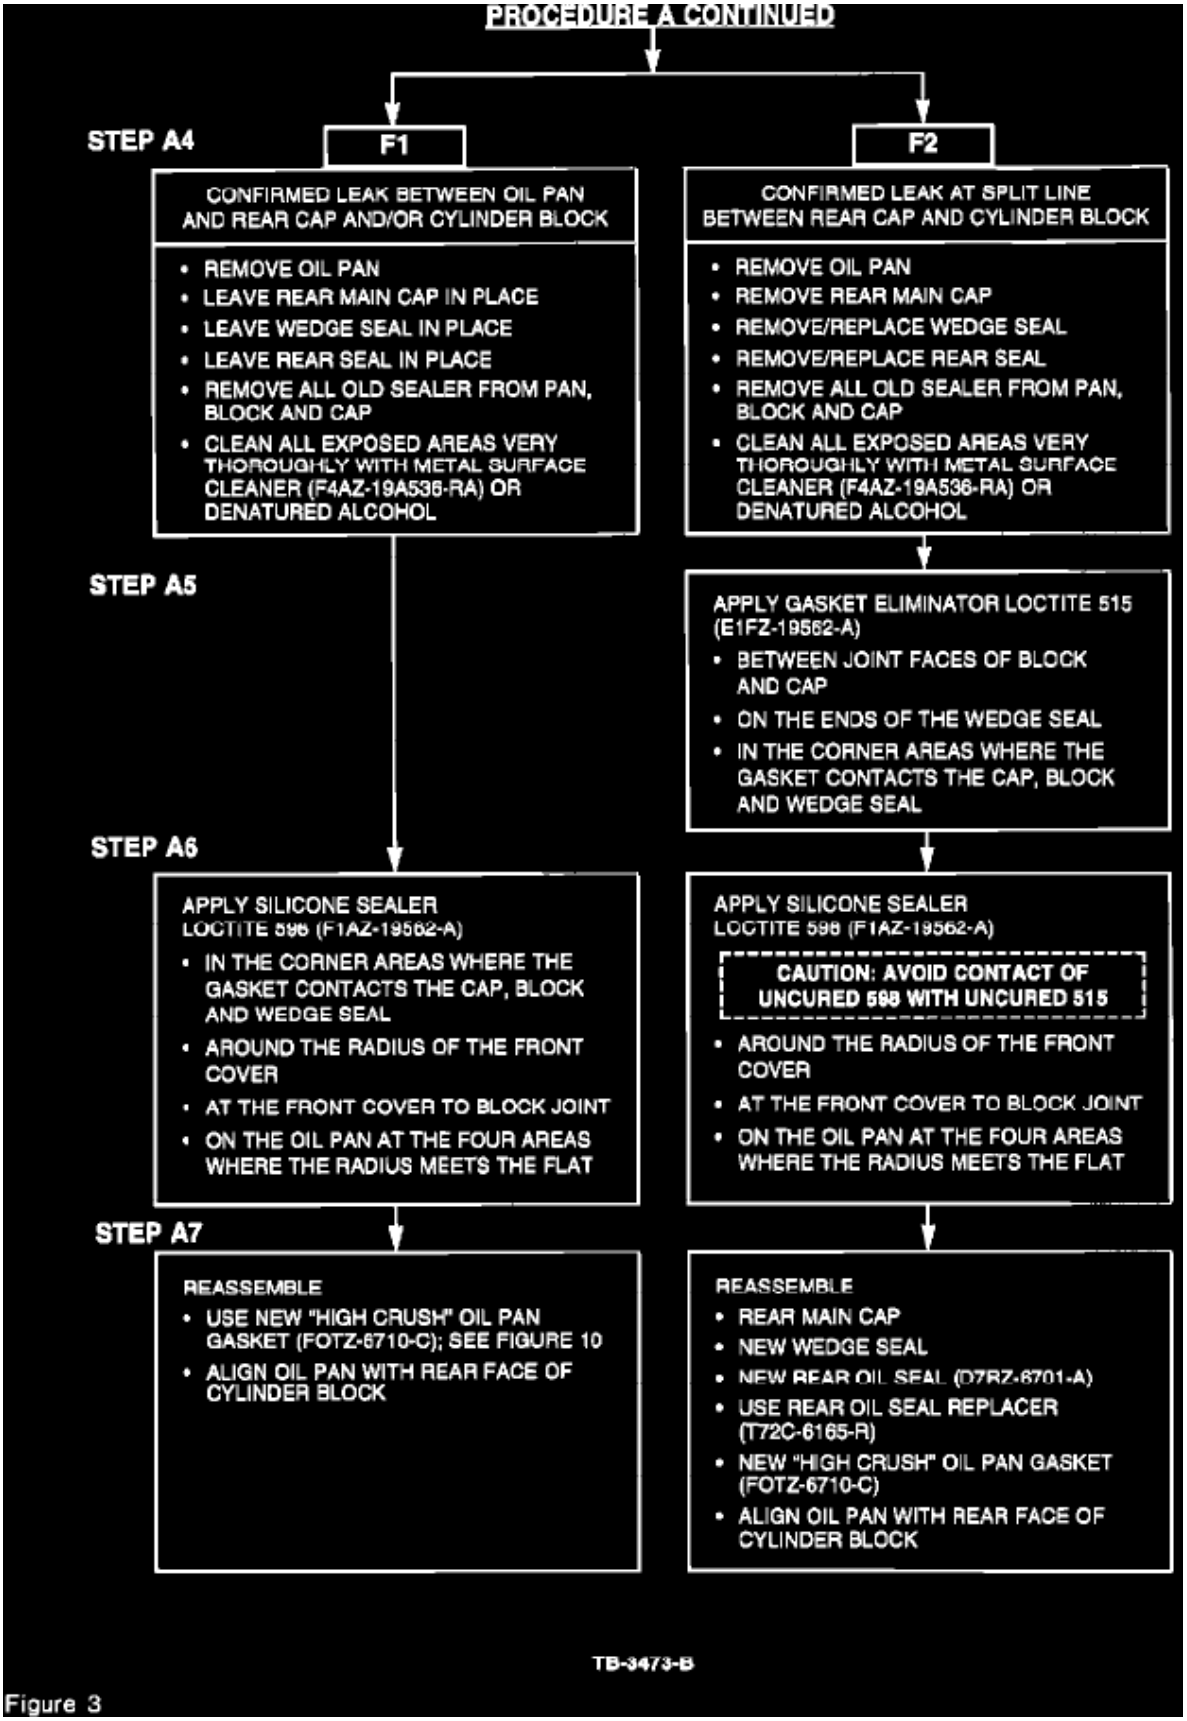
^ If bubbles are detected at the front or rear of the intake manifold gasket, a new intake manifold gasket (FOTZ-9439-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT INTAKE MANIFOLD, PROCEDURE B.

^ If bubbles are detected at the rocker cover rails, new rocker cover gaskets (F3TZ-6584-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT ROCKER COVER RAILS, PROCEDURE C.

^ If bubbles are detected at the front end of the engine, a new front seal (E6TZ-6700-A) or oil pan gasket (FOTZ-6710-C) will be required. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT THE FRONT END, PROCEDURE D.

Service Procedure - Repair

REAR END OIL LEAK - PROCEDURE A



PROCEDURE A CONTINUED
STEP A4
F1
CONFIRMED LEAK BETWEEN OIL PAN AND REAR CAP AND/OR CYLINDER BLOCK
• REMOVE OIL PAN
• LEAVE REAR MAIN CAP IN PLACE
• LEAVE WEDGE SEAL IN PLACE
• LEAVE REAR SEAL IN PLACE
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
F2
CONFIRMED LEAK AT SPLIT LINE BETWEEN REAR CAP AND CYLINDER BLOCK
• REMOVE OIL PAN
• REMOVE REAR MAIN CAP
• REMOVE/REPLACE WEDGE SEAL
• REMOVE/REPLACE REAR SEAL
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
STEP A5
APPLY GASKET ELIMINATOR LOCTITE 515 (E1FZ-19562-A)
• BETWEEN JOINT FACES OF BLOCK AND CAP
• ON THE ENDS OF THE WEDGE SEAL
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
STEP A6
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
CAUTION: AVOID CONTACT OF UNCURED 598 WITH UNCURED 515
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
STEP A7
REASSEMBLE
• USE NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C); SEE FIGURE 10
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
REASSEMBLE
• REAR MAIN CAP
• NEW WEDGE SEAL
• NEW REAR OIL SEAL (D7RZ-6701-A)
• USE REAR OIL SEAL REPLACER (T72C-6165-R)
• NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C)
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
TB-3473-B
Figure 3

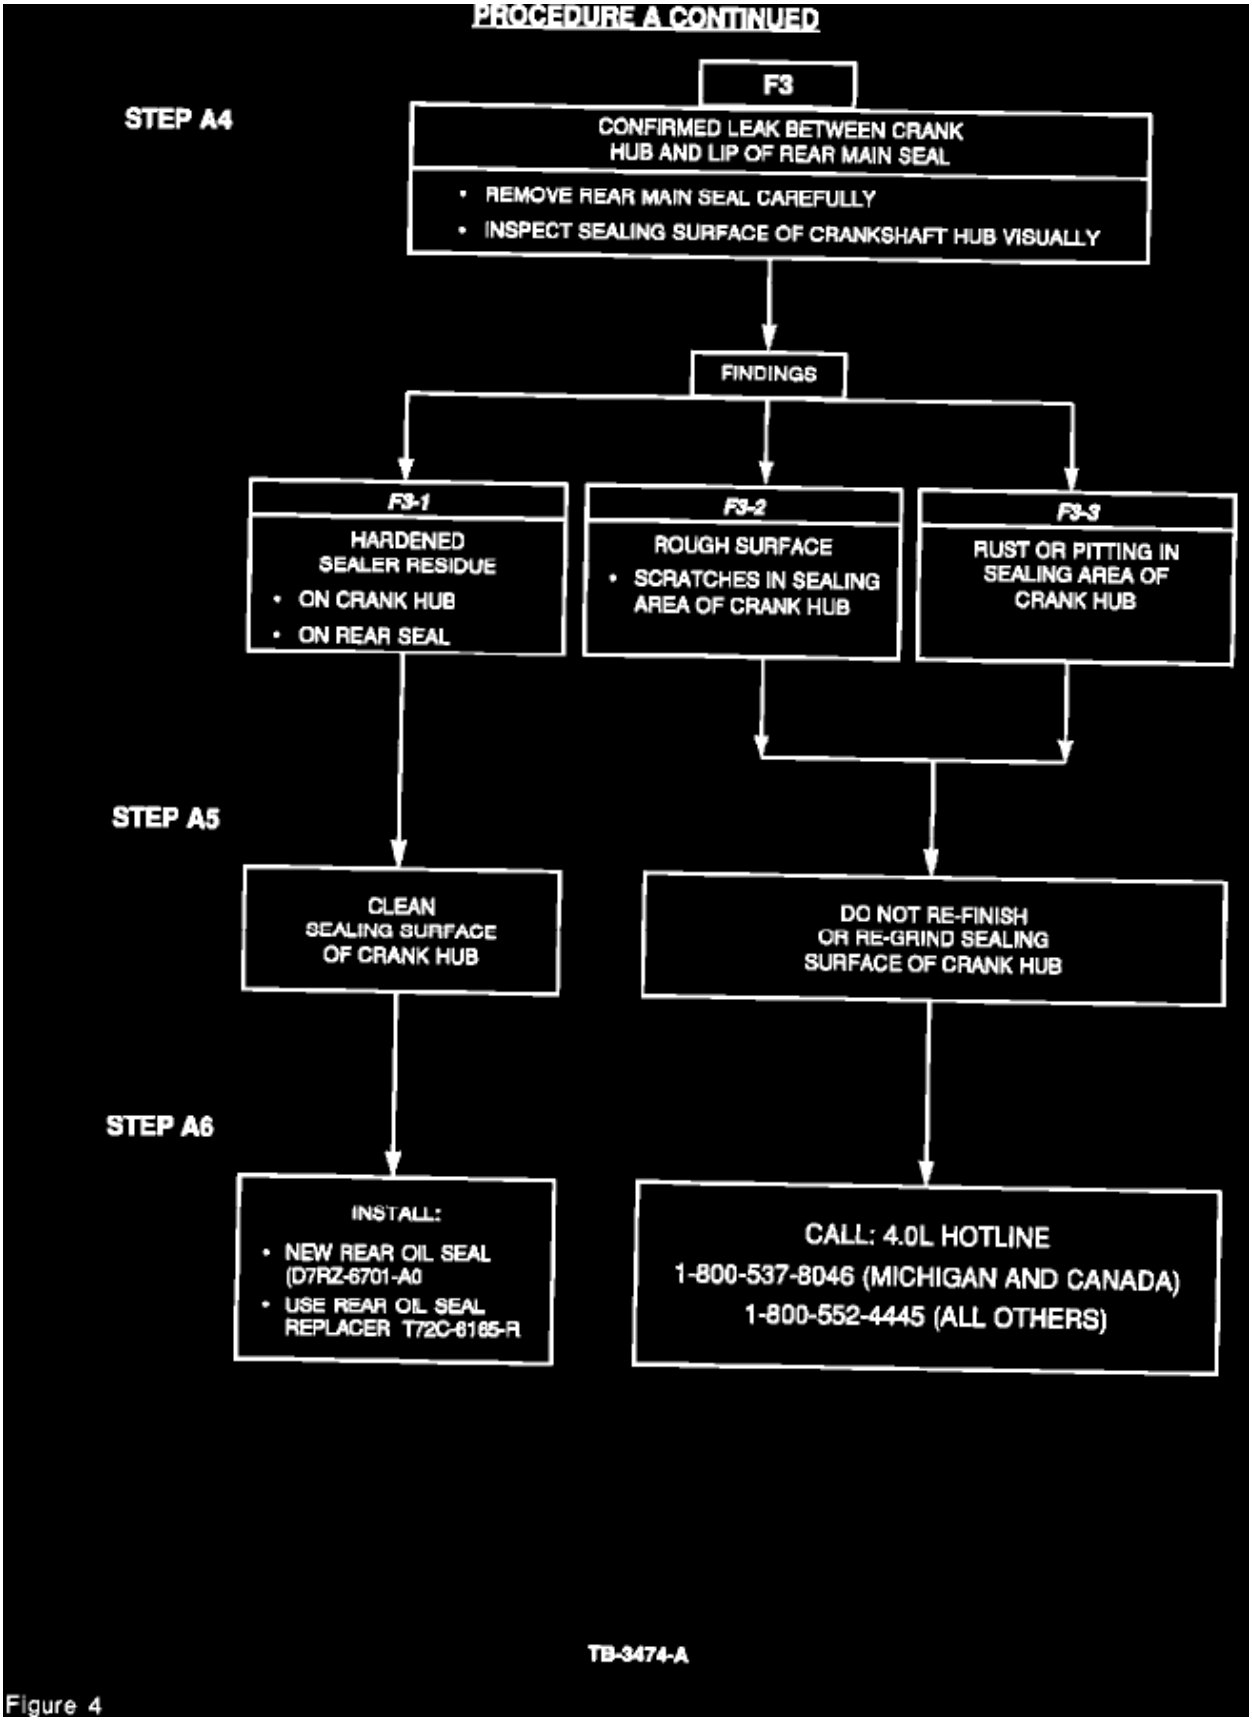


Figure 4

1. Repair procedure for a leak at oil pan gasket between the oil pan and cylinder block, or between the oil pan and the rear main cap. See block diagram Procedure A, Step A4/F1, Figures 3 and 4.

a. Remove the oil pan from the engine and remove the old gasket from the oil pan. Do not remove the rear main cap or wedge seal from the engine.

b. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

c. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap. Take special care to scrape/scratch all the old sealer from the exposed areas of the rear cap, wedge seal and cylinder block. This is a critical sealing area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER BLOCK.

d. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

e. Clean the transmission "BELLHOUSING" area, the rear of the cylinder block and the rear engine plate of ALL oil residue.

f. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corner of the radius areas at the front and rear of the oil pan.

g. Place the oil pan gasket (FOTZ-6710-C) in place in the groove in the oil pan.

h. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the corners where the rear main cap meets the cylinder block, at the corner areas of the radius area on the front cover and the front cover to cylinder block joint.

i. Set the oil pan in place and snug the four (4) pan nuts.

j. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .0100" (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

k. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

2. Repair procedure for a leak between the rear main cap and the cylinder block. See block diagram Procedure A, Step A4/F2.

a. Remove the oil pan, windage tray, oil pump and rear main cap from the engine.

b. Remove the rear main oil seal from the crankshaft and thoroughly inspect the main seal journal of the crankshaft for signs of rust, pitting, nicks or porosity.

c. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

d. Clean ALL the old sealer from the rear main bearing cap USING A SCRAPER AND WIRE WHEEL. The original Loctite sealer used during production assembly becomes extremely hard after it has cured. It is extremely important that ALL the old sealer be removed from the joint faces and grooves.

e. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap joint area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER

BLOCK.

f. Clean ALL the oil and old sealer from the "WEDGE SEAL" that fits around the rear main bearing cap in the oil pan gasket groove. Preferably use a new "WEDGE SEAL".

g. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

h. Clean the transmission "BELLHOUSING AREA", the rear of the cylinder block and the rear engine plate of ALL oil residue.

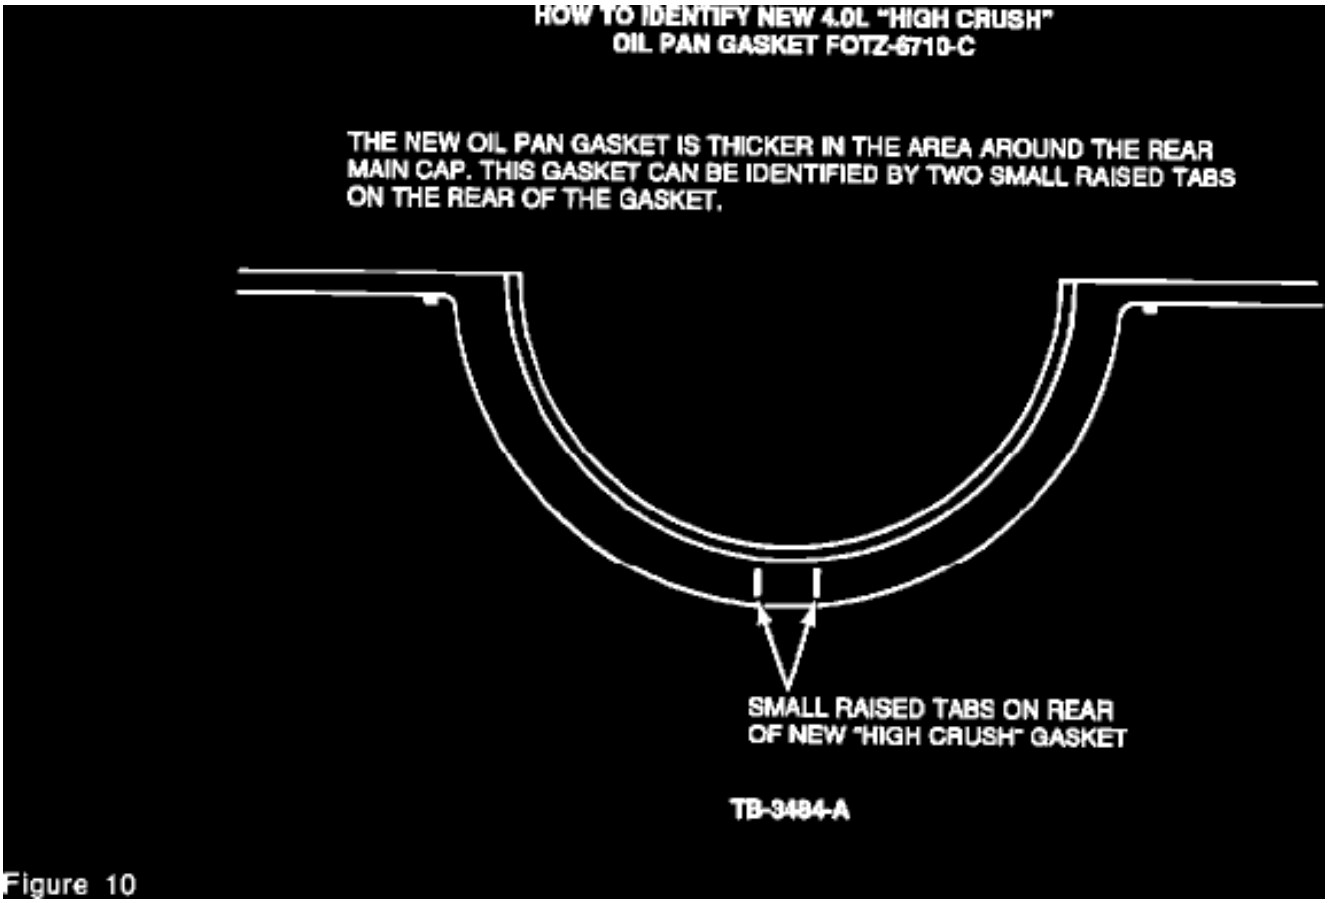

Figure 10

i. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) on the cylinder block along the corners of the rear main bearing cap joint area and on the joint face, approximately 1/2 inch (12.7 mm) from the rear of the block.

j. Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.

k. Align the rear main bearing cap to cylinder block by moving the bearing fore or aft (approx. 1/2 inch (12.7 mm) inward in the rear oil seal bore) so that the rear seal stop of the block and cap line up. This will assure that the rear main oil seal will seat squarely when installed in the bore.

l. Torque the rear main cap bolts to 66-77 lb.ft. (90-104 N-m).

m. Fill the cavities for the "WEDGE SEAL" on both sides of the rear main cap with Ford Gasket Eliminator (E1FZ-19562-A).

n. Place "WEDGE SEAL" in place and use a flat bladed screwdriver to fully seat the "WEDGE SEAL", forcing the excessive sealer out.

o. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) in the corners of the oil pan gasket groove of the rear main cap where the cap meets the cylinder block.

p. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) at the corner areas of the radius area on the front cover and at the front cover to cylinder block joint.

q. Reinstall the oil pump and windage tray. Torque to 13-15 lb.ft. (17-21 N-m).

r. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corners of the radius areas at the front and rear of the oil pan.

s. Place the oil pan gasket (FOTZ-6710-C), Figure 10, in place in the groove in the oil pan.

t. Set the oil pan in place and snug the four (4) oil pan bolts.

u. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .01000 (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

v. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

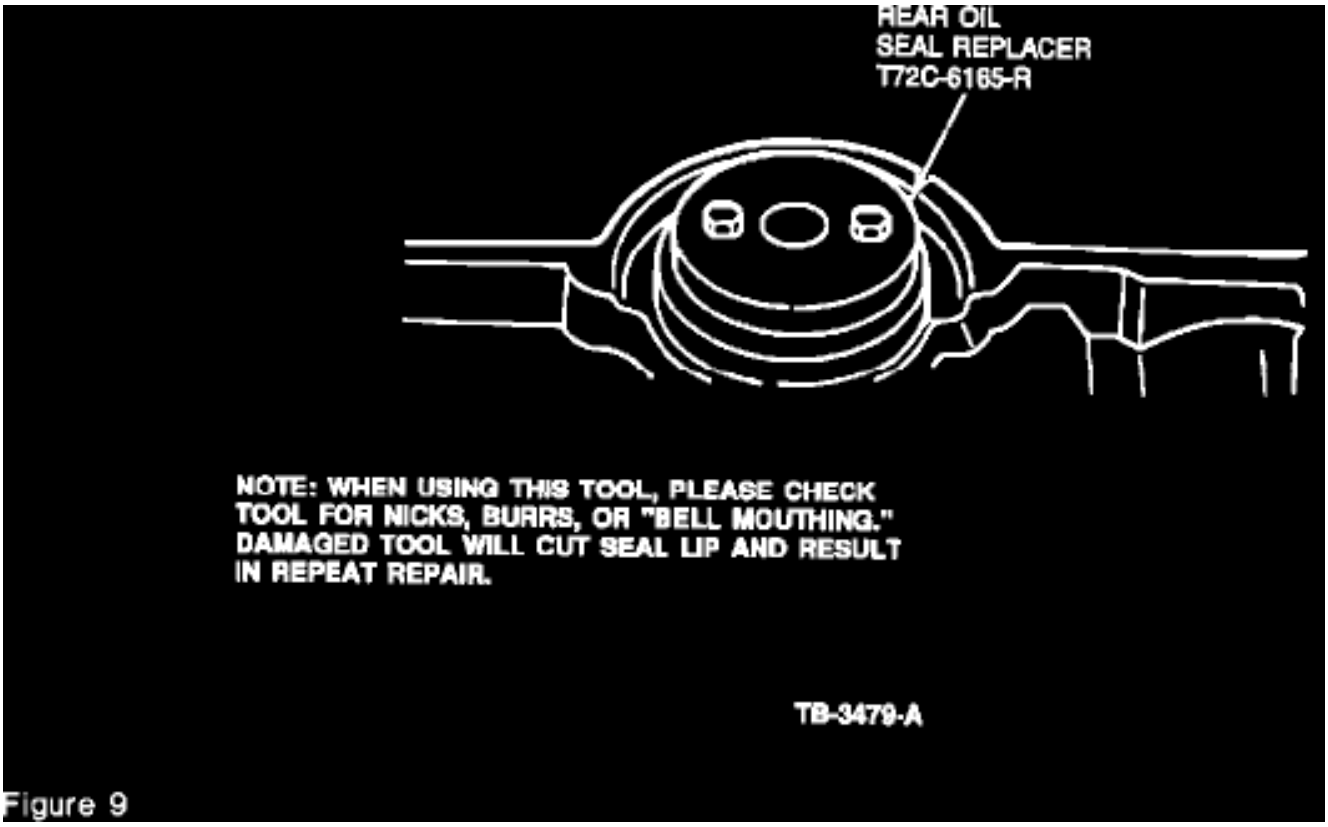

Figure 9

w. Coat the rear main oil seal (D7RZ-6701-A) with oil. Install the rear seal in the seal bore using Rear Oil Seal Replacer T72C-6165-R. This tool uses two flywheel bolts to draw the seal into position. Refer to Figure 9.

CAUTION:

DO NOT USE THE OLD STYLE HAMMER OPERATED TOOL.

3. Repair procedure for a leak between the rear main seal and the crankshaft. See block diagram, Procedure A, Step A4/F3.

a. Any presence of rust on the rear seal journal will cause a leak.

b. Any presence of pitting, porosity or nicks on the rear seal journal will cause a leak.

NOTE:

IF A LEAK IS PRESENT BETWEEN THE REAR MAIN SEAL AND CRANKSHAFT, PLEASE NOTIFY THE 4.0L "HOTLINE" AT (800) 537-8046 OR (800) 552-4445 PRIOR TO ANY ATTEMPT TO REPAIR THIS CONDITION.

Service Procedure - Repair For Oil Leaks At Intake Manifold

PROCEDURE B

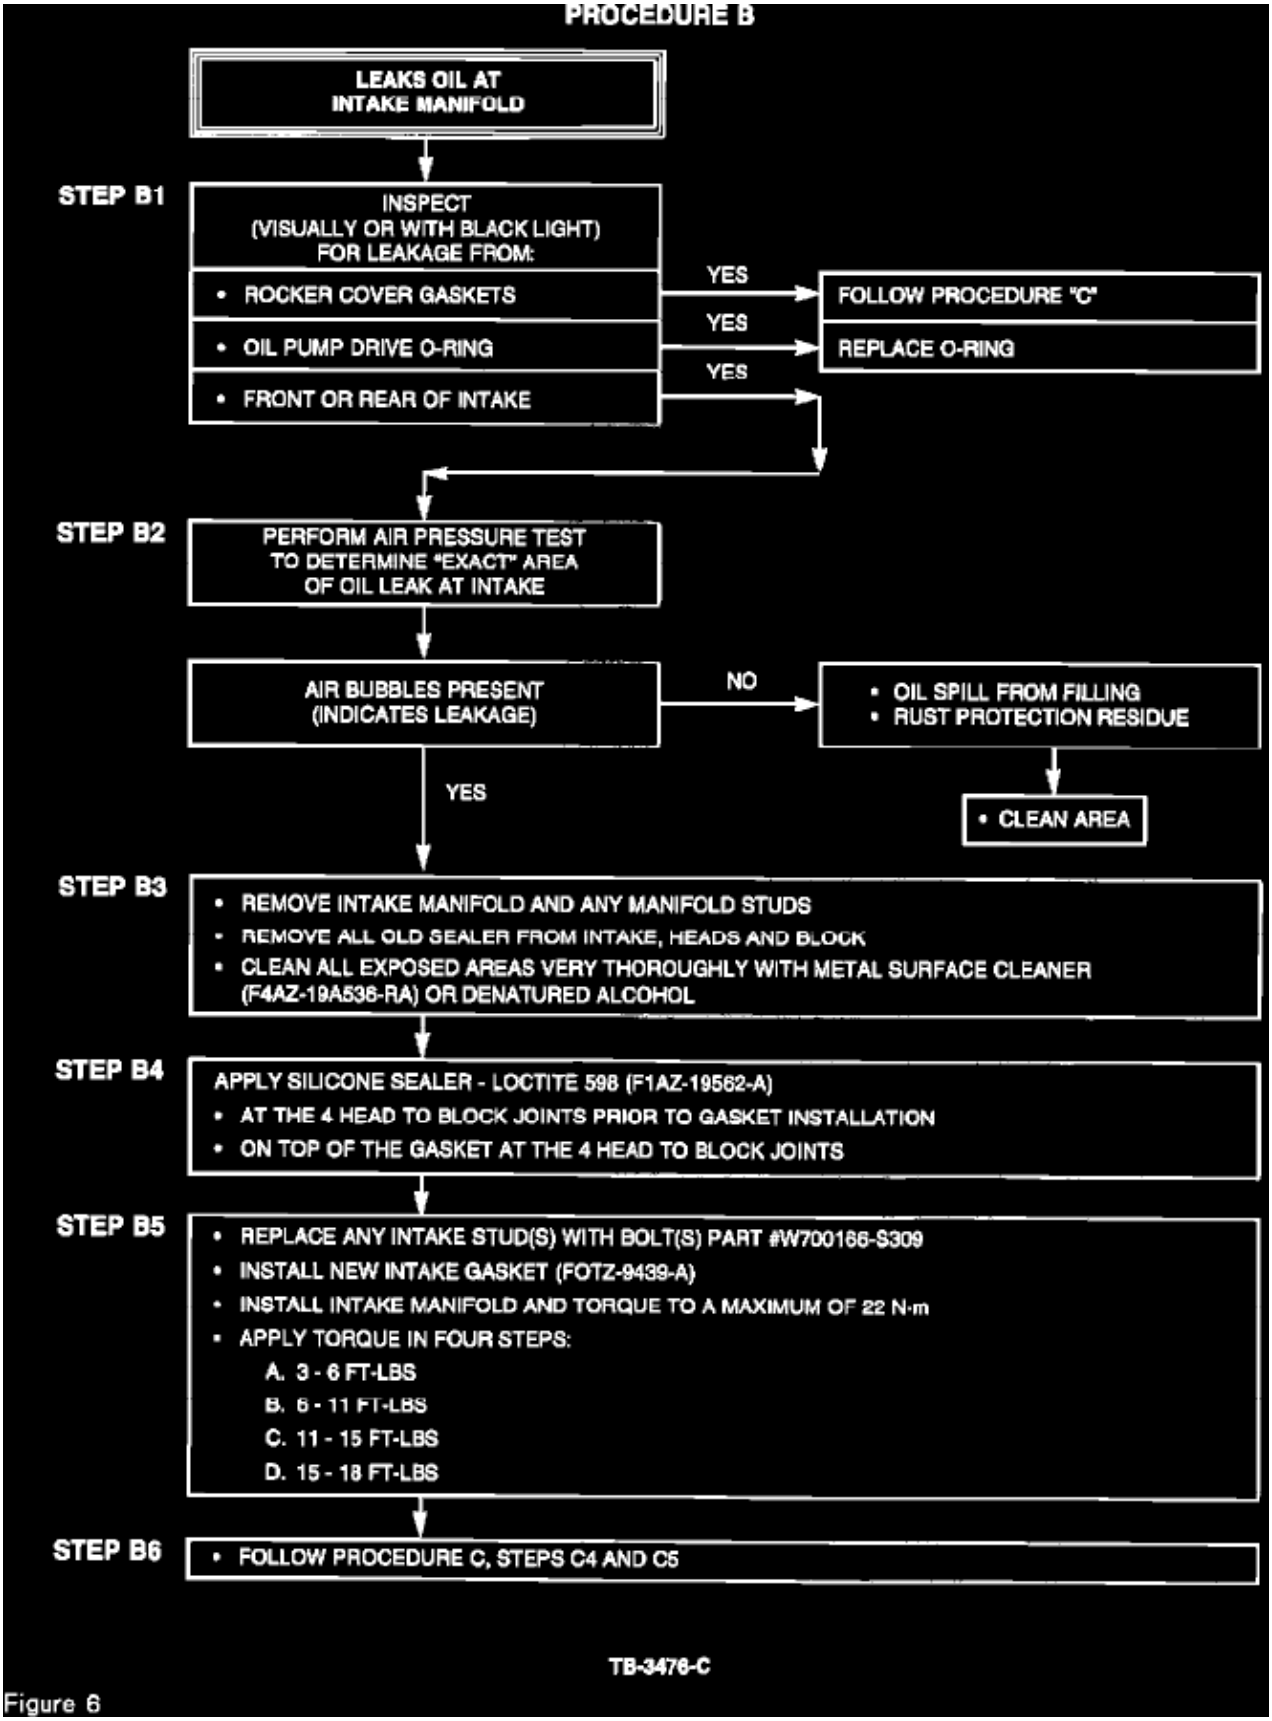

Figure 6

1. If the air pressure test showed no air bubbles, follow Procedure B2 to clean area of oil spill or other contamination.

2. If the air pressure test showed air bubbles present, follow Steps B3 through B6. Refer also to the Service Manual for the applicable year for further information pertinent to removal and installation of the intake manifold.

Service Procedure - Repair For Oil Leaks At Rocker Cover Rails

PROCEDURE C

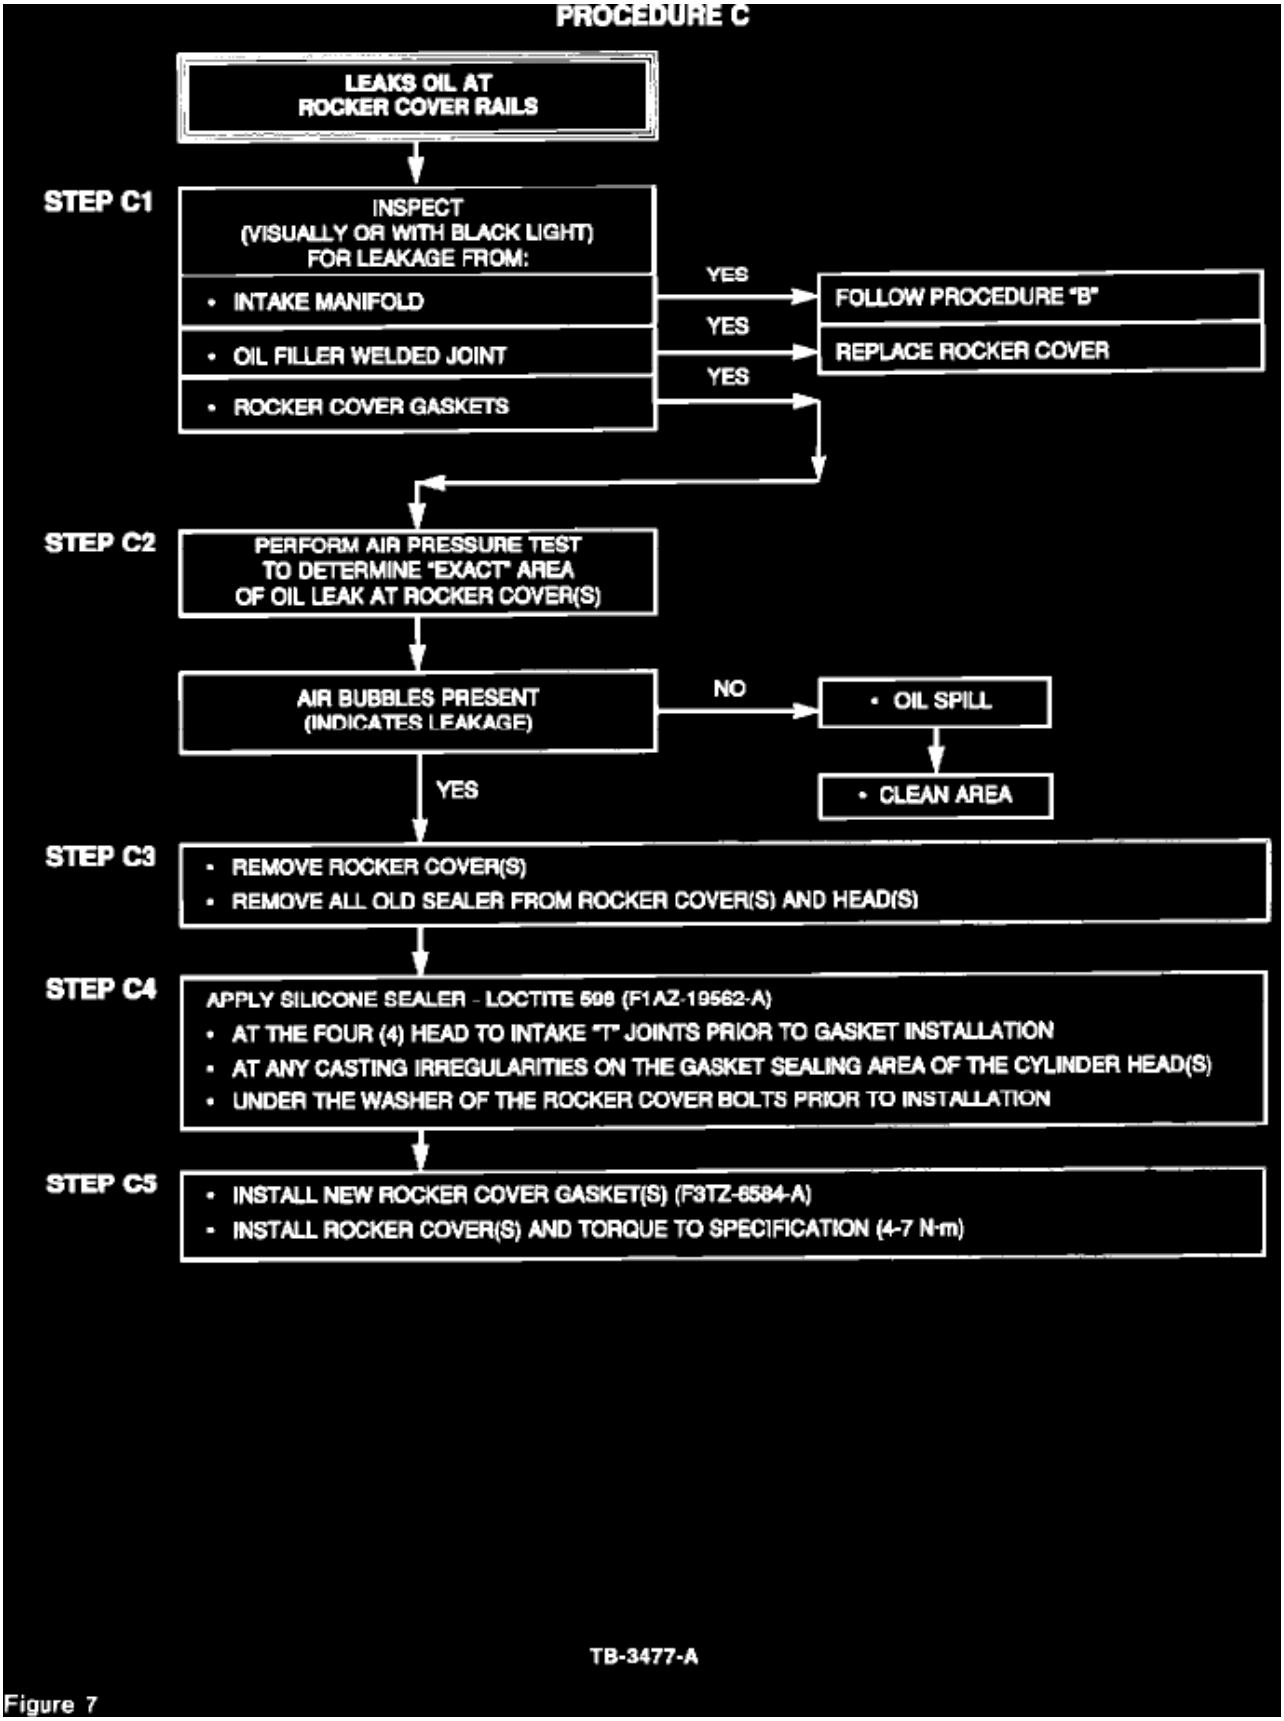

Figure 7

1. If the air pressure test showed no air bubbles, follow Procedure C2 to clean the area of any oil spill.

2. If the air pressure test showed air bubbles present, follow Steps C3 through C5.

Service Procedure - Repair For Oil Leaks At Front End

PROCEDURE D

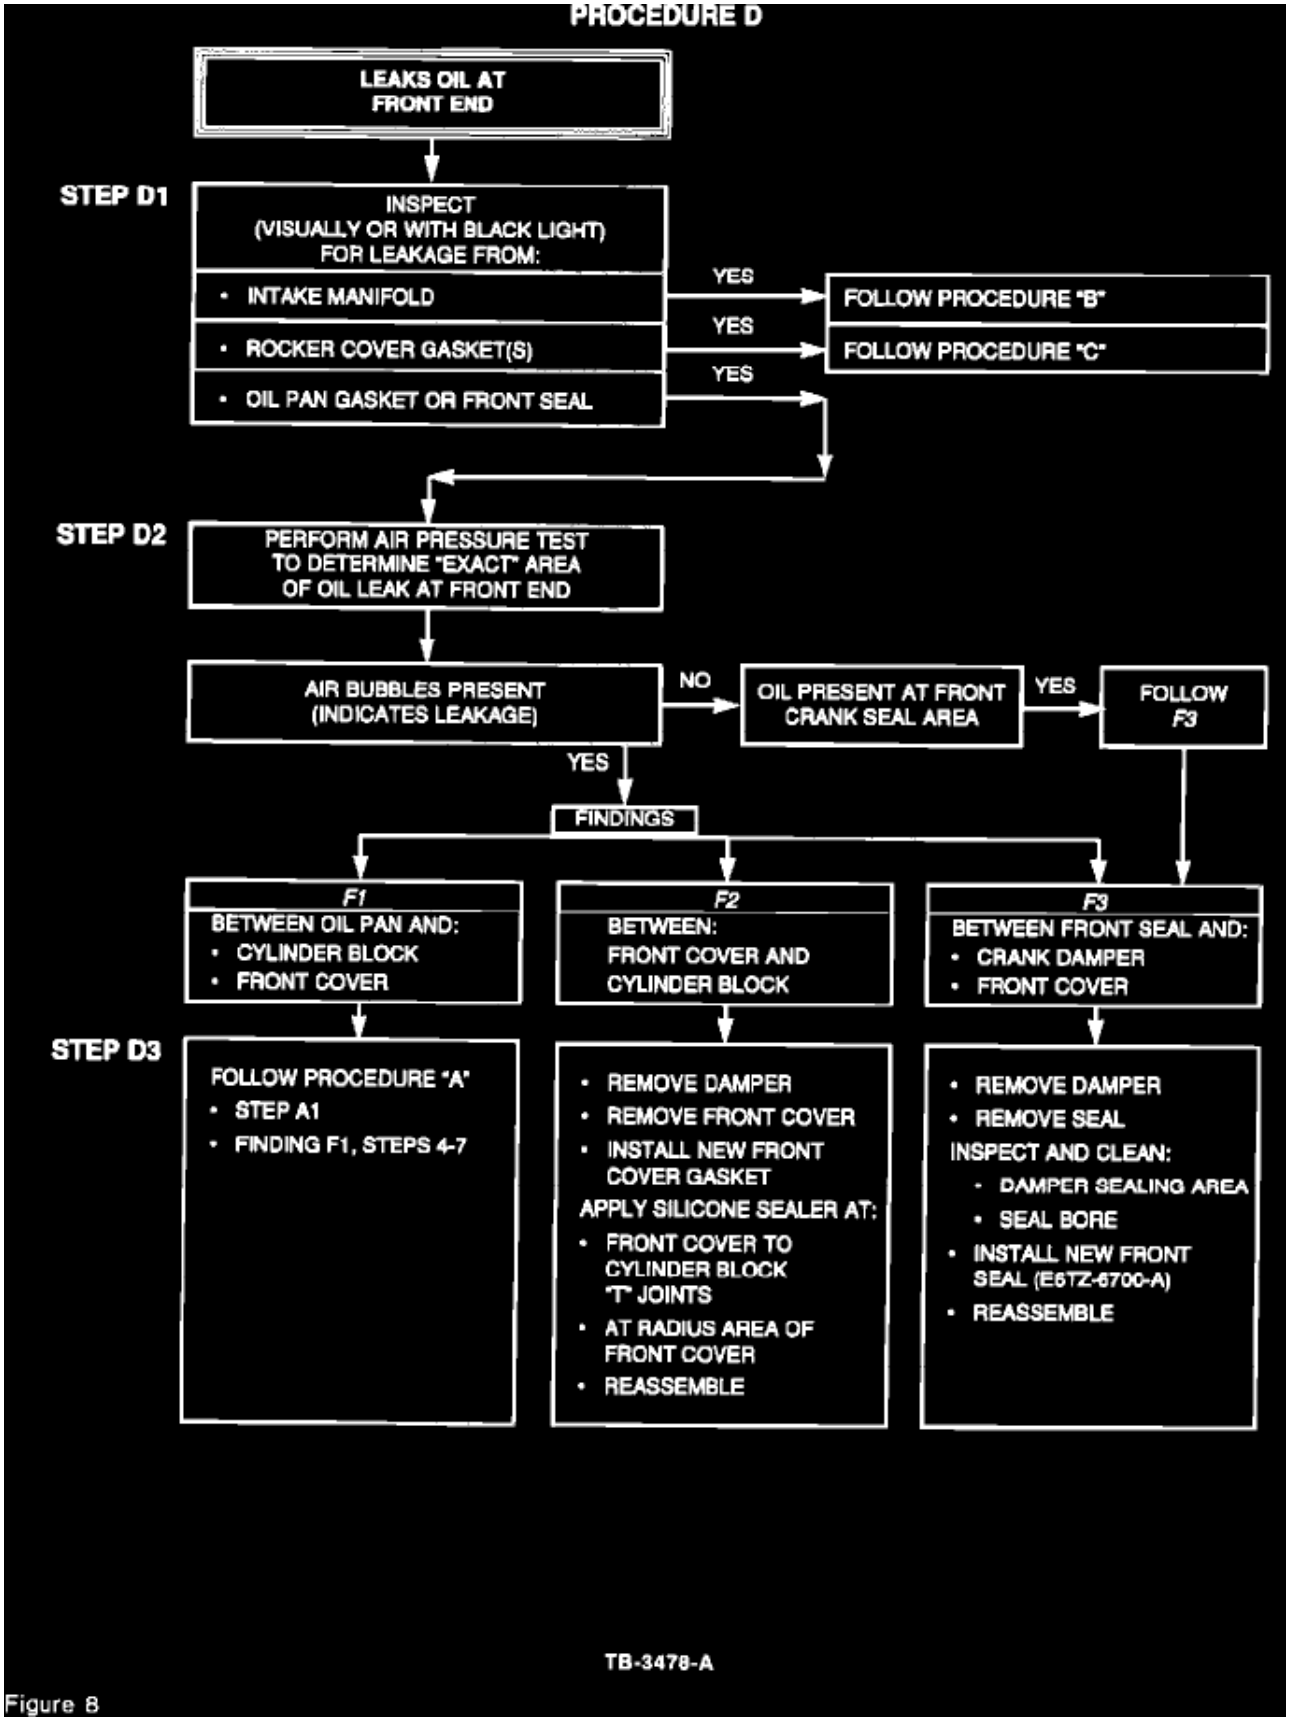

Figure 8

1. If the air pressure test showed no air bubbles, follow Procedure D, F3.

2. If the air pressure test showed air bubbles present, follow Procedure D, F1 or F2 as appropriate.

Crankshaft Main Bearing Seal: All Technical Service Bulletins Rear Main Oil Seal Replacement - Service Tip

Article No. 95-1-8

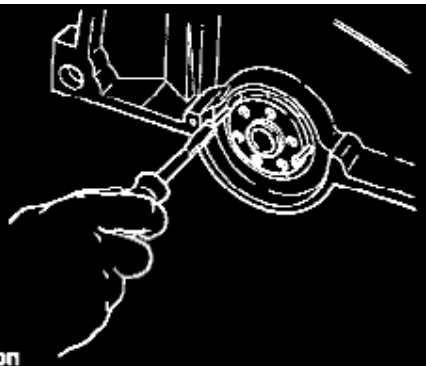
01/16/95

^ LEAK - REAR MAIN OIL SEAL REPLACEMENT - VEHICLES WITH 4.0L ENGINES - SERVICE TIP

^ REAR MAIN SEAL - 4.0L - NEW INSTALLATION TOOL

LIGHT TRUCK: 1990-94 AEROSTAR, RANGER 1991-94 EXPLORER

ISSUE: A redesigned tool for installation of rear main seals is available and must be used for all rear main seal replacements. Prior released tools (T72C-6165) and (T72C-6165-R) must not be used. Usage of obsolete tools may cause oil leaks due to seal damage, crankshaft journal damage or mispositioning of the seal.



Installation

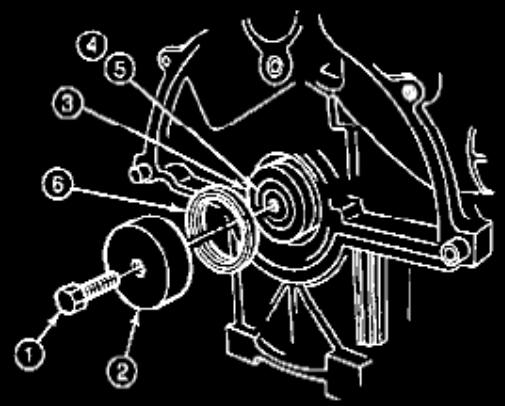
Crankshaft rear oil seals used for service applications can come either with or without a metallic crankshaft sleeve. Special Service Tool T95T-6701-A, Rear Crankshaft Seal Replacer, is used for both applications.

The rear crankshaft seal adapter and two (2) mounting screws attach to the crankshaft. The threaded hole in the center of the crankshaft seal adapter is used by the rear crankshaft seal replacer to draw down and locate the crankshaft rear oil seal.

The rear crankshaft seal protector is used for installing seals without a metallic sleeve. It is not used when installing a rear main oil seal with a sleeve.

CAUTION: Do not remove the metal sleeve from the seal.

CAUTION: This installation procedure requires the used of hand tools only. The used of power tools or hammering on the installer can damage the sleeve and seal.



Item	Part Number	Description
1	—	Bolt (Part of T95T-6701-A)
2	T95T-6701-A2	Rear Crankshaft Seal Replacer
3	T95T-6701-A1	Rear Crankshaft Seal Protector
4	T95T-6701-A4	Bolts
5	T95T-6701-A3	Rear Crankshaft Adapter
6	6701	Crankshaft Rear Oil Seal

Seal Installation With Metal Sleeve

1. Attach the rear crankshaft adapter to the rear of the crankshaft using the supplied mounting screws.
2. Apply a few drops of clean engine oil to the inboard side of the seal/sleeve at the area where the seal contacts the sleeve.
3. Apply a very light film of clean engine oil on the inner diameter of the sleeve and outer diameter of seal.
4. Slide the seal/sleeve over the rear crankshaft seal adapter with flange to the rear of the engine.
5. **NOTE: It is normal for the seal to sit approximately 0.76mm (0.030 inch) deeper than the sleeve flange. DO NOT ADJUST.**

   Use the rear crankshaft seal replacer and supplied bolt to push the rear seal into the cylinder block.

   Remove rear crankshaft seal adapter.

TB-4149-A

Figure 1

ACTION: If an oil leak is detected, refer to TSB 94-12-13 for proper diagnosis of the oil leak. If, after diagnosis, it is determined that a new rear main seal needs to be installed, use the procedure

found in TSB 94-12-13. Be sure to use the new Rear Oil Seal Replacer Tool (T95T-6701-A) when installing a new rear main seal. Refer to Figure 1 for more details.

General Information

LIGHT TRUCK: 1990-93 AEROSTAR, RANGER 1991-93 EXPLORER

This TSB is being republished in its entirety to correct the type of cleaner being used in Figures 1, 3, and 6.

ISSUE: The many sources of leaks which typically appear at the lower end, front end, intake manifold valley, and rocker cover rails have led to mis-diagnosis as to the source of the leak and improper repair procedures, repeat repairs, and customer dissatisfaction.

ACTION: This TSB article has been developed to list the latest sealing techniques and associated part numbers for:

^ Oil Pan

^ Rear Main Seal

^ Rocker Covers

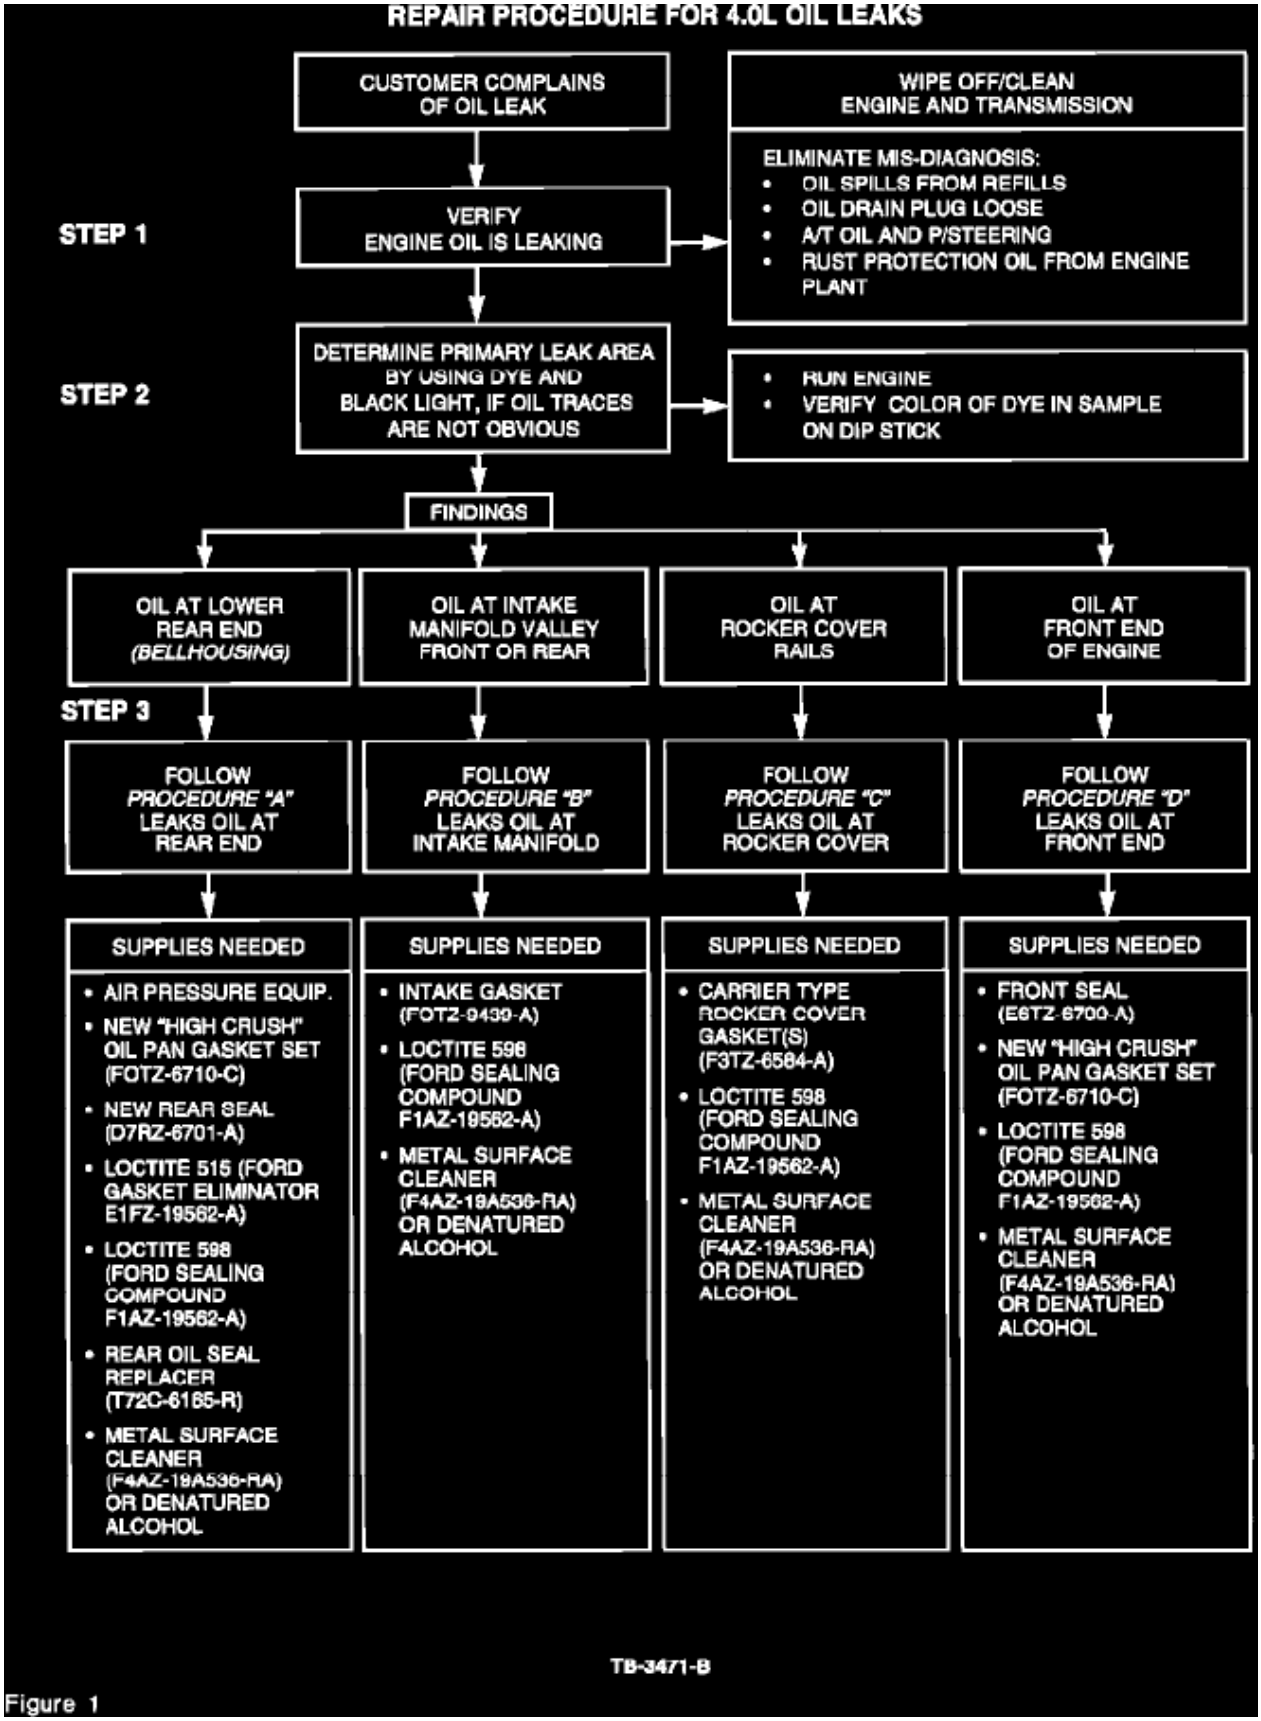

Figure 1

^ Intake Manifold

This article attempts to fully address all issues as one, in order to provide a diagnostic guide which leads to proper diagnosis and repair the first time. Use the following procedures to verify the location of the oil leak and perform the repair.

Service Procedure - Diagnosis

1. Perform Steps 1 and 2 of the block diagram shown in Figure 1. Perform a visual inspection to determine the general area of the oil leak.

2. After determining the "Findings" of Step 2, perform Step 3 by following Procedures A, B, C or D, whichever is appropriate, up to, but not including the air pressure test.

NOTE:

WHEN THE FINDINGS RESULT IN FOLLOWING PROCEDURE "A" FOR "LEAKS OIL AT REAR END", IT IS VERY IMPORTANT TO FOLLOW THE BLOCK DIAGRAM INSTRUCTIONS TO REMOVE THE TRANSMISSION, IF AN AEROSTAR, AND TO REMOVE THE ENGINE, IF AN EXPLORER/RANGER. THE PRACTICE OF REMOVING EXPLORER/RANGER OIL PANS WITH ENGINE IN VEHICLE CAN RESULT IN FAULTY DIAGNOSIS AND/OR REPAIR FOR THE PURPOSES OF THIS TSB.

If the leak has not been located and corrected at this point, then fabricate a device that is capable of applying a constant 1 to 3 psi of air pressure to the engine crankcase. The Rotunda Leak Tester 134-00003, or equivalent, which contains a pressure regulator and gauge capable of a 1 to 3 psi range, may be used.

3. Verify the location of the oil leak by pressurizing the engine crankcase with a constant supply of 3 psi of air pressure and the use of leak detection solution (liquid detergent and water). This process will verify the exact location of the leak. Dye and black light will verify a leak is present, but may not verify the exact location of the leak.

a. Assemble the necessary hose and fittings to connect an air pressure regulator and air pressure gauge to the shop air supply and to the engine crankcase through the dipstick tube.

b. Test the device to make sure 1-3 psi of air pressure can be maintained. Bursts of pressure over 3 psi can damage engine seals.

c. Before starting the test, make sure the regulator valve is completely closed so as not to accidentally apply a big burst of air to the engine when starting the test.

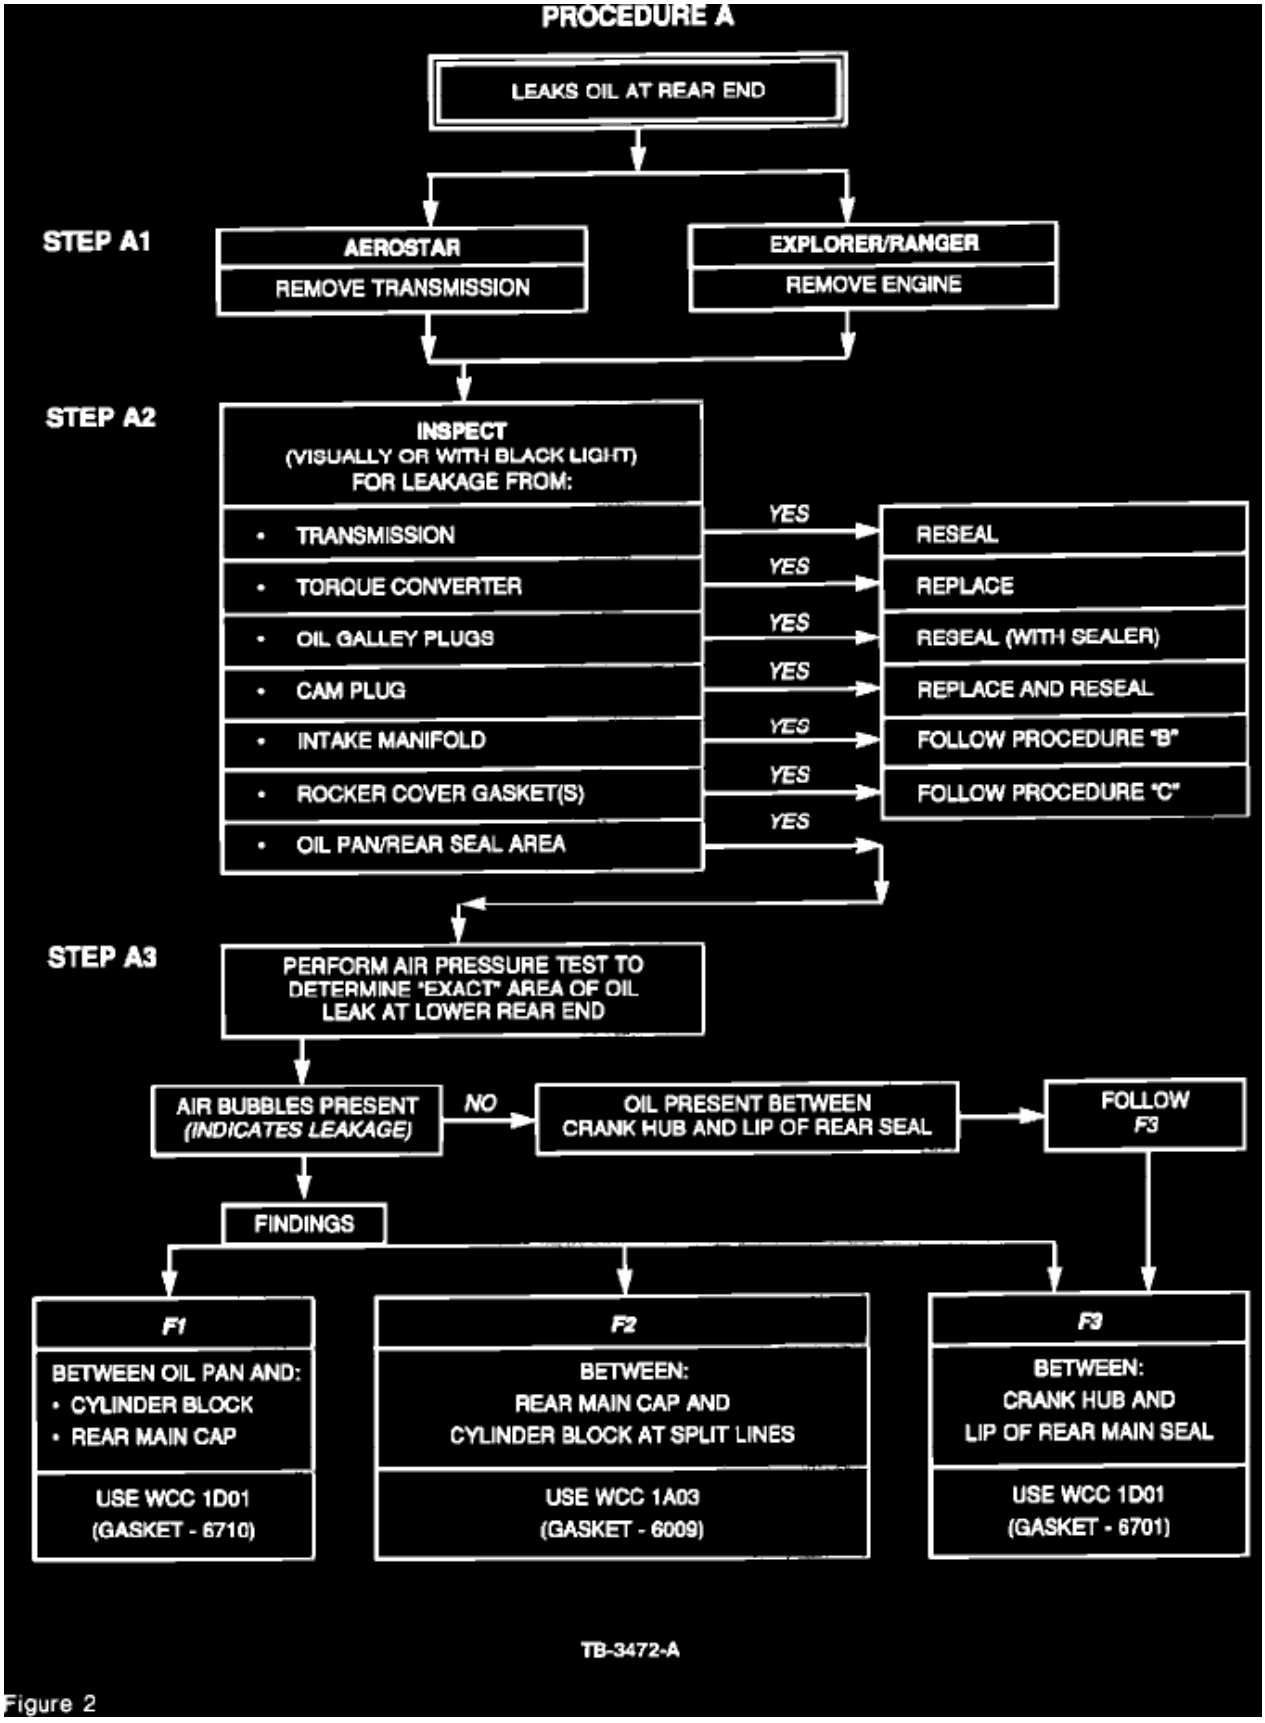
d. Attach the outlet (regulated) hose from the regulator/gauge device to the dipstick.

e. To trap air in the engine, plug any ports and passages (PCV valve, air inlet connection) that will allow air to escape.

f. Slowly open the regulator valve until 1-3 psi of air pressure registers on the gauge.

g. Keeping air pressure applied, brush or squirt a solution of liquid detergent and water or commercially available liquid leak detector (Snoop, Bubbles) to the primary area identified in Step 2 of the block diagram.

^ If the primary area is in the rear seal area, apply the solution to the rear seal, rear cap, rear cap to cylinder block and oil pan gasket areas.



PROCEDURE A
LEAKS OIL AT REAR END
STEP A1
AEROSTAR
REMOVE TRANSMISSION
EXPLORER/RANGER
REMOVE ENGINE
STEP A2
INSPECT
(VISUALLY OR WITH BLACK LIGHT)
FOR LEAKAGE FROM:
• TRANSMISSION
• TORQUE CONVERTER
• OIL GALLEY PLUGS
• CAM PLUG
• INTAKE MANIFOLD
• ROCKER COVER GASKET(S)
• OIL PAN/REAR SEAL AREA

Figure 2

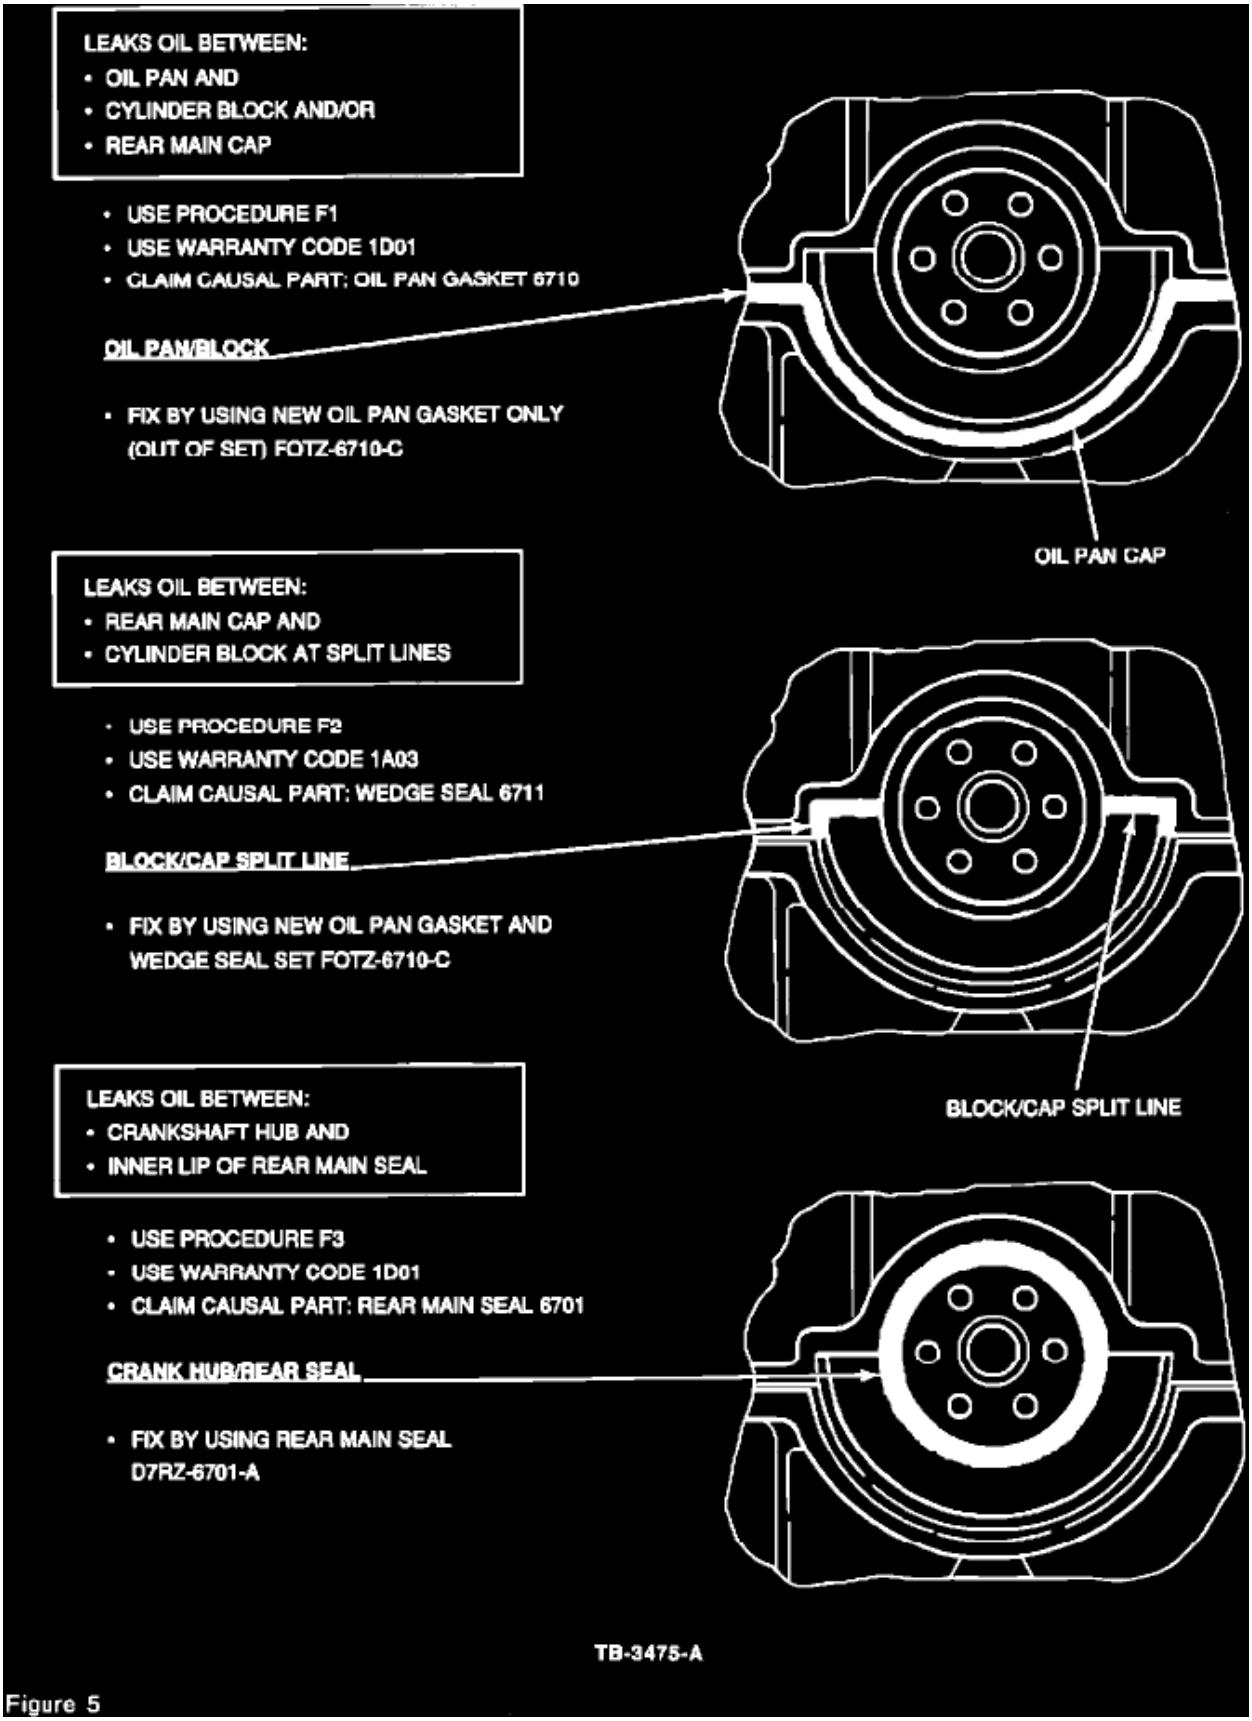

Figure 5

^ If bubbles are detected only at the oil pan gasket, between the oil pan and the cylinder block, or between the oil pan and the rear main cap, only the oil pan gasket needs replacing. Note

Procedure A, Figure 2, Step A3/F1, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A1.

^ If bubbles are detected between the rear main cap and the cylinder block, the rear cap must be removed and resealed. Note Procedure A, Figure 2, Step A3/F2, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A2.

^ If bubbles are detected between the rear seal lip and crank hub, a new rear oil seal will be required. Under certain circumstances, as outlined in the block diagram, it will be necessary to call the 4.OL Hotline. Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A3.

^ If no bubbles are detected, but oil is present in the area between the crank hub and the lip of the rear seal, carefully remove the seal and inspect the crankshaft rear seal journal. (A leak may occur

at the rear seal only when the engine is running.) Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Follow repair procedures outlined on the block diagram.

NOTE:

ANY APPEARANCE OF RUST, PITTING, POROSITY, OR NICKS ON THE REAR SEAL JOURNAL WILL CAUSE A LEAK.

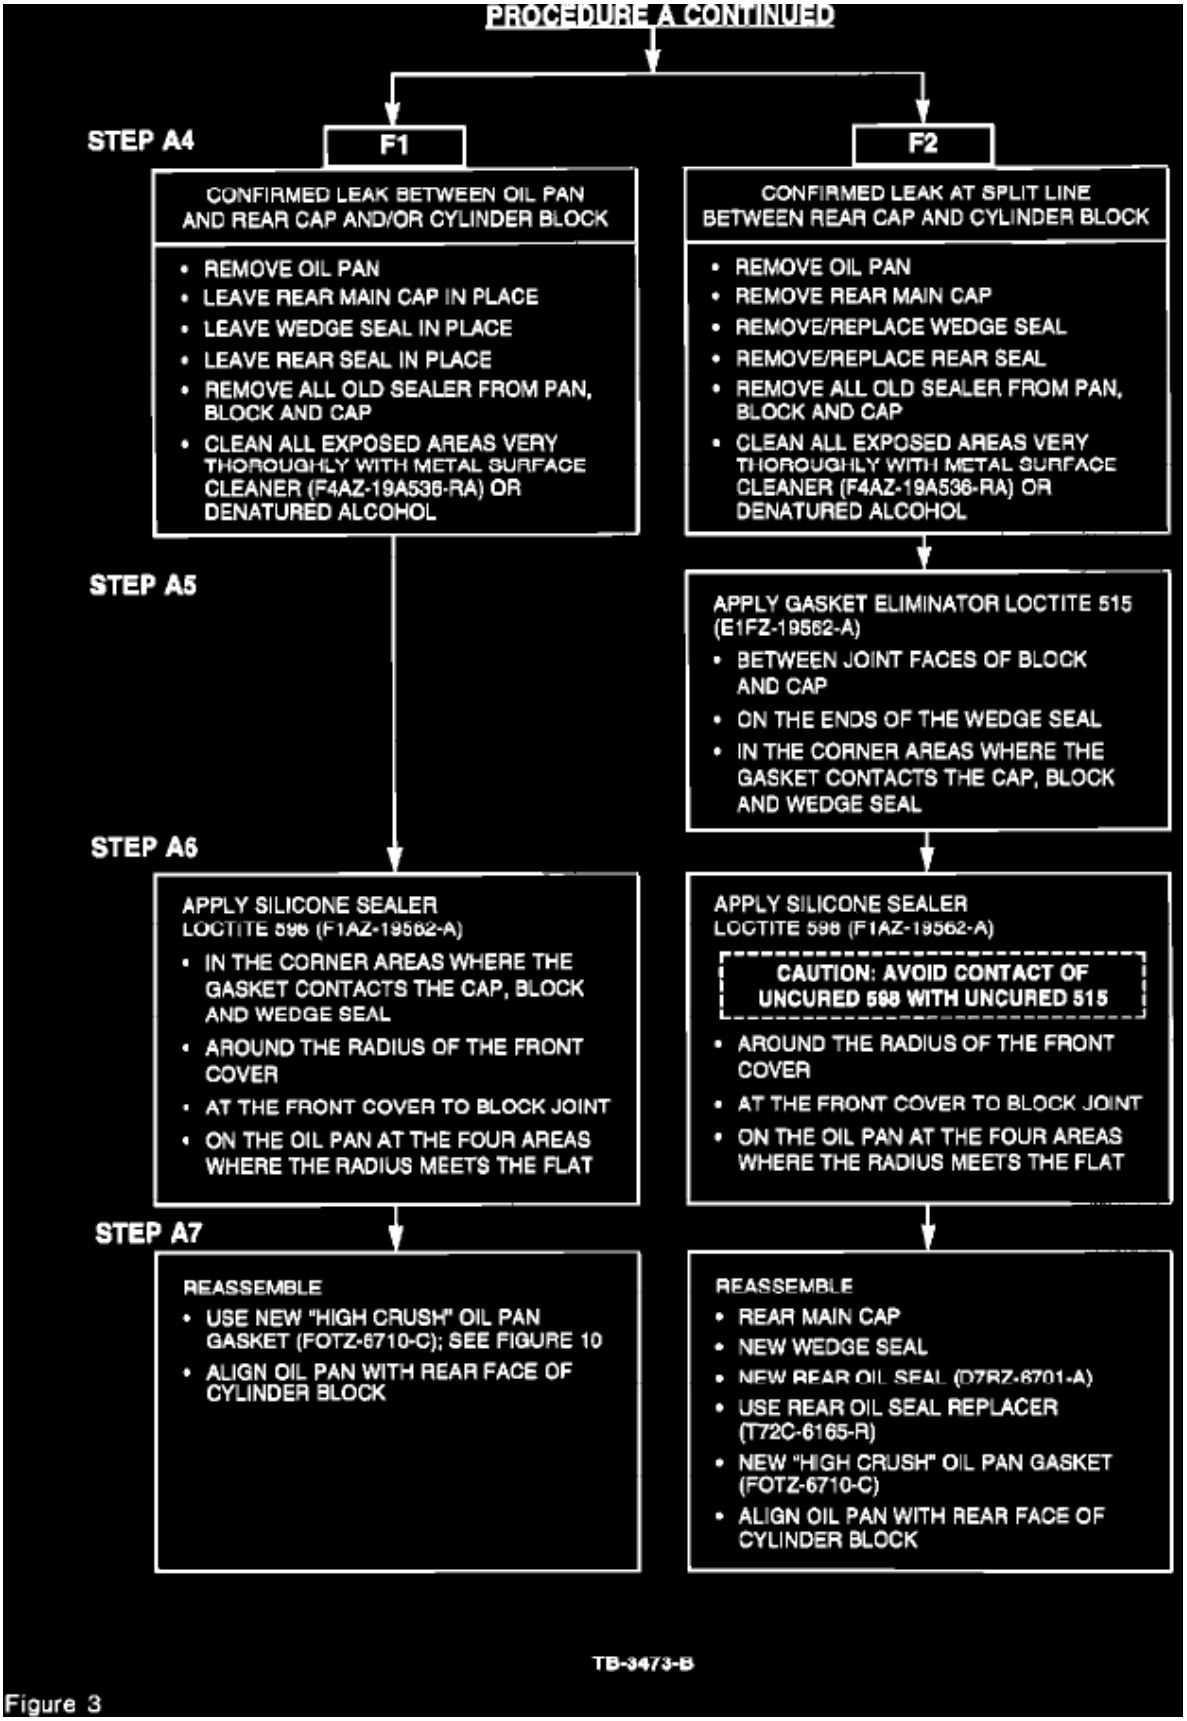
^ If bubbles are detected at the front or rear of the intake manifold gasket, a new intake manifold gasket (FOTZ-9439-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT INTAKE MANIFOLD, PROCEDURE B.

^ If bubbles are detected at the rocker cover rails, new rocker cover gaskets (F3TZ-6584-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT ROCKER COVER RAILS, PROCEDURE C.

^ If bubbles are detected at the front end of the engine, a new front seal (E6TZ-6700-A) or oil pan gasket (FOTZ-6710-C) will be required. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT THE FRONT END, PROCEDURE D.

Service Procedure - Repair

REAR END OIL LEAK - PROCEDURE A



PROCEDURE A CONTINUED
STEP A4
F1
CONFIRMED LEAK BETWEEN OIL PAN AND REAR CAP AND/OR CYLINDER BLOCK
• REMOVE OIL PAN
• LEAVE REAR MAIN CAP IN PLACE
• LEAVE WEDGE SEAL IN PLACE
• LEAVE REAR SEAL IN PLACE
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
F2
CONFIRMED LEAK AT SPLIT LINE BETWEEN REAR CAP AND CYLINDER BLOCK
• REMOVE OIL PAN
• REMOVE REAR MAIN CAP
• REMOVE/REPLACE WEDGE SEAL
• REMOVE/REPLACE REAR SEAL
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
STEP A5
APPLY GASKET ELIMINATOR LOCTITE 515 (E1FZ-19562-A)
• BETWEEN JOINT FACES OF BLOCK AND CAP
• ON THE ENDS OF THE WEDGE SEAL
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
STEP A6
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
CAUTION: AVOID CONTACT OF UNCURED 598 WITH UNCURED 515
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
STEP A7
REASSEMBLE
• USE NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C); SEE FIGURE 10
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
REASSEMBLE
• REAR MAIN CAP
• NEW WEDGE SEAL
• NEW REAR OIL SEAL (D7RZ-6701-A)
• USE REAR OIL SEAL REPLACER (T72C-6165-R)
• NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C)
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
TB-3473-B
Figure 3

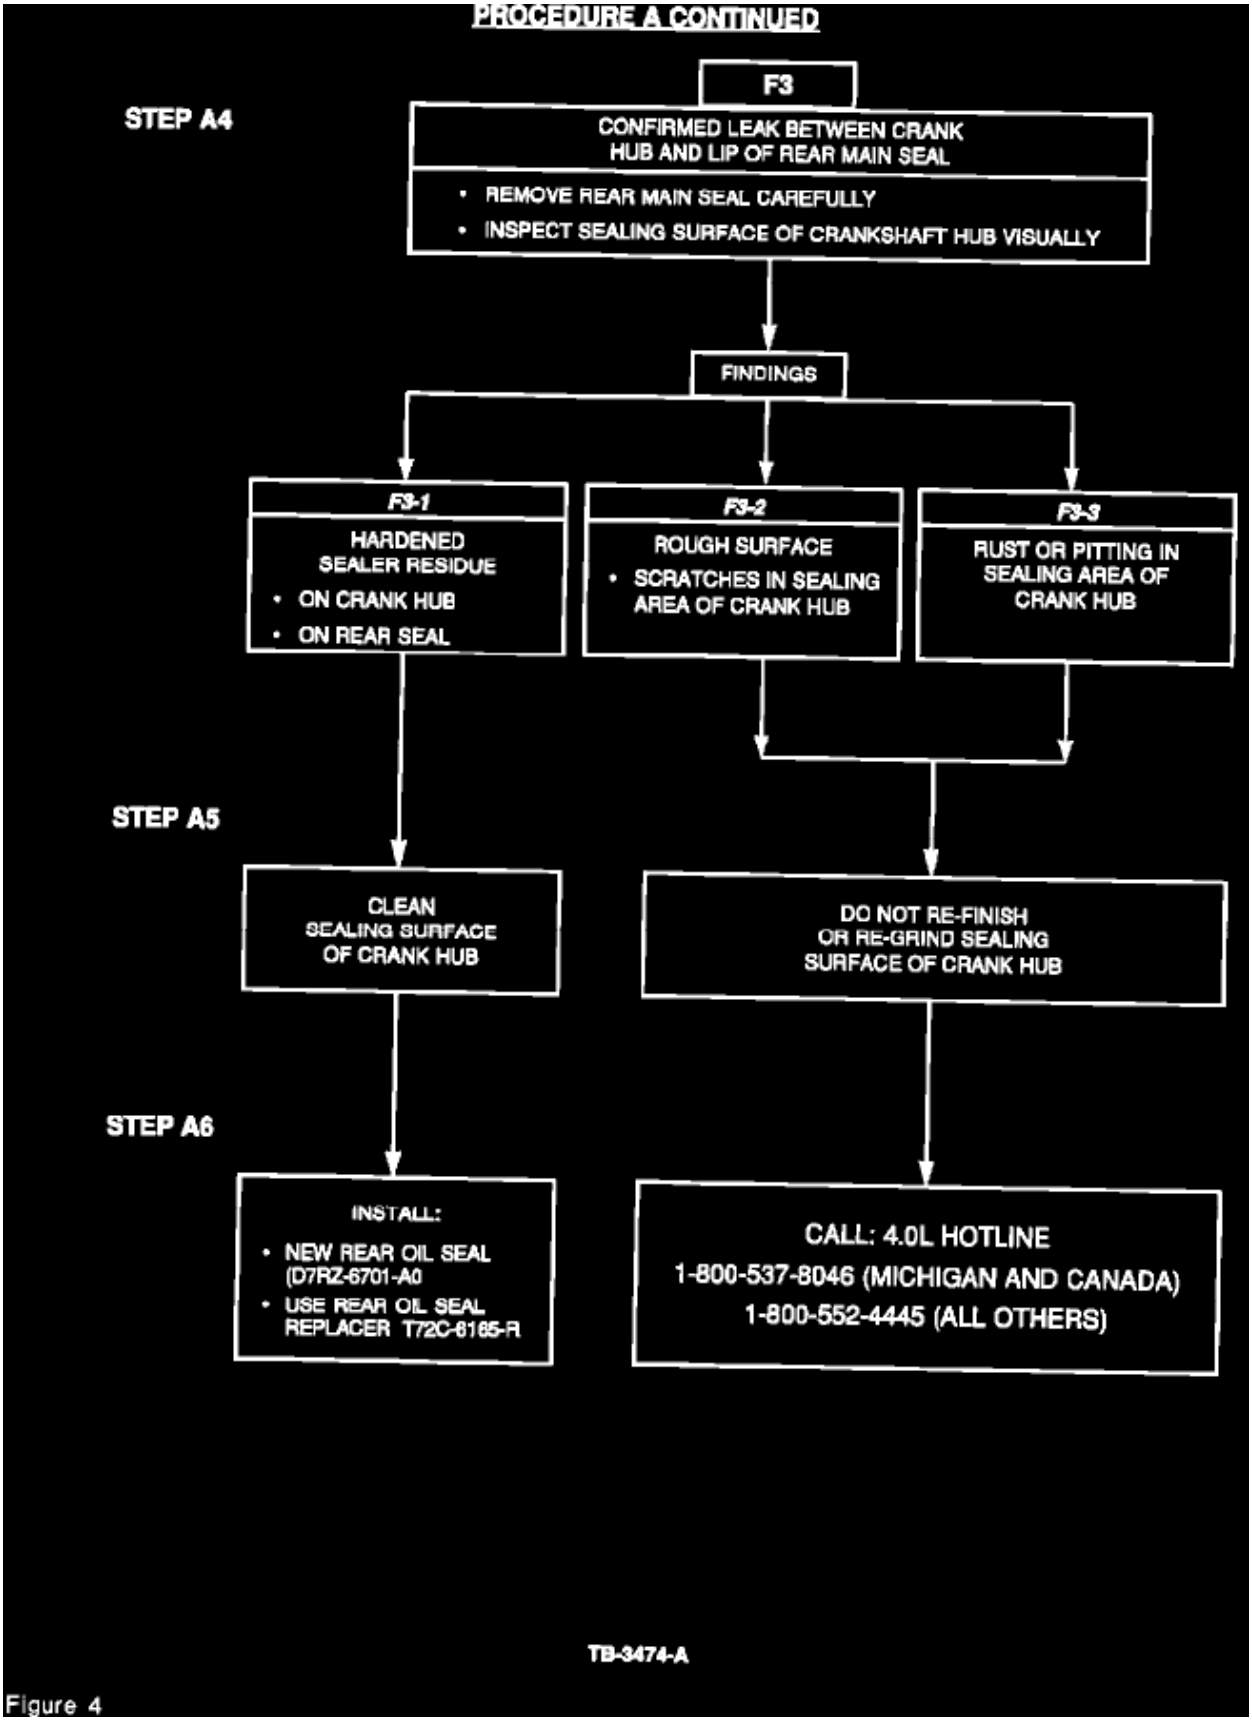


Figure 4

1. Repair procedure for a leak at oil pan gasket between the oil pan and cylinder block, or between the oil pan and the rear main cap. See block diagram Procedure A, Step A4/F1, Figures 3 and 4.

a. Remove the oil pan from the engine and remove the old gasket from the oil pan. Do not remove the rear main cap or wedge seal from the engine.

b. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

c. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap. Take special care to scrape/scratch all the old sealer from the exposed areas of the rear cap, wedge seal and cylinder block. This is a critical sealing area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER BLOCK.

d. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

e. Clean the transmission "BELLHOUSING" area, the rear of the cylinder block and the rear engine plate of ALL oil residue.

f. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corner of the radius areas at the front and rear of the oil pan.

g. Place the oil pan gasket (FOTZ-6710-C) in place in the groove in the oil pan.

h. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the corners where the rear main cap meets the cylinder block, at the corner areas of the radius area on the front cover and the front cover to cylinder block joint.

i. Set the oil pan in place and snug the four (4) pan nuts.

j. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .0100" (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

k. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

2. Repair procedure for a leak between the rear main cap and the cylinder block. See block diagram Procedure A, Step A4/F2.

a. Remove the oil pan, windage tray, oil pump and rear main cap from the engine.

b. Remove the rear main oil seal from the crankshaft and thoroughly inspect the main seal journal of the crankshaft for signs of rust, pitting, nicks or porosity.

c. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

d. Clean ALL the old sealer from the rear main bearing cap USING A SCRAPER AND WIRE WHEEL. The original Loctite sealer used during production assembly becomes extremely hard after it has cured. It is extremely important that ALL the old sealer be removed from the joint faces and grooves.

e. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap joint area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER

BLOCK.

f. Clean ALL the oil and old sealer from the "WEDGE SEAL" that fits around the rear main bearing cap in the oil pan gasket groove. Preferably use a new "WEDGE SEAL".

g. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

h. Clean the transmission "BELLHOUSING AREA", the rear of the cylinder block and the rear engine plate of ALL oil residue.

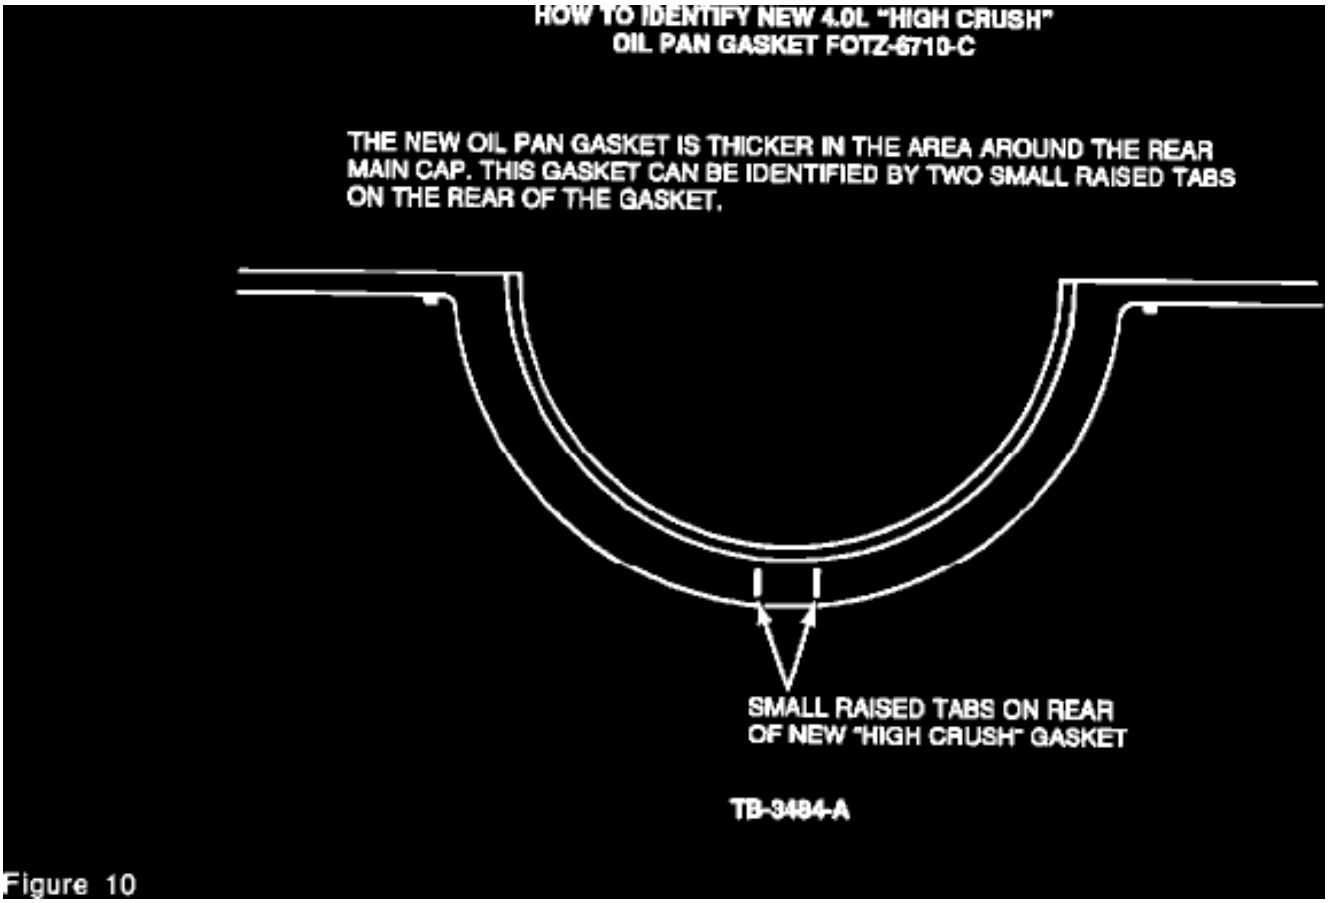

Figure 10

i. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) on the cylinder block along the corners of the rear main bearing cap joint area and on the joint face, approximately 1/2 inch (12.7 mm) from the rear of the block.

j. Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.

k. Align the rear main bearing cap to cylinder block by moving the bearing fore or aft (approx. 1/2 inch (12.7 mm) inward in the rear oil seal bore) so that the rear seal stop of the block and cap line up. This will assure that the rear main oil seal will seat squarely when installed in the bore.

l. Torque the rear main cap bolts to 66-77 lb.ft. (90-104 N-m).

m. Fill the cavities for the "WEDGE SEAL" on both sides of the rear main cap with Ford Gasket Eliminator (E1FZ-19562-A).

n. Place "WEDGE SEAL" in place and use a flat bladed screwdriver to fully seat the "WEDGE SEAL", forcing the excessive sealer out.

o. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) in the corners of the oil pan gasket groove of the rear main cap where the cap meets the cylinder block.

p. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) at the corner areas of the radius area on the front cover and at the front cover to cylinder block joint.

q. Reinstall the oil pump and windage tray. Torque to 13-15 lb.ft. (17-21 N-m).

r. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corners of the radius areas at the front and rear of the oil pan.

s. Place the oil pan gasket (FOTZ-6710-C), Figure 10, in place in the groove in the oil pan.

t. Set the oil pan in place and snug the four (4) oil pan bolts.

u. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .01000 (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

v. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

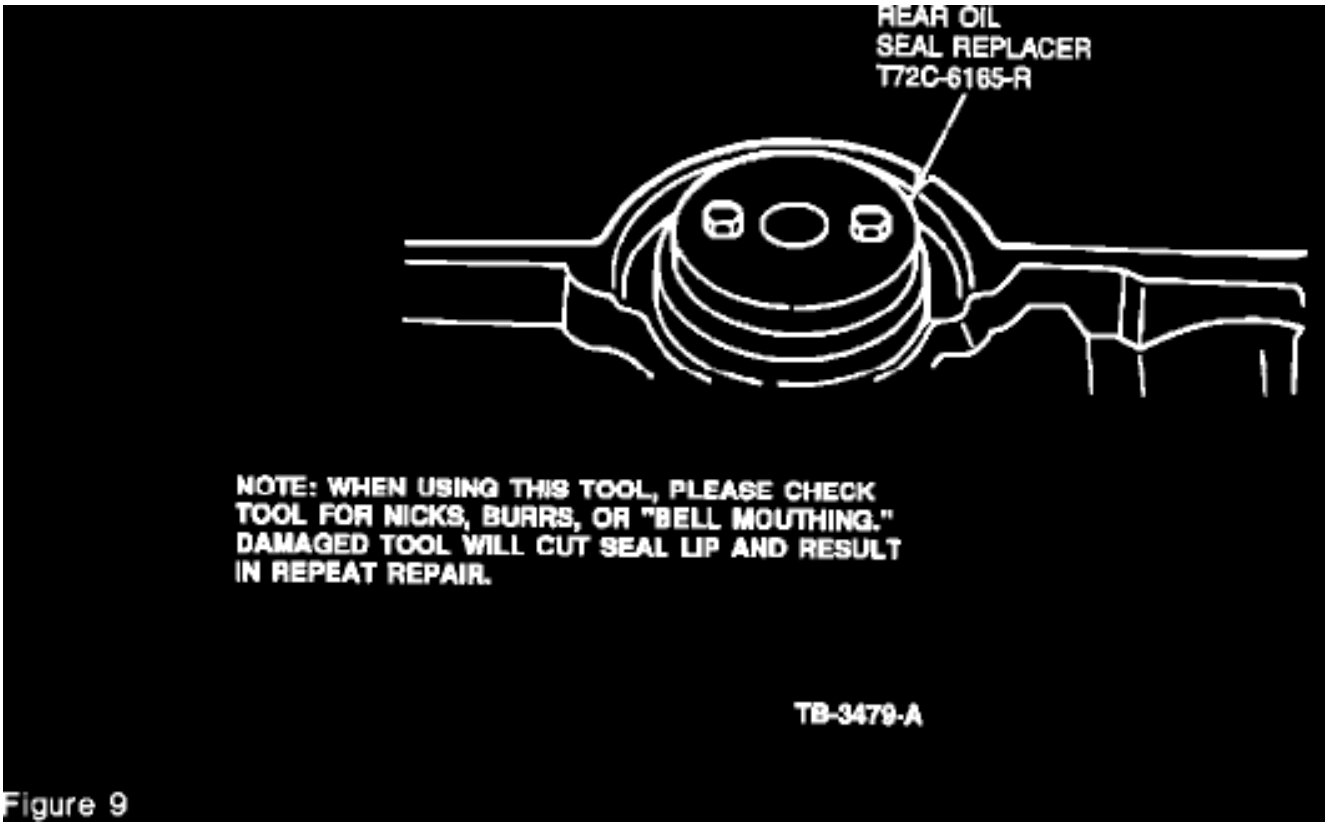

Figure 9

w. Coat the rear main oil seal (D7RZ-6701-A) with oil. Install the rear seal in the seal bore using Rear Oil Seal Replacer T72C-6165-R. This tool uses two flywheel bolts to draw the seal into position. Refer to Figure 9.

CAUTION:

DO NOT USE THE OLD STYLE HAMMER OPERATED TOOL.

3. Repair procedure for a leak between the rear main seal and the crankshaft. See block diagram, Procedure A, Step A4/F3.

a. Any presence of rust on the rear seal journal will cause a leak.

b. Any presence of pitting, porosity or nicks on the rear seal journal will cause a leak.

NOTE:

IF A LEAK IS PRESENT BETWEEN THE REAR MAIN SEAL AND CRANKSHAFT, PLEASE NOTIFY THE 4.0L "HOTLINE" AT (800) 537-8046 OR (800) 552-4445 PRIOR TO ANY ATTEMPT TO REPAIR THIS CONDITION.

Service Procedure - Repair For Oil Leaks At Intake Manifold

PROCEDURE B

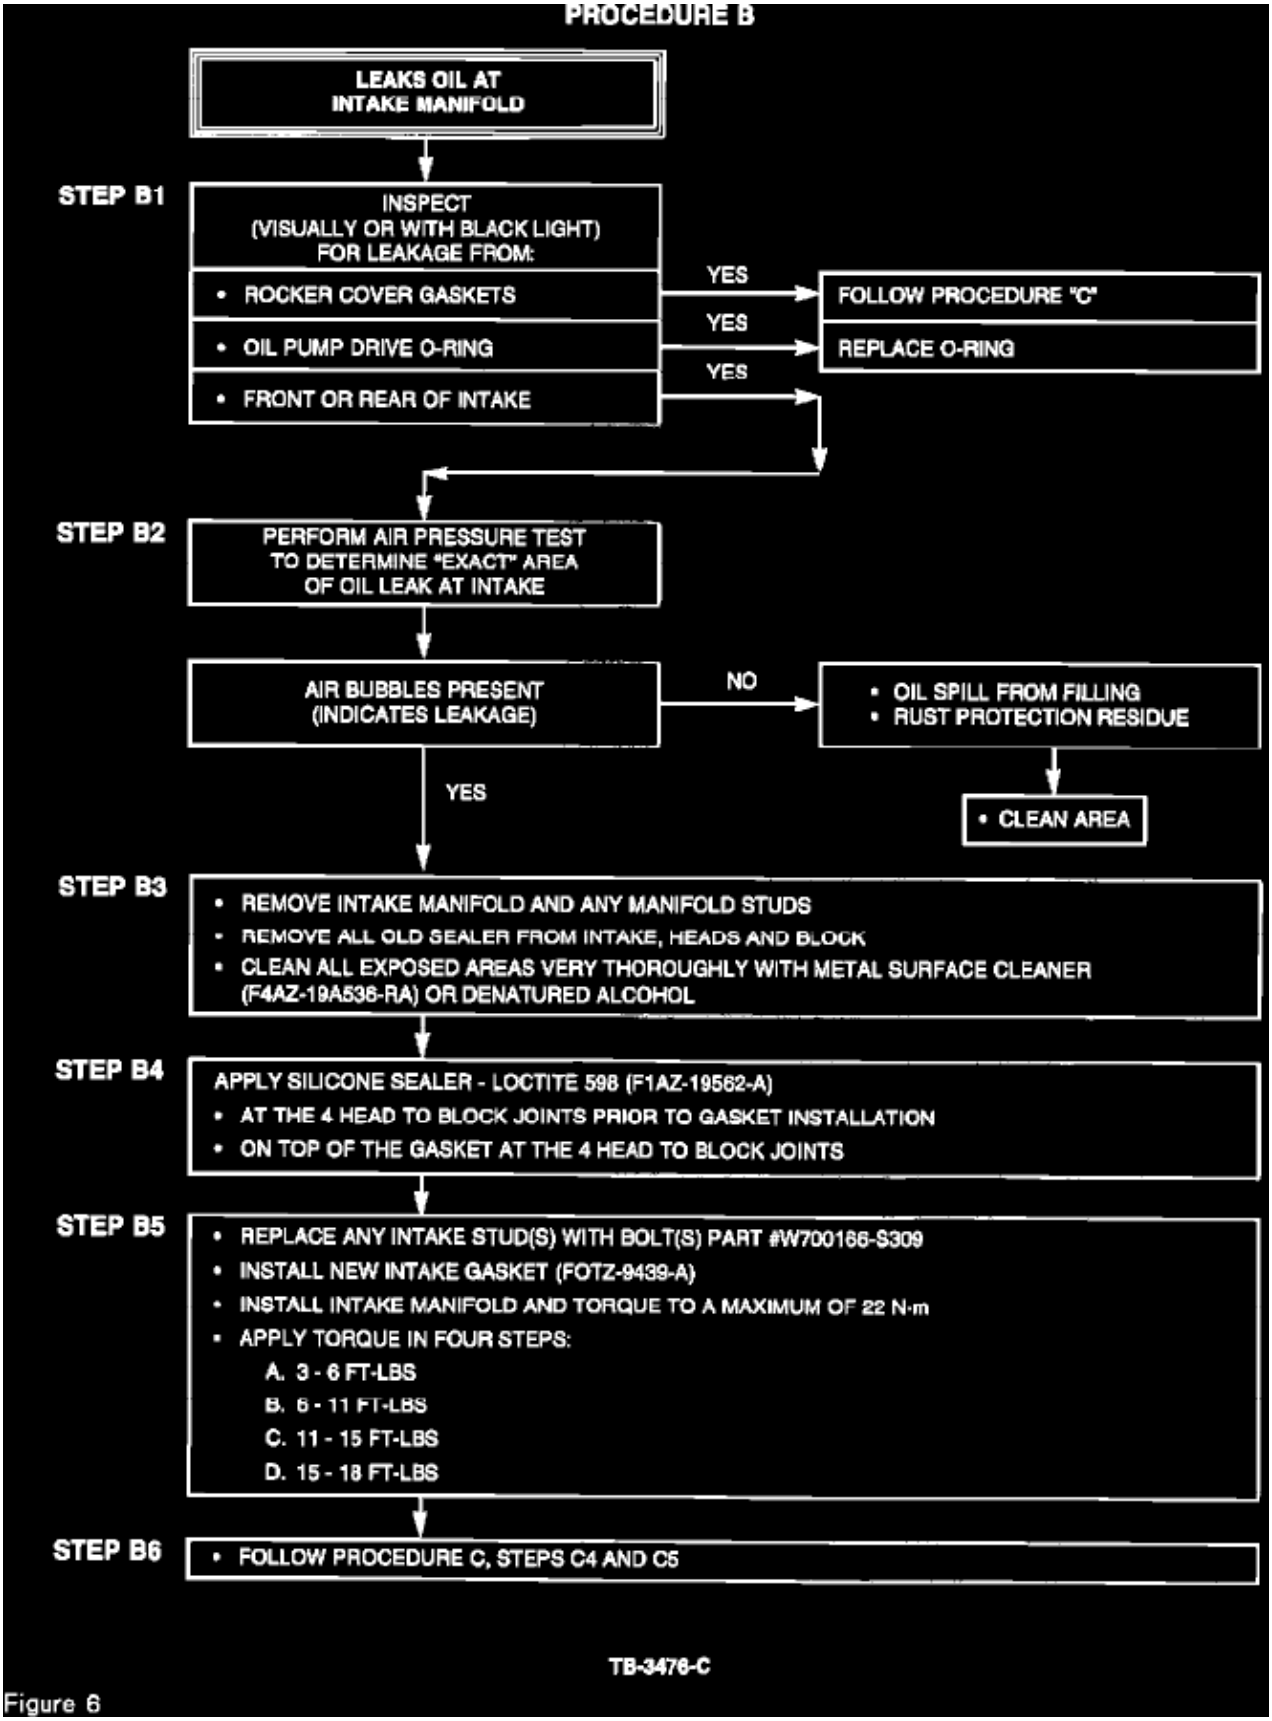

Figure 6

1. If the air pressure test showed no air bubbles, follow Procedure B2 to clean area of oil spill or other contamination.

2. If the air pressure test showed air bubbles present, follow Steps B3 through B6. Refer also to the Service Manual for the applicable year for further information pertinent to removal and installation of the intake manifold.

Service Procedure - Repair For Oil Leaks At Rocker Cover Rails

PROCEDURE C

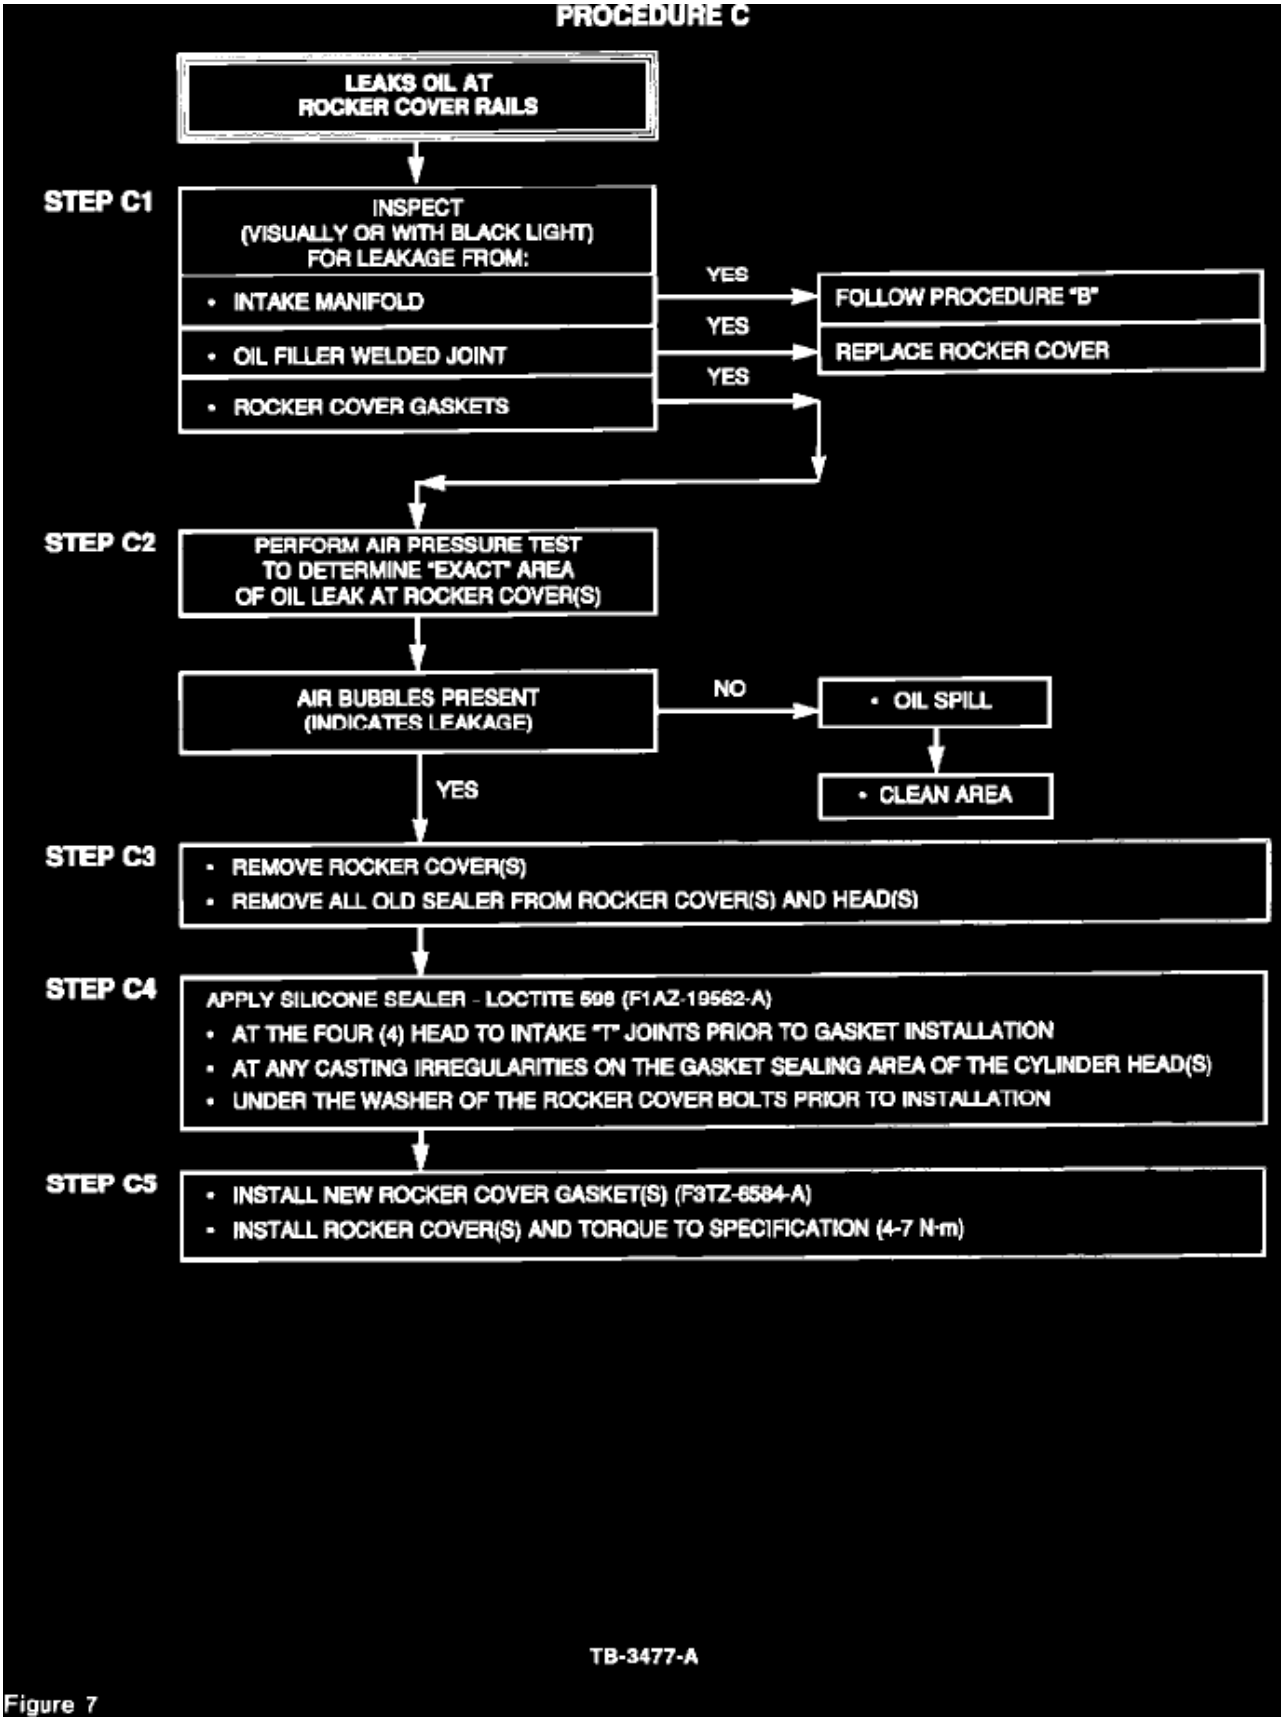

Figure 7

1. If the air pressure test showed no air bubbles, follow Procedure C2 to clean the area of any oil spill.

2. If the air pressure test showed air bubbles present, follow Steps C3 through C5.

Service Procedure - Repair For Oil Leaks At Front End

PROCEDURE D

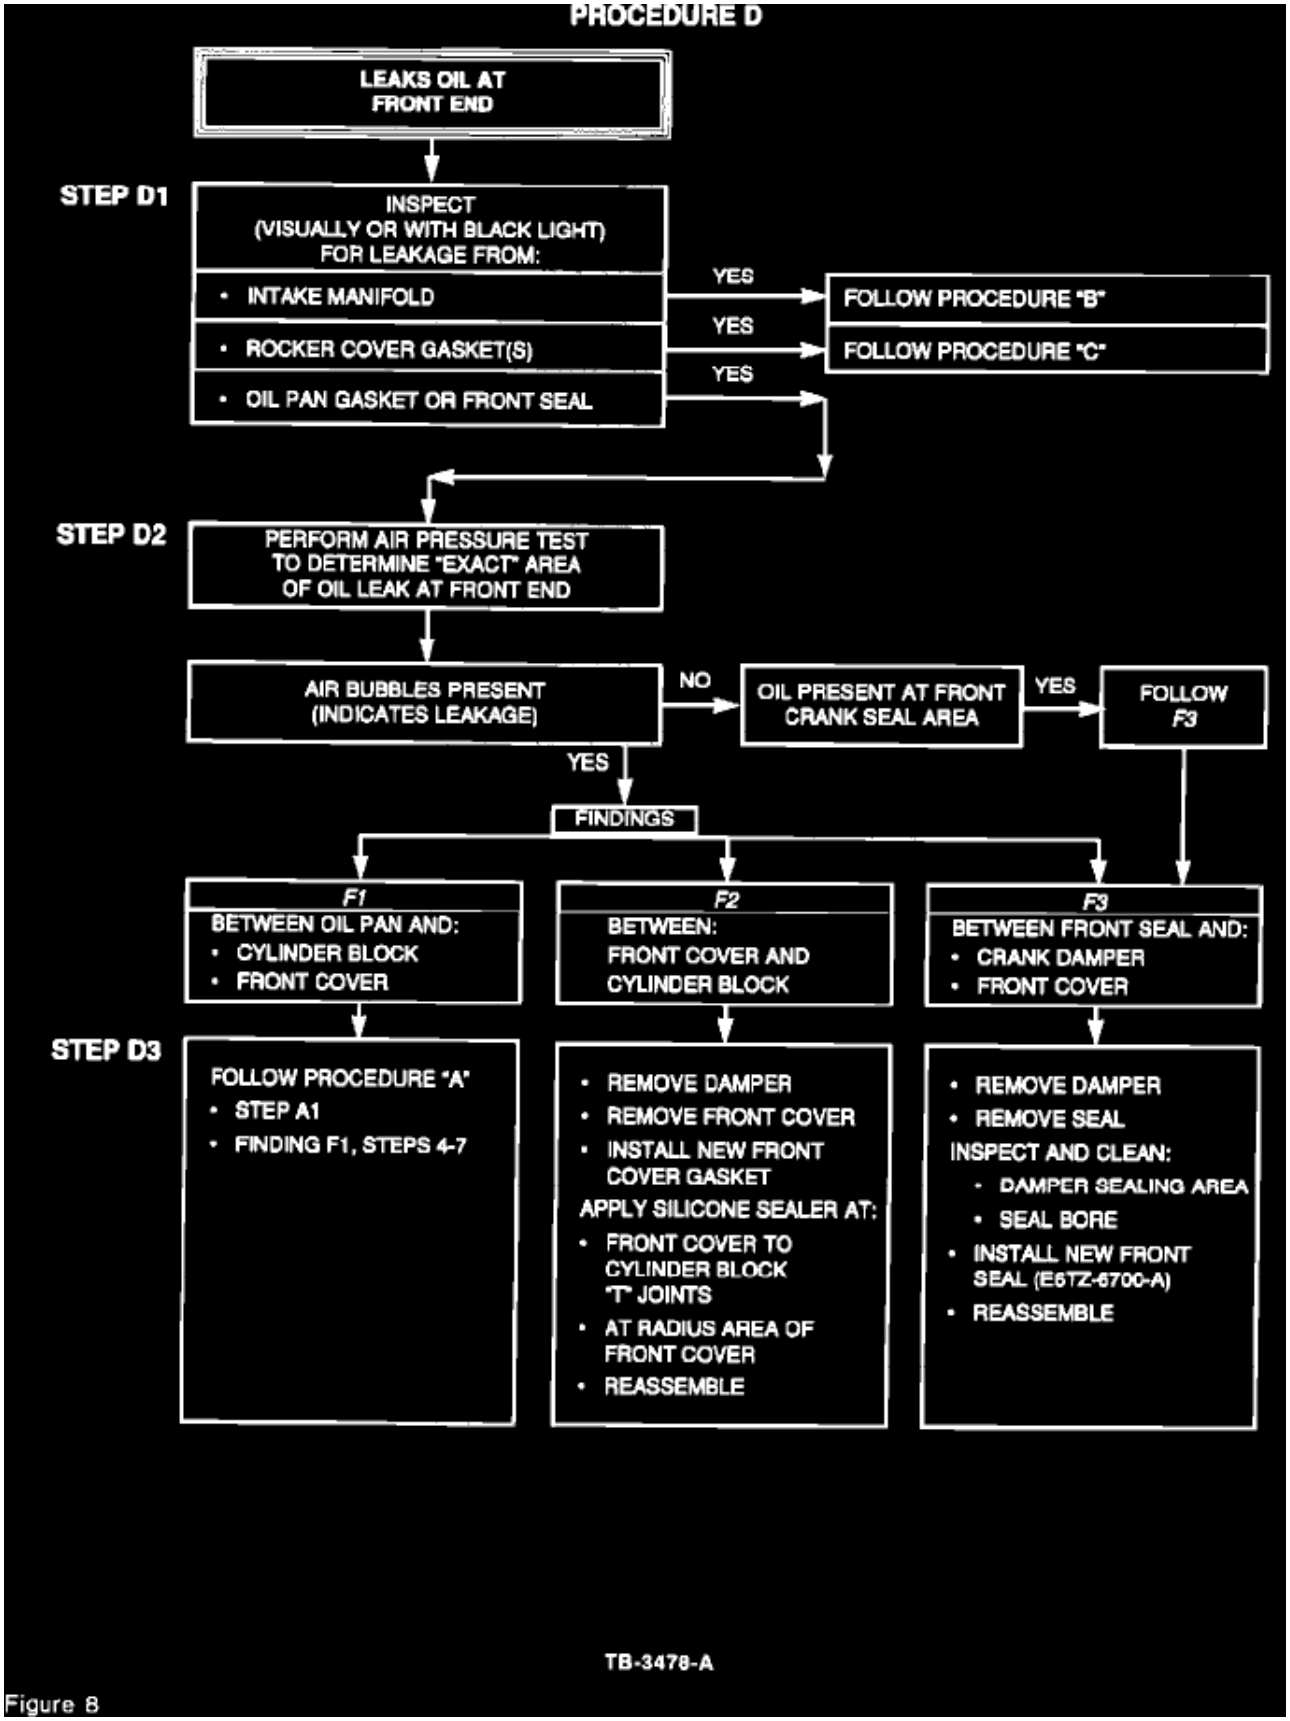

Figure 8

1. If the air pressure test showed no air bubbles, follow Procedure D, F3.

2. If the air pressure test showed air bubbles present, follow Procedure D, F1 or F2 as appropriate.

Crankshaft Main Bearing Seal: All Technical Service Bulletins Rear Main Oil Seal Replacement - Service Tip

Article No. 95-1-8

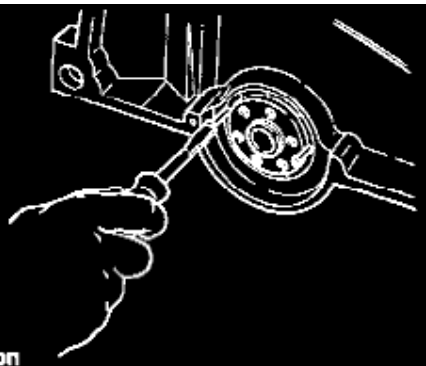
01/16/95

^ LEAK - REAR MAIN OIL SEAL REPLACEMENT - VEHICLES WITH 4.0L ENGINES - SERVICE TIP

^ REAR MAIN SEAL - 4.0L - NEW INSTALLATION TOOL

LIGHT TRUCK: 1990-94 AEROSTAR, RANGER 1991-94 EXPLORER

ISSUE: A redesigned tool for installation of rear main seals is available and must be used for all rear main seal replacements. Prior released tools (T72C-6165) and (T72C-6165-R) must not be used. Usage of obsolete tools may cause oil leaks due to seal damage, crankshaft journal damage or mispositioning of the seal.



Installation

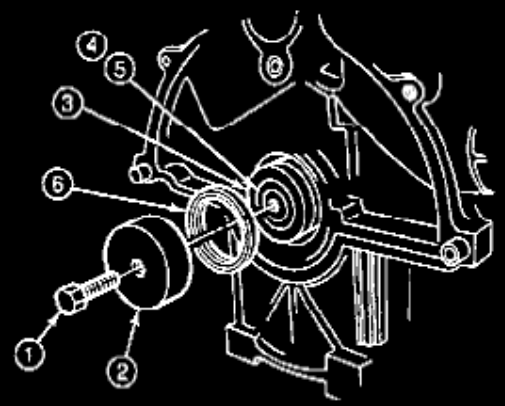
Crankshaft rear oil seals used for service applications can come either with or without a metallic crankshaft sleeve. Special Service Tool T95T-6701-A, Rear Crankshaft Seal Replacer, is used for both applications.

The rear crankshaft seal adapter and two (2) mounting screws attach to the crankshaft. The threaded hole in the center of the crankshaft seal adapter is used by the rear crankshaft seal replacer to draw down and locate the crankshaft rear oil seal.

The rear crankshaft seal protector is used for installing seals without a metallic sleeve. It is not used when installing a rear main oil seal with a sleeve.

CAUTION: Do not remove the metal sleeve from the seal.

CAUTION: This installation procedure requires the used of hand tools only. The used of power tools or hammering on the installer can damage the sleeve and seal.



Item	Part Number	Description
1	—	Bolt (Part of T95T-6701-A)
2	T95T-6701-A2	Rear Crankshaft Seal Replacer
3	T95T-6701-A1	Rear Crankshaft Seal Protector
4	T95T-6701-A4	Bolts
5	T95T-6701-A3	Rear Crankshaft Adapter
6	6701	Crankshaft Rear Oil Seal

Seal Installation With Metal Sleeve

1. Attach the rear crankshaft adapter to the rear of the crankshaft using the supplied mounting screws.
2. Apply a few drops of clean engine oil to the inboard side of the seal/sleeve at the area where the seal contacts the sleeve.
3. Apply a very light film of clean engine oil on the inner diameter of the sleeve and outer diameter of seal.
4. Slide the seal/sleeve over the rear crankshaft seal adapter with flange to the rear of the engine.
5. **NOTE: It is normal for the seal to sit approximately 0.76mm (0.030 inch) deeper than the sleeve flange. DO NOT ADJUST.**

   Use the rear crankshaft seal replacer and supplied bolt to push the rear seal into the cylinder block.

   Remove rear crankshaft seal adapter.

TB-4149-A

Figure 1

ACTION: If an oil leak is detected, refer to TSB 94-12-13 for proper diagnosis of the oil leak. If, after diagnosis, it is determined that a new rear main seal needs to be installed, use the procedure

found in TSB 94-12-13. Be sure to use the new Rear Oil Seal Replacer Tool (T95T-6701-A) when installing a new rear main seal. Refer to Figure 1 for more details.

Crankshaft Main Bearing Seal: Service and Repair

*** THIS ARTICLE REFLECTS CHANGES MADE BY TSB 9518 DATED JANUARY 16, 1995

REMOVAL

1. Remove the transmission. 2. Remove flywheel.

Rear Main Seal Removal

3. Use an awl to punch two holes in the crankshaft rear oil seal. Punch the holes on opposite sides of the crankshaft and just above the bearing

cap-to-cylinder block split line. Install a sheet metal screw in each hole. Use two large screwdrivers or small pry bars and pry against both screws at the same time to remove the crankshaft rear oil seal. It may be necessary to place small blocks of wood against the cylinder block to provide a fulcrum point for the pry bars. Use caution throughout this procedure to avoid scratching or otherwise damaging the crankshaft oil seal surface.

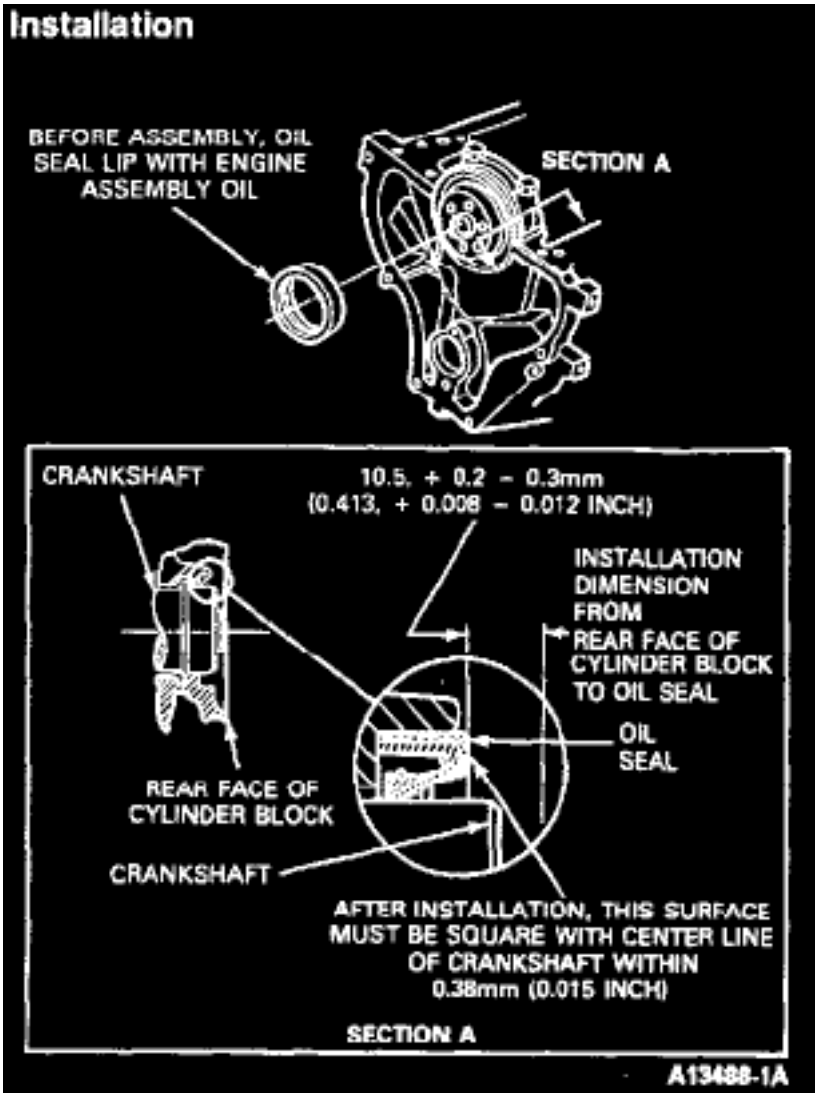
4. Clean the oil seal recess in the cylinder block and main bearing cap. Inspect and clean the oil seal contact surface on the crankshaft.

INSTALLATION

CAUTION: This installation procedure requires the use of hand tools only. The use of power tools or hammering on the installer can damage the sleeve and seal.

Rear Main Seal Installation Tool

1. Attach the rear crankshaft adapter to the rear of the crankshaft using the supplied mounting screws.



Rear Main Oil Seal Installation

2. Apply a few drops of clean engine oil to the inboard side of the seal/sleeve at the area where the seal contacts the sleeve. 3. Apply a very light film of clean engine oil on the inner diameter of the sleeve and outer diameter of seal. 4. Slide the seal/sleeve over the rear crankshaft seal adapter with flange to the rear of the engine.

NOTE: It is normal for the seal to sit approximately 0.76 mm (0.030 inch) deeper than the sleeve flange. Do not adjust.

5. Use the rear crankshaft seal replacer and supplied bolt to push the rear seal into the cylinder block. 6. Remove the rear crankshaft seal adapter. 7. Install flywheel. Tighten flywheel bolts in two stages.

a. First stage - 12-15 Nm (9-11 ft lb) b. Second stage - 68-74 Nm (50-55 ft lb)

8. Install transmission.

General Information

LIGHT TRUCK: 1990-93 AEROSTAR, RANGER 1991-93 EXPLORER

This TSB is being republished in its entirety to correct the type of cleaner being used in Figures 1, 3, and 6.

ISSUE: The many sources of leaks which typically appear at the lower end, front end, intake manifold valley, and rocker cover rails have led to mis-diagnosis as to the source of the leak and improper repair procedures, repeat repairs, and customer dissatisfaction.

ACTION: This TSB article has been developed to list the latest sealing techniques and associated part numbers for:

^ Oil Pan

^ Rear Main Seal

^ Rocker Covers

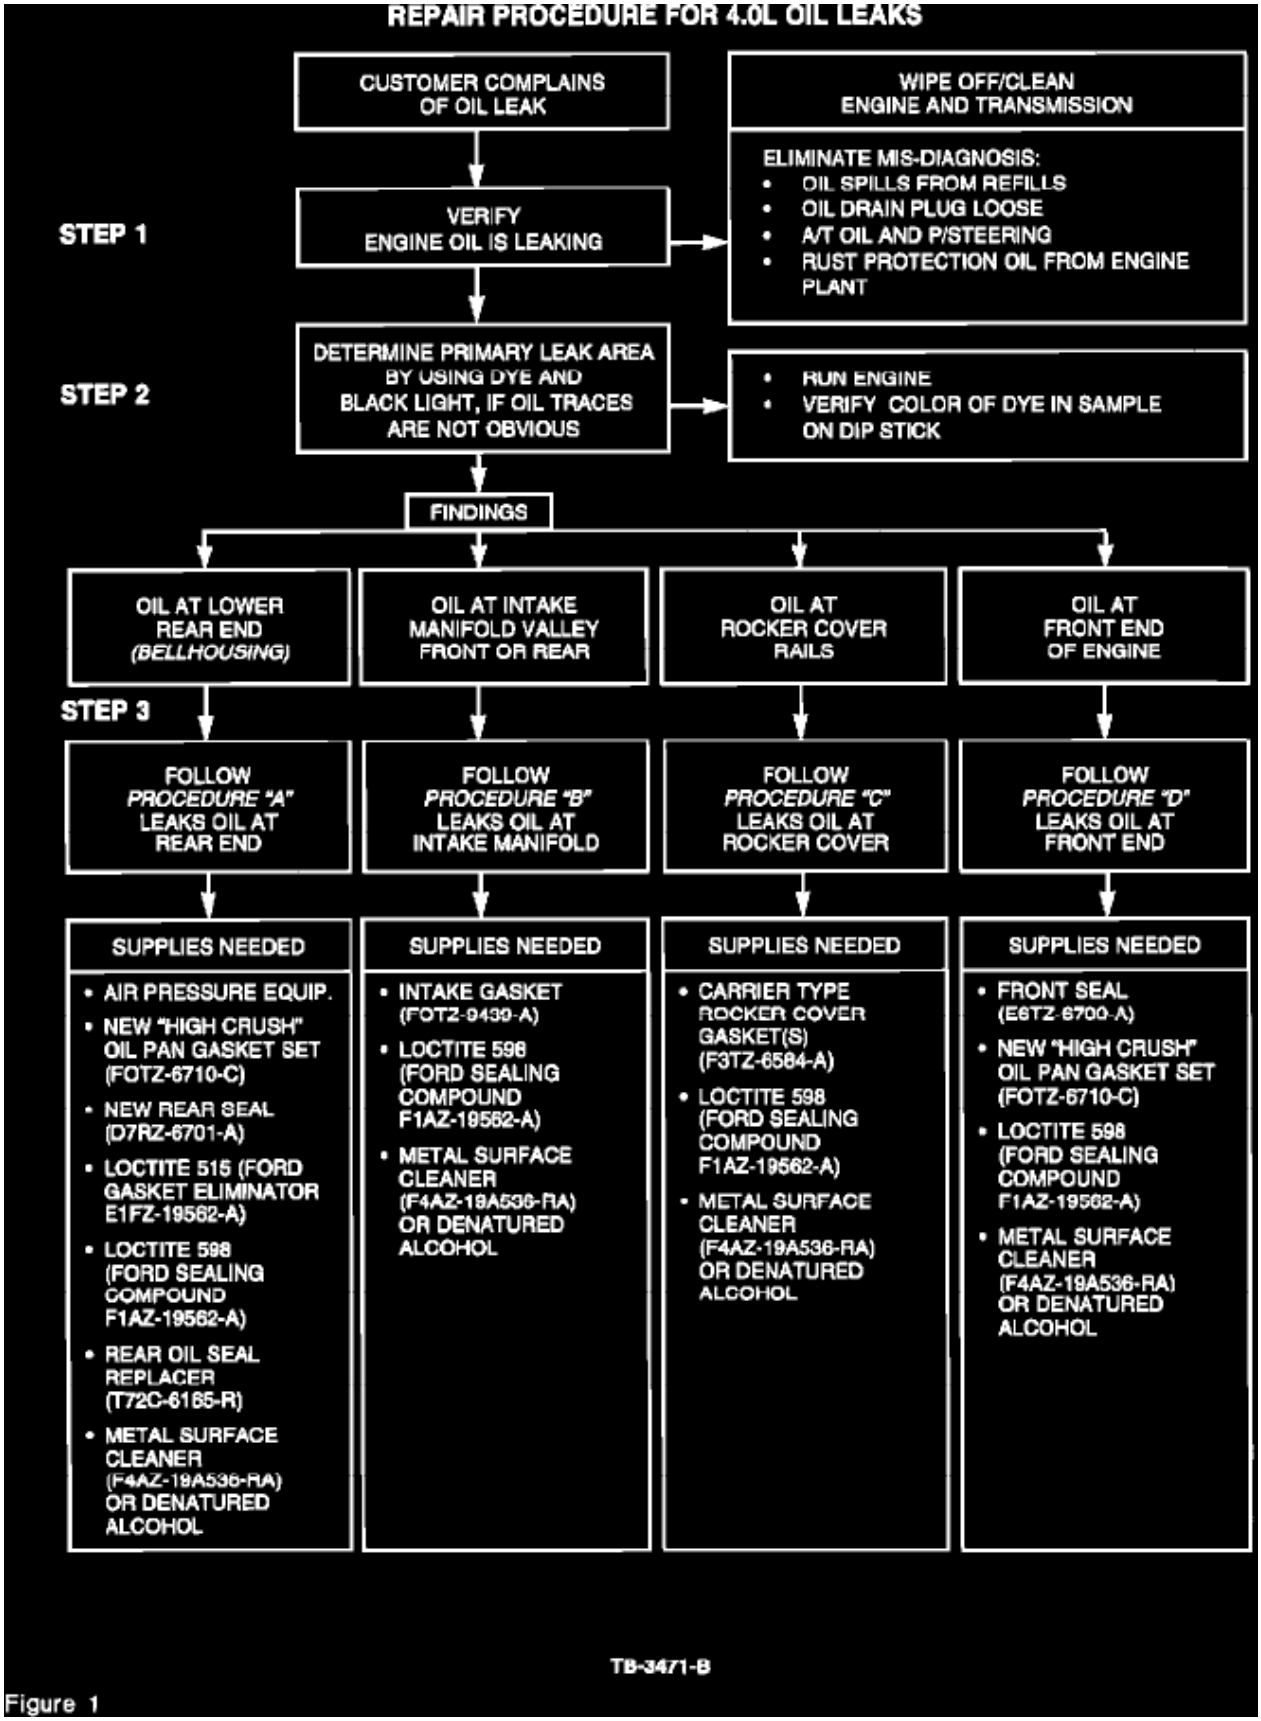

Figure 1

^ Intake Manifold

This article attempts to fully address all issues as one, in order to provide a diagnostic guide which leads to proper diagnosis and repair the first time. Use the following procedures to verify the location of the oil leak and perform the repair.

Service Procedure - Diagnosis

1. Perform Steps 1 and 2 of the block diagram shown in Figure 1. Perform a visual inspection to determine the general area of the oil leak.

2. After determining the "Findings" of Step 2, perform Step 3 by following Procedures A, B, C or D, whichever is appropriate, up to, but not including the air pressure test.

NOTE:

WHEN THE FINDINGS RESULT IN FOLLOWING PROCEDURE "A" FOR "LEAKS OIL AT REAR END", IT IS VERY IMPORTANT TO FOLLOW THE BLOCK DIAGRAM INSTRUCTIONS TO REMOVE THE TRANSMISSION, IF AN AEROSTAR, AND TO REMOVE THE ENGINE, IF AN EXPLORER/RANGER. THE PRACTICE OF REMOVING EXPLORER/RANGER OIL PANS WITH ENGINE IN VEHICLE CAN RESULT IN FAULTY DIAGNOSIS AND/OR REPAIR FOR THE PURPOSES OF THIS TSB.

If the leak has not been located and corrected at this point, then fabricate a device that is capable of applying a constant 1 to 3 psi of air pressure to the engine crankcase. The Rotunda Leak Tester 134-00003, or equivalent, which contains a pressure regulator and gauge capable of a 1 to 3 psi range, may be used.

3. Verify the location of the oil leak by pressurizing the engine crankcase with a constant supply of 3 psi of air pressure and the use of leak detection solution (liquid detergent and water). This process will verify the exact location of the leak. Dye and black light will verify a leak is present, but may not verify the exact location of the leak.

a. Assemble the necessary hose and fittings to connect an air pressure regulator and air pressure gauge to the shop air supply and to the engine crankcase through the dipstick tube.

b. Test the device to make sure 1-3 psi of air pressure can be maintained. Bursts of pressure over 3 psi can damage engine seals.

c. Before starting the test, make sure the regulator valve is completely closed so as not to accidentally apply a big burst of air to the engine when starting the test.

d. Attach the outlet (regulated) hose from the regulator/gauge device to the dipstick.

e. To trap air in the engine, plug any ports and passages (PCV valve, air inlet connection) that will allow air to escape.

f. Slowly open the regulator valve until 1-3 psi of air pressure registers on the gauge.

g. Keeping air pressure applied, brush or squirt a solution of liquid detergent and water or commercially available liquid leak detector (Snoop, Bubbles) to the primary area identified in Step 2 of the block diagram.

^ If the primary area is in the rear seal area, apply the solution to the rear seal, rear cap, rear cap to cylinder block and oil pan gasket areas.

Figure 2

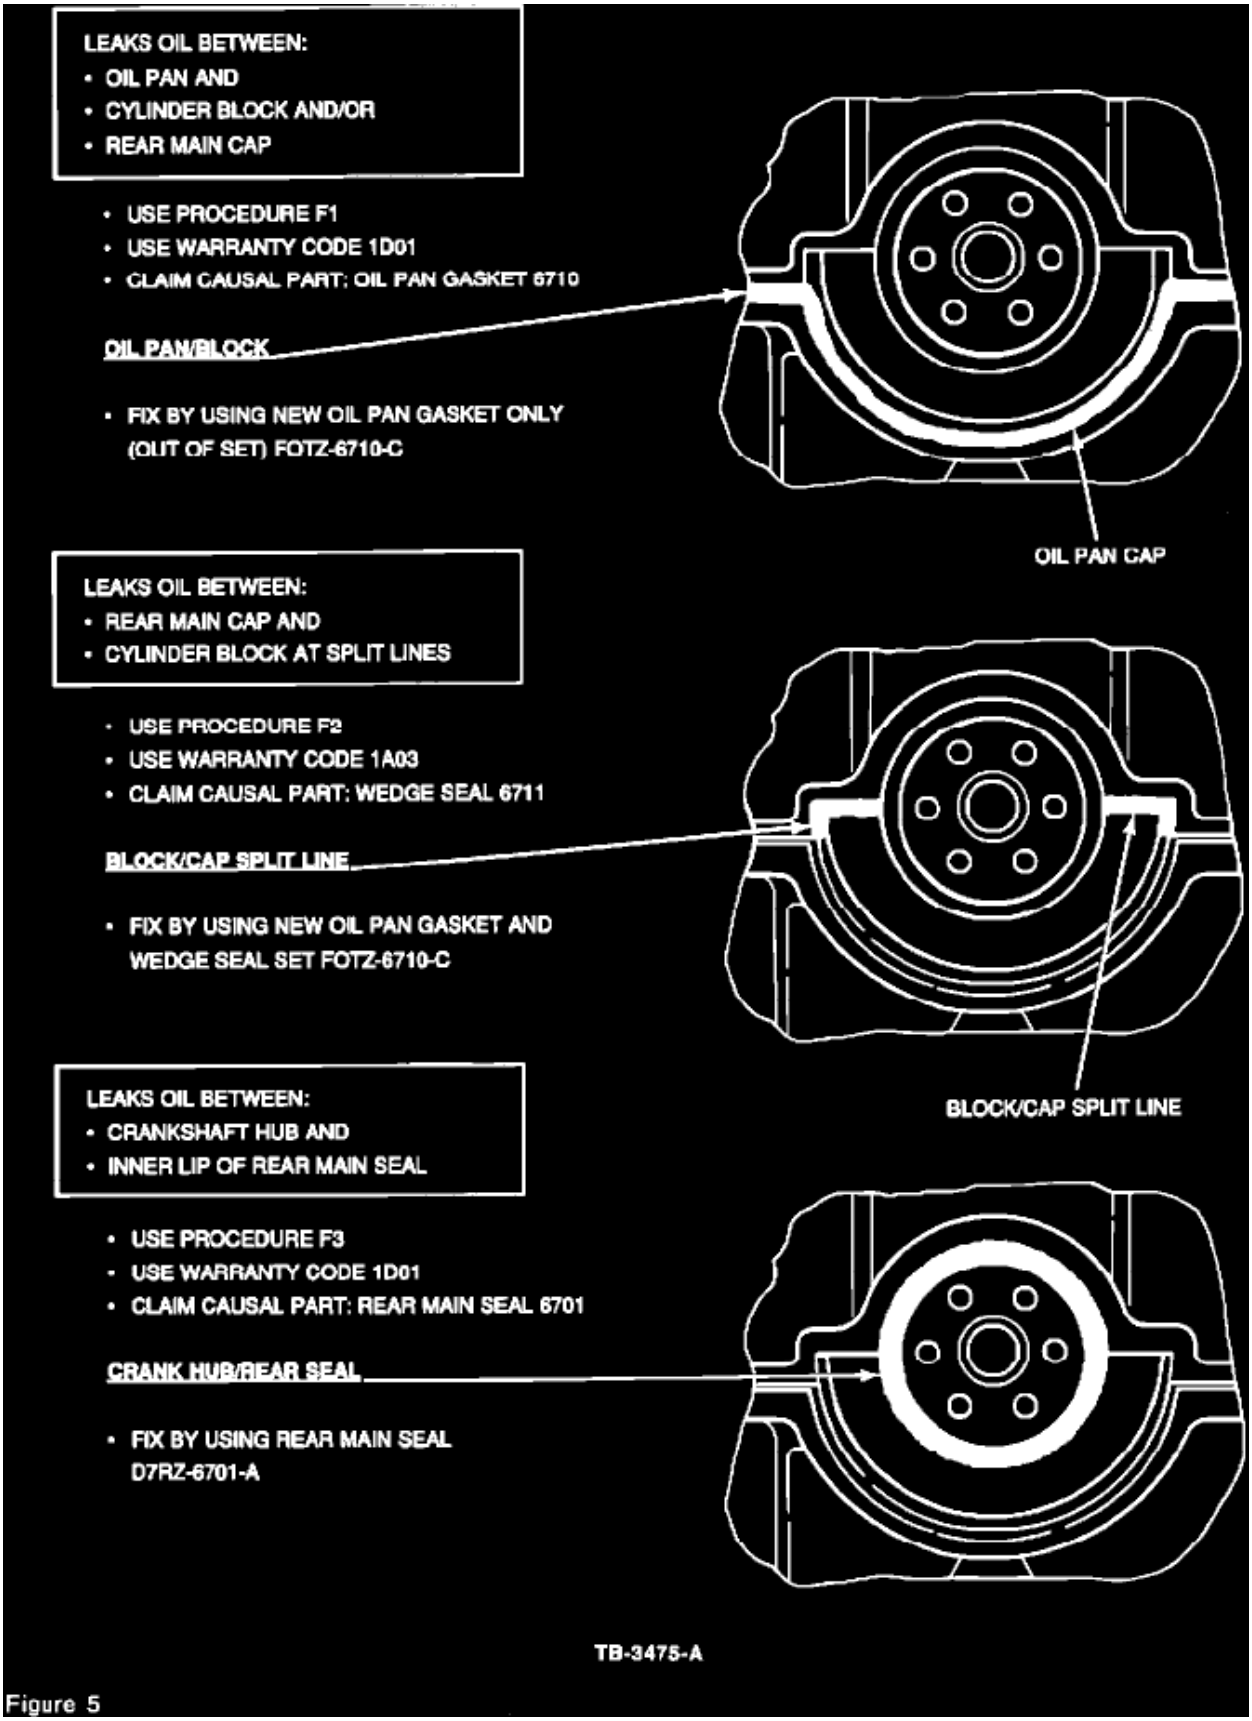

Figure 5

^ If bubbles are detected only at the oil pan gasket, between the oil pan and the cylinder block, or between the oil pan and the rear main cap, only the oil pan gasket needs replacing. Note

Procedure A, Figure 2, Step A3/F1, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A1.

^ If bubbles are detected between the rear main cap and the cylinder block, the rear cap must be removed and resealed. Note Procedure A, Figure 2, Step A3/F2, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A2.

^ If bubbles are detected between the rear seal lip and crank hub, a new rear oil seal will be required. Under certain circumstances, as outlined in the block diagram, it will be necessary to call the 4.OL Hotline. Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A3.

^ If no bubbles are detected, but oil is present in the area between the crank hub and the lip of the rear seal, carefully remove the seal and inspect the crankshaft rear seal journal. (A leak may occur

at the rear seal only when the engine is running.) Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Follow repair procedures outlined on the block diagram.

NOTE:

ANY APPEARANCE OF RUST, PITTING, POROSITY, OR NICKS ON THE REAR SEAL JOURNAL WILL CAUSE A LEAK.

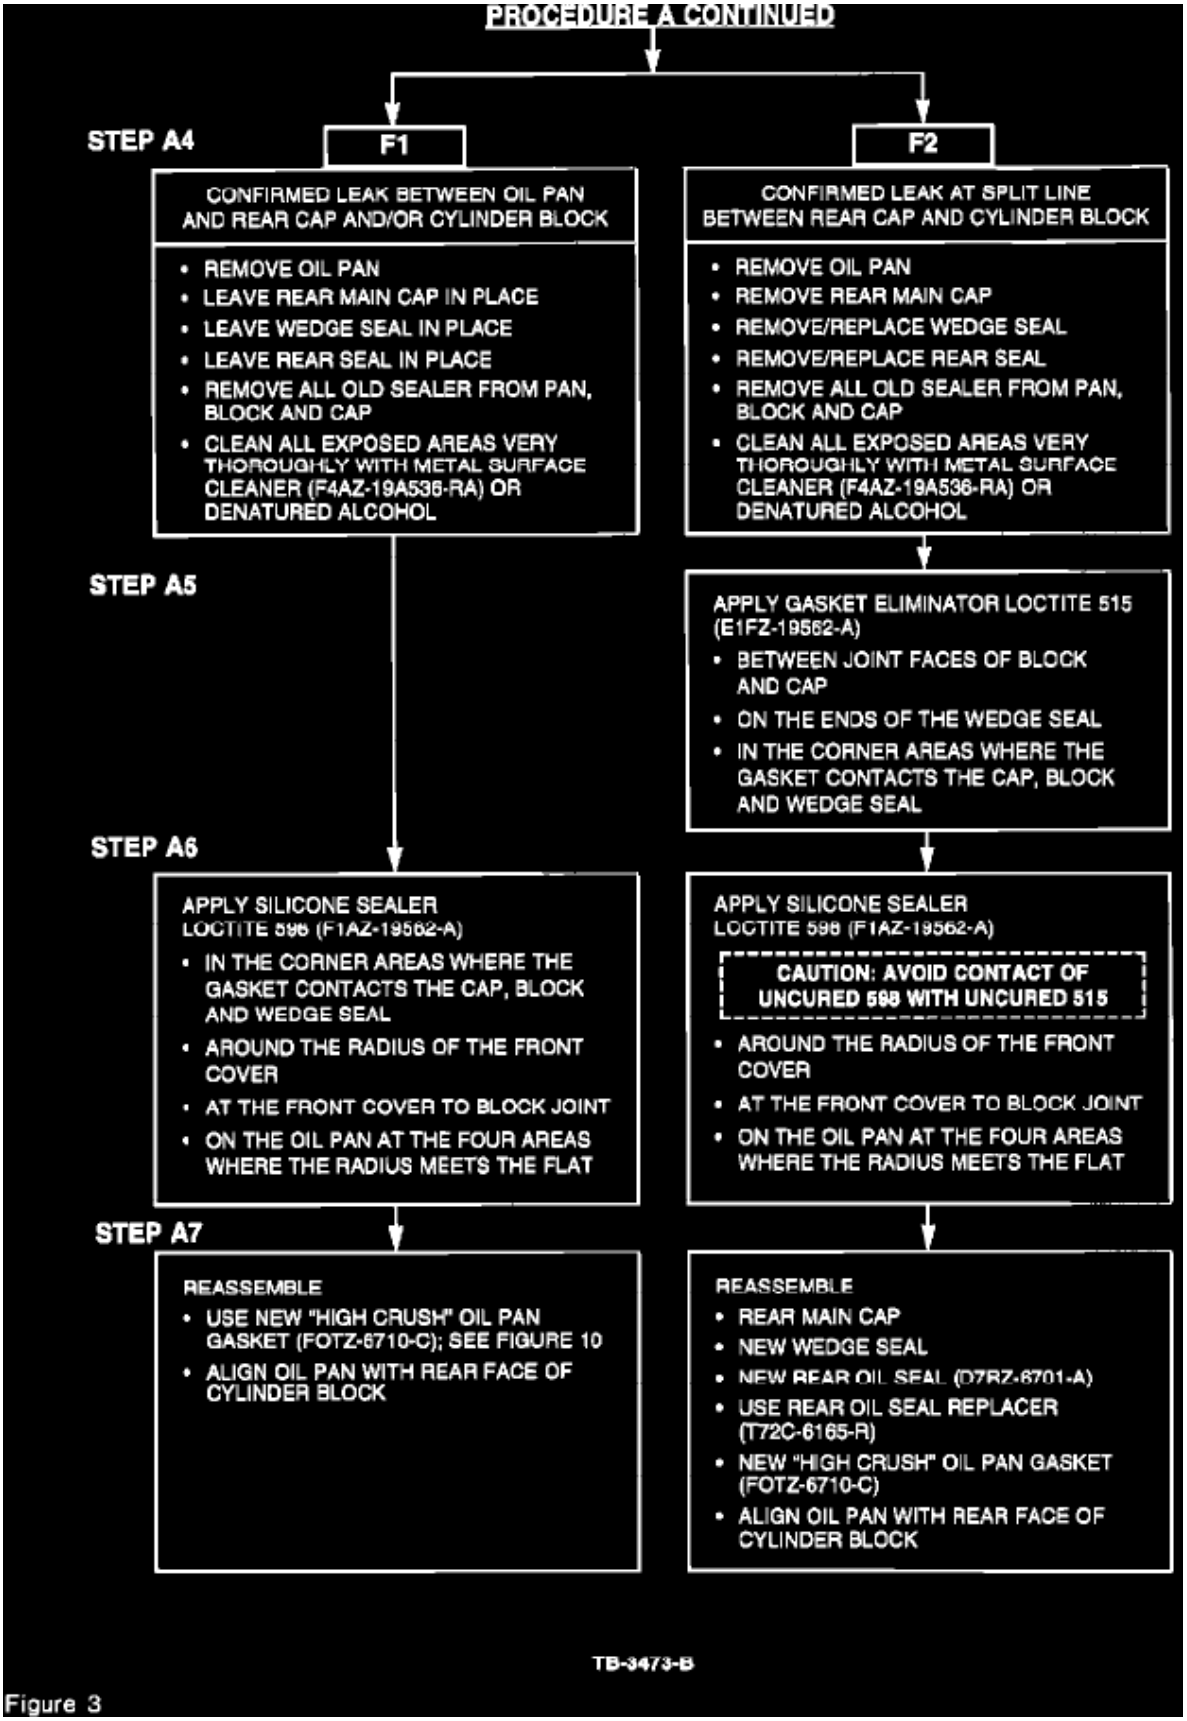
^ If bubbles are detected at the front or rear of the intake manifold gasket, a new intake manifold gasket (FOTZ-9439-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT INTAKE MANIFOLD, PROCEDURE B.

^ If bubbles are detected at the rocker cover rails, new rocker cover gaskets (F3TZ-6584-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT ROCKER COVER RAILS, PROCEDURE C.

^ If bubbles are detected at the front end of the engine, a new front seal (E6TZ-6700-A) or oil pan gasket (FOTZ-6710-C) will be required. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT THE FRONT END, PROCEDURE D.

Service Procedure - Repair

REAR END OIL LEAK - PROCEDURE A



PROCEDURE A CONTINUED
STEP A4
F1
CONFIRMED LEAK BETWEEN OIL PAN AND REAR CAP AND/OR CYLINDER BLOCK
• REMOVE OIL PAN
• LEAVE REAR MAIN CAP IN PLACE
• LEAVE WEDGE SEAL IN PLACE
• LEAVE REAR SEAL IN PLACE
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
F2
CONFIRMED LEAK AT SPLIT LINE BETWEEN REAR CAP AND CYLINDER BLOCK
• REMOVE OIL PAN
• REMOVE REAR MAIN CAP
• REMOVE/REPLACE WEDGE SEAL
• REMOVE/REPLACE REAR SEAL
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
STEP A5
APPLY GASKET ELIMINATOR LOCTITE 515 (E1FZ-19562-A)
• BETWEEN JOINT FACES OF BLOCK AND CAP
• ON THE ENDS OF THE WEDGE SEAL
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
STEP A6
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
CAUTION: AVOID CONTACT OF UNCURED 598 WITH UNCURED 515
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
STEP A7
REASSEMBLE
• USE NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C); SEE FIGURE 10
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
REASSEMBLE
• REAR MAIN CAP
• NEW WEDGE SEAL
• NEW REAR OIL SEAL (D7RZ-6701-A)
• USE REAR OIL SEAL REPLACER (T72C-6165-R)
• NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C)
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
TB-3473-B
Figure 3

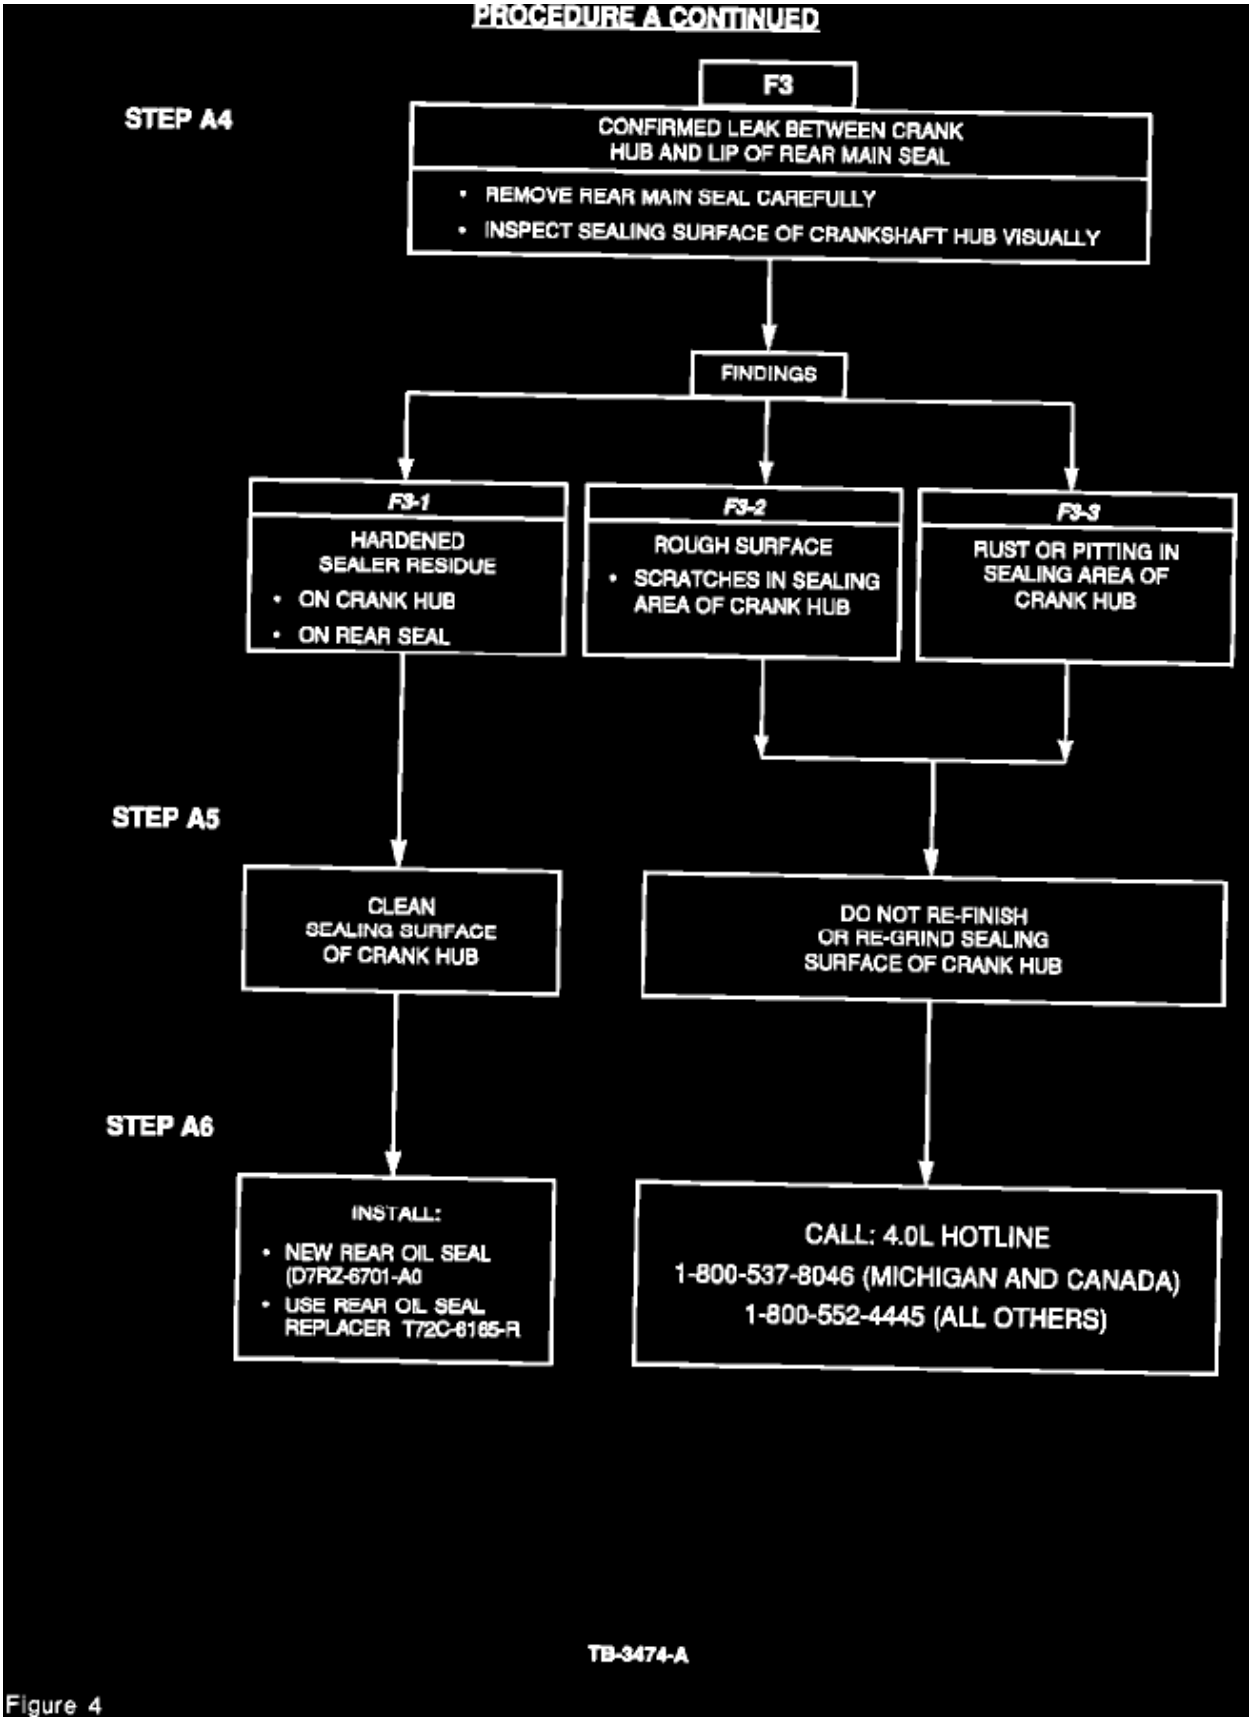


Figure 4

1. Repair procedure for a leak at oil pan gasket between the oil pan and cylinder block, or between the oil pan and the rear main cap. See block diagram Procedure A, Step A4/F1, Figures 3 and 4.

a. Remove the oil pan from the engine and remove the old gasket from the oil pan. Do not remove the rear main cap or wedge seal from the engine.

b. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

c. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap. Take special care to scrape/scratch all the old sealer from the exposed areas of the rear cap, wedge seal and cylinder block. This is a critical sealing area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER BLOCK.

d. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

e. Clean the transmission "BELLHOUSING" area, the rear of the cylinder block and the rear engine plate of ALL oil residue.

f. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corner of the radius areas at the front and rear of the oil pan.

g. Place the oil pan gasket (FOTZ-6710-C) in place in the groove in the oil pan.

h. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the corners where the rear main cap meets the cylinder block, at the corner areas of the radius area on the front cover and the front cover to cylinder block joint.

i. Set the oil pan in place and snug the four (4) pan nuts.

j. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .0100" (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

k. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

2. Repair procedure for a leak between the rear main cap and the cylinder block. See block diagram Procedure A, Step A4/F2.

a. Remove the oil pan, windage tray, oil pump and rear main cap from the engine.

b. Remove the rear main oil seal from the crankshaft and thoroughly inspect the main seal journal of the crankshaft for signs of rust, pitting, nicks or porosity.

c. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

d. Clean ALL the old sealer from the rear main bearing cap USING A SCRAPER AND WIRE WHEEL. The original Loctite sealer used during production assembly becomes extremely hard after it has cured. It is extremely important that ALL the old sealer be removed from the joint faces and grooves.

e. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap joint area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER

BLOCK.

f. Clean ALL the oil and old sealer from the "WEDGE SEAL" that fits around the rear main bearing cap in the oil pan gasket groove. Preferably use a new "WEDGE SEAL".

g. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

h. Clean the transmission "BELLHOUSING AREA", the rear of the cylinder block and the rear engine plate of ALL oil residue.

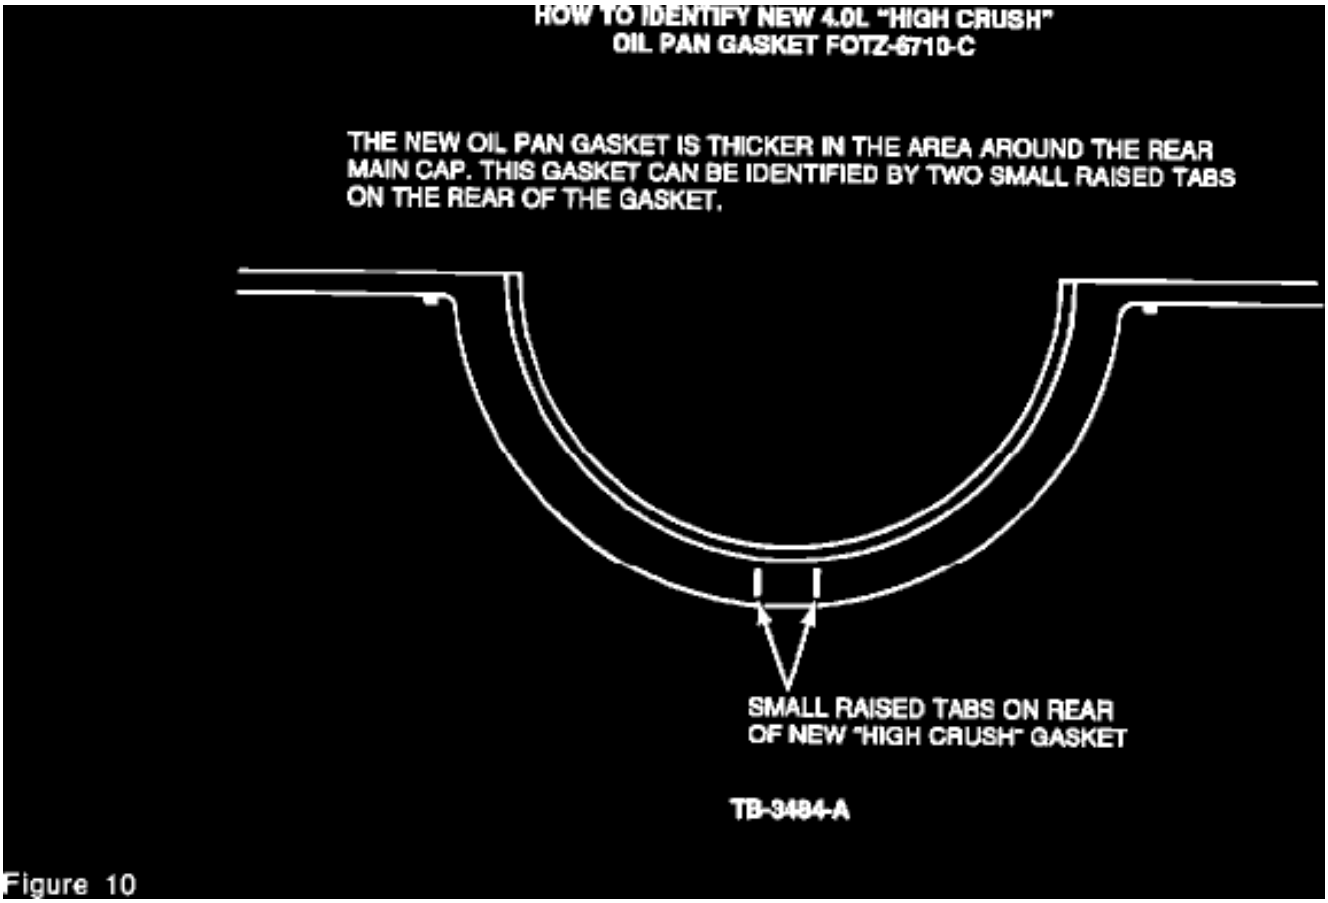

Figure 10

i. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) on the cylinder block along the corners of the rear main bearing cap joint area and on the joint face, approximately 1/2 inch (12.7 mm) from the rear of the block.

j. Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.

k. Align the rear main bearing cap to cylinder block by moving the bearing fore or aft (approx. 1/2 inch (12.7 mm) inward in the rear oil seal bore) so that the rear seal stop of the block and cap line up. This will assure that the rear main oil seal will seat squarely when installed in the bore.

l. Torque the rear main cap bolts to 66-77 lb.ft. (90-104 N-m).

m. Fill the cavities for the "WEDGE SEAL" on both sides of the rear main cap with Ford Gasket Eliminator (E1FZ-19562-A).

n. Place "WEDGE SEAL" in place and use a flat bladed screwdriver to fully seat the "WEDGE SEAL", forcing the excessive sealer out.

o. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) in the corners of the oil pan gasket groove of the rear main cap where the cap meets the cylinder block.

p. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) at the corner areas of the radius area on the front cover and at the front cover to cylinder block joint.

q. Reinstall the oil pump and windage tray. Torque to 13-15 lb.ft. (17-21 N-m).

r. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corners of the radius areas at the front and rear of the oil pan.

s. Place the oil pan gasket (FOTZ-6710-C), Figure 10, in place in the groove in the oil pan.

t. Set the oil pan in place and snug the four (4) oil pan bolts.

u. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .01000 (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

v. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

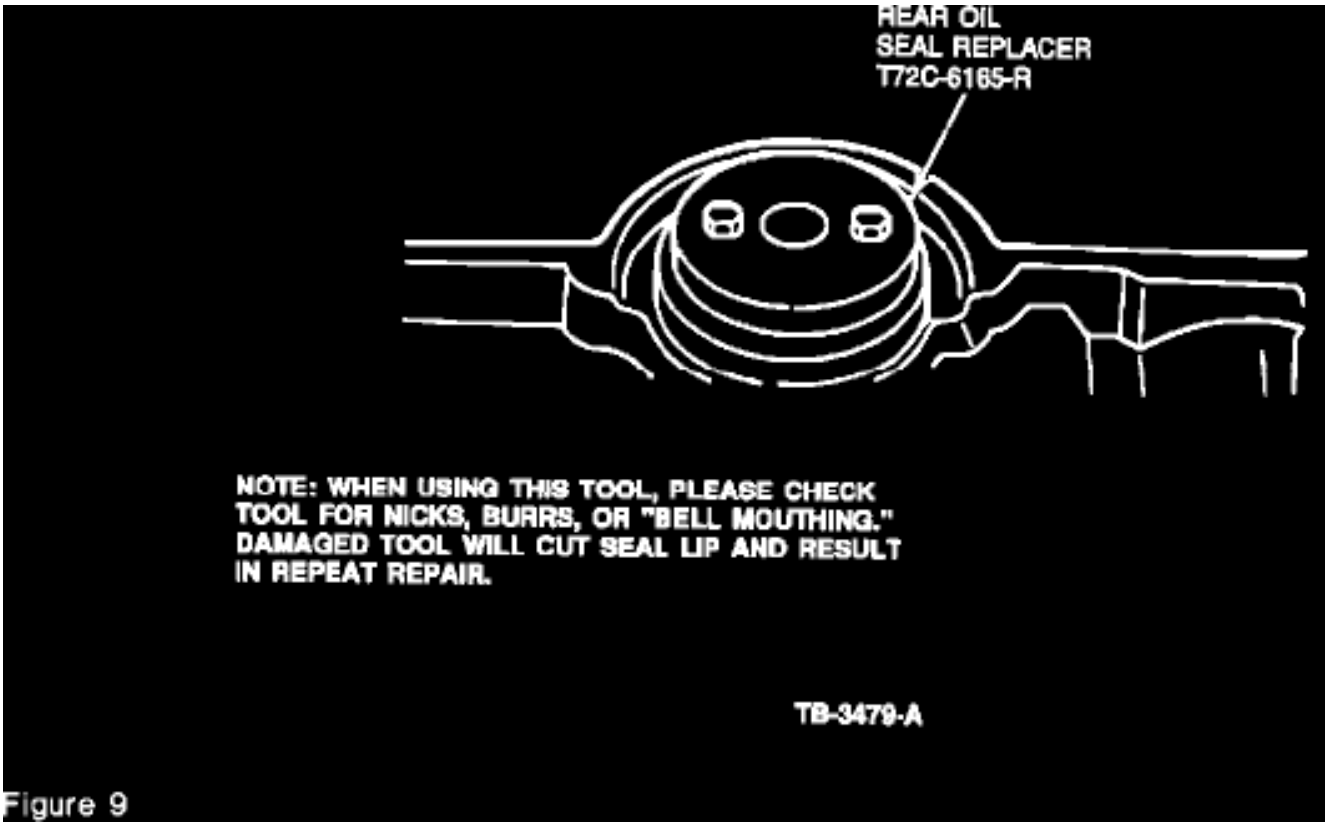

Figure 9

w. Coat the rear main oil seal (D7RZ-6701-A) with oil. Install the rear seal in the seal bore using Rear Oil Seal Replacer T72C-6165-R. This tool uses two flywheel bolts to draw the seal into position. Refer to Figure 9.

CAUTION:

DO NOT USE THE OLD STYLE HAMMER OPERATED TOOL.

3. Repair procedure for a leak between the rear main seal and the crankshaft. See block diagram, Procedure A, Step A4/F3.

a. Any presence of rust on the rear seal journal will cause a leak.

b. Any presence of pitting, porosity or nicks on the rear seal journal will cause a leak.

NOTE:

IF A LEAK IS PRESENT BETWEEN THE REAR MAIN SEAL AND CRANKSHAFT, PLEASE NOTIFY THE 4.0L "HOTLINE" AT (800) 537-8046 OR (800) 552-4445 PRIOR TO ANY ATTEMPT TO REPAIR THIS CONDITION.

Service Procedure - Repair For Oil Leaks At Intake Manifold

PROCEDURE B

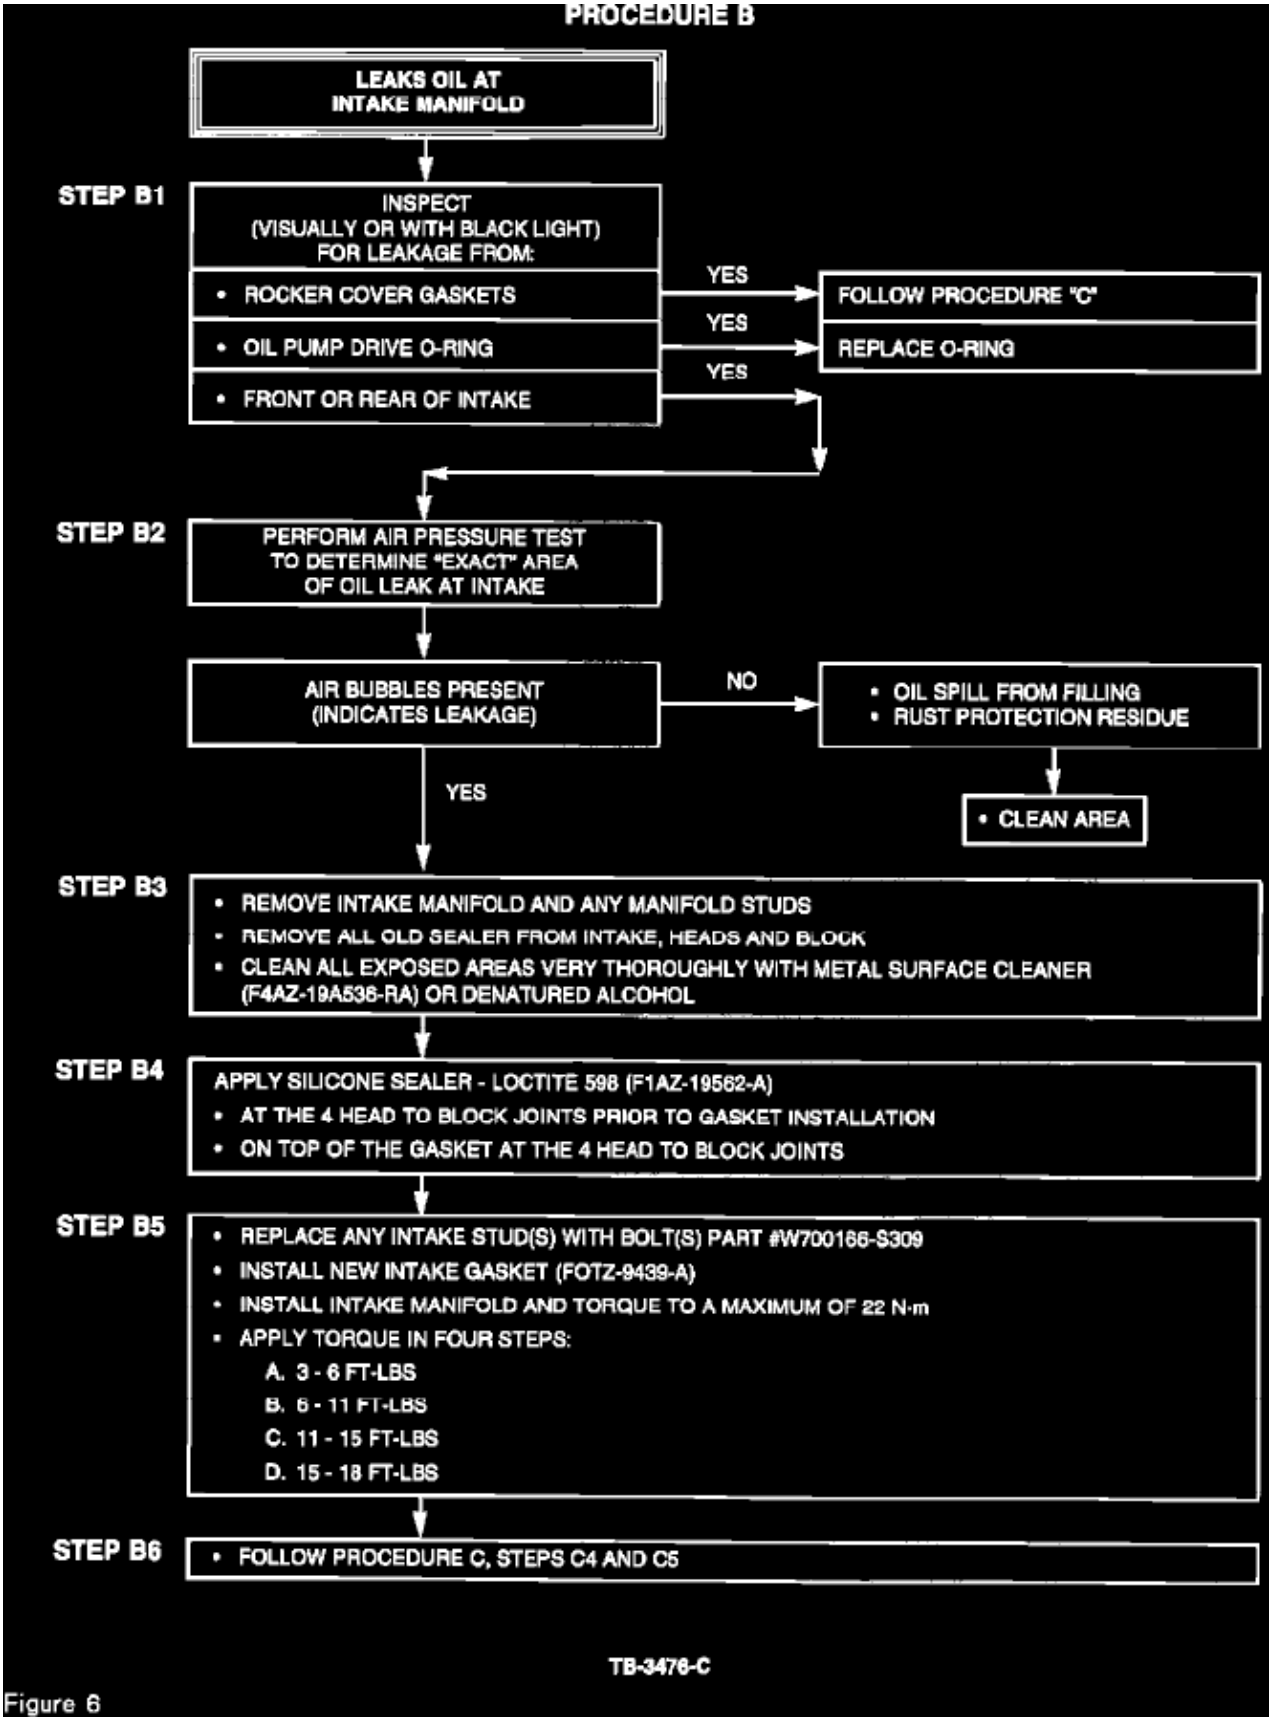

Figure 6

1. If the air pressure test showed no air bubbles, follow Procedure B2 to clean area of oil spill or other contamination.

2. If the air pressure test showed air bubbles present, follow Steps B3 through B6. Refer also to the Service Manual for the applicable year for further information pertinent to removal and installation of the intake manifold.

Service Procedure - Repair For Oil Leaks At Rocker Cover Rails

PROCEDURE C

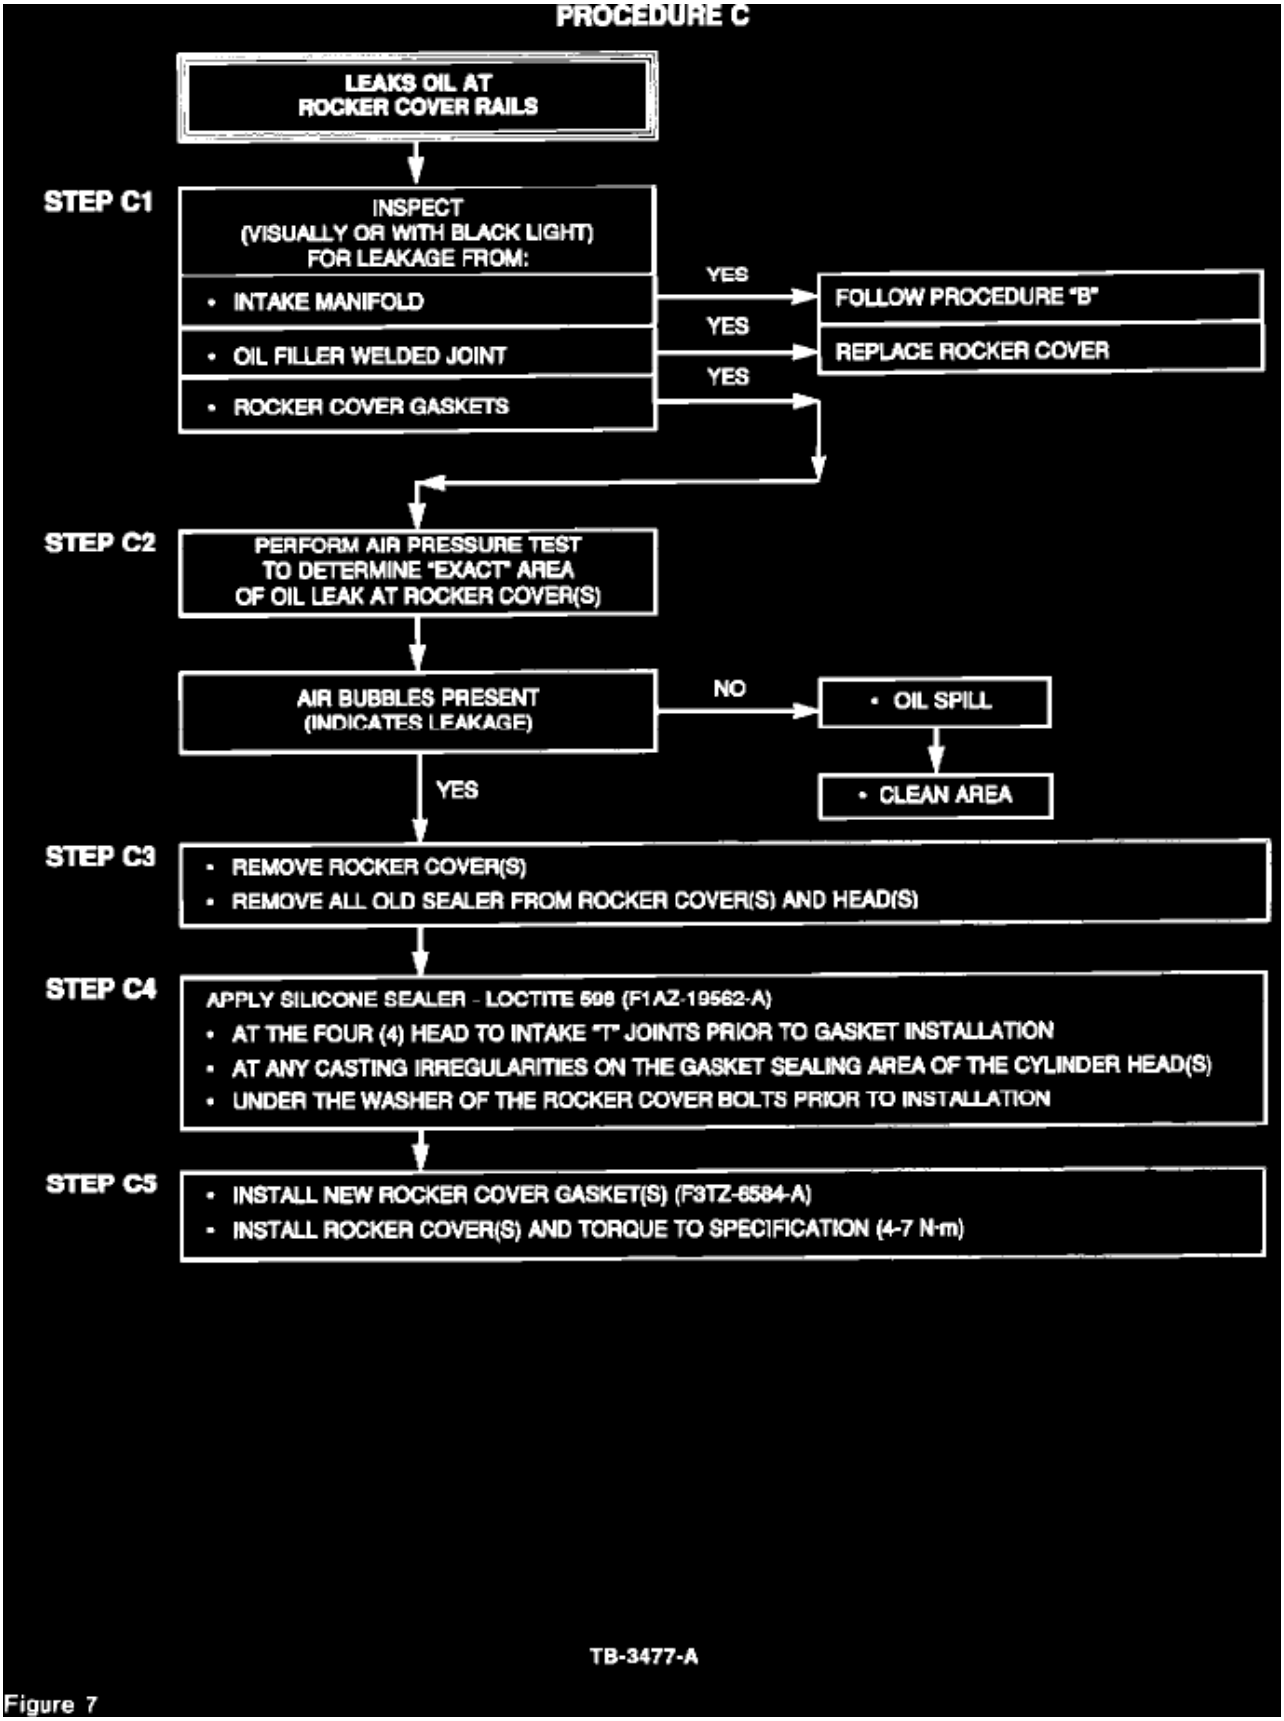

Figure 7

1. If the air pressure test showed no air bubbles, follow Procedure C2 to clean the area of any oil spill.

2. If the air pressure test showed air bubbles present, follow Steps C3 through C5.

Service Procedure - Repair For Oil Leaks At Front End

PROCEDURE D

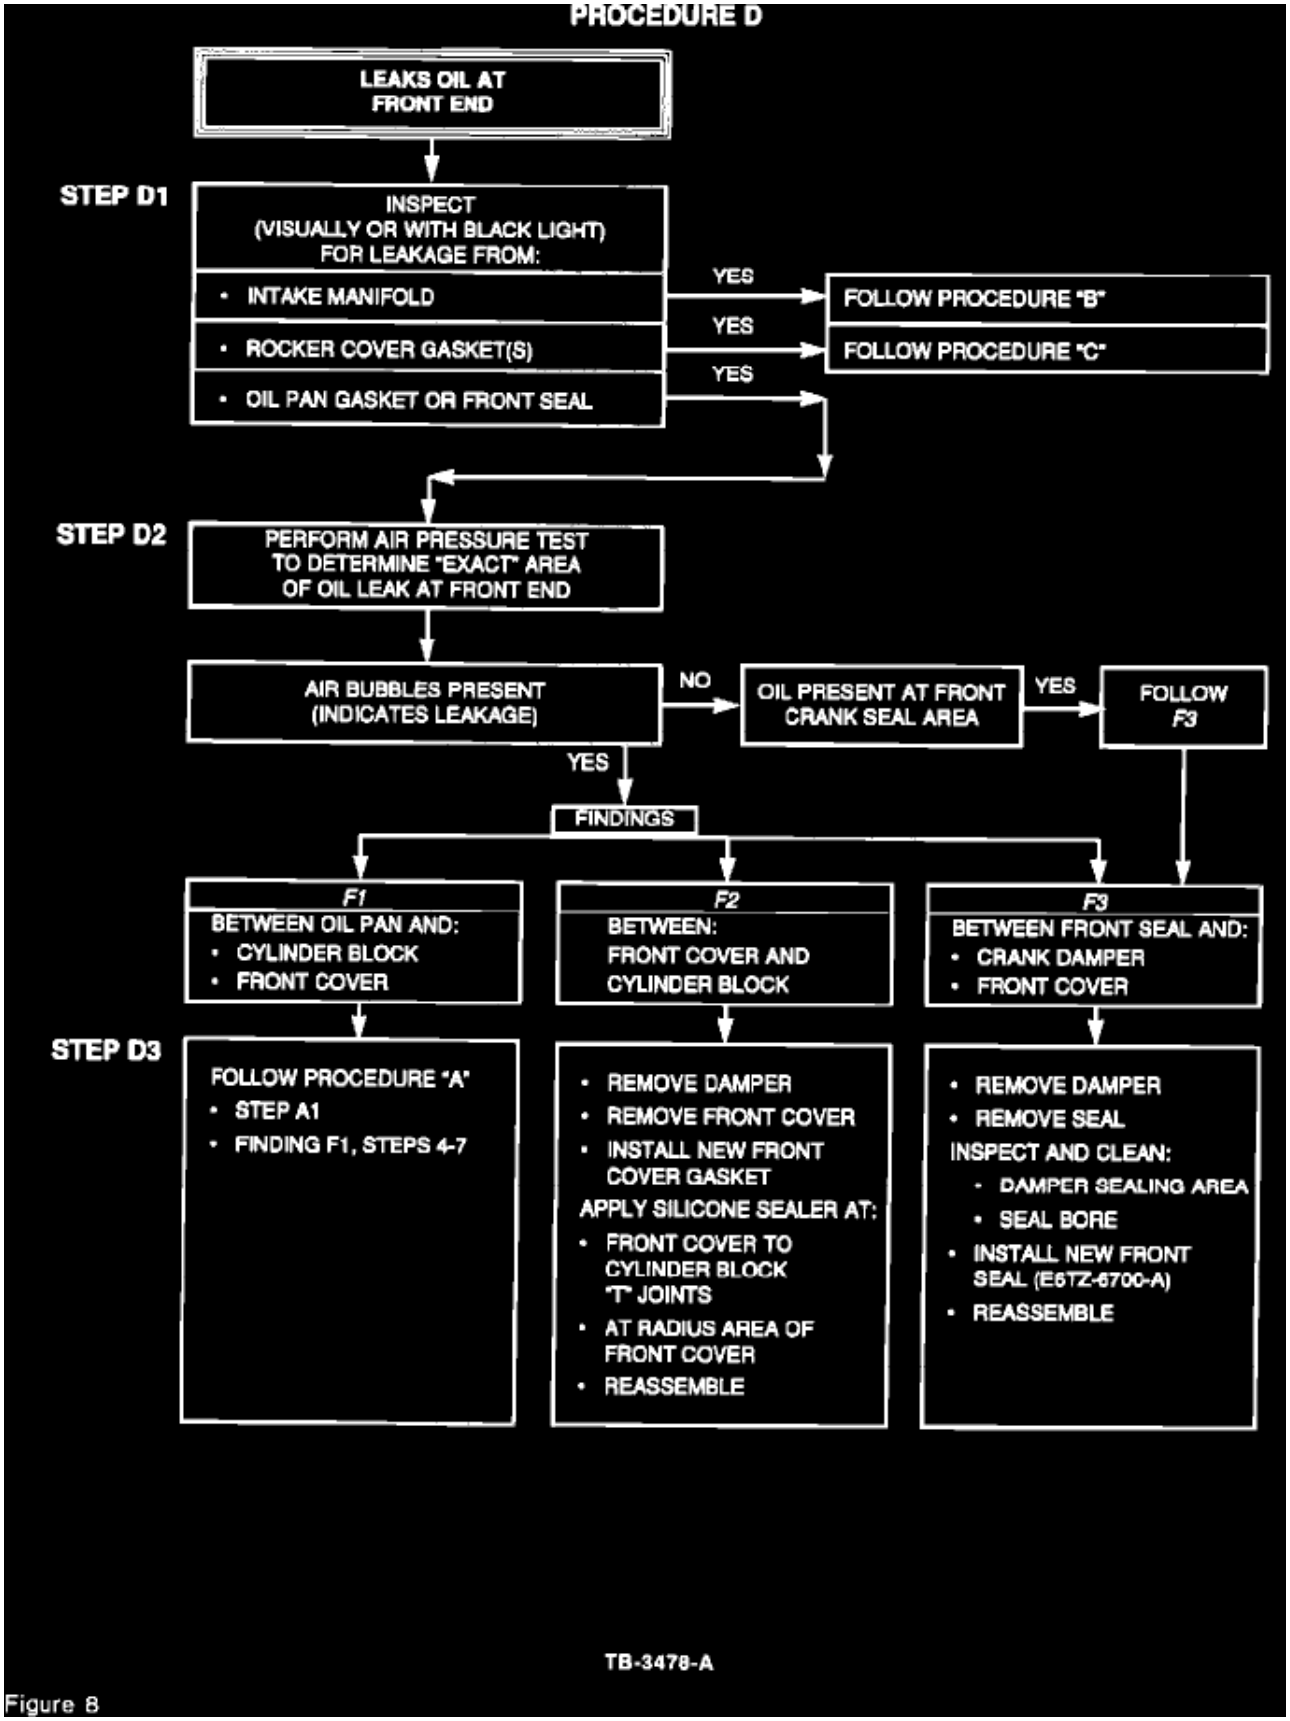

Figure 8

1. If the air pressure test showed no air bubbles, follow Procedure D, F3.

2. If the air pressure test showed air bubbles present, follow Procedure D, F1 or F2 as appropriate.

General Information

LIGHT TRUCK: 1990-93 AEROSTAR, RANGER 1991-93 EXPLORER

This TSB is being republished in its entirety to correct the type of cleaner being used in Figures 1, 3, and 6.

ISSUE: The many sources of leaks which typically appear at the lower end, front end, intake manifold valley, and rocker cover rails have led to mis-diagnosis as to the source of the leak and improper repair procedures, repeat repairs, and customer dissatisfaction.

ACTION: This TSB article has been developed to list the latest sealing techniques and associated part numbers for:

^ Oil Pan

^ Rear Main Seal

^ Rocker Covers

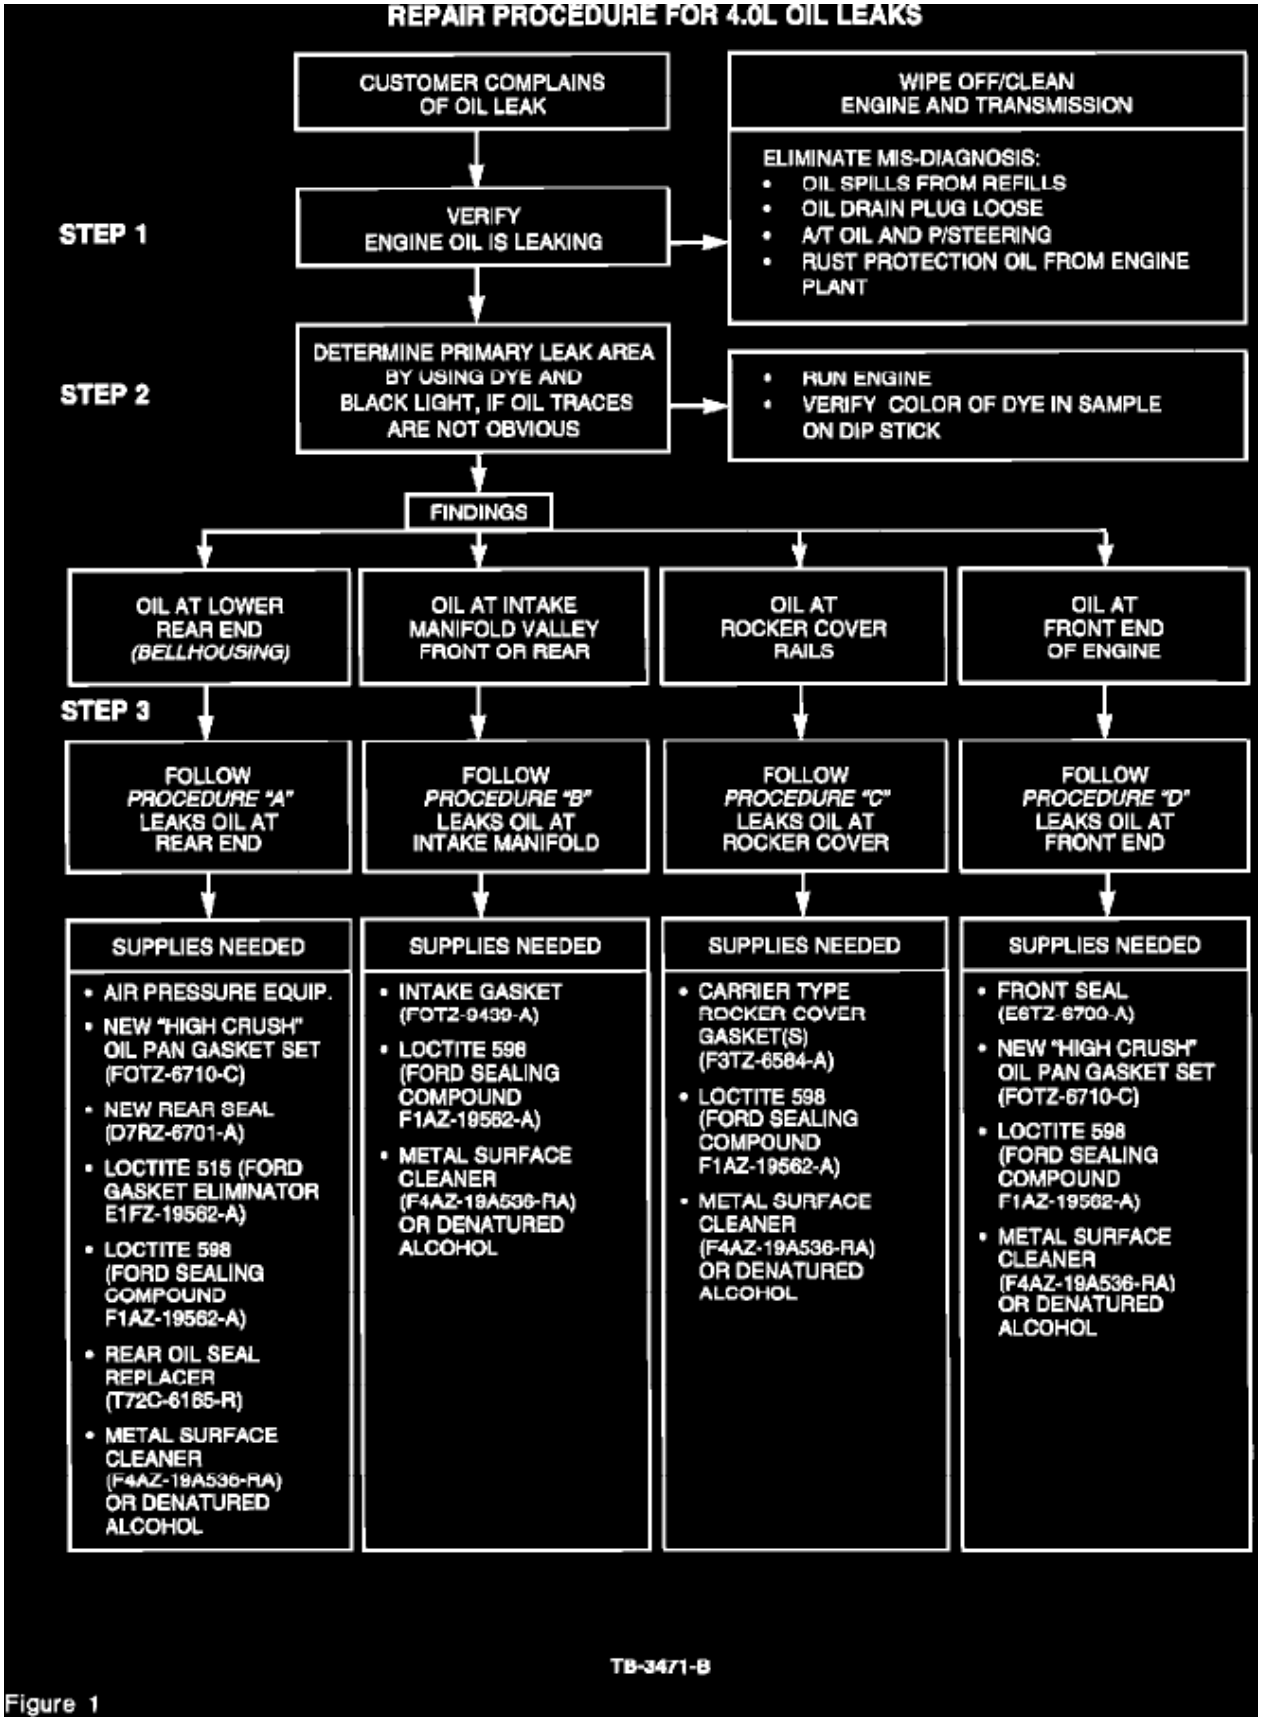

Figure 1

^ Intake Manifold

This article attempts to fully address all issues as one, in order to provide a diagnostic guide which leads to proper diagnosis and repair the first time. Use the following procedures to verify the location of the oil leak and perform the repair.

Service Procedure - Diagnosis

1. Perform Steps 1 and 2 of the block diagram shown in Figure 1. Perform a visual inspection to determine the general area of the oil leak.

2. After determining the "Findings" of Step 2, perform Step 3 by following Procedures A, B, C or D, whichever is appropriate, up to, but not including the air pressure test.

NOTE:

WHEN THE FINDINGS RESULT IN FOLLOWING PROCEDURE "A" FOR "LEAKS OIL AT REAR END", IT IS VERY IMPORTANT TO FOLLOW THE BLOCK DIAGRAM INSTRUCTIONS TO REMOVE THE TRANSMISSION, IF AN AEROSTAR, AND TO REMOVE THE ENGINE, IF AN EXPLORER/RANGER. THE PRACTICE OF REMOVING EXPLORER/RANGER OIL PANS WITH ENGINE IN VEHICLE CAN RESULT IN FAULTY DIAGNOSIS AND/OR REPAIR FOR THE PURPOSES OF THIS TSB.

If the leak has not been located and corrected at this point, then fabricate a device that is capable of applying a constant 1 to 3 psi of air pressure to the engine crankcase. The Rotunda Leak Tester 134-00003, or equivalent, which contains a pressure regulator and gauge capable of a 1 to 3 psi range, may be used.

3. Verify the location of the oil leak by pressurizing the engine crankcase with a constant supply of 3 psi of air pressure and the use of leak detection solution (liquid detergent and water). This process will verify the exact location of the leak. Dye and black light will verify a leak is present, but may not verify the exact location of the leak.

a. Assemble the necessary hose and fittings to connect an air pressure regulator and air pressure gauge to the shop air supply and to the engine crankcase through the dipstick tube.

b. Test the device to make sure 1-3 psi of air pressure can be maintained. Bursts of pressure over 3 psi can damage engine seals.

c. Before starting the test, make sure the regulator valve is completely closed so as not to accidentally apply a big burst of air to the engine when starting the test.

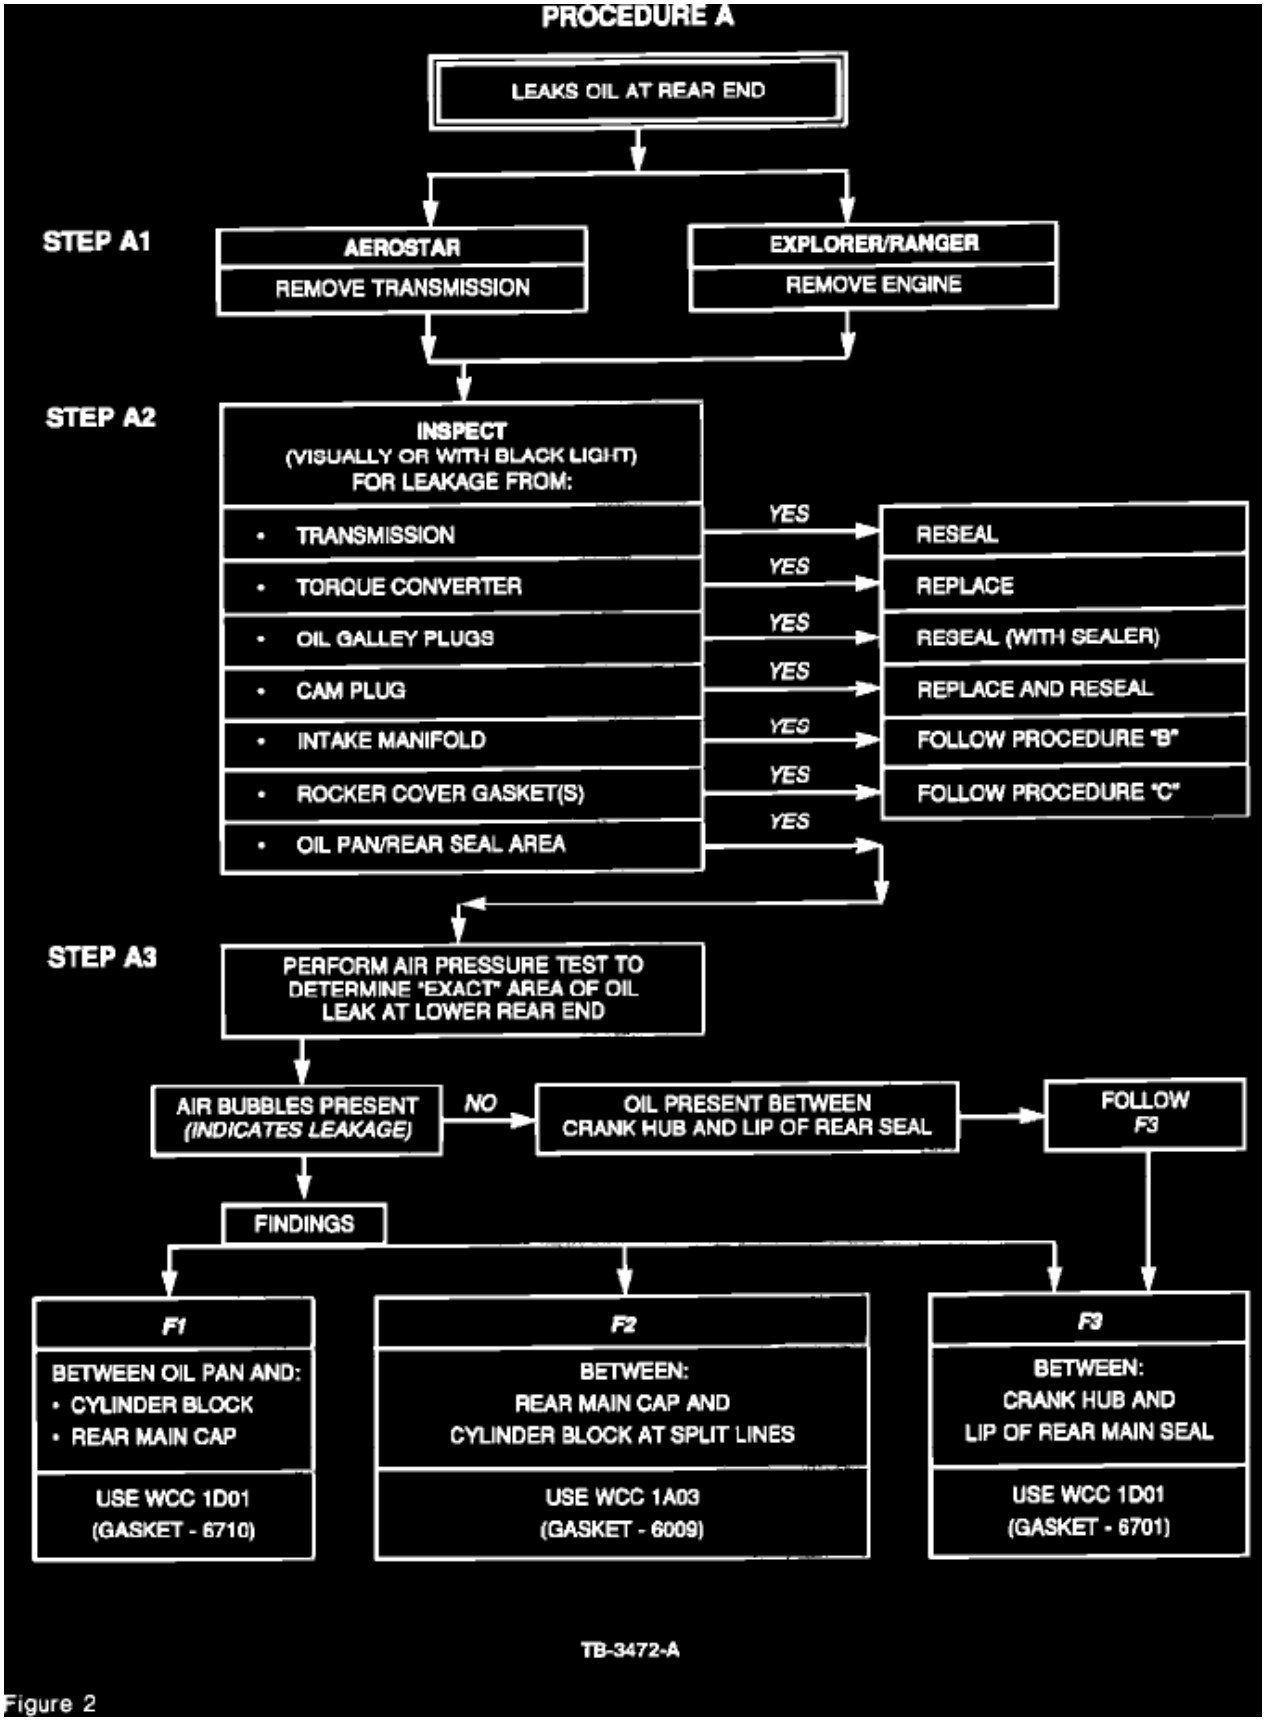
d. Attach the outlet (regulated) hose from the regulator/gauge device to the dipstick.

e. To trap air in the engine, plug any ports and passages (PCV valve, air inlet connection) that will allow air to escape.

f. Slowly open the regulator valve until 1-3 psi of air pressure registers on the gauge.

g. Keeping air pressure applied, brush or squirt a solution of liquid detergent and water or commercially available liquid leak detector (Snoop, Bubbles) to the primary area identified in Step 2 of the block diagram.

^ If the primary area is in the rear seal area, apply the solution to the rear seal, rear cap, rear cap to cylinder block and oil pan gasket areas.



PROCEDURE A
LEAKS OIL AT REAR END
STEP A1
AEROSTAR
REMOVE TRANSMISSION
EXPLORER/RANGER
REMOVE ENGINE
STEP A2
INSPECT
(VISUALLY OR WITH BLACK LIGHT)
FOR LEAKAGE FROM:
• TRANSMISSION
• TORQUE CONVERTER
• OIL GALLEY PLUGS
• CAM PLUG
• INTAKE MANIFOLD
• ROCKER COVER GASKET(S)
• OIL PAN/REAR SEAL AREA
YES
RESEAL
REPLACE
RESEAL (WITH SEALER)
REPLACE AND RESEAL
FOLLOW PROCEDURE "B"
FOLLOW PROCEDURE "C"
STEP A3
PERFORM AIR PRESSURE TEST TO
DETERMINE "EXACT" AREA OF OIL
LEAK AT LOWER REAR END
AIR BUBBLES PRESENT
(INDICATES LEAKAGE)
NO
OIL PRESENT BETWEEN
CRANK HUB AND LIP OF REAR SEAL
FOLLOW
F3
FINDINGS
F1
BETWEEN OIL PAN AND:
• CYLINDER BLOCK
• REAR MAIN CAP
USE WCC 1D01
(GASKET - 6710)
F2
BETWEEN:
REAR MAIN CAP AND
CYLINDER BLOCK AT SPLIT LINES
USE WCC 1A03
(GASKET - 6009)
F3
BETWEEN:
CRANK HUB AND
LIP OF REAR MAIN SEAL
USE WCC 1D01

Figure 2

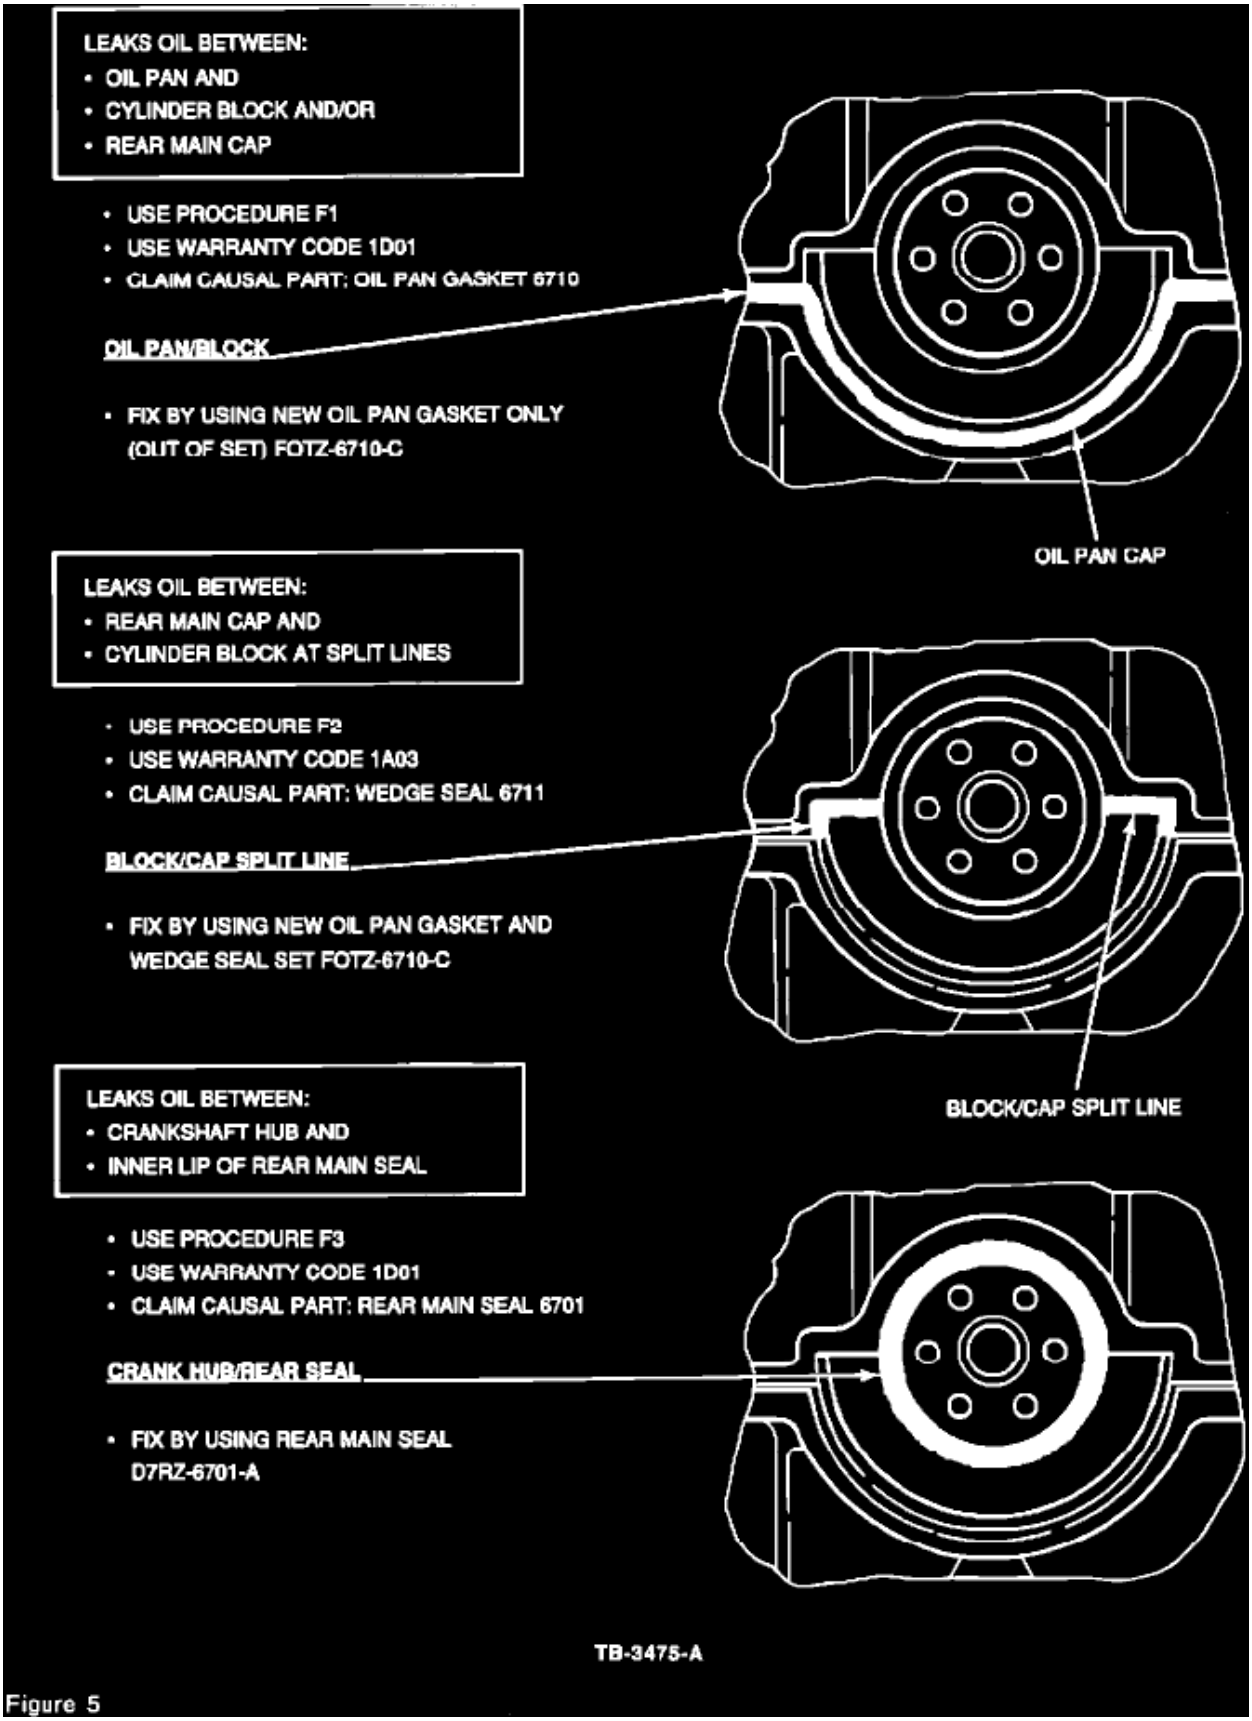

Figure 5

^ If bubbles are detected only at the oil pan gasket, between the oil pan and the cylinder block, or between the oil pan and the rear main cap, only the oil pan gasket needs replacing. Note

Procedure A, Figure 2, Step A3/F1, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A1.

^ If bubbles are detected between the rear main cap and the cylinder block, the rear cap must be removed and resealed. Note Procedure A, Figure 2, Step A3/F2, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A2.

^ If bubbles are detected between the rear seal lip and crank hub, a new rear oil seal will be required. Under certain circumstances, as outlined in the block diagram, it will be necessary to call the 4.OL Hotline. Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A3.

^ If no bubbles are detected, but oil is present in the area between the crank hub and the lip of the rear seal, carefully remove the seal and inspect the crankshaft rear seal journal. (A leak may occur

at the rear seal only when the engine is running.) Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Follow repair procedures outlined on the block diagram.

NOTE:

ANY APPEARANCE OF RUST, PITTING, POROSITY, OR NICKS ON THE REAR SEAL JOURNAL WILL CAUSE A LEAK.

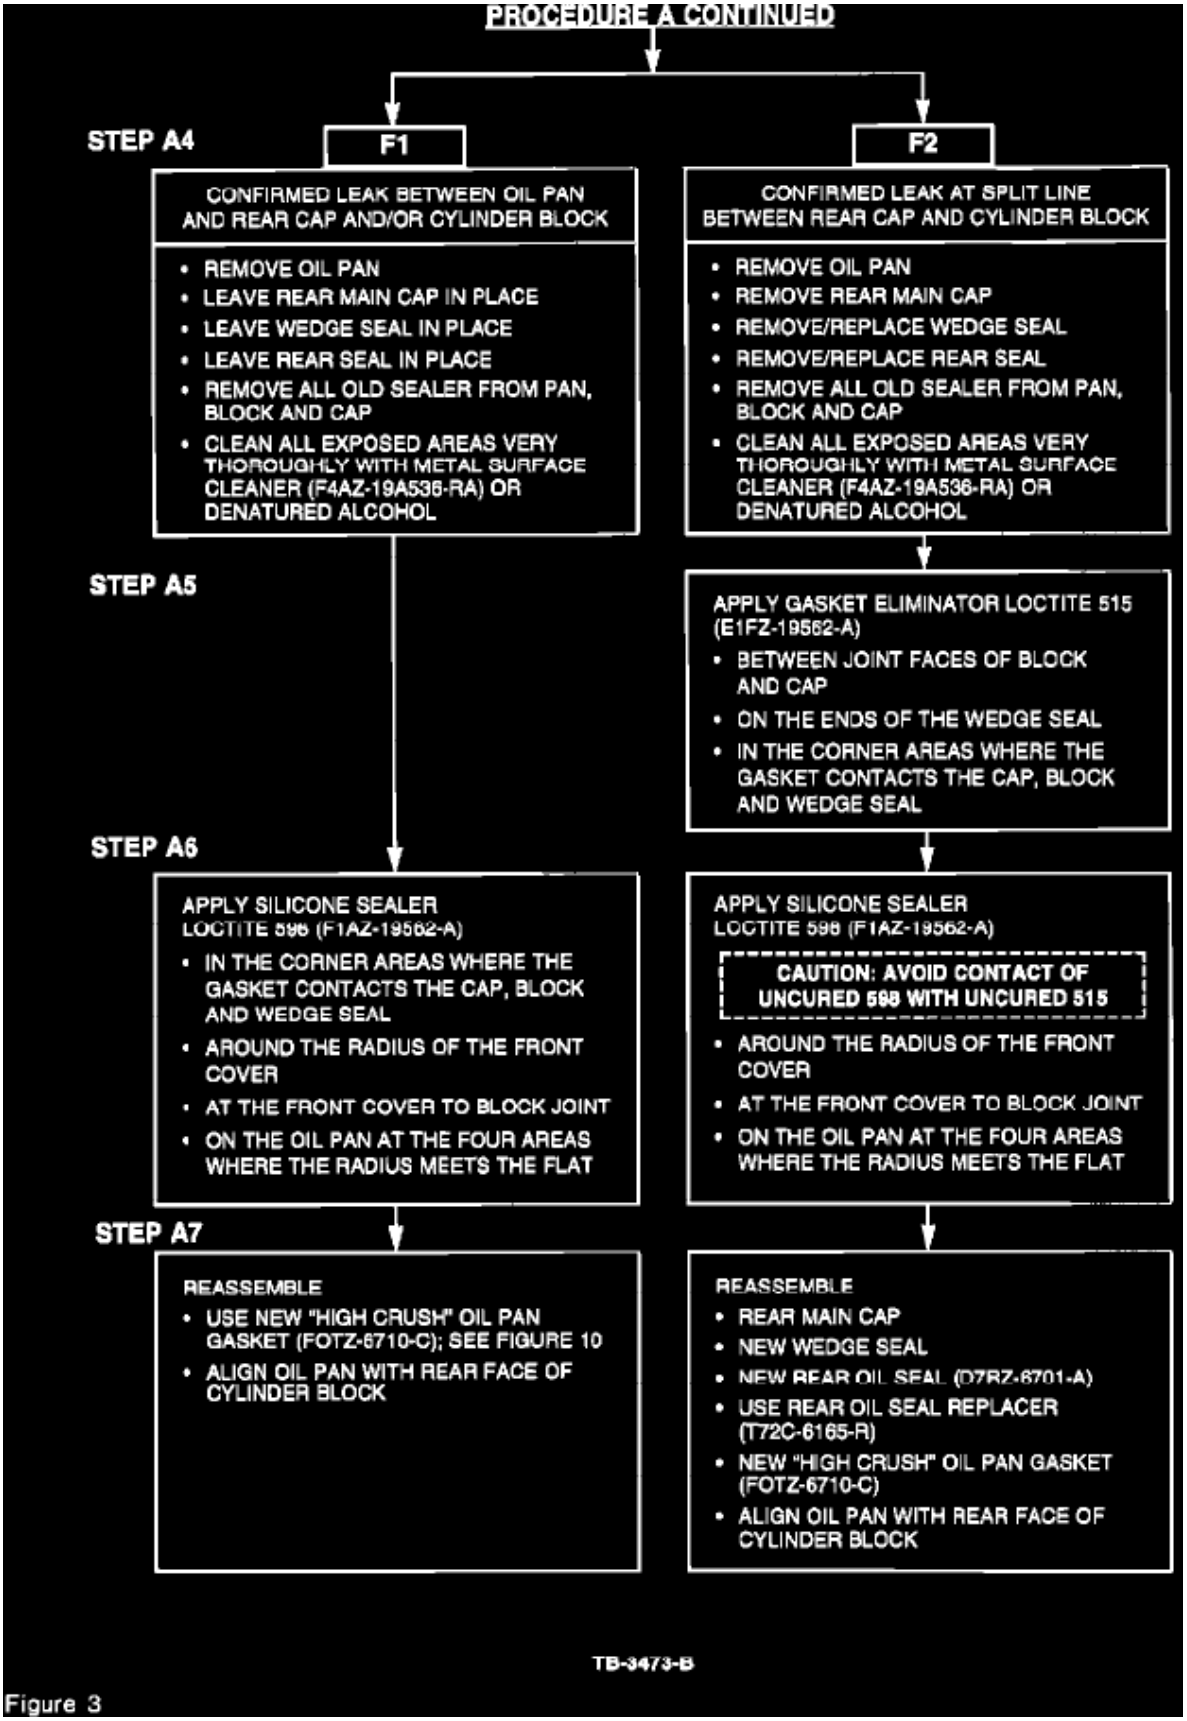
^ If bubbles are detected at the front or rear of the intake manifold gasket, a new intake manifold gasket (FOTZ-9439-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT INTAKE MANIFOLD, PROCEDURE B.

^ If bubbles are detected at the rocker cover rails, new rocker cover gaskets (F3TZ-6584-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT ROCKER COVER RAILS, PROCEDURE C.

^ If bubbles are detected at the front end of the engine, a new front seal (E6TZ-6700-A) or oil pan gasket (FOTZ-6710-C) will be required. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT THE FRONT END, PROCEDURE D.

Service Procedure - Repair

REAR END OIL LEAK - PROCEDURE A



PROCEDURE A CONTINUED
STEP A4
F1
CONFIRMED LEAK BETWEEN OIL PAN AND REAR CAP AND/OR CYLINDER BLOCK
• REMOVE OIL PAN
• LEAVE REAR MAIN CAP IN PLACE
• LEAVE WEDGE SEAL IN PLACE
• LEAVE REAR SEAL IN PLACE
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
F2
CONFIRMED LEAK AT SPLIT LINE BETWEEN REAR CAP AND CYLINDER BLOCK
• REMOVE OIL PAN
• REMOVE REAR MAIN CAP
• REMOVE/REPLACE WEDGE SEAL
• REMOVE/REPLACE REAR SEAL
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
STEP A5
APPLY GASKET ELIMINATOR LOCTITE 515 (E1FZ-19562-A)
• BETWEEN JOINT FACES OF BLOCK AND CAP
• ON THE ENDS OF THE WEDGE SEAL
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
STEP A6
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
CAUTION: AVOID CONTACT OF UNCURED 598 WITH UNCURED 515
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
STEP A7
REASSEMBLE
• USE NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C); SEE FIGURE 10
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
REASSEMBLE
• REAR MAIN CAP
• NEW WEDGE SEAL
• NEW REAR OIL SEAL (D7RZ-6701-A)
• USE REAR OIL SEAL REPLACER (T72C-6165-R)
• NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C)
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
TB-3473-B
Figure 3

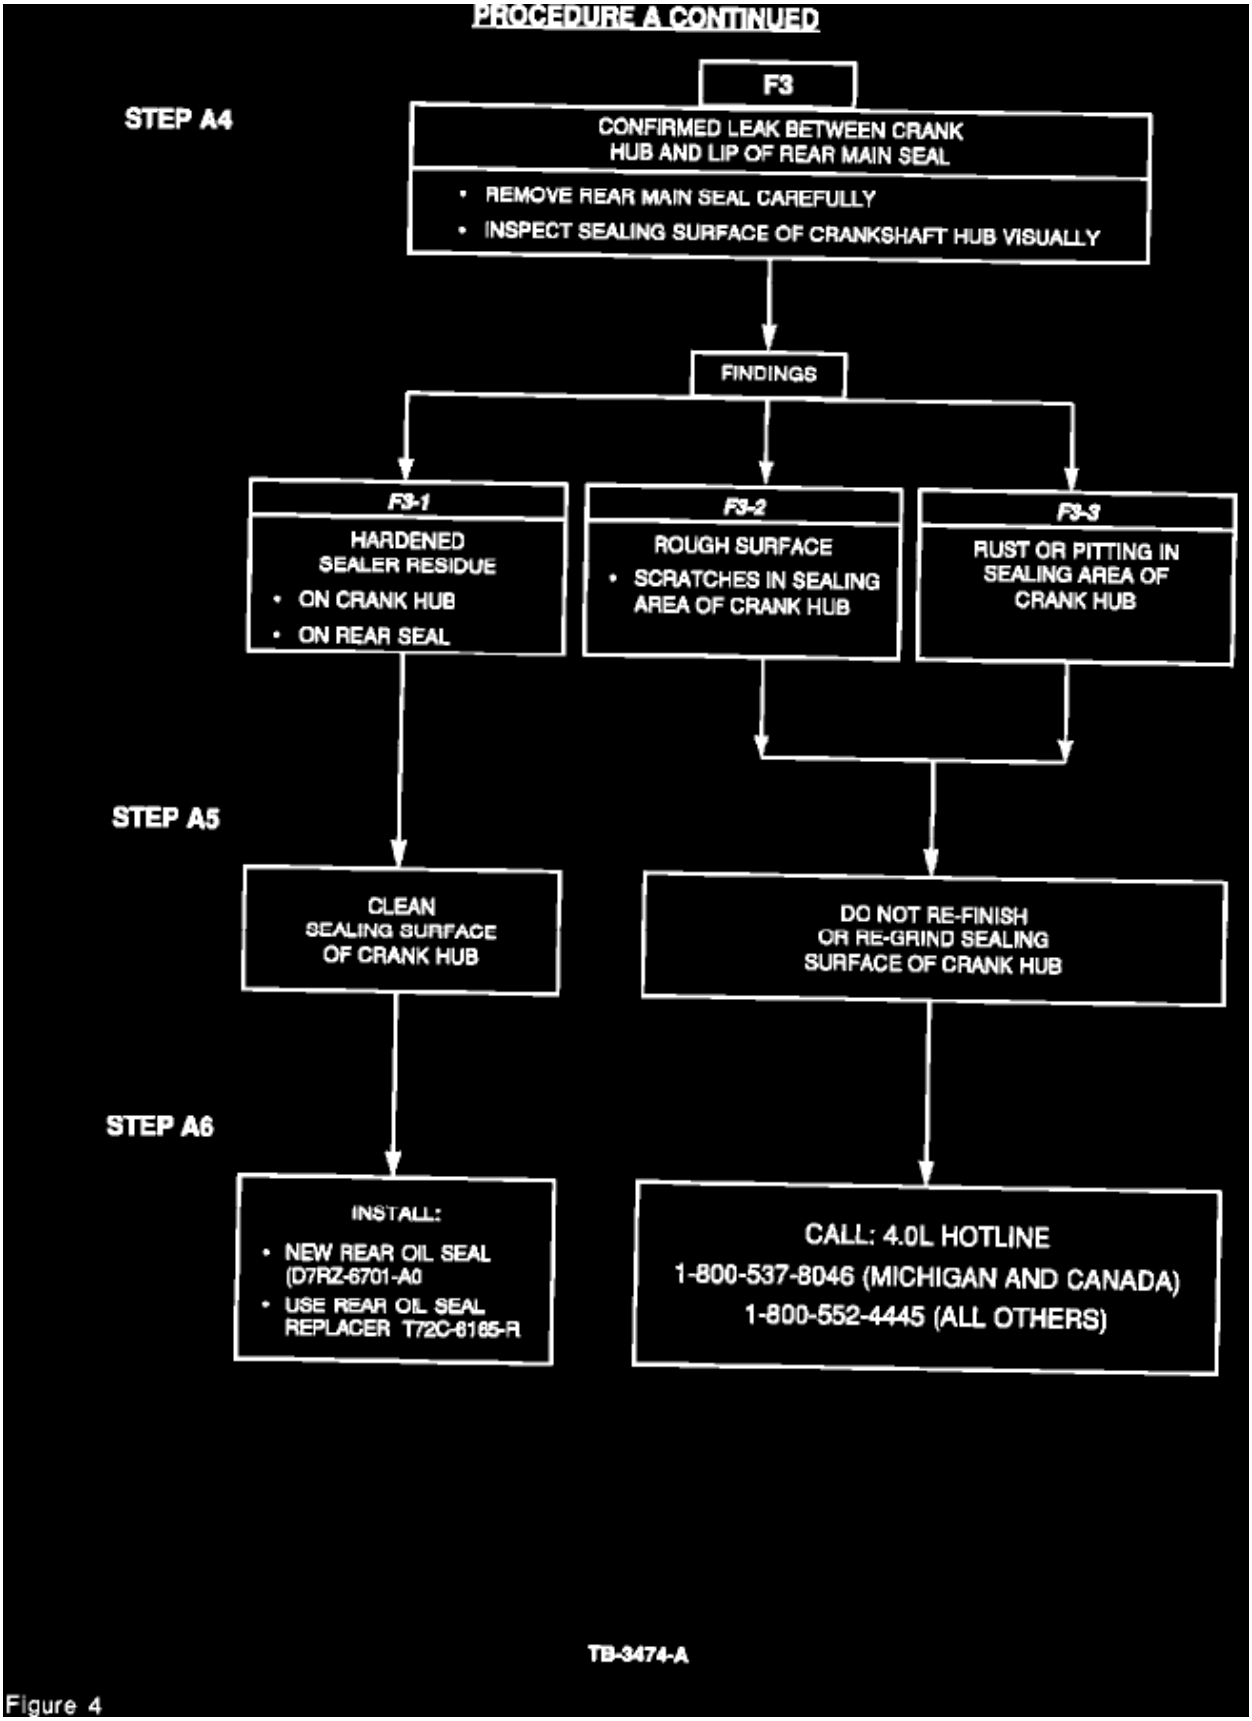


Figure 4

1. Repair procedure for a leak at oil pan gasket between the oil pan and cylinder block, or between the oil pan and the rear main cap. See block diagram Procedure A, Step A4/F1, Figures 3 and 4.

a. Remove the oil pan from the engine and remove the old gasket from the oil pan. Do not remove the rear main cap or wedge seal from the engine.

b. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

c. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap. Take special care to scrape/scratch all the old sealer from the exposed areas of the rear cap, wedge seal and cylinder block. This is a critical sealing area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER BLOCK.

d. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

e. Clean the transmission "BELLHOUSING" area, the rear of the cylinder block and the rear engine plate of ALL oil residue.

f. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corner of the radius areas at the front and rear of the oil pan.

g. Place the oil pan gasket (FOTZ-6710-C) in place in the groove in the oil pan.

h. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the corners where the rear main cap meets the cylinder block, at the corner areas of the radius area on the front cover and the front cover to cylinder block joint.

i. Set the oil pan in place and snug the four (4) pan nuts.

j. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .0100" (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

k. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

2. Repair procedure for a leak between the rear main cap and the cylinder block. See block diagram Procedure A, Step A4/F2.

a. Remove the oil pan, windage tray, oil pump and rear main cap from the engine.

b. Remove the rear main oil seal from the crankshaft and thoroughly inspect the main seal journal of the crankshaft for signs of rust, pitting, nicks or porosity.

c. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

d. Clean ALL the old sealer from the rear main bearing cap USING A SCRAPER AND WIRE WHEEL. The original Loctite sealer used during production assembly becomes extremely hard after it has cured. It is extremely important that ALL the old sealer be removed from the joint faces and grooves.

e. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap joint area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER

BLOCK.

f. Clean ALL the oil and old sealer from the "WEDGE SEAL" that fits around the rear main bearing cap in the oil pan gasket groove. Preferably use a new "WEDGE SEAL".

g. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

h. Clean the transmission "BELLHOUSING AREA", the rear of the cylinder block and the rear engine plate of ALL oil residue.

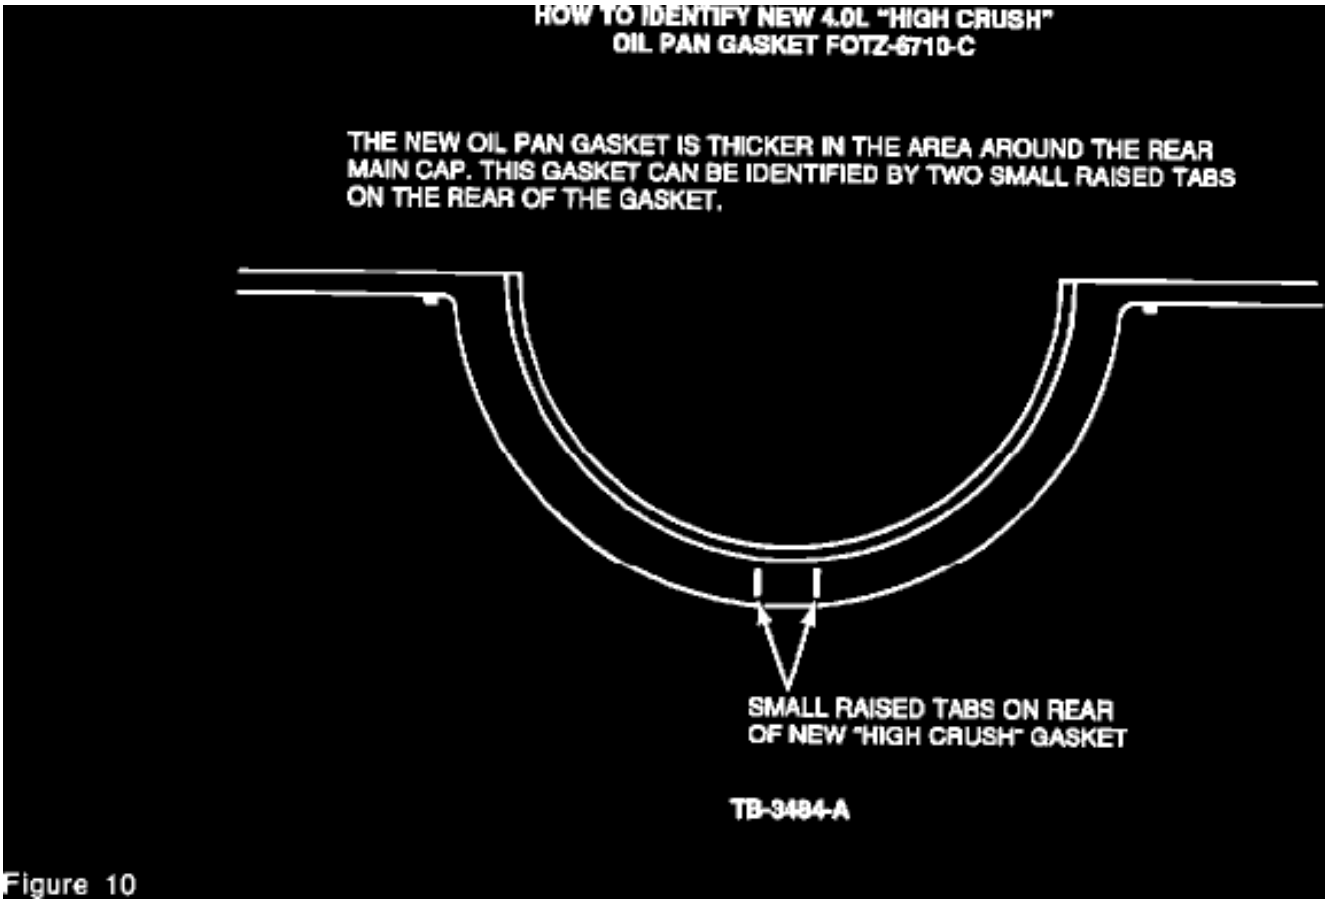

Figure 10

i. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) on the cylinder block along the corners of the rear main bearing cap joint area and on the joint face, approximately 1/2 inch (12.7 mm) from the rear of the block.

j. Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.

k. Align the rear main bearing cap to cylinder block by moving the bearing fore or aft (approx. 1/2 inch (12.7 mm) inward in the rear oil seal bore) so that the rear seal stop of the block and cap line up. This will assure that the rear main oil seal will seat squarely when installed in the bore.

l. Torque the rear main cap bolts to 66-77 lb.ft. (90-104 N-m).

m. Fill the cavities for the "WEDGE SEAL" on both sides of the rear main cap with Ford Gasket Eliminator (E1FZ-19562-A).

n. Place "WEDGE SEAL" in place and use a flat bladed screwdriver to fully seat the "WEDGE SEAL", forcing the excessive sealer out.

o. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) in the corners of the oil pan gasket groove of the rear main cap where the cap meets the cylinder block.

p. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) at the corner areas of the radius area on the front cover and at the front cover to cylinder block joint.

q. Reinstall the oil pump and windage tray. Torque to 13-15 lb.ft. (17-21 N-m).

r. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corners of the radius areas at the front and rear of the oil pan.

s. Place the oil pan gasket (FOTZ-6710-C), Figure 10, in place in the groove in the oil pan.

t. Set the oil pan in place and snug the four (4) oil pan bolts.

u. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .01000 (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

v. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

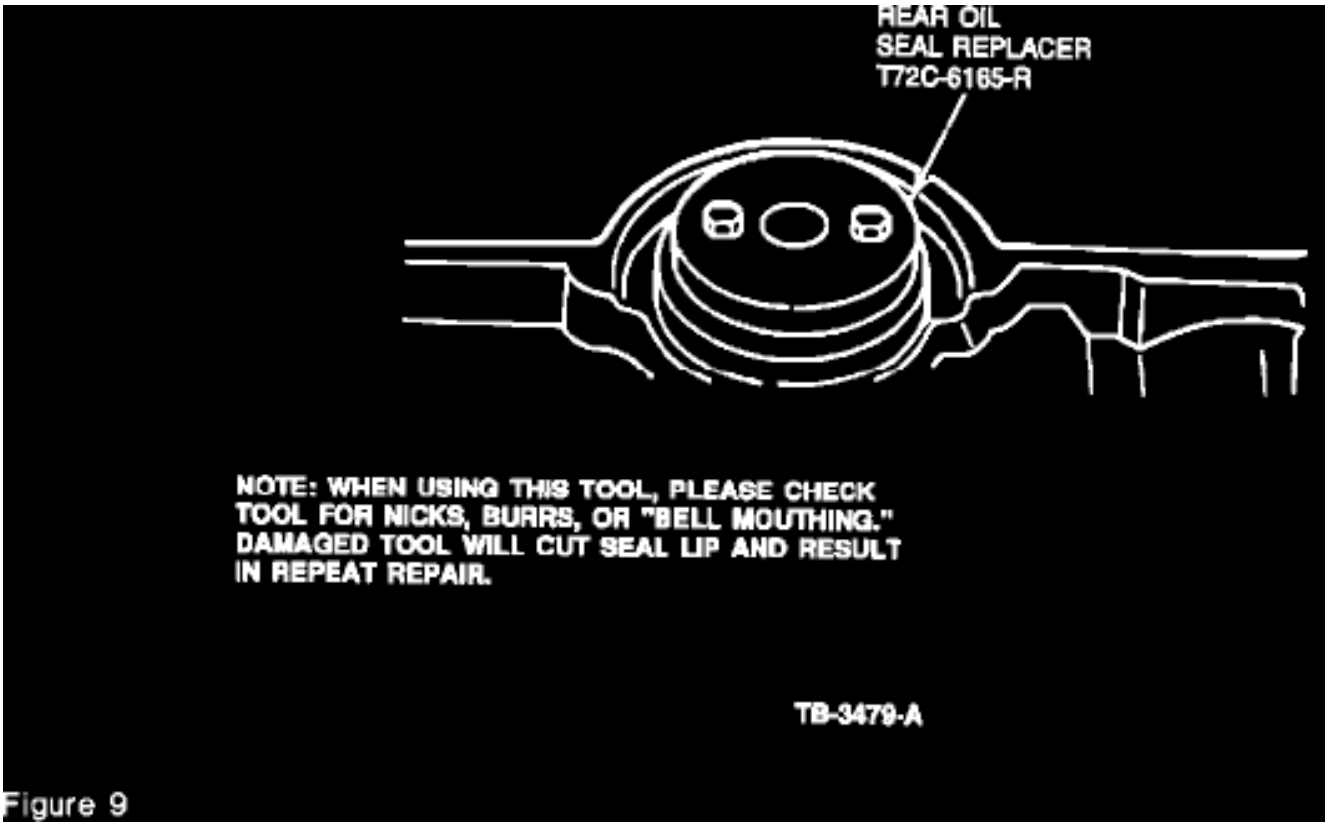

Figure 9

w. Coat the rear main oil seal (D7RZ-6701-A) with oil. Install the rear seal in the seal bore using Rear Oil Seal Replacer T72C-6165-R. This tool uses two flywheel bolts to draw the seal into position. Refer to Figure 9.

CAUTION:

DO NOT USE THE OLD STYLE HAMMER OPERATED TOOL.

3. Repair procedure for a leak between the rear main seal and the crankshaft. See block diagram, Procedure A, Step A4/F3.

a. Any presence of rust on the rear seal journal will cause a leak.

b. Any presence of pitting, porosity or nicks on the rear seal journal will cause a leak.

NOTE:

IF A LEAK IS PRESENT BETWEEN THE REAR MAIN SEAL AND CRANKSHAFT, PLEASE NOTIFY THE 4.0L "HOTLINE" AT (800) 537-8046 OR (800) 552-4445 PRIOR TO ANY ATTEMPT TO REPAIR THIS CONDITION.

Service Procedure - Repair For Oil Leaks At Intake Manifold

PROCEDURE B

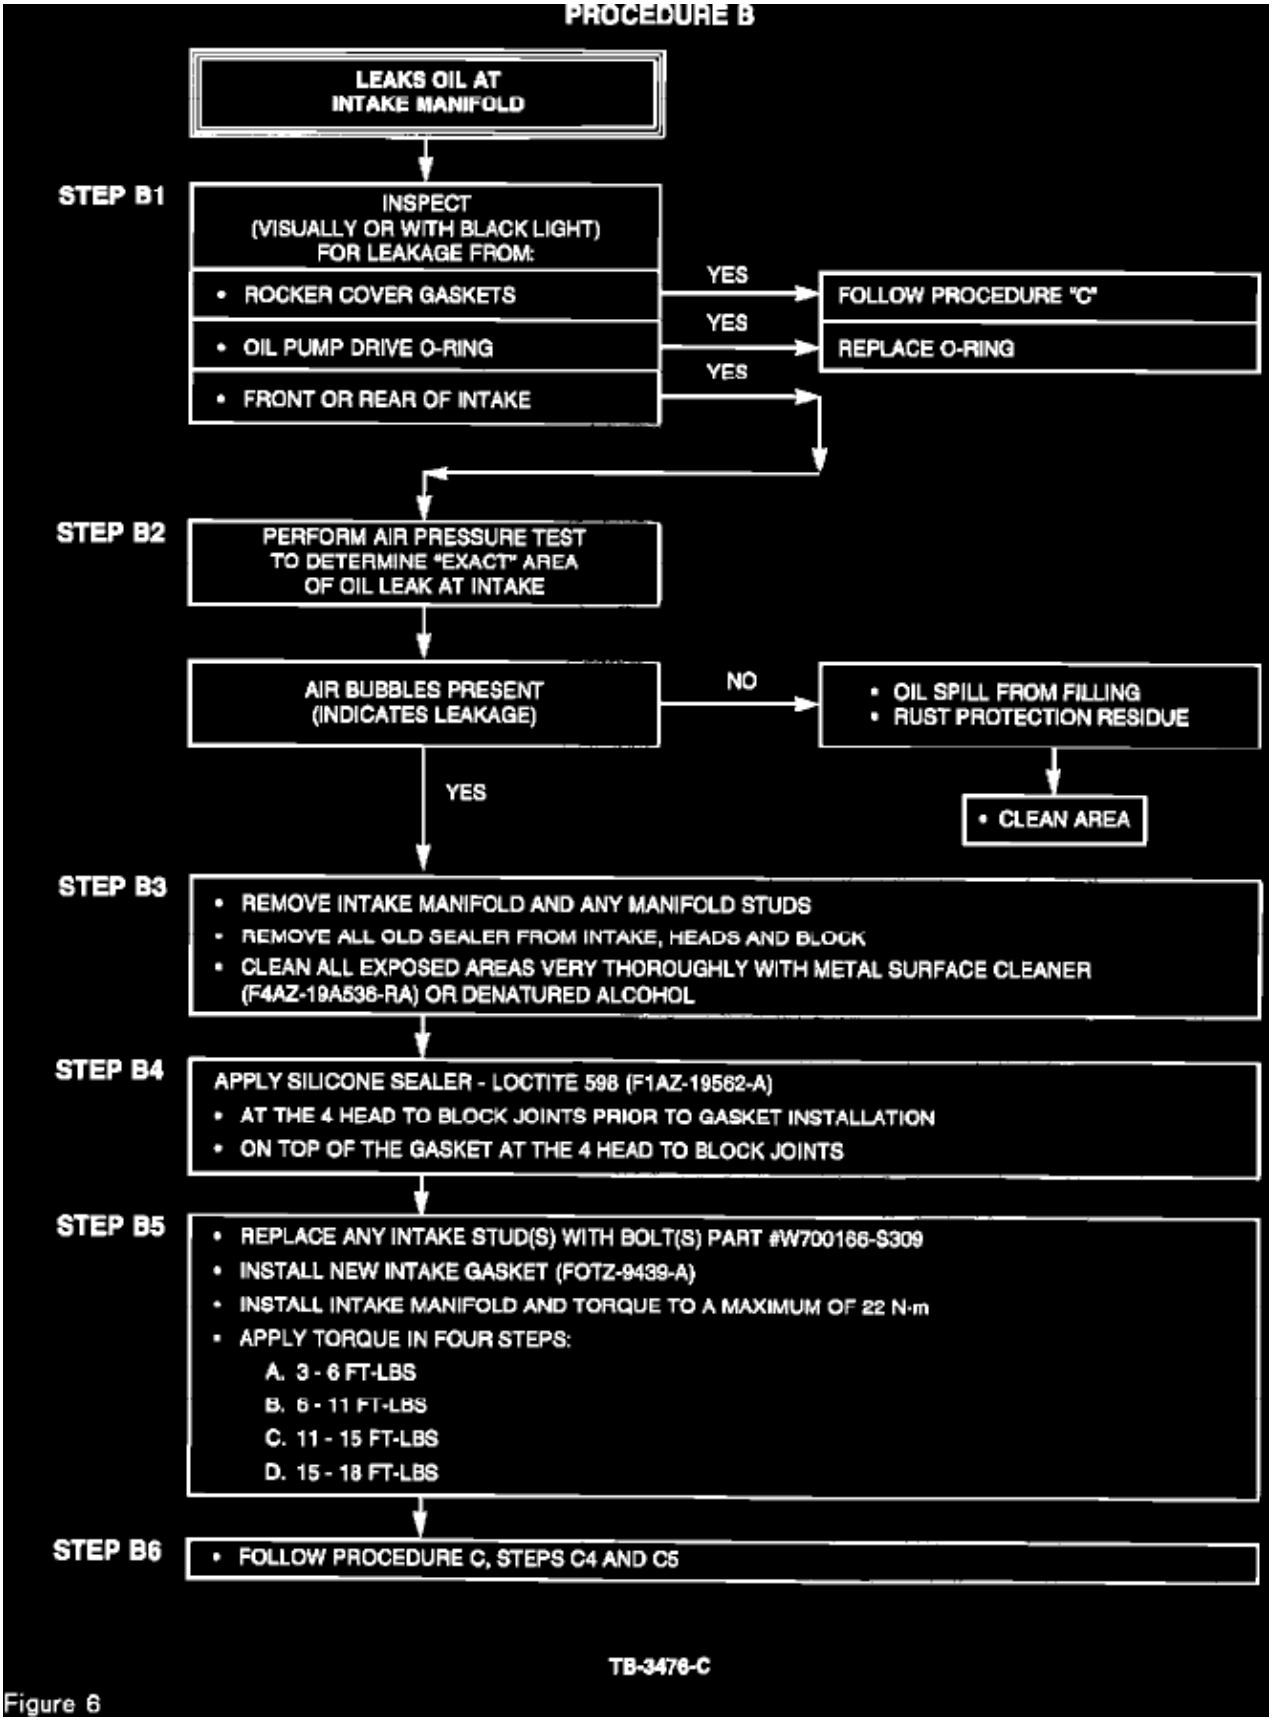

Figure 6

1. If the air pressure test showed no air bubbles, follow Procedure B2 to clean area of oil spill or other contamination.

2. If the air pressure test showed air bubbles present, follow Steps B3 through B6. Refer also to the Service Manual for the applicable year for further information pertinent to removal and installation of the intake manifold.

Service Procedure - Repair For Oil Leaks At Rocker Cover Rails

PROCEDURE C

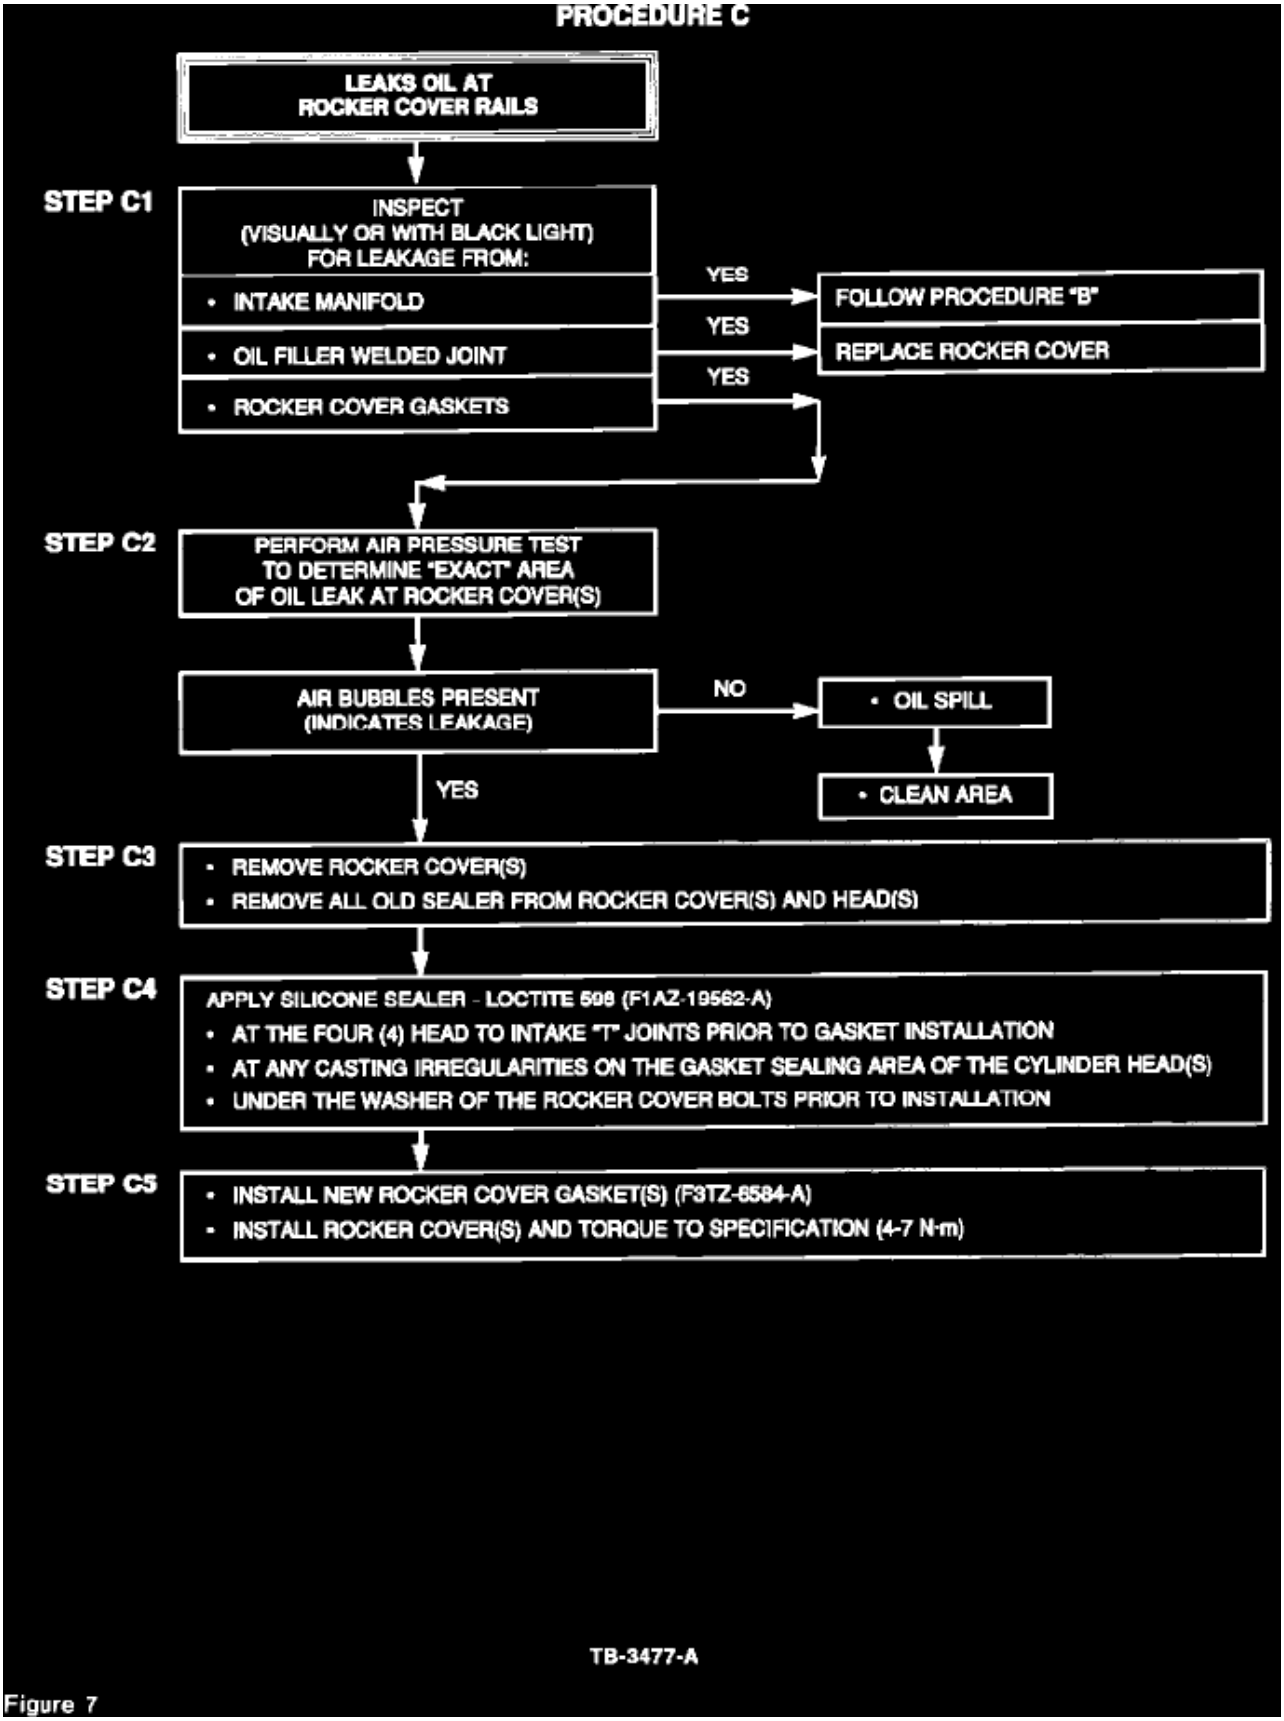

Figure 7

1. If the air pressure test showed no air bubbles, follow Procedure C2 to clean the area of any oil spill.

2. If the air pressure test showed air bubbles present, follow Steps C3 through C5.

Service Procedure - Repair For Oil Leaks At Front End

PROCEDURE D

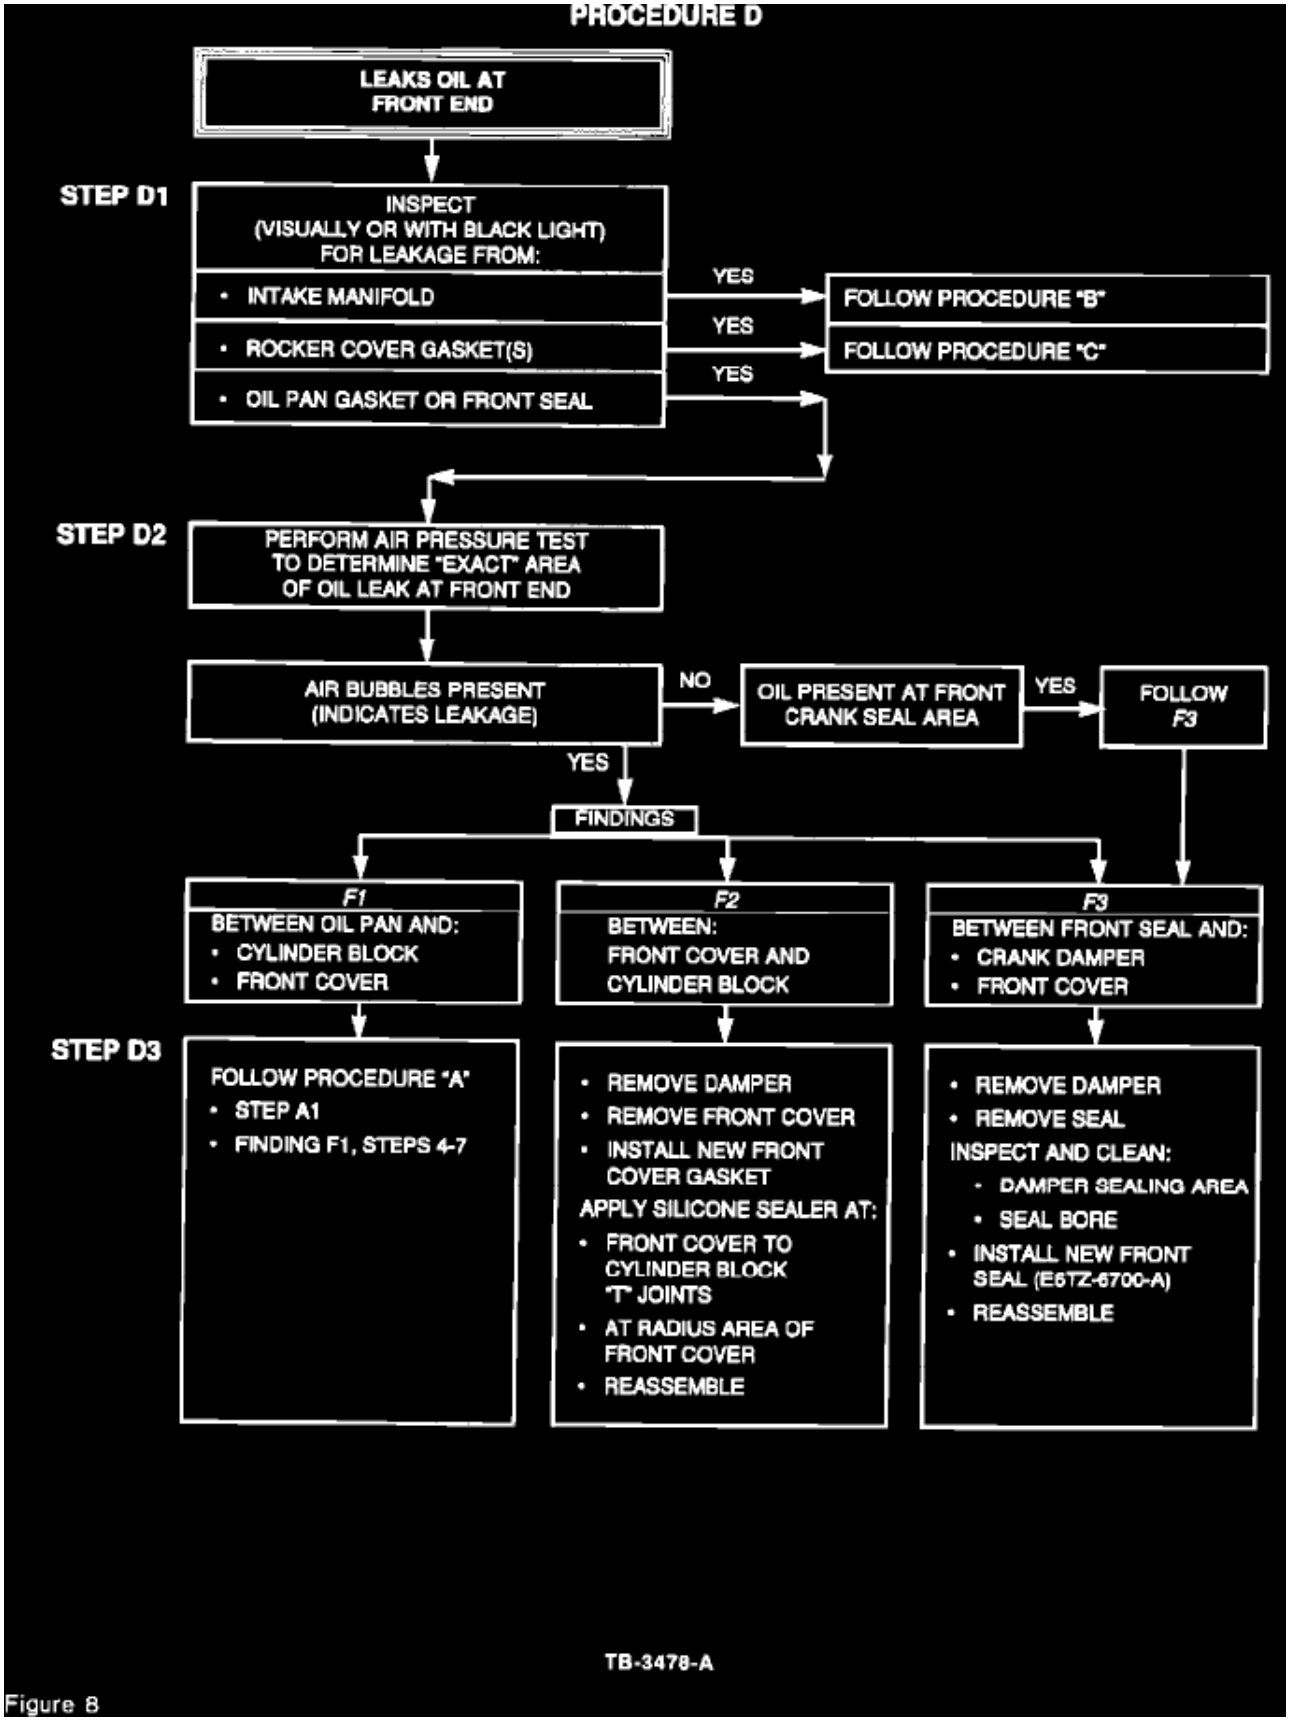

Figure 8

1. If the air pressure test showed no air bubbles, follow Procedure D, F3.

2. If the air pressure test showed air bubbles present, follow Procedure D, F1 or F2 as appropriate.

General Information

LIGHT TRUCK: 1990-93 AEROSTAR, RANGER 1991-93 EXPLORER

This TSB is being republished in its entirety to correct the type of cleaner being used in Figures 1, 3, and 6.

ISSUE: The many sources of leaks which typically appear at the lower end, front end, intake manifold valley, and rocker cover rails have led to mis-diagnosis as to the source of the leak and improper repair procedures, repeat repairs, and customer dissatisfaction.

ACTION: This TSB article has been developed to list the latest sealing techniques and associated part numbers for:

^ Oil Pan

^ Rear Main Seal

^ Rocker Covers

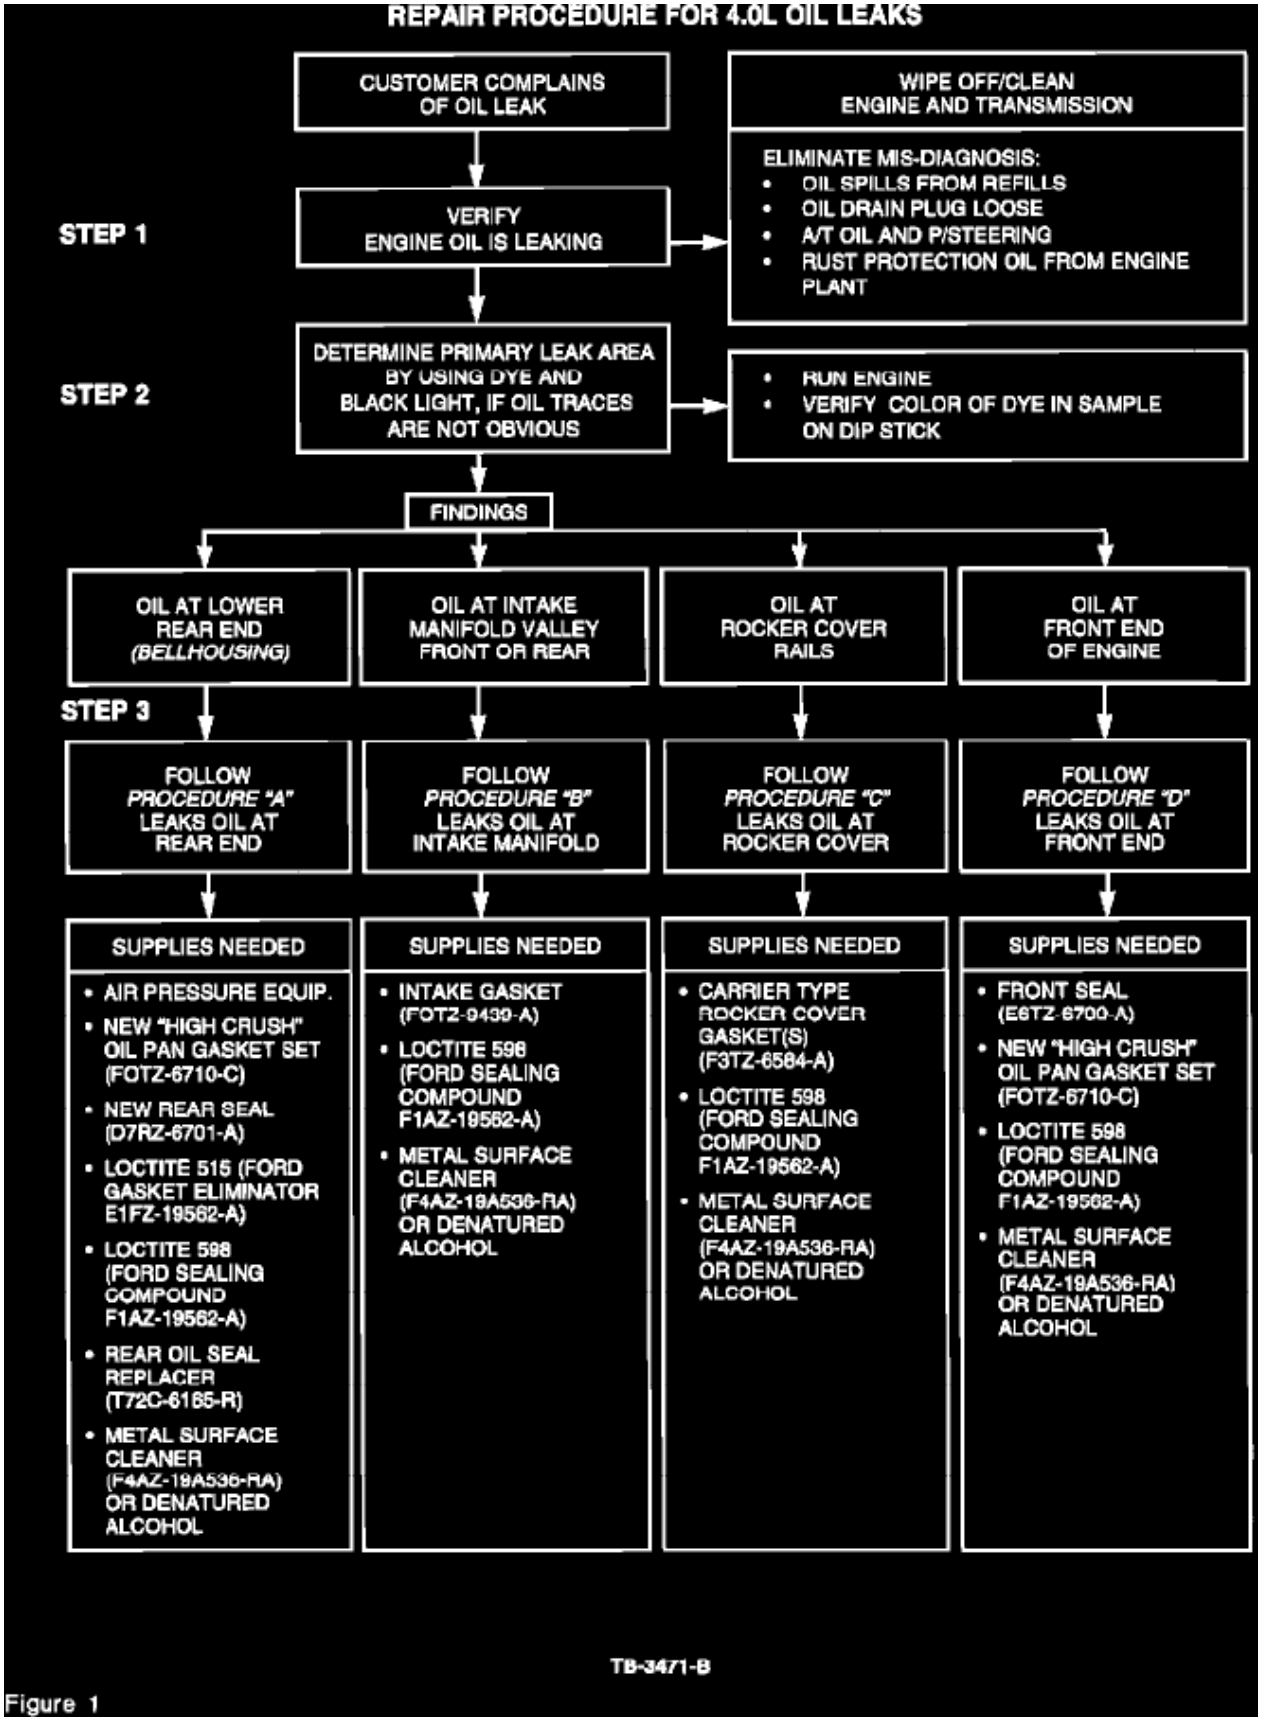

Figure 1

^ Intake Manifold

This article attempts to fully address all issues as one, in order to provide a diagnostic guide which leads to proper diagnosis and repair the first time. Use the following procedures to verify the location of the oil leak and perform the repair.

Service Procedure - Diagnosis

1. Perform Steps 1 and 2 of the block diagram shown in Figure 1. Perform a visual inspection to determine the general area of the oil leak.

2. After determining the "Findings" of Step 2, perform Step 3 by following Procedures A, B, C or D, whichever is appropriate, up to, but not including the air pressure test.

NOTE:

WHEN THE FINDINGS RESULT IN FOLLOWING PROCEDURE "A" FOR "LEAKS OIL AT REAR END", IT IS VERY IMPORTANT TO FOLLOW THE BLOCK DIAGRAM INSTRUCTIONS TO REMOVE THE TRANSMISSION, IF AN AEROSTAR, AND TO REMOVE THE ENGINE, IF AN EXPLORER/RANGER. THE PRACTICE OF REMOVING EXPLORER/RANGER OIL PANS WITH ENGINE IN VEHICLE CAN RESULT IN FAULTY DIAGNOSIS AND/OR REPAIR FOR THE PURPOSES OF THIS TSB.

If the leak has not been located and corrected at this point, then fabricate a device that is capable of applying a constant 1 to 3 psi of air pressure to the engine crankcase. The Rotunda Leak Tester 134-00003, or equivalent, which contains a pressure regulator and gauge capable of a 1 to 3 psi range, may be used.

3. Verify the location of the oil leak by pressurizing the engine crankcase with a constant supply of 3 psi of air pressure and the use of leak detection solution (liquid detergent and water). This process will verify the exact location of the leak. Dye and black light will verify a leak is present, but may not verify the exact location of the leak.

a. Assemble the necessary hose and fittings to connect an air pressure regulator and air pressure gauge to the shop air supply and to the engine crankcase through the dipstick tube.

b. Test the device to make sure 1-3 psi of air pressure can be maintained. Bursts of pressure over 3 psi can damage engine seals.

c. Before starting the test, make sure the regulator valve is completely closed so as not to accidentally apply a big burst of air to the engine when starting the test.

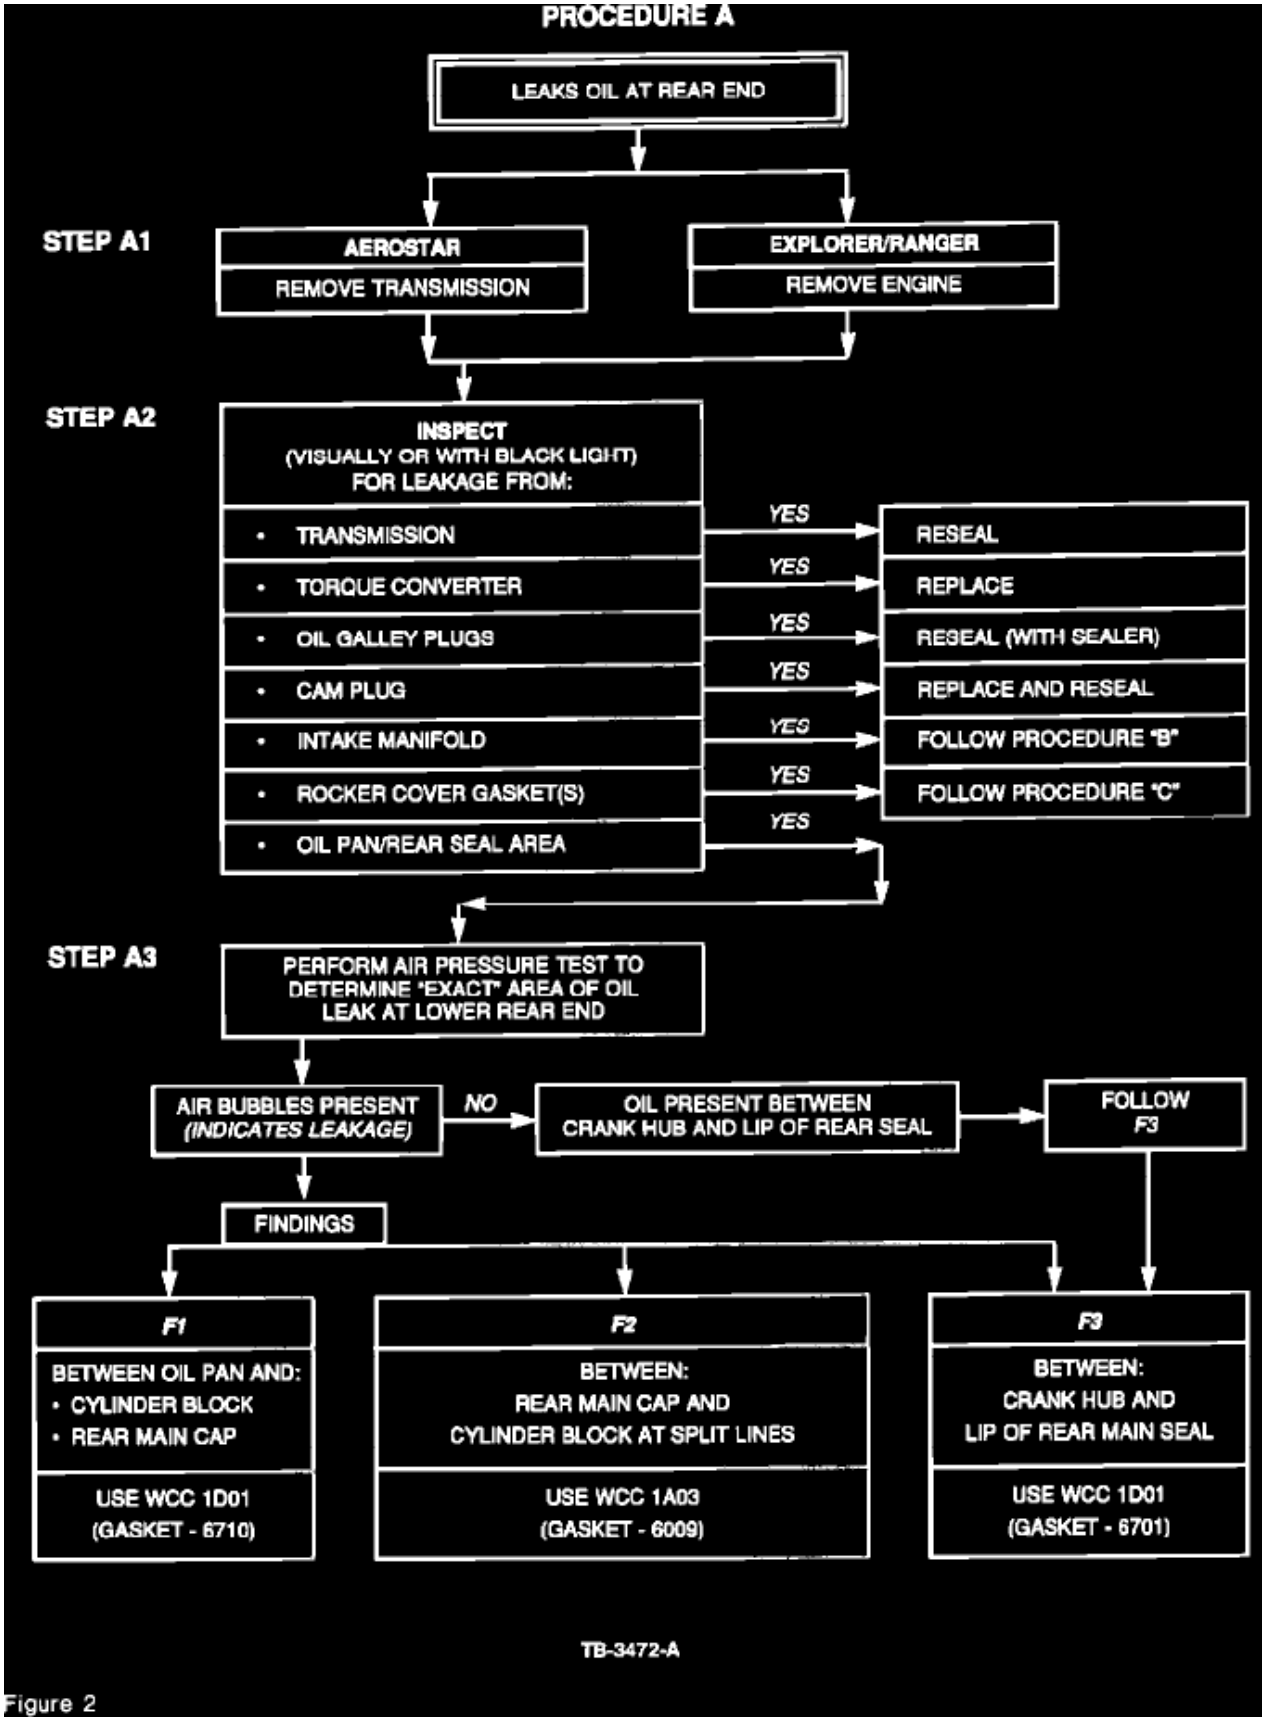
d. Attach the outlet (regulated) hose from the regulator/gauge device to the dipstick.

e. To trap air in the engine, plug any ports and passages (PCV valve, air inlet connection) that will allow air to escape.

f. Slowly open the regulator valve until 1-3 psi of air pressure registers on the gauge.

g. Keeping air pressure applied, brush or squirt a solution of liquid detergent and water or commercially available liquid leak detector (Snoop, Bubbles) to the primary area identified in Step 2 of the block diagram.

^ If the primary area is in the rear seal area, apply the solution to the rear seal, rear cap, rear cap to cylinder block and oil pan gasket areas.



PROCEDURE A
LEAKS OIL AT REAR END
STEP A1
AEROSTAR
REMOVE TRANSMISSION
EXPLORER/RANGER
REMOVE ENGINE
STEP A2
INSPECT
(VISUALLY OR WITH BLACK LIGHT)
FOR LEAKAGE FROM:
• TRANSMISSION
• TORQUE CONVERTER
• OIL GALLEY PLUGS
• CAM PLUG
• INTAKE MANIFOLD
• ROCKER COVER GASKET(S)
• OIL PAN/REAR SEAL AREA
YES
RESEAL
REPLACE
RESEAL (WITH SEALER)
REPLACE AND RESEAL
FOLLOW PROCEDURE "B"
FOLLOW PROCEDURE "C"
STEP A3
PERFORM AIR PRESSURE TEST TO
DETERMINE "EXACT" AREA OF OIL
LEAK AT LOWER REAR END
AIR BUBBLES PRESENT
(INDICATES LEAKAGE)
NO
OIL PRESENT BETWEEN
CRANK HUB AND LIP OF REAR SEAL
FOLLOW
F3
FINDINGS
F1
BETWEEN OIL PAN AND:
• CYLINDER BLOCK
• REAR MAIN CAP
USE WCC 1D01
(GASKET - 6710)

Figure 2

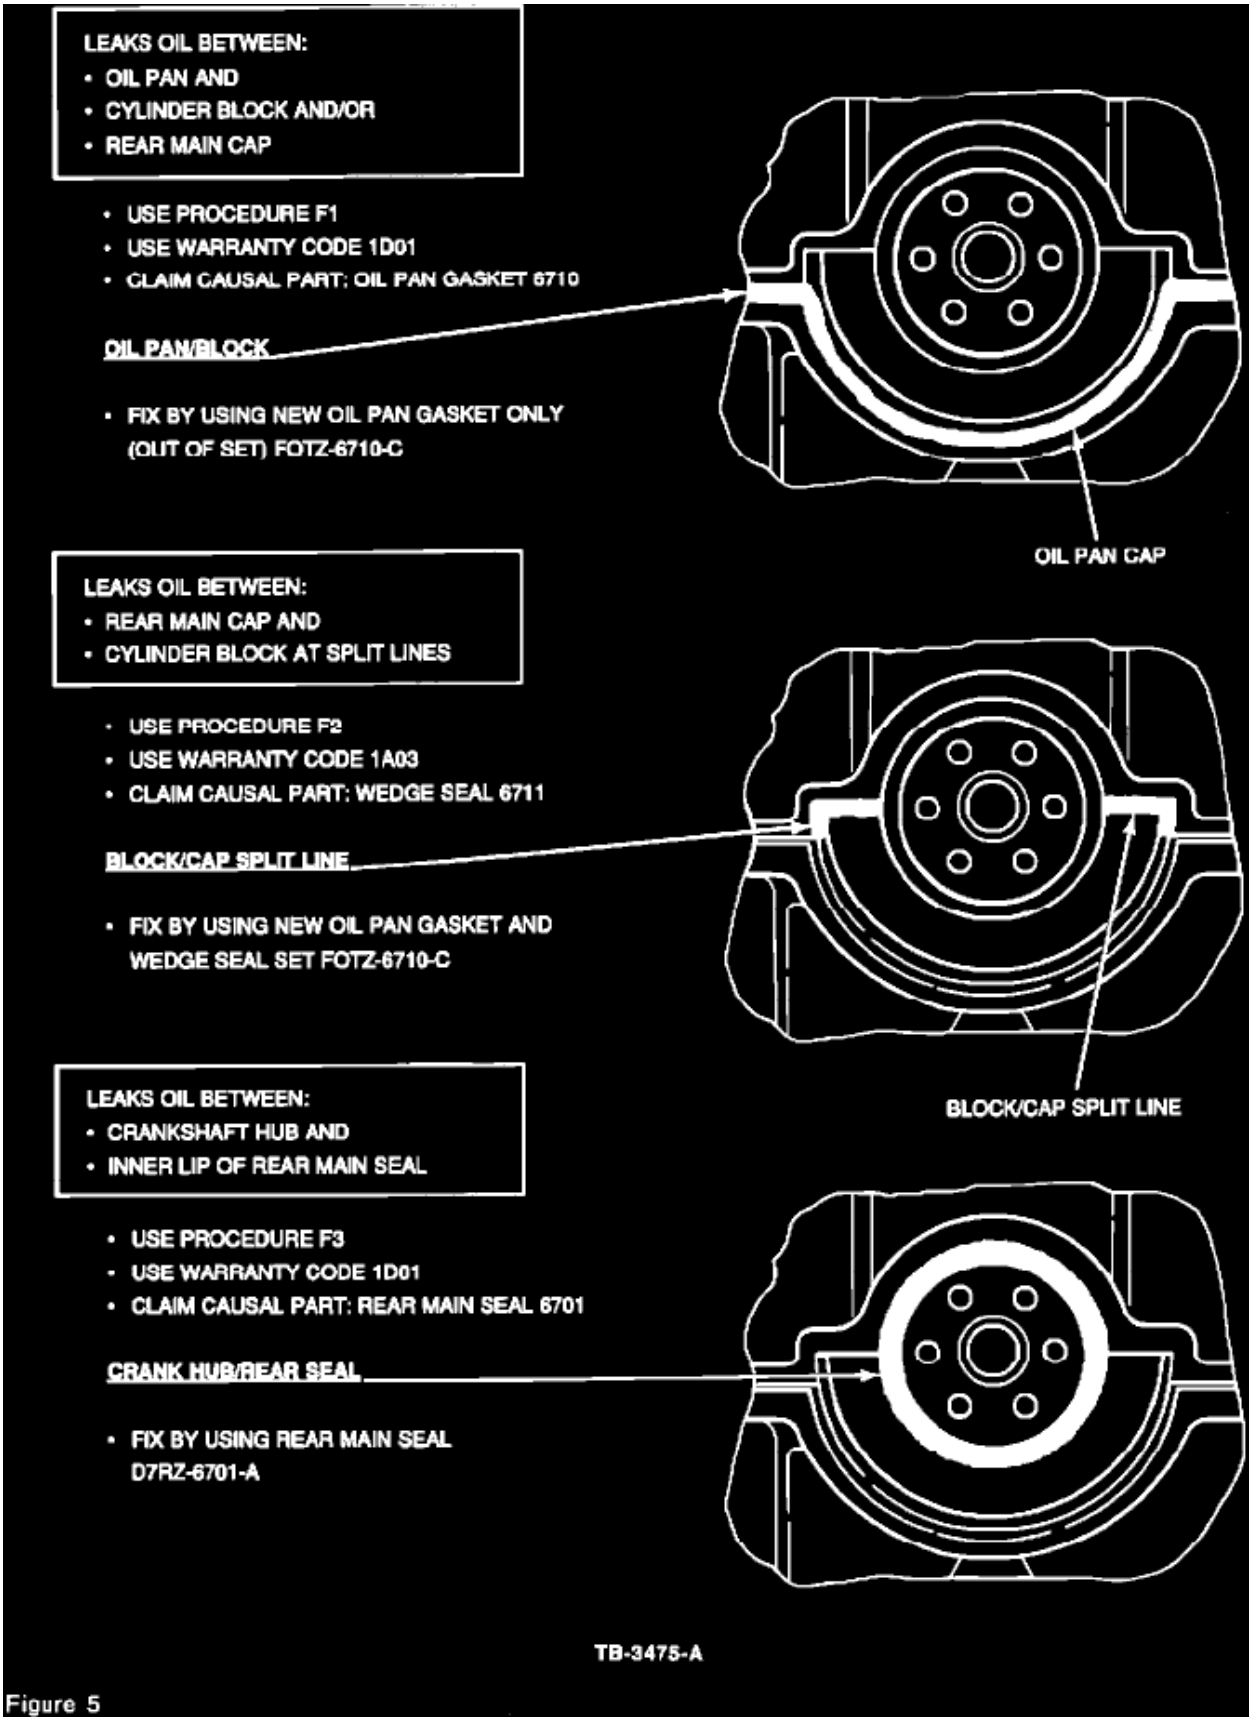

Figure 5

^ If bubbles are detected only at the oil pan gasket, between the oil pan and the cylinder block, or between the oil pan and the rear main cap, only the oil pan gasket needs replacing. Note

Procedure A, Figure 2, Step A3/F1, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A1.

^ If bubbles are detected between the rear main cap and the cylinder block, the rear cap must be removed and resealed. Note Procedure A, Figure 2, Step A3/F2, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A2.

^ If bubbles are detected between the rear seal lip and crank hub, a new rear oil seal will be required. Under certain circumstances, as outlined in the block diagram, it will be necessary to call the 4.OL Hotline. Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A3.

^ If no bubbles are detected, but oil is present in the area between the crank hub and the lip of the rear seal, carefully remove the seal and inspect the crankshaft rear seal journal. (A leak may occur

at the rear seal only when the engine is running.) Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Follow repair procedures outlined on the block diagram.

NOTE:

ANY APPEARANCE OF RUST, PITTING, POROSITY, OR NICKS ON THE REAR SEAL JOURNAL WILL CAUSE A LEAK.

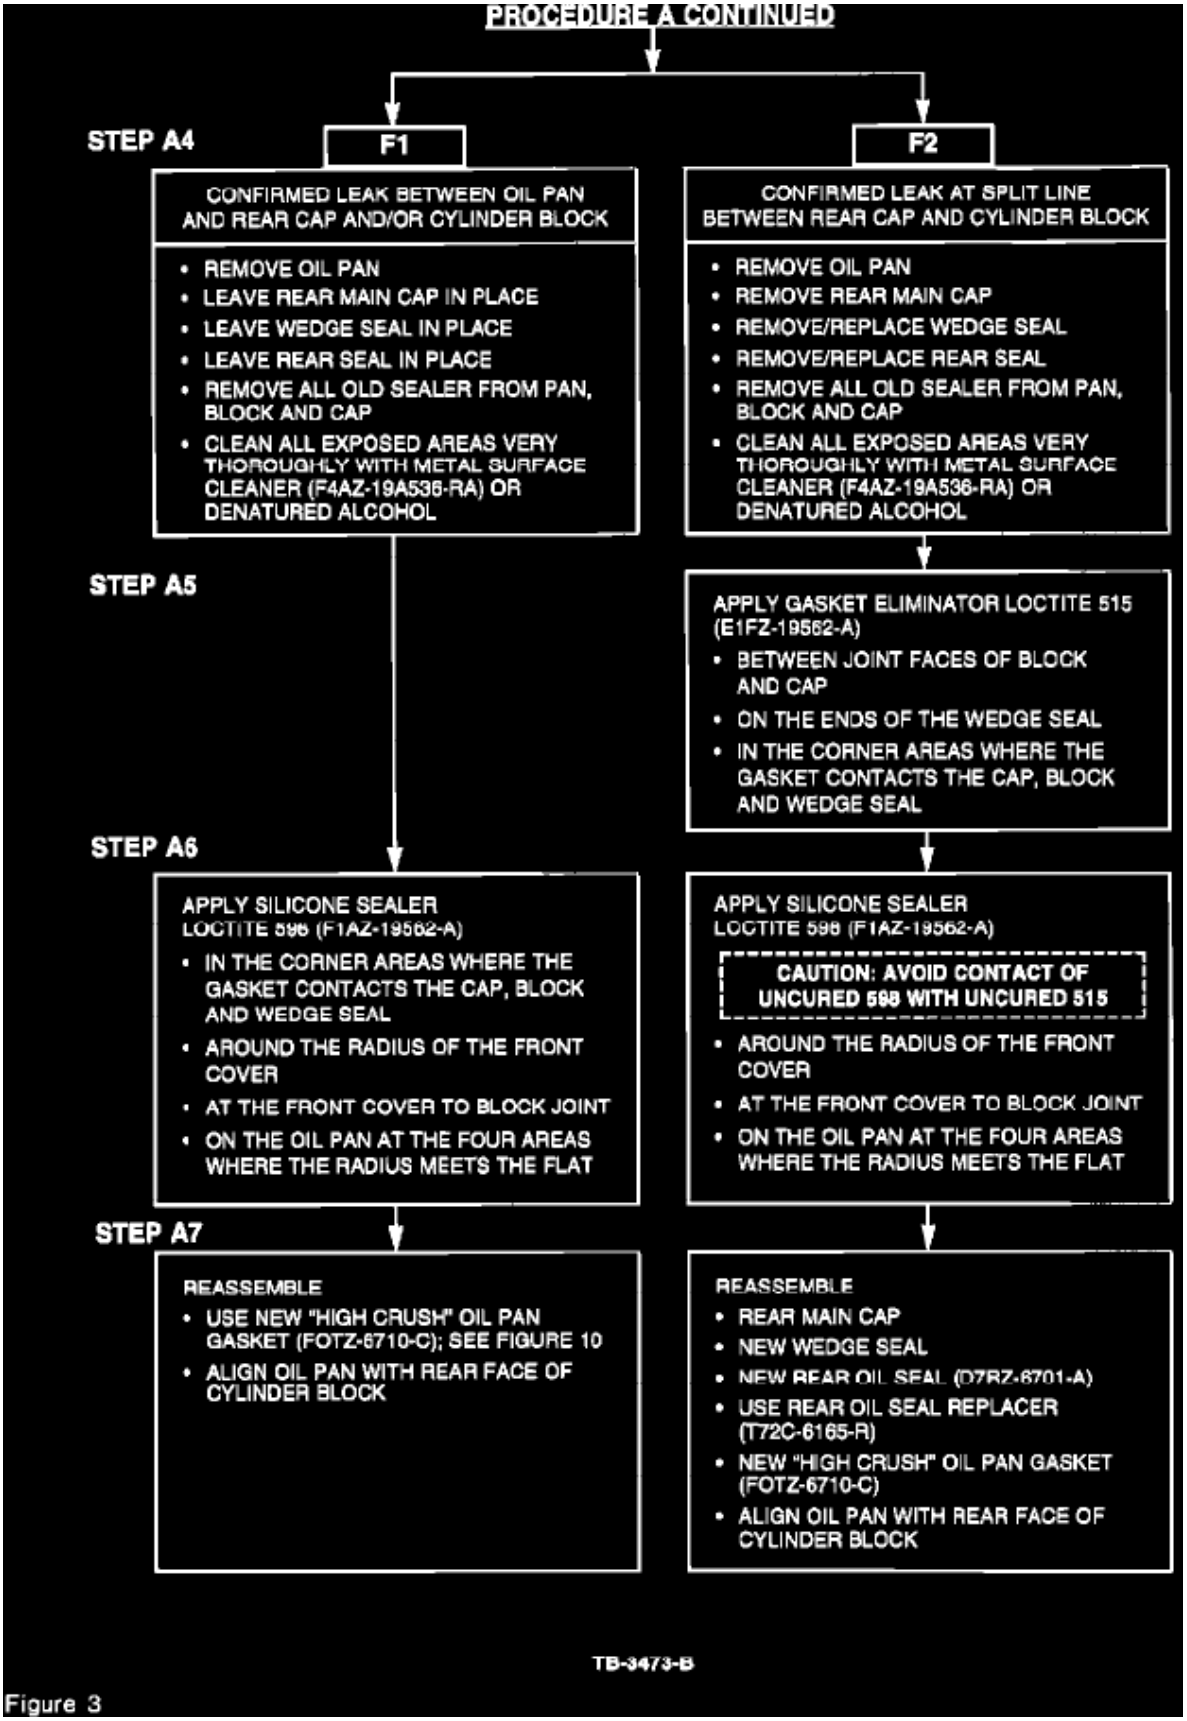
^ If bubbles are detected at the front or rear of the intake manifold gasket, a new intake manifold gasket (FOTZ-9439-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT INTAKE MANIFOLD, PROCEDURE B.

^ If bubbles are detected at the rocker cover rails, new rocker cover gaskets (F3TZ-6584-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT ROCKER COVER RAILS, PROCEDURE C.

^ If bubbles are detected at the front end of the engine, a new front seal (E6TZ-6700-A) or oil pan gasket (FOTZ-6710-C) will be required. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT THE FRONT END, PROCEDURE D.

Service Procedure - Repair

REAR END OIL LEAK - PROCEDURE A



PROCEDURE A CONTINUED
STEP A4
F1
CONFIRMED LEAK BETWEEN OIL PAN AND REAR CAP AND/OR CYLINDER BLOCK
• REMOVE OIL PAN
• LEAVE REAR MAIN CAP IN PLACE
• LEAVE WEDGE SEAL IN PLACE
• LEAVE REAR SEAL IN PLACE
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
F2
CONFIRMED LEAK AT SPLIT LINE BETWEEN REAR CAP AND CYLINDER BLOCK
• REMOVE OIL PAN
• REMOVE REAR MAIN CAP
• REMOVE/REPLACE WEDGE SEAL
• REMOVE/REPLACE REAR SEAL
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
STEP A5
APPLY GASKET ELIMINATOR LOCTITE 515 (E1FZ-19562-A)
• BETWEEN JOINT FACES OF BLOCK AND CAP
• ON THE ENDS OF THE WEDGE SEAL
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
STEP A6
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
CAUTION: AVOID CONTACT OF UNCURED 598 WITH UNCURED 515
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
STEP A7
REASSEMBLE
• USE NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C); SEE FIGURE 10
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
REASSEMBLE
• REAR MAIN CAP
• NEW WEDGE SEAL
• NEW REAR OIL SEAL (D7RZ-6701-A)
• USE REAR OIL SEAL REPLACER (T72C-6165-R)
• NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C)
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
TB-3473-B
Figure 3

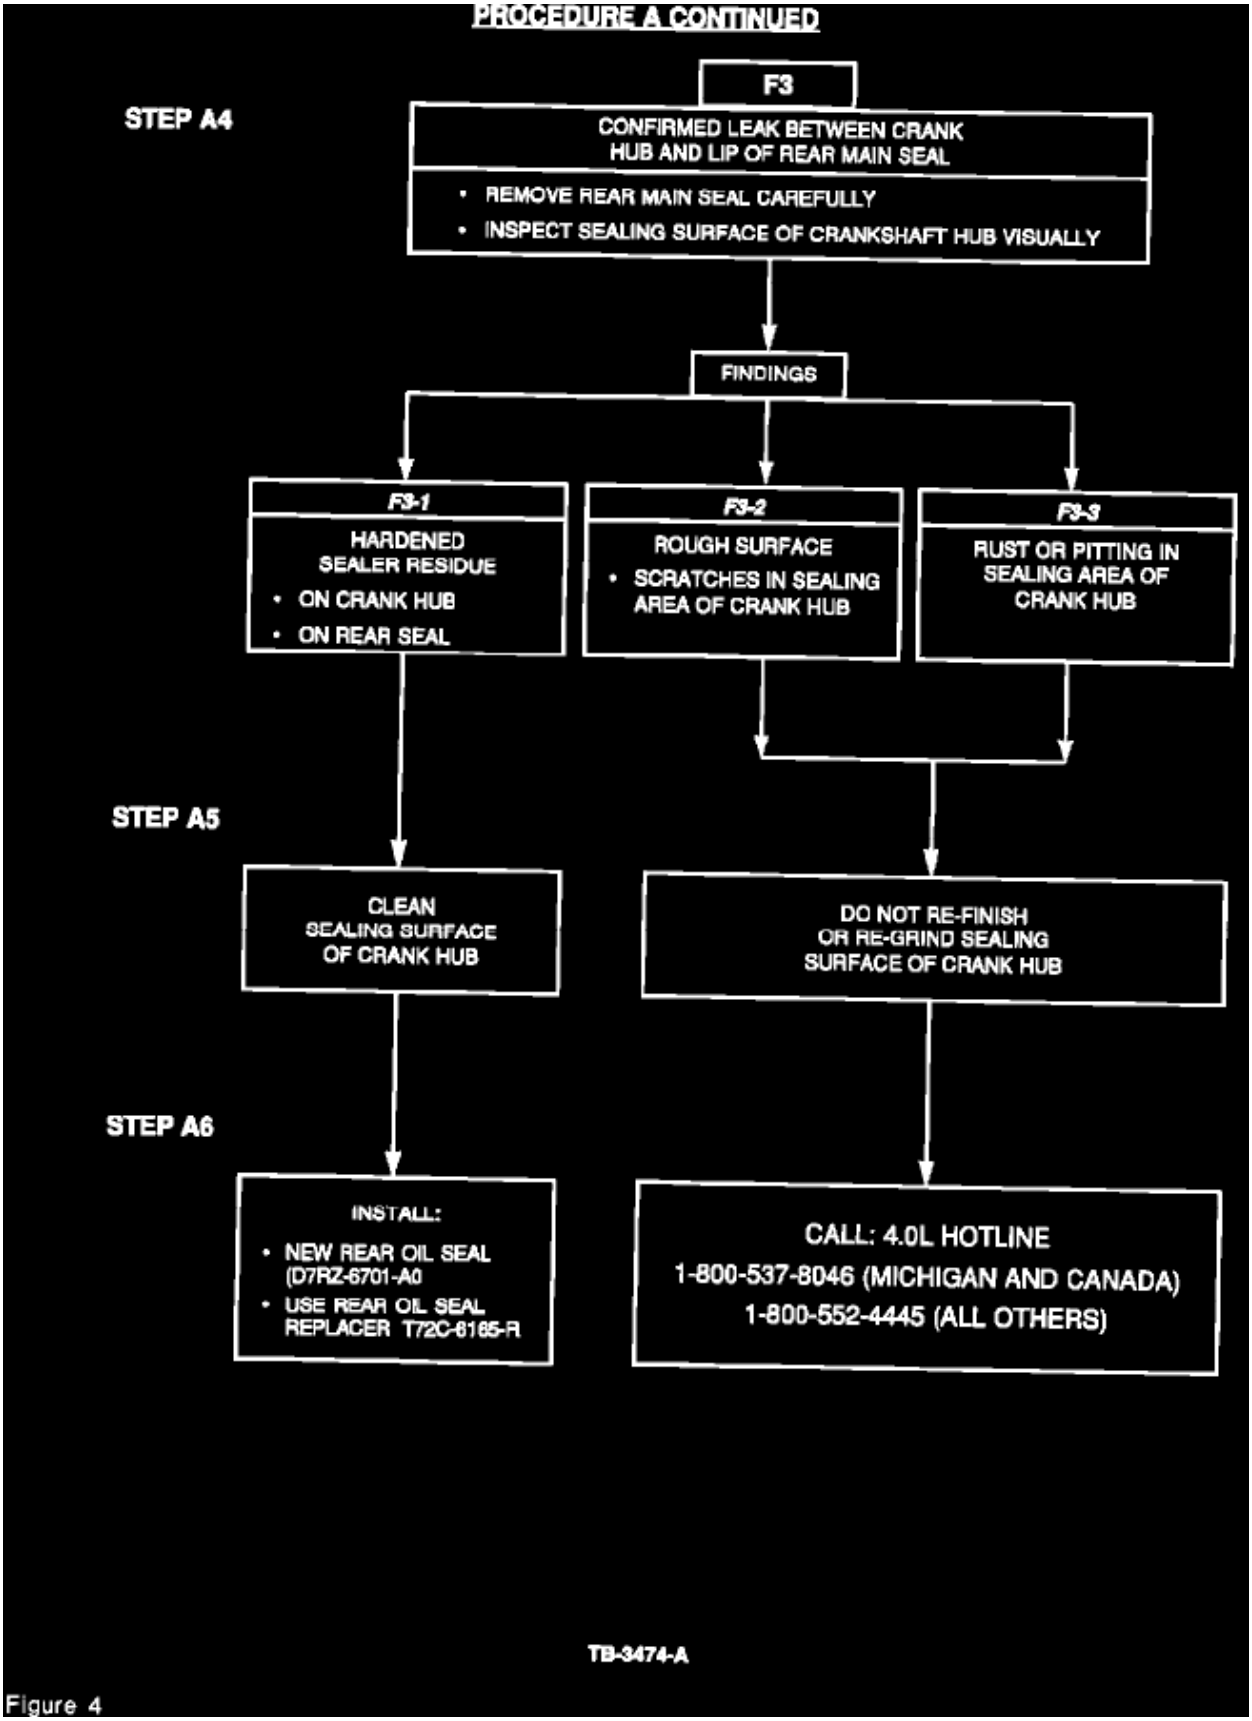


Figure 4

1. Repair procedure for a leak at oil pan gasket between the oil pan and cylinder block, or between the oil pan and the rear main cap. See block diagram Procedure A, Step A4/F1, Figures 3 and 4.

a. Remove the oil pan from the engine and remove the old gasket from the oil pan. Do not remove the rear main cap or wedge seal from the engine.

b. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

c. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap. Take special care to scrape/scratch all the old sealer from the exposed areas of the rear cap, wedge seal and cylinder block. This is a critical sealing area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER BLOCK.

d. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

e. Clean the transmission "BELLHOUSING" area, the rear of the cylinder block and the rear engine plate of ALL oil residue.

f. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corner of the radius areas at the front and rear of the oil pan.

g. Place the oil pan gasket (FOTZ-6710-C) in place in the groove in the oil pan.

h. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the corners where the rear main cap meets the cylinder block, at the corner areas of the radius area on the front cover and the front cover to cylinder block joint.

i. Set the oil pan in place and snug the four (4) pan nuts.

j. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .0100" (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

k. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

2. Repair procedure for a leak between the rear main cap and the cylinder block. See block diagram Procedure A, Step A4/F2.

a. Remove the oil pan, windage tray, oil pump and rear main cap from the engine.

b. Remove the rear main oil seal from the crankshaft and thoroughly inspect the main seal journal of the crankshaft for signs of rust, pitting, nicks or porosity.

c. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

d. Clean ALL the old sealer from the rear main bearing cap USING A SCRAPER AND WIRE WHEEL. The original Loctite sealer used during production assembly becomes extremely hard after it has cured. It is extremely important that ALL the old sealer be removed from the joint faces and grooves.

e. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap joint area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER

BLOCK.

f. Clean ALL the oil and old sealer from the "WEDGE SEAL" that fits around the rear main bearing cap in the oil pan gasket groove. Preferably use a new "WEDGE SEAL".

g. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

h. Clean the transmission "BELLHOUSING AREA", the rear of the cylinder block and the rear engine plate of ALL oil residue.

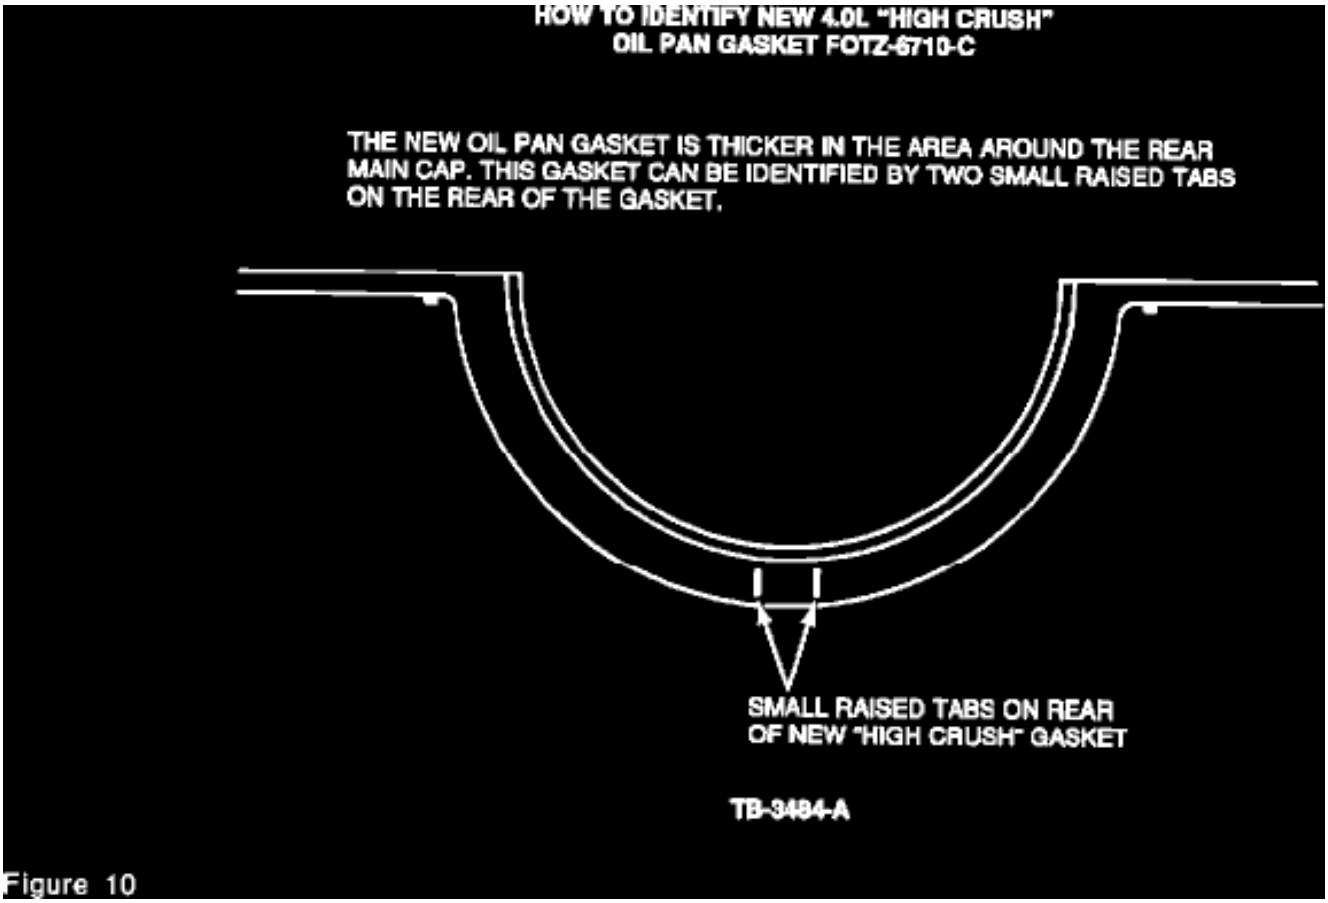

Figure 10

i. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) on the cylinder block along the corners of the rear main bearing cap joint area and on the joint face, approximately 1/2 inch (12.7 mm) from the rear of the block.

j. Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.

k. Align the rear main bearing cap to cylinder block by moving the bearing fore or aft (approx. 1/2 inch (12.7 mm) inward in the rear oil seal bore) so that the rear seal stop of the block and cap line up. This will assure that the rear main oil seal will seat squarely when installed in the bore.

l. Torque the rear main cap bolts to 66-77 lb.ft. (90-104 N-m).

m. Fill the cavities for the "WEDGE SEAL" on both sides of the rear main cap with Ford Gasket Eliminator (E1FZ-19562-A).

n. Place "WEDGE SEAL" in place and use a flat bladed screwdriver to fully seat the "WEDGE SEAL", forcing the excessive sealer out.

o. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) in the corners of the oil pan gasket groove of the rear main cap where the cap meets the cylinder block.

p. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) at the corner areas of the radius area on the front cover and at the front cover to cylinder block joint.

q. Reinstall the oil pump and windage tray. Torque to 13-15 lb.ft. (17-21 N-m).

r. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corners of the radius areas at the front and rear of the oil pan.

s. Place the oil pan gasket (FOTZ-6710-C), Figure 10, in place in the groove in the oil pan.

t. Set the oil pan in place and snug the four (4) oil pan bolts.

u. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .01000 (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

v. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

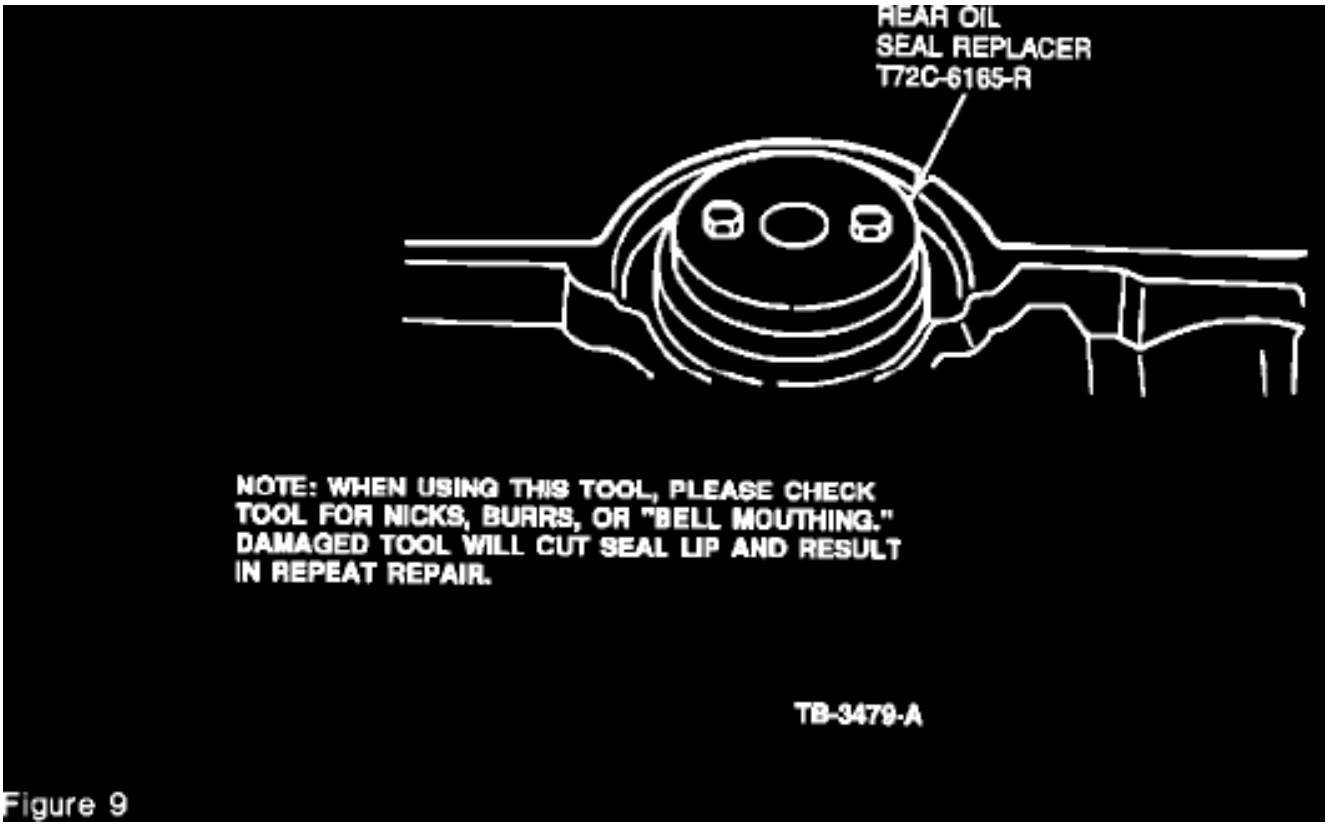

Figure 9

w. Coat the rear main oil seal (D7RZ-6701-A) with oil. Install the rear seal in the seal bore using Rear Oil Seal Replacer T72C-6165-R. This tool uses two flywheel bolts to draw the seal into position. Refer to Figure 9.

CAUTION:

DO NOT USE THE OLD STYLE HAMMER OPERATED TOOL.

3. Repair procedure for a leak between the rear main seal and the crankshaft. See block diagram, Procedure A, Step A4/F3.

a. Any presence of rust on the rear seal journal will cause a leak.

b. Any presence of pitting, porosity or nicks on the rear seal journal will cause a leak.

NOTE:

IF A LEAK IS PRESENT BETWEEN THE REAR MAIN SEAL AND CRANKSHAFT, PLEASE NOTIFY THE 4.0L "HOTLINE" AT (800) 537-8046 OR (800) 552-4445 PRIOR TO ANY ATTEMPT TO REPAIR THIS CONDITION.

Service Procedure - Repair For Oil Leaks At Intake Manifold

PROCEDURE B

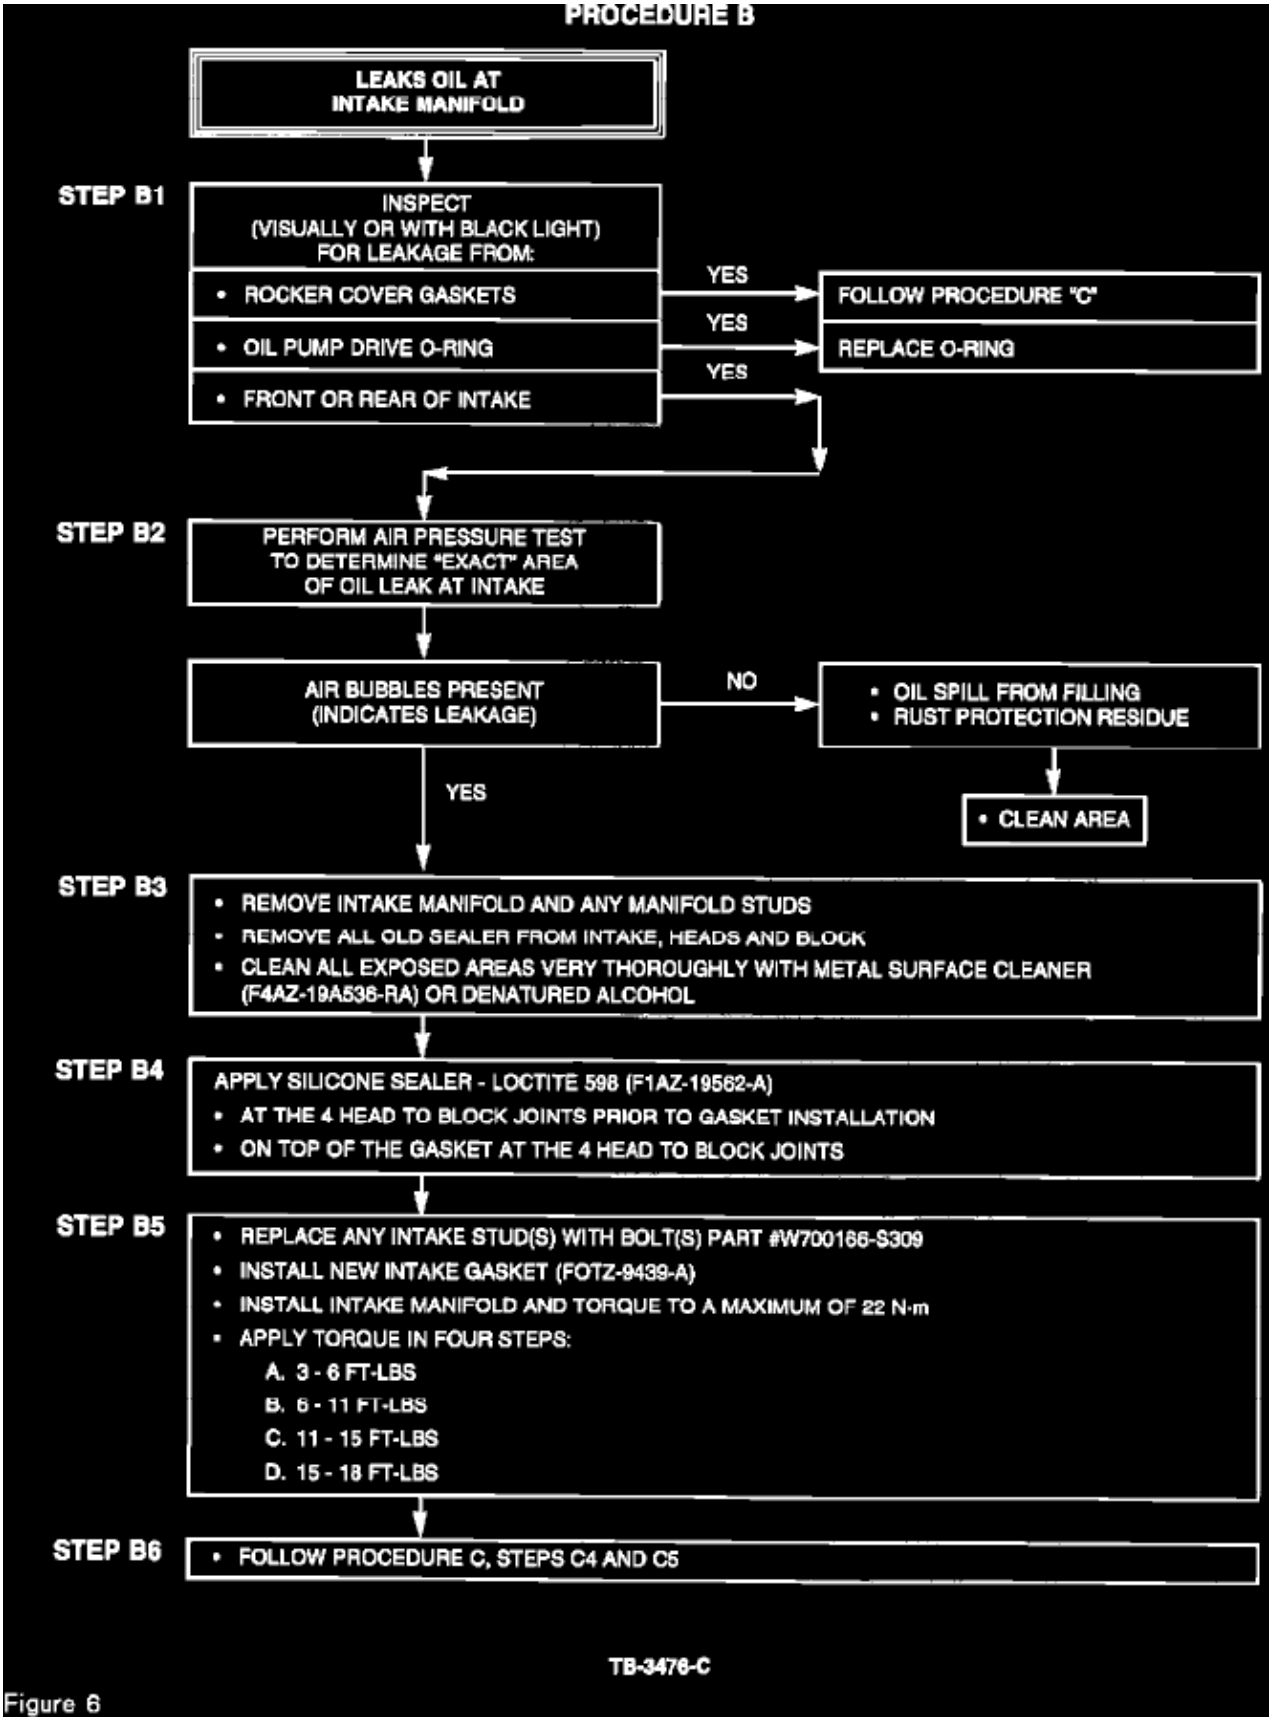

Figure 6

1. If the air pressure test showed no air bubbles, follow Procedure B2 to clean area of oil spill or other contamination.

2. If the air pressure test showed air bubbles present, follow Steps B3 through B6. Refer also to the Service Manual for the applicable year for further information pertinent to removal and installation of the intake manifold.

Service Procedure - Repair For Oil Leaks At Rocker Cover Rails

PROCEDURE C

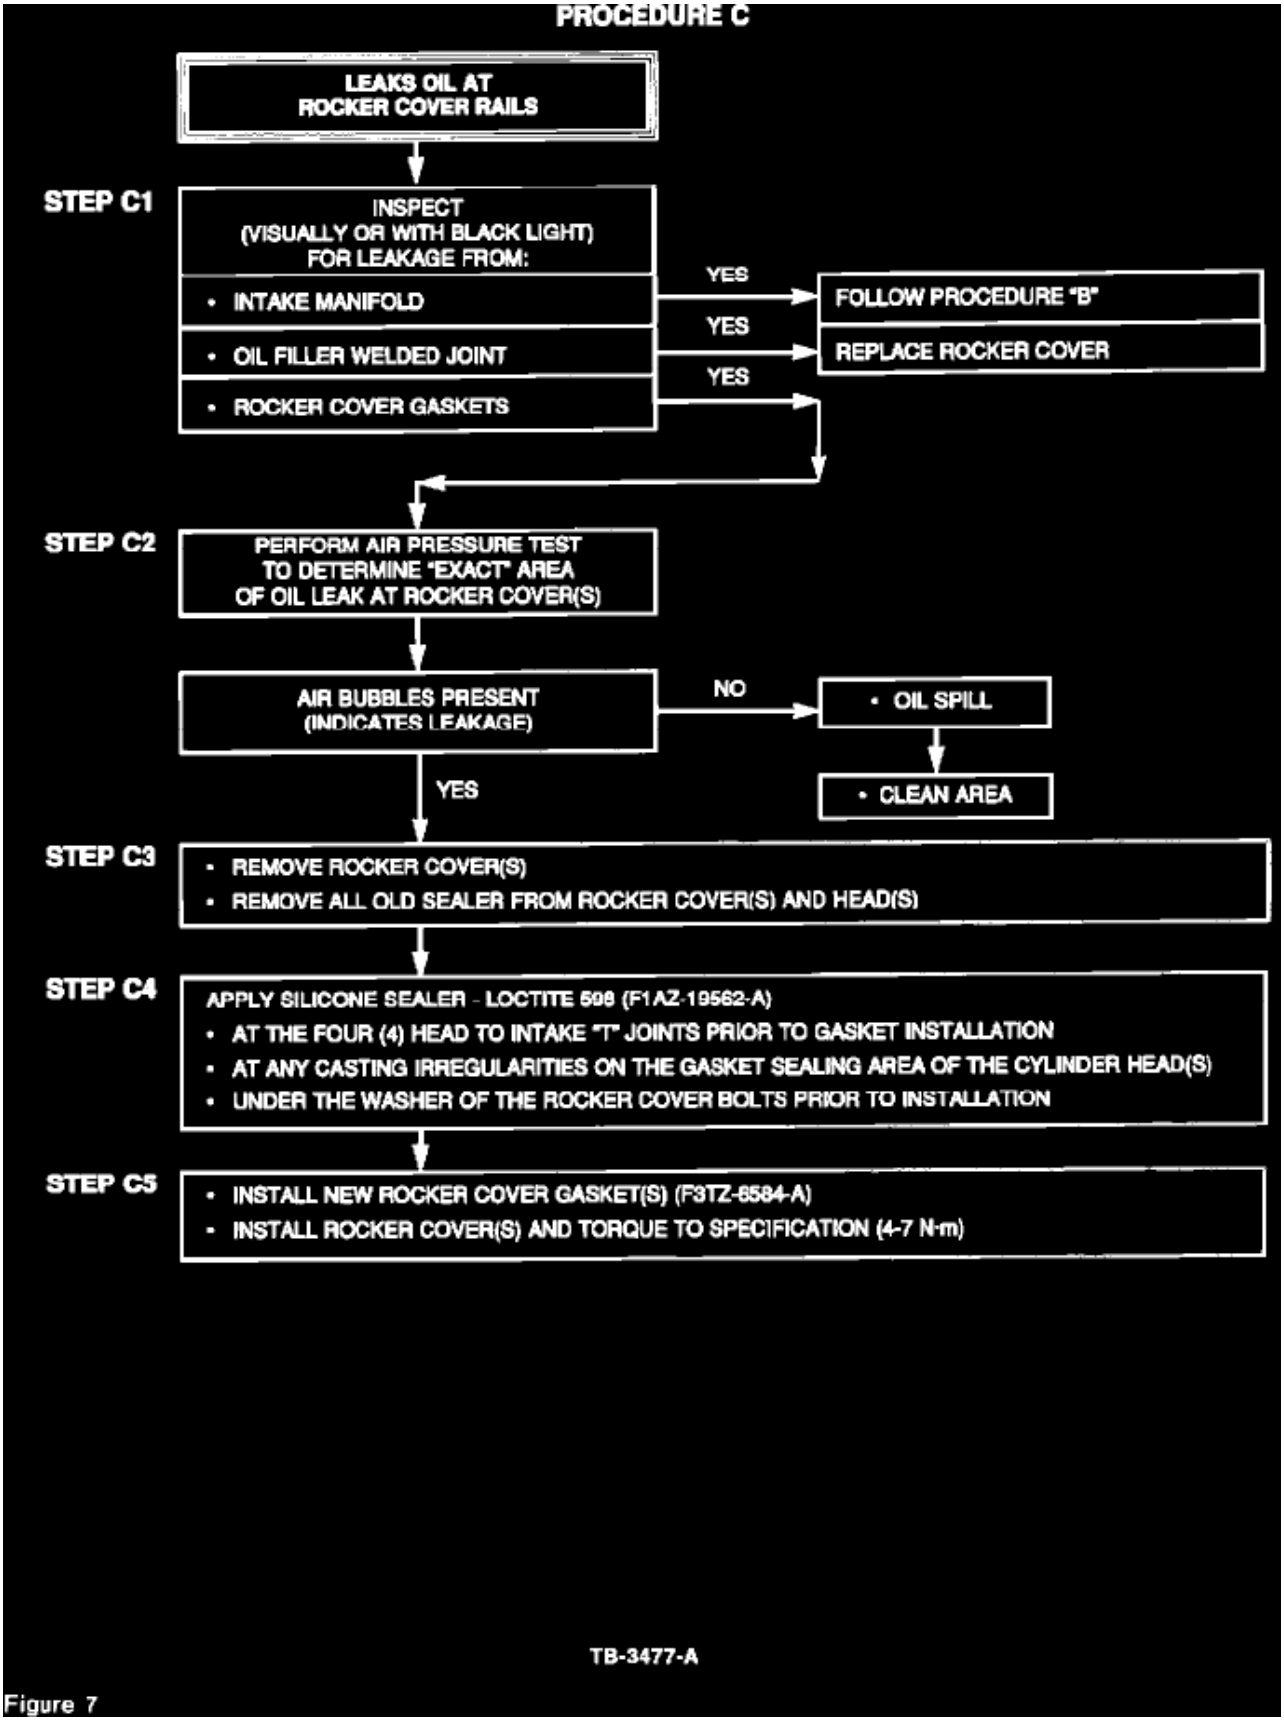

Figure 7

1. If the air pressure test showed no air bubbles, follow Procedure C2 to clean the area of any oil spill.

2. If the air pressure test showed air bubbles present, follow Steps C3 through C5.

Service Procedure - Repair For Oil Leaks At Front End

PROCEDURE D

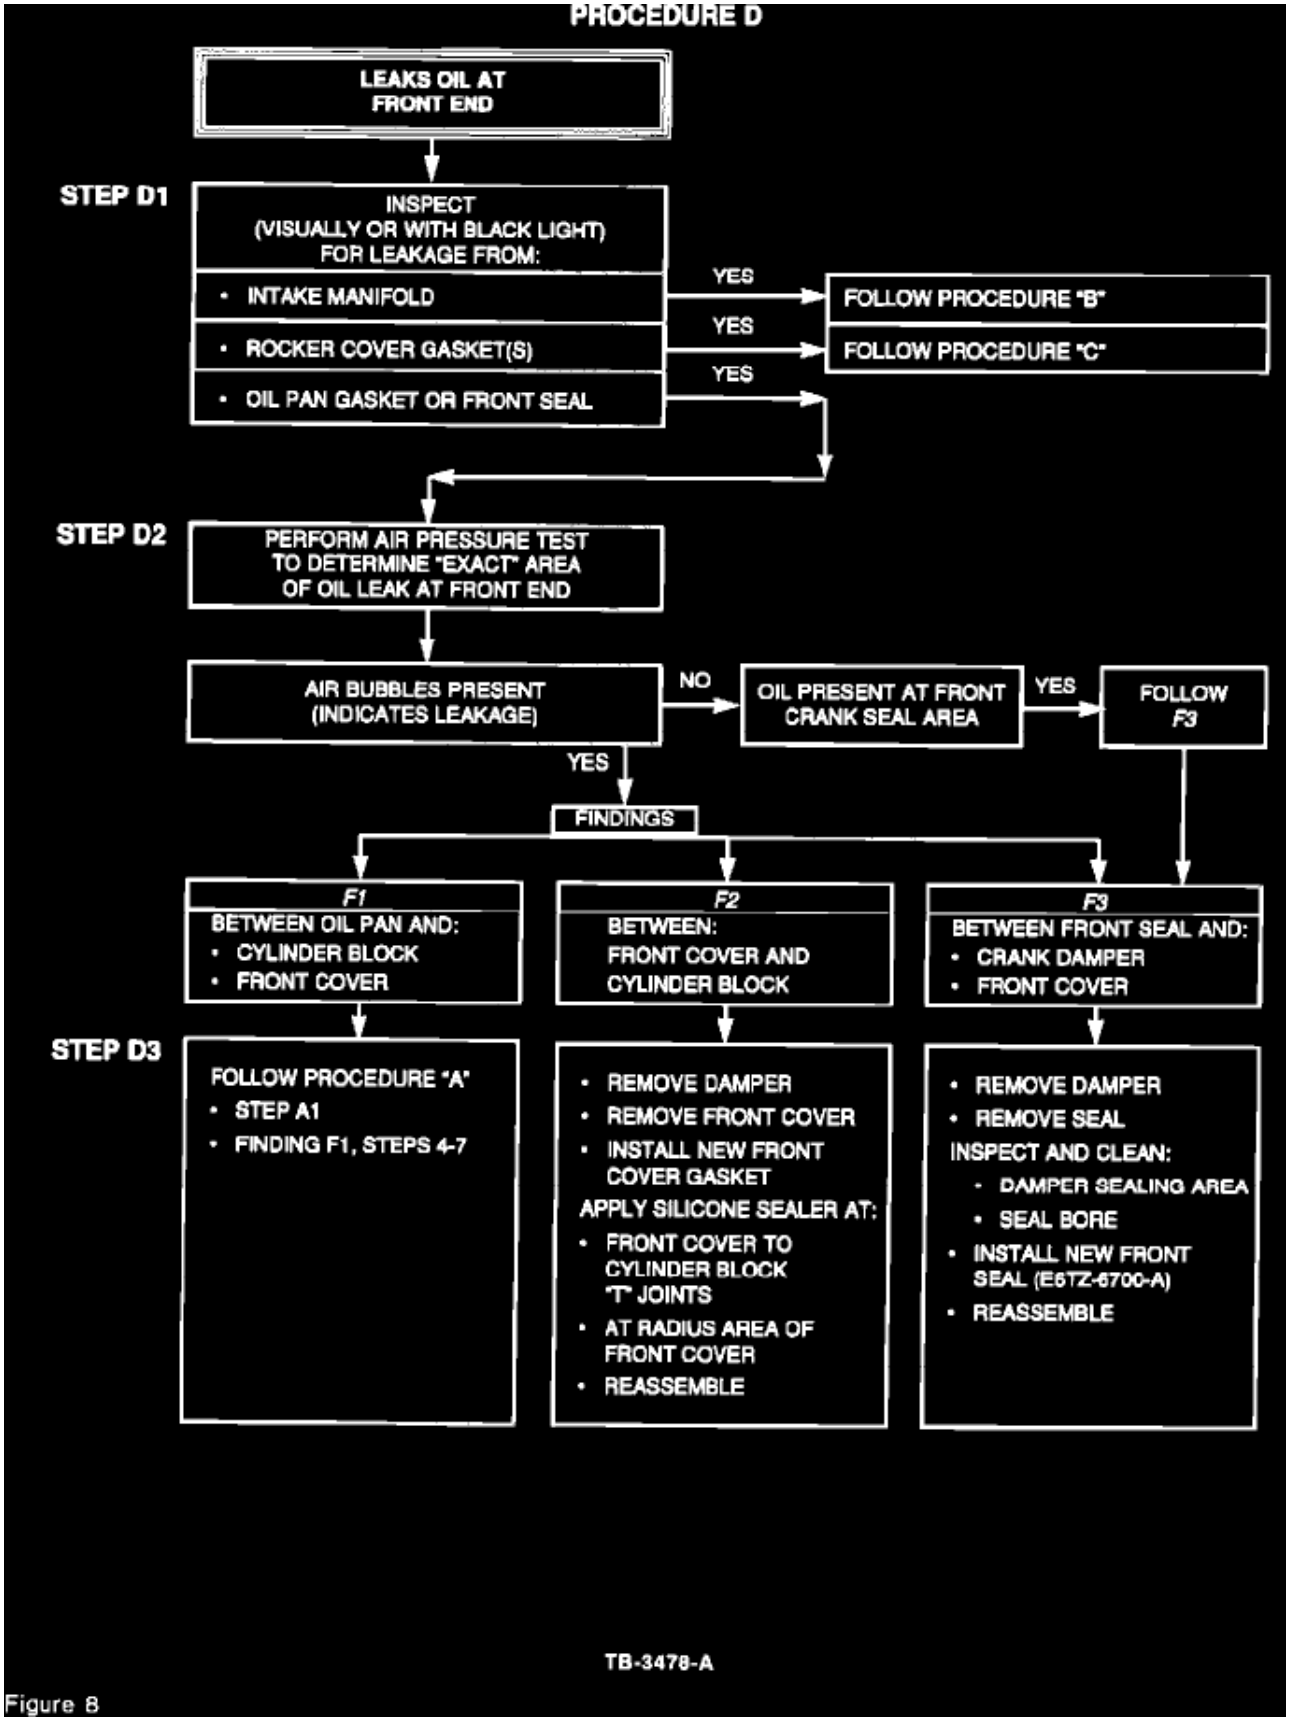

Figure 8

1. If the air pressure test showed no air bubbles, follow Procedure D, F3.

2. If the air pressure test showed air bubbles present, follow Procedure D, F1 or F2 as appropriate.

General Information

LIGHT TRUCK: 1990-93 AEROSTAR, RANGER 1991-93 EXPLORER

This TSB is being republished in its entirety to correct the type of cleaner being used in Figures 1, 3, and 6.

ISSUE: The many sources of leaks which typically appear at the lower end, front end, intake manifold valley, and rocker cover rails have led to mis-diagnosis as to the source of the leak and improper repair procedures, repeat repairs, and customer dissatisfaction.

ACTION: This TSB article has been developed to list the latest sealing techniques and associated part numbers for:

^ Oil Pan

^ Rear Main Seal

^ Rocker Covers

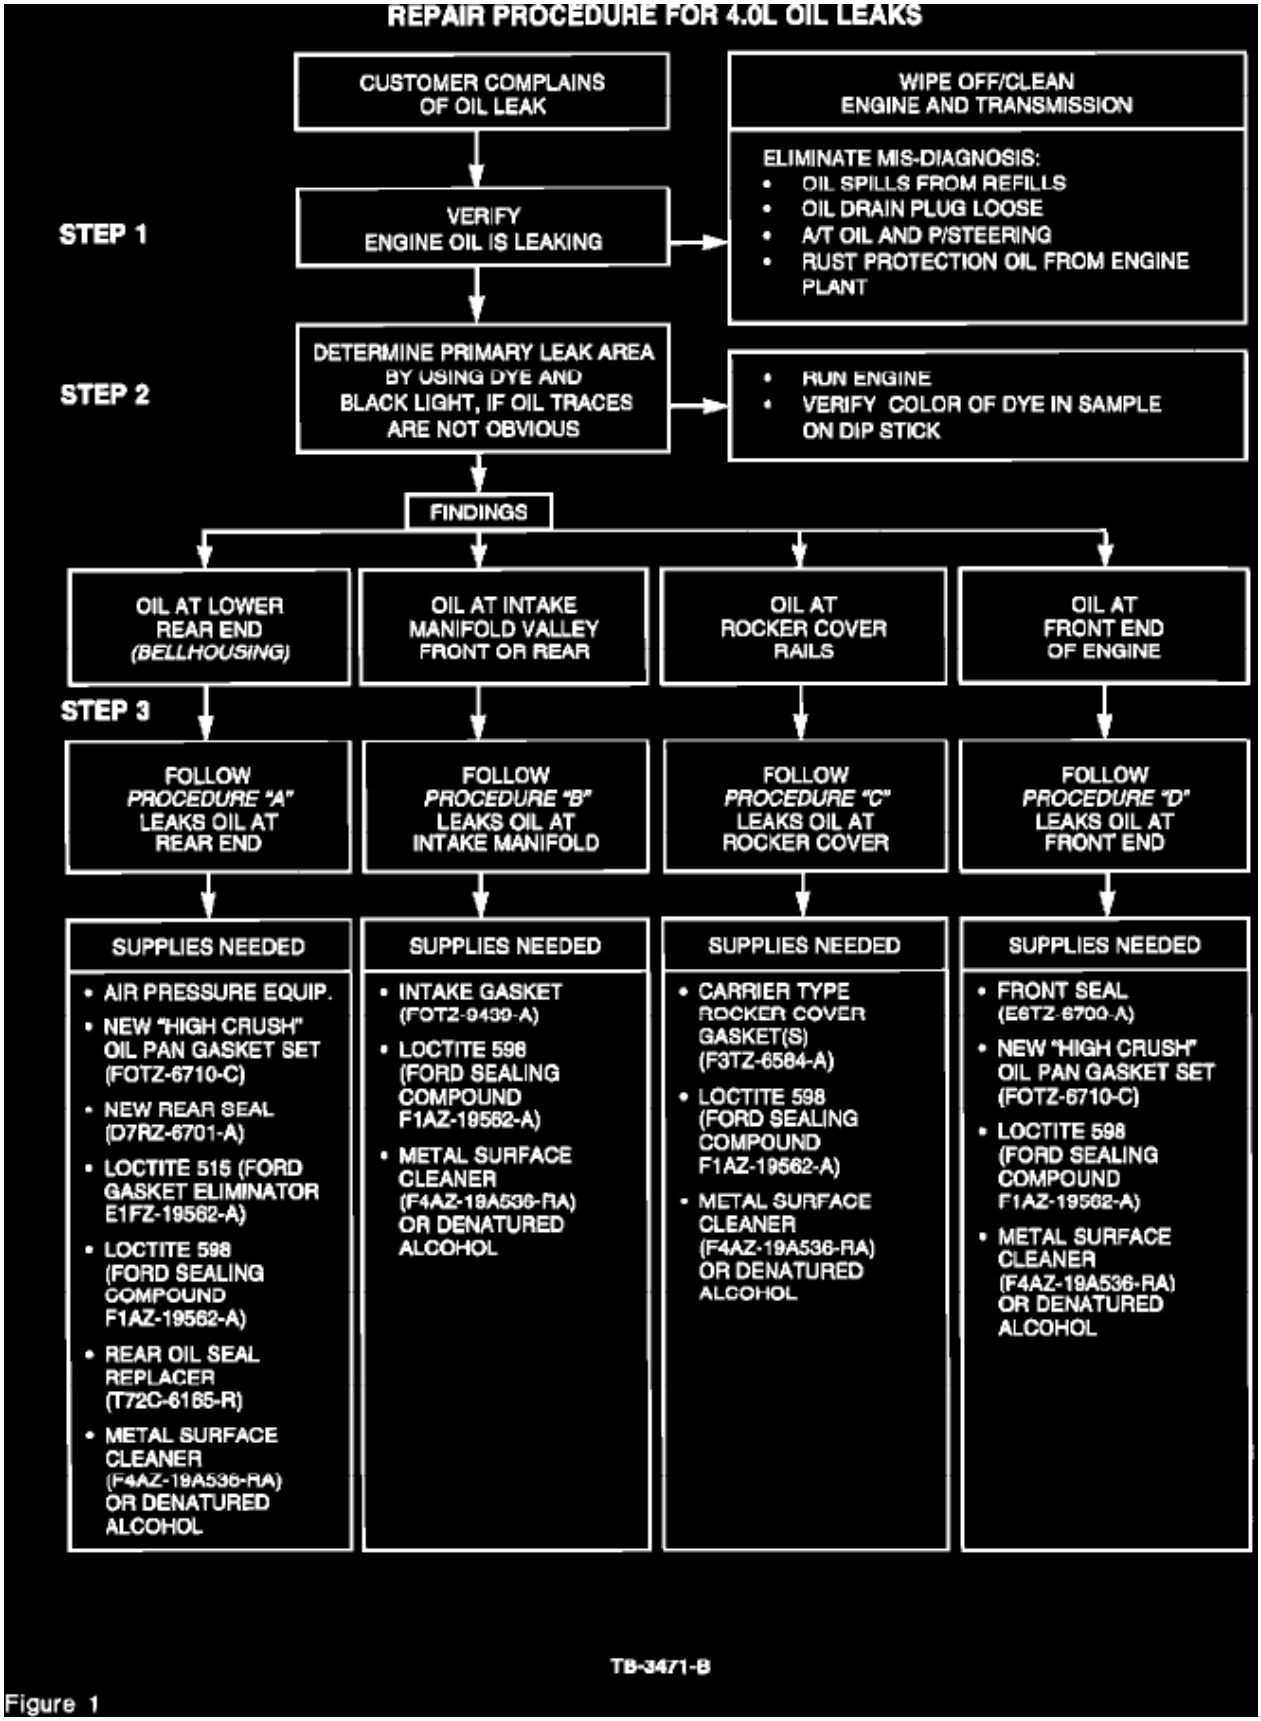

Figure 1

^ Intake Manifold

This article attempts to fully address all issues as one, in order to provide a diagnostic guide which leads to proper diagnosis and repair the first time. Use the following procedures to verify the location of the oil leak and perform the repair.

Service Procedure - Diagnosis

1. Perform Steps 1 and 2 of the block diagram shown in Figure 1. Perform a visual inspection to determine the general area of the oil leak.

2. After determining the "Findings" of Step 2, perform Step 3 by following Procedures A, B, C or D, whichever is appropriate, up to, but not including the air pressure test.

NOTE:

WHEN THE FINDINGS RESULT IN FOLLOWING PROCEDURE "A" FOR "LEAKS OIL AT REAR END", IT IS VERY IMPORTANT TO FOLLOW THE BLOCK DIAGRAM INSTRUCTIONS TO REMOVE THE TRANSMISSION, IF AN AEROSTAR, AND TO REMOVE THE ENGINE, IF AN EXPLORER/RANGER. THE PRACTICE OF REMOVING EXPLORER/RANGER OIL PANS WITH ENGINE IN VEHICLE CAN RESULT IN FAULTY DIAGNOSIS AND/OR REPAIR FOR THE PURPOSES OF THIS TSB.

If the leak has not been located and corrected at this point, then fabricate a device that is capable of applying a constant 1 to 3 psi of air pressure to the engine crankcase. The Rotunda Leak Tester 134-00003, or equivalent, which contains a pressure regulator and gauge capable of a 1 to 3 psi range, may be used.

3. Verify the location of the oil leak by pressurizing the engine crankcase with a constant supply of 3 psi of air pressure and the use of leak detection solution (liquid detergent and water). This process will verify the exact location of the leak. Dye and black light will verify a leak is present, but may not verify the exact location of the leak.

a. Assemble the necessary hose and fittings to connect an air pressure regulator and air pressure gauge to the shop air supply and to the engine crankcase through the dipstick tube.

b. Test the device to make sure 1-3 psi of air pressure can be maintained. Bursts of pressure over 3 psi can damage engine seals.

c. Before starting the test, make sure the regulator valve is completely closed so as not to accidentally apply a big burst of air to the engine when starting the test.

d. Attach the outlet (regulated) hose from the regulator/gauge device to the dipstick.

e. To trap air in the engine, plug any ports and passages (PCV valve, air inlet connection) that will allow air to escape.

f. Slowly open the regulator valve until 1-3 psi of air pressure registers on the gauge.

g. Keeping air pressure applied, brush or squirt a solution of liquid detergent and water or commercially available liquid leak detector (Snoop, Bubbles) to the primary area identified in Step 2 of the block diagram.

^ If the primary area is in the rear seal area, apply the solution to the rear seal, rear cap, rear cap to cylinder block and oil pan gasket areas.

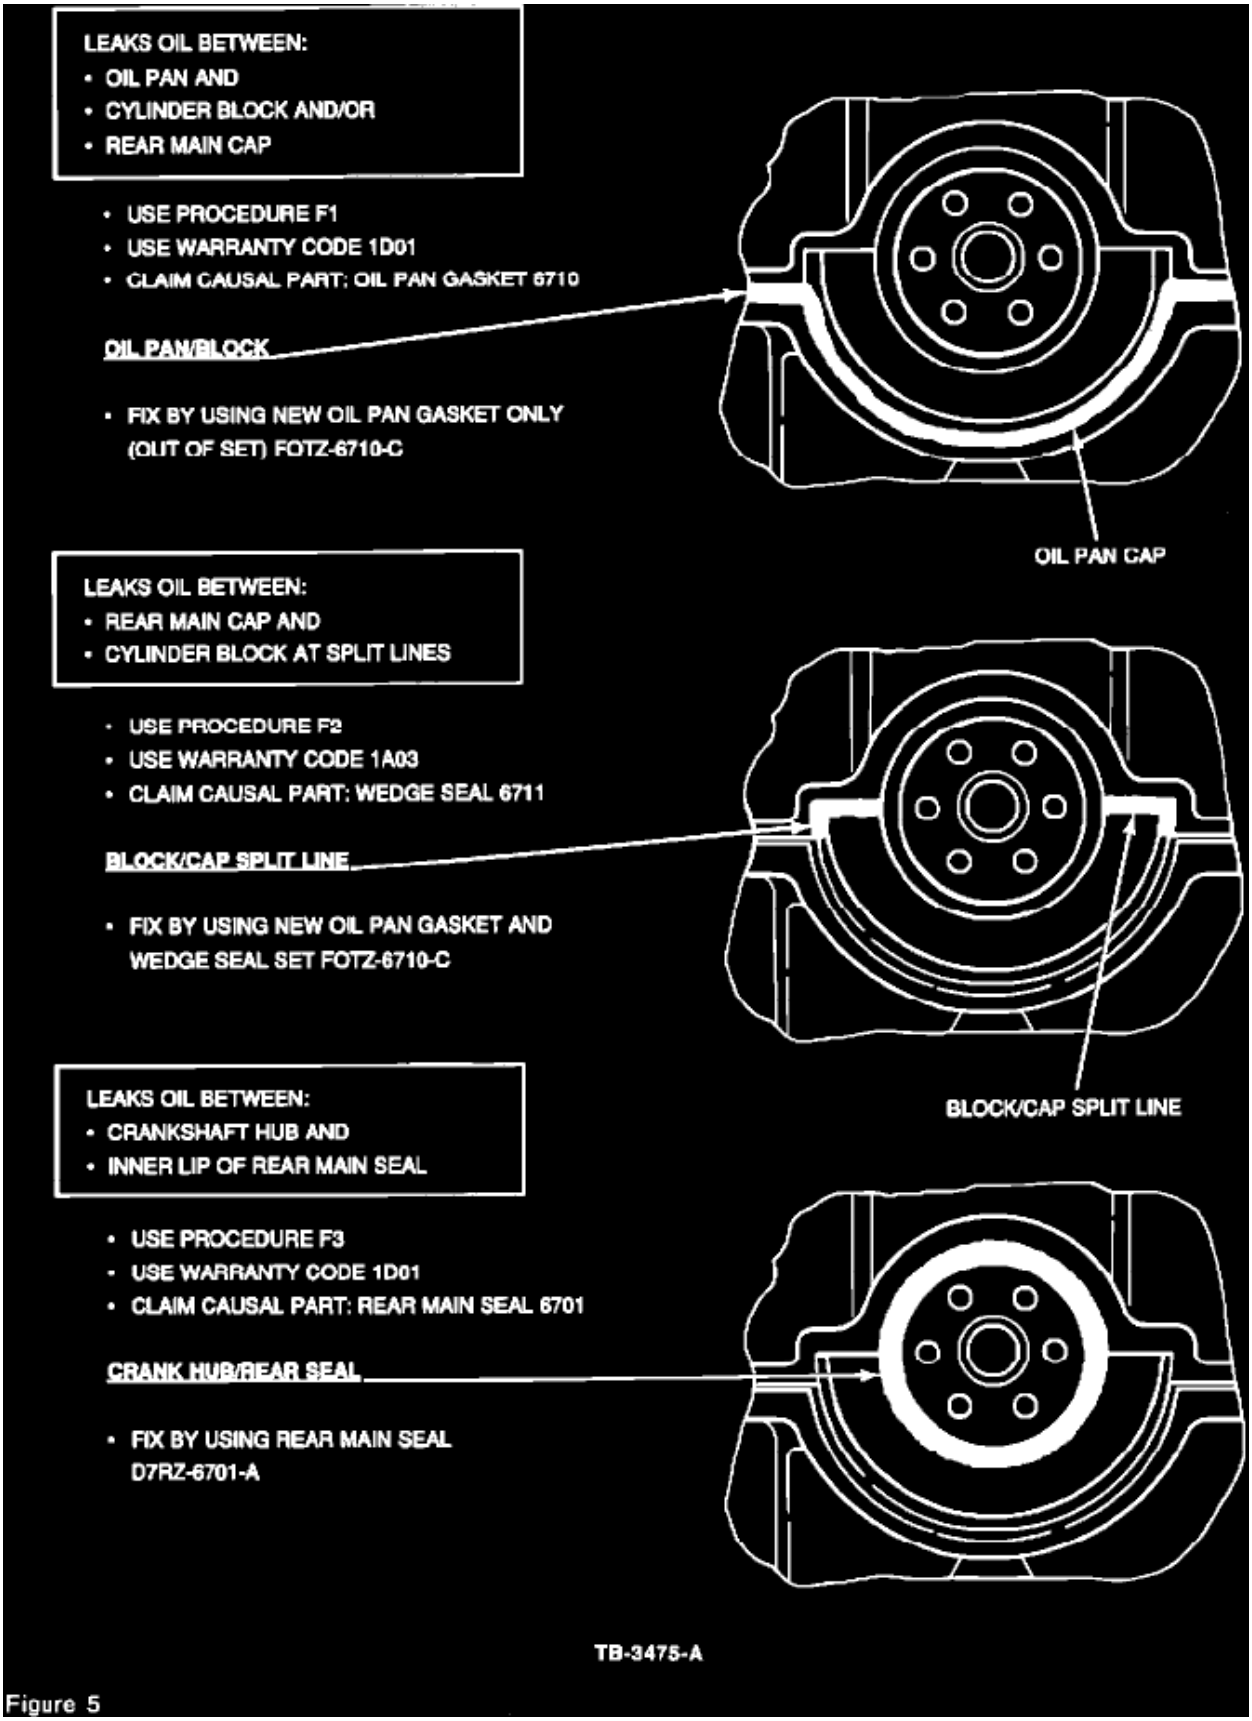

Figure 5

^ If bubbles are detected only at the oil pan gasket, between the oil pan and the cylinder block, or between the oil pan and the rear main cap, only the oil pan gasket needs replacing. Note

Procedure A, Figure 2, Step A3/F1, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A1.

^ If bubbles are detected between the rear main cap and the cylinder block, the rear cap must be removed and resealed. Note Procedure A, Figure 2, Step A3/F2, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A2.

^ If bubbles are detected between the rear seal lip and crank hub, a new rear oil seal will be required. Under certain circumstances, as outlined in the block diagram, it will be necessary to call the 4.OL Hotline. Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A3.

^ If no bubbles are detected, but oil is present in the area between the crank hub and the lip of the rear seal, carefully remove the seal and inspect the crankshaft rear seal journal. (A leak may occur

at the rear seal only when the engine is running.) Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Follow repair procedures outlined on the block diagram.

NOTE:

ANY APPEARANCE OF RUST, PITTING, POROSITY, OR NICKS ON THE REAR SEAL JOURNAL WILL CAUSE A LEAK.

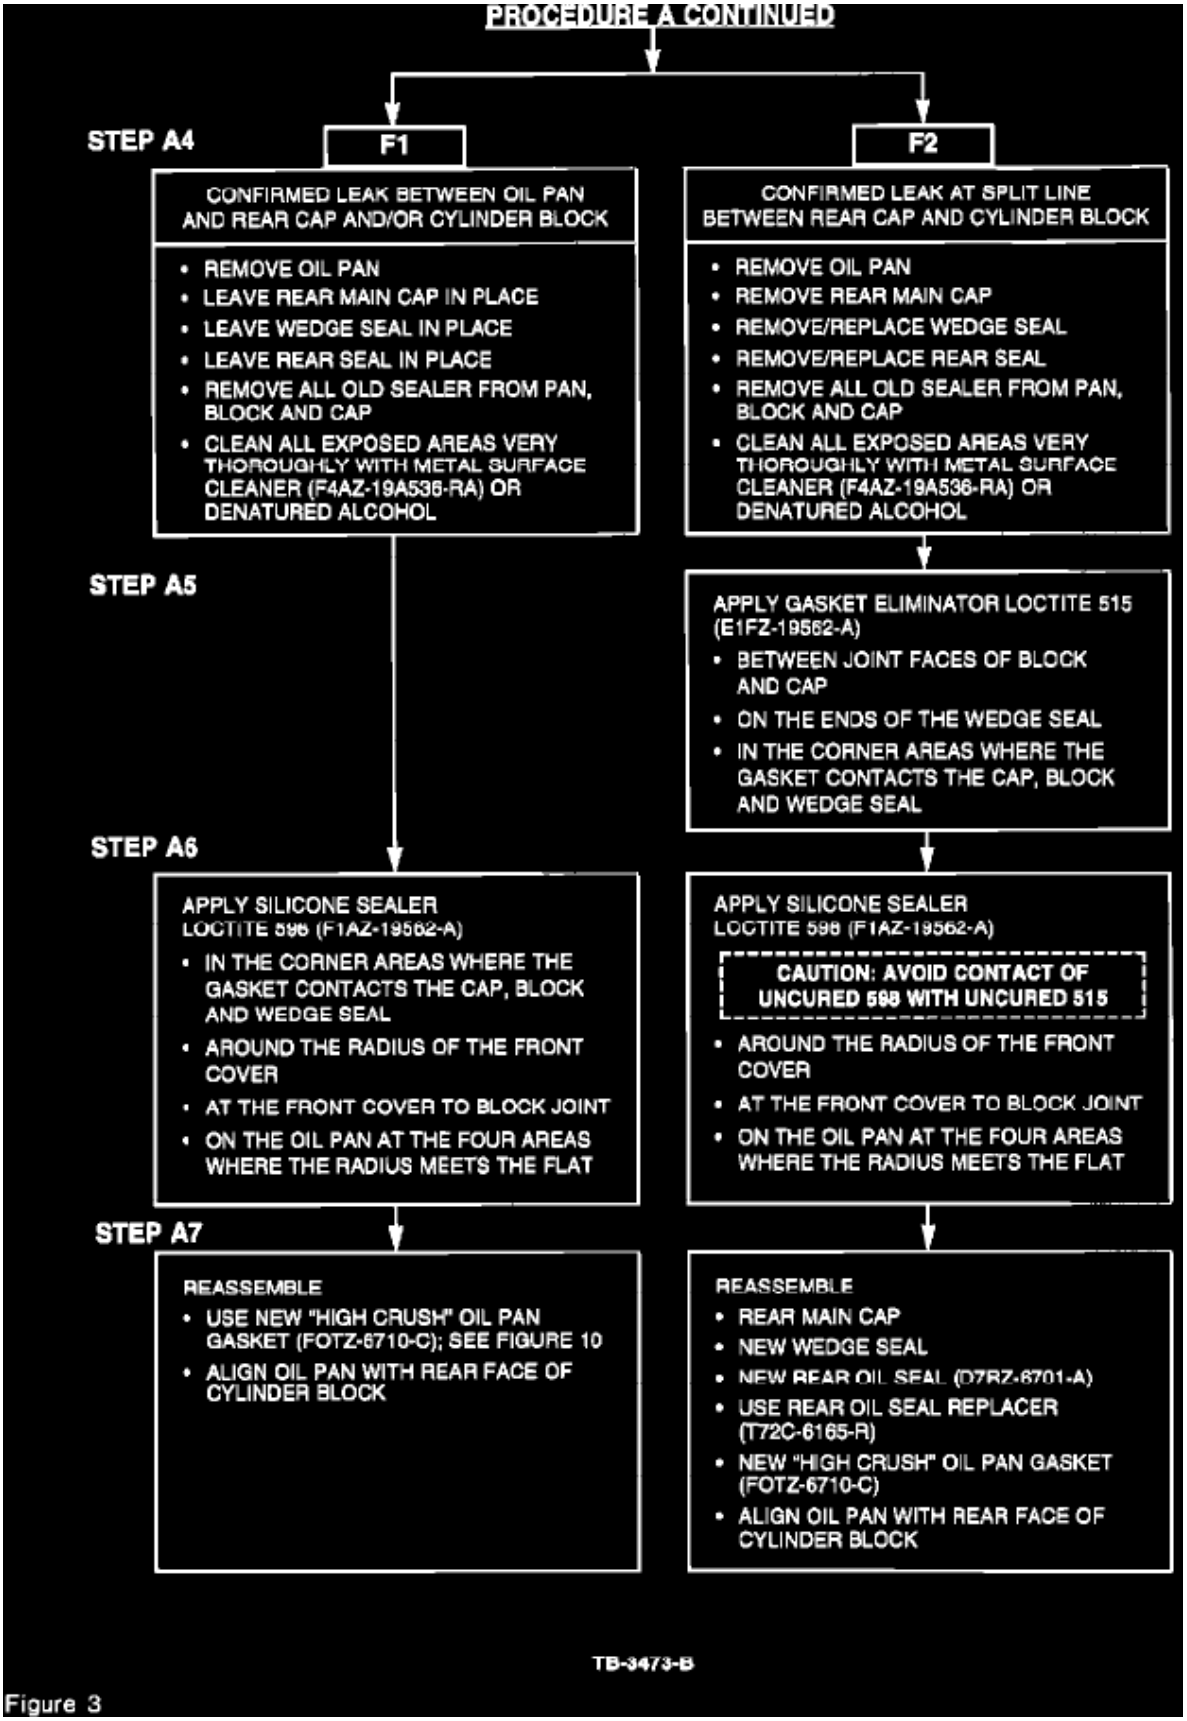
^ If bubbles are detected at the front or rear of the intake manifold gasket, a new intake manifold gasket (FOTZ-9439-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT INTAKE MANIFOLD, PROCEDURE B.

^ If bubbles are detected at the rocker cover rails, new rocker cover gaskets (F3TZ-6584-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT ROCKER COVER RAILS, PROCEDURE C.

^ If bubbles are detected at the front end of the engine, a new front seal (E6TZ-6700-A) or oil pan gasket (FOTZ-6710-C) will be required. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT THE FRONT END, PROCEDURE D.

Service Procedure - Repair

REAR END OIL LEAK - PROCEDURE A



PROCEDURE A CONTINUED
STEP A4
F1
CONFIRMED LEAK BETWEEN OIL PAN AND REAR CAP AND/OR CYLINDER BLOCK
• REMOVE OIL PAN
• LEAVE REAR MAIN CAP IN PLACE
• LEAVE WEDGE SEAL IN PLACE
• LEAVE REAR SEAL IN PLACE
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
F2
CONFIRMED LEAK AT SPLIT LINE BETWEEN REAR CAP AND CYLINDER BLOCK
• REMOVE OIL PAN
• REMOVE REAR MAIN CAP
• REMOVE/REPLACE WEDGE SEAL
• REMOVE/REPLACE REAR SEAL
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
STEP A5
APPLY GASKET ELIMINATOR LOCTITE 515 (E1FZ-19562-A)
• BETWEEN JOINT FACES OF BLOCK AND CAP
• ON THE ENDS OF THE WEDGE SEAL
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
STEP A6
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
CAUTION: AVOID CONTACT OF UNCURED 598 WITH UNCURED 515
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
STEP A7
REASSEMBLE
• USE NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C); SEE FIGURE 10
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
REASSEMBLE
• REAR MAIN CAP
• NEW WEDGE SEAL
• NEW REAR OIL SEAL (D7RZ-6701-A)
• USE REAR OIL SEAL REPLACER (T72C-6165-R)
• NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C)
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
TB-3473-B
Figure 3

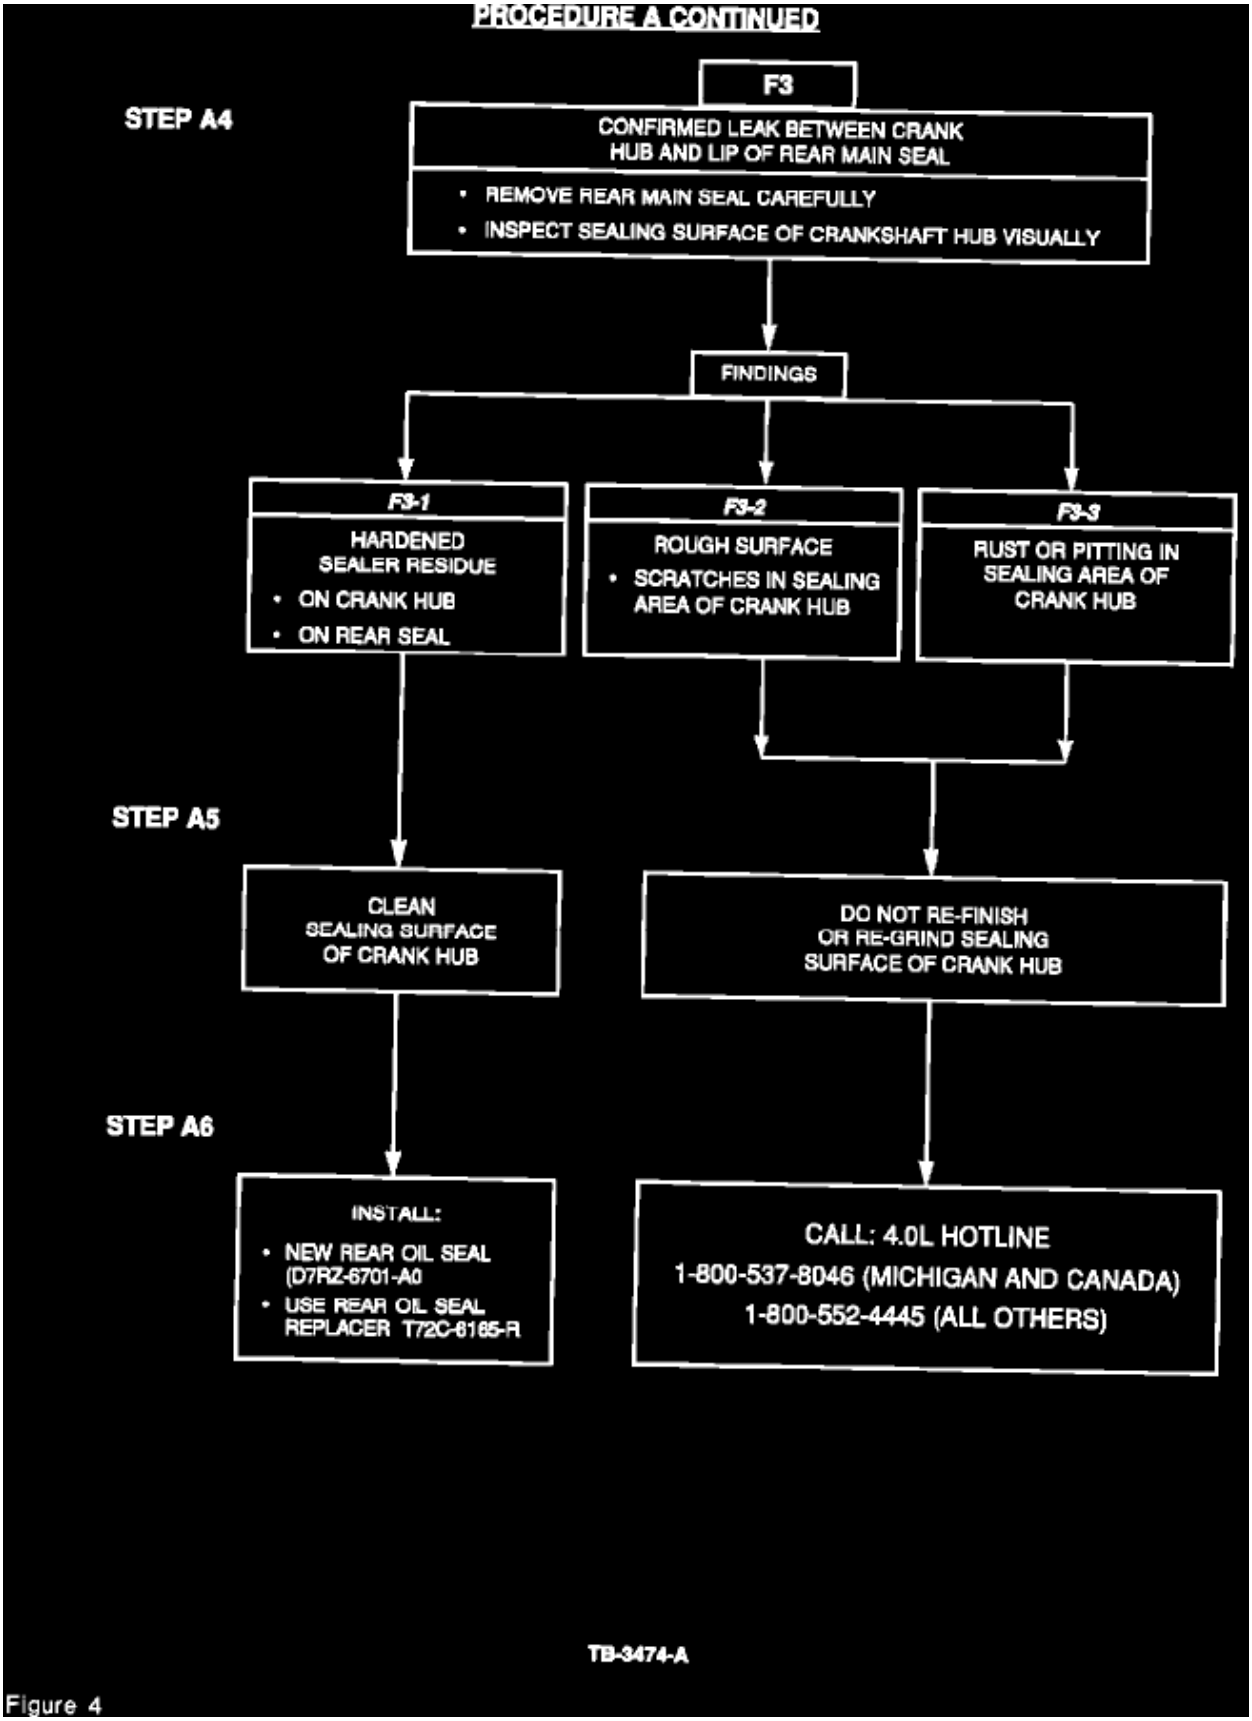


Figure 4

1. Repair procedure for a leak at oil pan gasket between the oil pan and cylinder block, or between the oil pan and the rear main cap. See block diagram Procedure A, Step A4/F1, Figures 3 and 4.

a. Remove the oil pan from the engine and remove the old gasket from the oil pan. Do not remove the rear main cap or wedge seal from the engine.

b. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

c. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap. Take special care to scrape/scratch all the old sealer from the exposed areas of the rear cap, wedge seal and cylinder block. This is a critical sealing area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER BLOCK.

d. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

e. Clean the transmission "BELLHOUSING" area, the rear of the cylinder block and the rear engine plate of ALL oil residue.

f. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corner of the radius areas at the front and rear of the oil pan.

g. Place the oil pan gasket (FOTZ-6710-C) in place in the groove in the oil pan.

h. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the corners where the rear main cap meets the cylinder block, at the corner areas of the radius area on the front cover and the front cover to cylinder block joint.

i. Set the oil pan in place and snug the four (4) pan nuts.

j. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .0100" (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

k. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

2. Repair procedure for a leak between the rear main cap and the cylinder block. See block diagram Procedure A, Step A4/F2.

a. Remove the oil pan, windage tray, oil pump and rear main cap from the engine.

b. Remove the rear main oil seal from the crankshaft and thoroughly inspect the main seal journal of the crankshaft for signs of rust, pitting, nicks or porosity.

c. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

d. Clean ALL the old sealer from the rear main bearing cap USING A SCRAPER AND WIRE WHEEL. The original Loctite sealer used during production assembly becomes extremely hard after it has cured. It is extremely important that ALL the old sealer be removed from the joint faces and grooves.

e. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap joint area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER

BLOCK.

f. Clean ALL the oil and old sealer from the "WEDGE SEAL" that fits around the rear main bearing cap in the oil pan gasket groove. Preferably use a new "WEDGE SEAL".

g. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

h. Clean the transmission "BELLHOUSING AREA", the rear of the cylinder block and the rear engine plate of ALL oil residue.

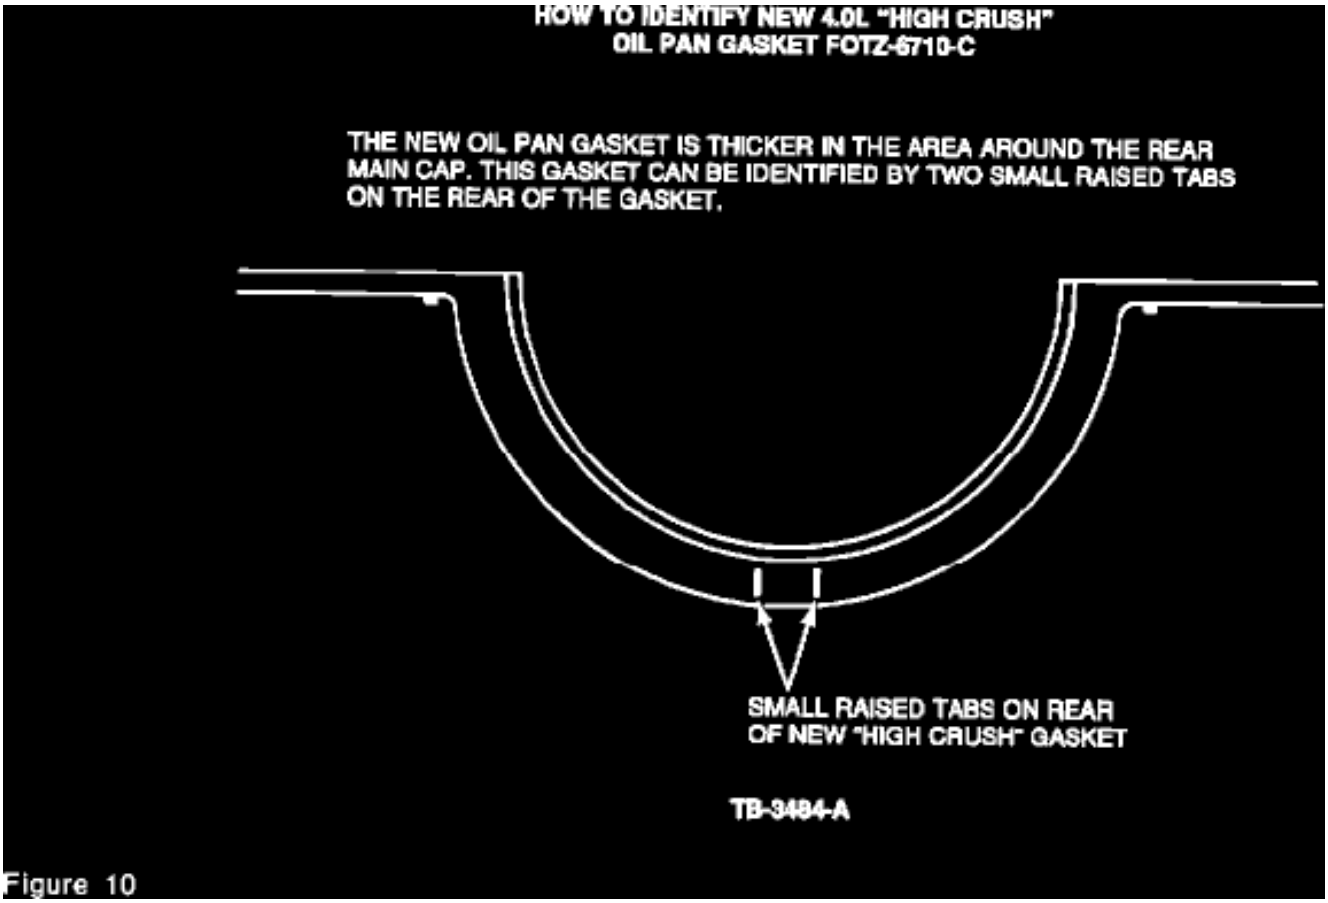

Figure 10

i. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) on the cylinder block along the corners of the rear main bearing cap joint area and on the joint face, approximately 1/2 inch (12.7 mm) from the rear of the block.

j. Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.

k. Align the rear main bearing cap to cylinder block by moving the bearing fore or aft (approx. 1/2 inch (12.7 mm) inward in the rear oil seal bore) so that the rear seal stop of the block and cap line up. This will assure that the rear main oil seal will seat squarely when installed in the bore.

l. Torque the rear main cap bolts to 66-77 lb.ft. (90-104 N-m).

m. Fill the cavities for the "WEDGE SEAL" on both sides of the rear main cap with Ford Gasket Eliminator (E1FZ-19562-A).

n. Place "WEDGE SEAL" in place and use a flat bladed screwdriver to fully seat the "WEDGE SEAL", forcing the excessive sealer out.

o. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) in the corners of the oil pan gasket groove of the rear main cap where the cap meets the cylinder block.

p. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) at the corner areas of the radius area on the front cover and at the front cover to cylinder block joint.

q. Reinstall the oil pump and windage tray. Torque to 13-15 lb.ft. (17-21 N-m).

r. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corners of the radius areas at the front and rear of the oil pan.

s. Place the oil pan gasket (FOTZ-6710-C), Figure 10, in place in the groove in the oil pan.

t. Set the oil pan in place and snug the four (4) oil pan bolts.

u. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .01000 (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

v. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

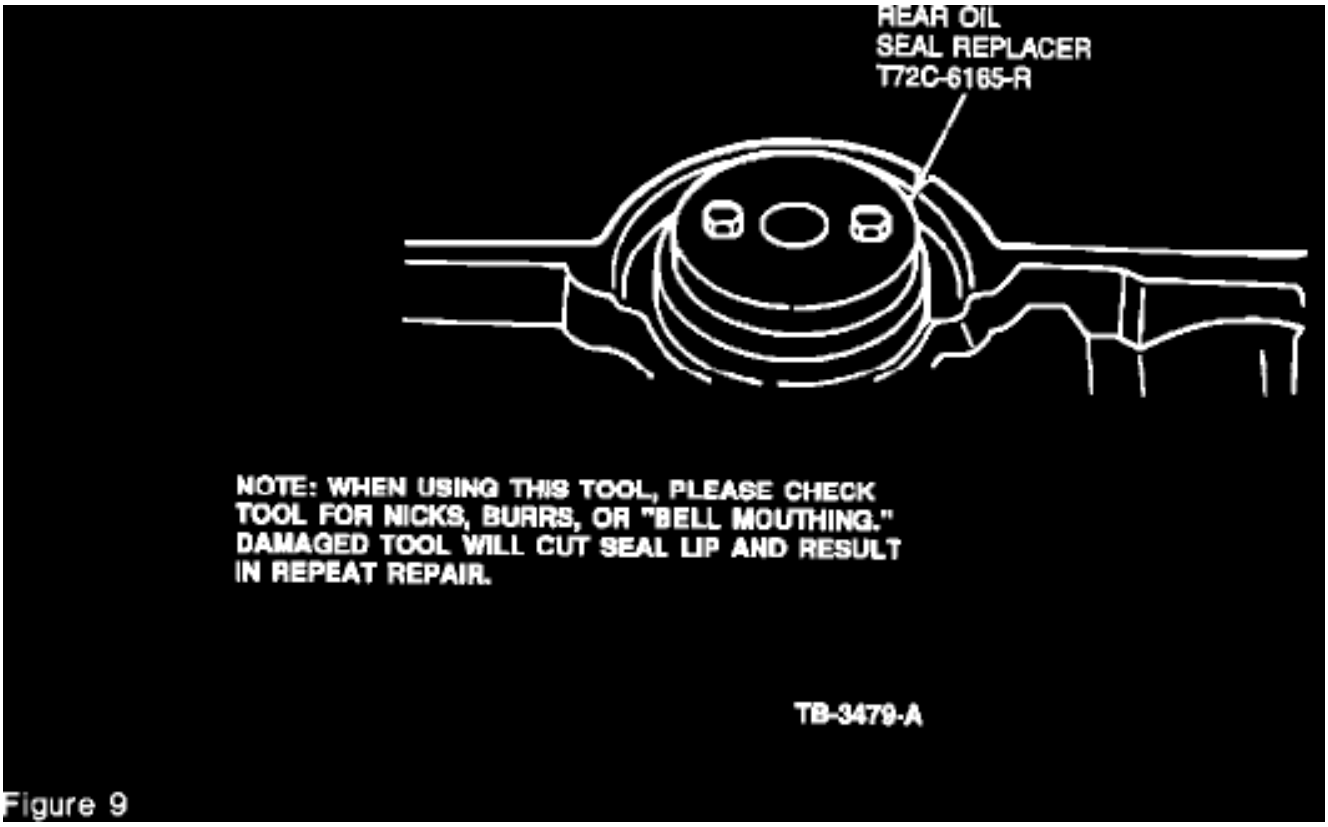

Figure 9

w. Coat the rear main oil seal (D7RZ-6701-A) with oil. Install the rear seal in the seal bore using Rear Oil Seal Replacer T72C-6165-R. This tool uses two flywheel bolts to draw the seal into position. Refer to Figure 9.

CAUTION:

DO NOT USE THE OLD STYLE HAMMER OPERATED TOOL.

3. Repair procedure for a leak between the rear main seal and the crankshaft. See block diagram, Procedure A, Step A4/F3.

a. Any presence of rust on the rear seal journal will cause a leak.

b. Any presence of pitting, porosity or nicks on the rear seal journal will cause a leak.

NOTE:

IF A LEAK IS PRESENT BETWEEN THE REAR MAIN SEAL AND CRANKSHAFT, PLEASE NOTIFY THE 4.0L "HOTLINE" AT (800) 537-8046 OR (800) 552-4445 PRIOR TO ANY ATTEMPT TO REPAIR THIS CONDITION.

Service Procedure - Repair For Oil Leaks At Intake Manifold

PROCEDURE B

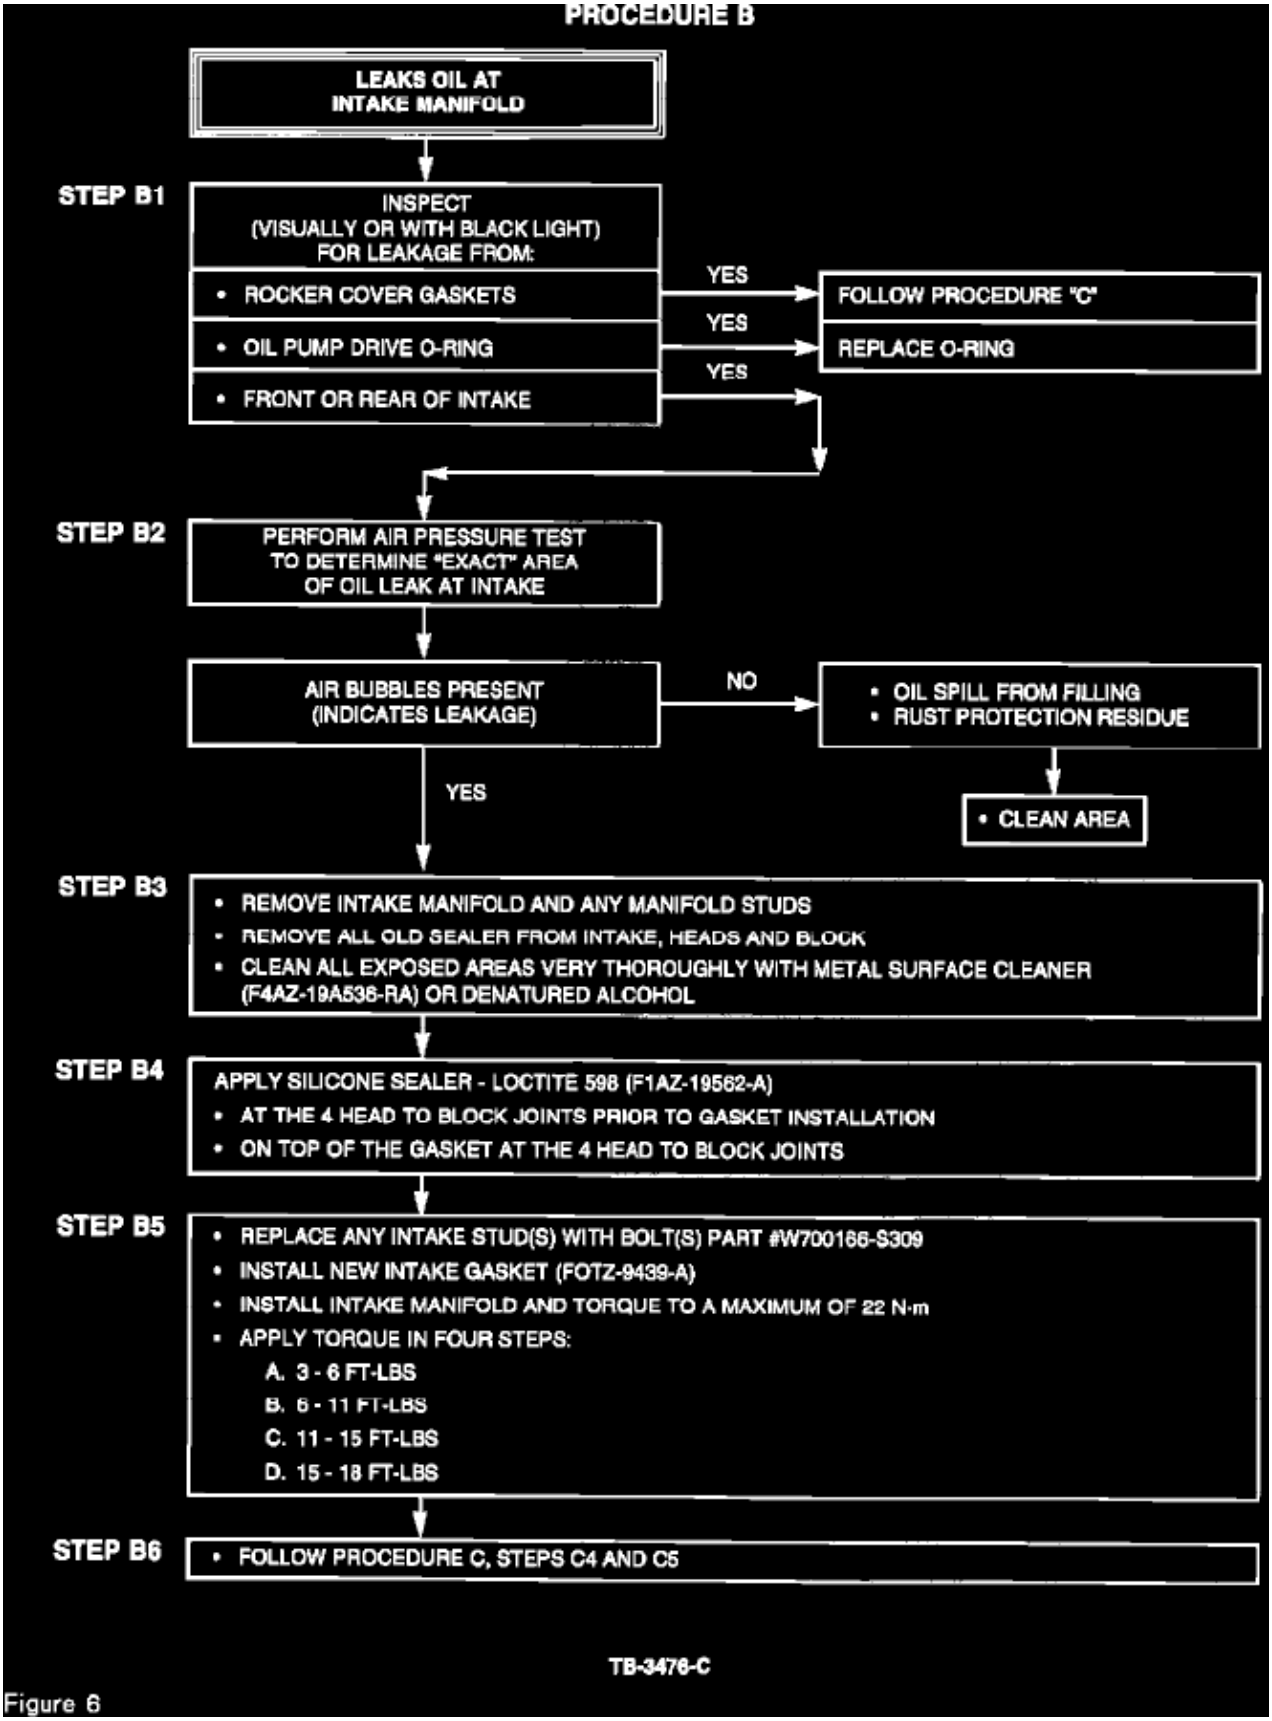

Figure 6

1. If the air pressure test showed no air bubbles, follow Procedure B2 to clean area of oil spill or other contamination.

2. If the air pressure test showed air bubbles present, follow Steps B3 through B6. Refer also to the Service Manual for the applicable year for further information pertinent to removal and installation of the intake manifold.

Service Procedure - Repair For Oil Leaks At Rocker Cover Rails

PROCEDURE C

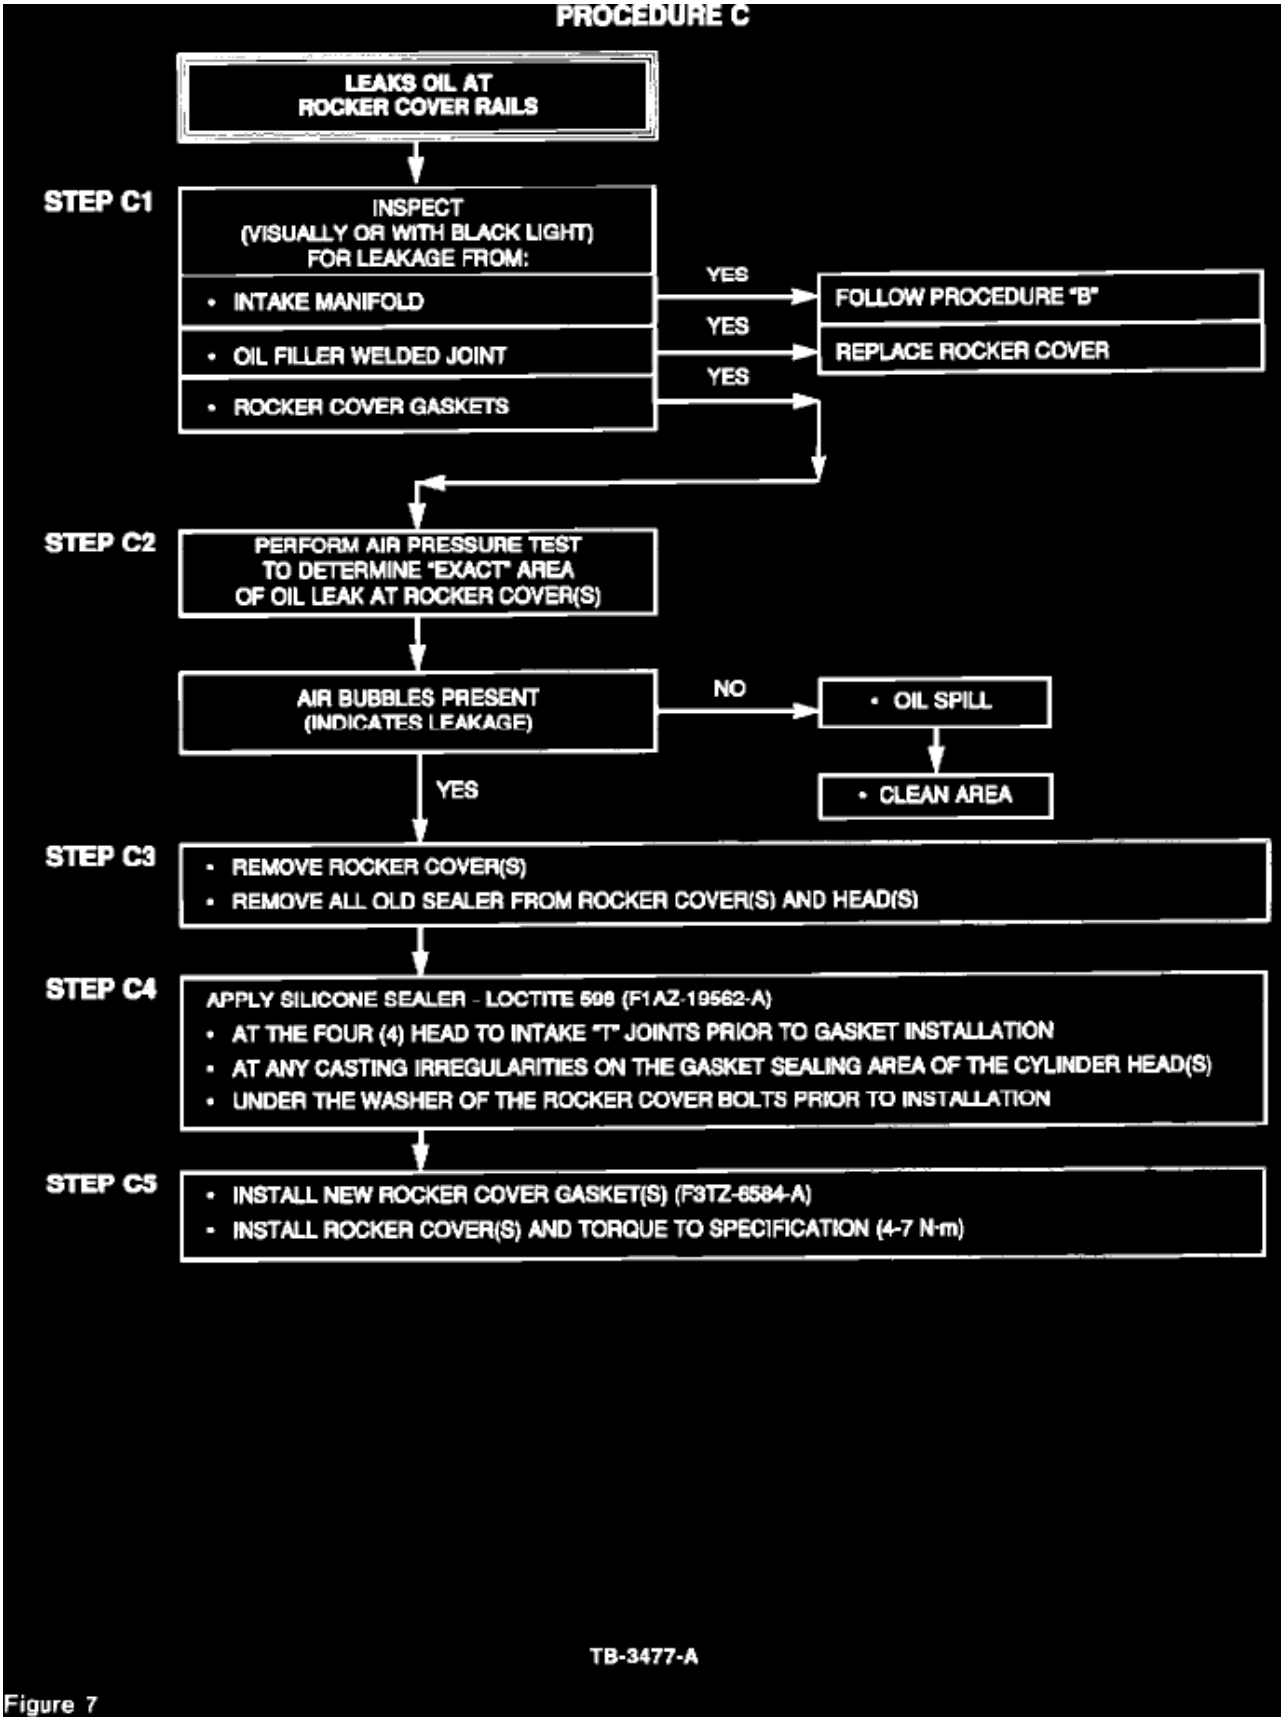

Figure 7

1. If the air pressure test showed no air bubbles, follow Procedure C2 to clean the area of any oil spill.

2. If the air pressure test showed air bubbles present, follow Steps C3 through C5.

Service Procedure - Repair For Oil Leaks At Front End

PROCEDURE D

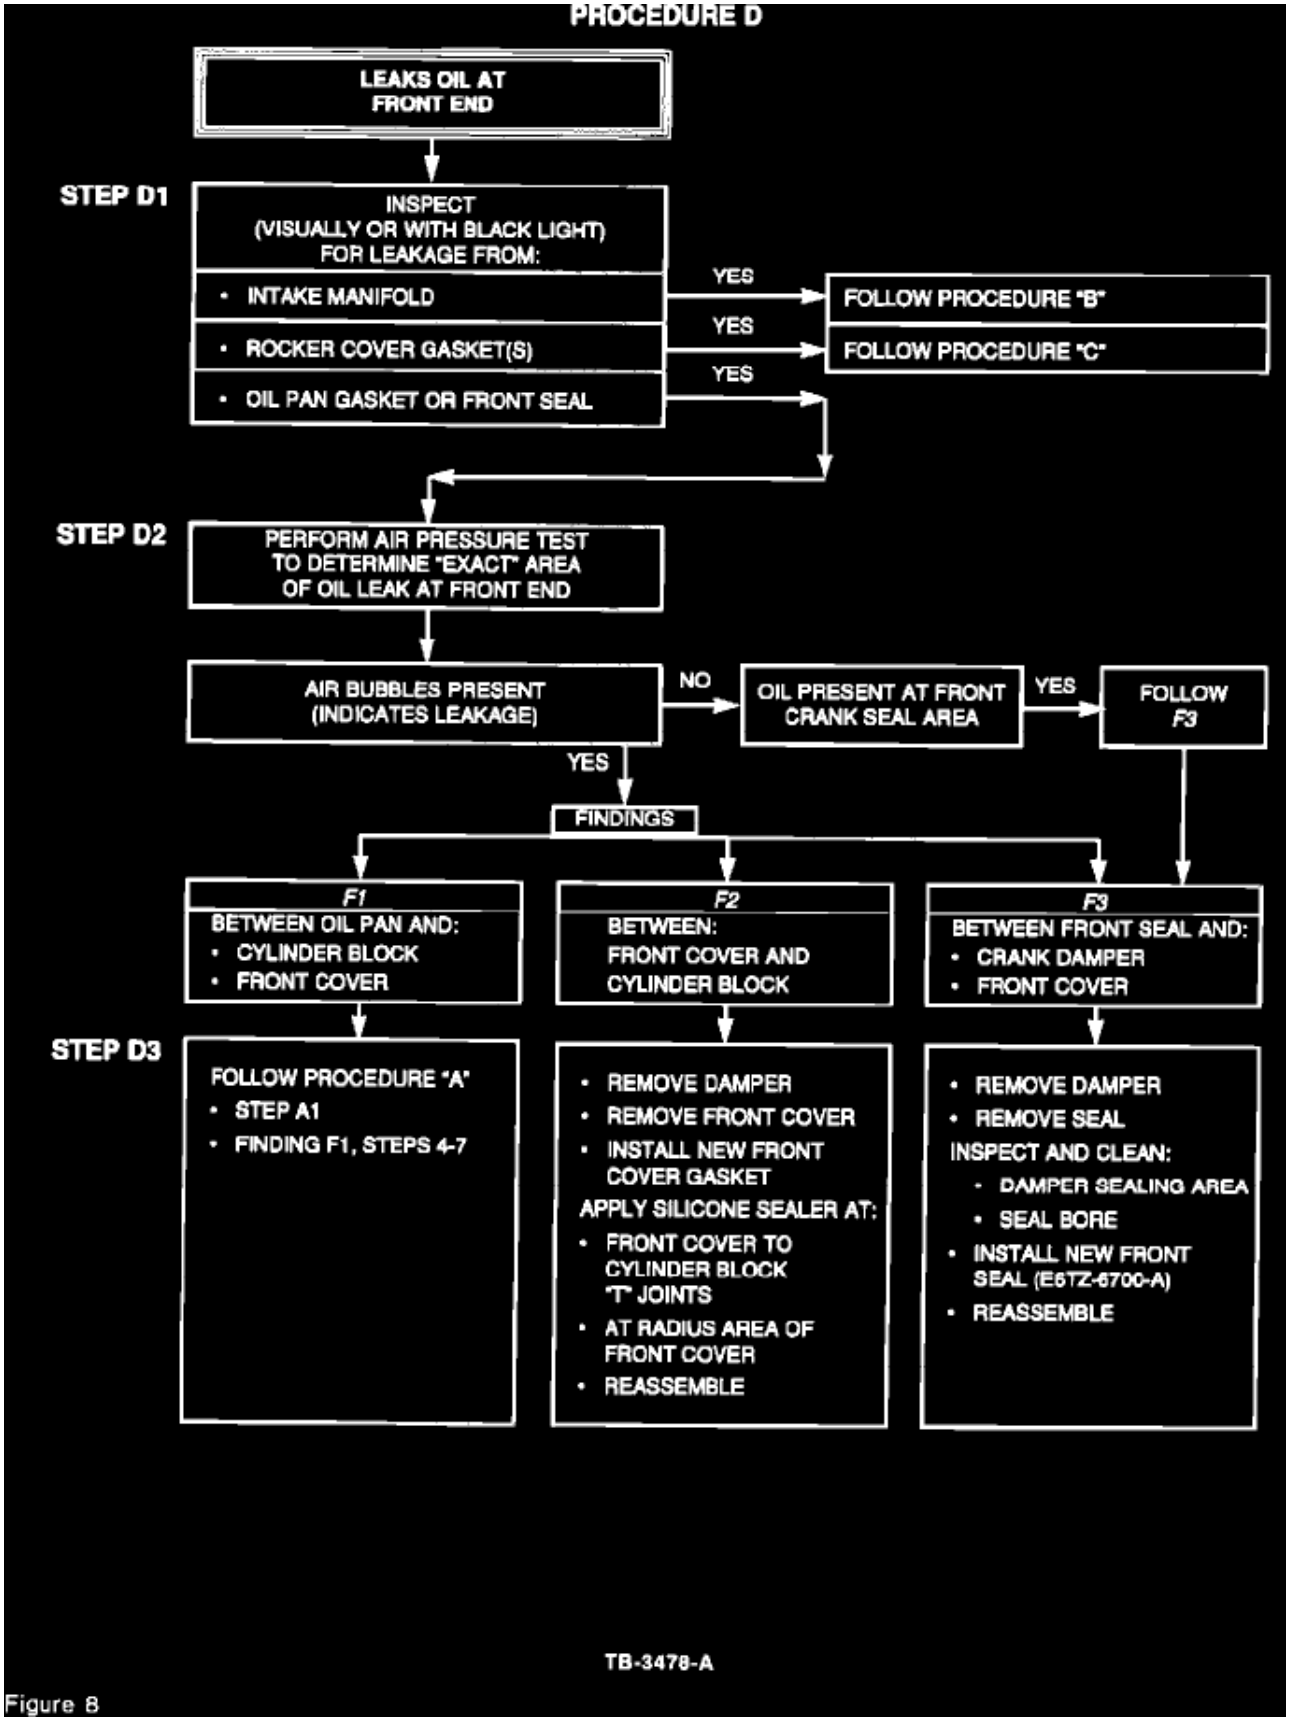

Figure 8

1. If the air pressure test showed no air bubbles, follow Procedure D, F3.

2. If the air pressure test showed air bubbles present, follow Procedure D, F1 or F2 as appropriate.

General Information

LIGHT TRUCK: 1990-93 AEROSTAR, RANGER 1991-93 EXPLORER

This TSB is being republished in its entirety to correct the type of cleaner being used in Figures 1, 3, and 6.

ISSUE: The many sources of leaks which typically appear at the lower end, front end, intake manifold valley, and rocker cover rails have led to mis-diagnosis as to the source of the leak and improper repair procedures, repeat repairs, and customer dissatisfaction.

ACTION: This TSB article has been developed to list the latest sealing techniques and associated part numbers for:

^ Oil Pan

^ Rear Main Seal

^ Rocker Covers

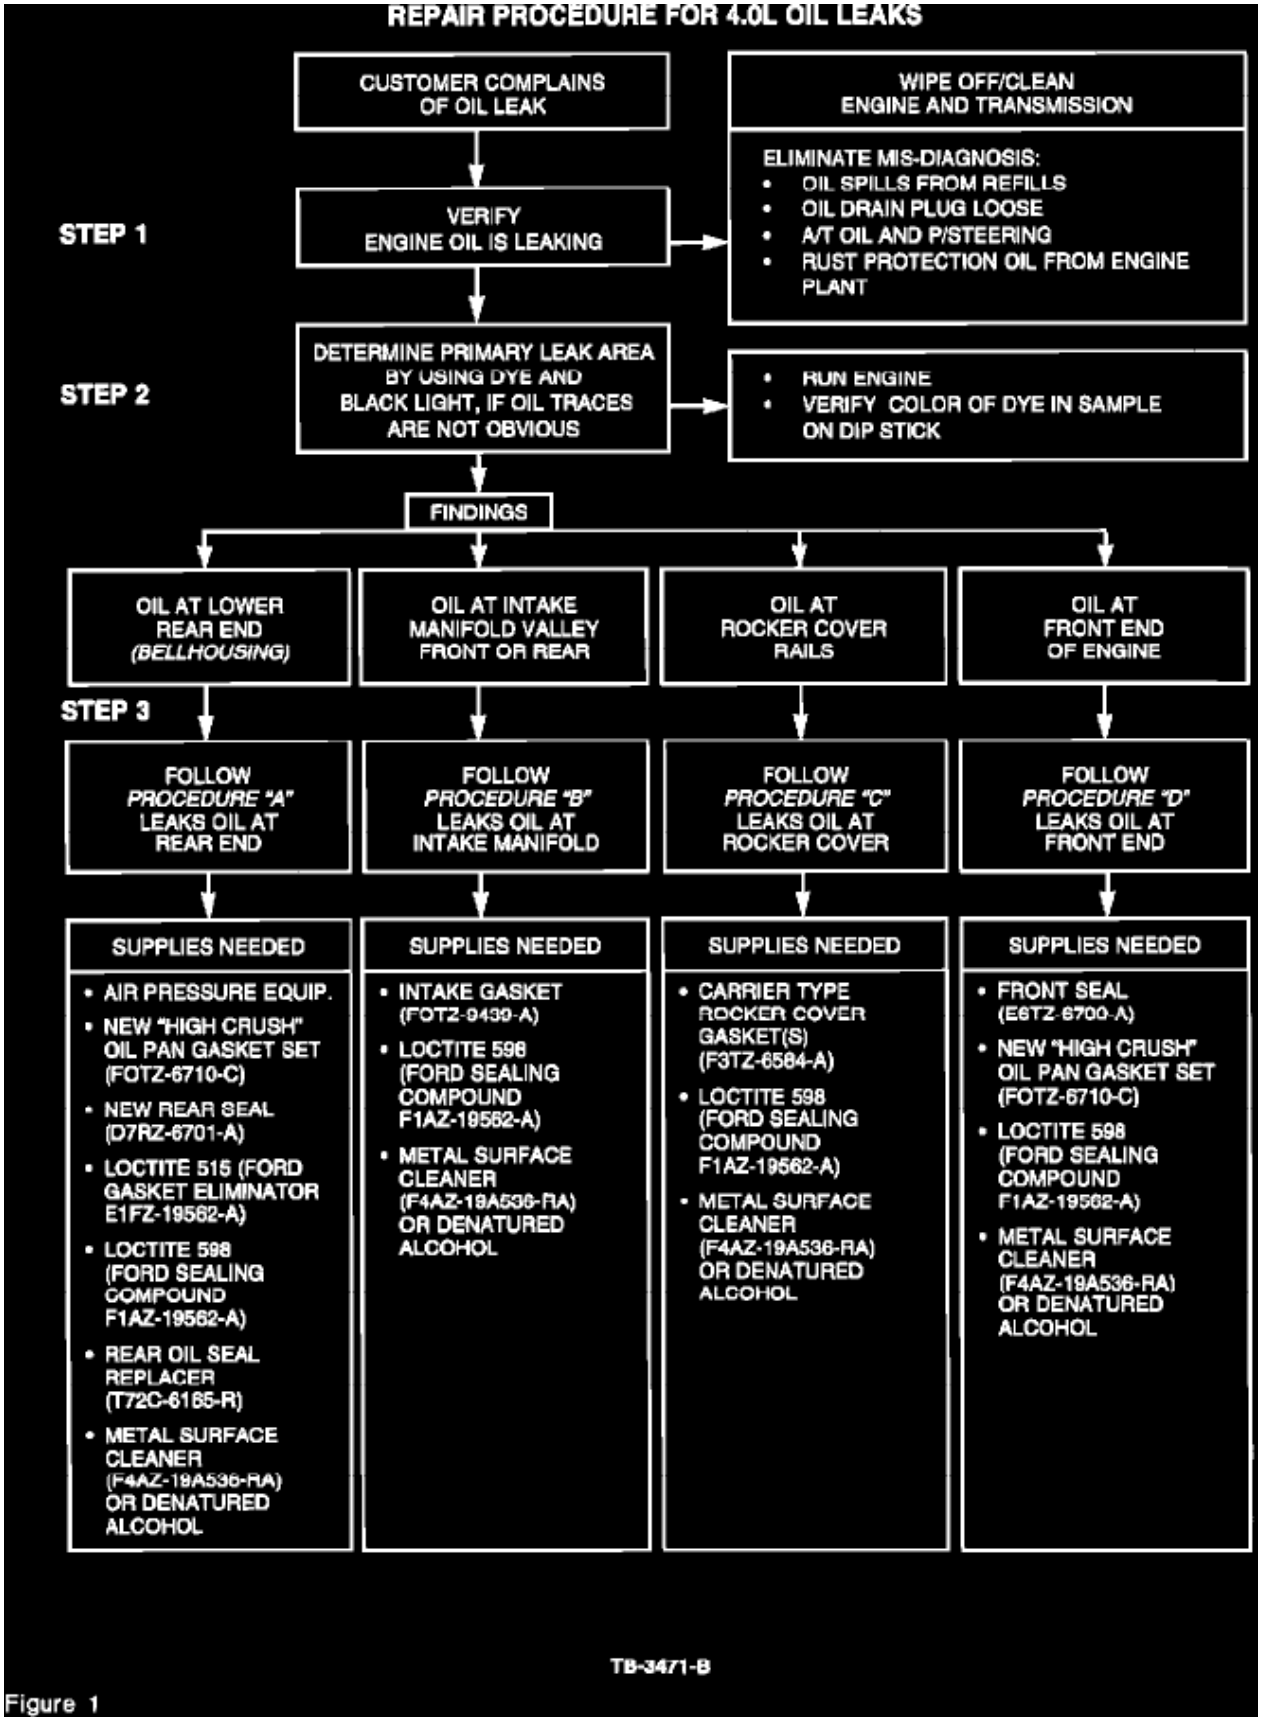

Figure 1

^ Intake Manifold

This article attempts to fully address all issues as one, in order to provide a diagnostic guide which leads to proper diagnosis and repair the first time. Use the following procedures to verify the location of the oil leak and perform the repair.

Service Procedure - Diagnosis

1. Perform Steps 1 and 2 of the block diagram shown in Figure 1. Perform a visual inspection to determine the general area of the oil leak.

2. After determining the "Findings" of Step 2, perform Step 3 by following Procedures A, B, C or D, whichever is appropriate, up to, but not including the air pressure test.

NOTE:

WHEN THE FINDINGS RESULT IN FOLLOWING PROCEDURE "A" FOR "LEAKS OIL AT REAR END", IT IS VERY IMPORTANT TO FOLLOW THE BLOCK DIAGRAM INSTRUCTIONS TO REMOVE THE TRANSMISSION, IF AN AEROSTAR, AND TO REMOVE THE ENGINE, IF AN EXPLORER/RANGER. THE PRACTICE OF REMOVING EXPLORER/RANGER OIL PANS WITH ENGINE IN VEHICLE CAN RESULT IN FAULTY DIAGNOSIS AND/OR REPAIR FOR THE PURPOSES OF THIS TSB.

If the leak has not been located and corrected at this point, then fabricate a device that is capable of applying a constant 1 to 3 psi of air pressure to the engine crankcase. The Rotunda Leak Tester 134-00003, or equivalent, which contains a pressure regulator and gauge capable of a 1 to 3 psi range, may be used.

3. Verify the location of the oil leak by pressurizing the engine crankcase with a constant supply of 3 psi of air pressure and the use of leak detection solution (liquid detergent and water). This process will verify the exact location of the leak. Dye and black light will verify a leak is present, but may not verify the exact location of the leak.

a. Assemble the necessary hose and fittings to connect an air pressure regulator and air pressure gauge to the shop air supply and to the engine crankcase through the dipstick tube.

b. Test the device to make sure 1-3 psi of air pressure can be maintained. Bursts of pressure over 3 psi can damage engine seals.

c. Before starting the test, make sure the regulator valve is completely closed so as not to accidentally apply a big burst of air to the engine when starting the test.

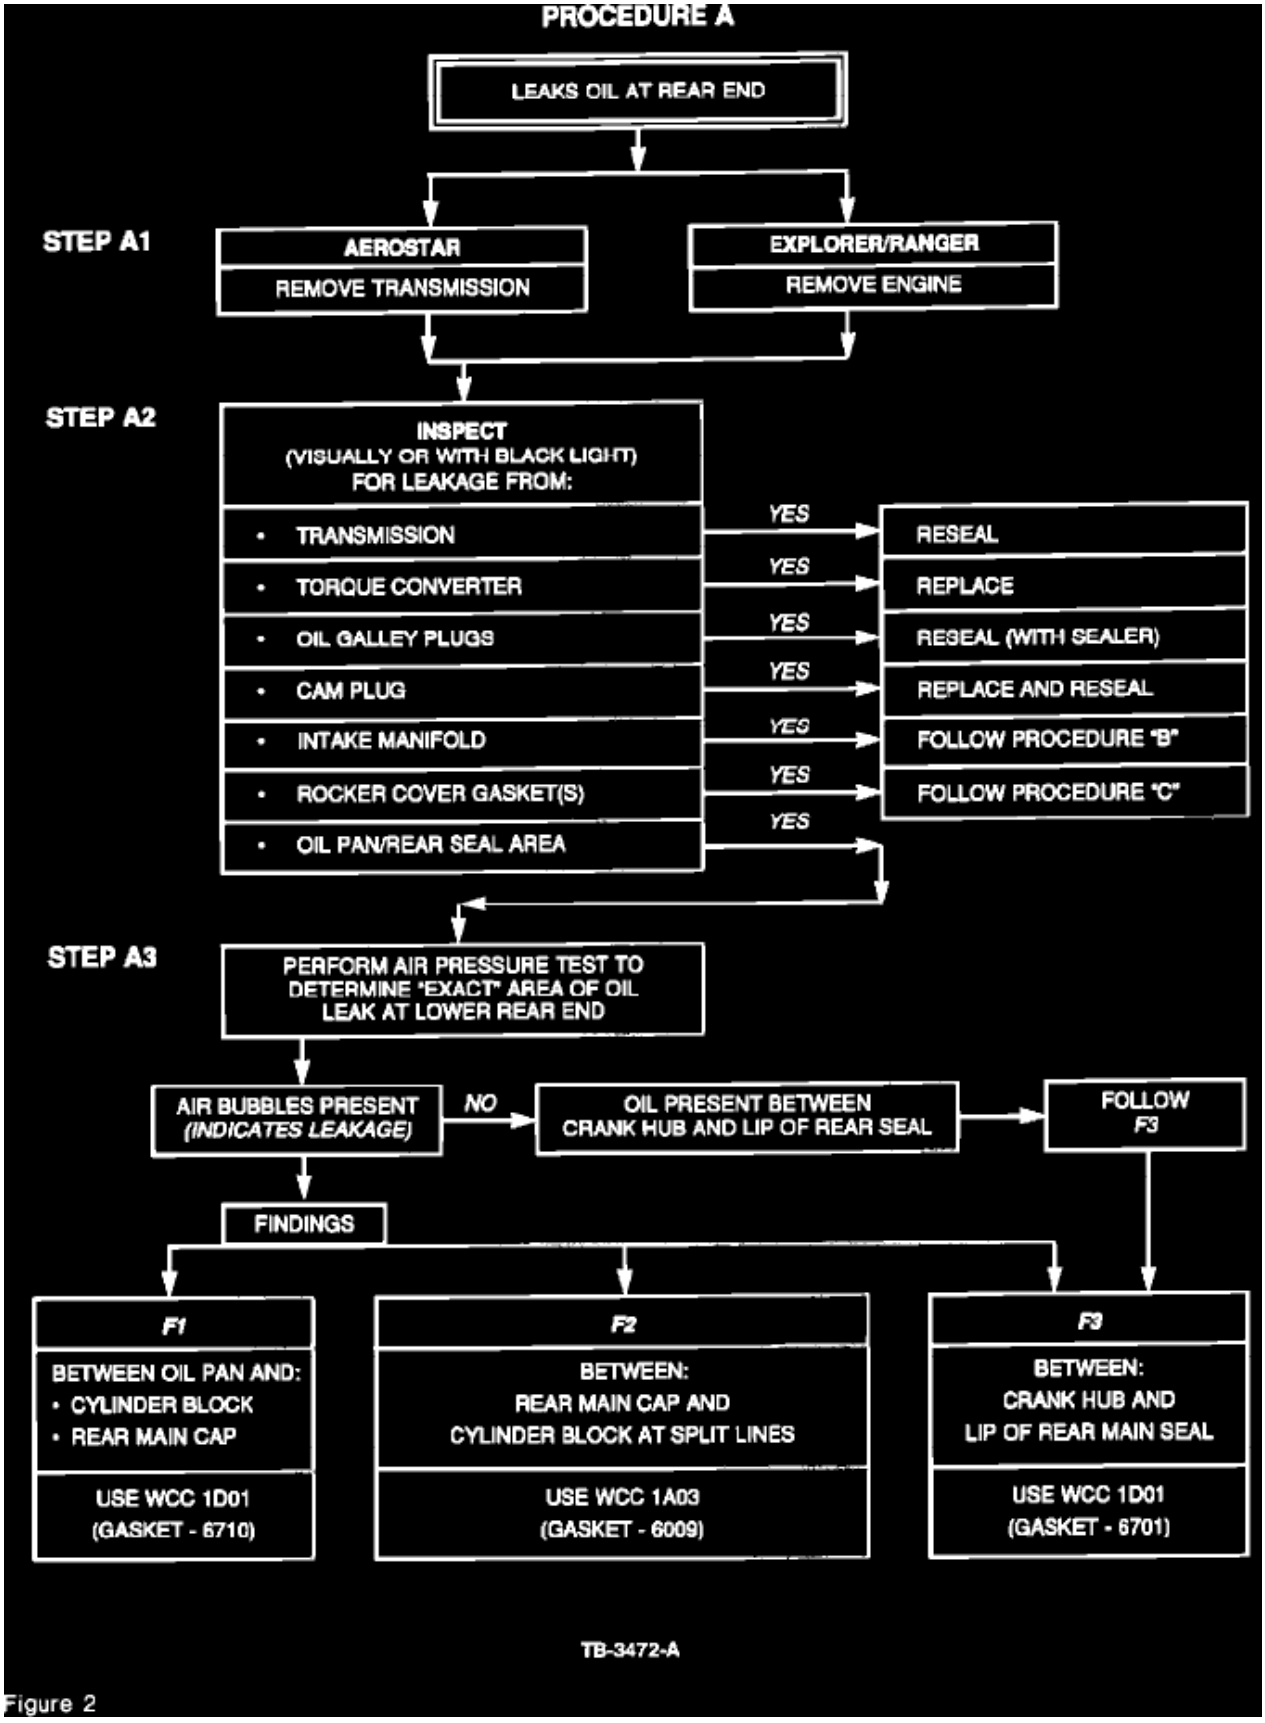
d. Attach the outlet (regulated) hose from the regulator/gauge device to the dipstick.

e. To trap air in the engine, plug any ports and passages (PCV valve, air inlet connection) that will allow air to escape.

f. Slowly open the regulator valve until 1-3 psi of air pressure registers on the gauge.

g. Keeping air pressure applied, brush or squirt a solution of liquid detergent and water or commercially available liquid leak detector (Snoop, Bubbles) to the primary area identified in Step 2 of the block diagram.

^ If the primary area is in the rear seal area, apply the solution to the rear seal, rear cap, rear cap to cylinder block and oil pan gasket areas.



PROCEDURE A
LEAKS OIL AT REAR END
STEP A1
AEROSTAR
REMOVE TRANSMISSION
EXPLORER/RANGER
REMOVE ENGINE
STEP A2
INSPECT
(VISUALLY OR WITH BLACK LIGHT)
FOR LEAKAGE FROM:
• TRANSMISSION
• TORQUE CONVERTER
• OIL GALLEY PLUGS
• CAM PLUG
• INTAKE MANIFOLD
• ROCKER COVER GASKET(S)
• OIL PAN/REAR SEAL AREA
YES
RESEAL
REPLACE
RESEAL (WITH SEALER)
REPLACE AND RESEAL
FOLLOW PROCEDURE "B"
FOLLOW PROCEDURE "C"
STEP A3
PERFORM AIR PRESSURE TEST TO
DETERMINE "EXACT" AREA OF OIL
LEAK AT LOWER REAR END
AIR BUBBLES PRESENT
(INDICATES LEAKAGE)
NO
OIL PRESENT BETWEEN
CRANK HUB AND LIP OF REAR SEAL
FOLLOW
F3
FINDINGS
F1
BETWEEN OIL PAN AND:
• CYLINDER BLOCK
• REAR MAIN CAP
USE WCC 1D01
(GASKET - 6710)
F2
BETWEEN:
REAR MAIN CAP AND
CYLINDER BLOCK AT SPLIT LINES
USE WCC 1A03
(GASKET - 6009)
F3
BETWEEN:
CRANK HUB AND
LIP OF REAR MAIN SEAL
USE WCC 1D01
(GASKET - 6701)
TB-3472-A

Figure 2

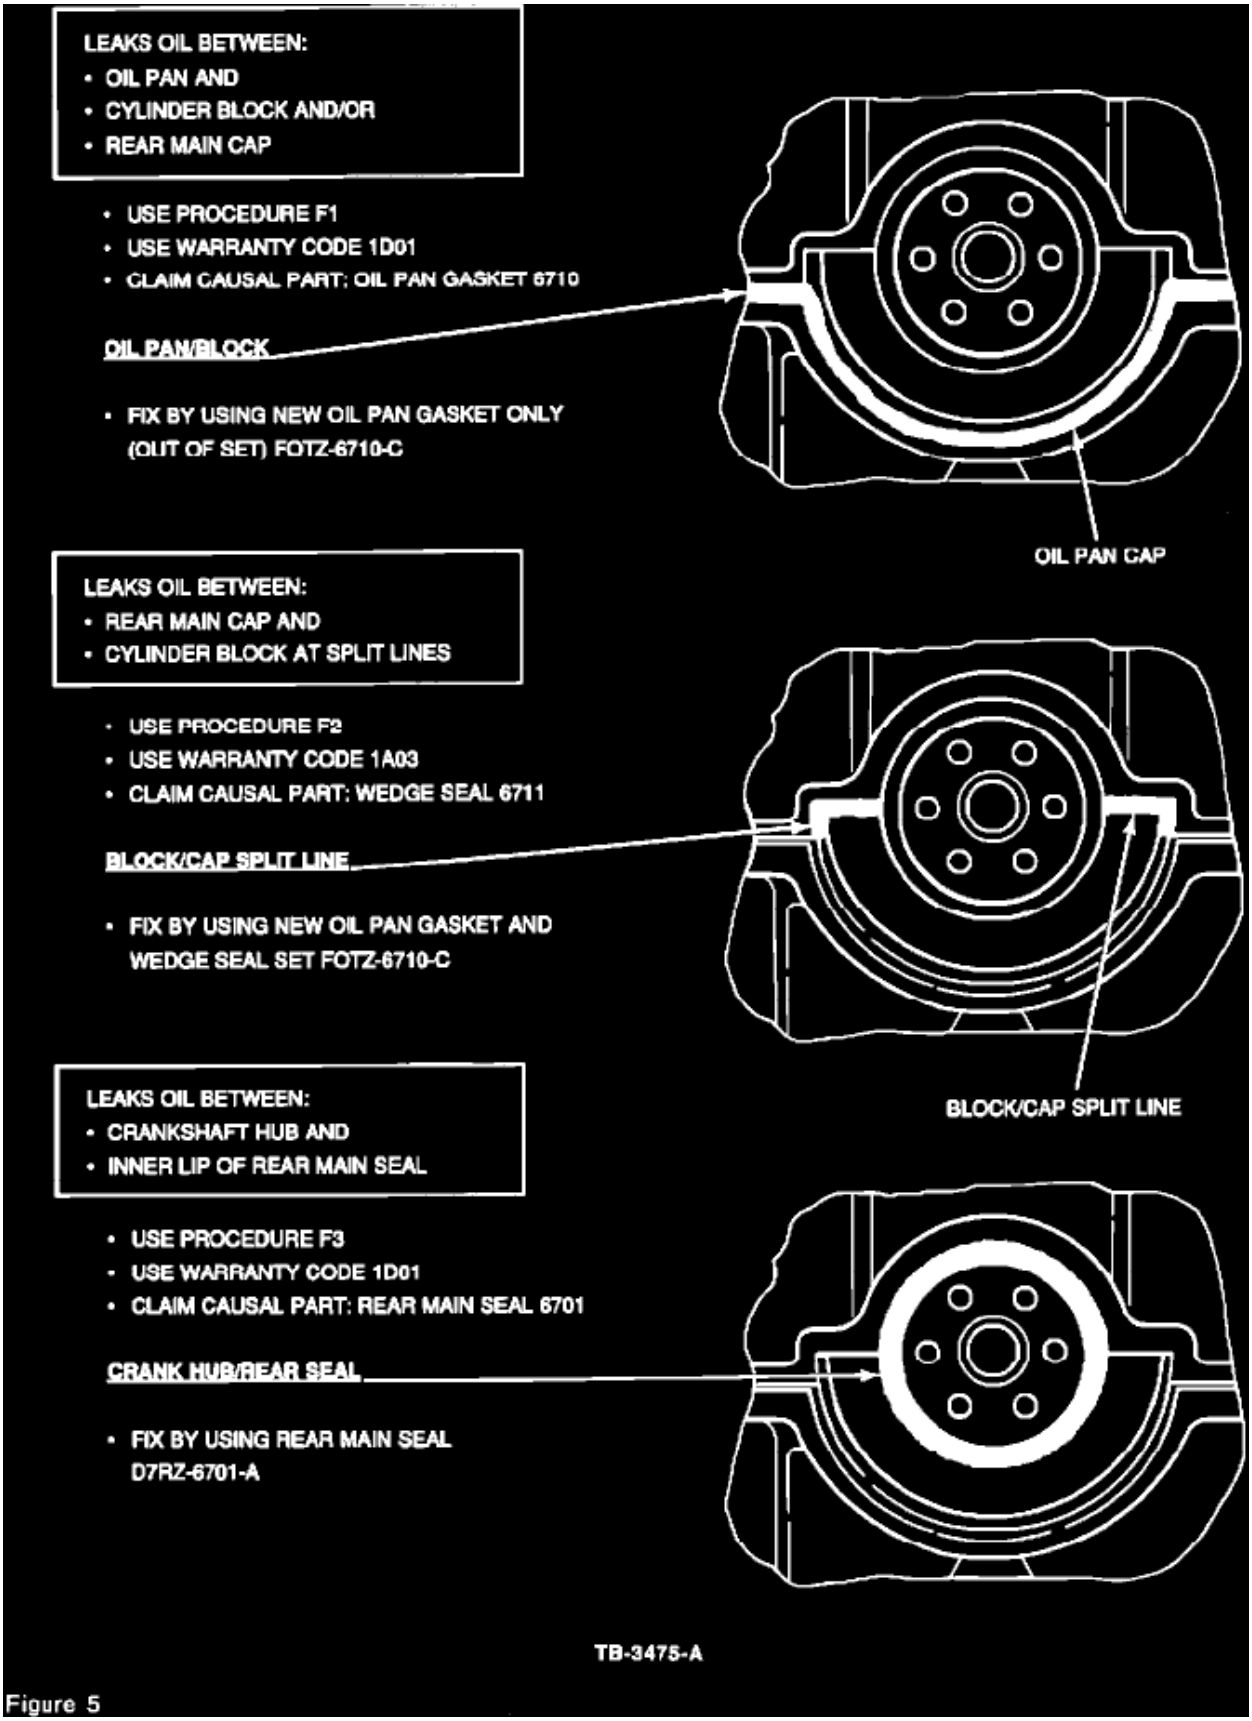


Figure 5

^ If bubbles are detected only at the oil pan gasket, between the oil pan and the cylinder block, or between the oil pan and the rear main cap, only the oil pan gasket needs replacing. Note

Procedure A, Figure 2, Step A3/F1, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A1.

^ If bubbles are detected between the rear main cap and the cylinder block, the rear cap must be removed and resealed. Note Procedure A, Figure 2, Step A3/F2, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A2.

^ If bubbles are detected between the rear seal lip and crank hub, a new rear oil seal will be required. Under certain circumstances, as outlined in the block diagram, it will be necessary to call the 4.OL Hotline. Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A3.

^ If no bubbles are detected, but oil is present in the area between the crank hub and the lip of the rear seal, carefully remove the seal and inspect the crankshaft rear seal journal. (A leak may occur

at the rear seal only when the engine is running.) Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Follow repair procedures outlined on the block diagram.

NOTE:

ANY APPEARANCE OF RUST, PITTING, POROSITY, OR NICKS ON THE REAR SEAL JOURNAL WILL CAUSE A LEAK.

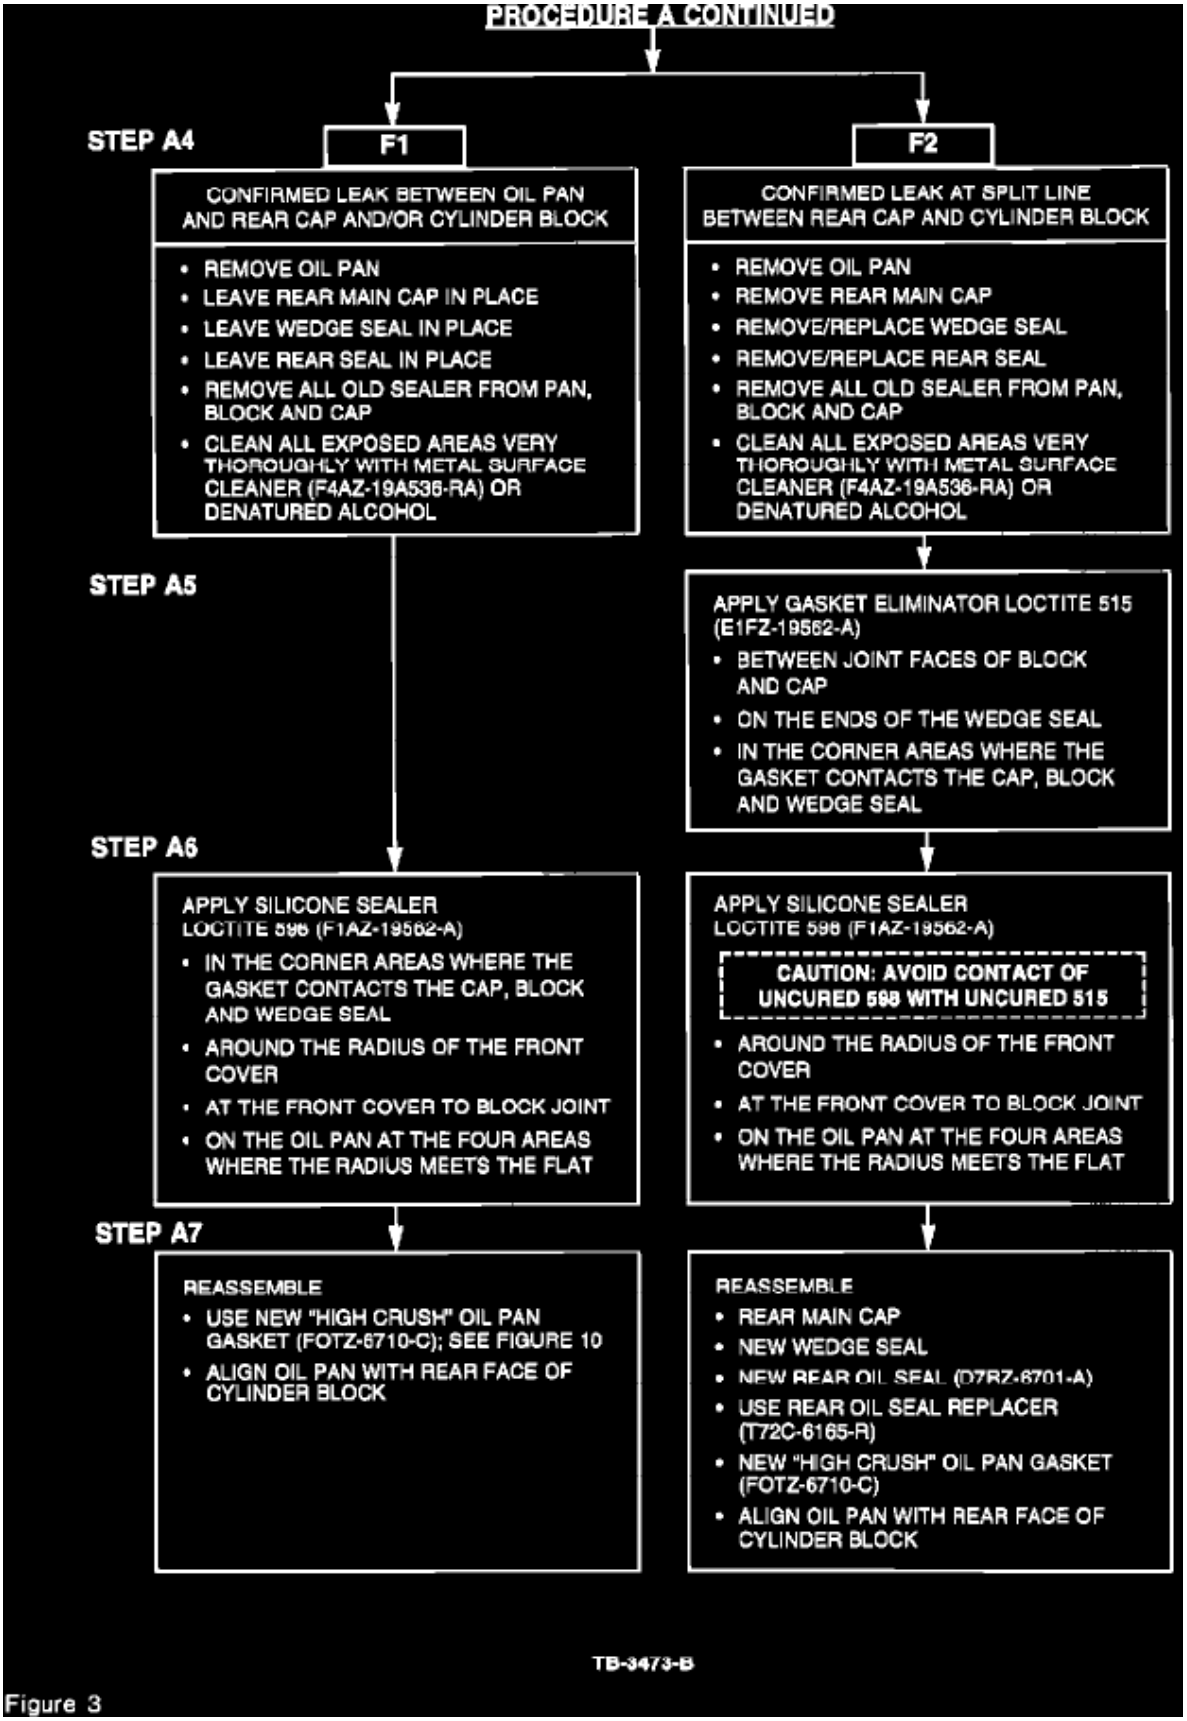
^ If bubbles are detected at the front or rear of the intake manifold gasket, a new intake manifold gasket (FOTZ-9439-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT INTAKE MANIFOLD, PROCEDURE B.

^ If bubbles are detected at the rocker cover rails, new rocker cover gaskets (F3TZ-6584-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT ROCKER COVER RAILS, PROCEDURE C.

^ If bubbles are detected at the front end of the engine, a new front seal (E6TZ-6700-A) or oil pan gasket (FOTZ-6710-C) will be required. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT THE FRONT END, PROCEDURE D.

Service Procedure - Repair

REAR END OIL LEAK - PROCEDURE A



PROCEDURE A CONTINUED
STEP A4
F1
CONFIRMED LEAK BETWEEN OIL PAN AND REAR CAP AND/OR CYLINDER BLOCK
• REMOVE OIL PAN
• LEAVE REAR MAIN CAP IN PLACE
• LEAVE WEDGE SEAL IN PLACE
• LEAVE REAR SEAL IN PLACE
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
F2
CONFIRMED LEAK AT SPLIT LINE BETWEEN REAR CAP AND CYLINDER BLOCK
• REMOVE OIL PAN
• REMOVE REAR MAIN CAP
• REMOVE/REPLACE WEDGE SEAL
• REMOVE/REPLACE REAR SEAL
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
STEP A5
APPLY GASKET ELIMINATOR LOCTITE 515 (E1FZ-19562-A)
• BETWEEN JOINT FACES OF BLOCK AND CAP
• ON THE ENDS OF THE WEDGE SEAL
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
STEP A6
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
CAUTION: AVOID CONTACT OF UNCURED 598 WITH UNCURED 515
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
STEP A7
REASSEMBLE
• USE NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C); SEE FIGURE 10
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
REASSEMBLE
• REAR MAIN CAP
• NEW WEDGE SEAL
• NEW REAR OIL SEAL (D7RZ-6701-A)
• USE REAR OIL SEAL REPLACER (T72C-6165-R)
• NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C)
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
TB-3473-B
Figure 3

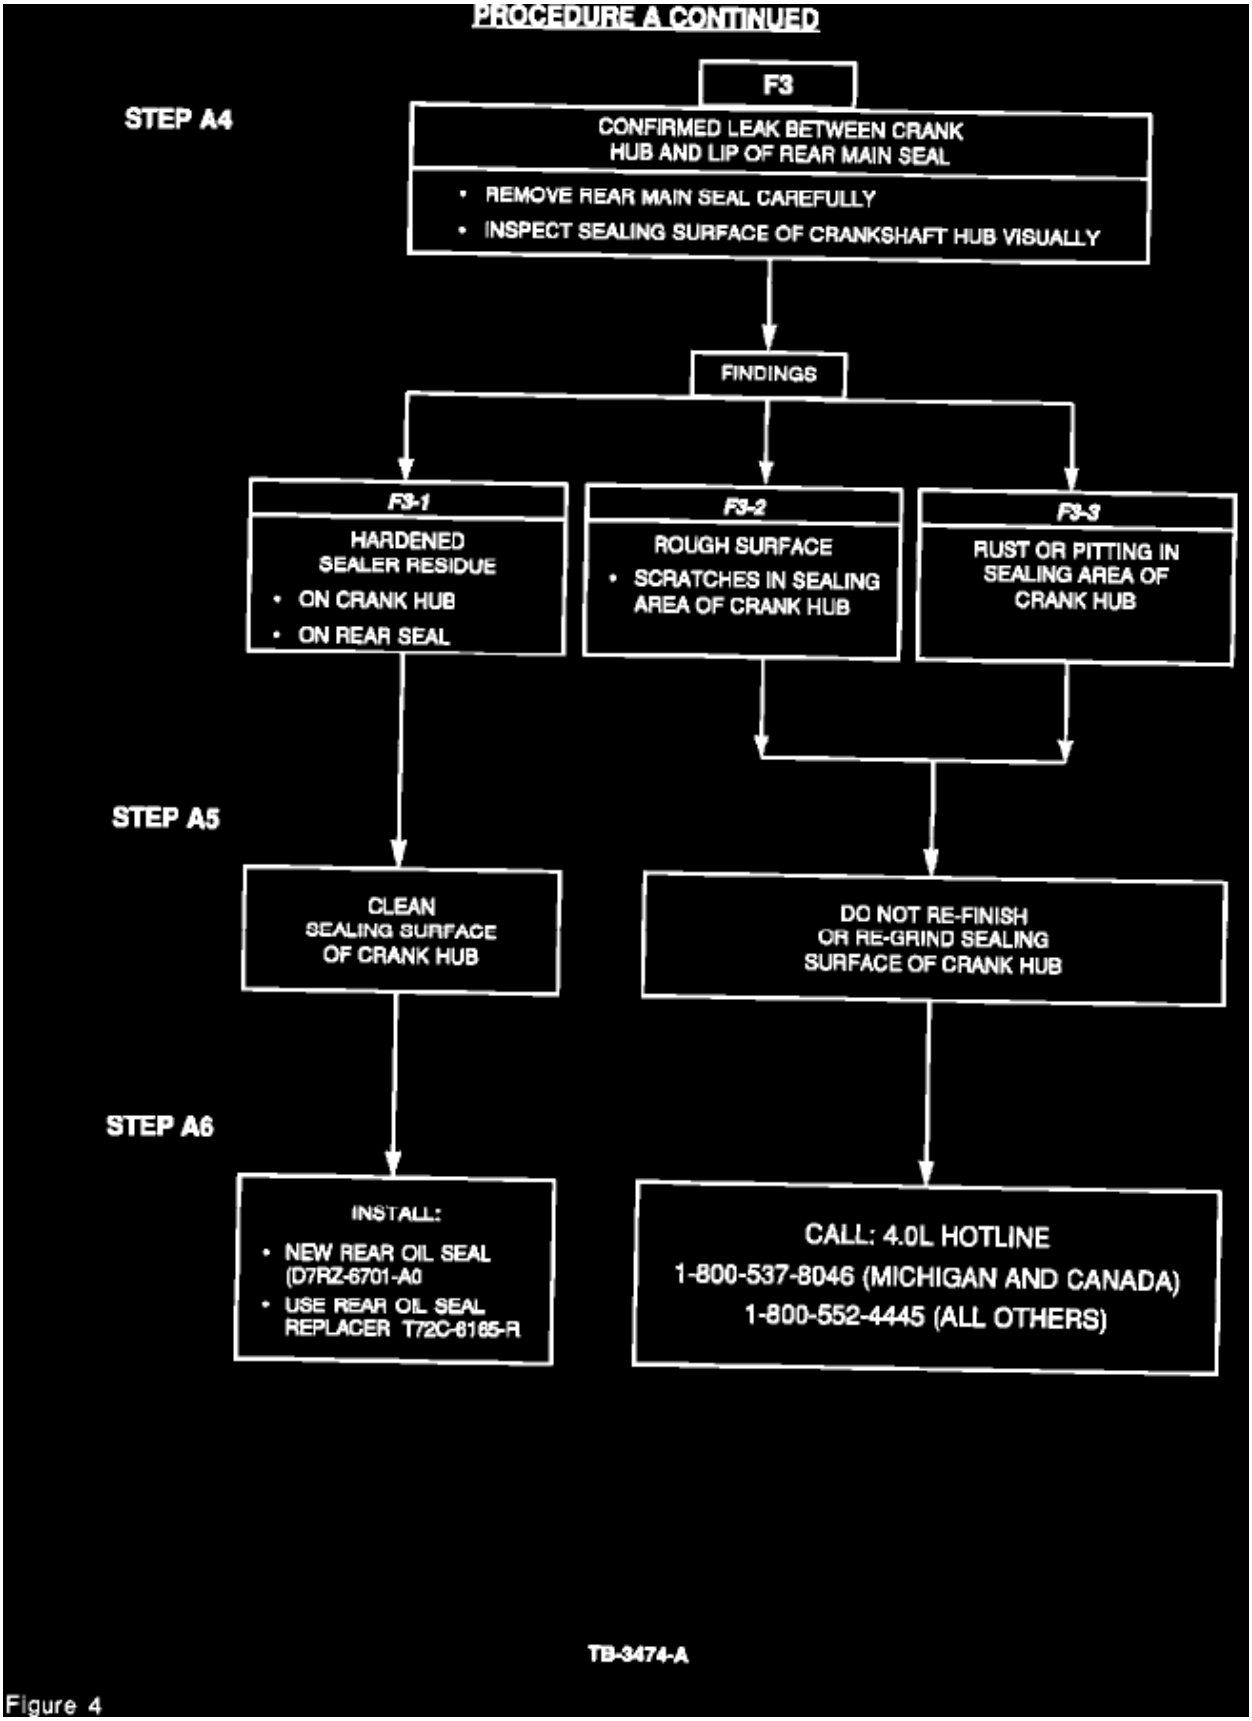


Figure 4

1. Repair procedure for a leak at oil pan gasket between the oil pan and cylinder block, or between the oil pan and the rear main cap. See block diagram Procedure A, Step A4/F1, Figures 3 and 4.

a. Remove the oil pan from the engine and remove the old gasket from the oil pan. Do not remove the rear main cap or wedge seal from the engine.

b. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

c. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap. Take special care to scrape/scratch all the old sealer from the exposed areas of the rear cap, wedge seal and cylinder block. This is a critical sealing area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER BLOCK.

d. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

e. Clean the transmission "BELLHOUSING" area, the rear of the cylinder block and the rear engine plate of ALL oil residue.

f. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corner of the radius areas at the front and rear of the oil pan.

g. Place the oil pan gasket (FOTZ-6710-C) in place in the groove in the oil pan.

h. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the corners where the rear main cap meets the cylinder block, at the corner areas of the radius area on the front cover and the front cover to cylinder block joint.

i. Set the oil pan in place and snug the four (4) pan nuts.

j. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .0100" (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

k. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

2. Repair procedure for a leak between the rear main cap and the cylinder block. See block diagram Procedure A, Step A4/F2.

a. Remove the oil pan, windage tray, oil pump and rear main cap from the engine.

b. Remove the rear main oil seal from the crankshaft and thoroughly inspect the main seal journal of the crankshaft for signs of rust, pitting, nicks or porosity.

c. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

d. Clean ALL the old sealer from the rear main bearing cap USING A SCRAPER AND WIRE WHEEL. The original Loctite sealer used during production assembly becomes extremely hard after it has cured. It is extremely important that ALL the old sealer be removed from the joint faces and grooves.

e. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap joint area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER

BLOCK.

f. Clean ALL the oil and old sealer from the "WEDGE SEAL" that fits around the rear main bearing cap in the oil pan gasket groove. Preferably use a new "WEDGE SEAL".

g. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

h. Clean the transmission "BELLHOUSING AREA", the rear of the cylinder block and the rear engine plate of ALL oil residue.

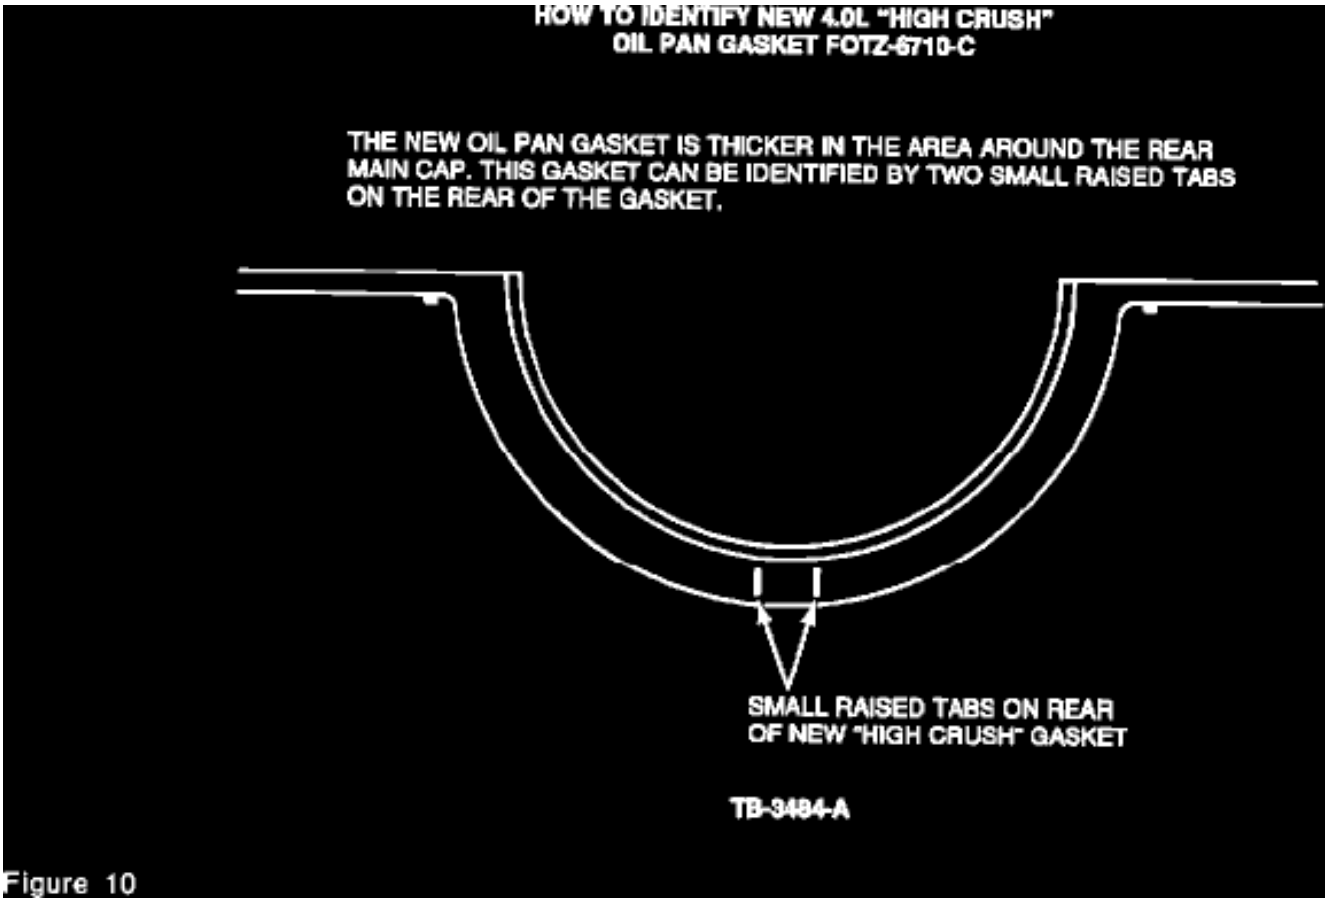

Figure 10

i. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) on the cylinder block along the corners of the rear main bearing cap joint area and on the joint face, approximately 1/2 inch (12.7 mm) from the rear of the block.

j. Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.

k. Align the rear main bearing cap to cylinder block by moving the bearing fore or aft (approx. 1/2 inch (12.7 mm) inward in the rear oil seal bore) so that the rear seal stop of the block and cap line up. This will assure that the rear main oil seal will seat squarely when installed in the bore.

l. Torque the rear main cap bolts to 66-77 lb.ft. (90-104 N-m).

m. Fill the cavities for the "WEDGE SEAL" on both sides of the rear main cap with Ford Gasket Eliminator (E1FZ-19562-A).

n. Place "WEDGE SEAL" in place and use a flat bladed screwdriver to fully seat the "WEDGE SEAL", forcing the excessive sealer out.

o. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) in the corners of the oil pan gasket groove of the rear main cap where the cap meets the cylinder block.

p. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) at the corner areas of the radius area on the front cover and at the front cover to cylinder block joint.

q. Reinstall the oil pump and windage tray. Torque to 13-15 lb.ft. (17-21 N-m).

r. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corners of the radius areas at the front and rear of the oil pan.

s. Place the oil pan gasket (FOTZ-6710-C), Figure 10, in place in the groove in the oil pan.

t. Set the oil pan in place and snug the four (4) oil pan bolts.

u. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .01000 (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

v. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

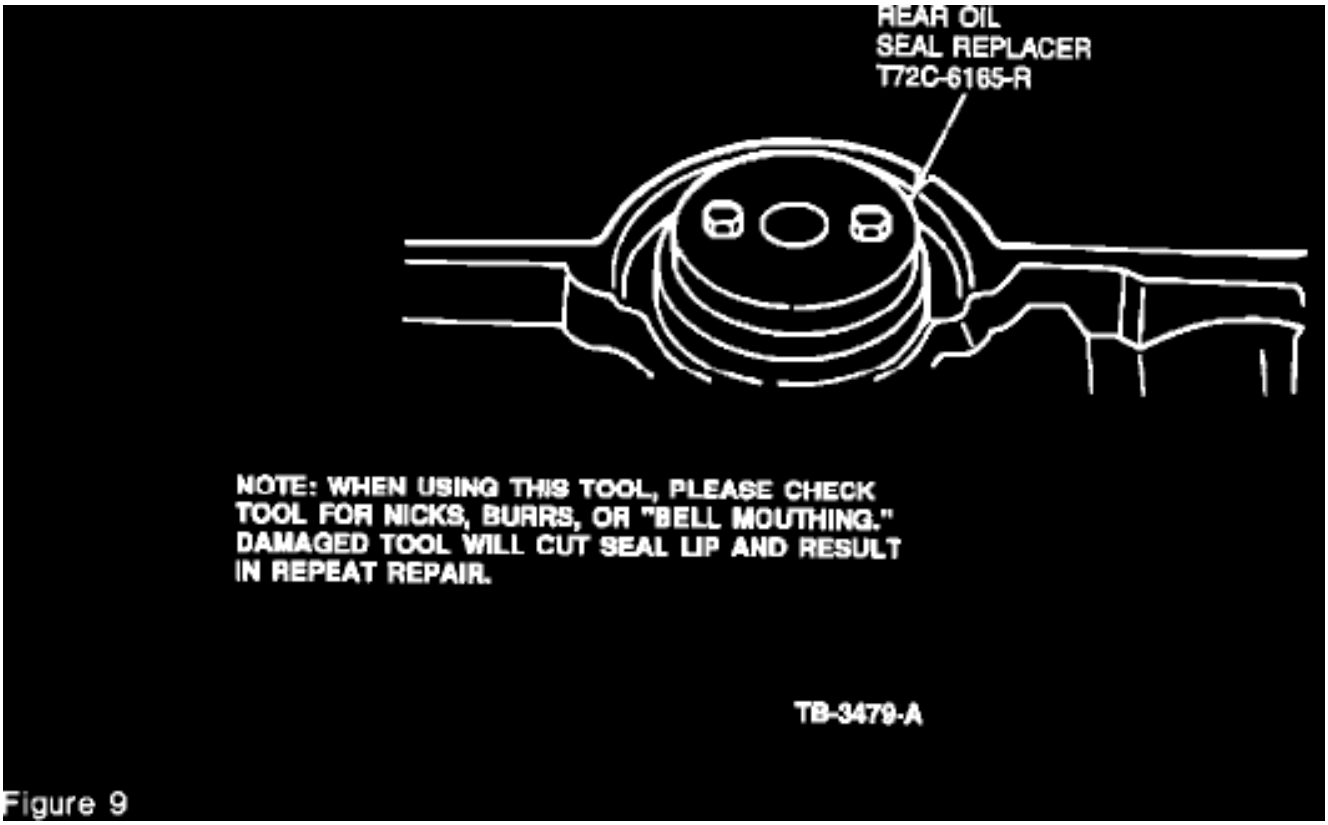

Figure 9

w. Coat the rear main oil seal (D7RZ-6701-A) with oil. Install the rear seal in the seal bore using Rear Oil Seal Replacer T72C-6165-R. This tool uses two flywheel bolts to draw the seal into position. Refer to Figure 9.

CAUTION:

DO NOT USE THE OLD STYLE HAMMER OPERATED TOOL.

3. Repair procedure for a leak between the rear main seal and the crankshaft. See block diagram, Procedure A, Step A4/F3.

a. Any presence of rust on the rear seal journal will cause a leak.

b. Any presence of pitting, porosity or nicks on the rear seal journal will cause a leak.

NOTE:

IF A LEAK IS PRESENT BETWEEN THE REAR MAIN SEAL AND CRANKSHAFT, PLEASE NOTIFY THE 4.0L "HOTLINE" AT (800) 537-8046 OR (800) 552-4445 PRIOR TO ANY ATTEMPT TO REPAIR THIS CONDITION.

Service Procedure - Repair For Oil Leaks At Intake Manifold

PROCEDURE B

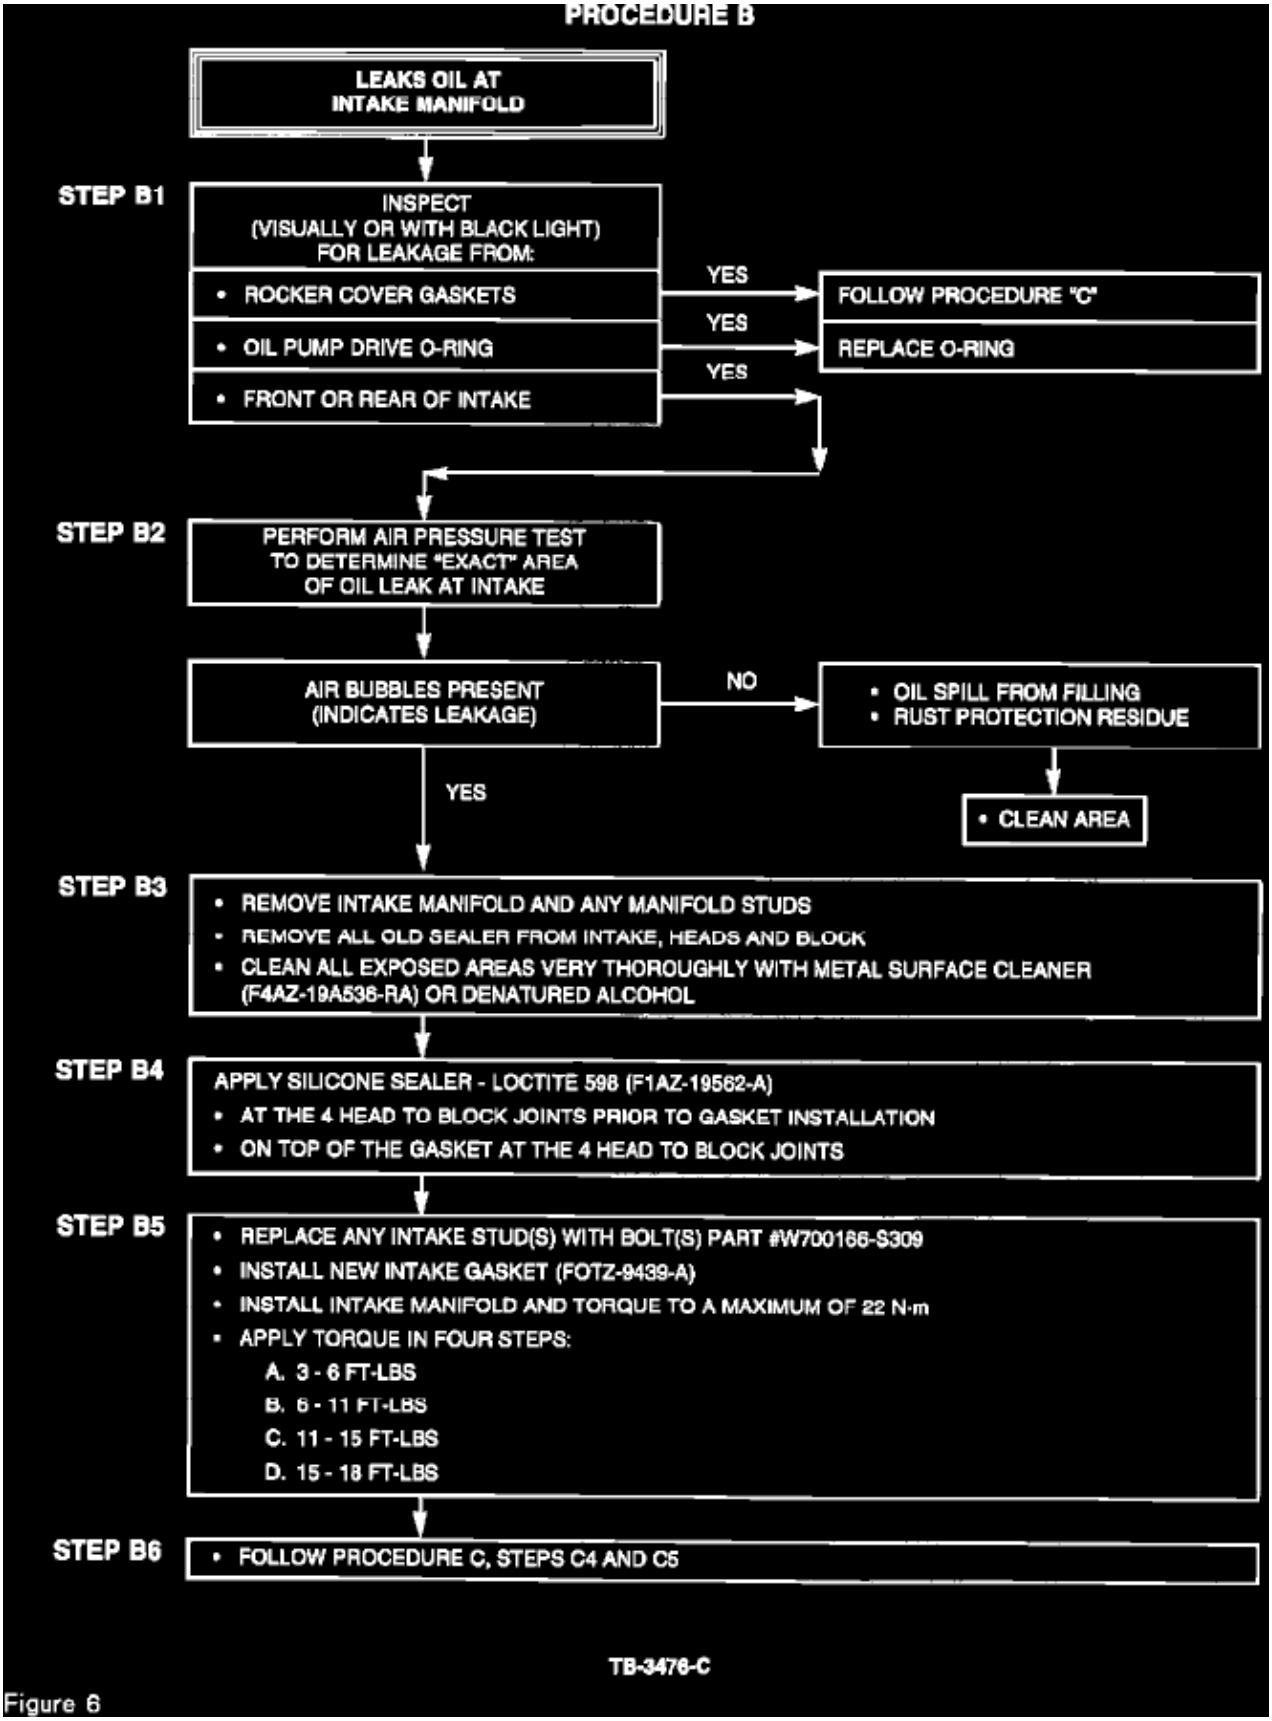

Figure 6

1. If the air pressure test showed no air bubbles, follow Procedure B2 to clean area of oil spill or other contamination.

2. If the air pressure test showed air bubbles present, follow Steps B3 through B6. Refer also to the Service Manual for the applicable year for further information pertinent to removal and installation of the intake manifold.

Service Procedure - Repair For Oil Leaks At Rocker Cover Rails

PROCEDURE C

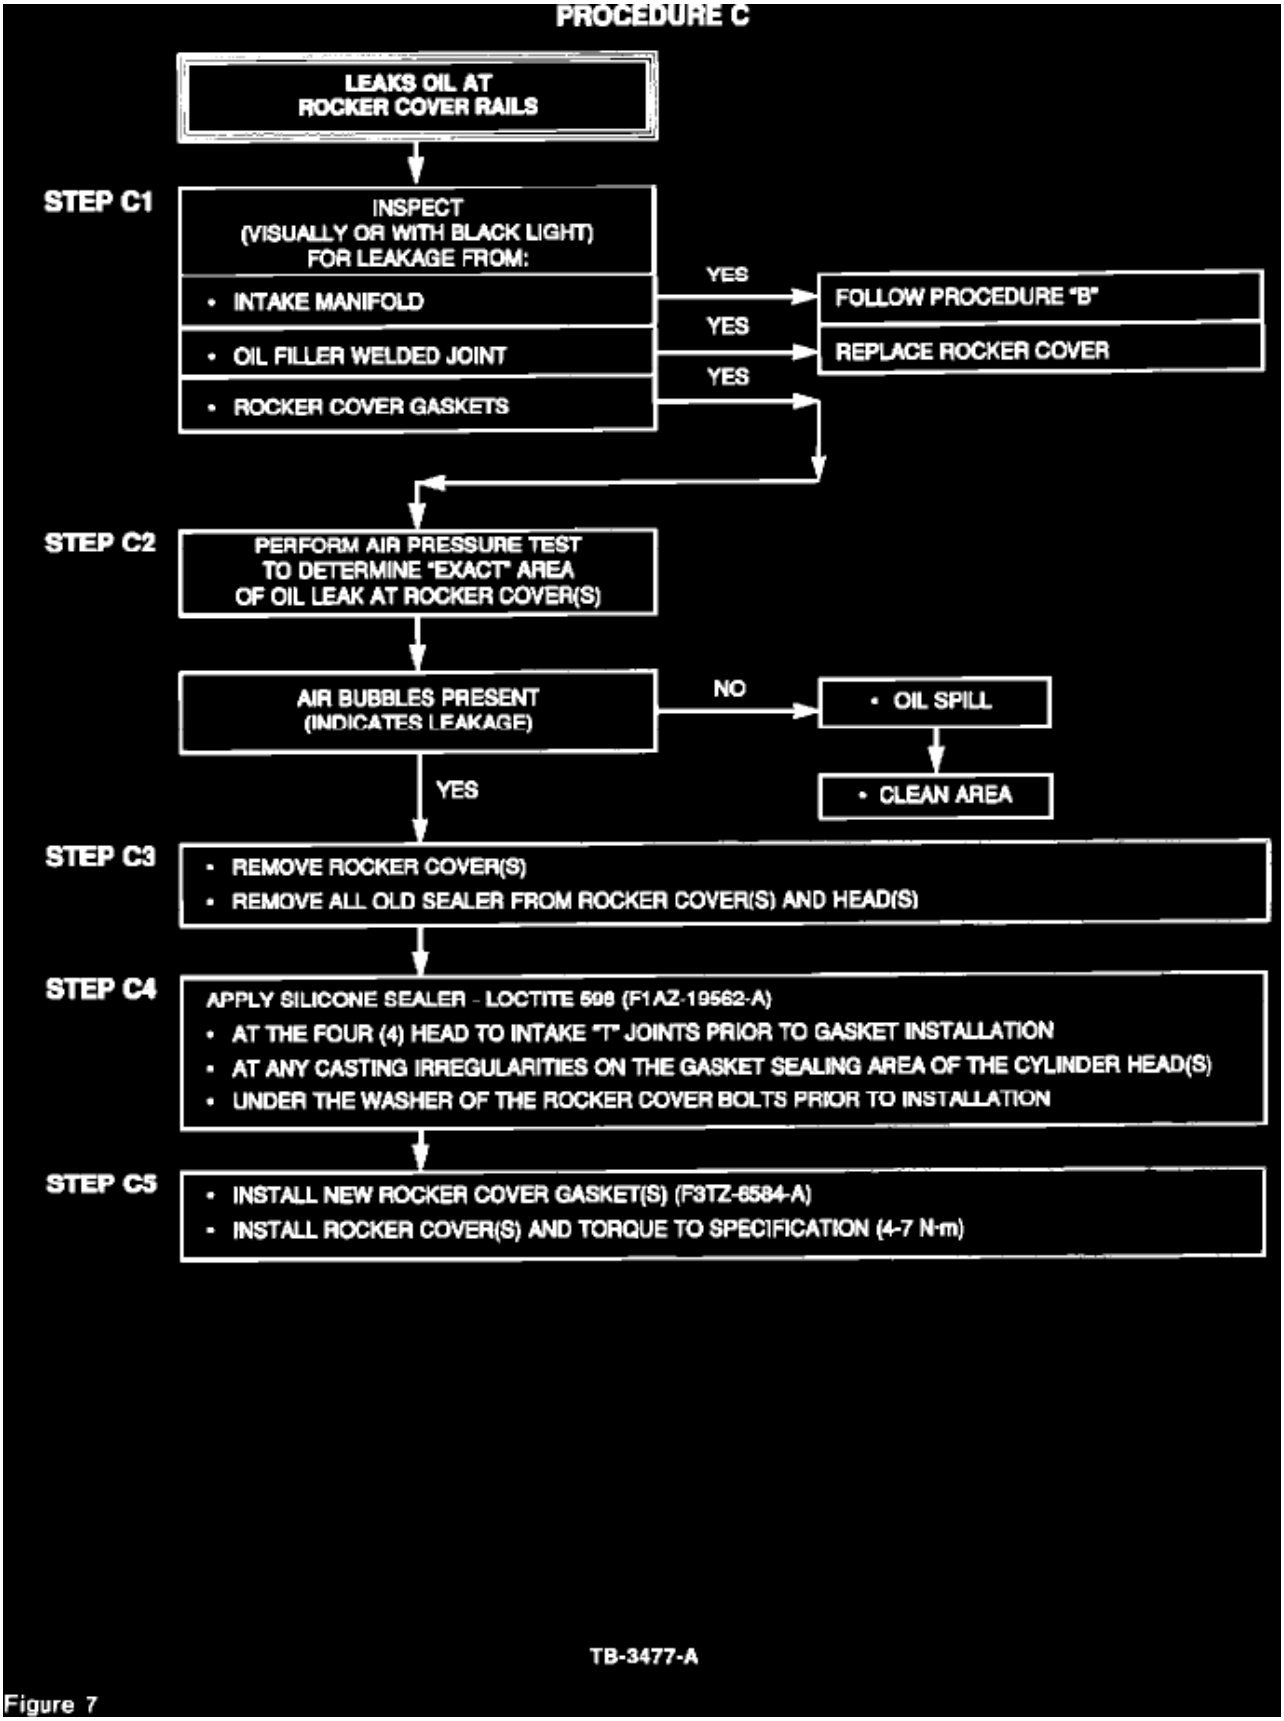

Figure 7

1. If the air pressure test showed no air bubbles, follow Procedure C2 to clean the area of any oil spill.

2. If the air pressure test showed air bubbles present, follow Steps C3 through C5.

Service Procedure - Repair For Oil Leaks At Front End

PROCEDURE D

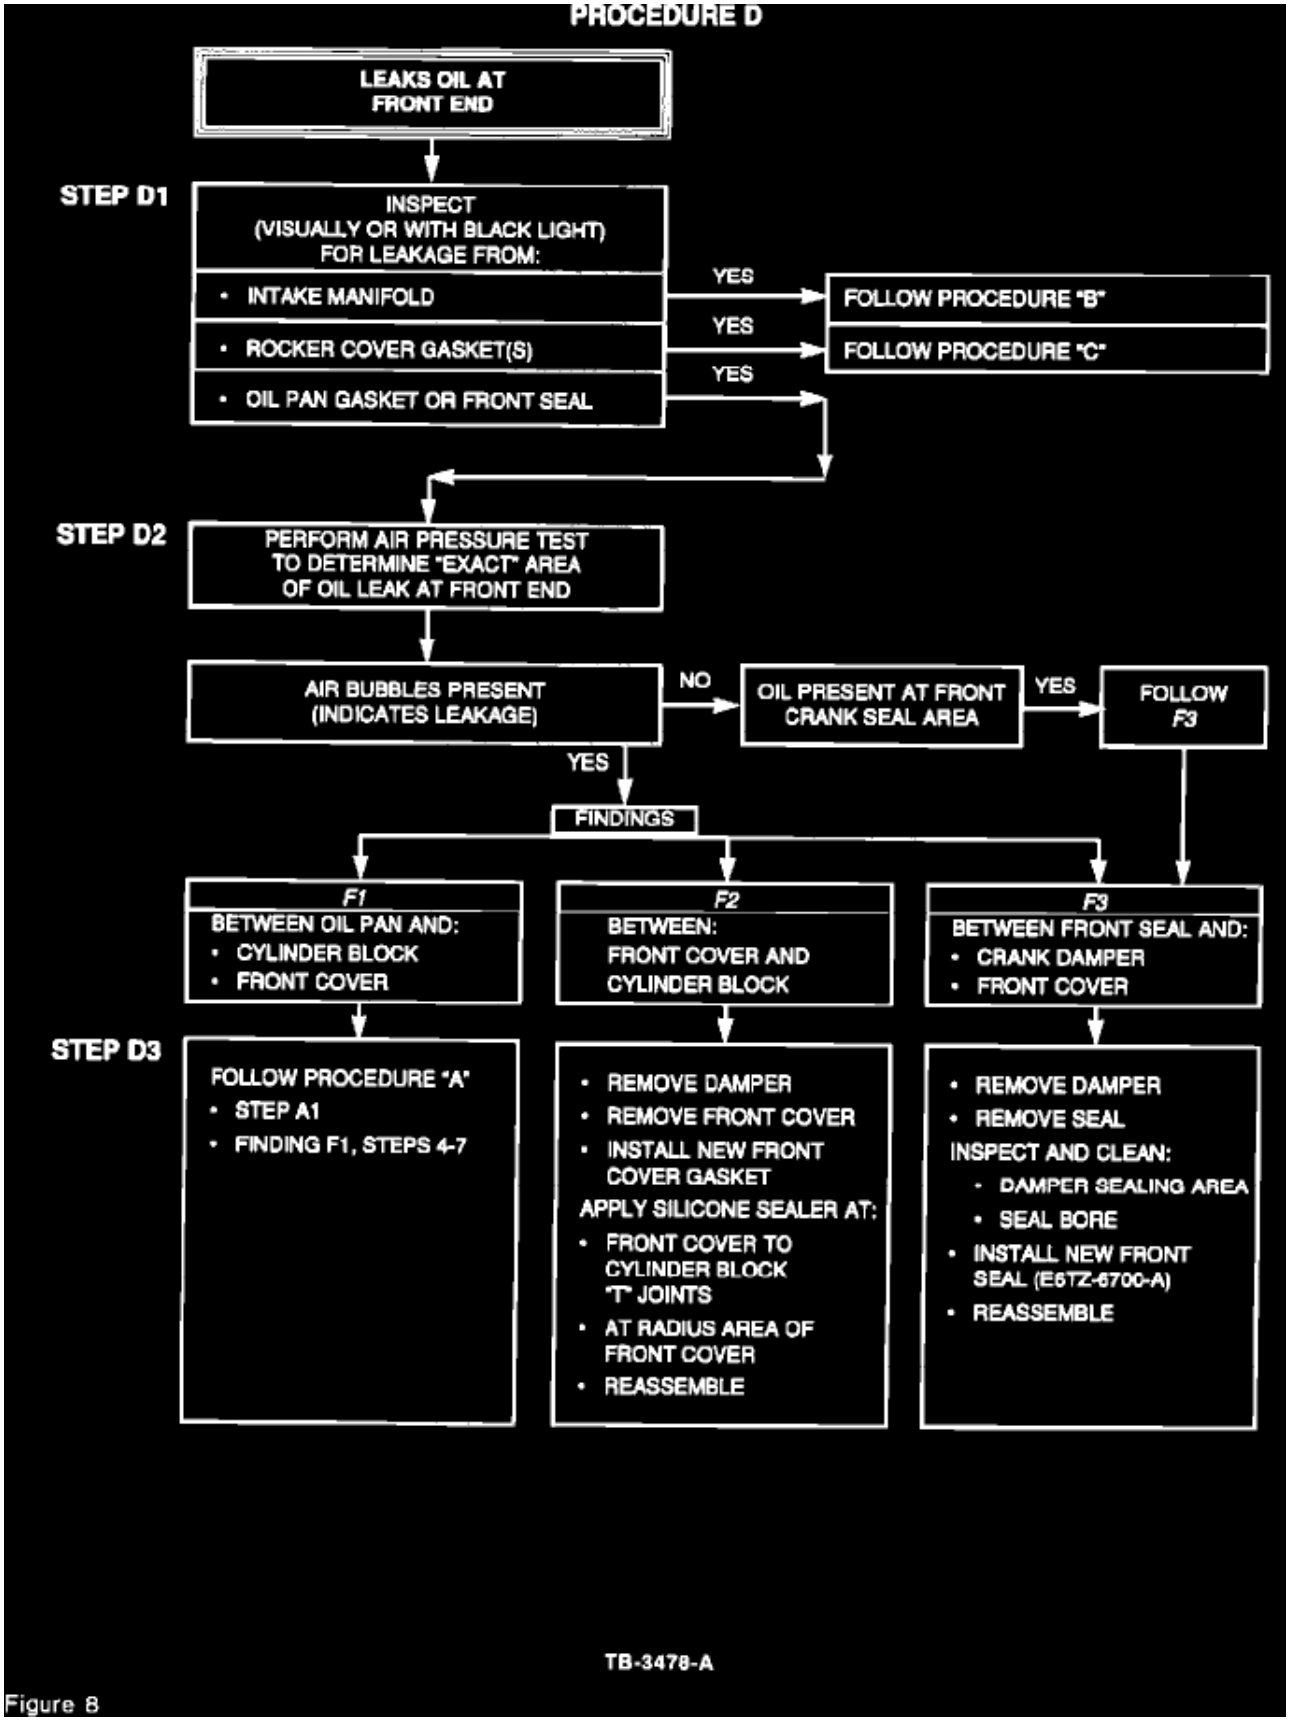

Figure 8

1. If the air pressure test showed no air bubbles, follow Procedure D, F3.

2. If the air pressure test showed air bubbles present, follow Procedure D, F1 or F2 as appropriate.

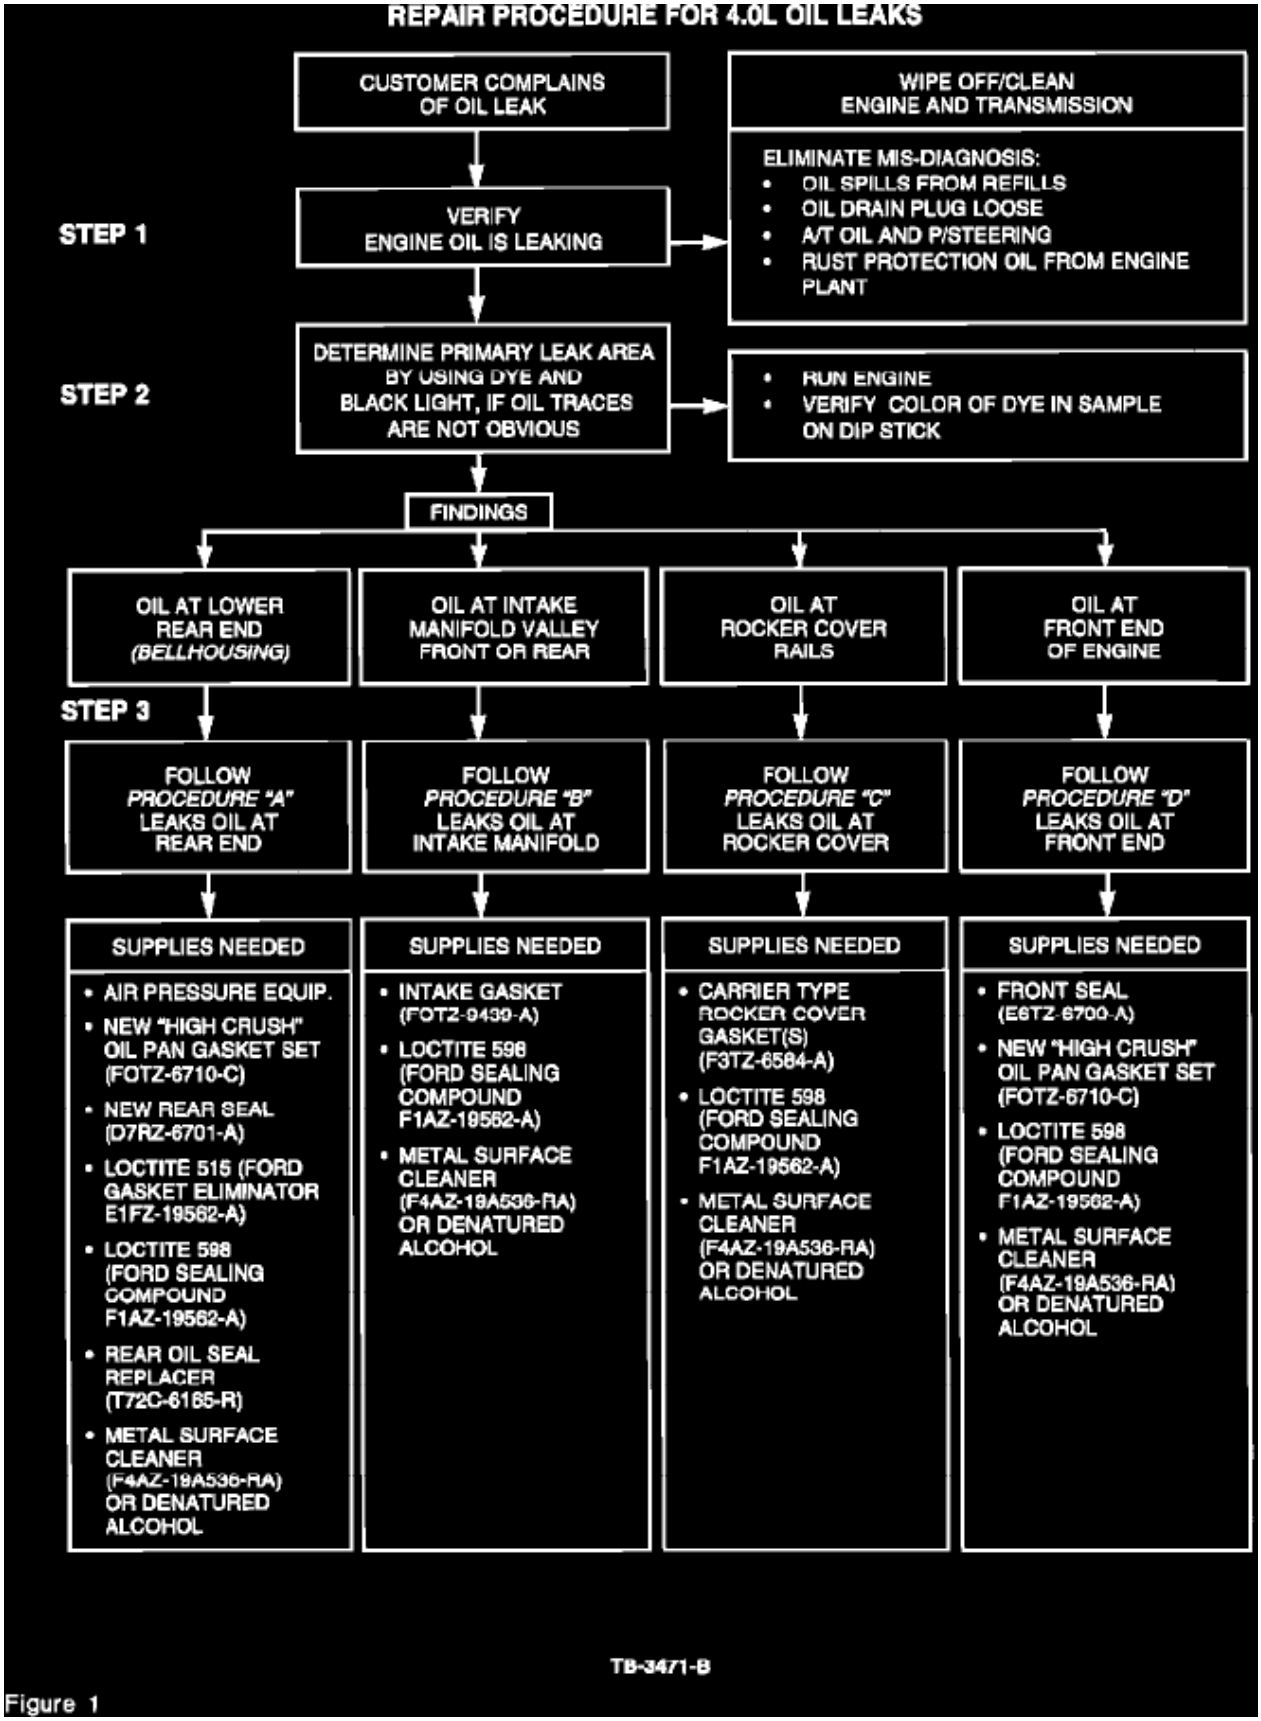

Figure 1

^ Intake Manifold

This article attempts to fully address all issues as one, in order to provide a diagnostic guide which leads to proper diagnosis and repair the first time. Use the following procedures to verify the location of the oil leak and perform the repair.

Service Procedure - Diagnosis

1. Perform Steps 1 and 2 of the block diagram shown in Figure 1. Perform a visual inspection to determine the general area of the oil leak.

2. After determining the "Findings" of Step 2, perform Step 3 by following Procedures A, B, C or D, whichever is appropriate, up to, but not including the air pressure test.

NOTE:

WHEN THE FINDINGS RESULT IN FOLLOWING PROCEDURE "A" FOR "LEAKS OIL AT REAR END", IT IS VERY IMPORTANT TO FOLLOW THE BLOCK DIAGRAM INSTRUCTIONS TO REMOVE THE TRANSMISSION, IF AN AEROSTAR, AND TO REMOVE THE ENGINE, IF AN EXPLORER/RANGER. THE PRACTICE OF REMOVING EXPLORER/RANGER OIL PANS WITH ENGINE IN VEHICLE CAN RESULT IN FAULTY DIAGNOSIS AND/OR REPAIR FOR THE PURPOSES OF THIS TSB.

If the leak has not been located and corrected at this point, then fabricate a device that is capable of applying a constant 1 to 3 psi of air pressure to the engine crankcase. The Rotunda Leak Tester 134-00003, or equivalent, which contains a pressure regulator and gauge capable of a 1 to 3 psi range, may be used.

3. Verify the location of the oil leak by pressurizing the engine crankcase with a constant supply of 3 psi of air pressure and the use of leak detection solution (liquid detergent and water). This process will verify the exact location of the leak. Dye and black light will verify a leak is present, but may not verify the exact location of the leak.

a. Assemble the necessary hose and fittings to connect an air pressure regulator and air pressure gauge to the shop air supply and to the engine crankcase through the dipstick tube.

b. Test the device to make sure 1-3 psi of air pressure can be maintained. Bursts of pressure over 3 psi can damage engine seals.

c. Before starting the test, make sure the regulator valve is completely closed so as not to accidentally apply a big burst of air to the engine when starting the test.

d. Attach the outlet (regulated) hose from the regulator/gauge device to the dipstick.

e. To trap air in the engine, plug any ports and passages (PCV valve, air inlet connection) that will allow air to escape.

f. Slowly open the regulator valve until 1-3 psi of air pressure registers on the gauge.

g. Keeping air pressure applied, brush or squirt a solution of liquid detergent and water or commercially available liquid leak detector (Snoop, Bubbles) to the primary area identified in Step 2 of the block diagram.

^ If the primary area is in the rear seal area, apply the solution to the rear seal, rear cap, rear cap to cylinder block and oil pan gasket areas.

Figure 2

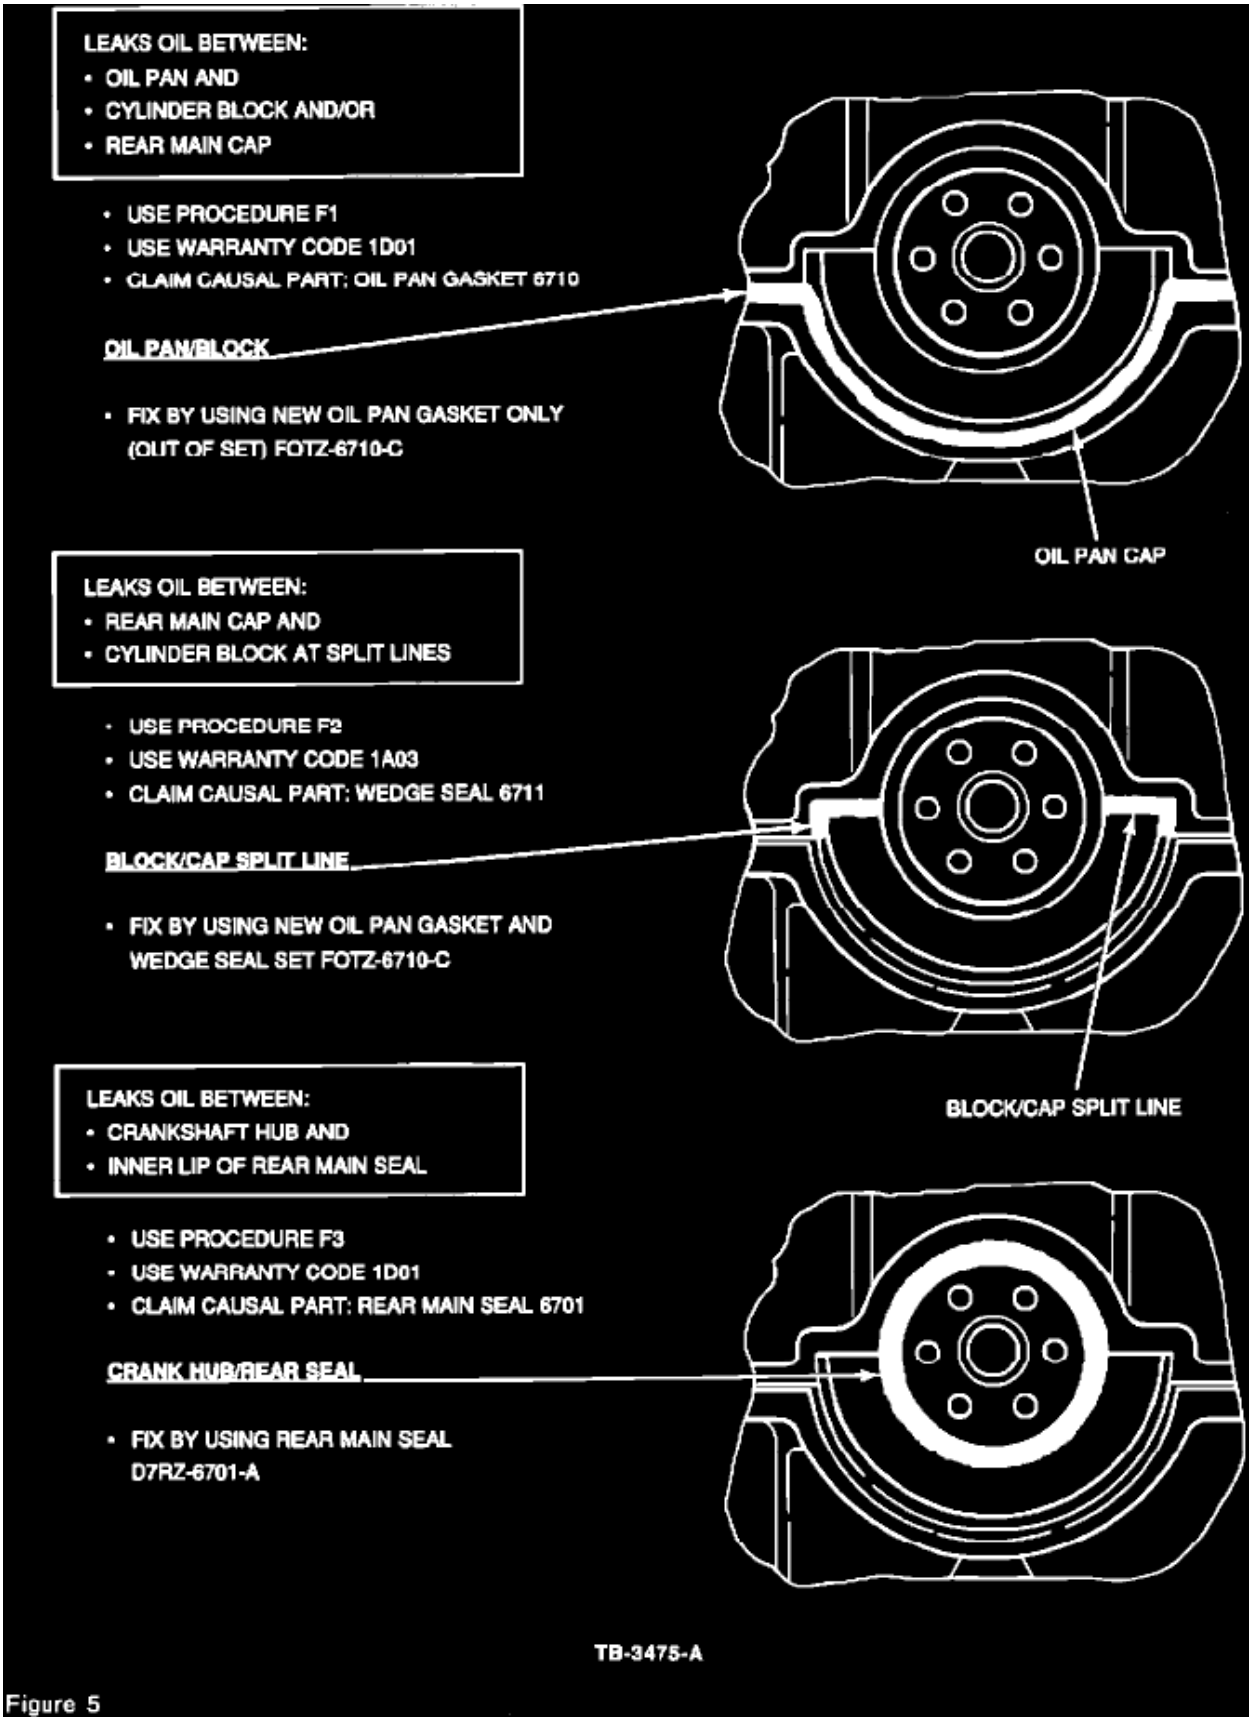

Figure 5

^ If bubbles are detected only at the oil pan gasket, between the oil pan and the cylinder block, or between the oil pan and the rear main cap, only the oil pan gasket needs replacing. Note

Procedure A, Figure 2, Step A3/F1, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A1.

^ If bubbles are detected between the rear main cap and the cylinder block, the rear cap must be removed and resealed. Note Procedure A, Figure 2, Step A3/F2, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A2.

^ If bubbles are detected between the rear seal lip and crank hub, a new rear oil seal will be required. Under certain circumstances, as outlined in the block diagram, it will be necessary to call the 4.OL Hotline. Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A3.

^ If no bubbles are detected, but oil is present in the area between the crank hub and the lip of the rear seal, carefully remove the seal and inspect the crankshaft rear seal journal. (A leak may occur

at the rear seal only when the engine is running.) Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Follow repair procedures outlined on the block diagram.

NOTE:

ANY APPEARANCE OF RUST, PITTING, POROSITY, OR NICKS ON THE REAR SEAL JOURNAL WILL CAUSE A LEAK.

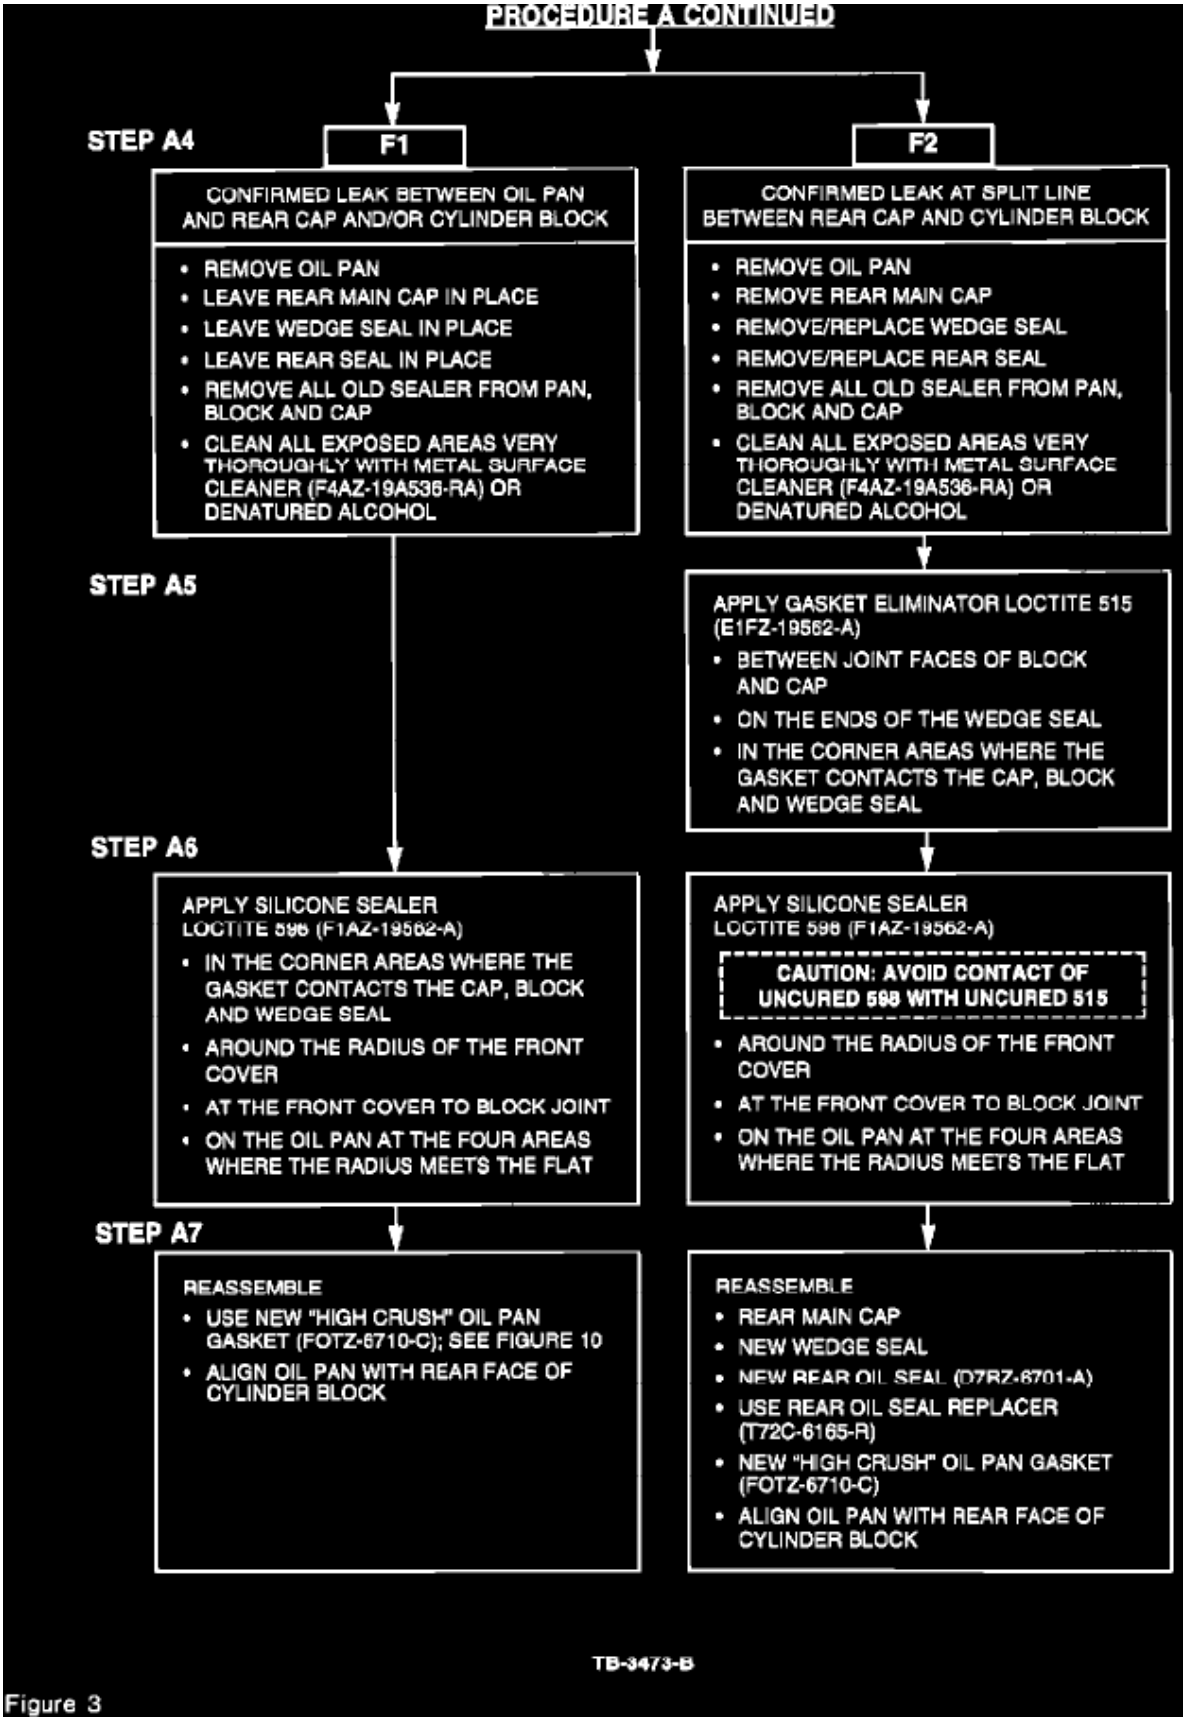
^ If bubbles are detected at the front or rear of the intake manifold gasket, a new intake manifold gasket (FOTZ-9439-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT INTAKE MANIFOLD, PROCEDURE B.

^ If bubbles are detected at the rocker cover rails, new rocker cover gaskets (F3TZ-6584-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT ROCKER COVER RAILS, PROCEDURE C.

^ If bubbles are detected at the front end of the engine, a new front seal (E6TZ-6700-A) or oil pan gasket (FOTZ-6710-C) will be required. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT THE FRONT END, PROCEDURE D.

Service Procedure - Repair

REAR END OIL LEAK - PROCEDURE A



PROCEDURE A CONTINUED
STEP A4
F1
CONFIRMED LEAK BETWEEN OIL PAN AND REAR CAP AND/OR CYLINDER BLOCK
• REMOVE OIL PAN
• LEAVE REAR MAIN CAP IN PLACE
• LEAVE WEDGE SEAL IN PLACE
• LEAVE REAR SEAL IN PLACE
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
F2
CONFIRMED LEAK AT SPLIT LINE BETWEEN REAR CAP AND CYLINDER BLOCK
• REMOVE OIL PAN
• REMOVE REAR MAIN CAP
• REMOVE/REPLACE WEDGE SEAL
• REMOVE/REPLACE REAR SEAL
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
STEP A5
APPLY GASKET ELIMINATOR LOCTITE 515 (E1FZ-19562-A)
• BETWEEN JOINT FACES OF BLOCK AND CAP
• ON THE ENDS OF THE WEDGE SEAL
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
STEP A6
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
CAUTION: AVOID CONTACT OF UNCURED 598 WITH UNCURED 515
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
STEP A7
REASSEMBLE
• USE NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C); SEE FIGURE 10
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
REASSEMBLE
• REAR MAIN CAP
• NEW WEDGE SEAL
• NEW REAR OIL SEAL (D7RZ-6701-A)
• USE REAR OIL SEAL REPLACER (T72C-6165-R)
• NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C)
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
TB-3473-B
Figure 3

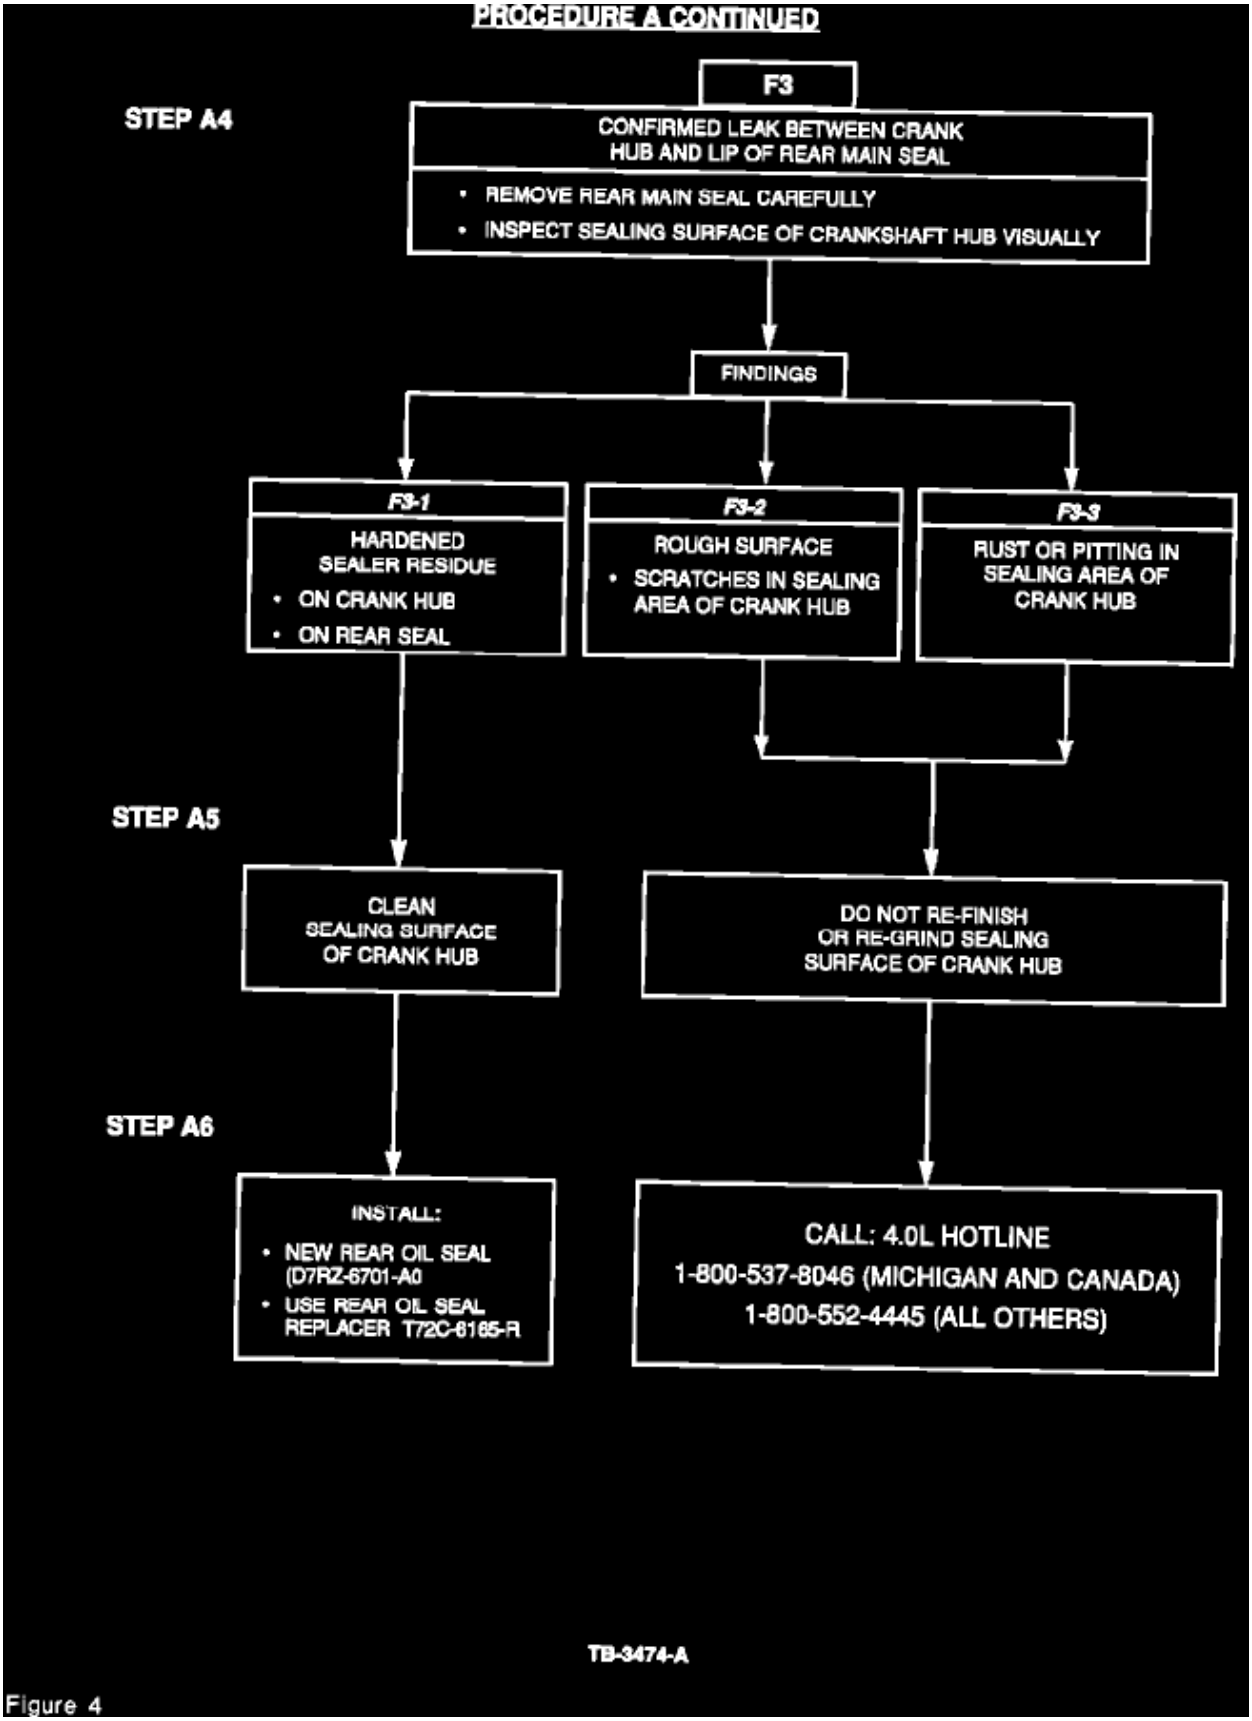


Figure 4

1. Repair procedure for a leak at oil pan gasket between the oil pan and cylinder block, or between the oil pan and the rear main cap. See block diagram Procedure A, Step A4/F1, Figures 3 and 4.

a. Remove the oil pan from the engine and remove the old gasket from the oil pan. Do not remove the rear main cap or wedge seal from the engine.

b. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

c. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap. Take special care to scrape/scratch all the old sealer from the exposed areas of the rear cap, wedge seal and cylinder block. This is a critical sealing area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER BLOCK.

d. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

e. Clean the transmission "BELLHOUSING" area, the rear of the cylinder block and the rear engine plate of ALL oil residue.

f. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corner of the radius areas at the front and rear of the oil pan.

g. Place the oil pan gasket (FOTZ-6710-C) in place in the groove in the oil pan.

h. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the corners where the rear main cap meets the cylinder block, at the corner areas of the radius area on the front cover and the front cover to cylinder block joint.

i. Set the oil pan in place and snug the four (4) pan nuts.

j. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .0100" (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

k. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

2. Repair procedure for a leak between the rear main cap and the cylinder block. See block diagram Procedure A, Step A4/F2.

a. Remove the oil pan, windage tray, oil pump and rear main cap from the engine.

b. Remove the rear main oil seal from the crankshaft and thoroughly inspect the main seal journal of the crankshaft for signs of rust, pitting, nicks or porosity.

c. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

d. Clean ALL the old sealer from the rear main bearing cap USING A SCRAPER AND WIRE WHEEL. The original Loctite sealer used during production assembly becomes extremely hard after it has cured. It is extremely important that ALL the old sealer be removed from the joint faces and grooves.

e. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap joint area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER

BLOCK.

f. Clean ALL the oil and old sealer from the "WEDGE SEAL" that fits around the rear main bearing cap in the oil pan gasket groove. Preferably use a new "WEDGE SEAL".

g. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

h. Clean the transmission "BELLHOUSING AREA", the rear of the cylinder block and the rear engine plate of ALL oil residue.

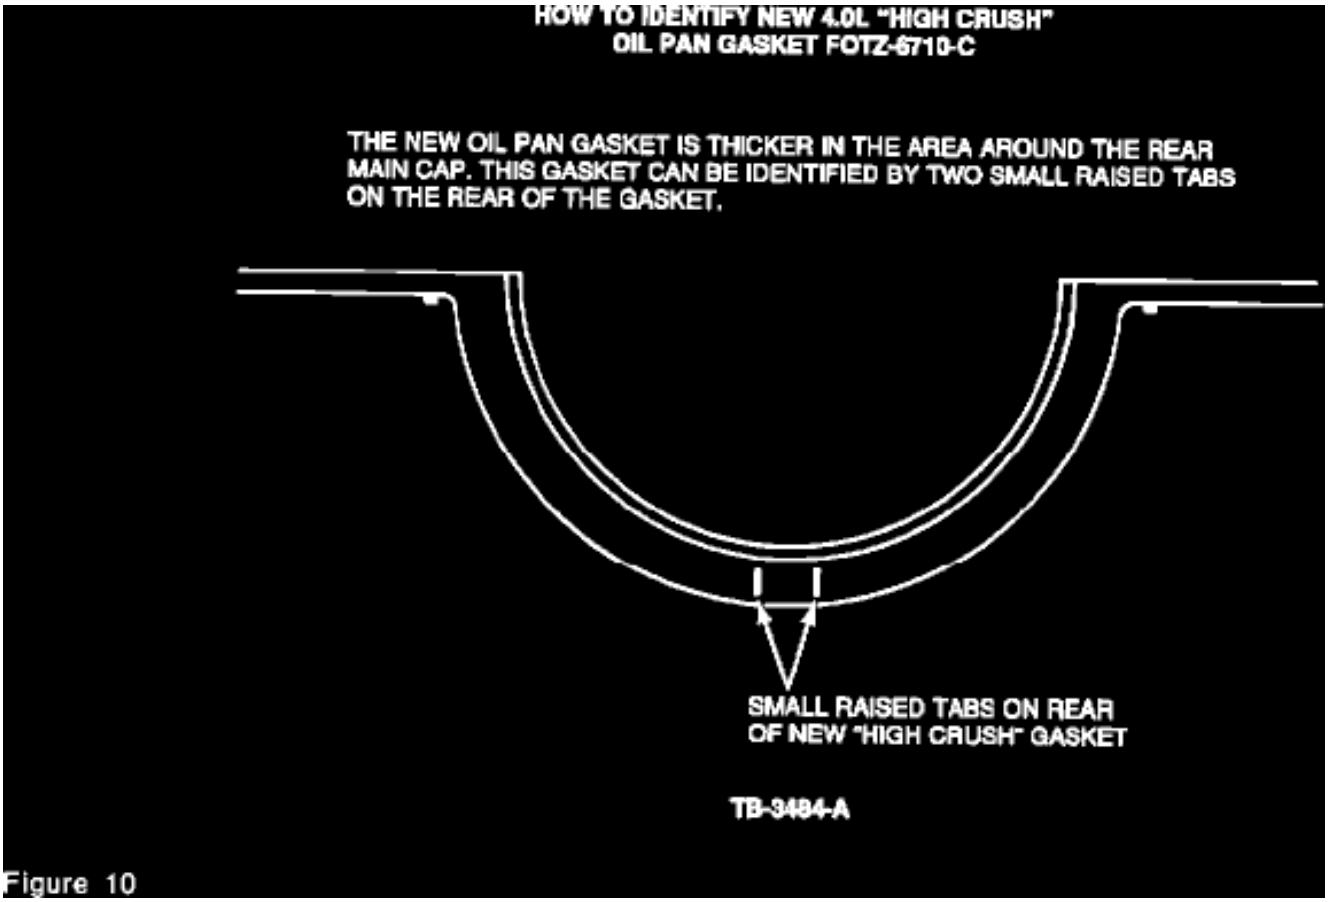

Figure 10

i. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) on the cylinder block along the corners of the rear main bearing cap joint area and on the joint face, approximately 1/2 inch (12.7 mm) from the rear of the block.

j. Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.

k. Align the rear main bearing cap to cylinder block by moving the bearing fore or aft (approx. 1/2 inch (12.7 mm) inward in the rear oil seal bore) so that the rear seal stop of the block and cap line up. This will assure that the rear main oil seal will seat squarely when installed in the bore.

l. Torque the rear main cap bolts to 66-77 lb.ft. (90-104 N-m).

m. Fill the cavities for the "WEDGE SEAL" on both sides of the rear main cap with Ford Gasket Eliminator (E1FZ-19562-A).

n. Place "WEDGE SEAL" in place and use a flat bladed screwdriver to fully seat the "WEDGE SEAL", forcing the excessive sealer out.

o. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) in the corners of the oil pan gasket groove of the rear main cap where the cap meets the cylinder block.

p. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) at the corner areas of the radius area on the front cover and at the front cover to cylinder block joint.

q. Reinstall the oil pump and windage tray. Torque to 13-15 lb.ft. (17-21 N-m).

r. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corners of the radius areas at the front and rear of the oil pan.

s. Place the oil pan gasket (FOTZ-6710-C), Figure 10, in place in the groove in the oil pan.

t. Set the oil pan in place and snug the four (4) oil pan bolts.

u. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .01000 (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

v. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

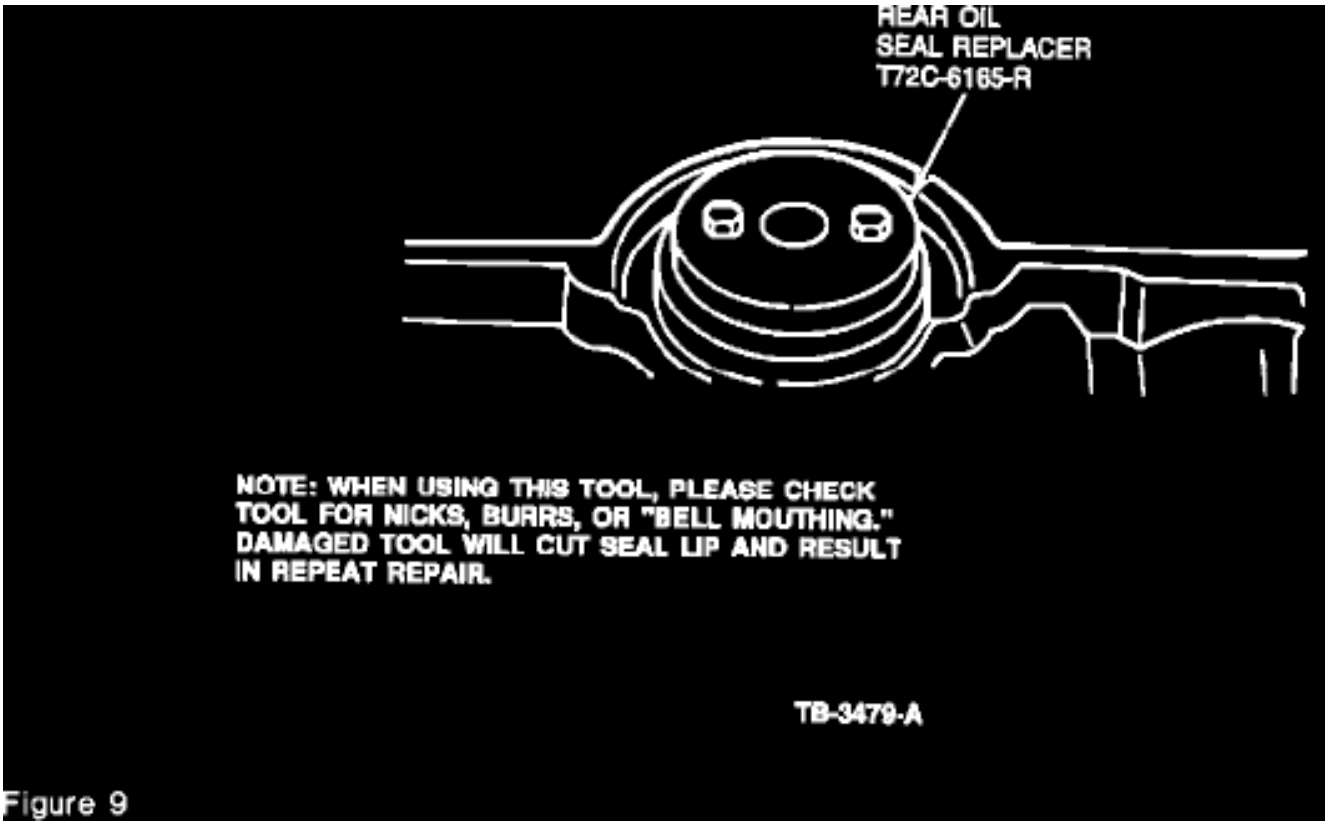

Figure 9

w. Coat the rear main oil seal (D7RZ-6701-A) with oil. Install the rear seal in the seal bore using Rear Oil Seal Replacer T72C-6165-R. This tool uses two flywheel bolts to draw the seal into position. Refer to Figure 9.

CAUTION:

DO NOT USE THE OLD STYLE HAMMER OPERATED TOOL.

3. Repair procedure for a leak between the rear main seal and the crankshaft. See block diagram, Procedure A, Step A4/F3.

a. Any presence of rust on the rear seal journal will cause a leak.

b. Any presence of pitting, porosity or nicks on the rear seal journal will cause a leak.

NOTE:

IF A LEAK IS PRESENT BETWEEN THE REAR MAIN SEAL AND CRANKSHAFT, PLEASE NOTIFY THE 4.0L "HOTLINE" AT (800) 537-8046 OR (800) 552-4445 PRIOR TO ANY ATTEMPT TO REPAIR THIS CONDITION.

Service Procedure - Repair For Oil Leaks At Intake Manifold

PROCEDURE B

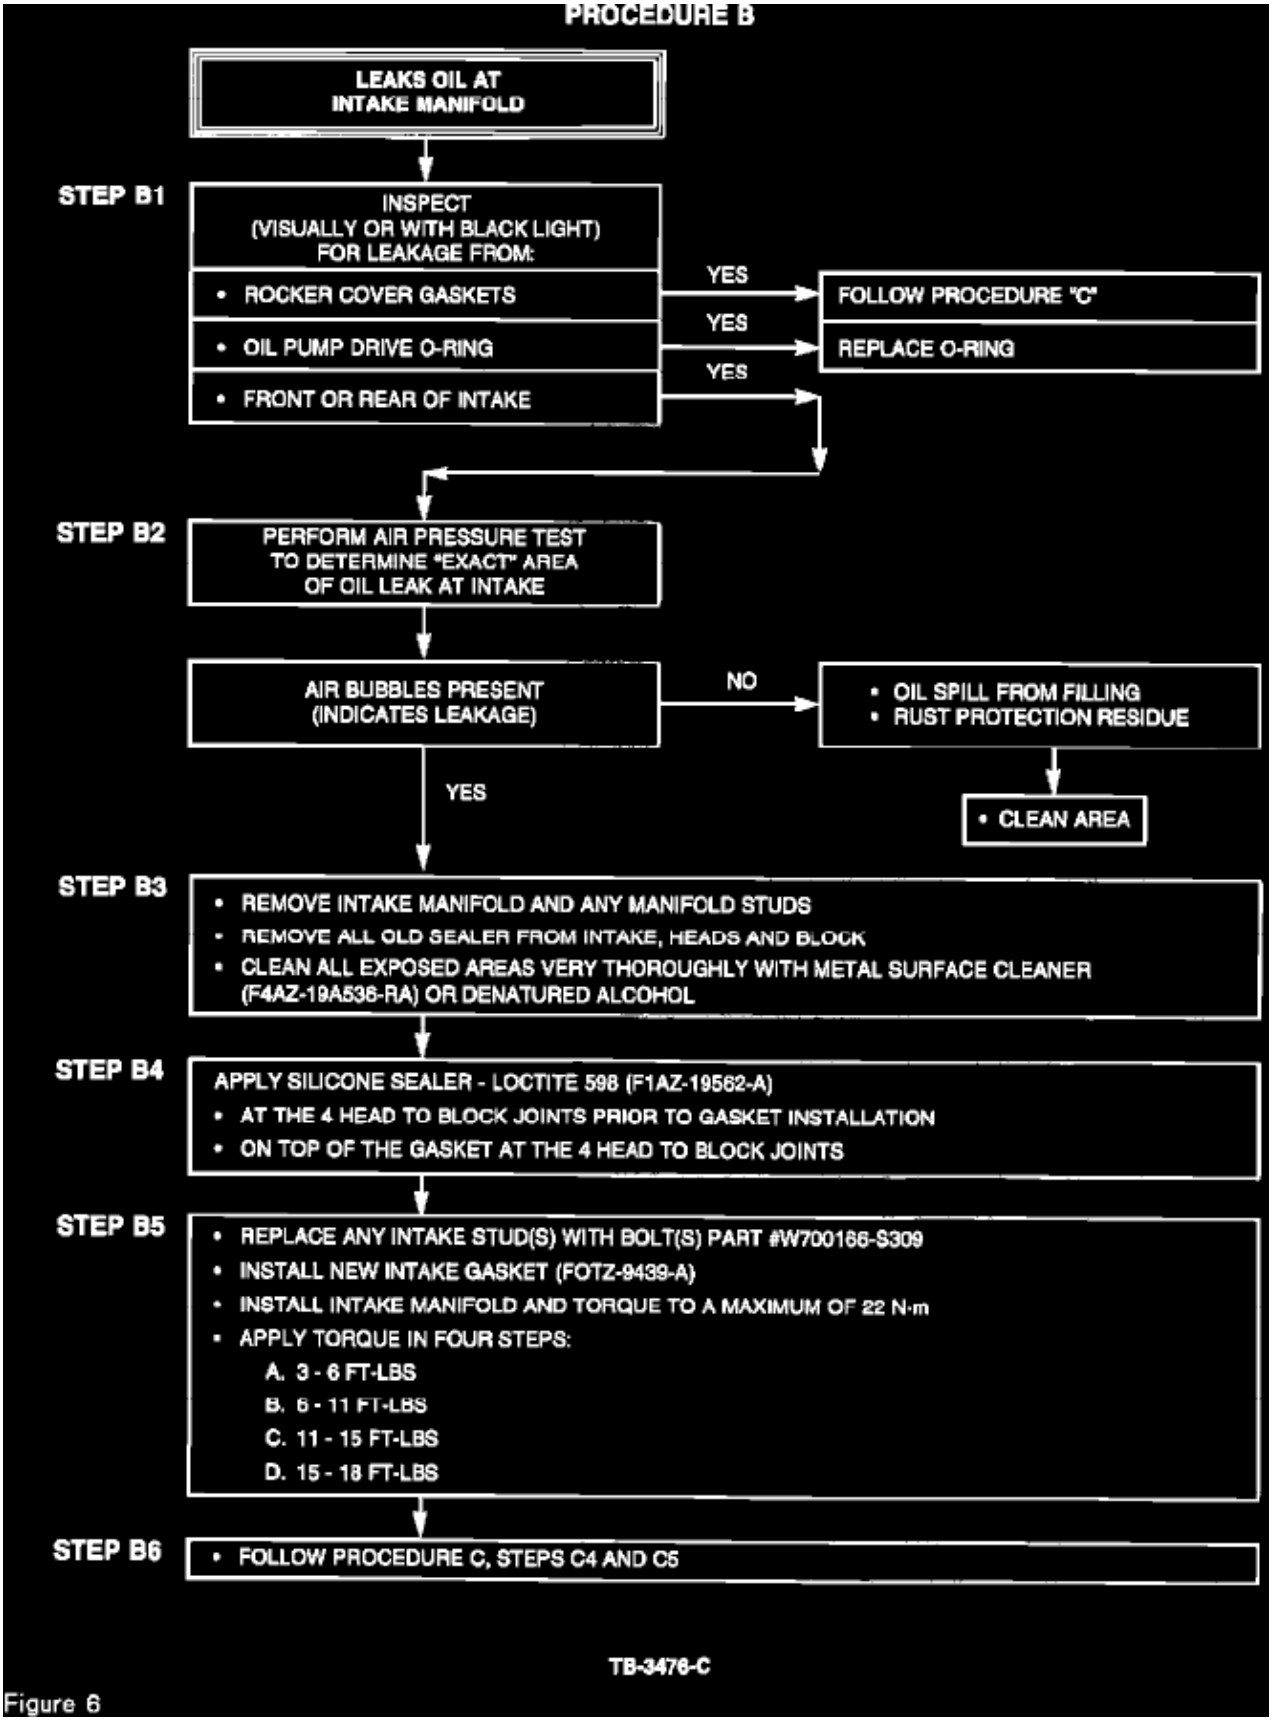

Figure 6

1. If the air pressure test showed no air bubbles, follow Procedure B2 to clean area of oil spill or other contamination.

2. If the air pressure test showed air bubbles present, follow Steps B3 through B6. Refer also to the Service Manual for the applicable year for further information pertinent to removal and installation of the intake manifold.

Service Procedure - Repair For Oil Leaks At Rocker Cover Rails

PROCEDURE C

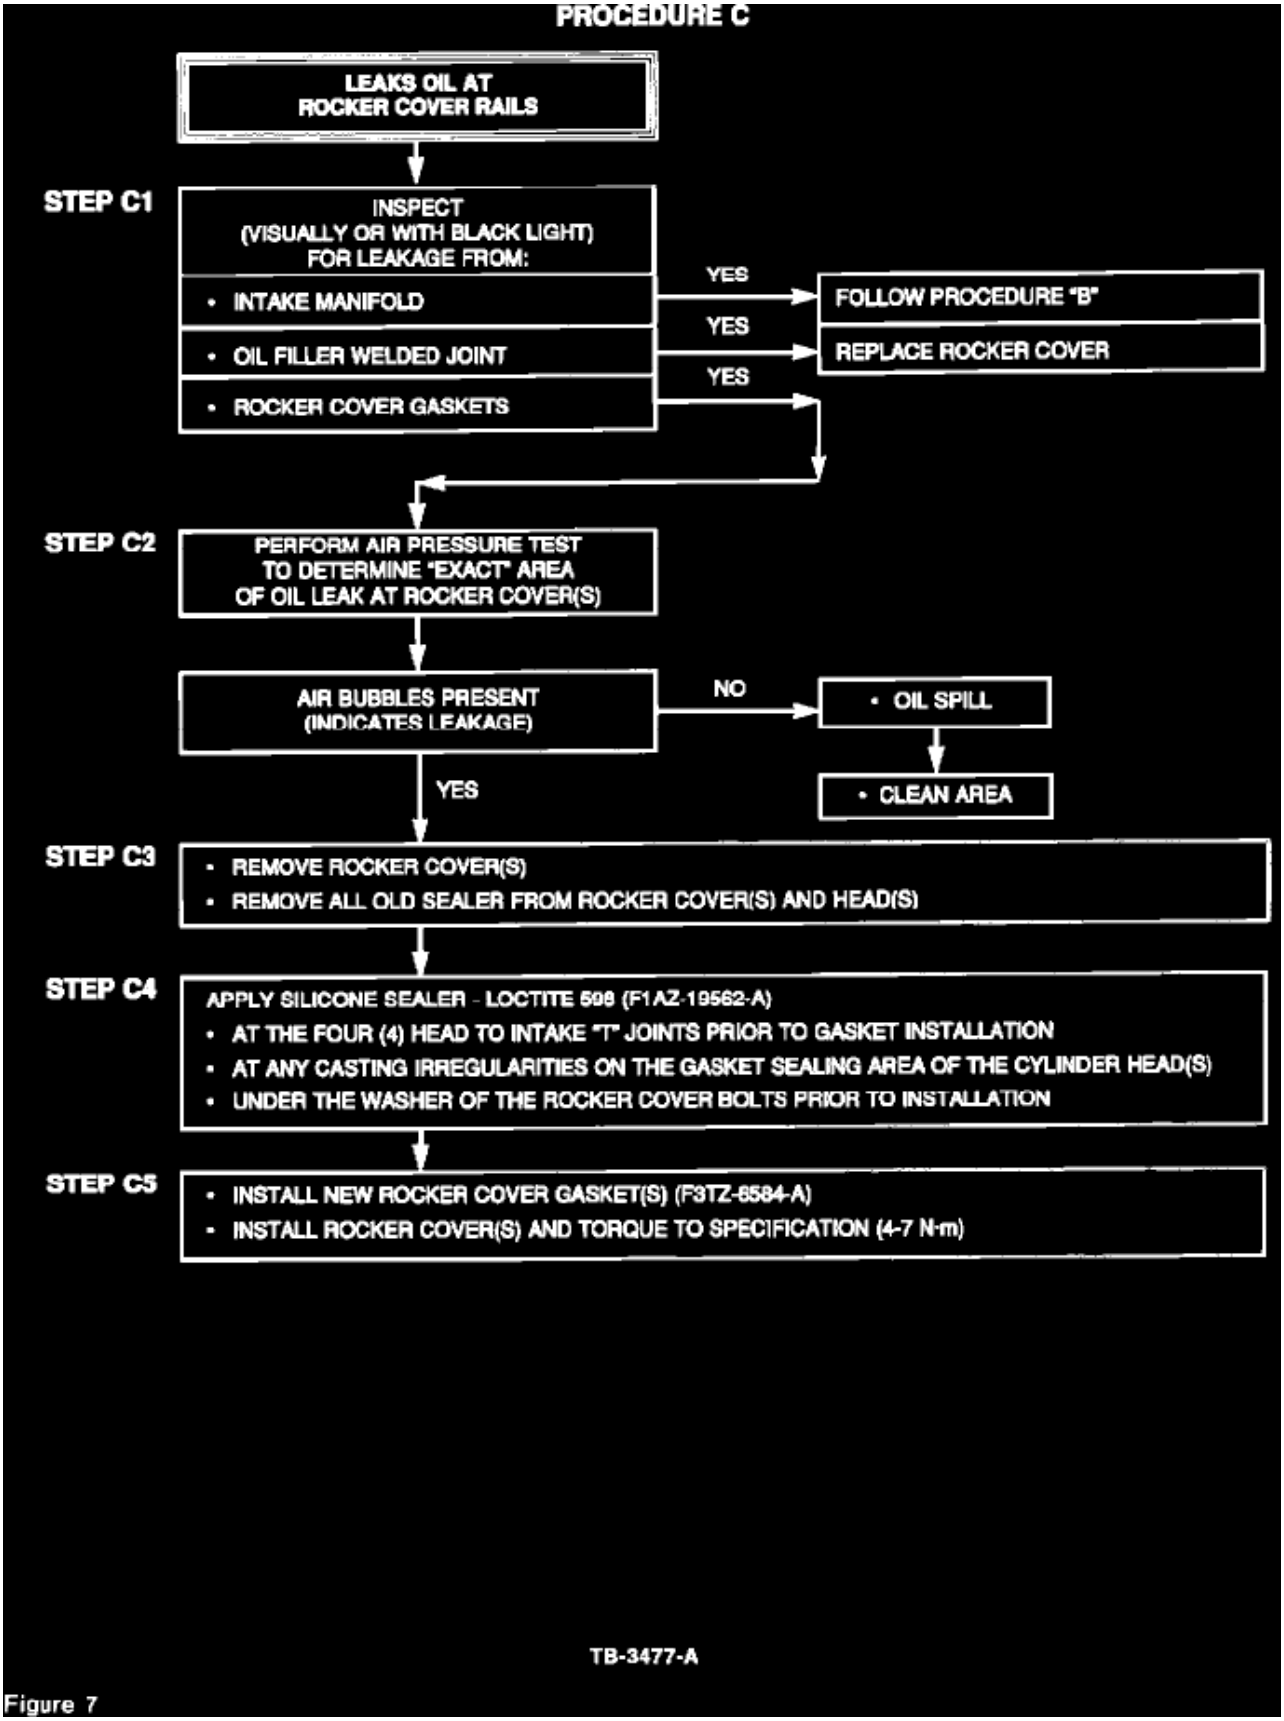

Figure 7

1. If the air pressure test showed no air bubbles, follow Procedure C2 to clean the area of any oil spill.

2. If the air pressure test showed air bubbles present, follow Steps C3 through C5.

Service Procedure - Repair For Oil Leaks At Front End

PROCEDURE D

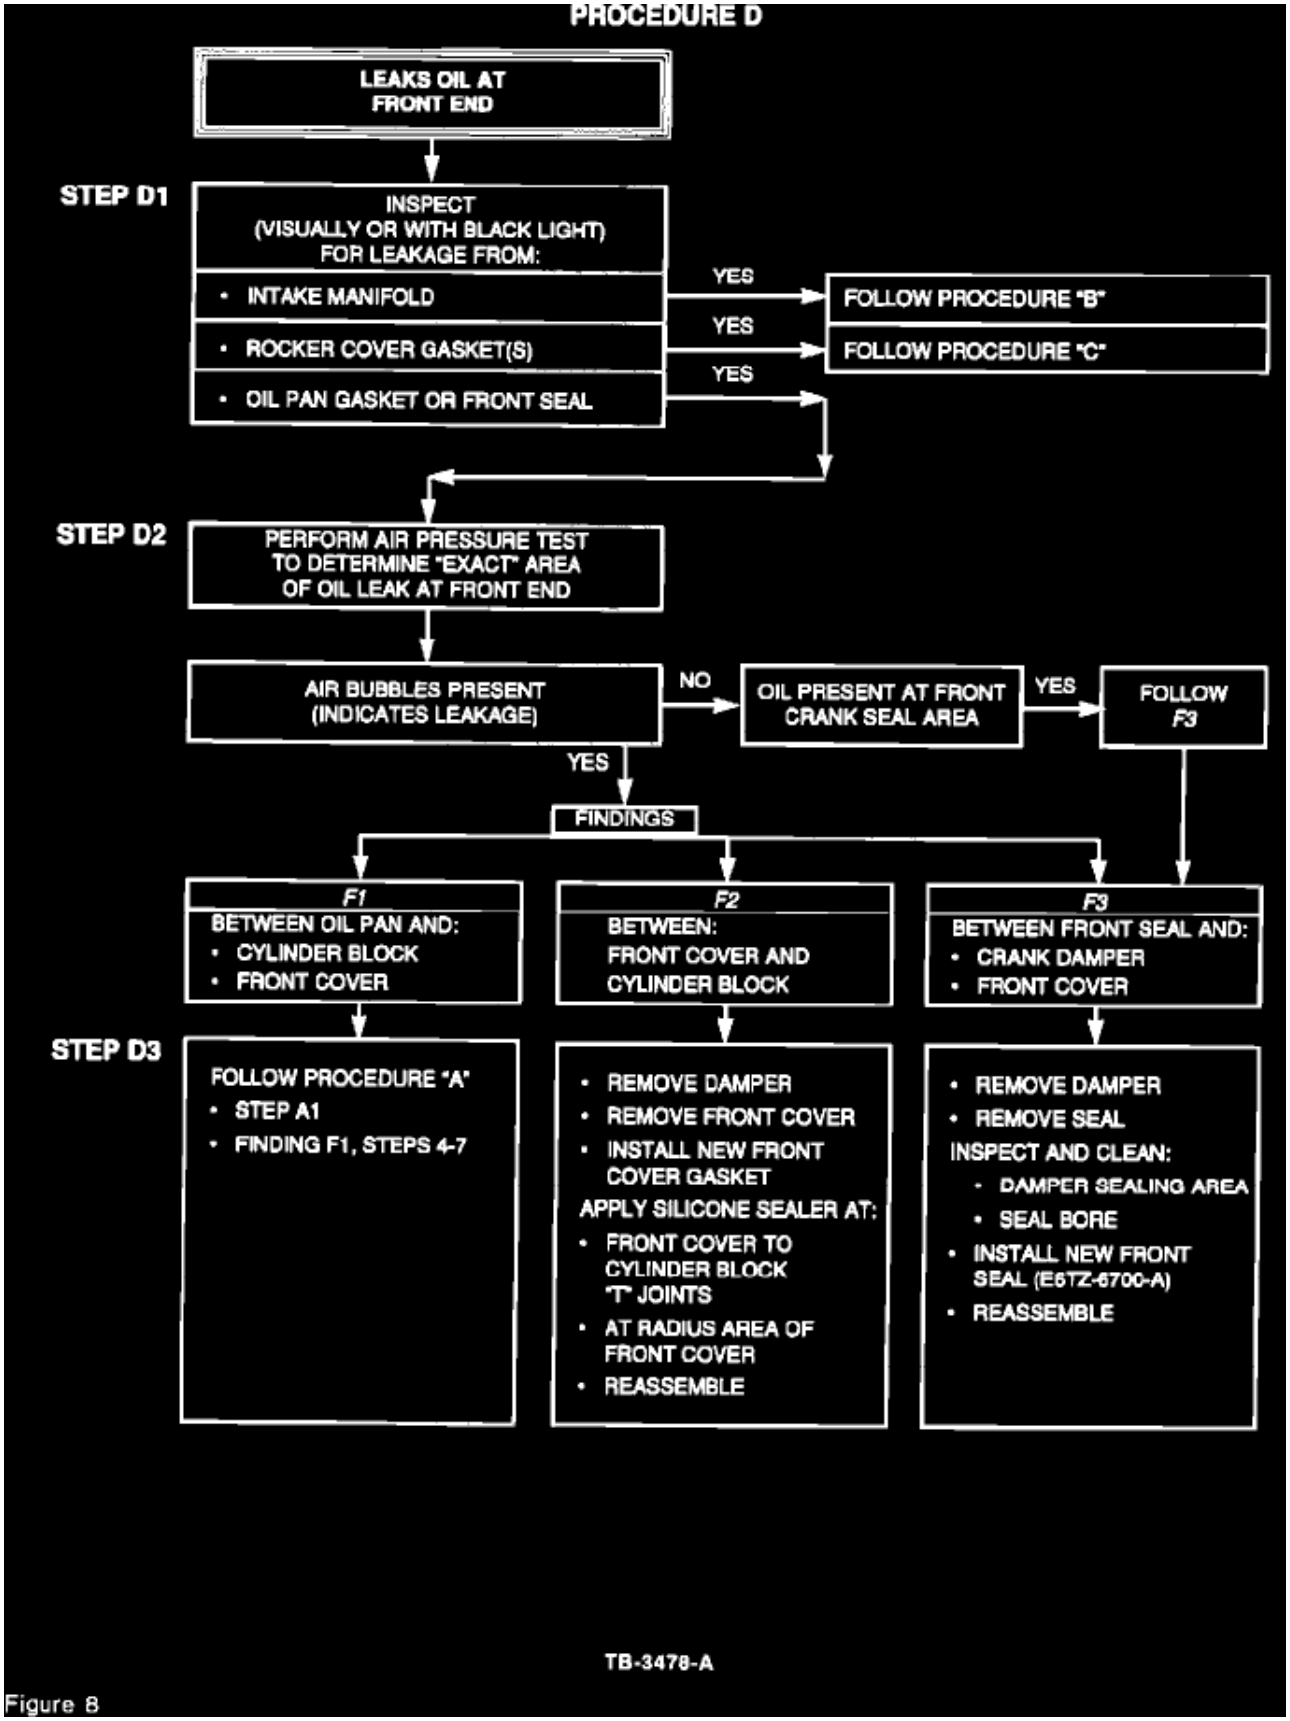

Figure 8

1. If the air pressure test showed no air bubbles, follow Procedure D, F3.

2. If the air pressure test showed air bubbles present, follow Procedure D, F1 or F2 as appropriate.

General Information

LIGHT TRUCK: 1990-93 AEROSTAR, RANGER 1991-93 EXPLORER

This TSB is being republished in its entirety to correct the type of cleaner being used in Figures 1, 3, and 6.

ISSUE: The many sources of leaks which typically appear at the lower end, front end, intake manifold valley, and rocker cover rails have led to mis-diagnosis as to the source of the leak and improper repair procedures, repeat repairs, and customer dissatisfaction.

ACTION: This TSB article has been developed to list the latest sealing techniques and associated part numbers for:

^ Oil Pan

^ Rear Main Seal

^ Rocker Covers

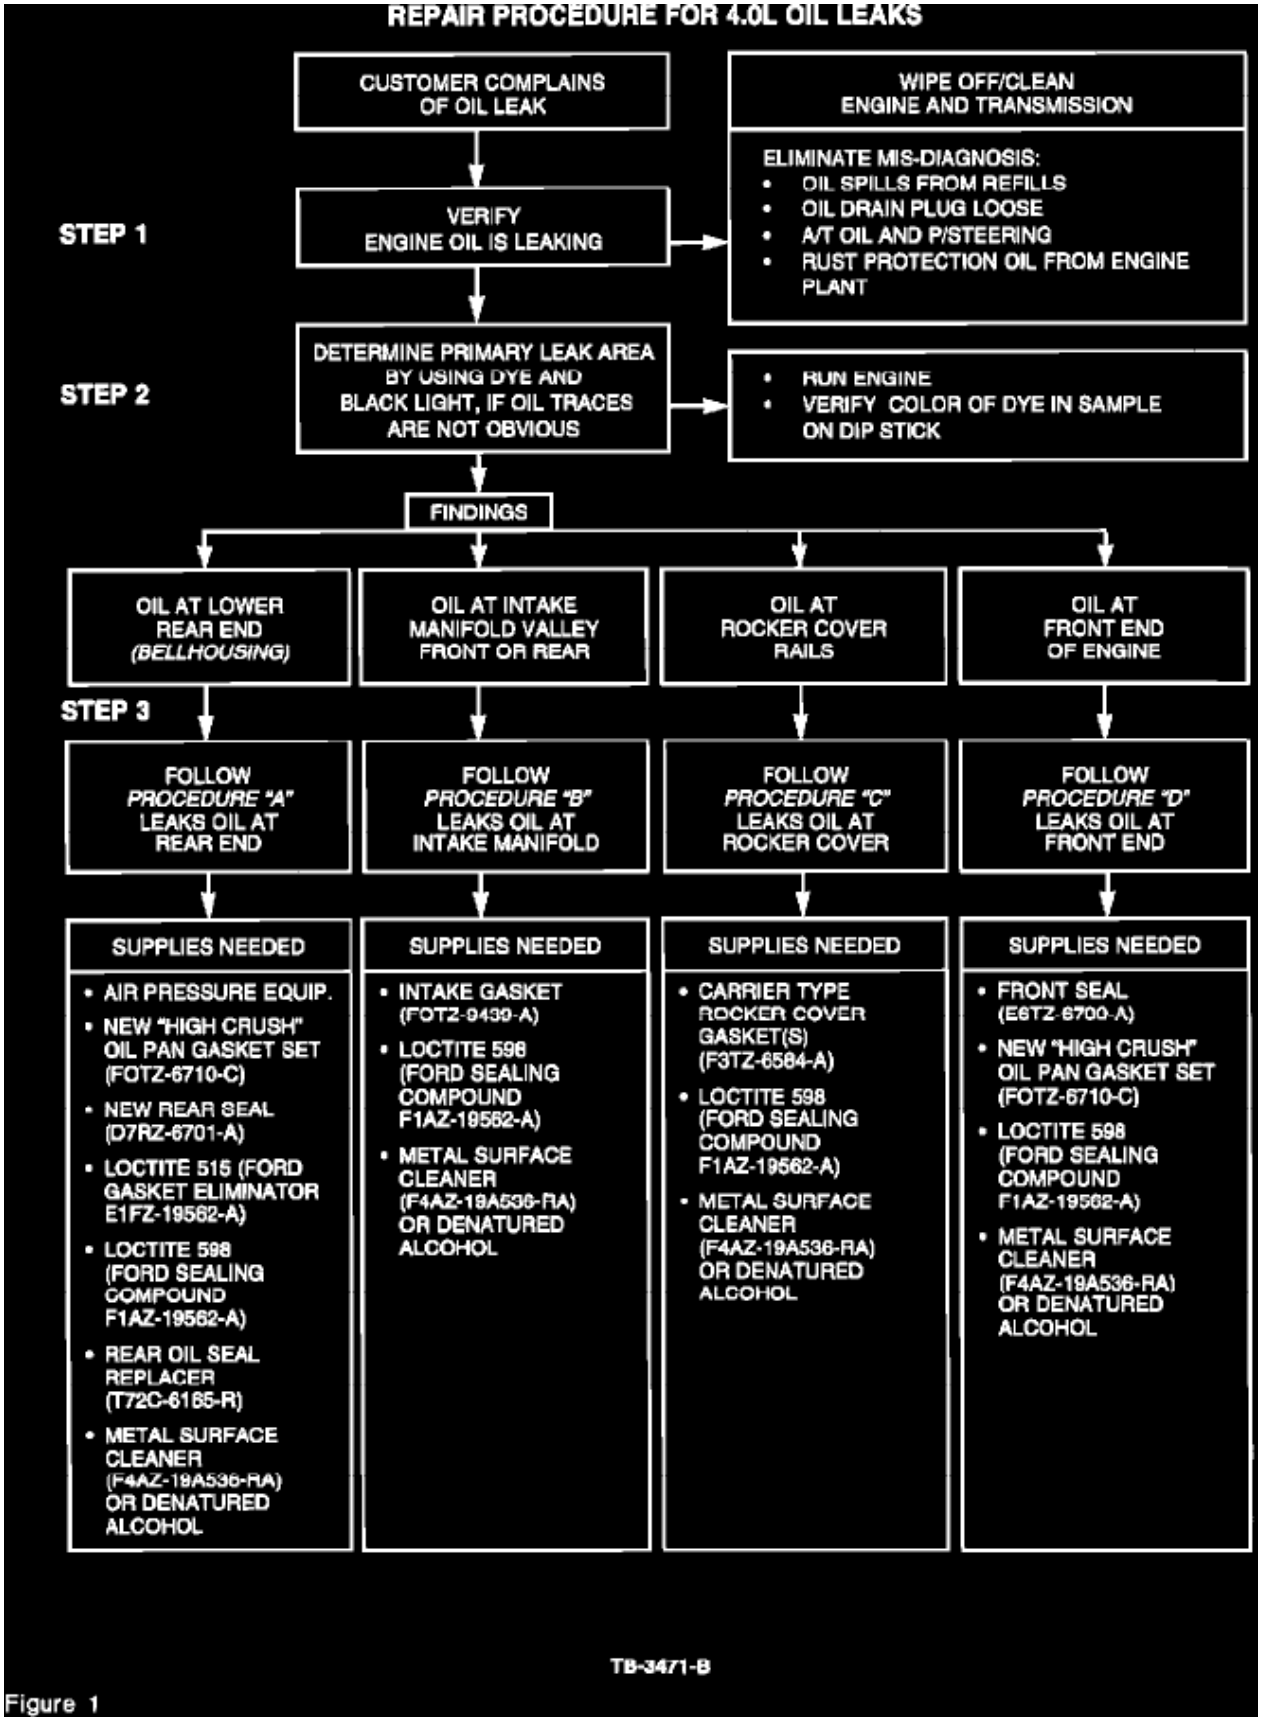

Figure 1

^ Intake Manifold

This article attempts to fully address all issues as one, in order to provide a diagnostic guide which leads to proper diagnosis and repair the first time. Use the following procedures to verify the location of the oil leak and perform the repair.

Service Procedure - Diagnosis

1. Perform Steps 1 and 2 of the block diagram shown in Figure 1. Perform a visual inspection to determine the general area of the oil leak.

2. After determining the "Findings" of Step 2, perform Step 3 by following Procedures A, B, C or D, whichever is appropriate, up to, but not including the air pressure test.

NOTE:

WHEN THE FINDINGS RESULT IN FOLLOWING PROCEDURE "A" FOR "LEAKS OIL AT REAR END", IT IS VERY IMPORTANT TO FOLLOW THE BLOCK DIAGRAM INSTRUCTIONS TO REMOVE THE TRANSMISSION, IF AN AEROSTAR, AND TO REMOVE THE ENGINE, IF AN EXPLORER/RANGER. THE PRACTICE OF REMOVING EXPLORER/RANGER OIL PANS WITH ENGINE IN VEHICLE CAN RESULT IN FAULTY DIAGNOSIS AND/OR REPAIR FOR THE PURPOSES OF THIS TSB.

If the leak has not been located and corrected at this point, then fabricate a device that is capable of applying a constant 1 to 3 psi of air pressure to the engine crankcase. The Rotunda Leak Tester 134-00003, or equivalent, which contains a pressure regulator and gauge capable of a 1 to 3 psi range, may be used.

3. Verify the location of the oil leak by pressurizing the engine crankcase with a constant supply of 3 psi of air pressure and the use of leak detection solution (liquid detergent and water). This process will verify the exact location of the leak. Dye and black light will verify a leak is present, but may not verify the exact location of the leak.

a. Assemble the necessary hose and fittings to connect an air pressure regulator and air pressure gauge to the shop air supply and to the engine crankcase through the dipstick tube.

b. Test the device to make sure 1-3 psi of air pressure can be maintained. Bursts of pressure over 3 psi can damage engine seals.

c. Before starting the test, make sure the regulator valve is completely closed so as not to accidentally apply a big burst of air to the engine when starting the test.

d. Attach the outlet (regulated) hose from the regulator/gauge device to the dipstick.

e. To trap air in the engine, plug any ports and passages (PCV valve, air inlet connection) that will allow air to escape.

f. Slowly open the regulator valve until 1-3 psi of air pressure registers on the gauge.

g. Keeping air pressure applied, brush or squirt a solution of liquid detergent and water or commercially available liquid leak detector (Snoop, Bubbles) to the primary area identified in Step 2 of the block diagram.

^ If the primary area is in the rear seal area, apply the solution to the rear seal, rear cap, rear cap to cylinder block and oil pan gasket areas.

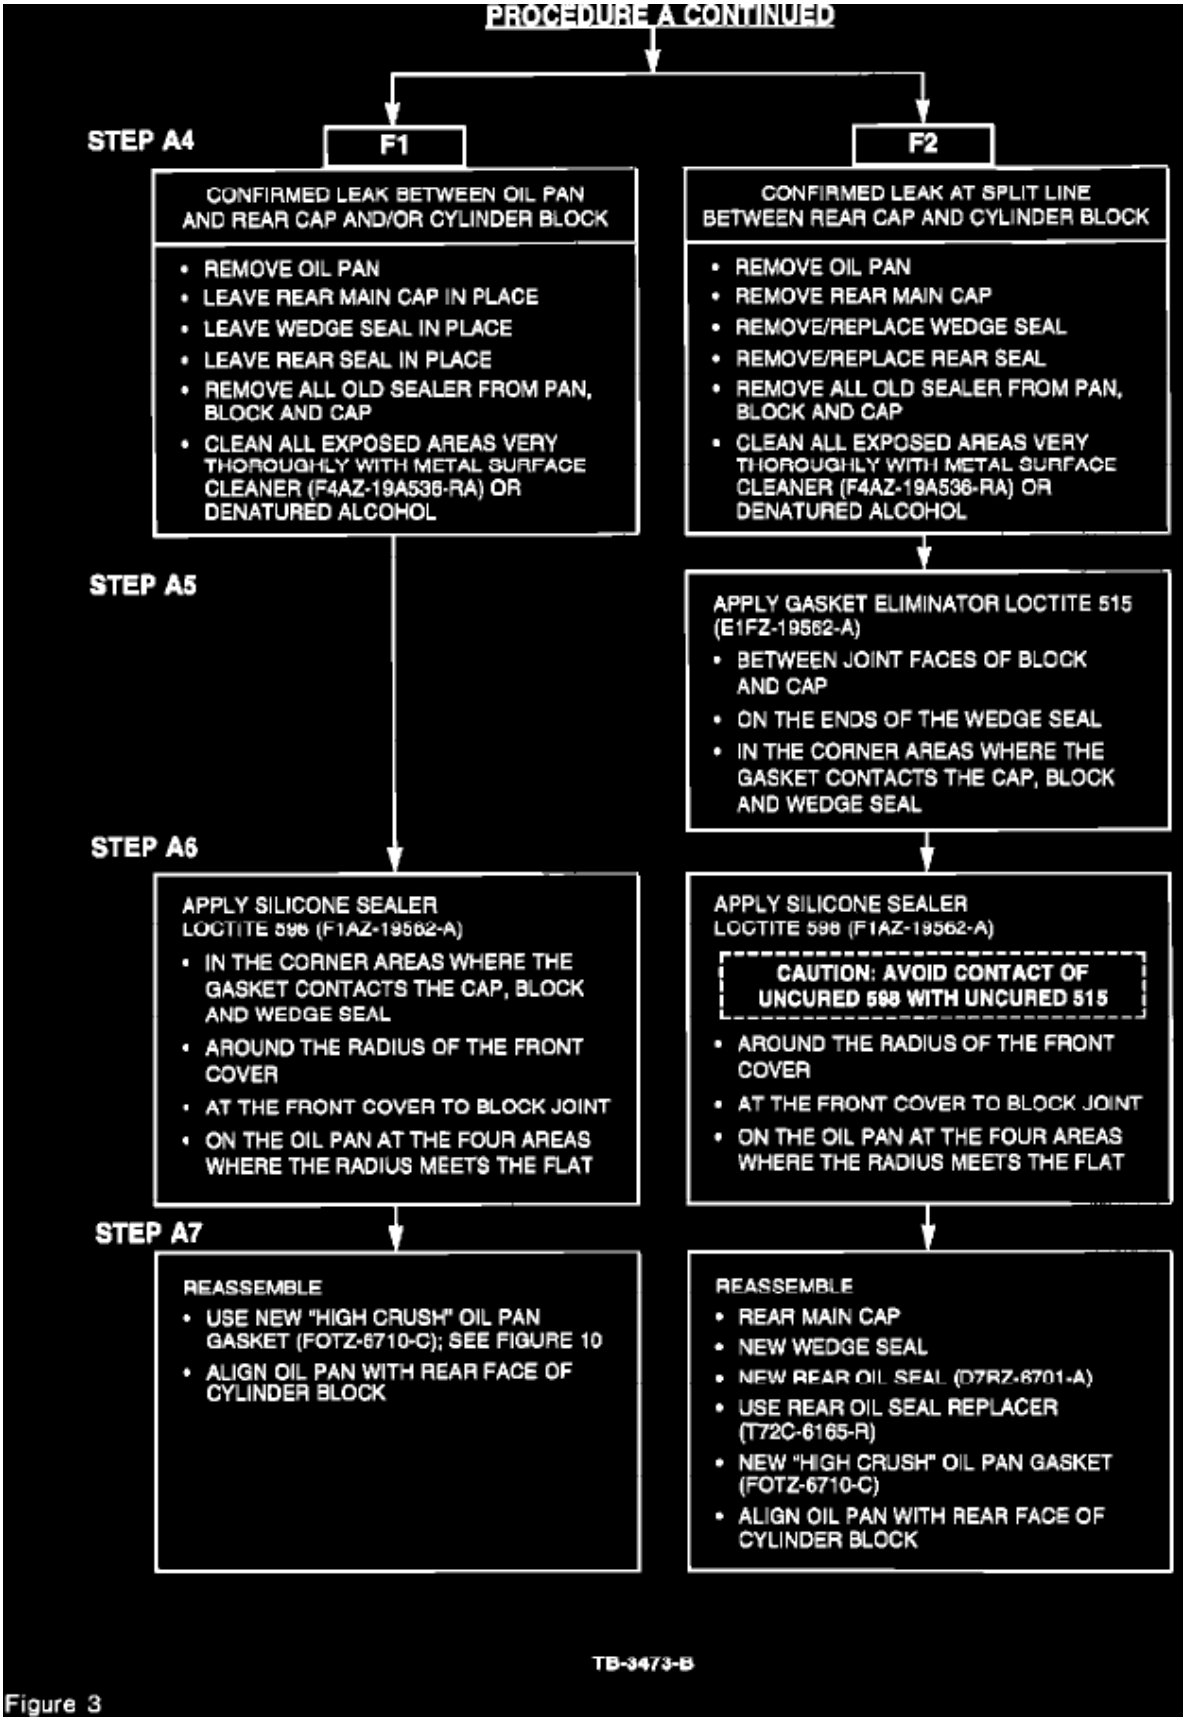
REAR END OIL LEAK - PROCEDURE A



PROCEDURE A CONTINUED
STEP A4
F1
CONFIRMED LEAK BETWEEN OIL PAN AND REAR CAP AND/OR CYLINDER BLOCK
• REMOVE OIL PAN
• LEAVE REAR MAIN CAP IN PLACE
• LEAVE WEDGE SEAL IN PLACE
• LEAVE REAR SEAL IN PLACE
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
F2
CONFIRMED LEAK AT SPLIT LINE BETWEEN REAR CAP AND CYLINDER BLOCK
• REMOVE OIL PAN
• REMOVE REAR MAIN CAP
• REMOVE/REPLACE WEDGE SEAL
• REMOVE/REPLACE REAR SEAL
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
STEP A5
APPLY GASKET ELIMINATOR LOCTITE 515 (E1FZ-19562-A)
• BETWEEN JOINT FACES OF BLOCK AND CAP
• ON THE ENDS OF THE WEDGE SEAL
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
STEP A6
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
CAUTION: AVOID CONTACT OF UNCURED 598 WITH UNCURED 515
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
STEP A7
REASSEMBLE
• USE NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C); SEE FIGURE 10
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
REASSEMBLE
• REAR MAIN CAP
• NEW WEDGE SEAL
• NEW REAR OIL SEAL (D7RZ-6701-A)
• USE REAR OIL SEAL REPLACER (T72C-6165-R)
• NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C)
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
TB-3473-B
Figure 3

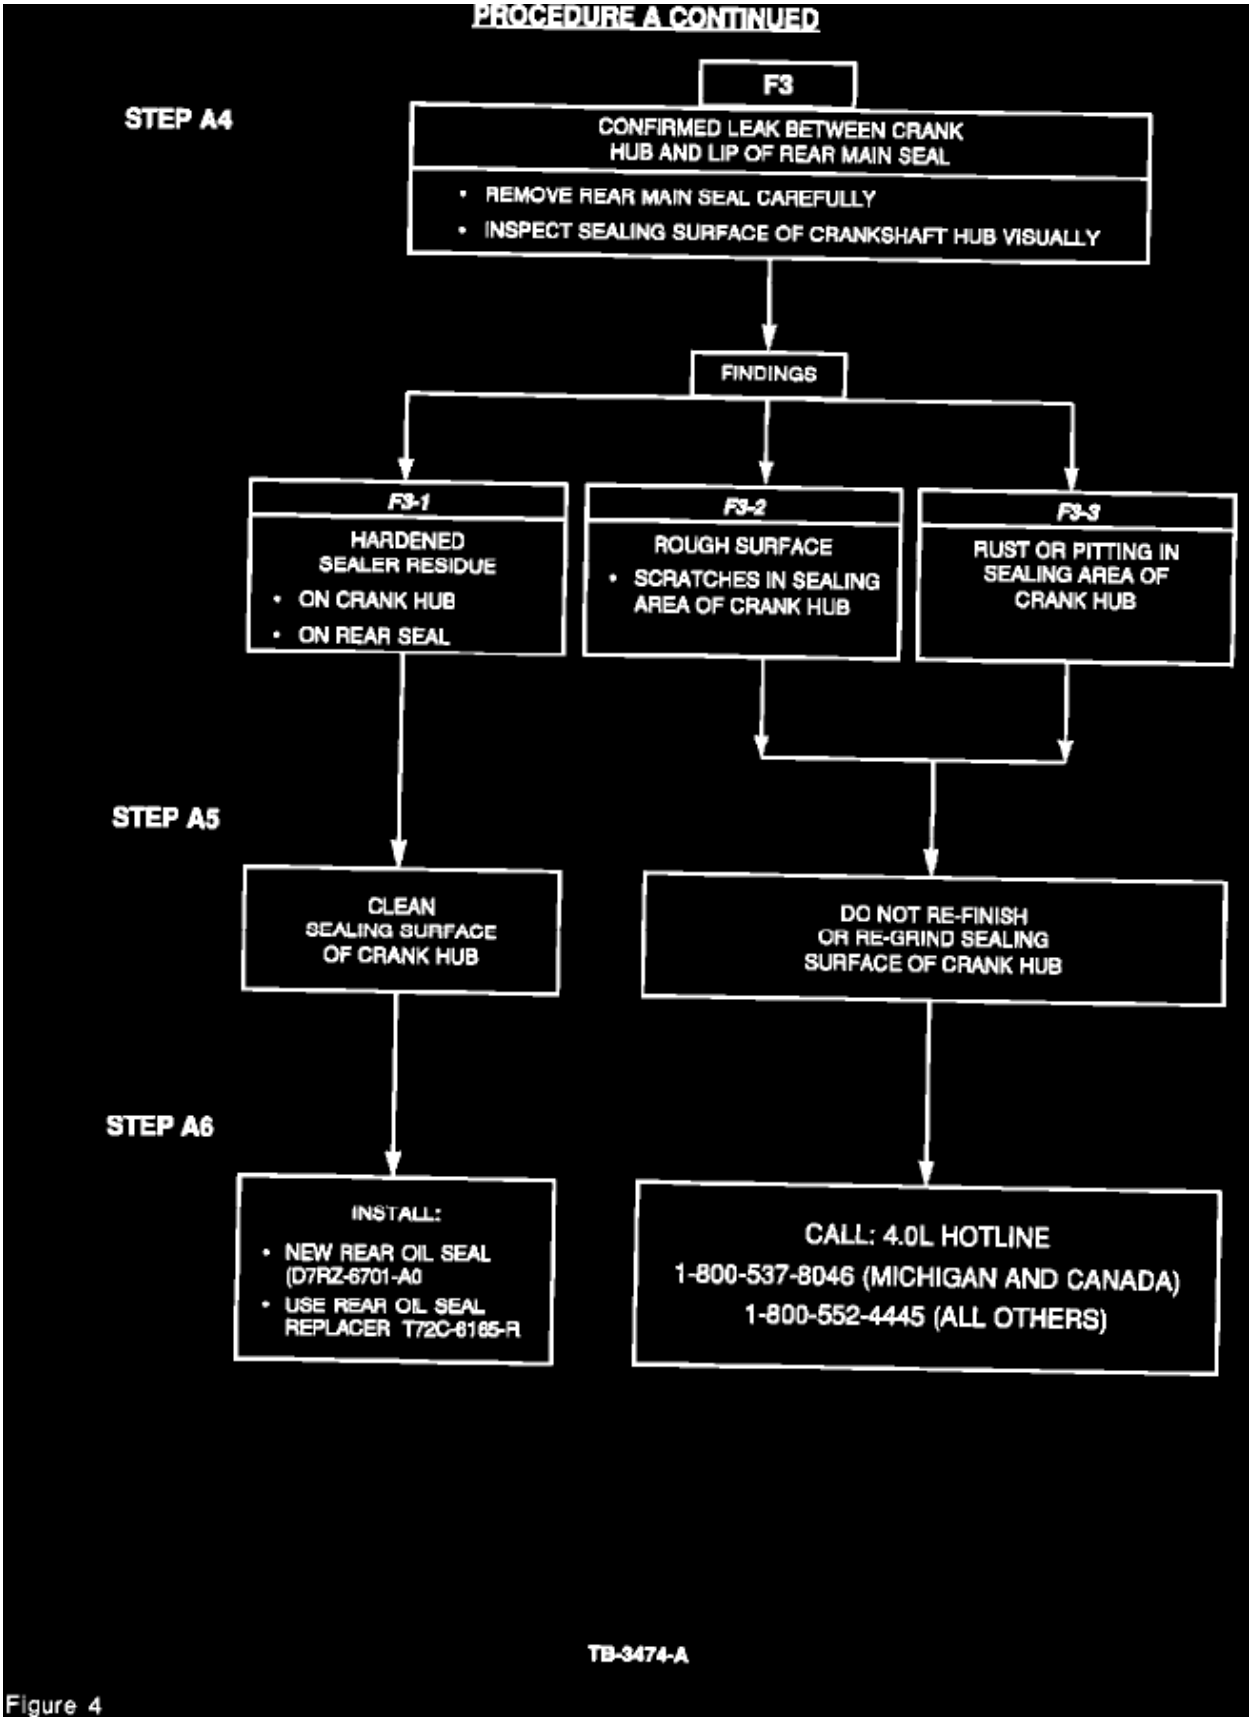


Figure 4

1. Repair procedure for a leak at oil pan gasket between the oil pan and cylinder block, or between the oil pan and the rear main cap. See block diagram Procedure A, Step A4/F1, Figures 3 and 4.

a. Remove the oil pan from the engine and remove the old gasket from the oil pan. Do not remove the rear main cap or wedge seal from the engine.

b. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

c. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap. Take special care to scrape/scratch all the old sealer from the exposed areas of the rear cap, wedge seal and cylinder block. This is a critical sealing area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER BLOCK.

d. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

e. Clean the transmission "BELLHOUSING" area, the rear of the cylinder block and the rear engine plate of ALL oil residue.

f. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corner of the radius areas at the front and rear of the oil pan.

g. Place the oil pan gasket (FOTZ-6710-C) in place in the groove in the oil pan.

h. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the corners where the rear main cap meets the cylinder block, at the corner areas of the radius area on the front cover and the front cover to cylinder block joint.

i. Set the oil pan in place and snug the four (4) pan nuts.

j. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .0100" (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

k. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

2. Repair procedure for a leak between the rear main cap and the cylinder block. See block diagram Procedure A, Step A4/F2.

a. Remove the oil pan, windage tray, oil pump and rear main cap from the engine.

b. Remove the rear main oil seal from the crankshaft and thoroughly inspect the main seal journal of the crankshaft for signs of rust, pitting, nicks or porosity.

c. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

d. Clean ALL the old sealer from the rear main bearing cap USING A SCRAPER AND WIRE WHEEL. The original Loctite sealer used during production assembly becomes extremely hard after it has cured. It is extremely important that ALL the old sealer be removed from the joint faces and grooves.

e. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap joint area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER

BLOCK.

f. Clean ALL the oil and old sealer from the "WEDGE SEAL" that fits around the rear main bearing cap in the oil pan gasket groove. Preferably use a new "WEDGE SEAL".

g. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

h. Clean the transmission "BELLHOUSING AREA", the rear of the cylinder block and the rear engine plate of ALL oil residue.

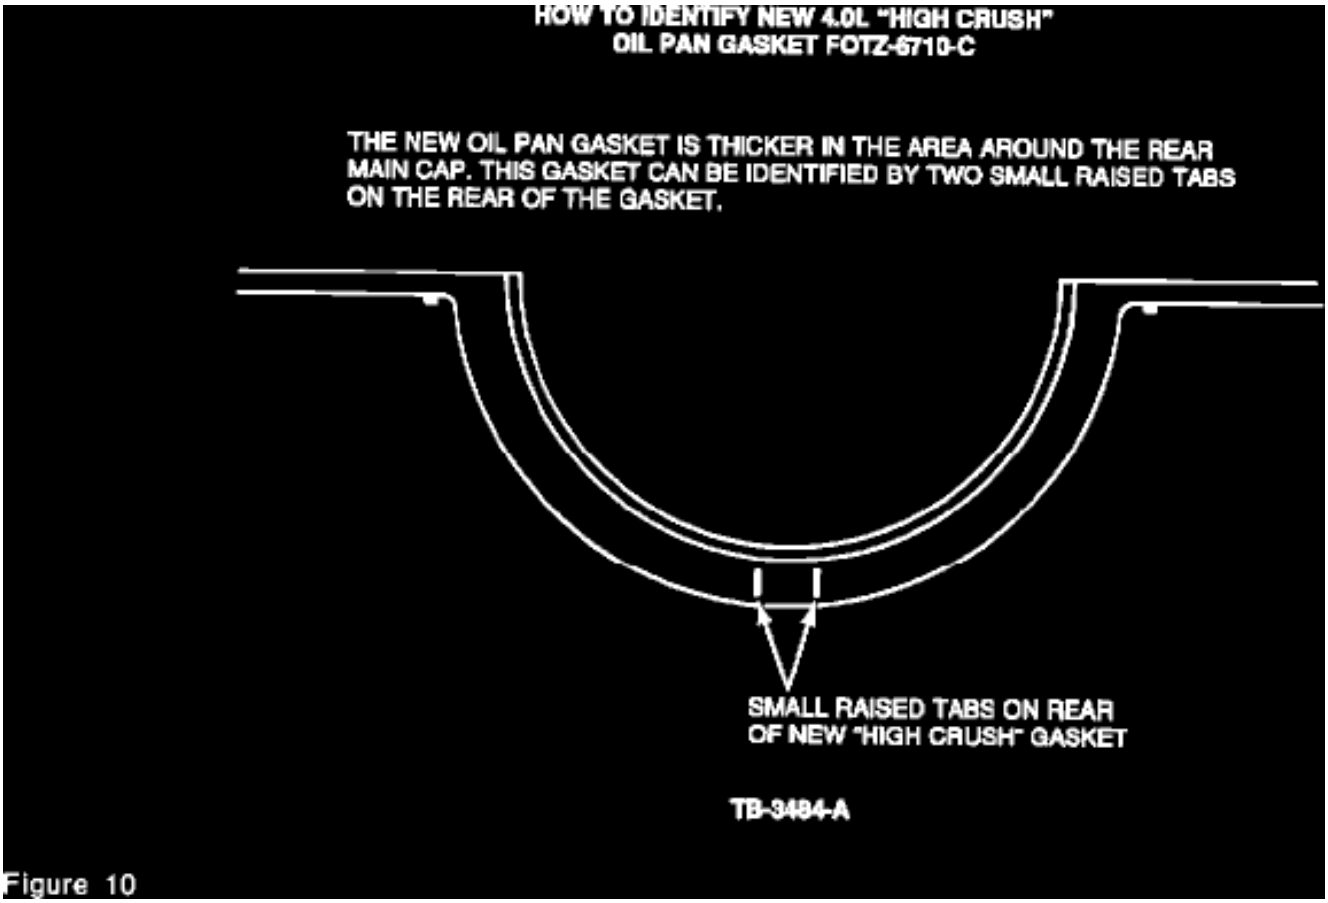

Figure 10

i. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) on the cylinder block along the corners of the rear main bearing cap joint area and on the joint face, approximately 1/2 inch (12.7 mm) from the rear of the block.

j. Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.

k. Align the rear main bearing cap to cylinder block by moving the bearing fore or aft (approx. 1/2 inch (12.7 mm) inward in the rear oil seal bore) so that the rear seal stop of the block and cap line up. This will assure that the rear main oil seal will seat squarely when installed in the bore.

l. Torque the rear main cap bolts to 66-77 lb.ft. (90-104 N-m).

m. Fill the cavities for the "WEDGE SEAL" on both sides of the rear main cap with Ford Gasket Eliminator (E1FZ-19562-A).

n. Place "WEDGE SEAL" in place and use a flat bladed screwdriver to fully seat the "WEDGE SEAL", forcing the excessive sealer out.

o. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) in the corners of the oil pan gasket groove of the rear main cap where the cap meets the cylinder block.

p. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) at the corner areas of the radius area on the front cover and at the front cover to cylinder block joint.

q. Reinstall the oil pump and windage tray. Torque to 13-15 lb.ft. (17-21 N-m).

r. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corners of the radius areas at the front and rear of the oil pan.

s. Place the oil pan gasket (FOTZ-6710-C), Figure 10, in place in the groove in the oil pan.

t. Set the oil pan in place and snug the four (4) oil pan bolts.

u. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .01000 (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

v. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

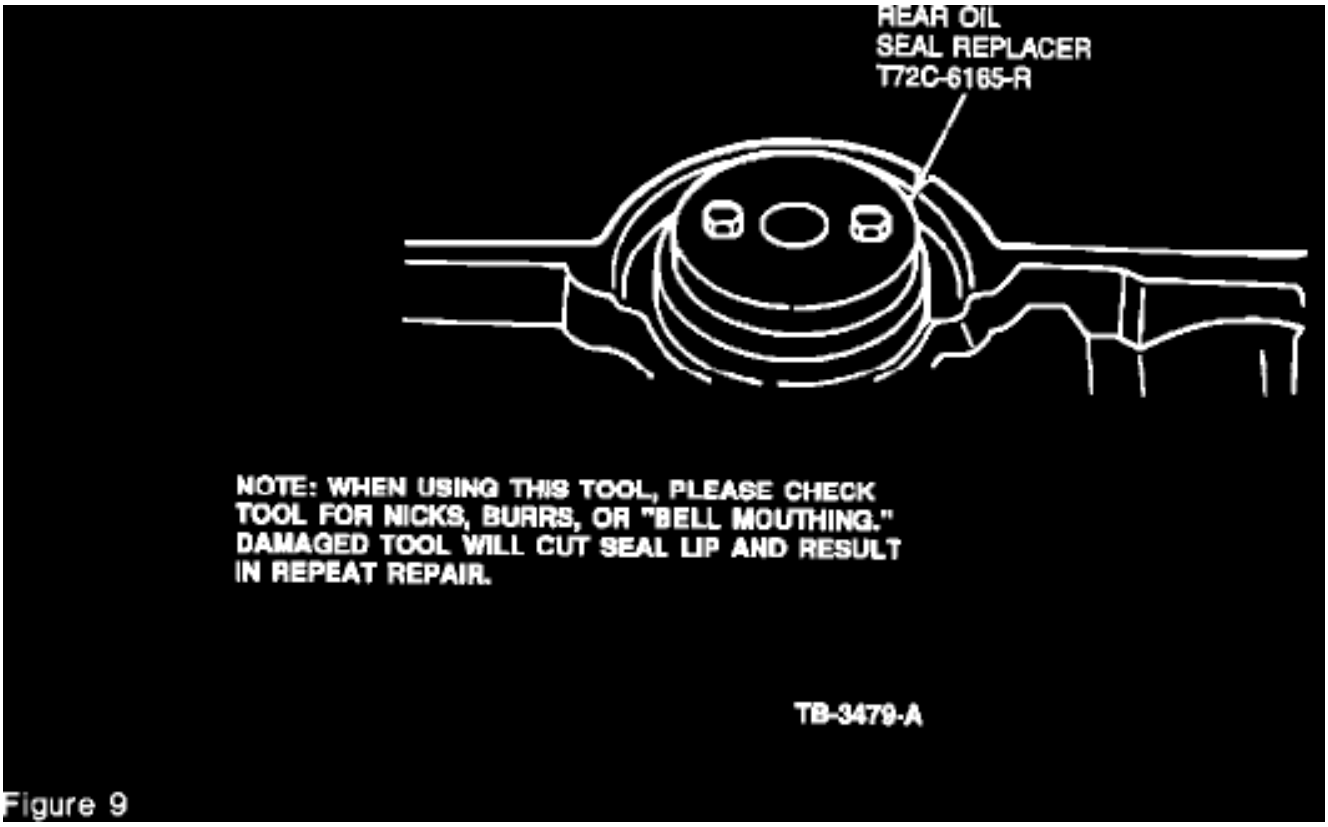

Figure 9

w. Coat the rear main oil seal (D7RZ-6701-A) with oil. Install the rear seal in the seal bore using Rear Oil Seal Replacer T72C-6165-R. This tool uses two flywheel bolts to draw the seal into position. Refer to Figure 9.

CAUTION:

DO NOT USE THE OLD STYLE HAMMER OPERATED TOOL.

3. Repair procedure for a leak between the rear main seal and the crankshaft. See block diagram, Procedure A, Step A4/F3.

a. Any presence of rust on the rear seal journal will cause a leak.

b. Any presence of pitting, porosity or nicks on the rear seal journal will cause a leak.

NOTE:

IF A LEAK IS PRESENT BETWEEN THE REAR MAIN SEAL AND CRANKSHAFT, PLEASE NOTIFY THE 4.0L "HOTLINE" AT (800) 537-8046 OR (800) 552-4445 PRIOR TO ANY ATTEMPT TO REPAIR THIS CONDITION.

Service Procedure - Repair For Oil Leaks At Intake Manifold

PROCEDURE B

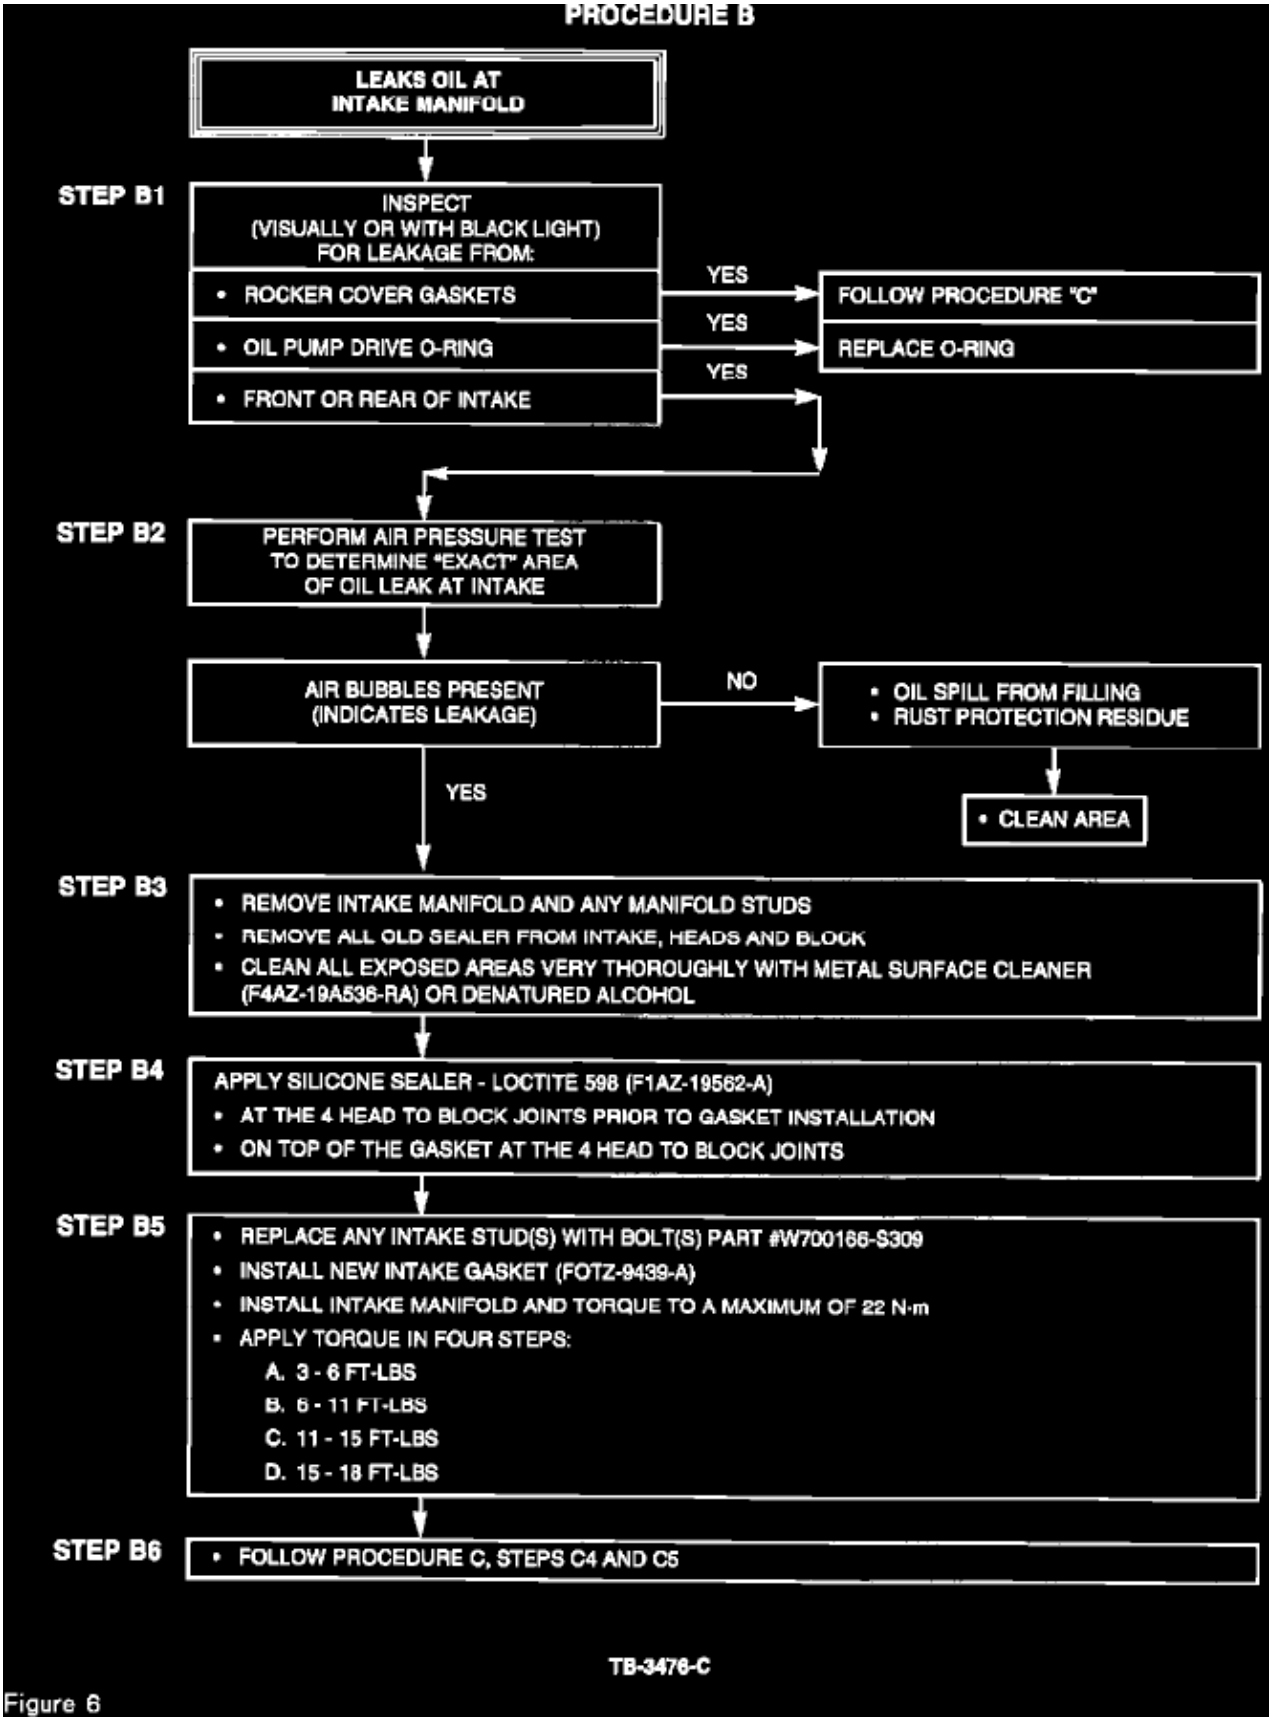

Figure 6

1. If the air pressure test showed no air bubbles, follow Procedure B2 to clean area of oil spill or other contamination.

2. If the air pressure test showed air bubbles present, follow Steps B3 through B6. Refer also to the Service Manual for the applicable year for further information pertinent to removal and installation of the intake manifold.

Service Procedure - Repair For Oil Leaks At Rocker Cover Rails

PROCEDURE C

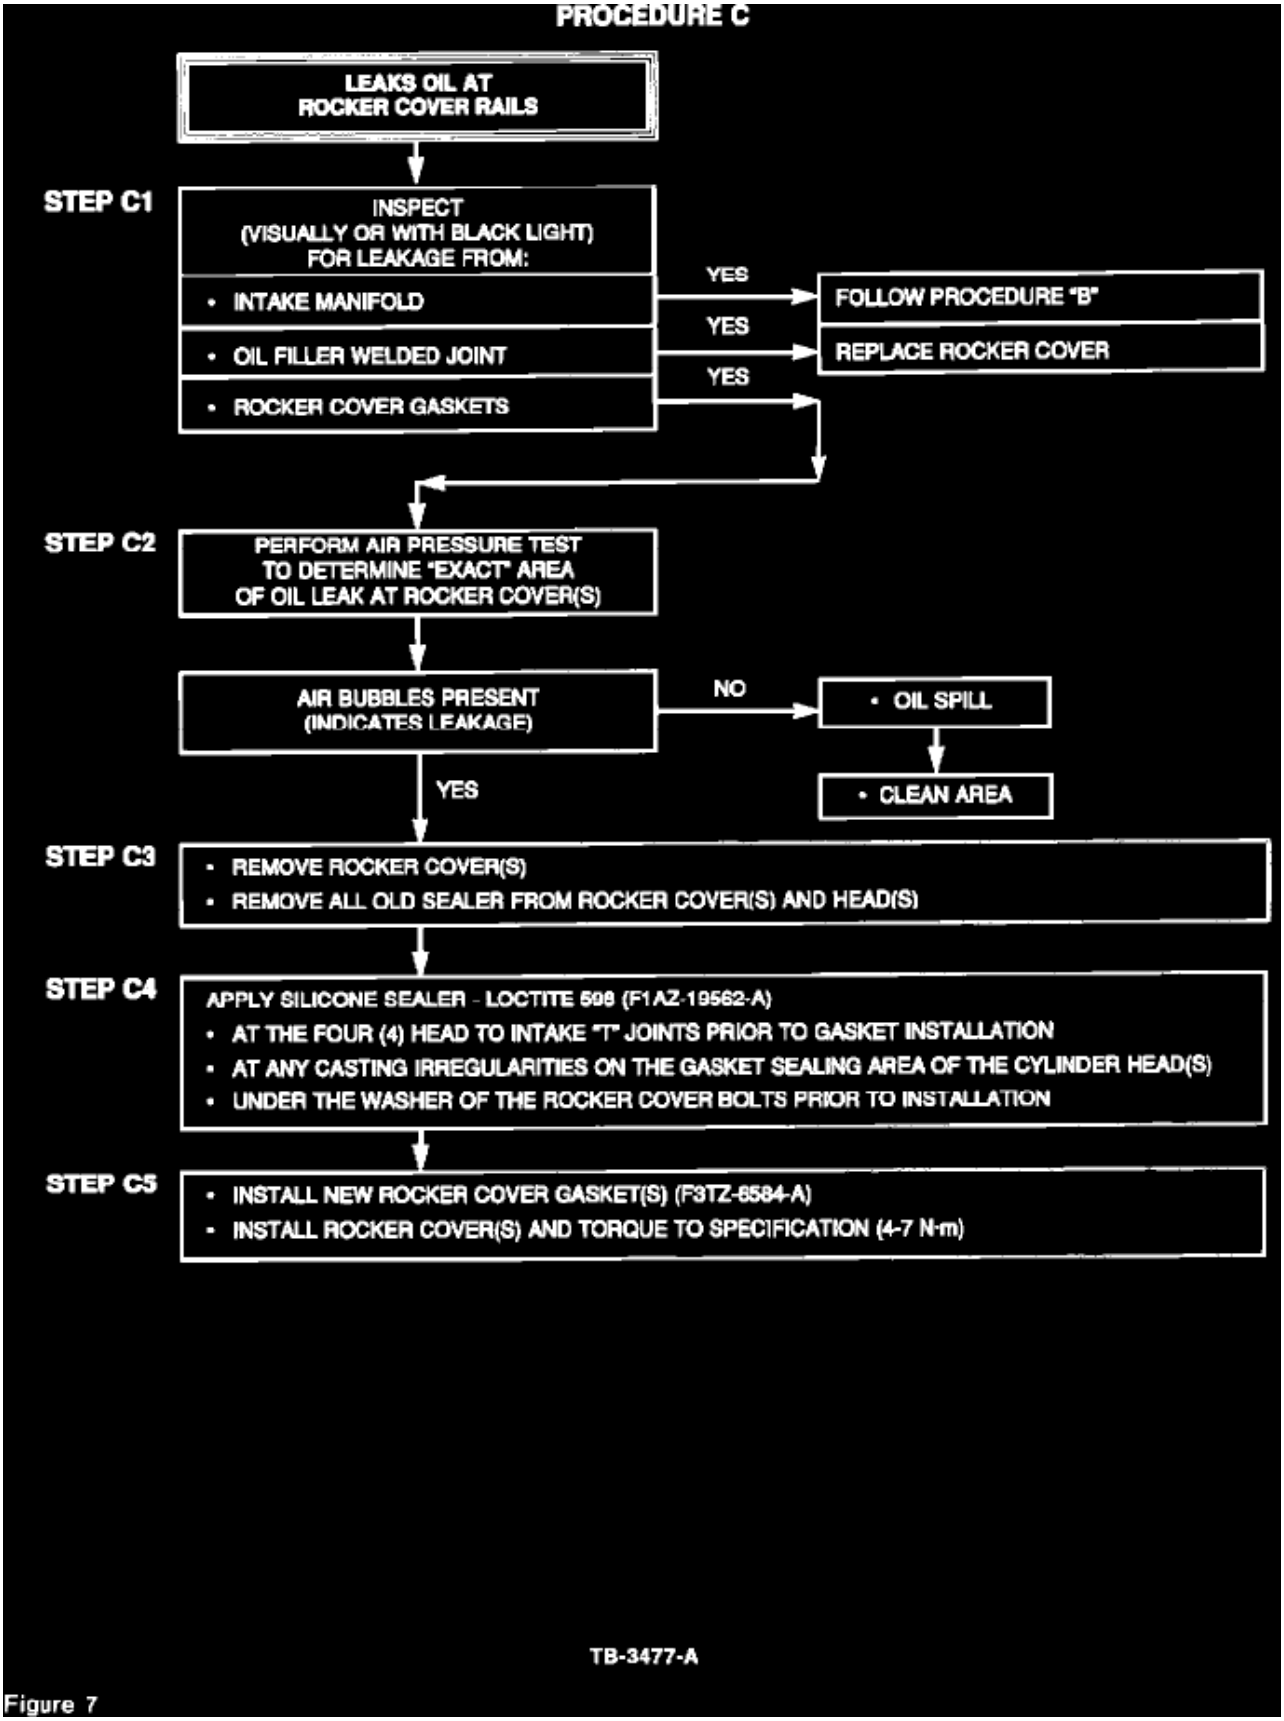

Figure 7

1. If the air pressure test showed no air bubbles, follow Procedure C2 to clean the area of any oil spill.

2. If the air pressure test showed air bubbles present, follow Steps C3 through C5.

Service Procedure - Repair For Oil Leaks At Front End

PROCEDURE D

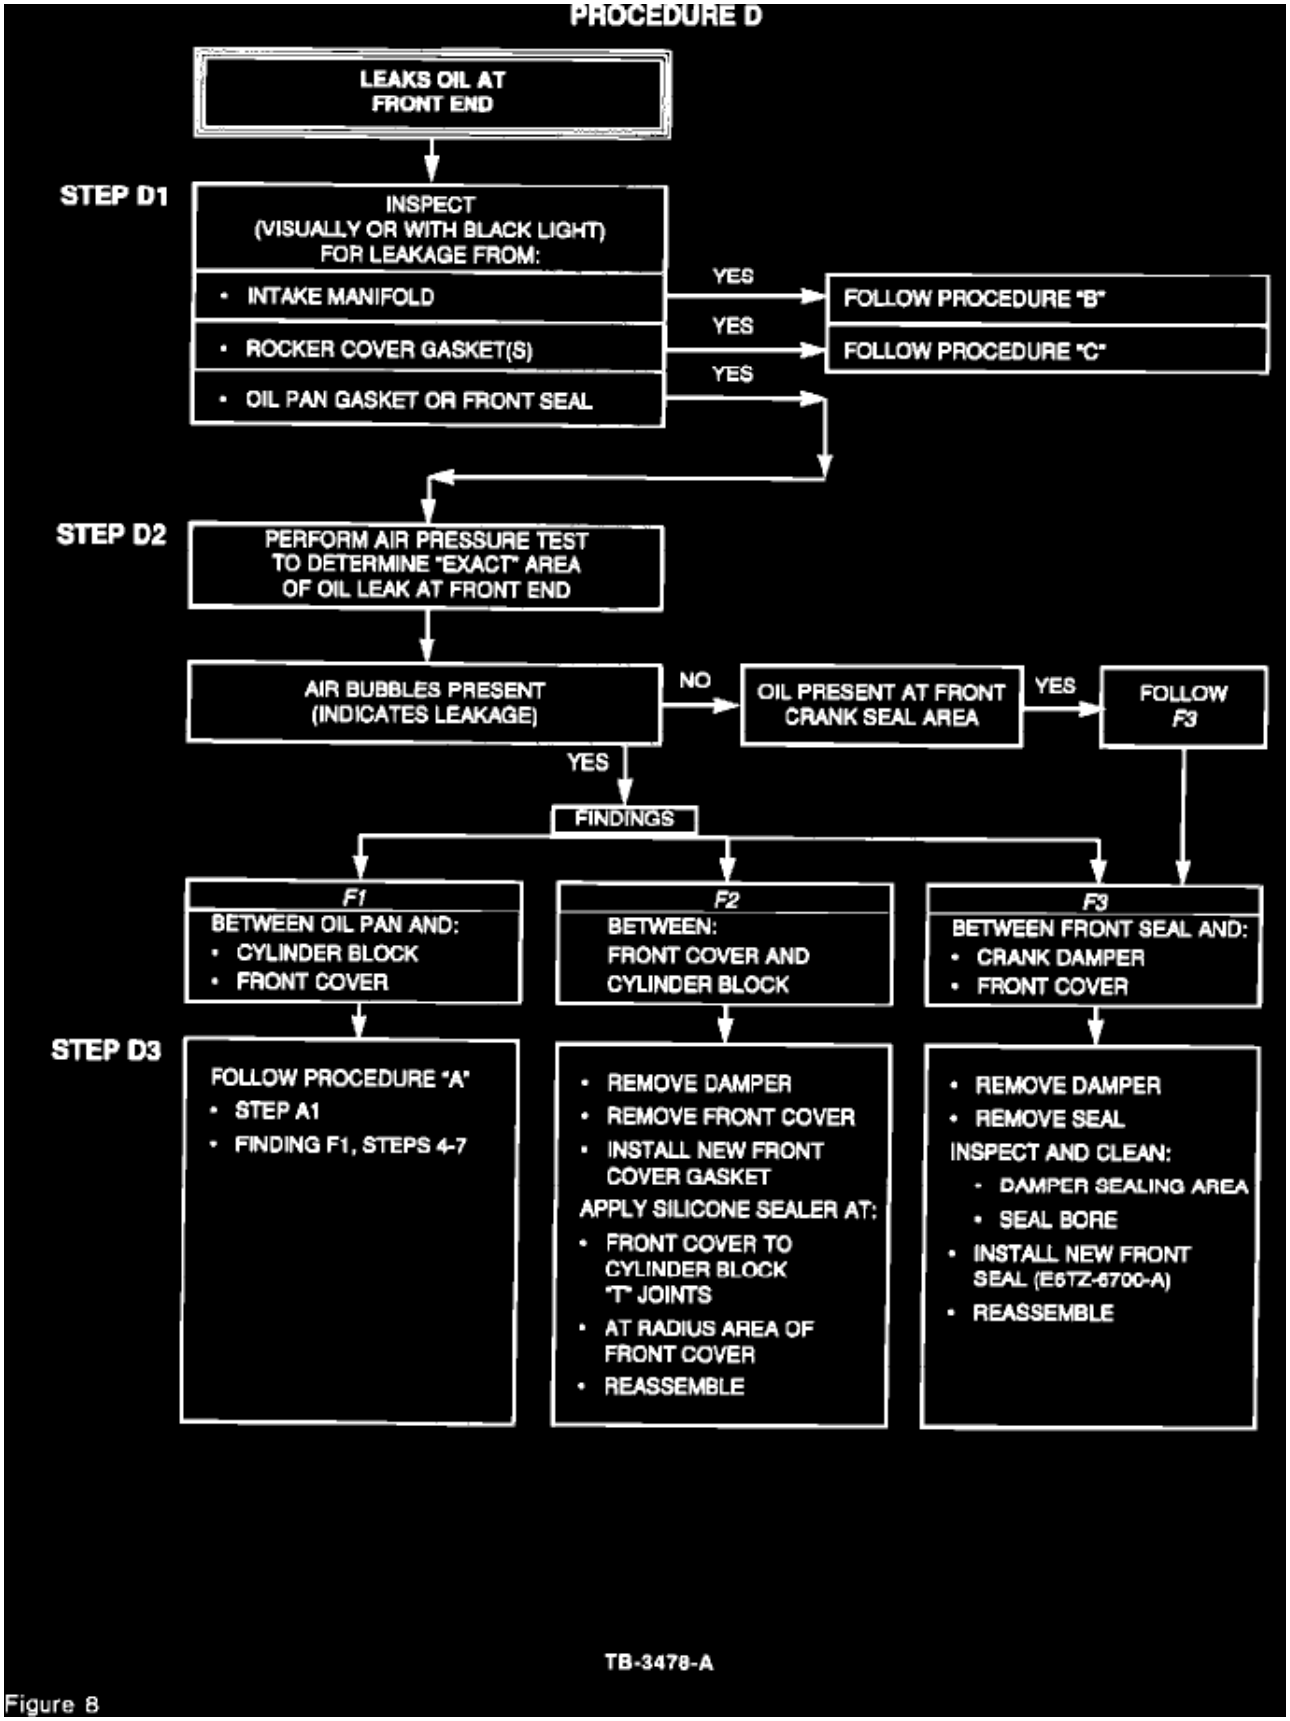

Figure 8

1. If the air pressure test showed no air bubbles, follow Procedure D, F3.

2. If the air pressure test showed air bubbles present, follow Procedure D, F1 or F2 as appropriate.

Catalytic Converter: All Technical Service Bulletins Exhaust System - Sulfur Odor

Article No. 93-24-19

11/24/93

EXHAUST - 4.0L - SULFUR ODOR

LIGHT TRUCK: 1990-93 RANGER 1991-93 EXPLORER

This TSB article is being republished in its entirety to correct the model application.

CALIBRATION: 0-58A-R00, 0-58P-R00, 1-58A-R10, 1-58P-R10, 2-58A-R00, 2-58P-R00, 0-58B-R00, 0-58R-R00, 1-58B-R10, 1-58R-R10, 2-58B-R00, 2-58R-R00

WARNING: THIS MODIFICATION IS AUTHORIZED ONLY FOR THE LISTED ENGINE. PERFORMING THIS MODIFICATION ON OTHER ENGINE CALIBRATIONS IS UNAUTHORIZED AND COULD CREATE LIABILITY UNDER APPLICABLE FEDERAL OR LOCAL LAWS.

ISSUE: An objectionable exhaust sulfur odor may be experienced during various driving conditions. This may be caused by the operating strategy of the EEC IV processor or by the catalytic converter, depending on the particular application.

ACTION: Use the following procedure to determine if a new EEC IV processor or a new catalytic converter is required. Vehicles previously serviced by TSB 93-3-17 may already have had the processor changed.

1. Perform the diagnostic procedure in the 1993 Powertrain Control/Emissions Diagnosis Service Manual, Page 2A-73. Service as required.

2. If the vehicle is a 1991-1992 Explorer with automatic transmission and the sulfur odor still exists:

a. Verify the processor part number. If not already updated, install a new EEC IV processor. Refer to the EEC IV Processor Application Chart contained in this TSB article for correct parts usage.

NOTE: THE BAP SENSOR IS NOT REQUIRED WITH THE NEW POWERTRAIN CONTROL MODULE BUT MAY REMAIN CONNECTED WITHOUT INTERFERENCE.

b. For 1991 models only, in addition to the standard entries on the Authorized Modifications Decal, write in the following instructions: "USE 1992 POWERTRAIN CONTROL/EMISSION DIAGNOSIS SERVICE MANUAL".

3. If the vehicle is:

a. a 1991-1992 Explorer with manual transmission,

b. a 1993 California Ranger/Explorer (automatic or manual transmission), or

General Information

LIGHT TRUCK: 1990-93 AEROSTAR, RANGER 1991-93 EXPLORER

This TSB is being republished in its entirety to correct the type of cleaner being used in Figures 1, 3, and 6.

ISSUE: The many sources of leaks which typically appear at the lower end, front end, intake manifold valley, and rocker cover rails have led to mis-diagnosis as to the source of the leak and improper repair procedures, repeat repairs, and customer dissatisfaction.

ACTION: This TSB article has been developed to list the latest sealing techniques and associated part numbers for:

^ Oil Pan

^ Rear Main Seal

^ Rocker Covers

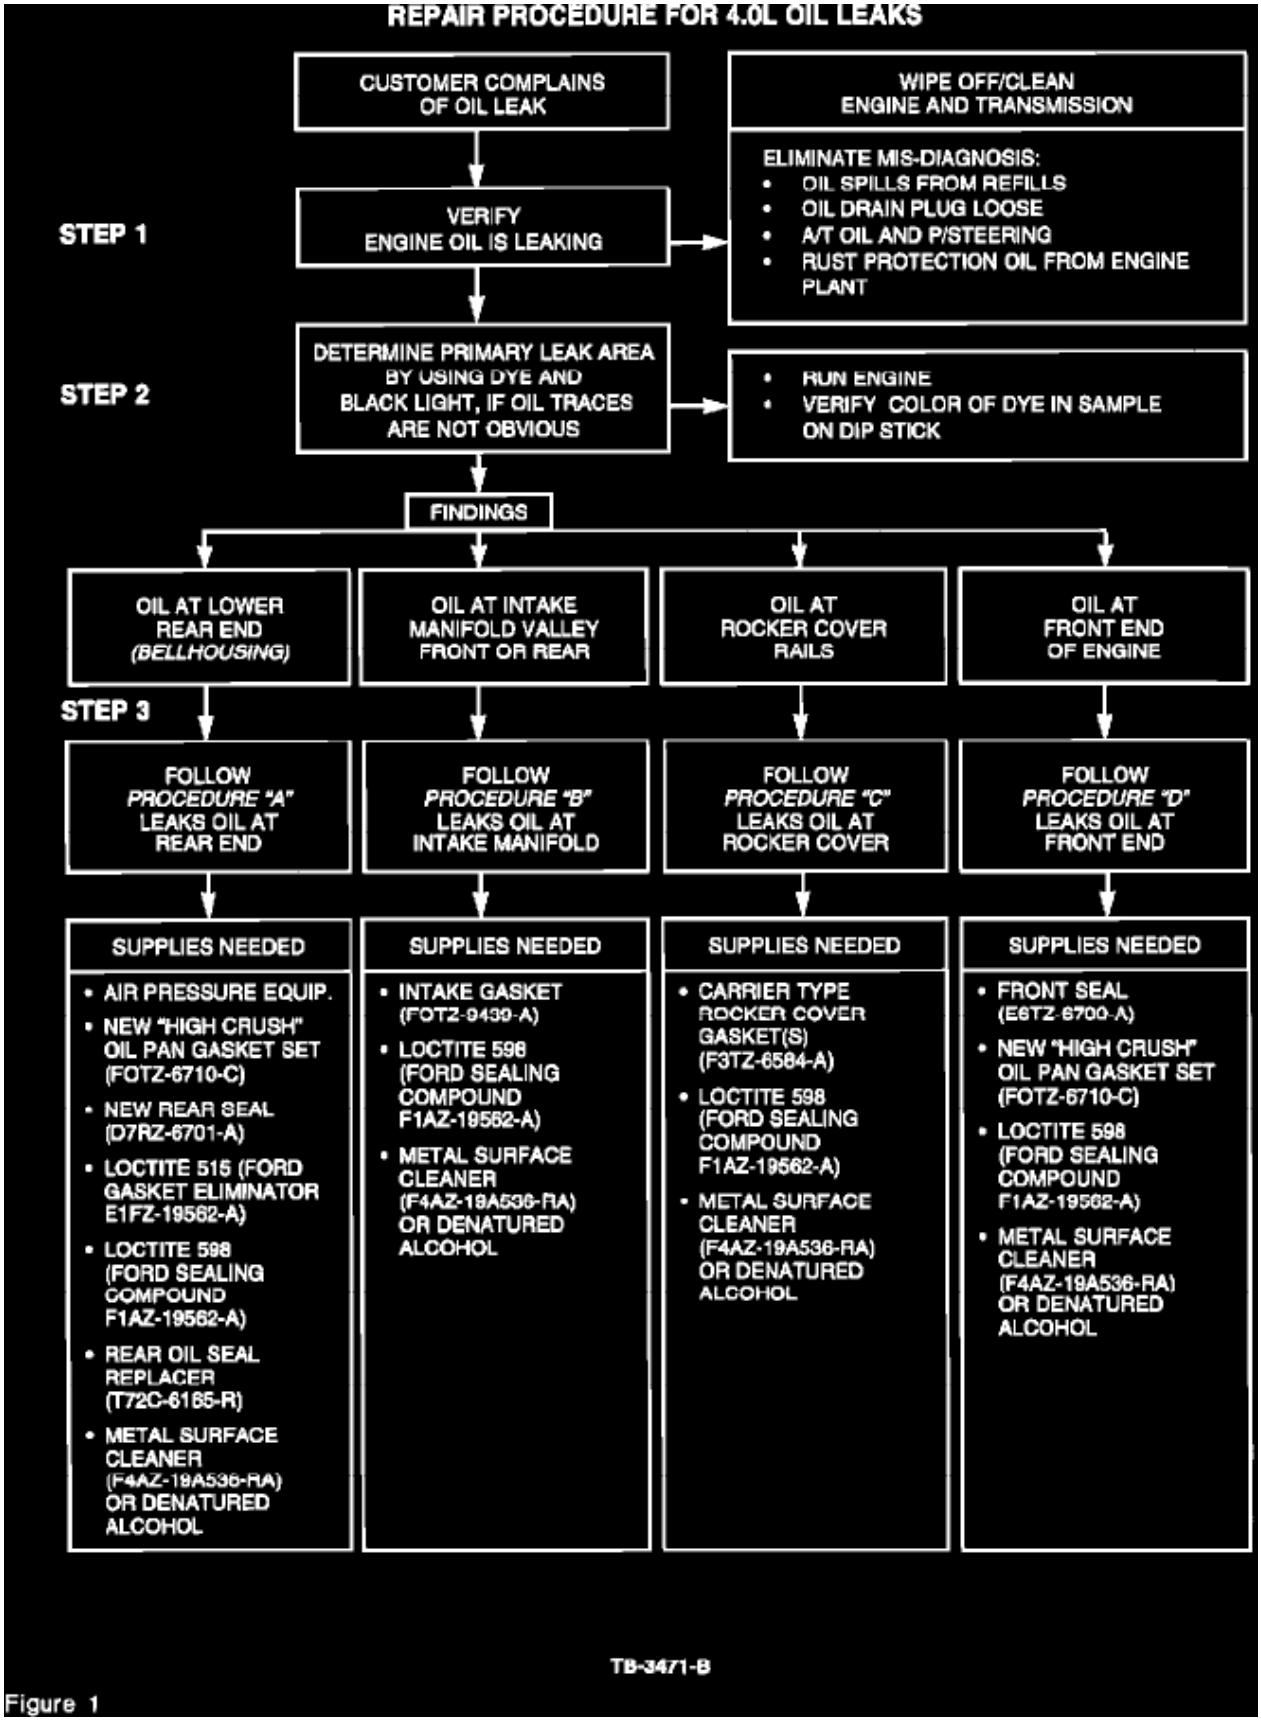

Figure 1

^ Intake Manifold

This article attempts to fully address all issues as one, in order to provide a diagnostic guide which leads to proper diagnosis and repair the first time. Use the following procedures to verify the location of the oil leak and perform the repair.

Service Procedure - Diagnosis

1. Perform Steps 1 and 2 of the block diagram shown in Figure 1. Perform a visual inspection to determine the general area of the oil leak.

2. After determining the "Findings" of Step 2, perform Step 3 by following Procedures A, B, C or D, whichever is appropriate, up to, but not including the air pressure test.

NOTE:

WHEN THE FINDINGS RESULT IN FOLLOWING PROCEDURE "A" FOR "LEAKS OIL AT REAR END", IT IS VERY IMPORTANT TO FOLLOW THE BLOCK DIAGRAM INSTRUCTIONS TO REMOVE THE TRANSMISSION, IF AN AEROSTAR, AND TO REMOVE THE ENGINE, IF AN EXPLORER/RANGER. THE PRACTICE OF REMOVING EXPLORER/RANGER OIL PANS WITH ENGINE IN VEHICLE CAN RESULT IN FAULTY DIAGNOSIS AND/OR REPAIR FOR THE PURPOSES OF THIS TSB.

If the leak has not been located and corrected at this point, then fabricate a device that is capable of applying a constant 1 to 3 psi of air pressure to the engine crankcase. The Rotunda Leak Tester 134-00003, or equivalent, which contains a pressure regulator and gauge capable of a 1 to 3 psi range, may be used.

3. Verify the location of the oil leak by pressurizing the engine crankcase with a constant supply of 3 psi of air pressure and the use of leak detection solution (liquid detergent and water). This process will verify the exact location of the leak. Dye and black light will verify a leak is present, but may not verify the exact location of the leak.

a. Assemble the necessary hose and fittings to connect an air pressure regulator and air pressure gauge to the shop air supply and to the engine crankcase through the dipstick tube.

b. Test the device to make sure 1-3 psi of air pressure can be maintained. Bursts of pressure over 3 psi can damage engine seals.

c. Before starting the test, make sure the regulator valve is completely closed so as not to accidentally apply a big burst of air to the engine when starting the test.

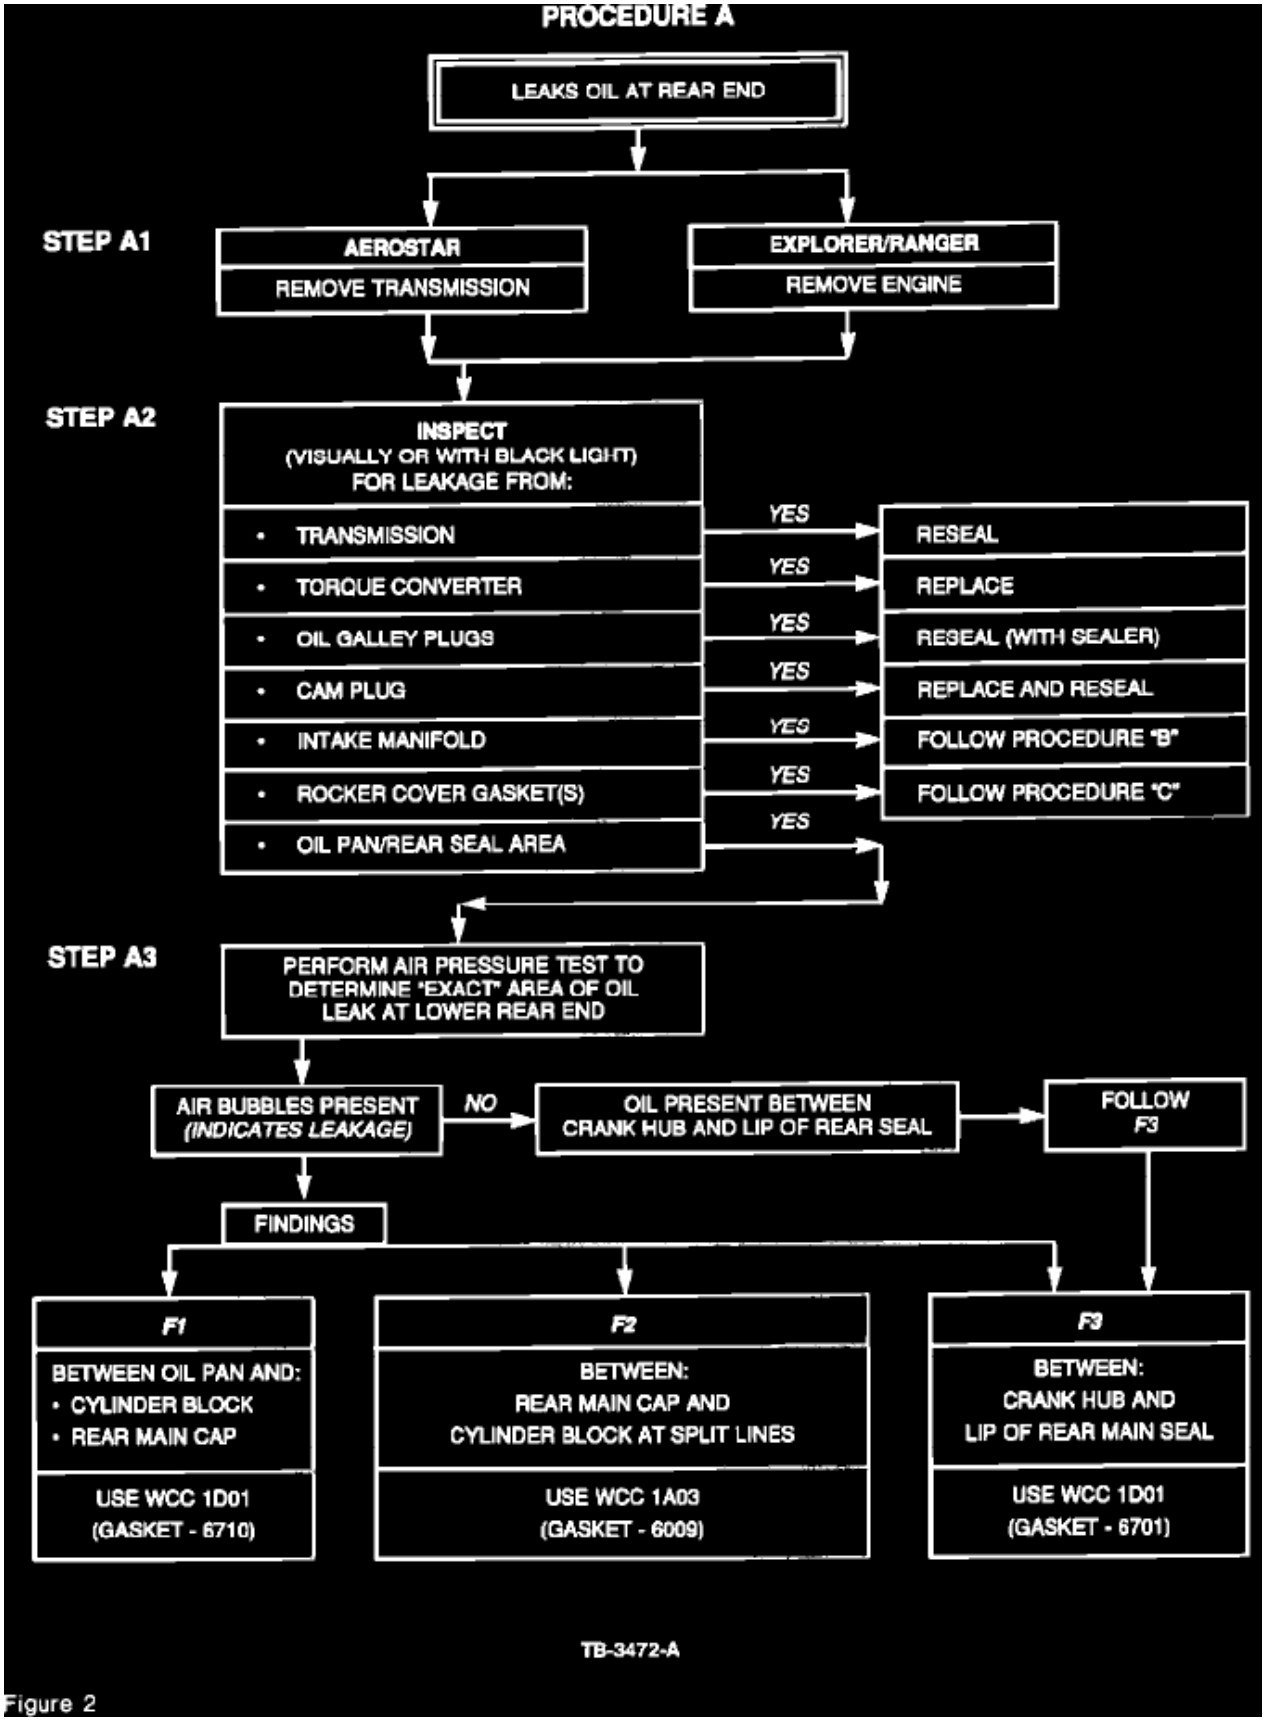
d. Attach the outlet (regulated) hose from the regulator/gauge device to the dipstick.

e. To trap air in the engine, plug any ports and passages (PCV valve, air inlet connection) that will allow air to escape.

f. Slowly open the regulator valve until 1-3 psi of air pressure registers on the gauge.

g. Keeping air pressure applied, brush or squirt a solution of liquid detergent and water or commercially available liquid leak detector (Snoop, Bubbles) to the primary area identified in Step 2 of the block diagram.

^ If the primary area is in the rear seal area, apply the solution to the rear seal, rear cap, rear cap to cylinder block and oil pan gasket areas.



PROCEDURE A
LEAKS OIL AT REAR END
STEP A1
AEROSTAR
REMOVE TRANSMISSION
EXPLORER/RANGER
REMOVE ENGINE
STEP A2
INSPECT
(VISUALLY OR WITH BLACK LIGHT)

Figure 2

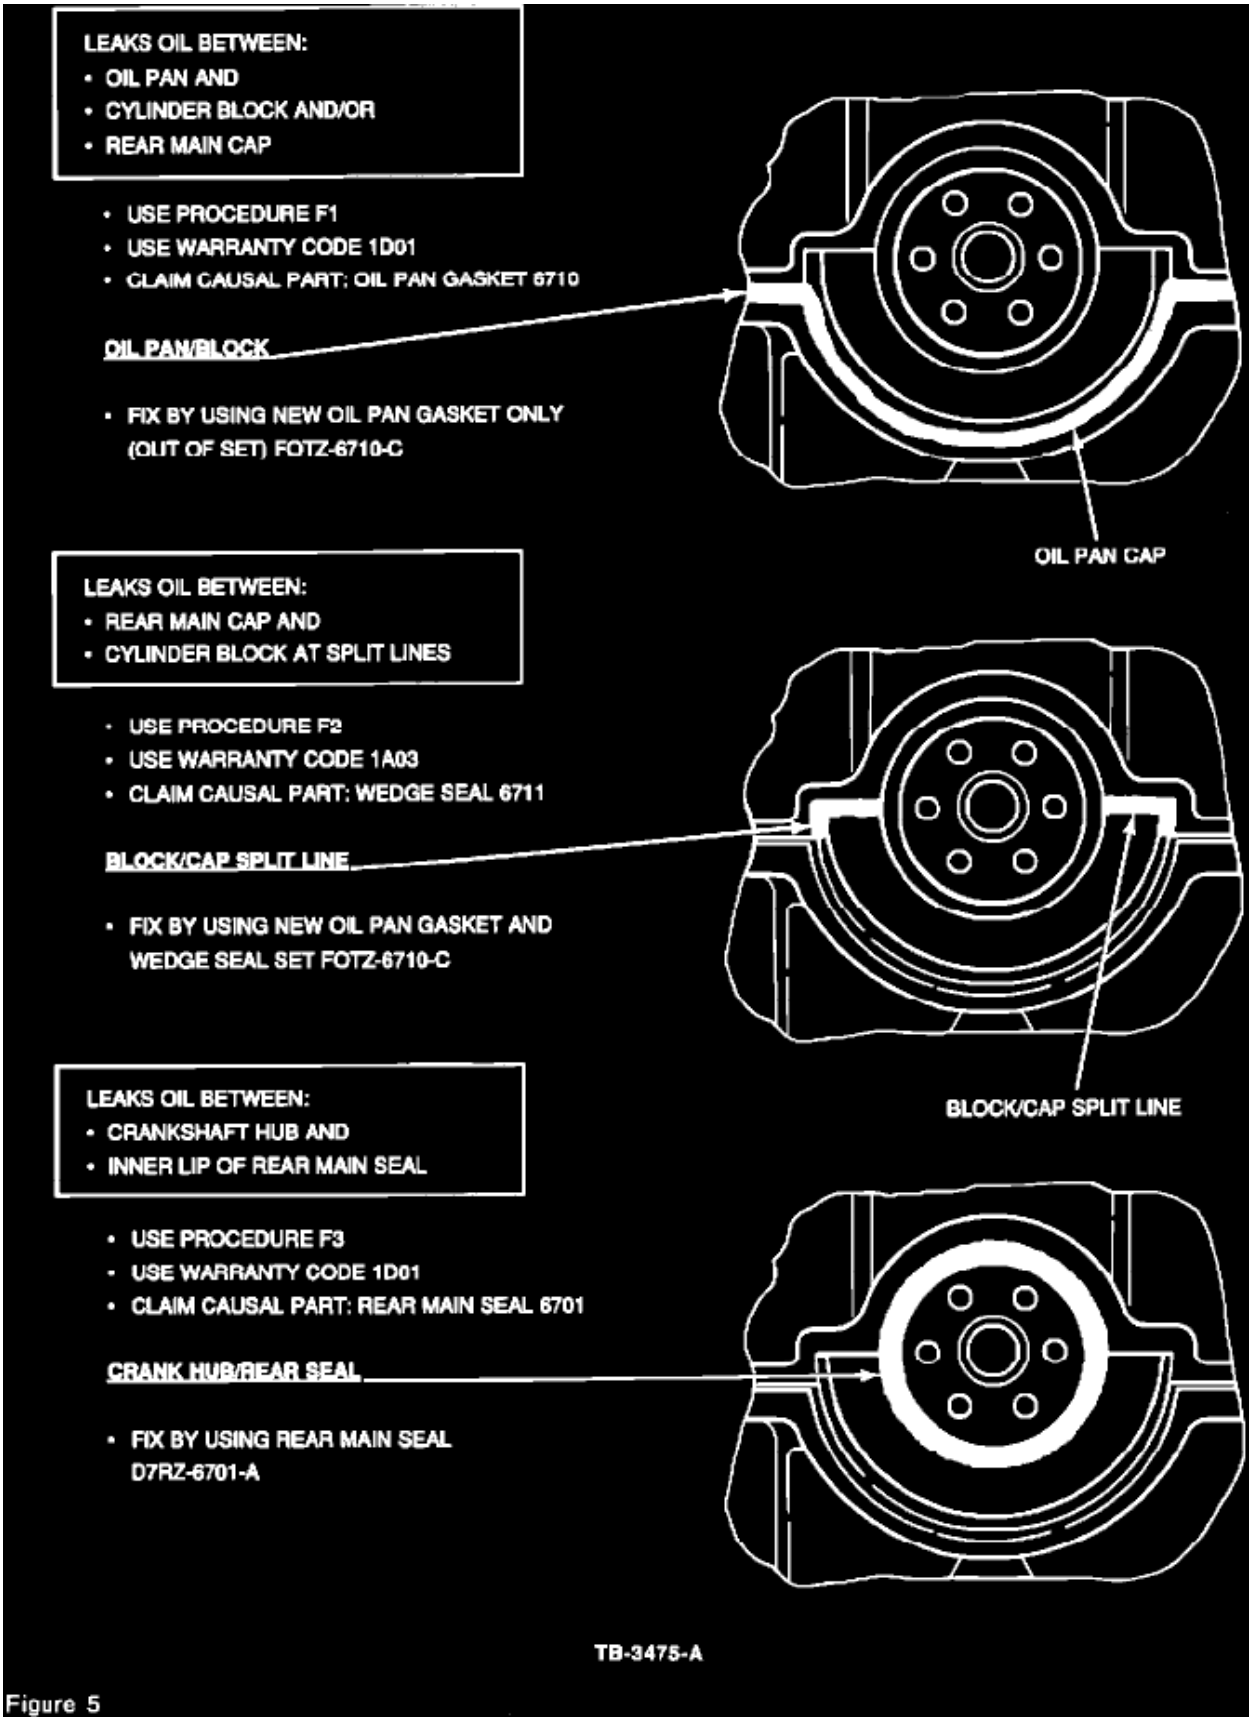

Figure 5

^ If bubbles are detected only at the oil pan gasket, between the oil pan and the cylinder block, or between the oil pan and the rear main cap, only the oil pan gasket needs replacing. Note

Procedure A, Figure 2, Step A3/F1, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A1.

^ If bubbles are detected between the rear main cap and the cylinder block, the rear cap must be removed and resealed. Note Procedure A, Figure 2, Step A3/F2, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A2.

^ If bubbles are detected between the rear seal lip and crank hub, a new rear oil seal will be required. Under certain circumstances, as outlined in the block diagram, it will be necessary to call the 4.OL Hotline. Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A3.

^ If no bubbles are detected, but oil is present in the area between the crank hub and the lip of the rear seal, carefully remove the seal and inspect the crankshaft rear seal journal. (A leak may occur

at the rear seal only when the engine is running.) Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Follow repair procedures outlined on the block diagram.

NOTE:

ANY APPEARANCE OF RUST, PITTING, POROSITY, OR NICKS ON THE REAR SEAL JOURNAL WILL CAUSE A LEAK.

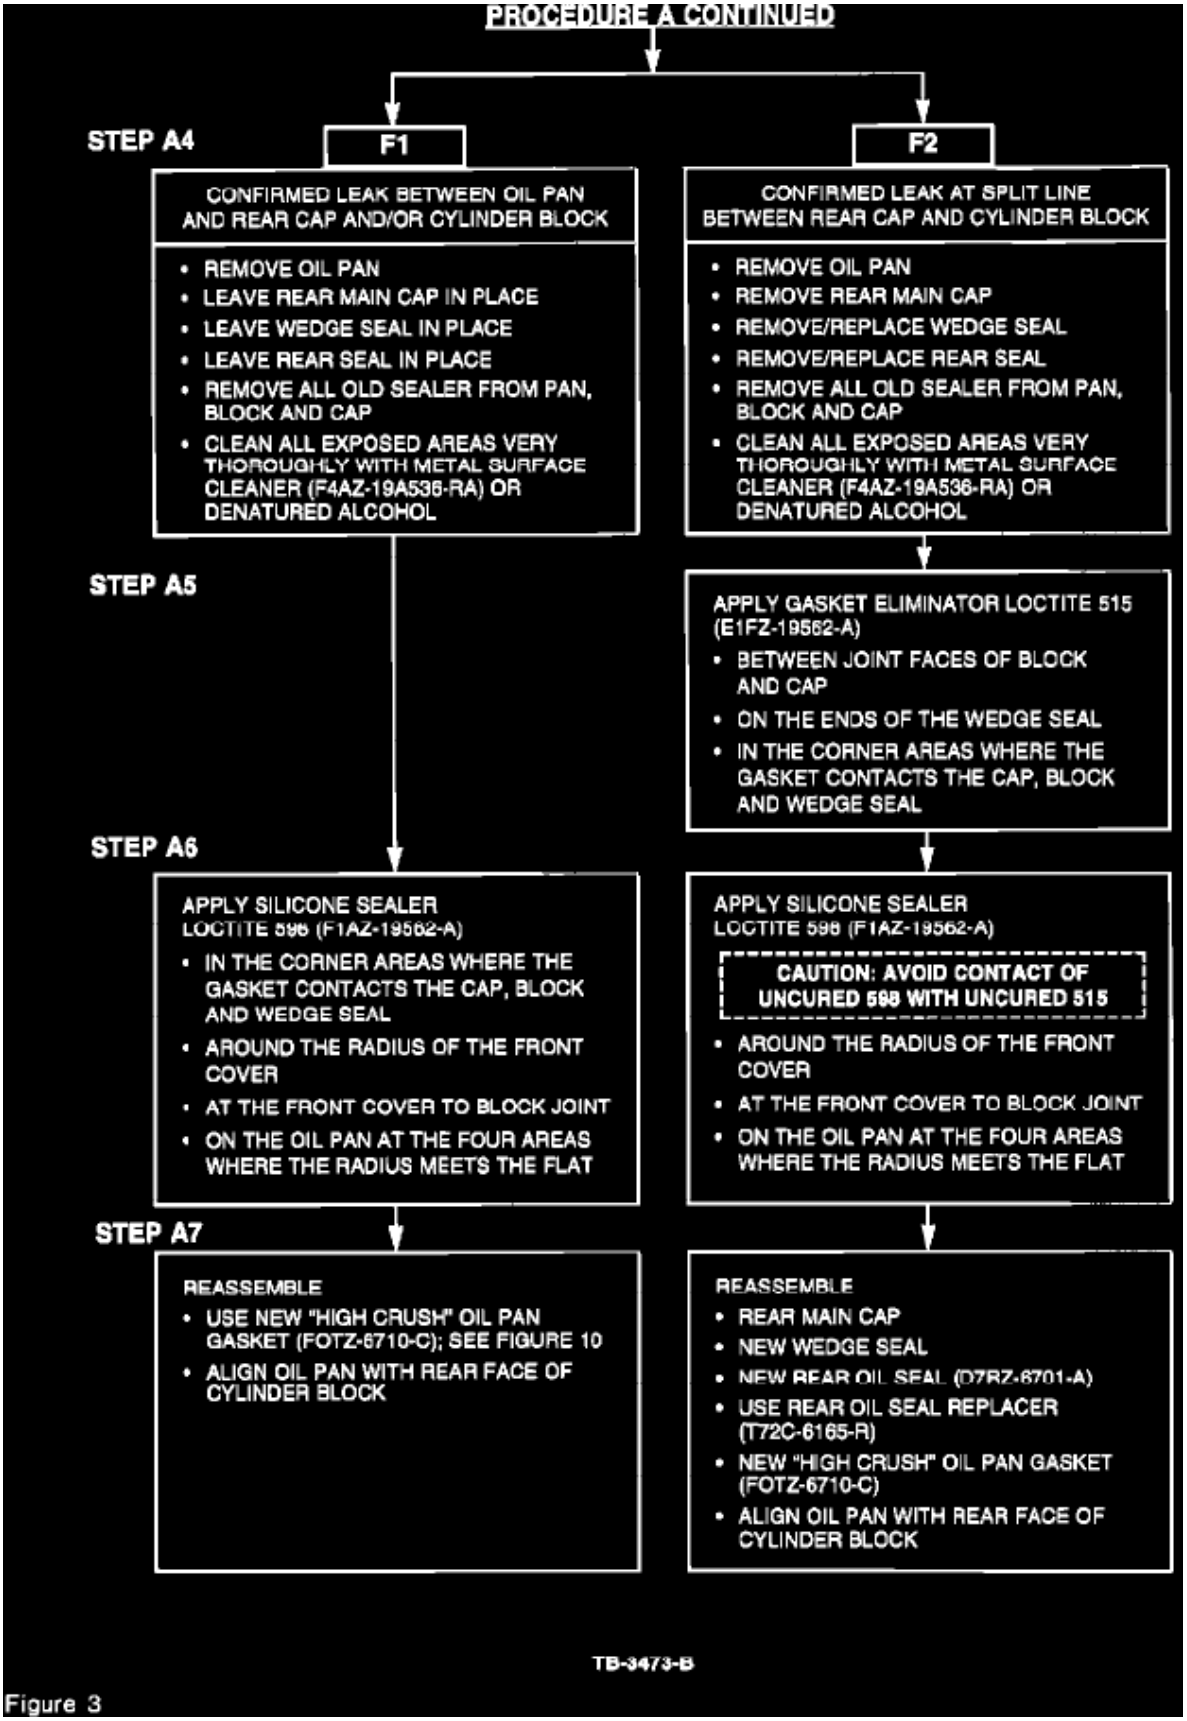
^ If bubbles are detected at the front or rear of the intake manifold gasket, a new intake manifold gasket (FOTZ-9439-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT INTAKE MANIFOLD, PROCEDURE B.

^ If bubbles are detected at the rocker cover rails, new rocker cover gaskets (F3TZ-6584-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT ROCKER COVER RAILS, PROCEDURE C.

^ If bubbles are detected at the front end of the engine, a new front seal (E6TZ-6700-A) or oil pan gasket (FOTZ-6710-C) will be required. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT THE FRONT END, PROCEDURE D.

Service Procedure - Repair

REAR END OIL LEAK - PROCEDURE A



PROCEDURE A CONTINUED
STEP A4
F1
CONFIRMED LEAK BETWEEN OIL PAN AND REAR CAP AND/OR CYLINDER BLOCK
• REMOVE OIL PAN
• LEAVE REAR MAIN CAP IN PLACE
• LEAVE WEDGE SEAL IN PLACE
• LEAVE REAR SEAL IN PLACE
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
F2
CONFIRMED LEAK AT SPLIT LINE BETWEEN REAR CAP AND CYLINDER BLOCK
• REMOVE OIL PAN
• REMOVE REAR MAIN CAP
• REMOVE/REPLACE WEDGE SEAL
• REMOVE/REPLACE REAR SEAL
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
STEP A5
APPLY GASKET ELIMINATOR LOCTITE 515 (E1FZ-19562-A)
• BETWEEN JOINT FACES OF BLOCK AND CAP
• ON THE ENDS OF THE WEDGE SEAL
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
STEP A6
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
CAUTION: AVOID CONTACT OF UNCURED 598 WITH UNCURED 515
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
STEP A7
REASSEMBLE
• USE NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C); SEE FIGURE 10
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
REASSEMBLE
• REAR MAIN CAP
• NEW WEDGE SEAL
• NEW REAR OIL SEAL (D7RZ-6701-A)
• USE REAR OIL SEAL REPLACER (T72C-6165-R)
• NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C)
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
TB-3473-B
Figure 3

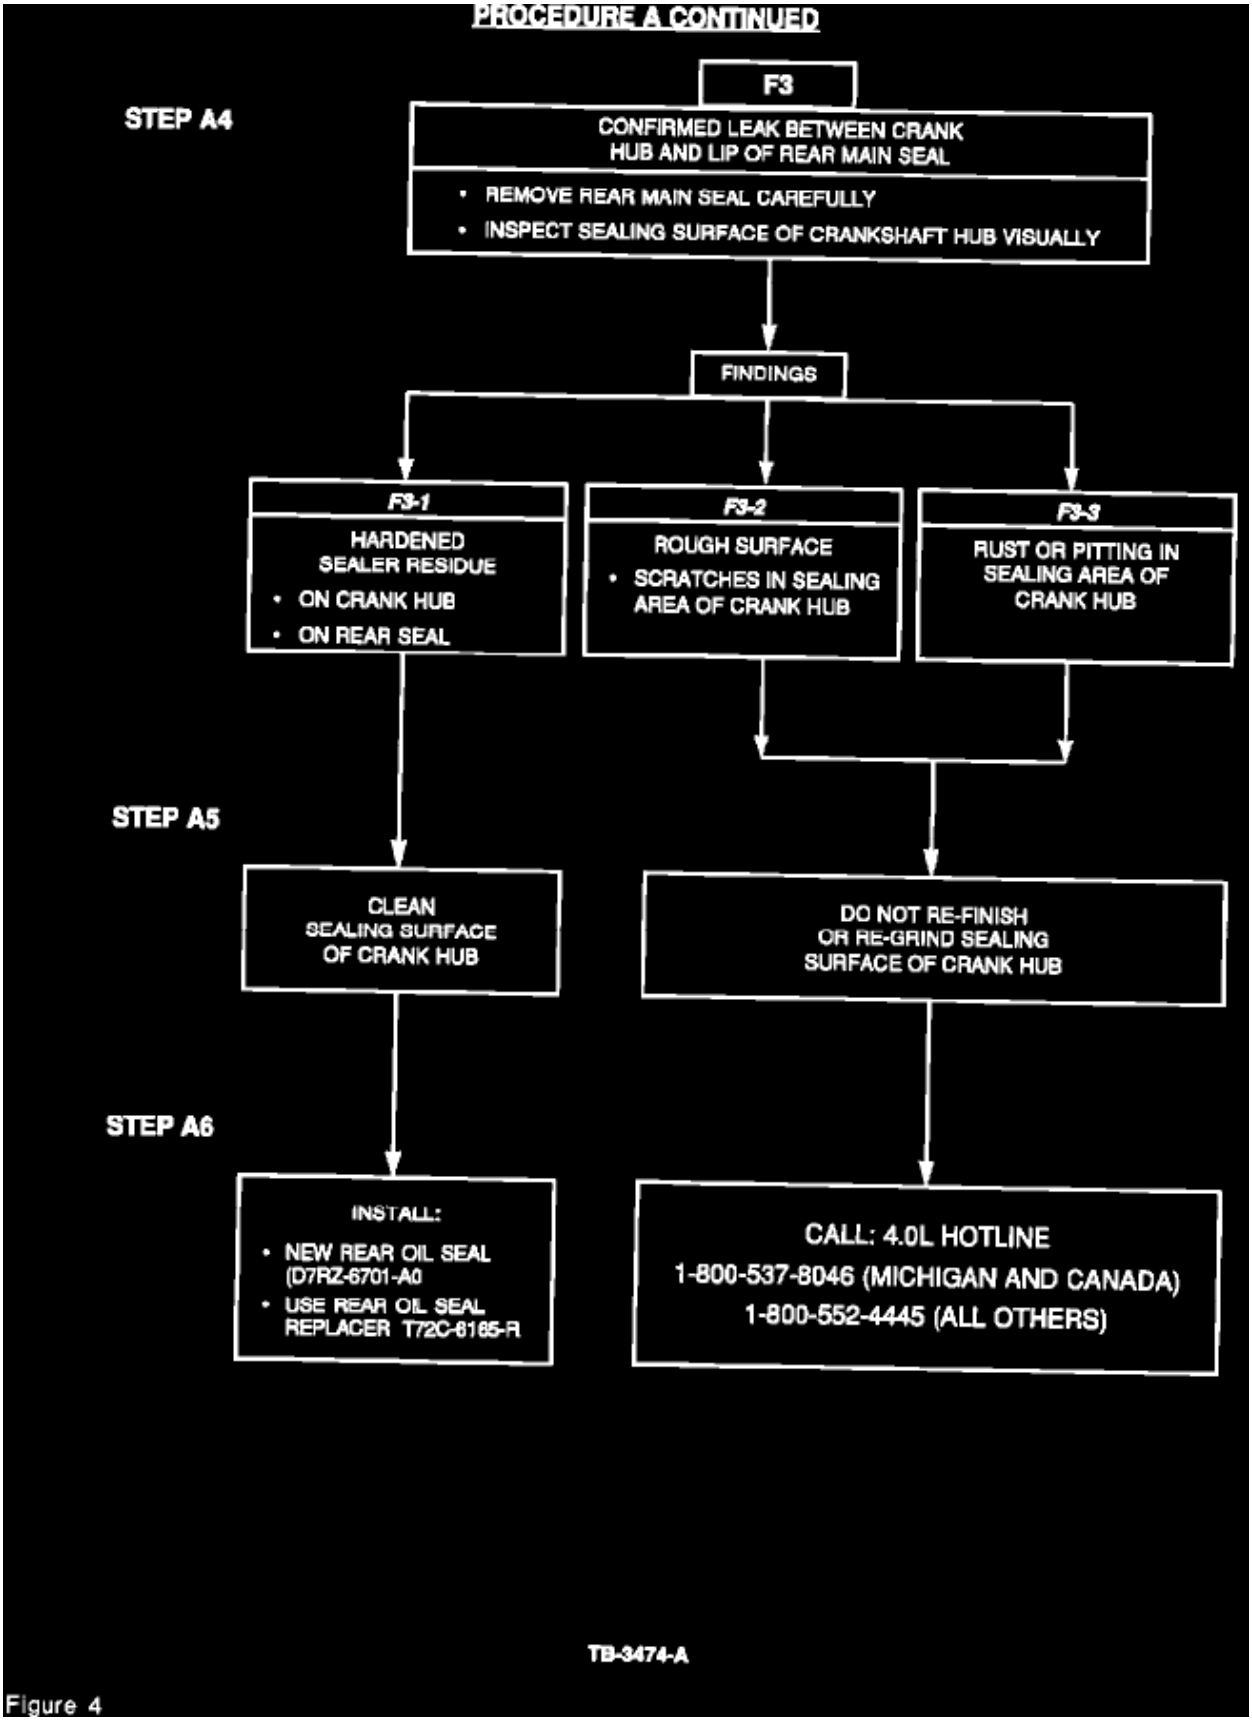


Figure 4

1. Repair procedure for a leak at oil pan gasket between the oil pan and cylinder block, or between the oil pan and the rear main cap. See block diagram Procedure A, Step A4/F1, Figures 3 and 4.

a. Remove the oil pan from the engine and remove the old gasket from the oil pan. Do not remove the rear main cap or wedge seal from the engine.

b. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

c. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap. Take special care to scrape/scratch all the old sealer from the exposed areas of the rear cap, wedge seal and cylinder block. This is a critical sealing area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER BLOCK.

d. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

e. Clean the transmission "BELLHOUSING" area, the rear of the cylinder block and the rear engine plate of ALL oil residue.

f. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corner of the radius areas at the front and rear of the oil pan.

g. Place the oil pan gasket (FOTZ-6710-C) in place in the groove in the oil pan.

h. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the corners where the rear main cap meets the cylinder block, at the corner areas of the radius area on the front cover and the front cover to cylinder block joint.

i. Set the oil pan in place and snug the four (4) pan nuts.

j. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .0100" (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

k. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

2. Repair procedure for a leak between the rear main cap and the cylinder block. See block diagram Procedure A, Step A4/F2.

a. Remove the oil pan, windage tray, oil pump and rear main cap from the engine.

b. Remove the rear main oil seal from the crankshaft and thoroughly inspect the main seal journal of the crankshaft for signs of rust, pitting, nicks or porosity.

c. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

d. Clean ALL the old sealer from the rear main bearing cap USING A SCRAPER AND WIRE WHEEL. The original Loctite sealer used during production assembly becomes extremely hard after it has cured. It is extremely important that ALL the old sealer be removed from the joint faces and grooves.

e. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap joint area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER

BLOCK.

f. Clean ALL the oil and old sealer from the "WEDGE SEAL" that fits around the rear main bearing cap in the oil pan gasket groove. Preferably use a new "WEDGE SEAL".

g. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

h. Clean the transmission "BELLHOUSING AREA", the rear of the cylinder block and the rear engine plate of ALL oil residue.

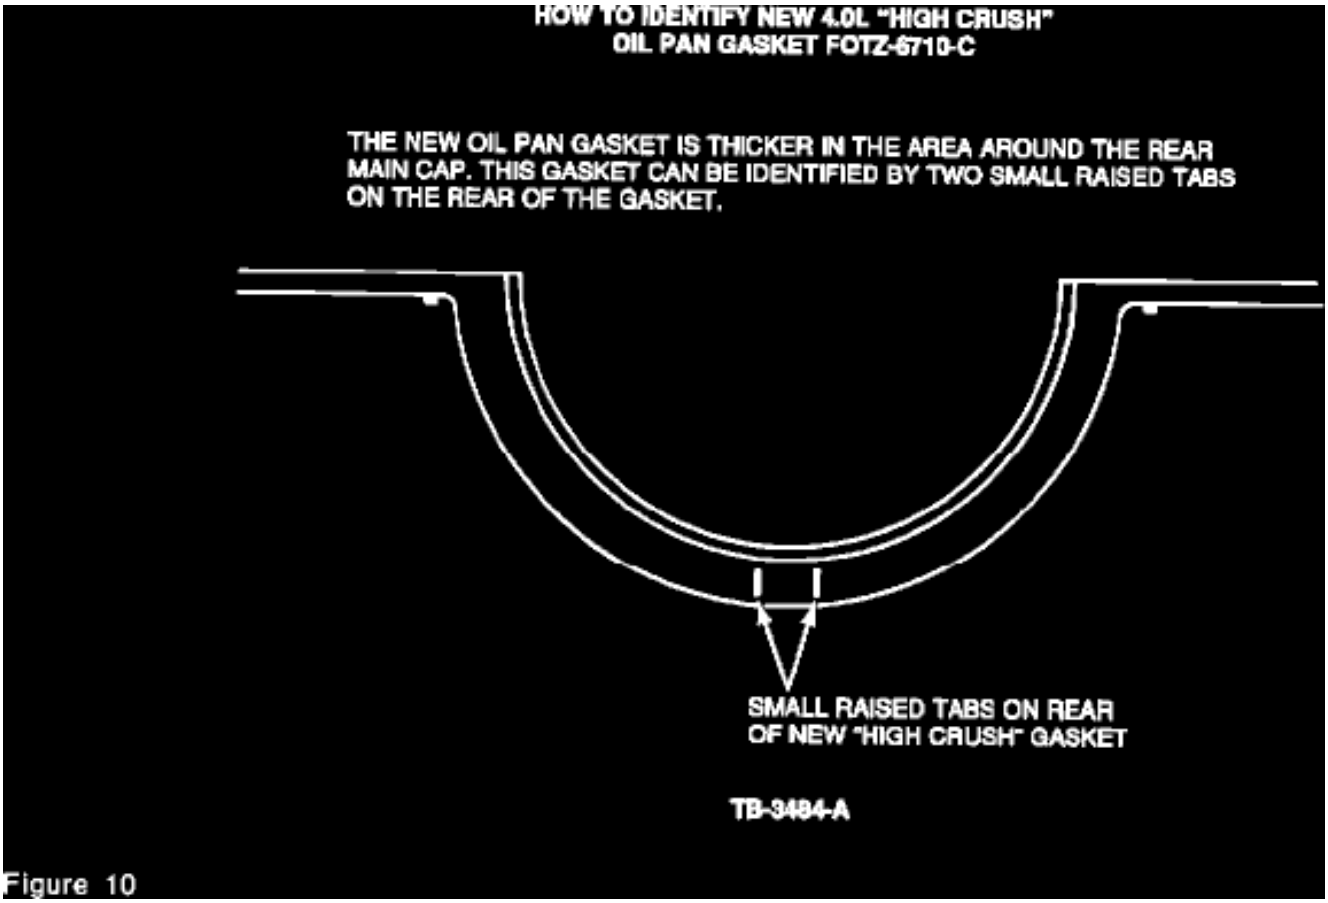

Figure 10

i. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) on the cylinder block along the corners of the rear main bearing cap joint area and on the joint face, approximately 1/2 inch (12.7 mm) from the rear of the block.

j. Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.

k. Align the rear main bearing cap to cylinder block by moving the bearing fore or aft (approx. 1/2 inch (12.7 mm) inward in the rear oil seal bore) so that the rear seal stop of the block and cap line up. This will assure that the rear main oil seal will seat squarely when installed in the bore.

l. Torque the rear main cap bolts to 66-77 lb.ft. (90-104 N-m).

m. Fill the cavities for the "WEDGE SEAL" on both sides of the rear main cap with Ford Gasket Eliminator (E1FZ-19562-A).

n. Place "WEDGE SEAL" in place and use a flat bladed screwdriver to fully seat the "WEDGE SEAL", forcing the excessive sealer out.

o. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) in the corners of the oil pan gasket groove of the rear main cap where the cap meets the cylinder block.

p. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) at the corner areas of the radius area on the front cover and at the front cover to cylinder block joint.

q. Reinstall the oil pump and windage tray. Torque to 13-15 lb.ft. (17-21 N-m).

r. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corners of the radius areas at the front and rear of the oil pan.

s. Place the oil pan gasket (FOTZ-6710-C), Figure 10, in place in the groove in the oil pan.

t. Set the oil pan in place and snug the four (4) oil pan bolts.

u. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .01000 (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

v. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

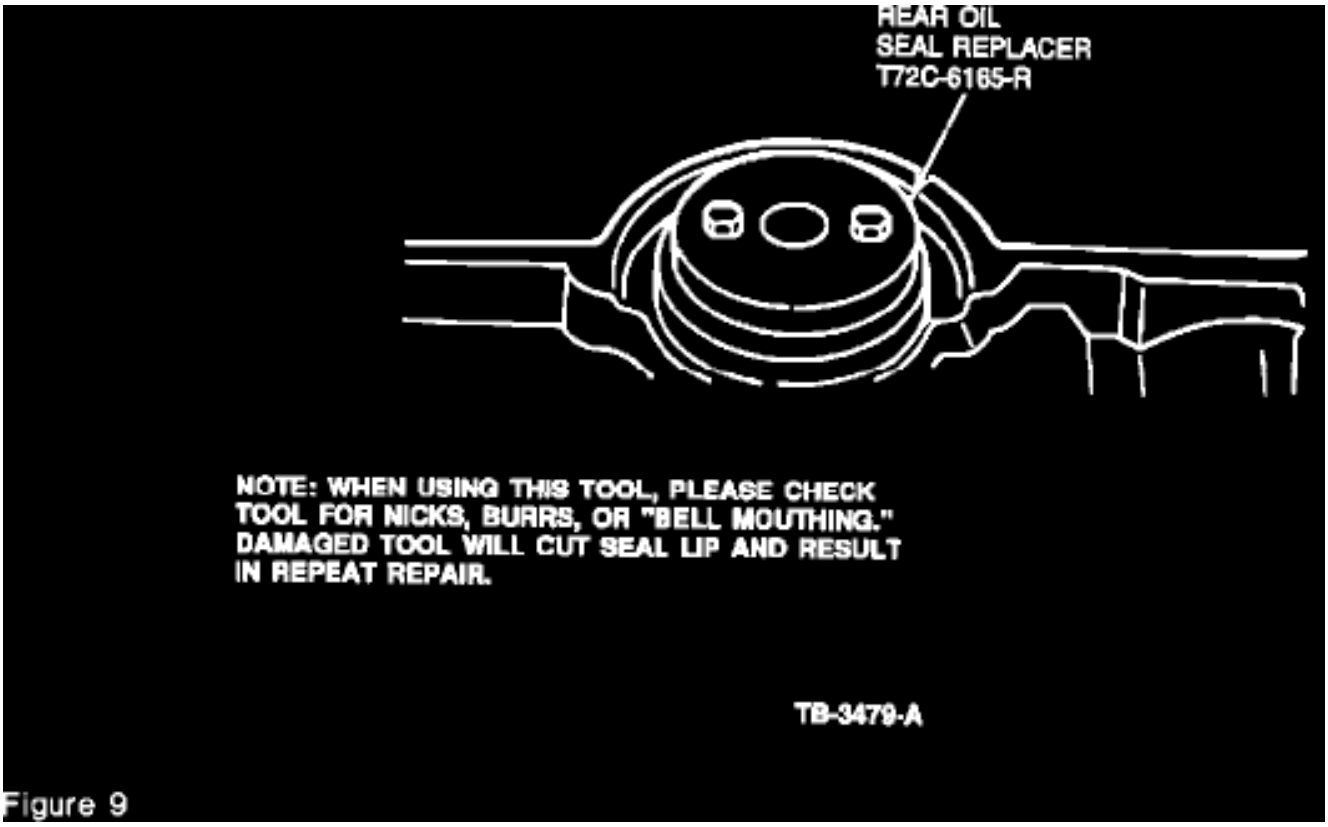

Figure 9

w. Coat the rear main oil seal (D7RZ-6701-A) with oil. Install the rear seal in the seal bore using Rear Oil Seal Replacer T72C-6165-R. This tool uses two flywheel bolts to draw the seal into position. Refer to Figure 9.

CAUTION:

DO NOT USE THE OLD STYLE HAMMER OPERATED TOOL.

3. Repair procedure for a leak between the rear main seal and the crankshaft. See block diagram, Procedure A, Step A4/F3.

a. Any presence of rust on the rear seal journal will cause a leak.

b. Any presence of pitting, porosity or nicks on the rear seal journal will cause a leak.

NOTE:

IF A LEAK IS PRESENT BETWEEN THE REAR MAIN SEAL AND CRANKSHAFT, PLEASE NOTIFY THE 4.0L "HOTLINE" AT (800) 537-8046 OR (800) 552-4445 PRIOR TO ANY ATTEMPT TO REPAIR THIS CONDITION.

Service Procedure - Repair For Oil Leaks At Intake Manifold

PROCEDURE B

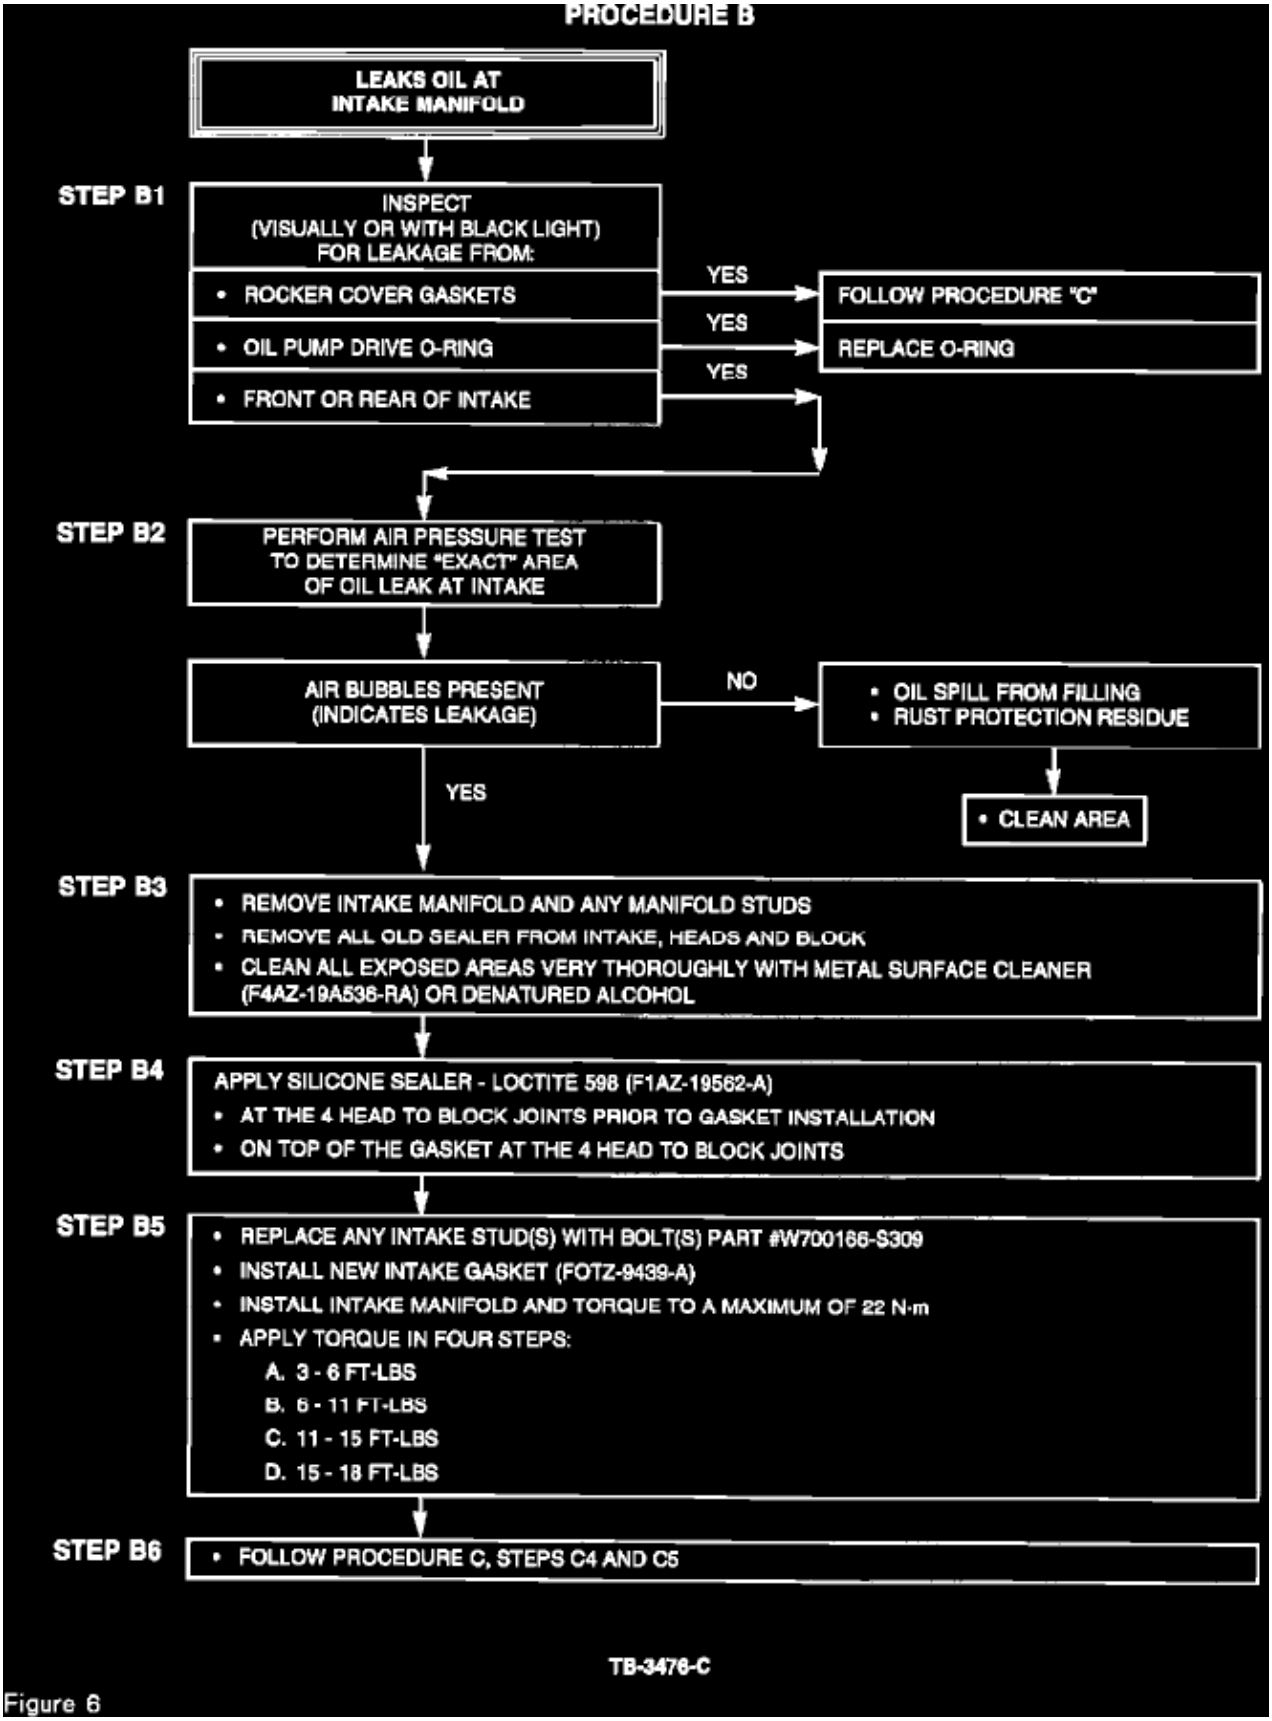

Figure 6

1. If the air pressure test showed no air bubbles, follow Procedure B2 to clean area of oil spill or other contamination.

2. If the air pressure test showed air bubbles present, follow Steps B3 through B6. Refer also to the Service Manual for the applicable year for further information pertinent to removal and installation of the intake manifold.

Service Procedure - Repair For Oil Leaks At Rocker Cover Rails

PROCEDURE C

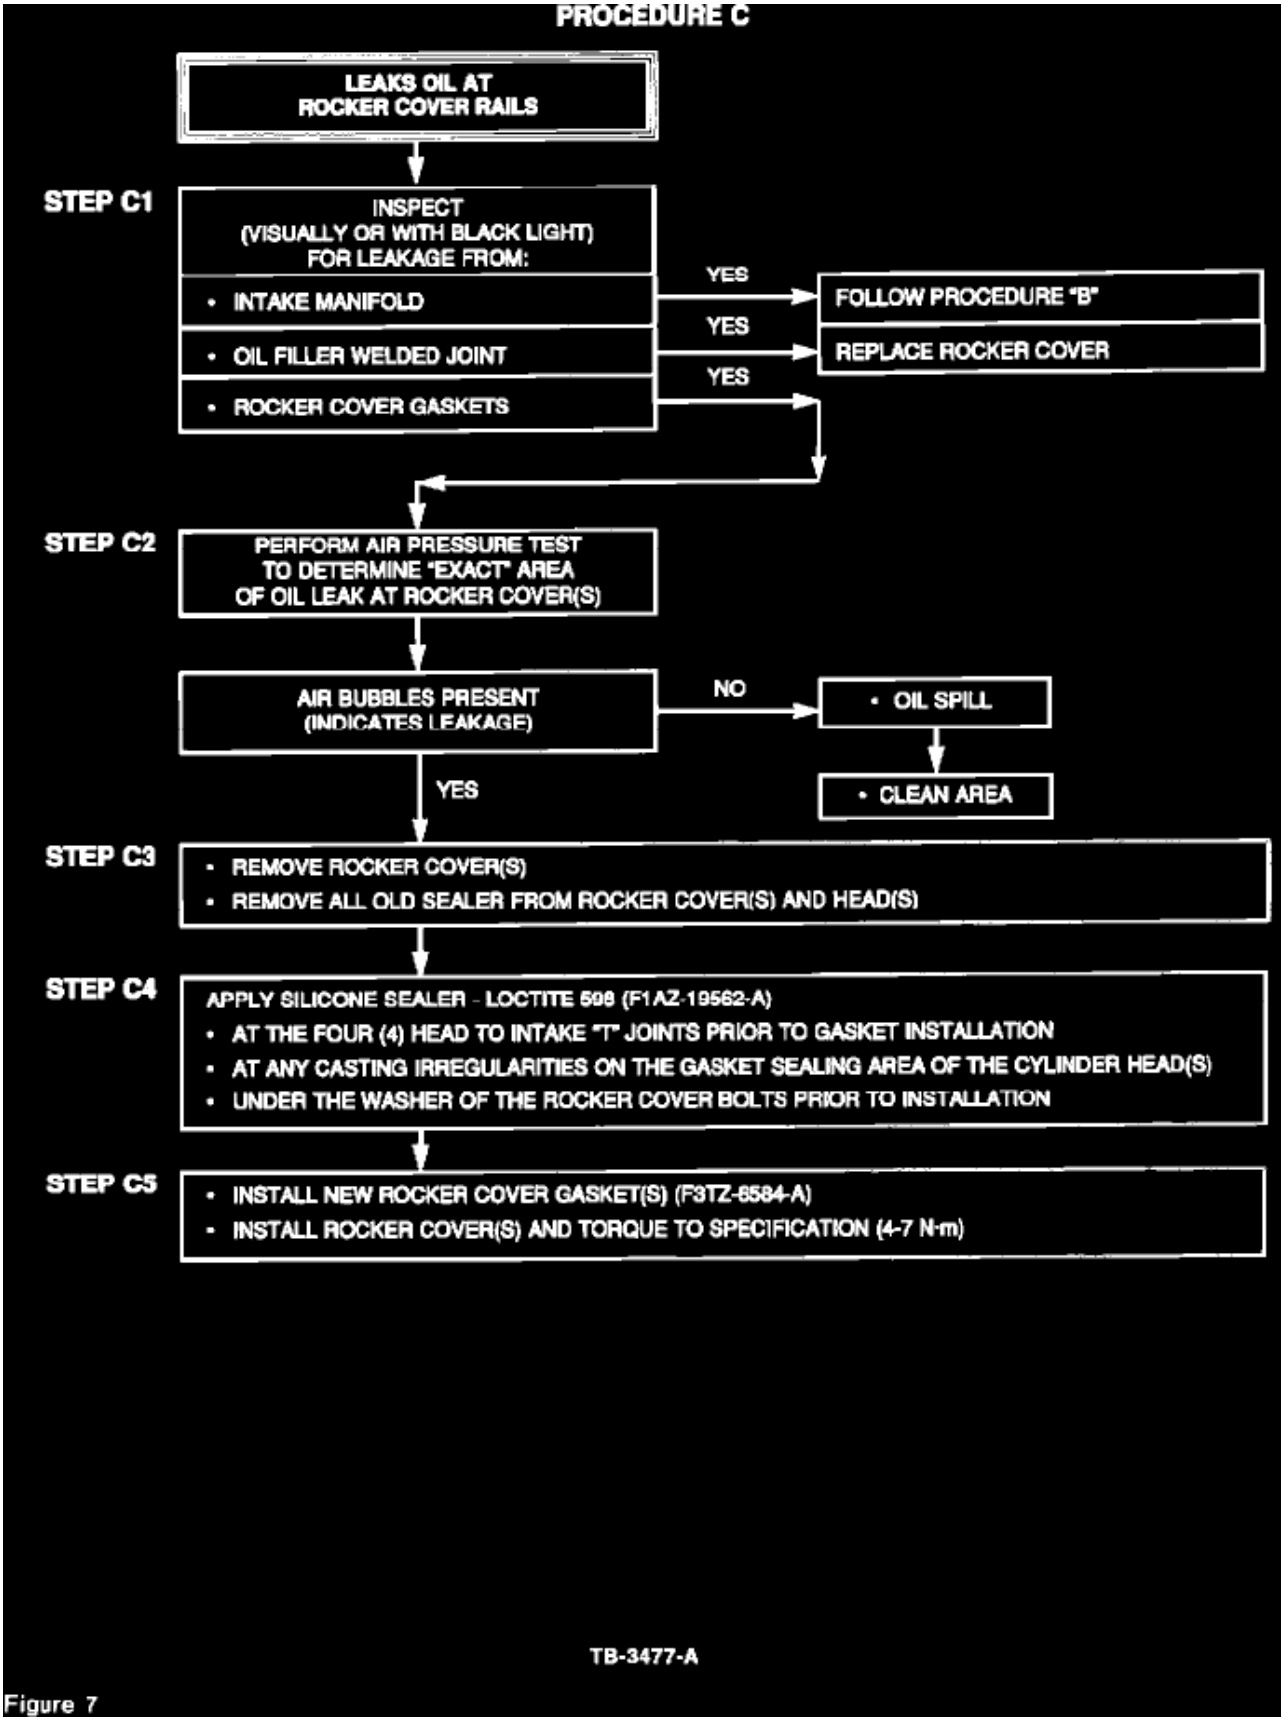

Figure 7

1. If the air pressure test showed no air bubbles, follow Procedure C2 to clean the area of any oil spill.

2. If the air pressure test showed air bubbles present, follow Steps C3 through C5.

Service Procedure - Repair For Oil Leaks At Front End

PROCEDURE D

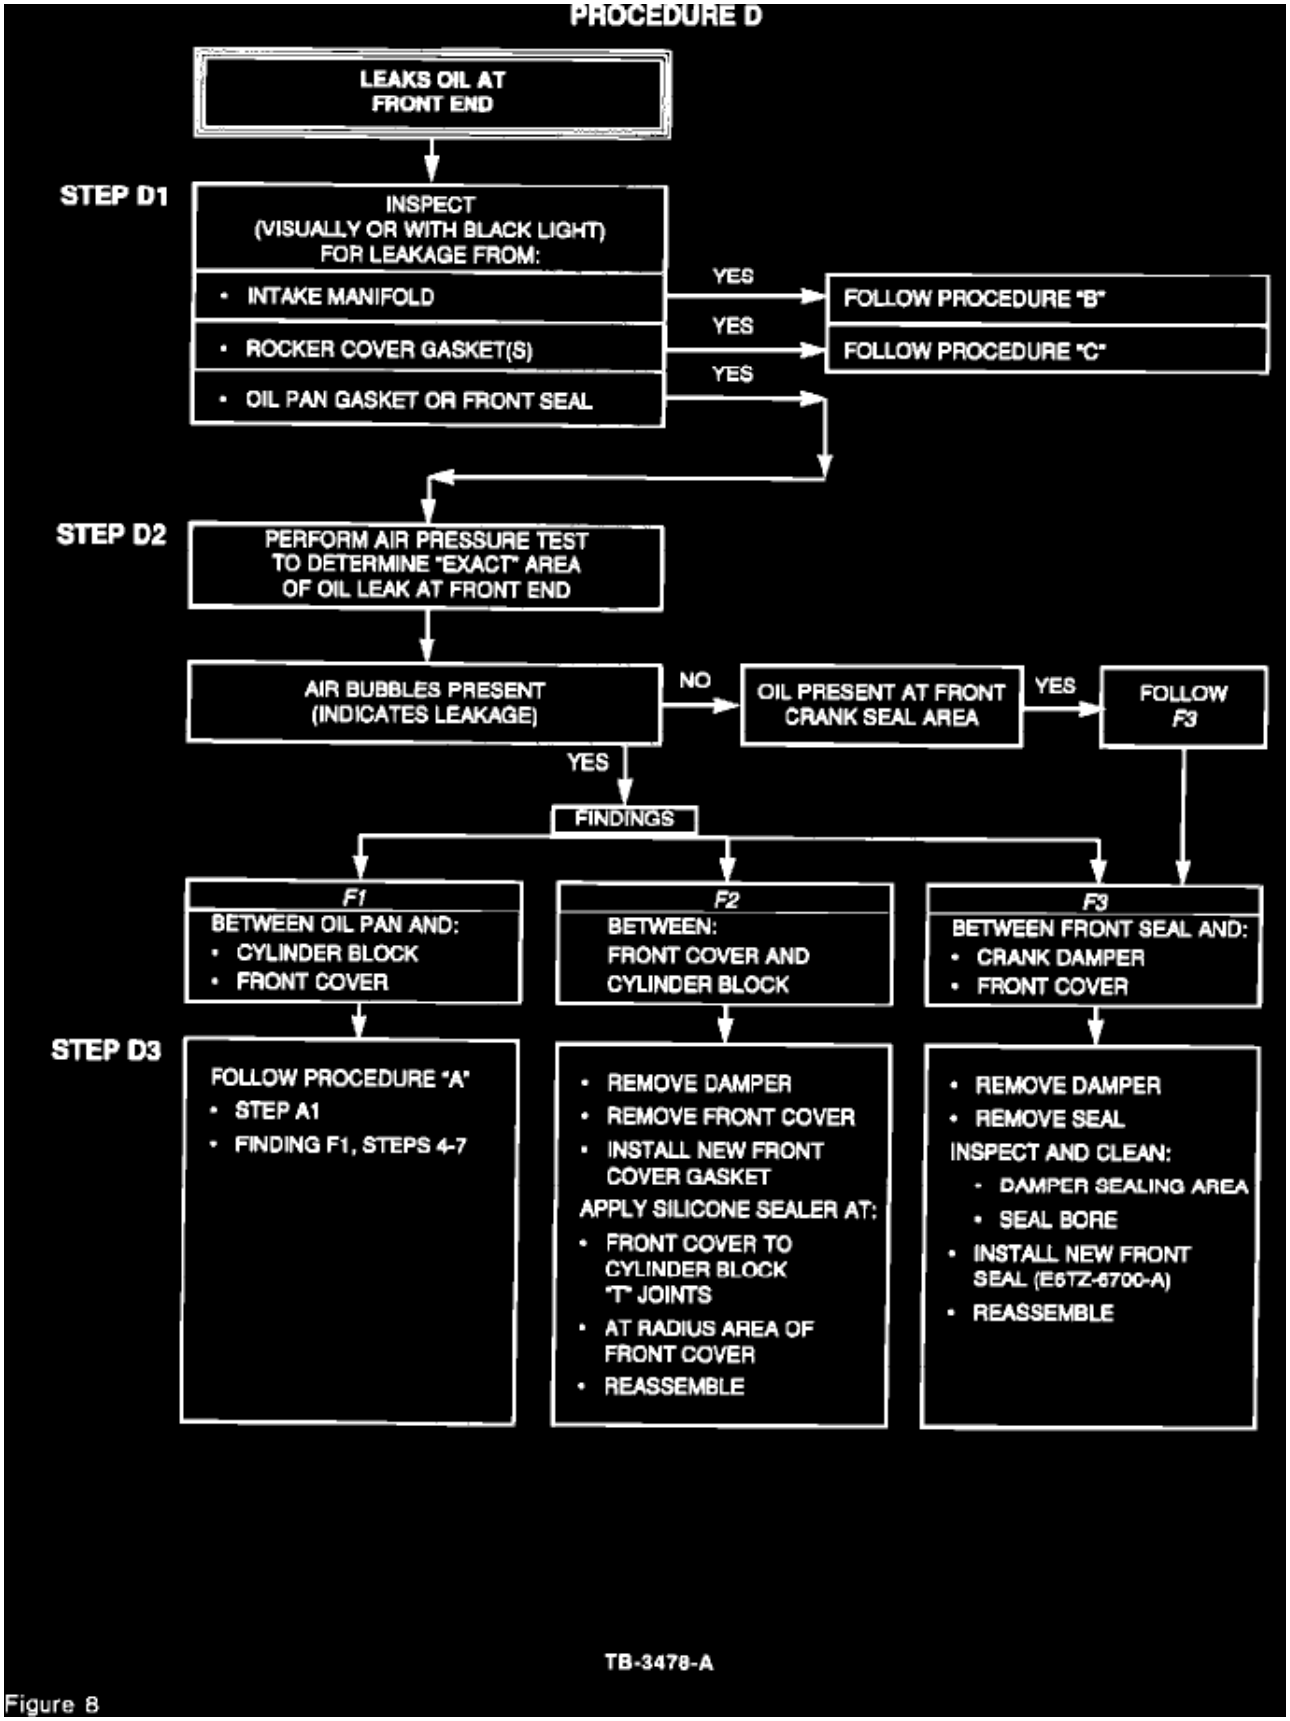

Figure 8

1. If the air pressure test showed no air bubbles, follow Procedure D, F3.

2. If the air pressure test showed air bubbles present, follow Procedure D, F1 or F2 as appropriate.

General Information

LIGHT TRUCK: 1990-93 AEROSTAR, RANGER 1991-93 EXPLORER

This TSB is being republished in its entirety to correct the type of cleaner being used in Figures 1, 3, and 6.

ISSUE: The many sources of leaks which typically appear at the lower end, front end, intake manifold valley, and rocker cover rails have led to mis-diagnosis as to the source of the leak and improper repair procedures, repeat repairs, and customer dissatisfaction.

ACTION: This TSB article has been developed to list the latest sealing techniques and associated part numbers for:

^ Oil Pan

^ Rear Main Seal

^ Rocker Covers

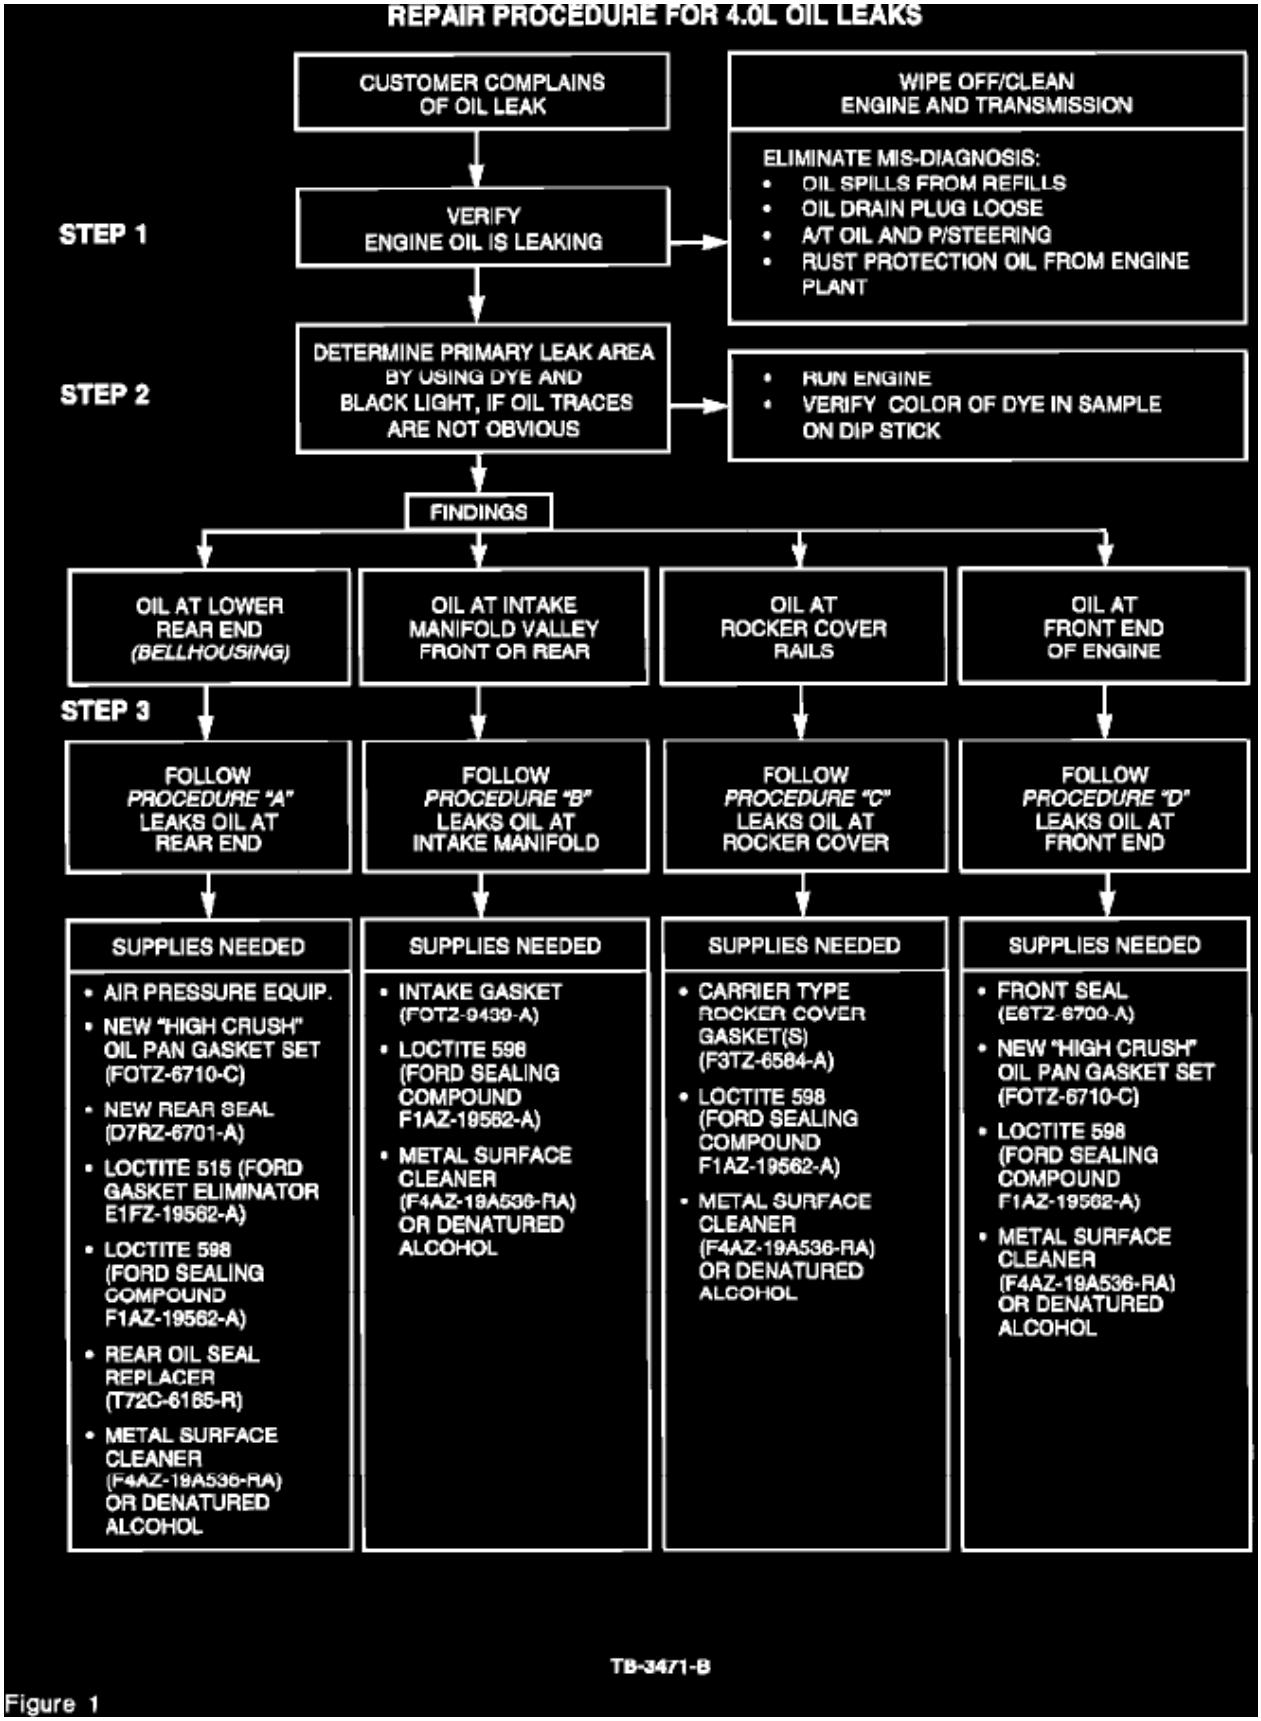

Figure 1

^ Intake Manifold

This article attempts to fully address all issues as one, in order to provide a diagnostic guide which leads to proper diagnosis and repair the first time. Use the following procedures to verify the location of the oil leak and perform the repair.

Service Procedure - Diagnosis

1. Perform Steps 1 and 2 of the block diagram shown in Figure 1. Perform a visual inspection to determine the general area of the oil leak.

2. After determining the "Findings" of Step 2, perform Step 3 by following Procedures A, B, C or D, whichever is appropriate, up to, but not including the air pressure test.

NOTE:

WHEN THE FINDINGS RESULT IN FOLLOWING PROCEDURE "A" FOR "LEAKS OIL AT REAR END", IT IS VERY IMPORTANT TO FOLLOW THE BLOCK DIAGRAM INSTRUCTIONS TO REMOVE THE TRANSMISSION, IF AN AEROSTAR, AND TO REMOVE THE ENGINE, IF AN EXPLORER/RANGER. THE PRACTICE OF REMOVING EXPLORER/RANGER OIL PANS WITH ENGINE IN VEHICLE CAN RESULT IN FAULTY DIAGNOSIS AND/OR REPAIR FOR THE PURPOSES OF THIS TSB.

If the leak has not been located and corrected at this point, then fabricate a device that is capable of applying a constant 1 to 3 psi of air pressure to the engine crankcase. The Rotunda Leak Tester 134-00003, or equivalent, which contains a pressure regulator and gauge capable of a 1 to 3 psi range, may be used.

3. Verify the location of the oil leak by pressurizing the engine crankcase with a constant supply of 3 psi of air pressure and the use of leak detection solution (liquid detergent and water). This process will verify the exact location of the leak. Dye and black light will verify a leak is present, but may not verify the exact location of the leak.

a. Assemble the necessary hose and fittings to connect an air pressure regulator and air pressure gauge to the shop air supply and to the engine crankcase through the dipstick tube.

b. Test the device to make sure 1-3 psi of air pressure can be maintained. Bursts of pressure over 3 psi can damage engine seals.

c. Before starting the test, make sure the regulator valve is completely closed so as not to accidentally apply a big burst of air to the engine when starting the test.

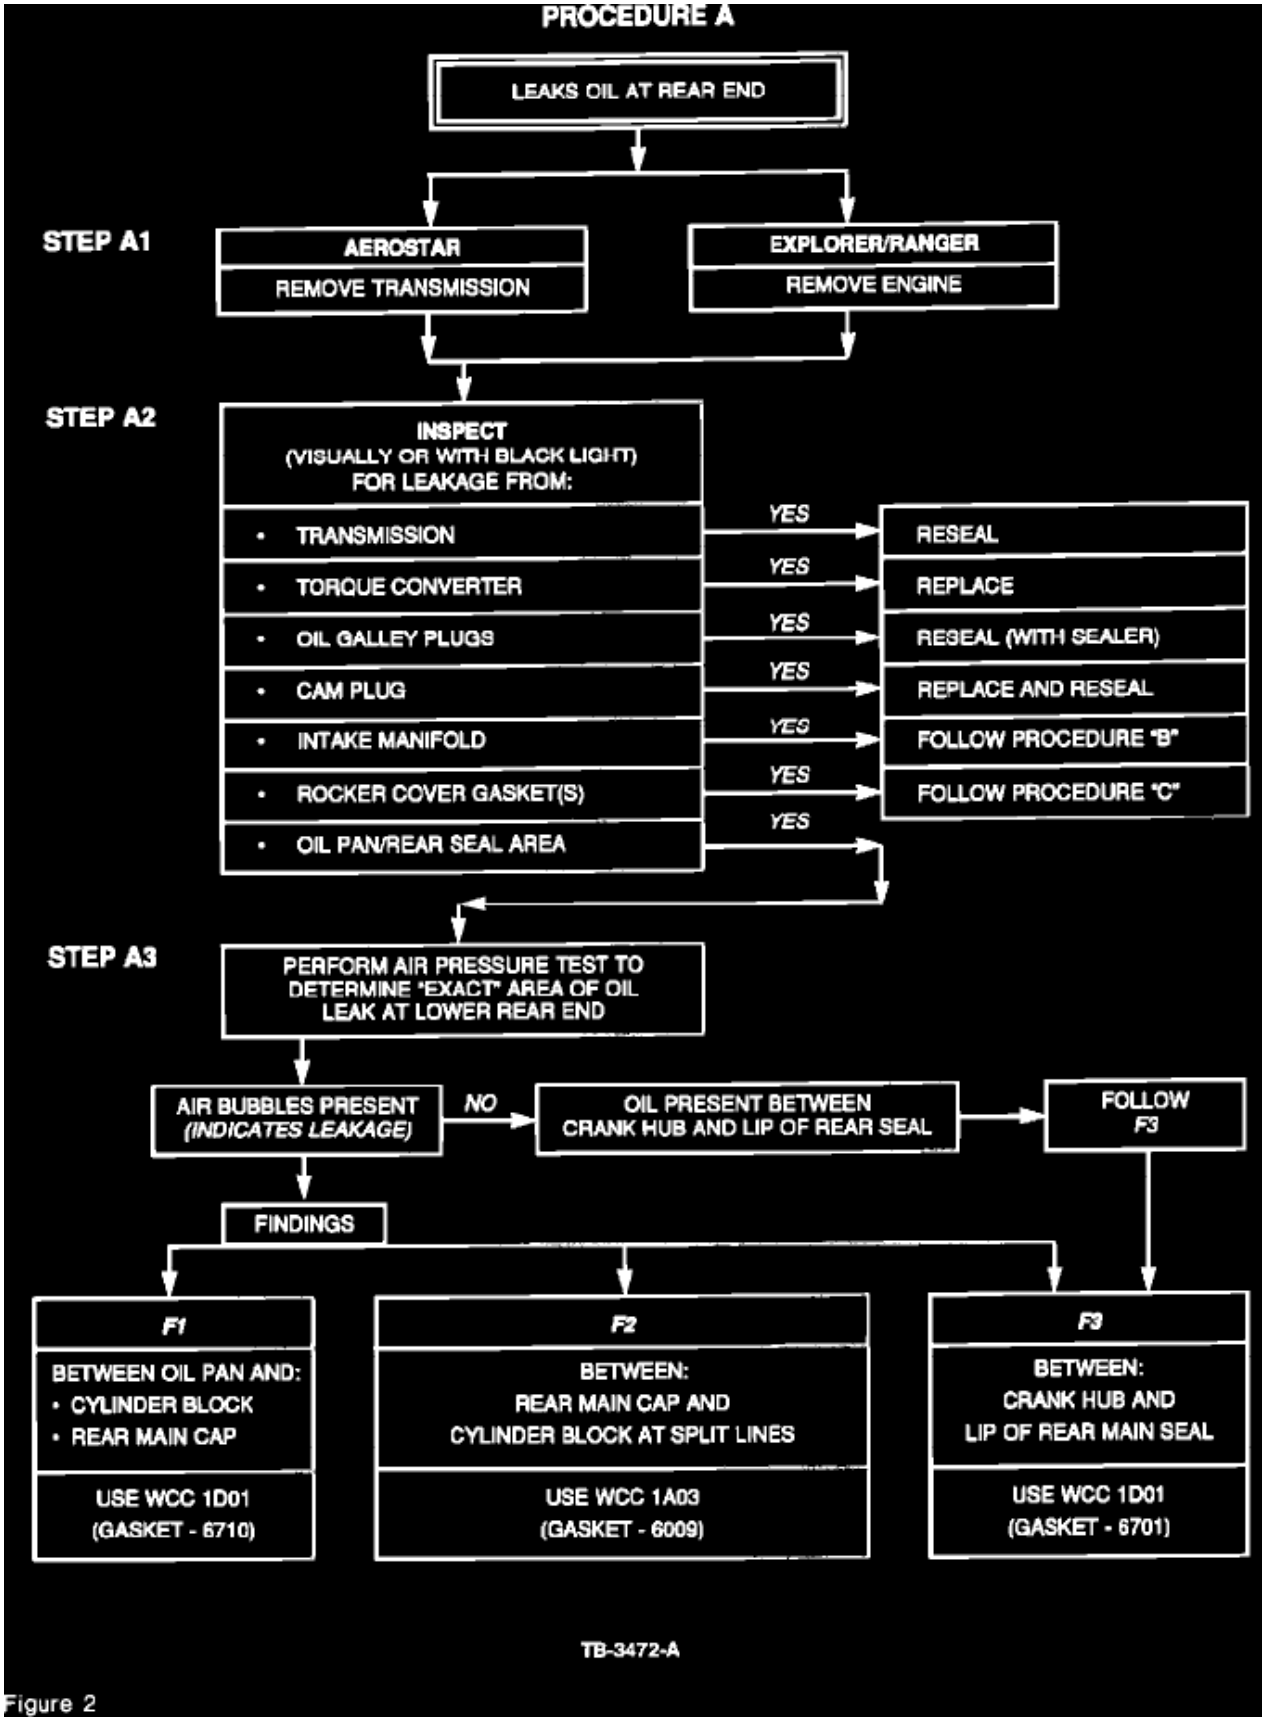
d. Attach the outlet (regulated) hose from the regulator/gauge device to the dipstick.

e. To trap air in the engine, plug any ports and passages (PCV valve, air inlet connection) that will allow air to escape.

f. Slowly open the regulator valve until 1-3 psi of air pressure registers on the gauge.

g. Keeping air pressure applied, brush or squirt a solution of liquid detergent and water or commercially available liquid leak detector (Snoop, Bubbles) to the primary area identified in Step 2 of the block diagram.

^ If the primary area is in the rear seal area, apply the solution to the rear seal, rear cap, rear cap to cylinder block and oil pan gasket areas.



PROCEDURE A
LEAKS OIL AT REAR END
STEP A1
AEROSTAR
REMOVE TRANSMISSION
EXPLORER/RANGER
REMOVE ENGINE
STEP A2
INSPECT
(VISUALLY OR WITH BLACK LIGHT)
FOR LEAKAGE FROM:
• TRANSMISSION
• TORQUE CONVERTER
• OIL GALLEY PLUGS
• CAM PLUG
• INTAKE MANIFOLD
• ROCKER COVER GASKET(S)
• OIL PAN/REAR SEAL AREA
YES
RESEAL
REPLACE
RESEAL (WITH SEALER)
REPLACE AND RESEAL
FOLLOW PROCEDURE "B"
FOLLOW PROCEDURE "C"
STEP A3
PERFORM AIR PRESSURE TEST TO
DETERMINE "EXACT" AREA OF OIL
LEAK AT LOWER REAR END
AIR BUBBLES PRESENT
(INDICATES LEAKAGE)
NO
OIL PRESENT BETWEEN
CRANK HUB AND LIP OF REAR SEAL
FOLLOW
F3
FINDINGS
F1
BETWEEN OIL PAN AND:
• CYLINDER BLOCK
• REAR MAIN CAP
USE WCC 1D01
(GASKET - 6710)

Figure 2

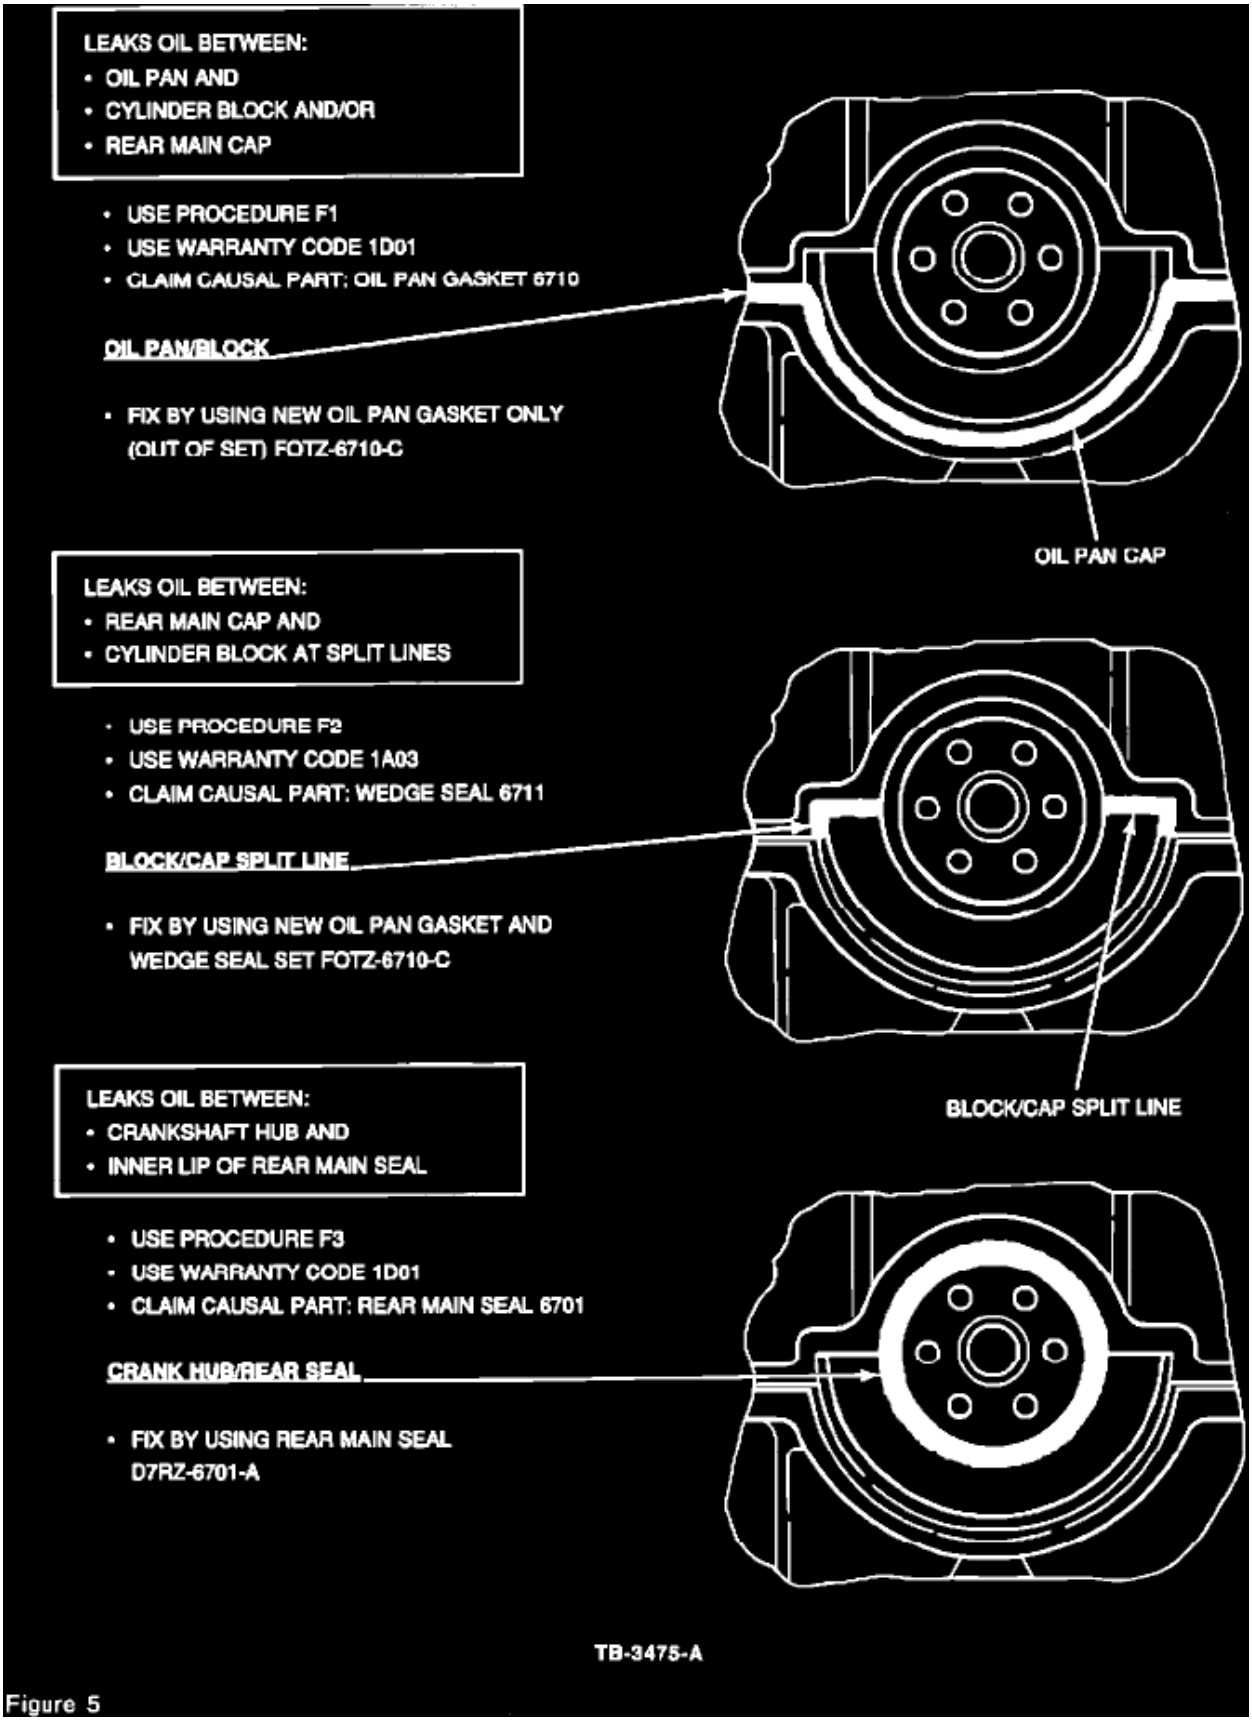

Figure 5

^ If bubbles are detected only at the oil pan gasket, between the oil pan and the cylinder block, or between the oil pan and the rear main cap, only the oil pan gasket needs replacing. Note

Procedure A, Figure 2, Step A3/F1, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A1.

^ If bubbles are detected between the rear main cap and the cylinder block, the rear cap must be removed and resealed. Note Procedure A, Figure 2, Step A3/F2, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A2.

^ If bubbles are detected between the rear seal lip and crank hub, a new rear oil seal will be required. Under certain circumstances, as outlined in the block diagram, it will be necessary to call the 4.OL Hotline. Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A3.

^ If no bubbles are detected, but oil is present in the area between the crank hub and the lip of the rear seal, carefully remove the seal and inspect the crankshaft rear seal journal. (A leak may occur

at the rear seal only when the engine is running.) Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Follow repair procedures outlined on the block diagram.

NOTE:

ANY APPEARANCE OF RUST, PITTING, POROSITY, OR NICKS ON THE REAR SEAL JOURNAL WILL CAUSE A LEAK.

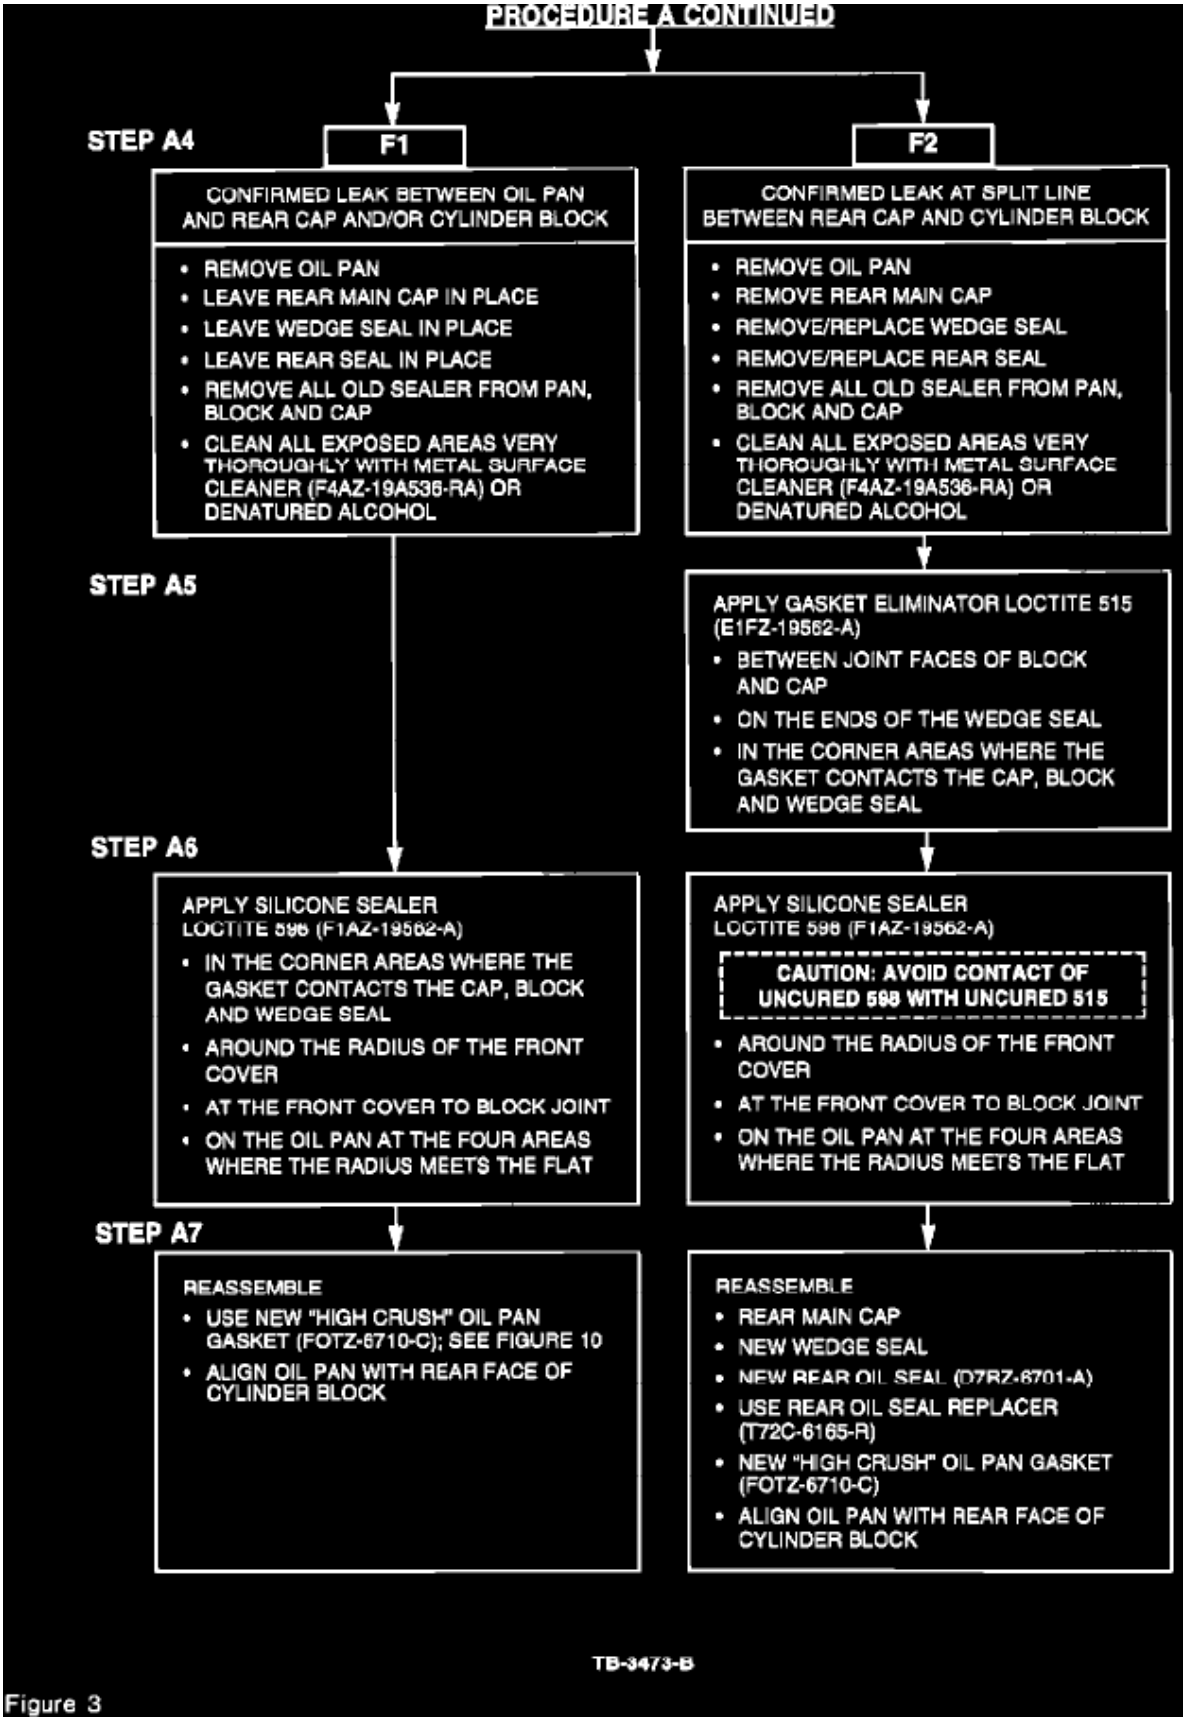
^ If bubbles are detected at the front or rear of the intake manifold gasket, a new intake manifold gasket (FOTZ-9439-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT INTAKE MANIFOLD, PROCEDURE B.

^ If bubbles are detected at the rocker cover rails, new rocker cover gaskets (F3TZ-6584-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT ROCKER COVER RAILS, PROCEDURE C.

^ If bubbles are detected at the front end of the engine, a new front seal (E6TZ-6700-A) or oil pan gasket (FOTZ-6710-C) will be required. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT THE FRONT END, PROCEDURE D.

Service Procedure - Repair

REAR END OIL LEAK - PROCEDURE A



PROCEDURE A CONTINUED
STEP A4
F1
CONFIRMED LEAK BETWEEN OIL PAN AND REAR CAP AND/OR CYLINDER BLOCK
• REMOVE OIL PAN
• LEAVE REAR MAIN CAP IN PLACE
• LEAVE WEDGE SEAL IN PLACE
• LEAVE REAR SEAL IN PLACE
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
F2
CONFIRMED LEAK AT SPLIT LINE BETWEEN REAR CAP AND CYLINDER BLOCK
• REMOVE OIL PAN
• REMOVE REAR MAIN CAP
• REMOVE/REPLACE WEDGE SEAL
• REMOVE/REPLACE REAR SEAL
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
STEP A5
APPLY GASKET ELIMINATOR LOCTITE 515 (E1FZ-19562-A)
• BETWEEN JOINT FACES OF BLOCK AND CAP
• ON THE ENDS OF THE WEDGE SEAL
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
STEP A6
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
CAUTION: AVOID CONTACT OF UNCURED 598 WITH UNCURED 515
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
STEP A7
REASSEMBLE
• USE NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C); SEE FIGURE 10
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
REASSEMBLE
• REAR MAIN CAP
• NEW WEDGE SEAL
• NEW REAR OIL SEAL (D7RZ-6701-A)
• USE REAR OIL SEAL REPLACER (T72C-6165-R)
• NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C)
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
TB-3473-B
Figure 3

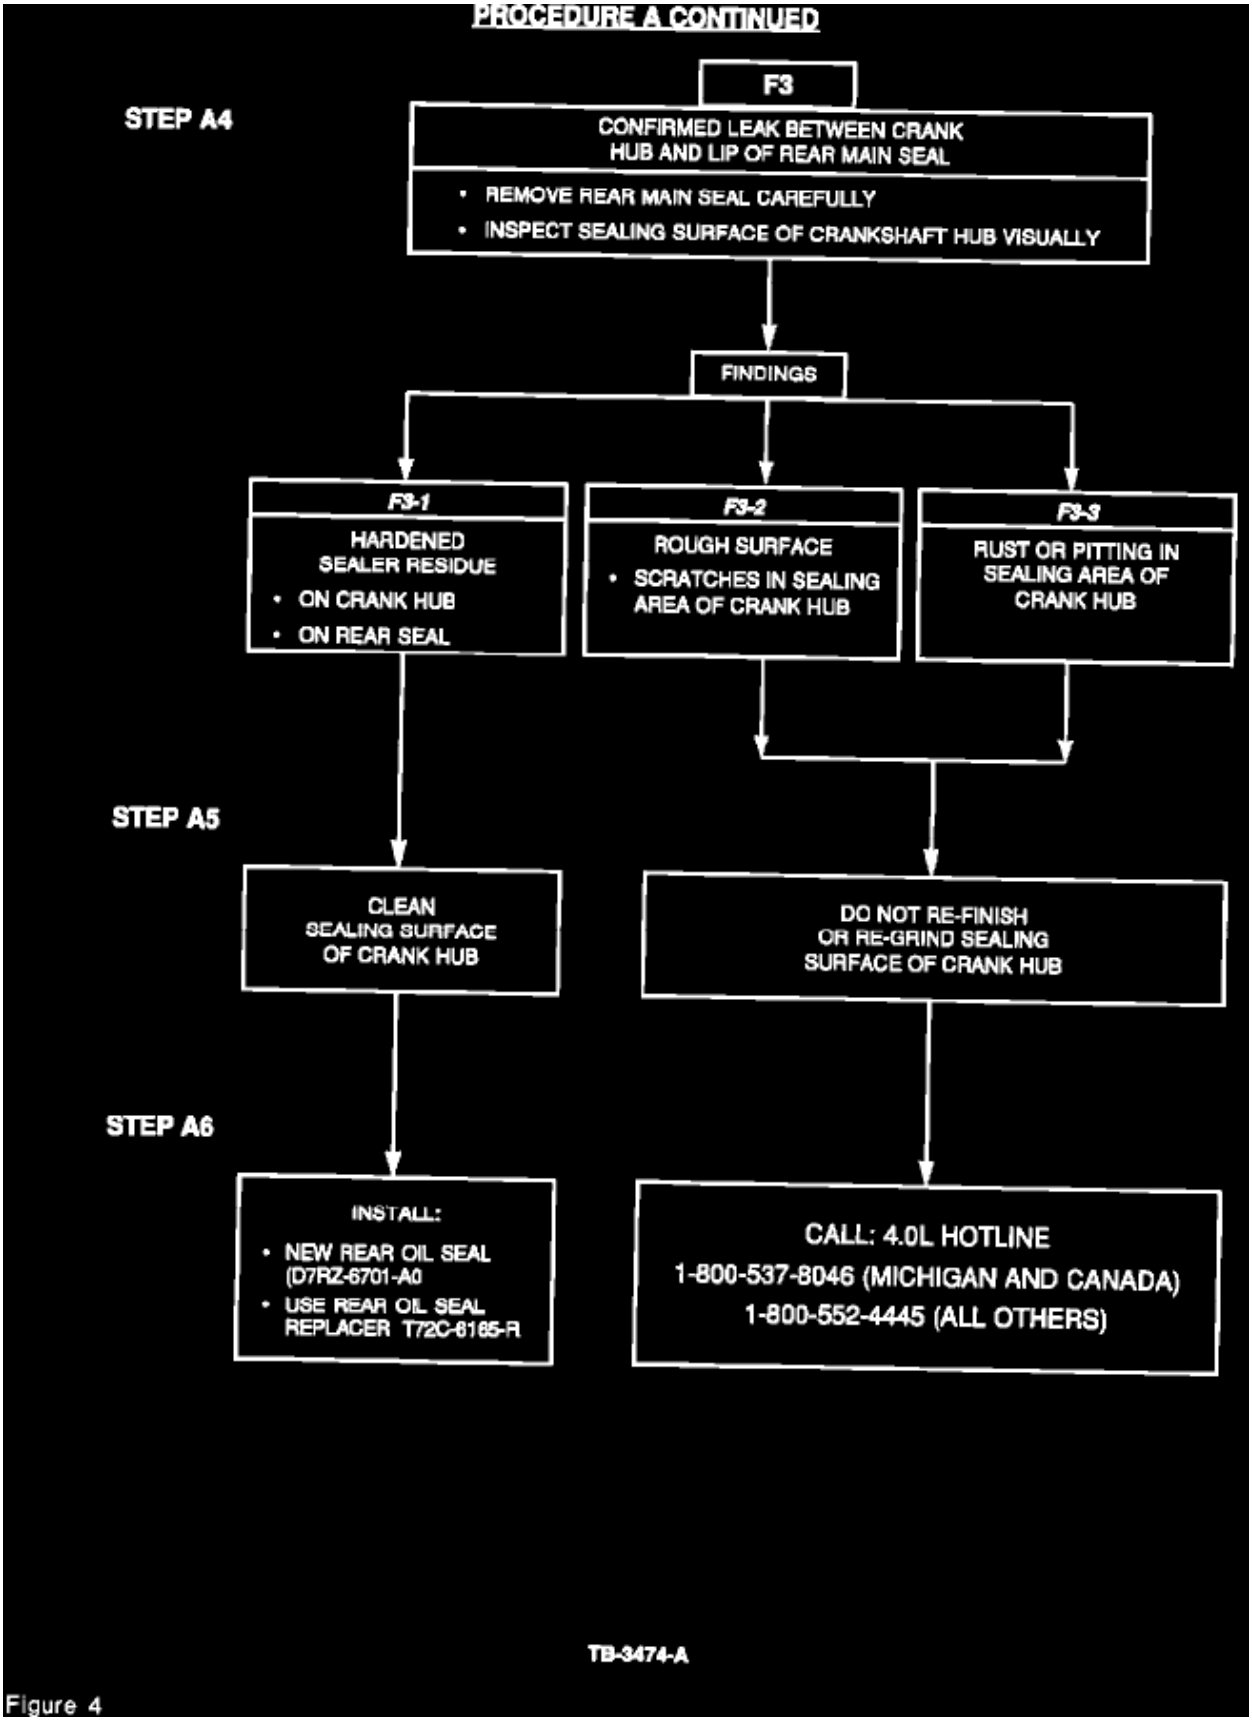


Figure 4

1. Repair procedure for a leak at oil pan gasket between the oil pan and cylinder block, or between the oil pan and the rear main cap. See block diagram Procedure A, Step A4/F1, Figures 3 and 4.

a. Remove the oil pan from the engine and remove the old gasket from the oil pan. Do not remove the rear main cap or wedge seal from the engine.

b. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

c. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap. Take special care to scrape/scratch all the old sealer from the exposed areas of the rear cap, wedge seal and cylinder block. This is a critical sealing area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER BLOCK.

d. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

e. Clean the transmission "BELLHOUSING" area, the rear of the cylinder block and the rear engine plate of ALL oil residue.

f. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corner of the radius areas at the front and rear of the oil pan.

g. Place the oil pan gasket (FOTZ-6710-C) in place in the groove in the oil pan.

h. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the corners where the rear main cap meets the cylinder block, at the corner areas of the radius area on the front cover and the front cover to cylinder block joint.

i. Set the oil pan in place and snug the four (4) pan nuts.

j. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .0100" (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

k. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

2. Repair procedure for a leak between the rear main cap and the cylinder block. See block diagram Procedure A, Step A4/F2.

a. Remove the oil pan, windage tray, oil pump and rear main cap from the engine.

b. Remove the rear main oil seal from the crankshaft and thoroughly inspect the main seal journal of the crankshaft for signs of rust, pitting, nicks or porosity.

c. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

d. Clean ALL the old sealer from the rear main bearing cap USING A SCRAPER AND WIRE WHEEL. The original Loctite sealer used during production assembly becomes extremely hard after it has cured. It is extremely important that ALL the old sealer be removed from the joint faces and grooves.

e. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap joint area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER

BLOCK.

f. Clean ALL the oil and old sealer from the "WEDGE SEAL" that fits around the rear main bearing cap in the oil pan gasket groove. Preferably use a new "WEDGE SEAL".

g. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

h. Clean the transmission "BELLHOUSING AREA", the rear of the cylinder block and the rear engine plate of ALL oil residue.

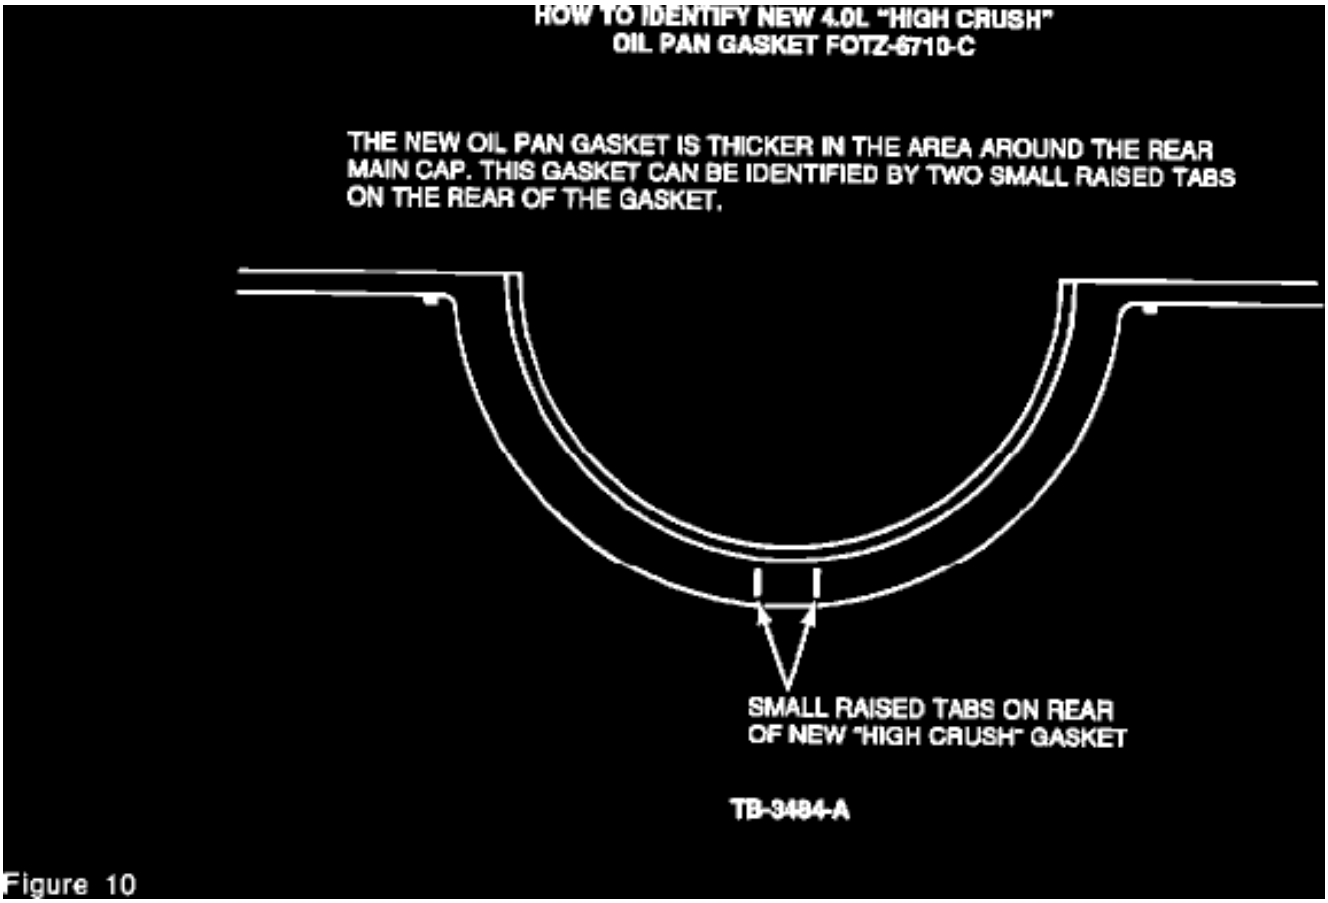

Figure 10

i. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) on the cylinder block along the corners of the rear main bearing cap joint area and on the joint face, approximately 1/2 inch (12.7 mm) from the rear of the block.

j. Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.

k. Align the rear main bearing cap to cylinder block by moving the bearing fore or aft (approx. 1/2 inch (12.7 mm) inward in the rear oil seal bore) so that the rear seal stop of the block and cap line up. This will assure that the rear main oil seal will seat squarely when installed in the bore.

l. Torque the rear main cap bolts to 66-77 lb.ft. (90-104 N-m).

m. Fill the cavities for the "WEDGE SEAL" on both sides of the rear main cap with Ford Gasket Eliminator (E1FZ-19562-A).

n. Place "WEDGE SEAL" in place and use a flat bladed screwdriver to fully seat the "WEDGE SEAL", forcing the excessive sealer out.

o. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) in the corners of the oil pan gasket groove of the rear main cap where the cap meets the cylinder block.

p. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) at the corner areas of the radius area on the front cover and at the front cover to cylinder block joint.

q. Reinstall the oil pump and windage tray. Torque to 13-15 lb.ft. (17-21 N-m).

r. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corners of the radius areas at the front and rear of the oil pan.

s. Place the oil pan gasket (FOTZ-6710-C), Figure 10, in place in the groove in the oil pan.

t. Set the oil pan in place and snug the four (4) oil pan bolts.

u. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .01000 (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

v. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

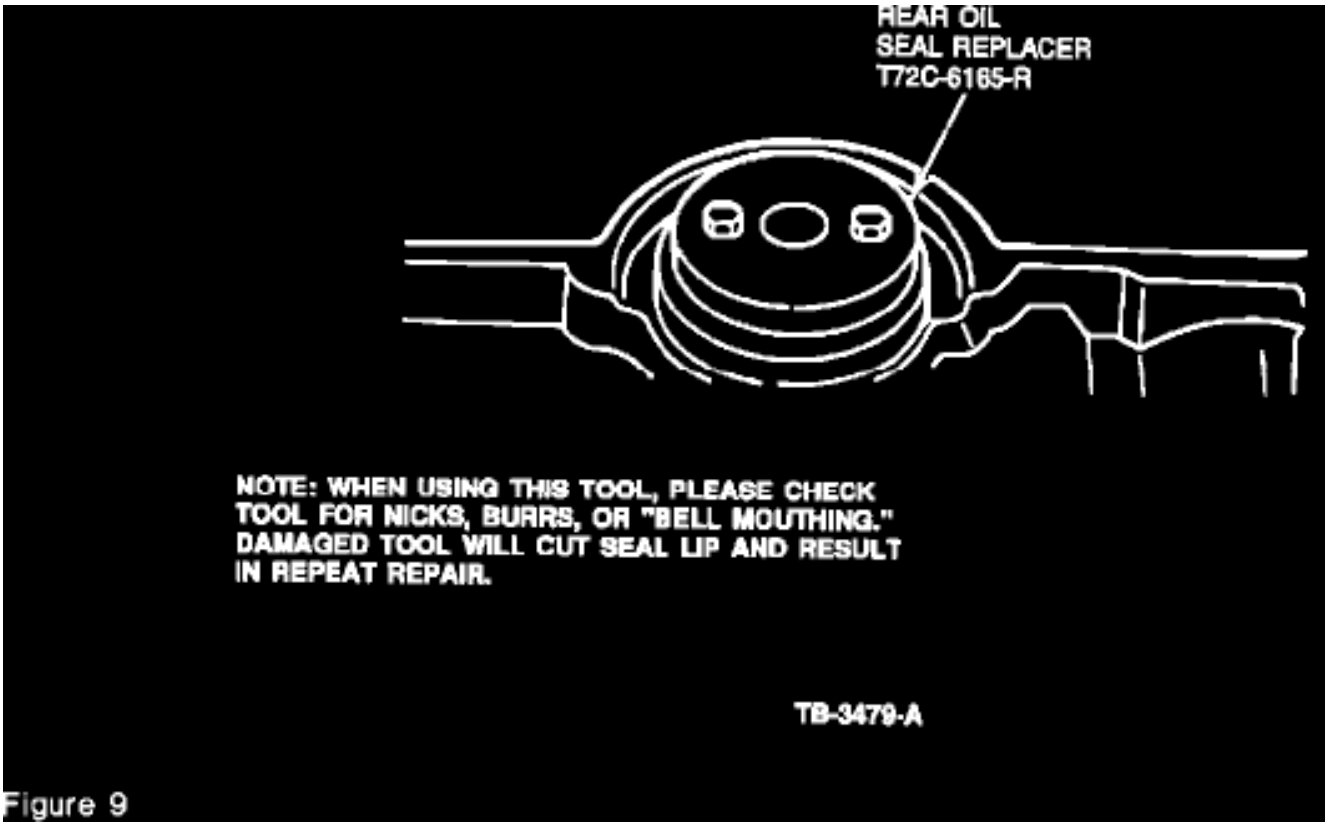

Figure 9

w. Coat the rear main oil seal (D7RZ-6701-A) with oil. Install the rear seal in the seal bore using Rear Oil Seal Replacer T72C-6165-R. This tool uses two flywheel bolts to draw the seal into position. Refer to Figure 9.

CAUTION:

DO NOT USE THE OLD STYLE HAMMER OPERATED TOOL.

3. Repair procedure for a leak between the rear main seal and the crankshaft. See block diagram, Procedure A, Step A4/F3.

a. Any presence of rust on the rear seal journal will cause a leak.

b. Any presence of pitting, porosity or nicks on the rear seal journal will cause a leak.

NOTE:

IF A LEAK IS PRESENT BETWEEN THE REAR MAIN SEAL AND CRANKSHAFT, PLEASE NOTIFY THE 4.0L "HOTLINE" AT (800) 537-8046 OR (800) 552-4445 PRIOR TO ANY ATTEMPT TO REPAIR THIS CONDITION.

Service Procedure - Repair For Oil Leaks At Intake Manifold

PROCEDURE B

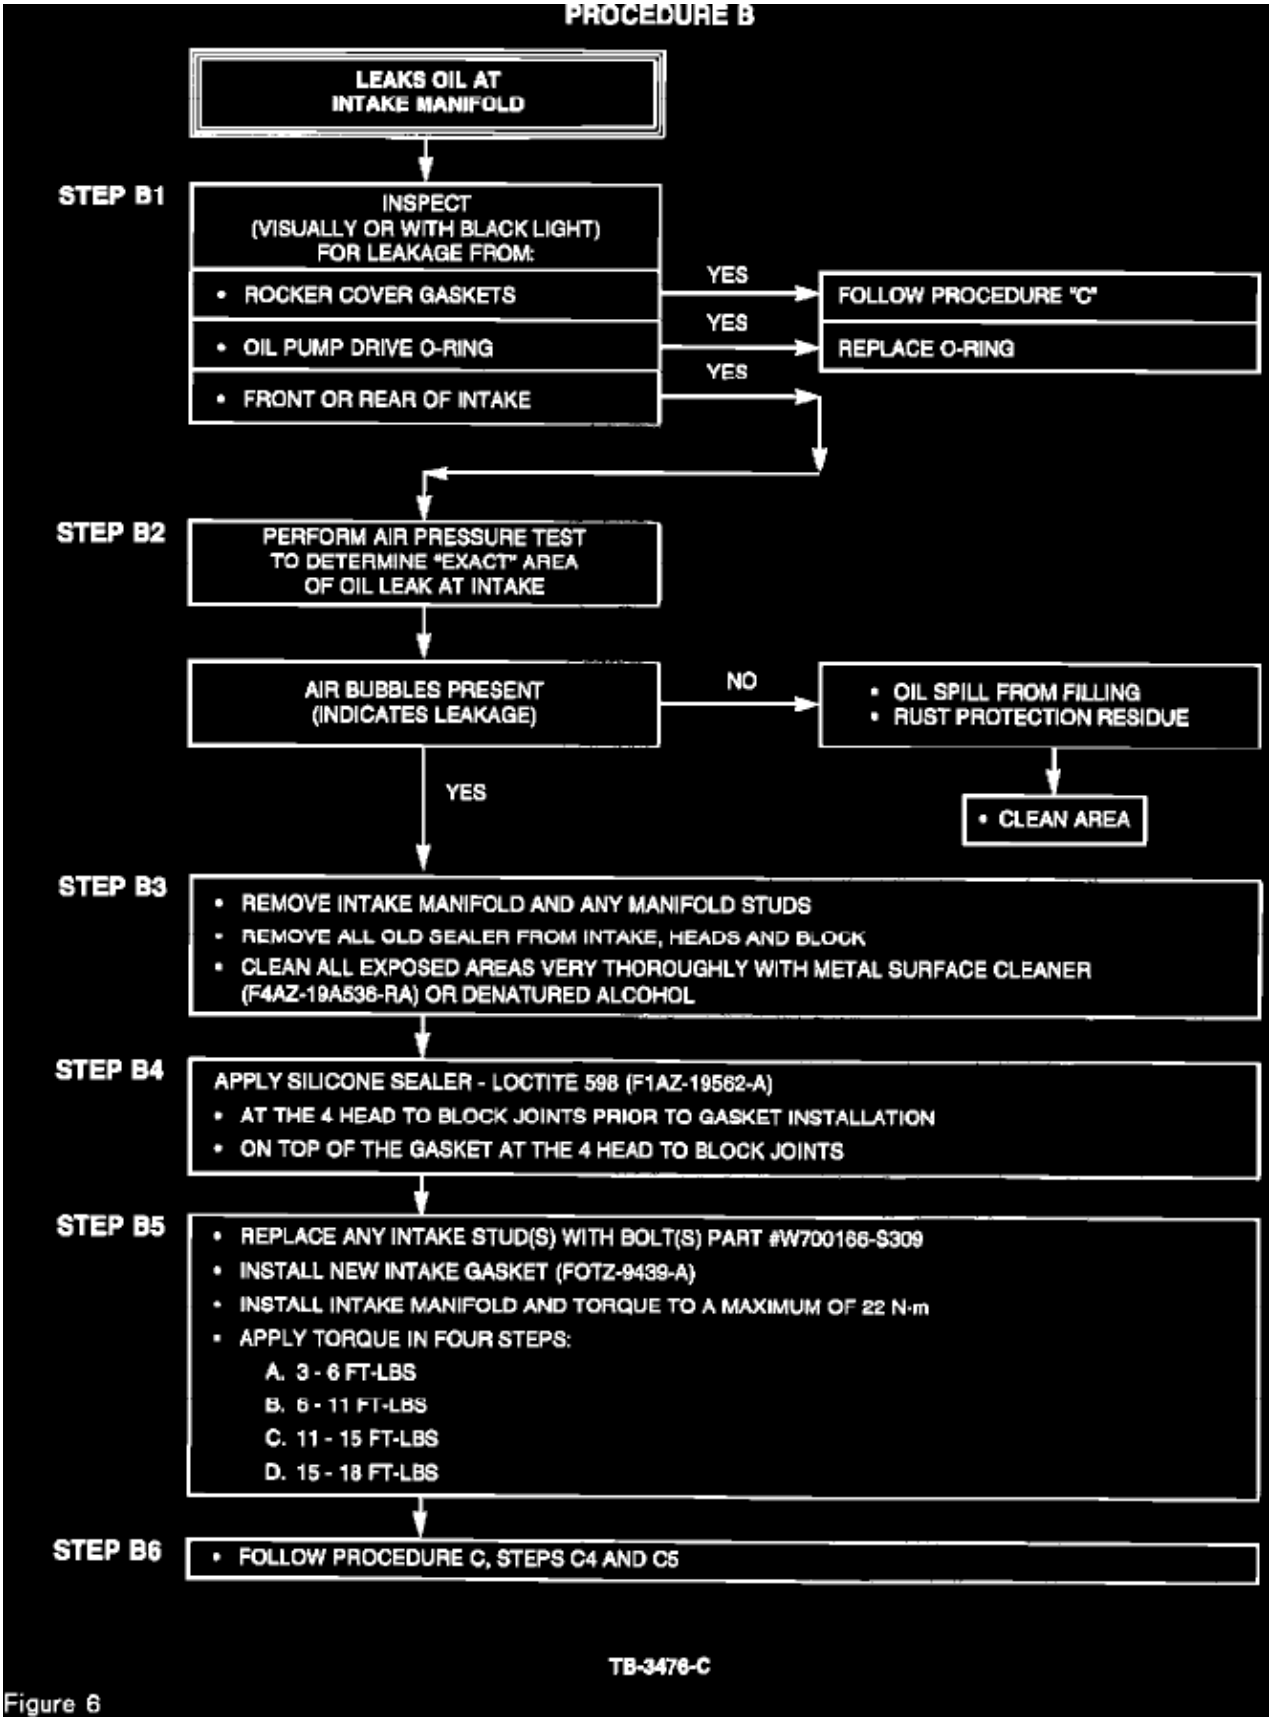

Figure 6

1. If the air pressure test showed no air bubbles, follow Procedure B2 to clean area of oil spill or other contamination.

2. If the air pressure test showed air bubbles present, follow Steps B3 through B6. Refer also to the Service Manual for the applicable year for further information pertinent to removal and installation of the intake manifold.

Service Procedure - Repair For Oil Leaks At Rocker Cover Rails

PROCEDURE C

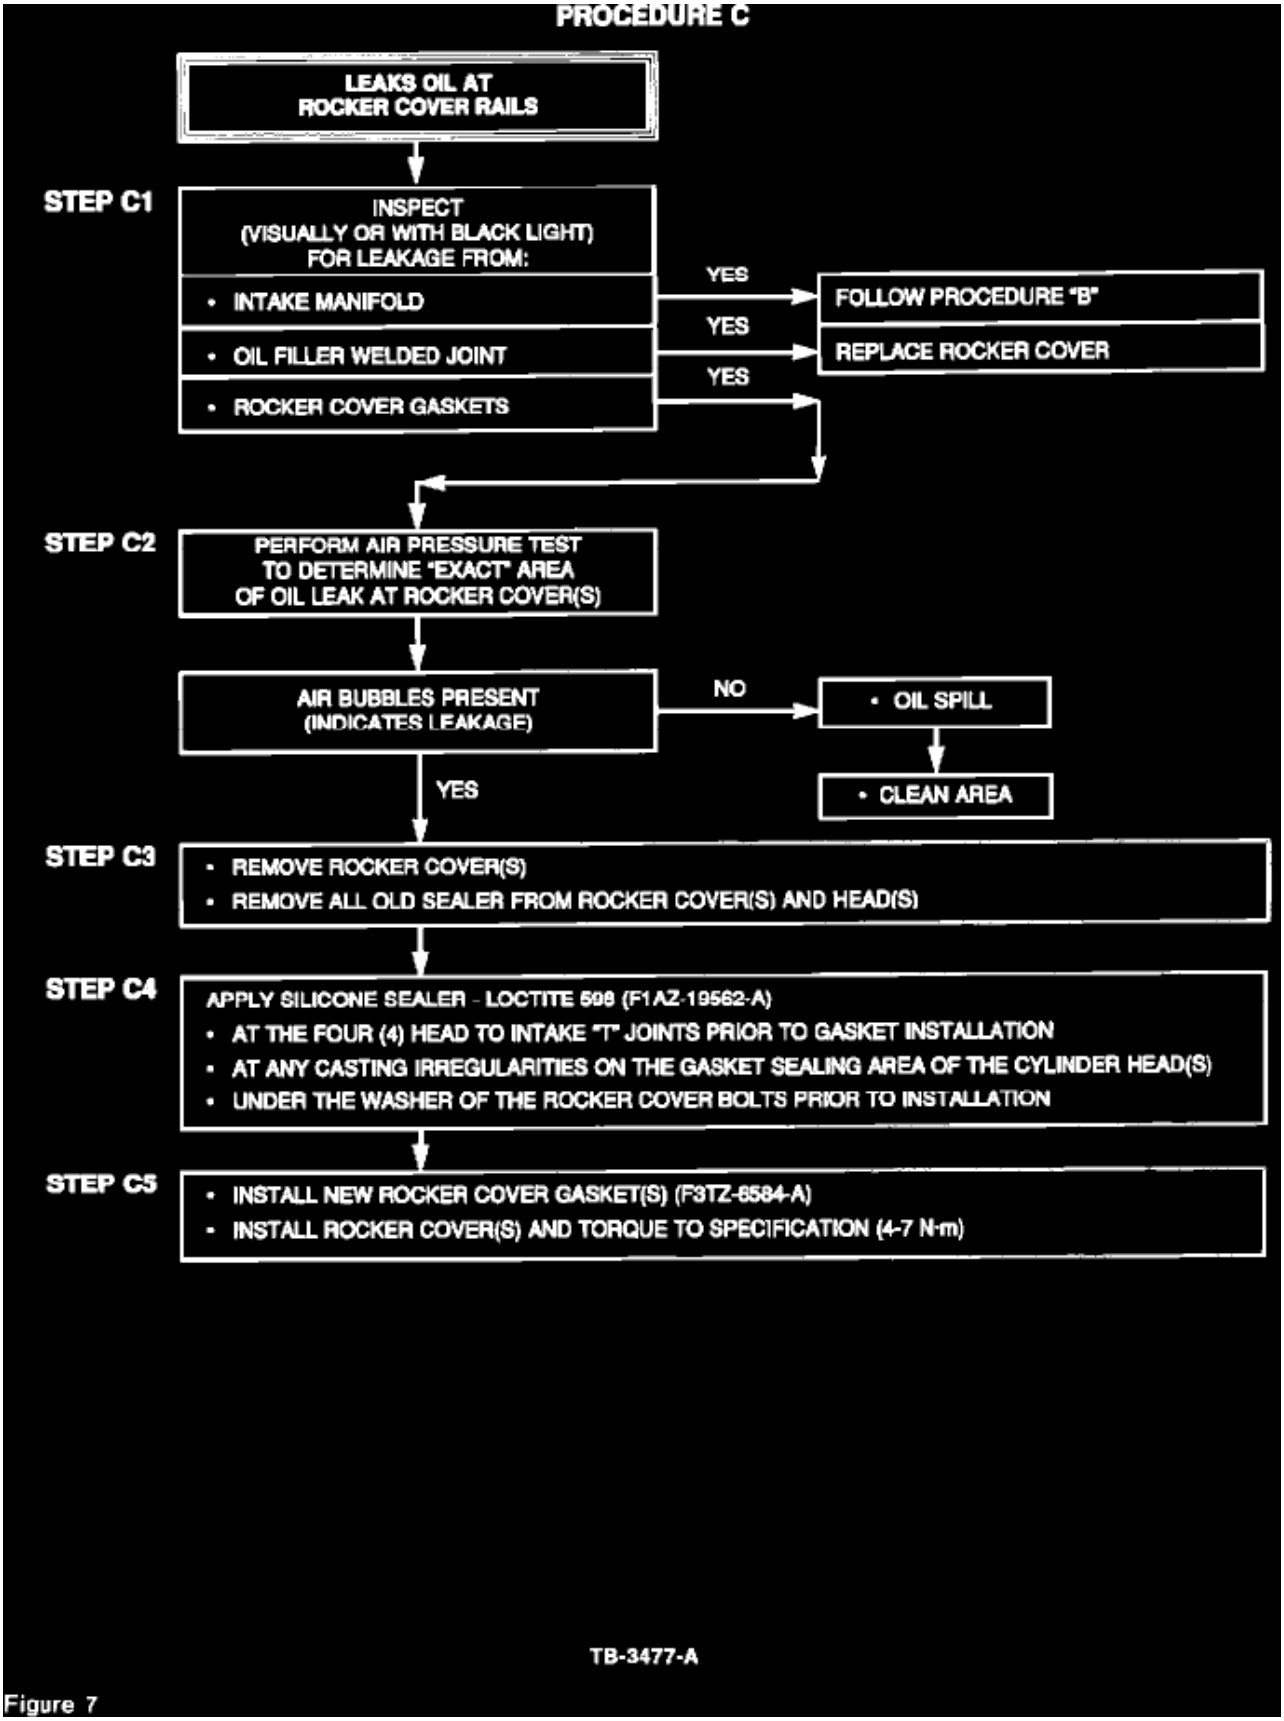

Figure 7

1. If the air pressure test showed no air bubbles, follow Procedure C2 to clean the area of any oil spill.

2. If the air pressure test showed air bubbles present, follow Steps C3 through C5.

Service Procedure - Repair For Oil Leaks At Front End

PROCEDURE D

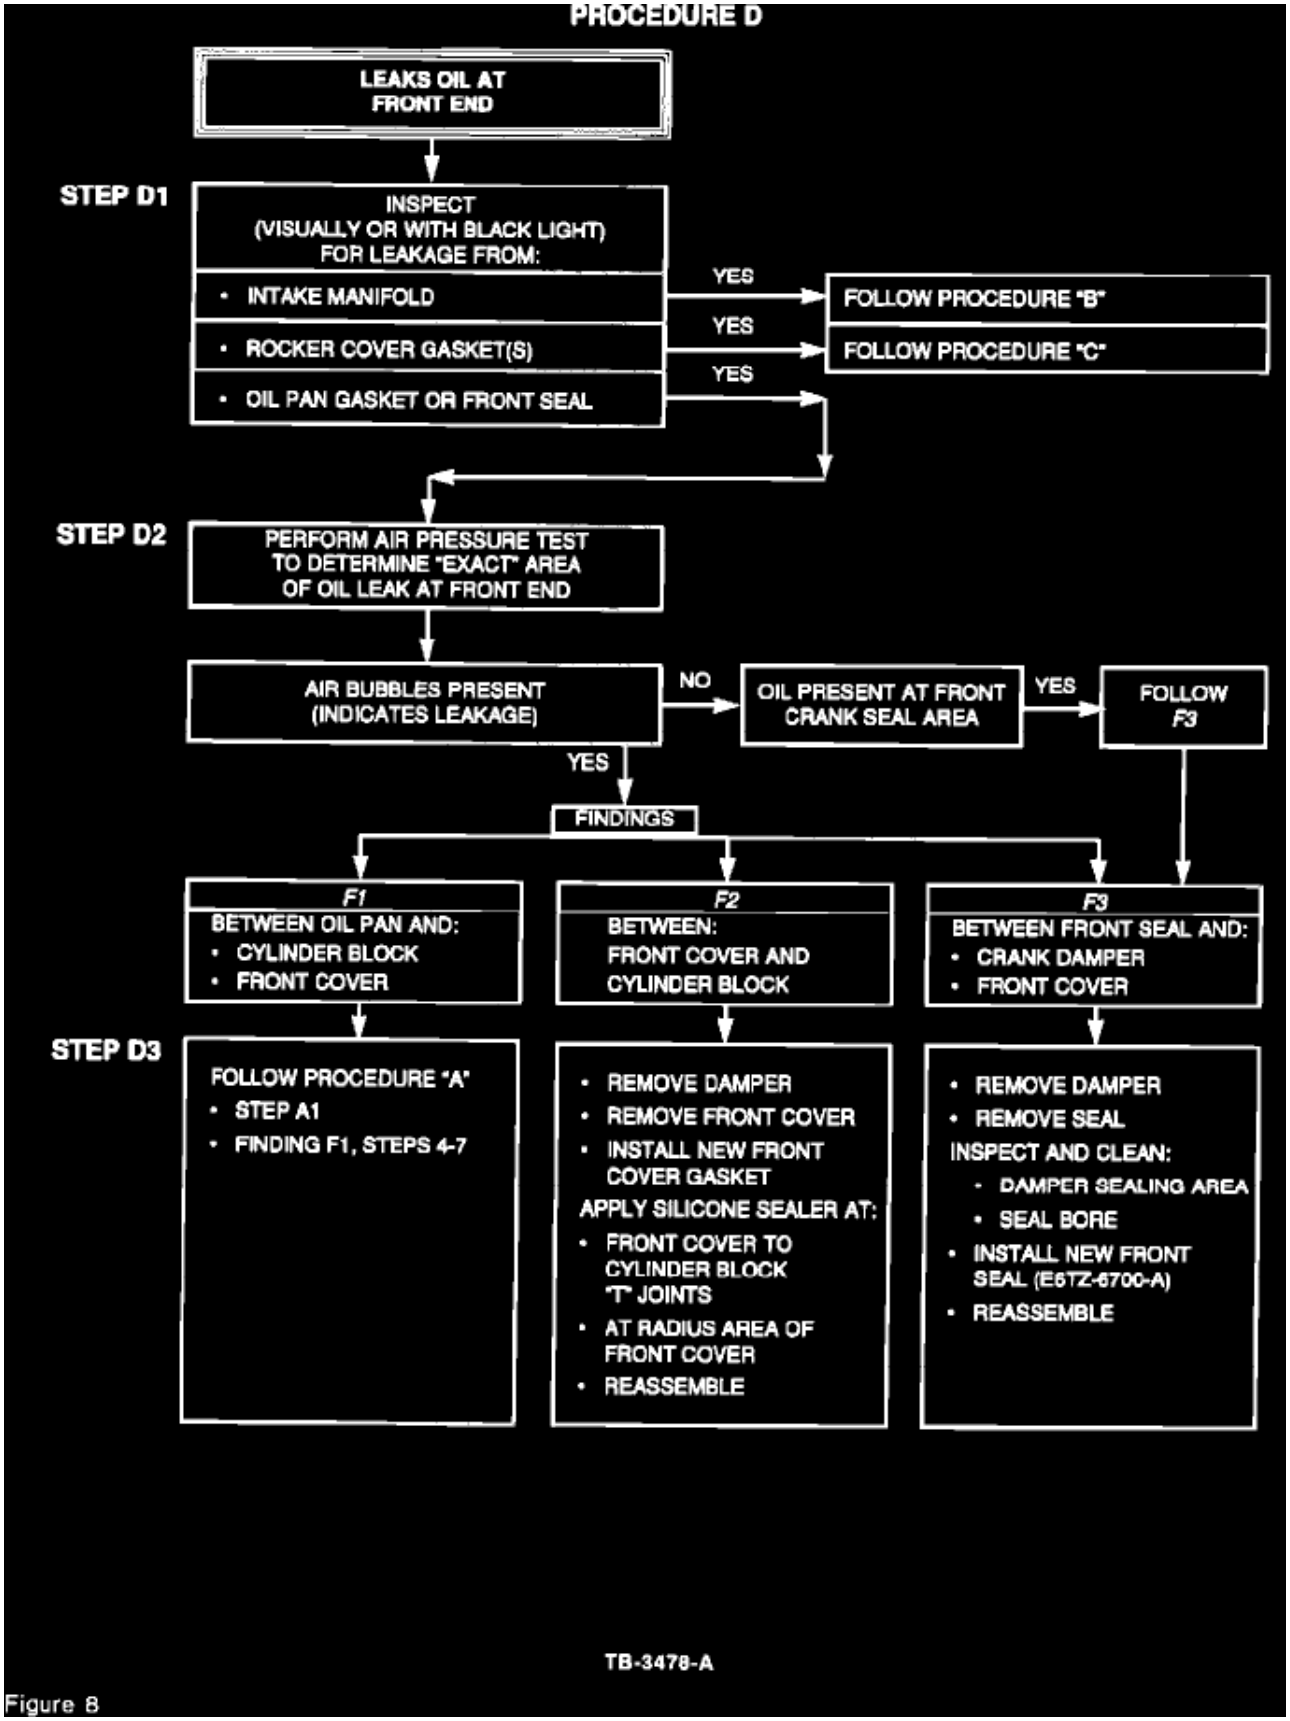

Figure 8

1. If the air pressure test showed no air bubbles, follow Procedure D, F3.

2. If the air pressure test showed air bubbles present, follow Procedure D, F1 or F2 as appropriate.

General Information

LIGHT TRUCK: 1990-93 AEROSTAR, RANGER 1991-93 EXPLORER

This TSB is being republished in its entirety to correct the type of cleaner being used in Figures 1, 3, and 6.

ISSUE: The many sources of leaks which typically appear at the lower end, front end, intake manifold valley, and rocker cover rails have led to mis-diagnosis as to the source of the leak and improper repair procedures, repeat repairs, and customer dissatisfaction.

ACTION: This TSB article has been developed to list the latest sealing techniques and associated part numbers for:

^ Oil Pan

^ Rear Main Seal

^ Rocker Covers

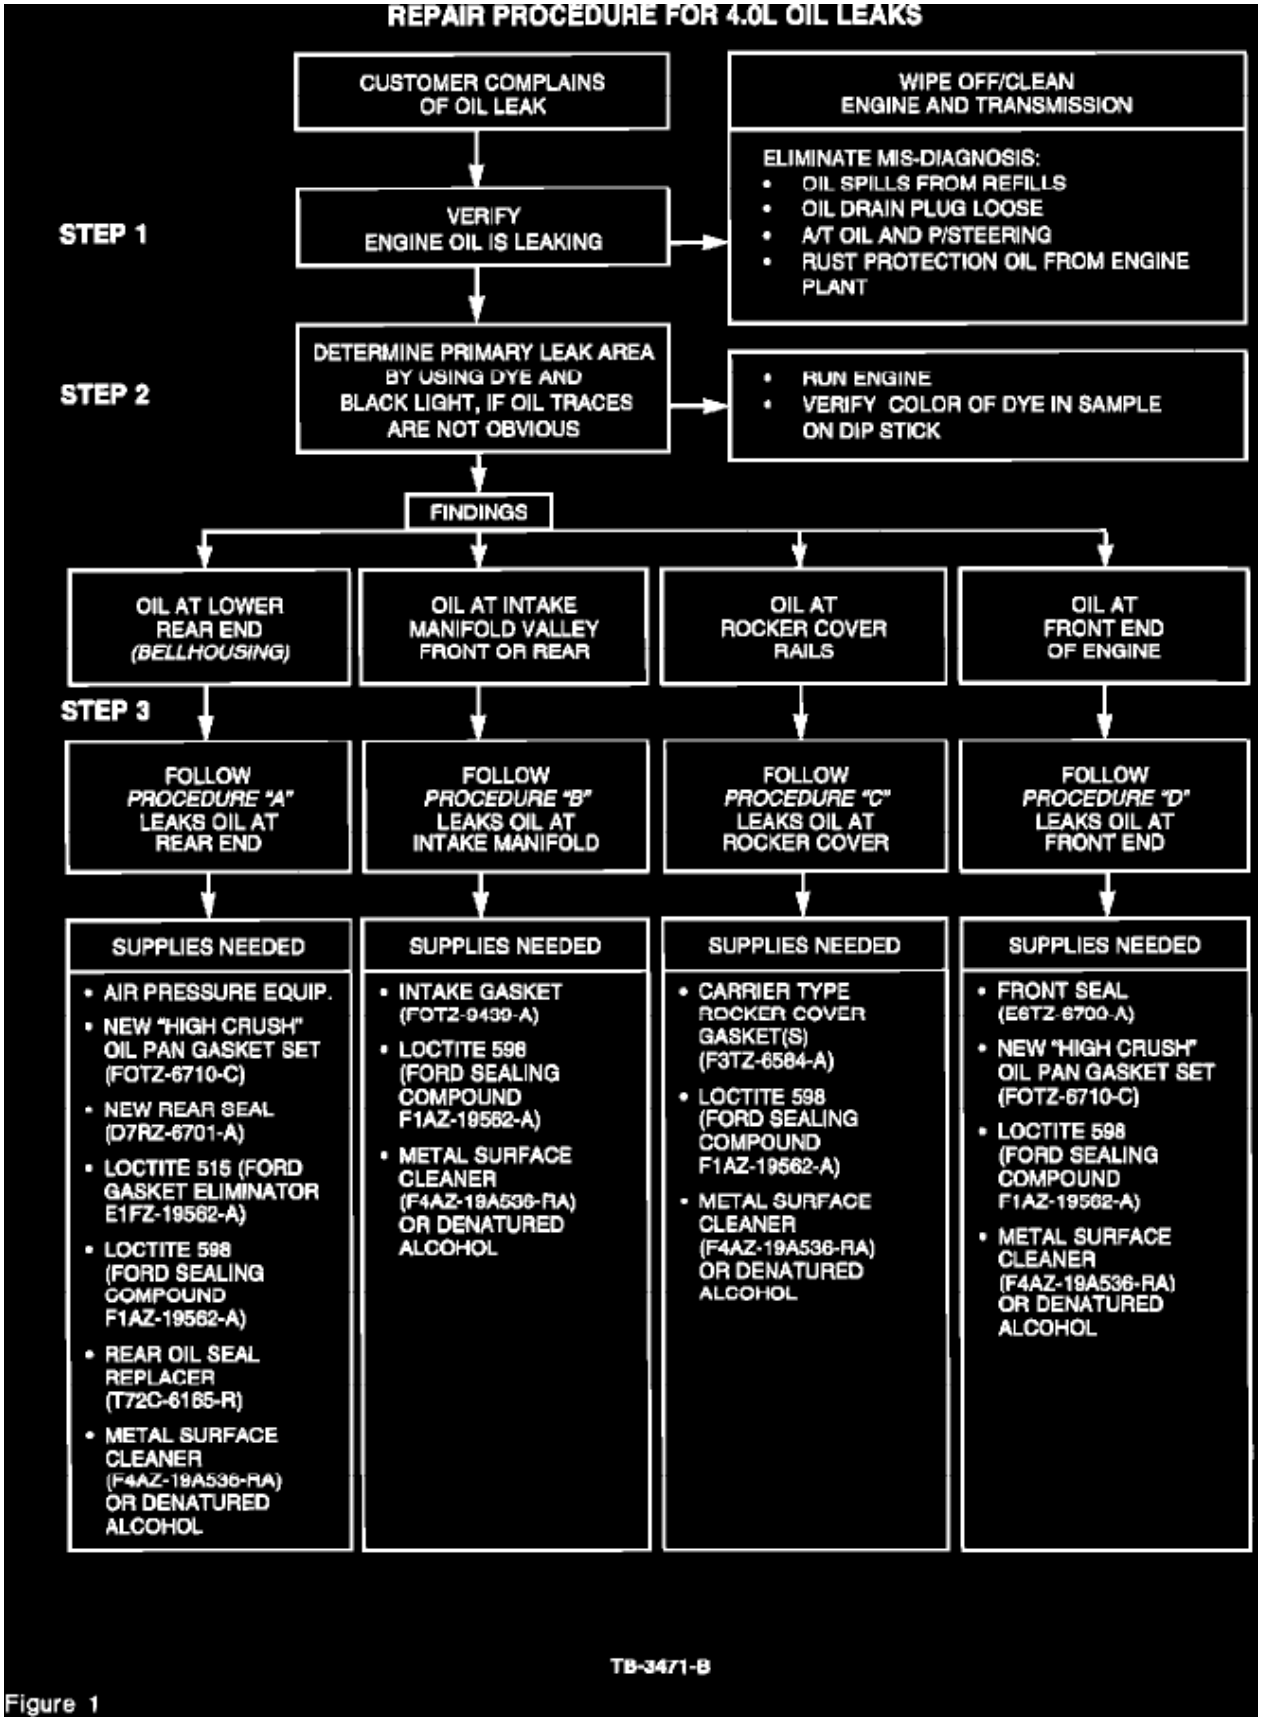

Figure 1

^ Intake Manifold

This article attempts to fully address all issues as one, in order to provide a diagnostic guide which leads to proper diagnosis and repair the first time. Use the following procedures to verify the location of the oil leak and perform the repair.

Service Procedure - Diagnosis

1. Perform Steps 1 and 2 of the block diagram shown in Figure 1. Perform a visual inspection to determine the general area of the oil leak.

2. After determining the "Findings" of Step 2, perform Step 3 by following Procedures A, B, C or D, whichever is appropriate, up to, but not including the air pressure test.

NOTE:

WHEN THE FINDINGS RESULT IN FOLLOWING PROCEDURE "A" FOR "LEAKS OIL AT REAR END", IT IS VERY IMPORTANT TO FOLLOW THE BLOCK DIAGRAM INSTRUCTIONS TO REMOVE THE TRANSMISSION, IF AN AEROSTAR, AND TO REMOVE THE ENGINE, IF AN EXPLORER/RANGER. THE PRACTICE OF REMOVING EXPLORER/RANGER OIL PANS WITH ENGINE IN VEHICLE CAN RESULT IN FAULTY DIAGNOSIS AND/OR REPAIR FOR THE PURPOSES OF THIS TSB.

If the leak has not been located and corrected at this point, then fabricate a device that is capable of applying a constant 1 to 3 psi of air pressure to the engine crankcase. The Rotunda Leak Tester 134-00003, or equivalent, which contains a pressure regulator and gauge capable of a 1 to 3 psi range, may be used.

3. Verify the location of the oil leak by pressurizing the engine crankcase with a constant supply of 3 psi of air pressure and the use of leak detection solution (liquid detergent and water). This process will verify the exact location of the leak. Dye and black light will verify a leak is present, but may not verify the exact location of the leak.

a. Assemble the necessary hose and fittings to connect an air pressure regulator and air pressure gauge to the shop air supply and to the engine crankcase through the dipstick tube.

b. Test the device to make sure 1-3 psi of air pressure can be maintained. Bursts of pressure over 3 psi can damage engine seals.

c. Before starting the test, make sure the regulator valve is completely closed so as not to accidentally apply a big burst of air to the engine when starting the test.

d. Attach the outlet (regulated) hose from the regulator/gauge device to the dipstick.

e. To trap air in the engine, plug any ports and passages (PCV valve, air inlet connection) that will allow air to escape.

f. Slowly open the regulator valve until 1-3 psi of air pressure registers on the gauge.

g. Keeping air pressure applied, brush or squirt a solution of liquid detergent and water or commercially available liquid leak detector (Snoop, Bubbles) to the primary area identified in Step 2 of the block diagram.

^ If the primary area is in the rear seal area, apply the solution to the rear seal, rear cap, rear cap to cylinder block and oil pan gasket areas.

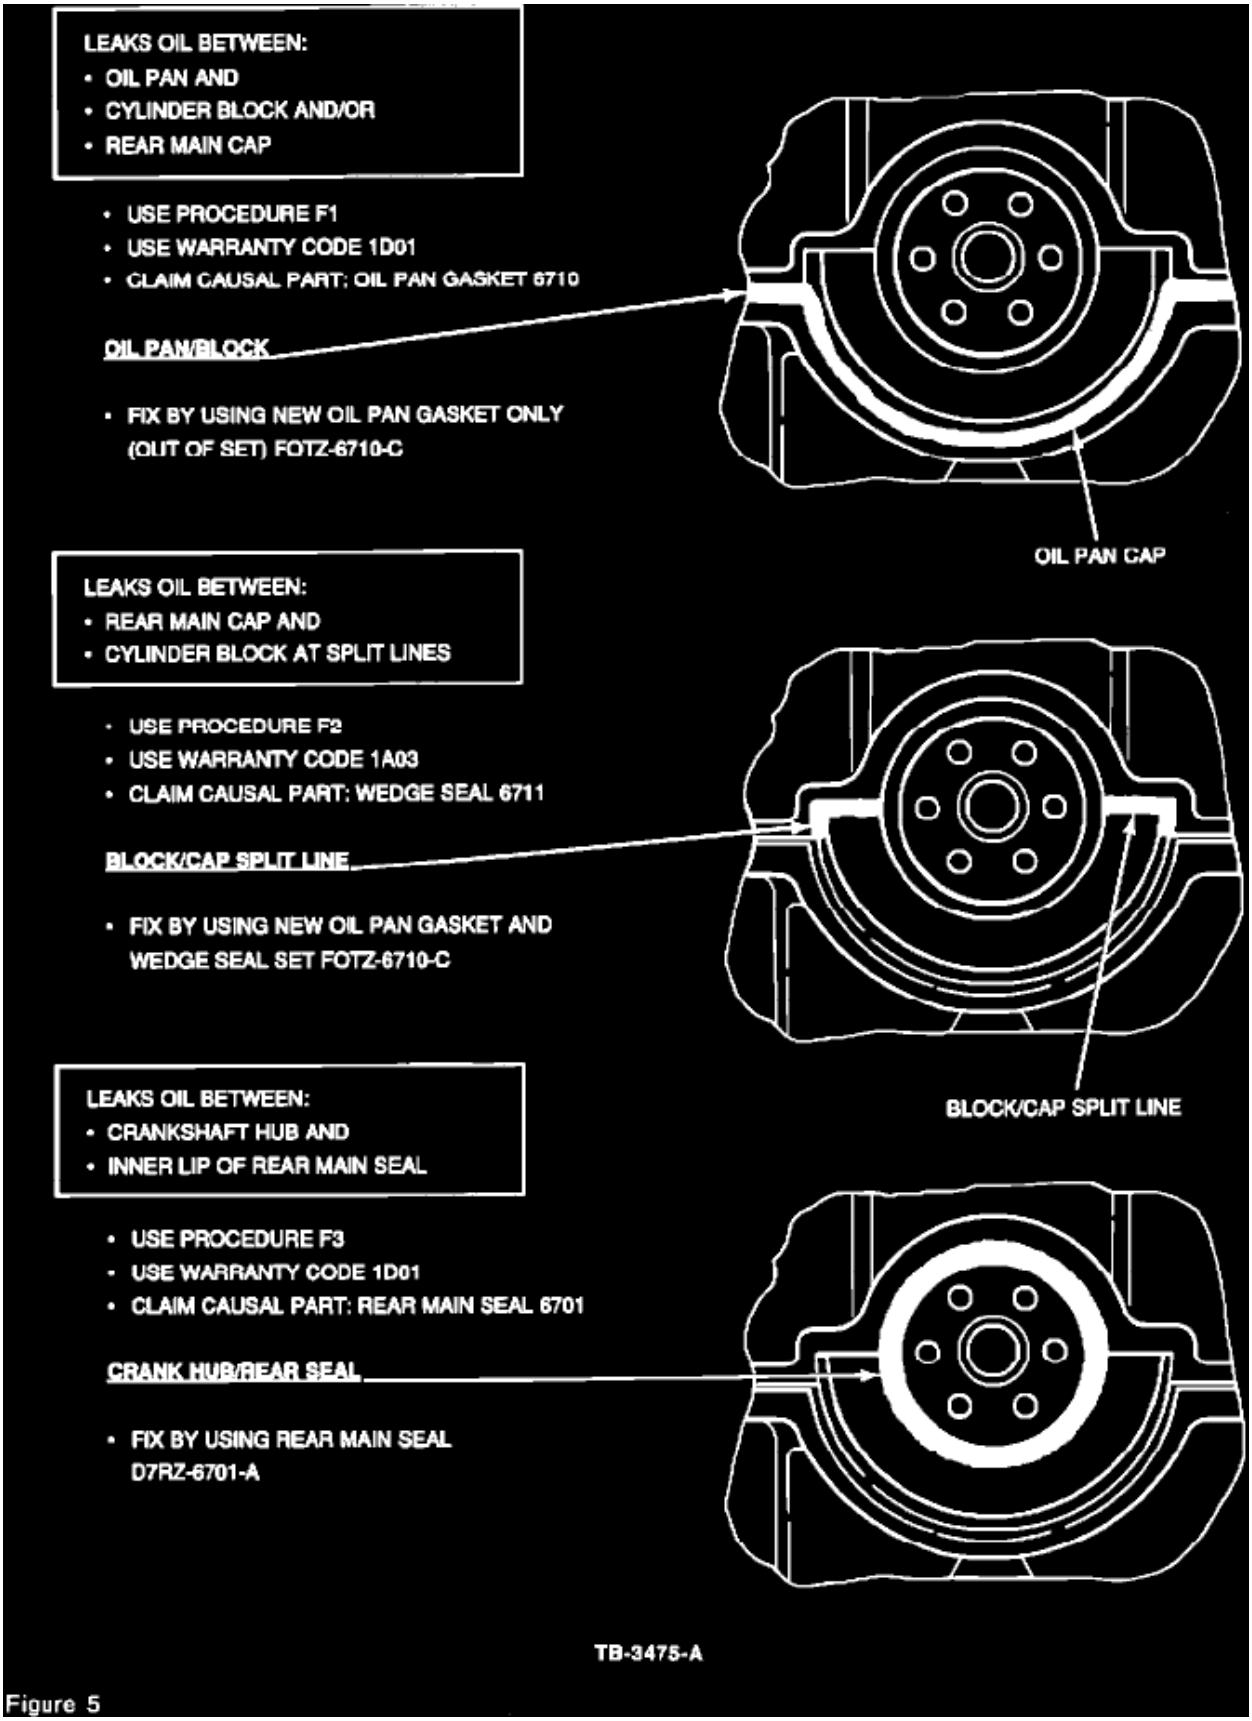

Figure 5

^ If bubbles are detected only at the oil pan gasket, between the oil pan and the cylinder block, or between the oil pan and the rear main cap, only the oil pan gasket needs replacing. Note

Procedure A, Figure 2, Step A3/F1, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A1.

^ If bubbles are detected between the rear main cap and the cylinder block, the rear cap must be removed and resealed. Note Procedure A, Figure 2, Step A3/F2, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A2.

^ If bubbles are detected between the rear seal lip and crank hub, a new rear oil seal will be required. Under certain circumstances, as outlined in the block diagram, it will be necessary to call the 4.OL Hotline. Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A3.

^ If no bubbles are detected, but oil is present in the area between the crank hub and the lip of the rear seal, carefully remove the seal and inspect the crankshaft rear seal journal. (A leak may occur

at the rear seal only when the engine is running.) Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Follow repair procedures outlined on the block diagram.

NOTE:

ANY APPEARANCE OF RUST, PITTING, POROSITY, OR NICKS ON THE REAR SEAL JOURNAL WILL CAUSE A LEAK.

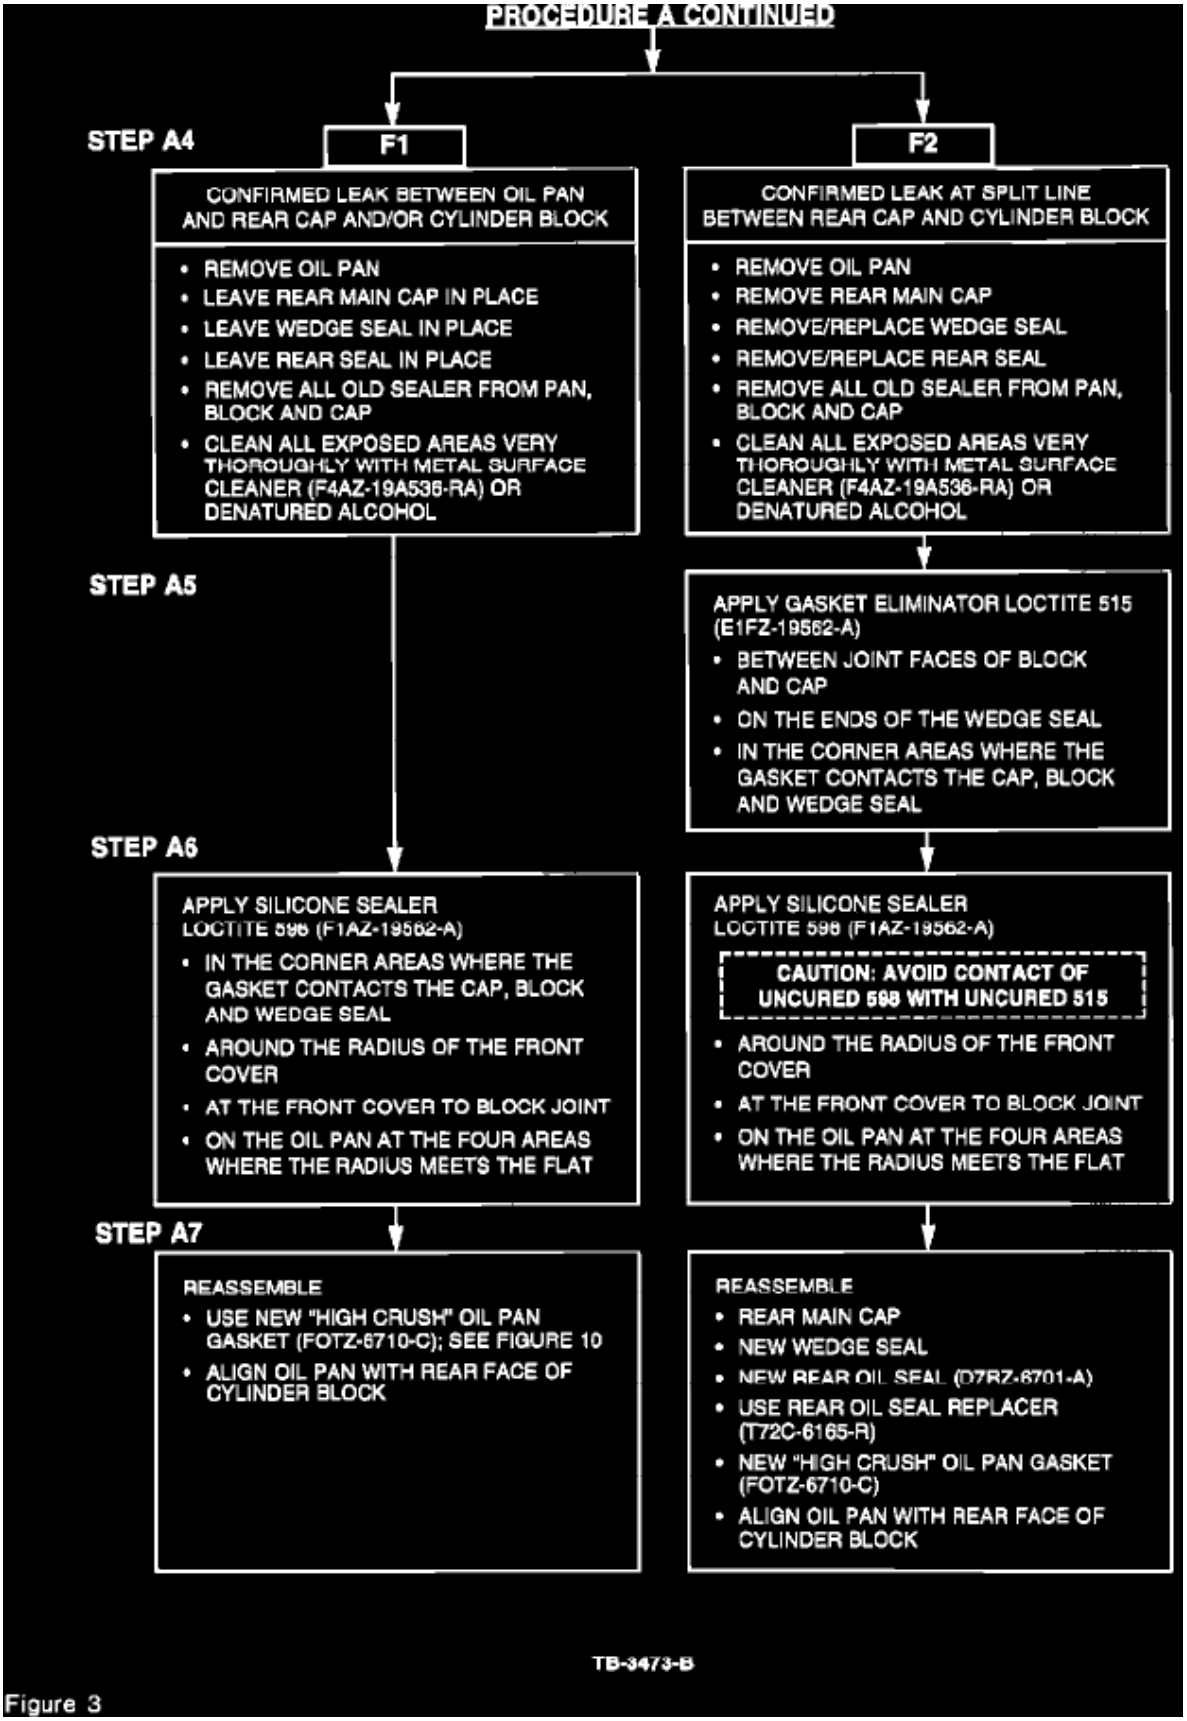
^ If bubbles are detected at the front or rear of the intake manifold gasket, a new intake manifold gasket (FOTZ-9439-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT INTAKE MANIFOLD, PROCEDURE B.

^ If bubbles are detected at the rocker cover rails, new rocker cover gaskets (F3TZ-6584-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT ROCKER COVER RAILS, PROCEDURE C.

^ If bubbles are detected at the front end of the engine, a new front seal (E6TZ-6700-A) or oil pan gasket (FOTZ-6710-C) will be required. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT THE FRONT END, PROCEDURE D.

Service Procedure - Repair

REAR END OIL LEAK - PROCEDURE A



PROCEDURE A CONTINUED
STEP A4
F1
CONFIRMED LEAK BETWEEN OIL PAN AND REAR CAP AND/OR CYLINDER BLOCK
• REMOVE OIL PAN
• LEAVE REAR MAIN CAP IN PLACE
• LEAVE WEDGE SEAL IN PLACE
• LEAVE REAR SEAL IN PLACE
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
F2
CONFIRMED LEAK AT SPLIT LINE BETWEEN REAR CAP AND CYLINDER BLOCK
• REMOVE OIL PAN
• REMOVE REAR MAIN CAP
• REMOVE/REPLACE WEDGE SEAL
• REMOVE/REPLACE REAR SEAL
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
STEP A5
APPLY GASKET ELIMINATOR LOCTITE 515 (E1FZ-19562-A)
• BETWEEN JOINT FACES OF BLOCK AND CAP
• ON THE ENDS OF THE WEDGE SEAL
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
STEP A6
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
CAUTION: AVOID CONTACT OF UNCURED 598 WITH UNCURED 515
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
STEP A7
REASSEMBLE
• USE NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C); SEE FIGURE 10
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
REASSEMBLE
• REAR MAIN CAP
• NEW WEDGE SEAL
• NEW REAR OIL SEAL (D7RZ-6701-A)
• USE REAR OIL SEAL REPLACER (T72C-6165-R)
• NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C)
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
TB-3473-B
Figure 3

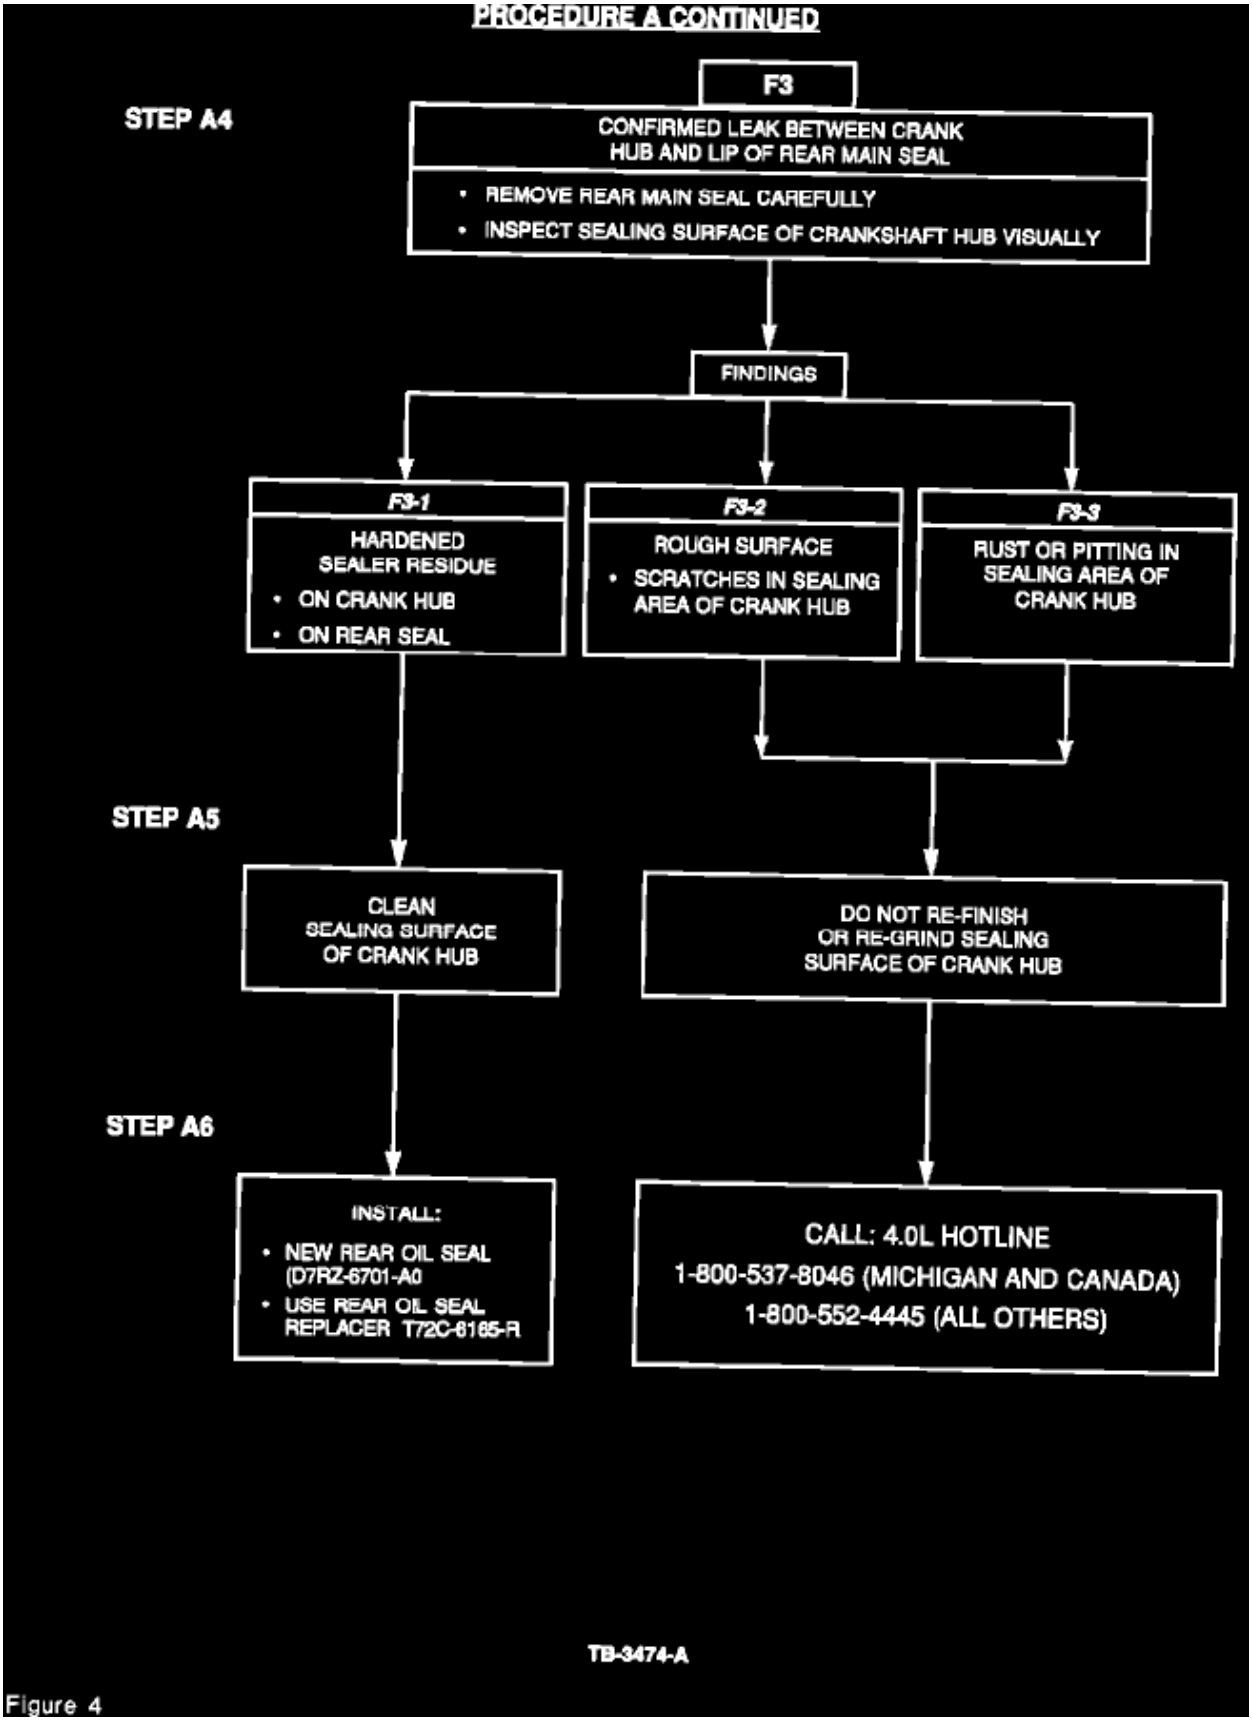


Figure 4

1. Repair procedure for a leak at oil pan gasket between the oil pan and cylinder block, or between the oil pan and the rear main cap. See block diagram Procedure A, Step A4/F1, Figures 3 and 4.

a. Remove the oil pan from the engine and remove the old gasket from the oil pan. Do not remove the rear main cap or wedge seal from the engine.

b. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

c. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap. Take special care to scrape/scratch all the old sealer from the exposed areas of the rear cap, wedge seal and cylinder block. This is a critical sealing area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER BLOCK.

d. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

e. Clean the transmission "BELLHOUSING" area, the rear of the cylinder block and the rear engine plate of ALL oil residue.

f. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corner of the radius areas at the front and rear of the oil pan.

g. Place the oil pan gasket (FOTZ-6710-C) in place in the groove in the oil pan.

h. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the corners where the rear main cap meets the cylinder block, at the corner areas of the radius area on the front cover and the front cover to cylinder block joint.

i. Set the oil pan in place and snug the four (4) pan nuts.

j. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .0100" (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

k. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

2. Repair procedure for a leak between the rear main cap and the cylinder block. See block diagram Procedure A, Step A4/F2.

a. Remove the oil pan, windage tray, oil pump and rear main cap from the engine.

b. Remove the rear main oil seal from the crankshaft and thoroughly inspect the main seal journal of the crankshaft for signs of rust, pitting, nicks or porosity.

c. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

d. Clean ALL the old sealer from the rear main bearing cap USING A SCRAPER AND WIRE WHEEL. The original Loctite sealer used during production assembly becomes extremely hard after it has cured. It is extremely important that ALL the old sealer be removed from the joint faces and grooves.

e. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap joint area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER

BLOCK.

f. Clean ALL the oil and old sealer from the "WEDGE SEAL" that fits around the rear main bearing cap in the oil pan gasket groove. Preferably use a new "WEDGE SEAL".

g. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

h. Clean the transmission "BELLHOUSING AREA", the rear of the cylinder block and the rear engine plate of ALL oil residue.

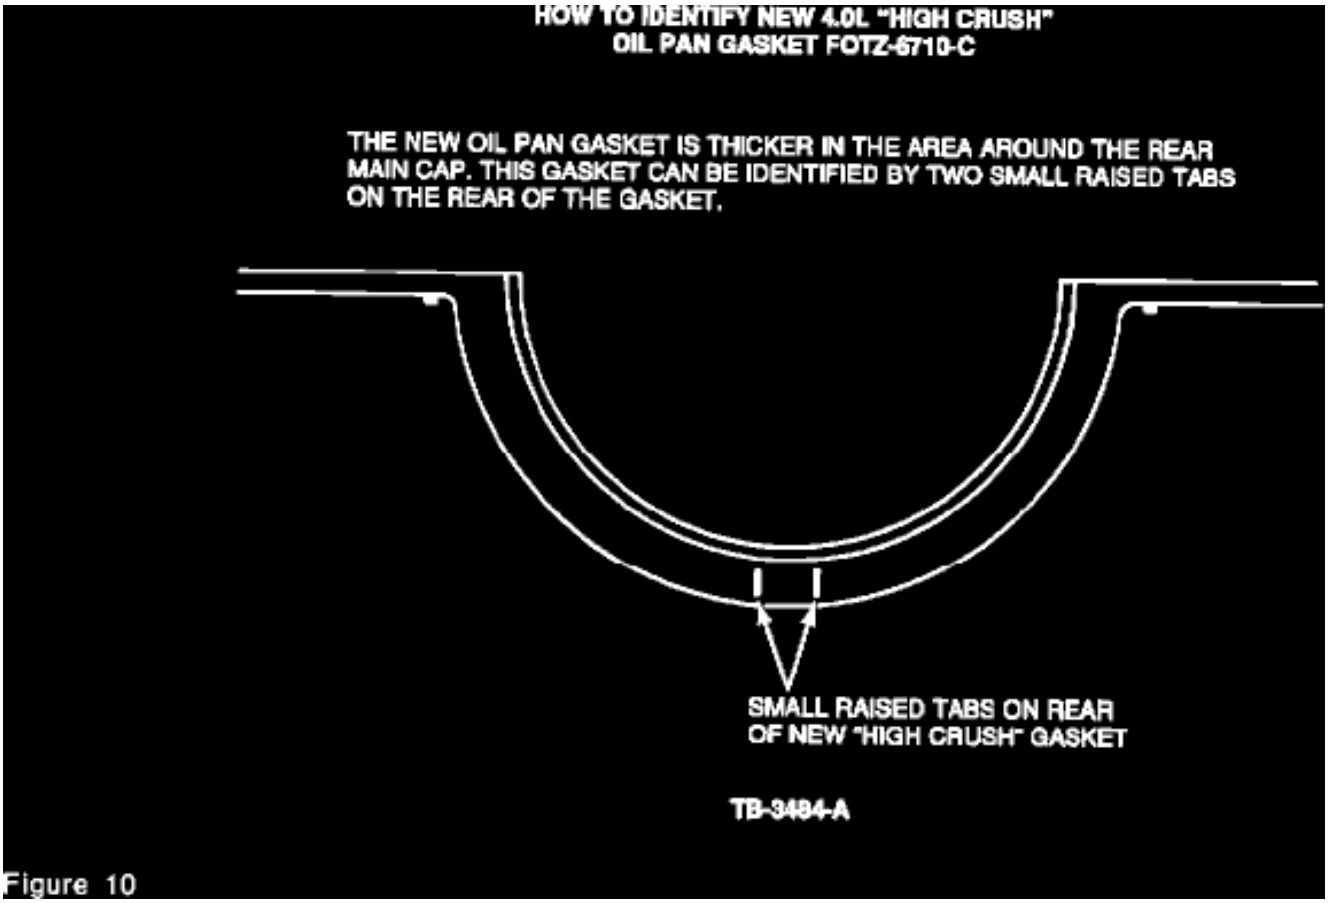

Figure 10

i. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) on the cylinder block along the corners of the rear main bearing cap joint area and on the joint face, approximately 1/2 inch (12.7 mm) from the rear of the block.

j. Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.

k. Align the rear main bearing cap to cylinder block by moving the bearing fore or aft (approx. 1/2 inch (12.7 mm) inward in the rear oil seal bore) so that the rear seal stop of the block and cap line up. This will assure that the rear main oil seal will seat squarely when installed in the bore.

l. Torque the rear main cap bolts to 66-77 lb.ft. (90-104 N-m).

m. Fill the cavities for the "WEDGE SEAL" on both sides of the rear main cap with Ford Gasket Eliminator (E1FZ-19562-A).

n. Place "WEDGE SEAL" in place and use a flat bladed screwdriver to fully seat the "WEDGE SEAL", forcing the excessive sealer out.

o. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) in the corners of the oil pan gasket groove of the rear main cap where the cap meets the cylinder block.

p. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) at the corner areas of the radius area on the front cover and at the front cover to cylinder block joint.

q. Reinstall the oil pump and windage tray. Torque to 13-15 lb.ft. (17-21 N-m).

r. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corners of the radius areas at the front and rear of the oil pan.

s. Place the oil pan gasket (FOTZ-6710-C), Figure 10, in place in the groove in the oil pan.

t. Set the oil pan in place and snug the four (4) oil pan bolts.

u. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .01000 (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

v. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

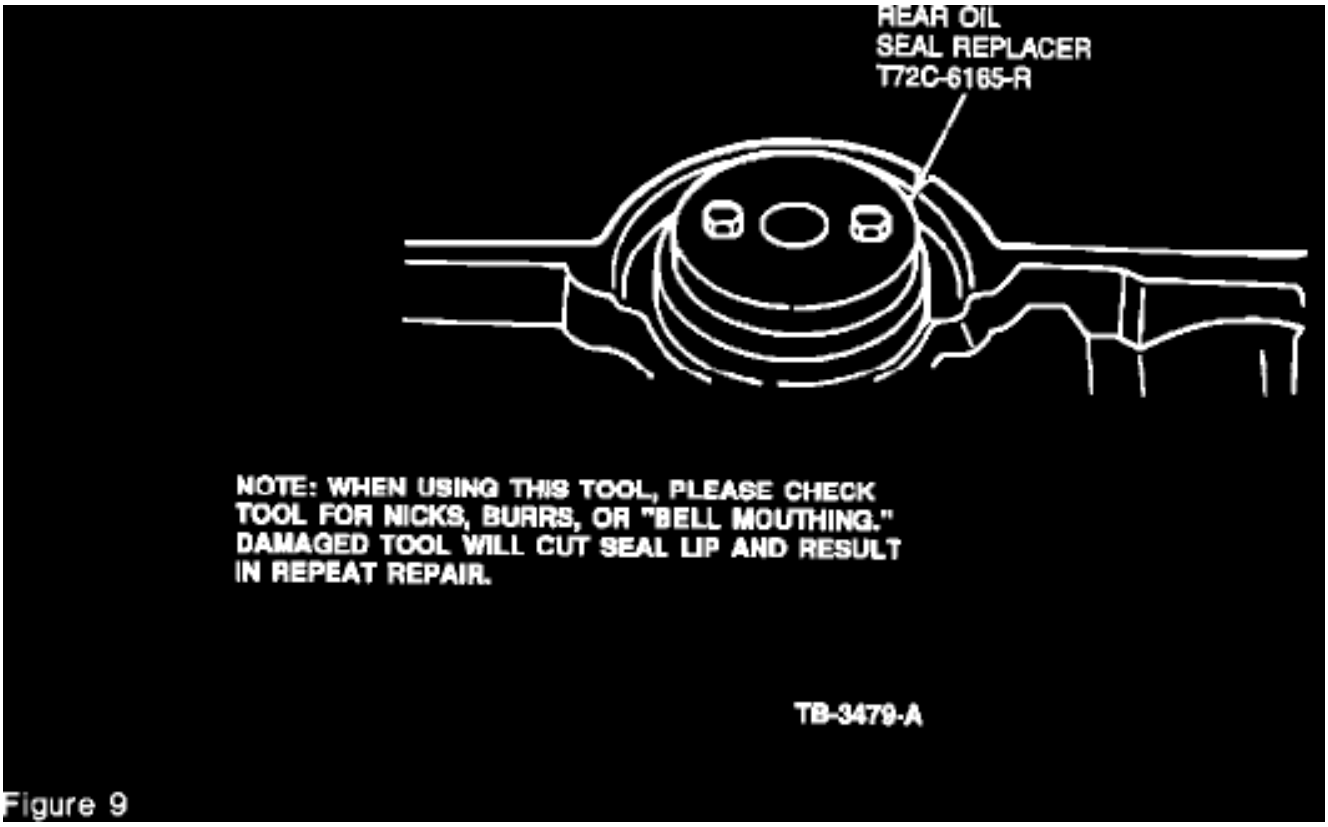

Figure 9

w. Coat the rear main oil seal (D7RZ-6701-A) with oil. Install the rear seal in the seal bore using Rear Oil Seal Replacer T72C-6165-R. This tool uses two flywheel bolts to draw the seal into position. Refer to Figure 9.

CAUTION:

DO NOT USE THE OLD STYLE HAMMER OPERATED TOOL.

3. Repair procedure for a leak between the rear main seal and the crankshaft. See block diagram, Procedure A, Step A4/F3.

a. Any presence of rust on the rear seal journal will cause a leak.

b. Any presence of pitting, porosity or nicks on the rear seal journal will cause a leak.

NOTE:

IF A LEAK IS PRESENT BETWEEN THE REAR MAIN SEAL AND CRANKSHAFT, PLEASE NOTIFY THE 4.0L "HOTLINE" AT (800) 537-8046 OR (800) 552-4445 PRIOR TO ANY ATTEMPT TO REPAIR THIS CONDITION.

Service Procedure - Repair For Oil Leaks At Intake Manifold

PROCEDURE B

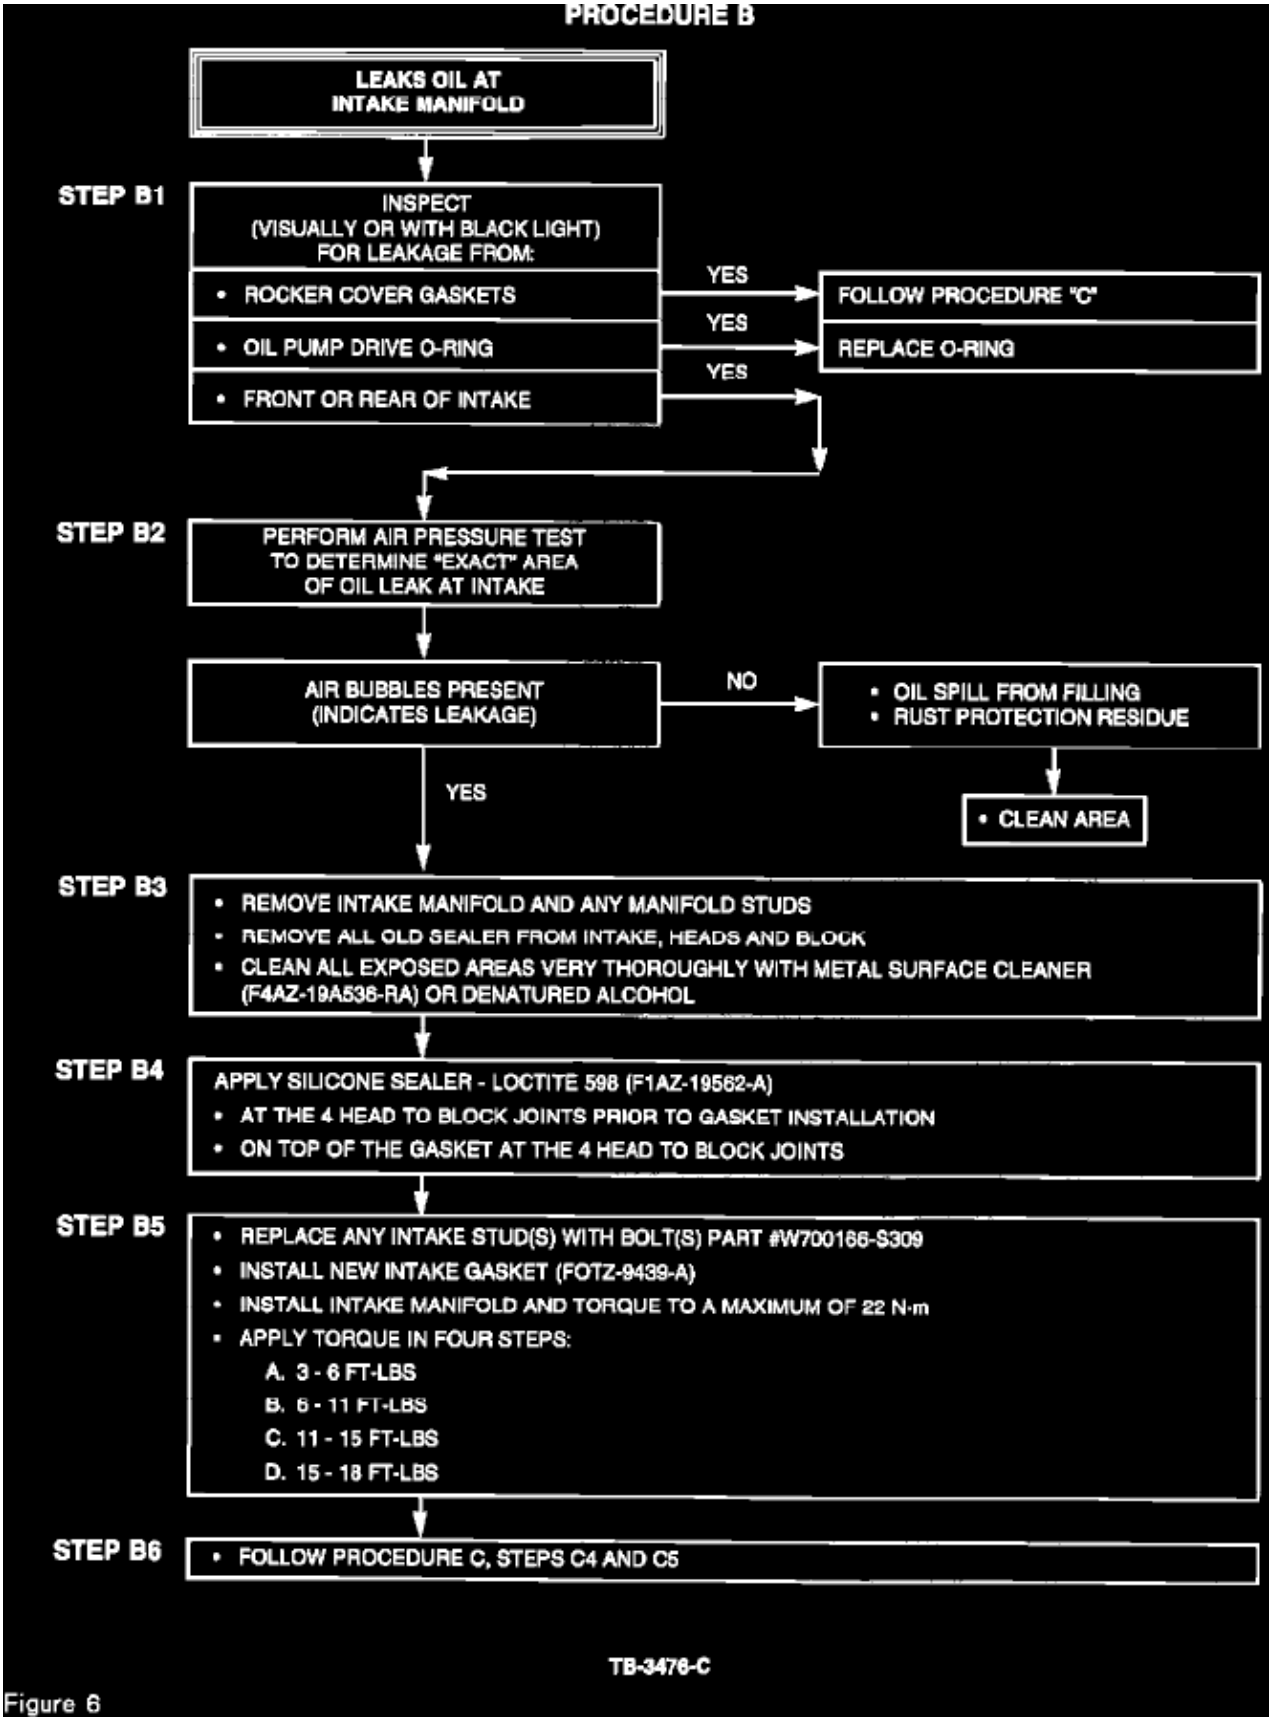

Figure 6

1. If the air pressure test showed no air bubbles, follow Procedure B2 to clean area of oil spill or other contamination.

2. If the air pressure test showed air bubbles present, follow Steps B3 through B6. Refer also to the Service Manual for the applicable year for further information pertinent to removal and installation of the intake manifold.

Service Procedure - Repair For Oil Leaks At Rocker Cover Rails

PROCEDURE C

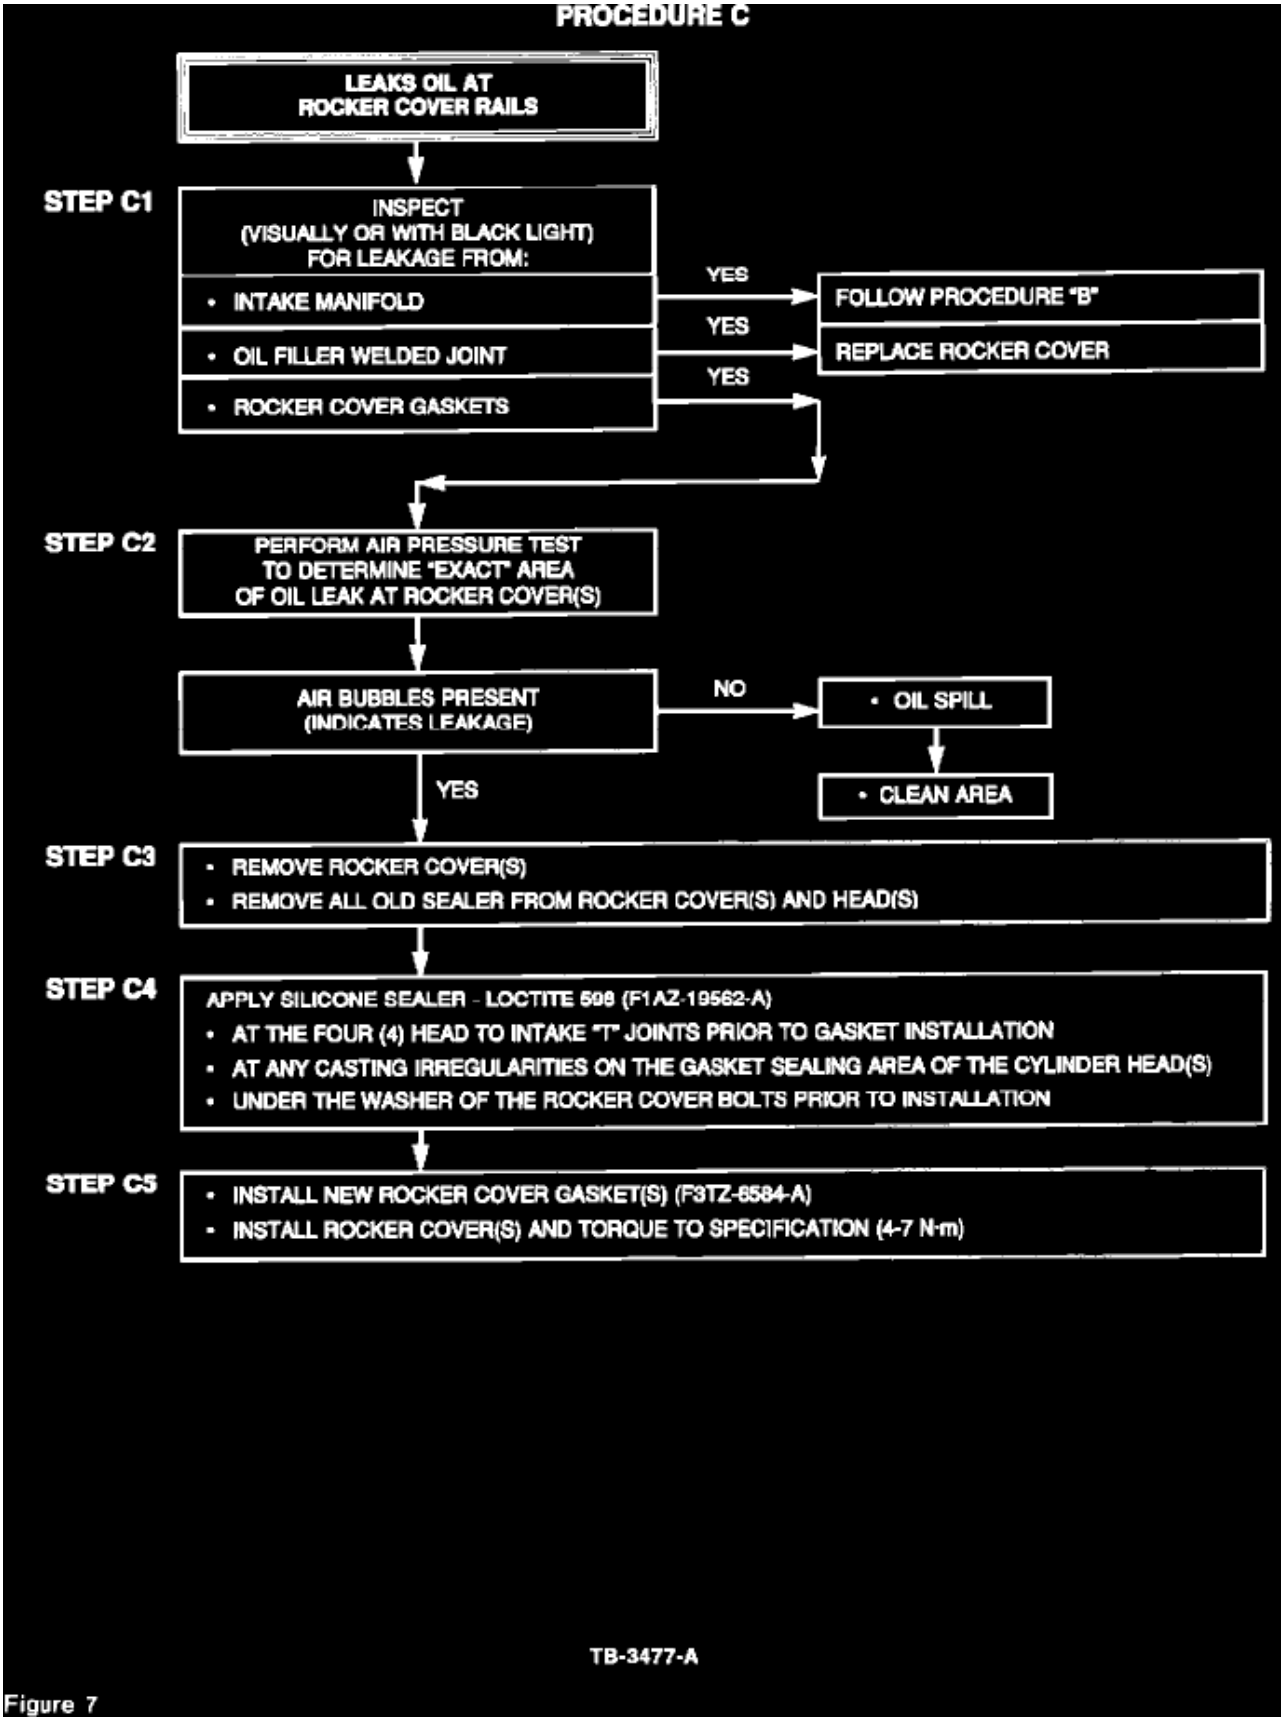

Figure 7

1. If the air pressure test showed no air bubbles, follow Procedure C2 to clean the area of any oil spill.

2. If the air pressure test showed air bubbles present, follow Steps C3 through C5.

Service Procedure - Repair For Oil Leaks At Front End

PROCEDURE D

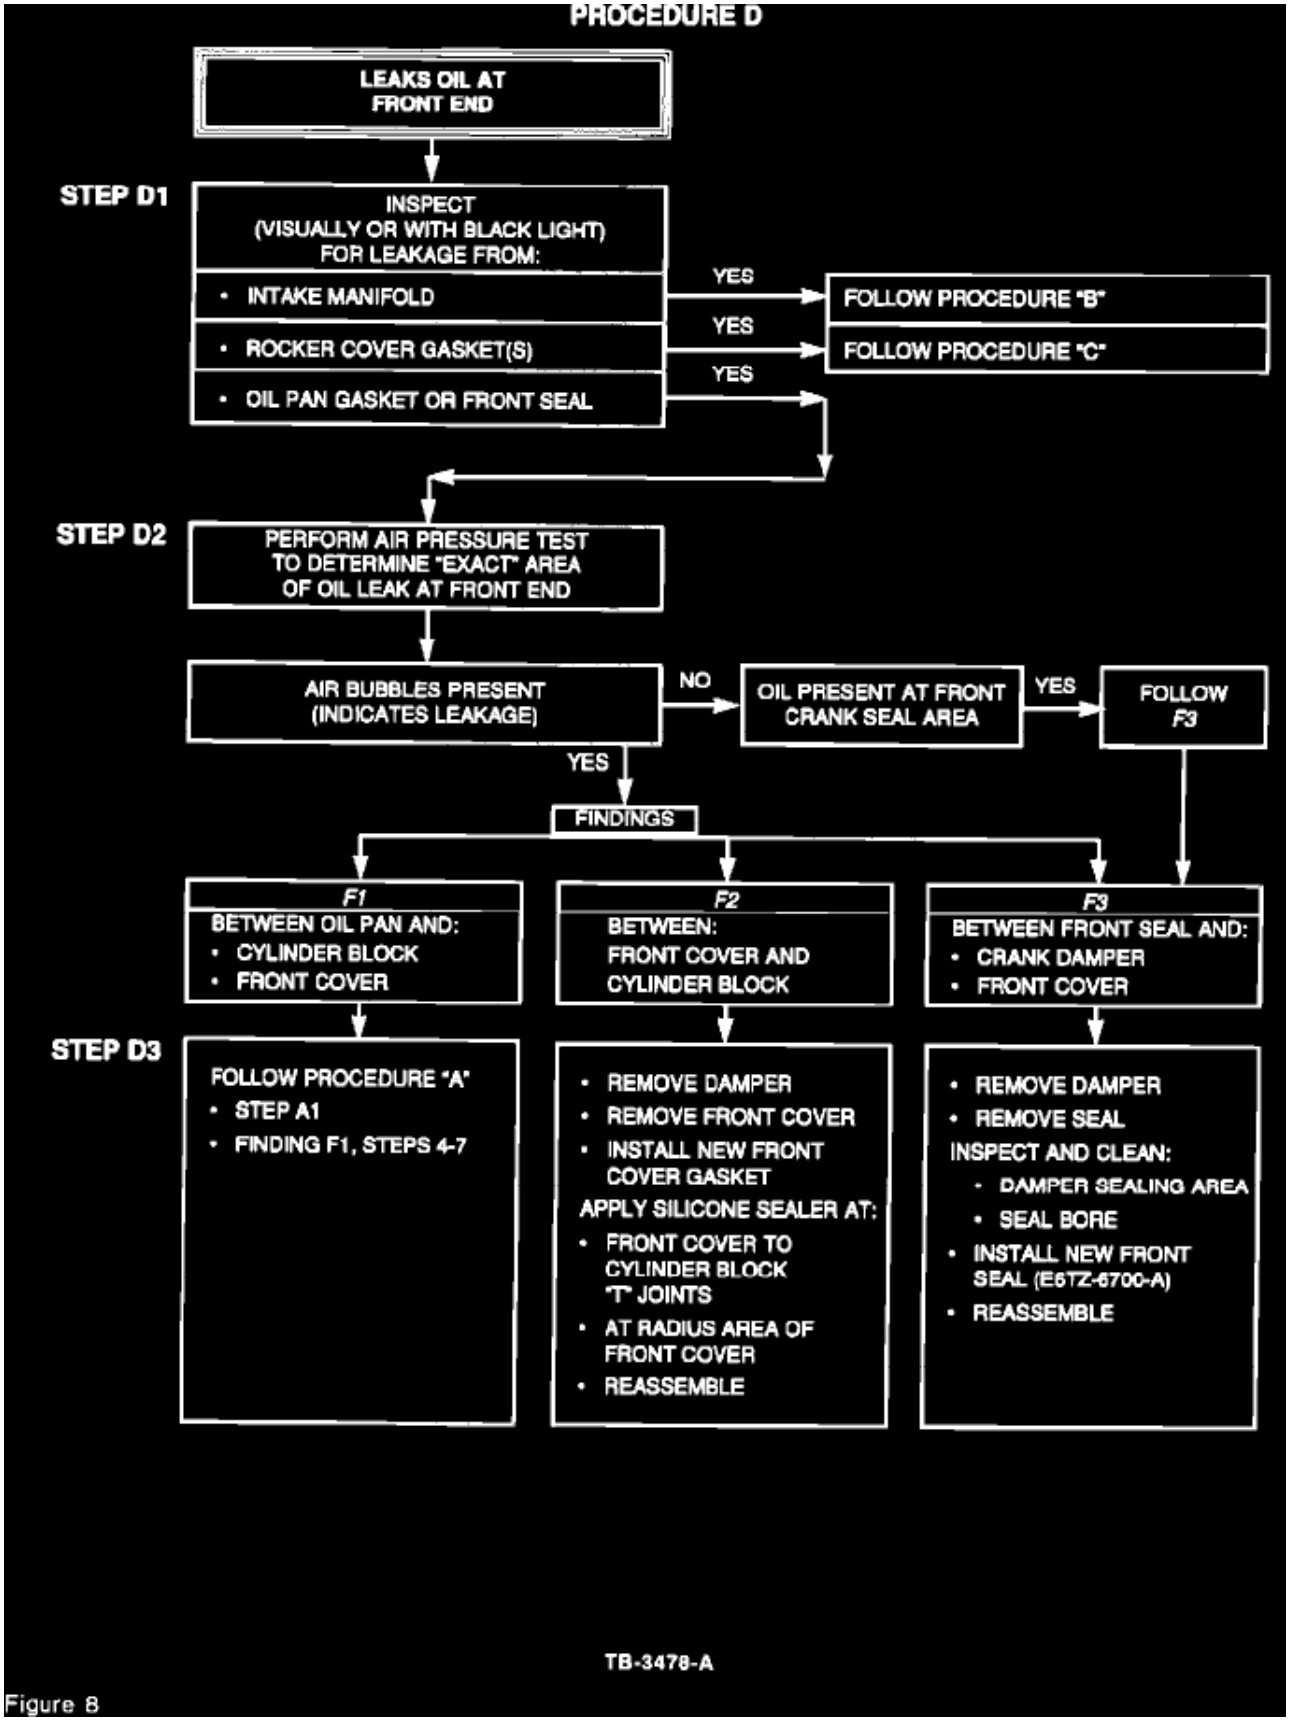

Figure 8

1. If the air pressure test showed no air bubbles, follow Procedure D, F3.

2. If the air pressure test showed air bubbles present, follow Procedure D, F1 or F2 as appropriate.

General Information

LIGHT TRUCK: 1990-93 AEROSTAR, RANGER 1991-93 EXPLORER

This TSB is being republished in its entirety to correct the type of cleaner being used in Figures 1, 3, and 6.

ISSUE: The many sources of leaks which typically appear at the lower end, front end, intake manifold valley, and rocker cover rails have led to mis-diagnosis as to the source of the leak and improper repair procedures, repeat repairs, and customer dissatisfaction.

ACTION: This TSB article has been developed to list the latest sealing techniques and associated part numbers for:

^ Oil Pan

^ Rear Main Seal

^ Rocker Covers

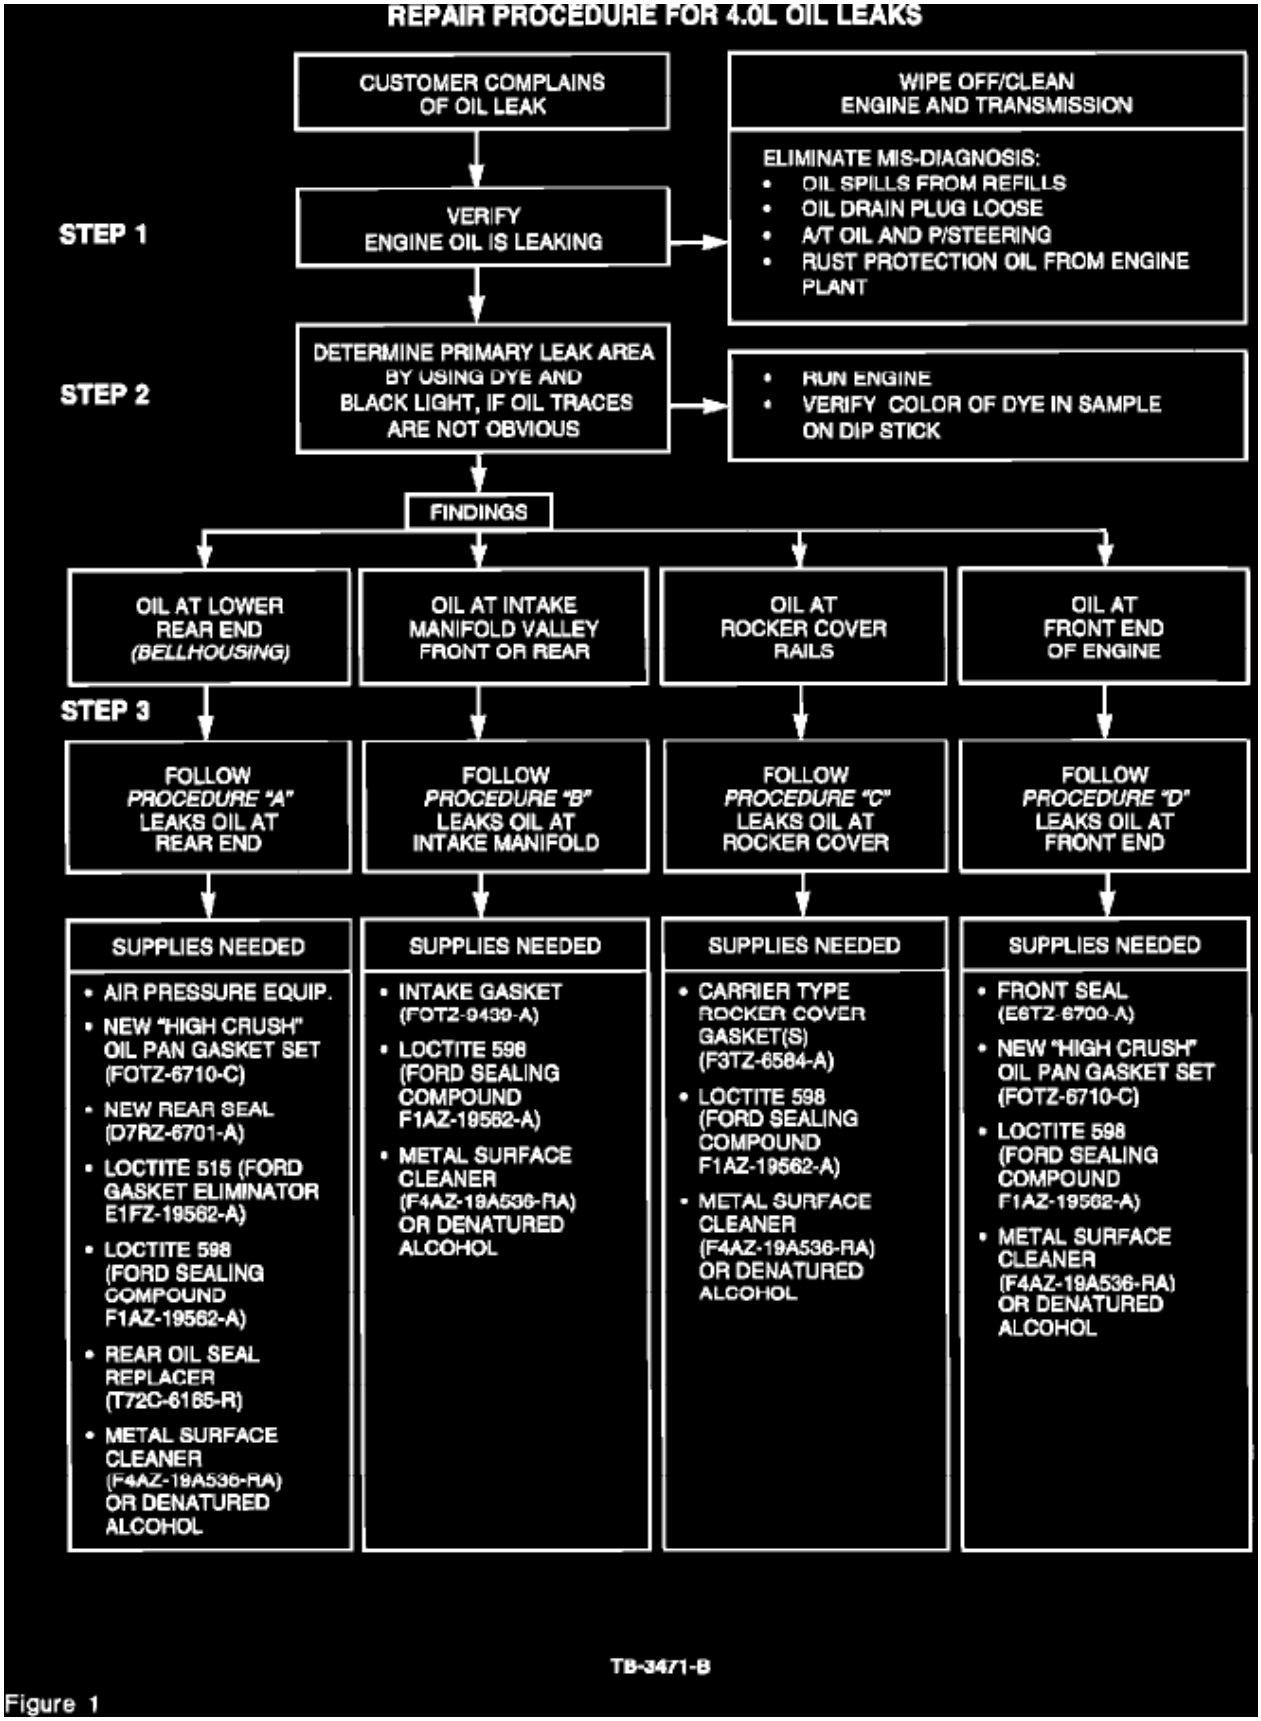

Figure 1

^ Intake Manifold

This article attempts to fully address all issues as one, in order to provide a diagnostic guide which leads to proper diagnosis and repair the first time. Use the following procedures to verify the location of the oil leak and perform the repair.

Service Procedure - Diagnosis

1. Perform Steps 1 and 2 of the block diagram shown in Figure 1. Perform a visual inspection to determine the general area of the oil leak.

2. After determining the "Findings" of Step 2, perform Step 3 by following Procedures A, B, C or D, whichever is appropriate, up to, but not including the air pressure test.

NOTE:

WHEN THE FINDINGS RESULT IN FOLLOWING PROCEDURE "A" FOR "LEAKS OIL AT REAR END", IT IS VERY IMPORTANT TO FOLLOW THE BLOCK DIAGRAM INSTRUCTIONS TO REMOVE THE TRANSMISSION, IF AN AEROSTAR, AND TO REMOVE THE ENGINE, IF AN EXPLORER/RANGER. THE PRACTICE OF REMOVING EXPLORER/RANGER OIL PANS WITH ENGINE IN VEHICLE CAN RESULT IN FAULTY DIAGNOSIS AND/OR REPAIR FOR THE PURPOSES OF THIS TSB.

If the leak has not been located and corrected at this point, then fabricate a device that is capable of applying a constant 1 to 3 psi of air pressure to the engine crankcase. The Rotunda Leak Tester 134-00003, or equivalent, which contains a pressure regulator and gauge capable of a 1 to 3 psi range, may be used.

3. Verify the location of the oil leak by pressurizing the engine crankcase with a constant supply of 3 psi of air pressure and the use of leak detection solution (liquid detergent and water). This process will verify the exact location of the leak. Dye and black light will verify a leak is present, but may not verify the exact location of the leak.

a. Assemble the necessary hose and fittings to connect an air pressure regulator and air pressure gauge to the shop air supply and to the engine crankcase through the dipstick tube.

b. Test the device to make sure 1-3 psi of air pressure can be maintained. Bursts of pressure over 3 psi can damage engine seals.

c. Before starting the test, make sure the regulator valve is completely closed so as not to accidentally apply a big burst of air to the engine when starting the test.

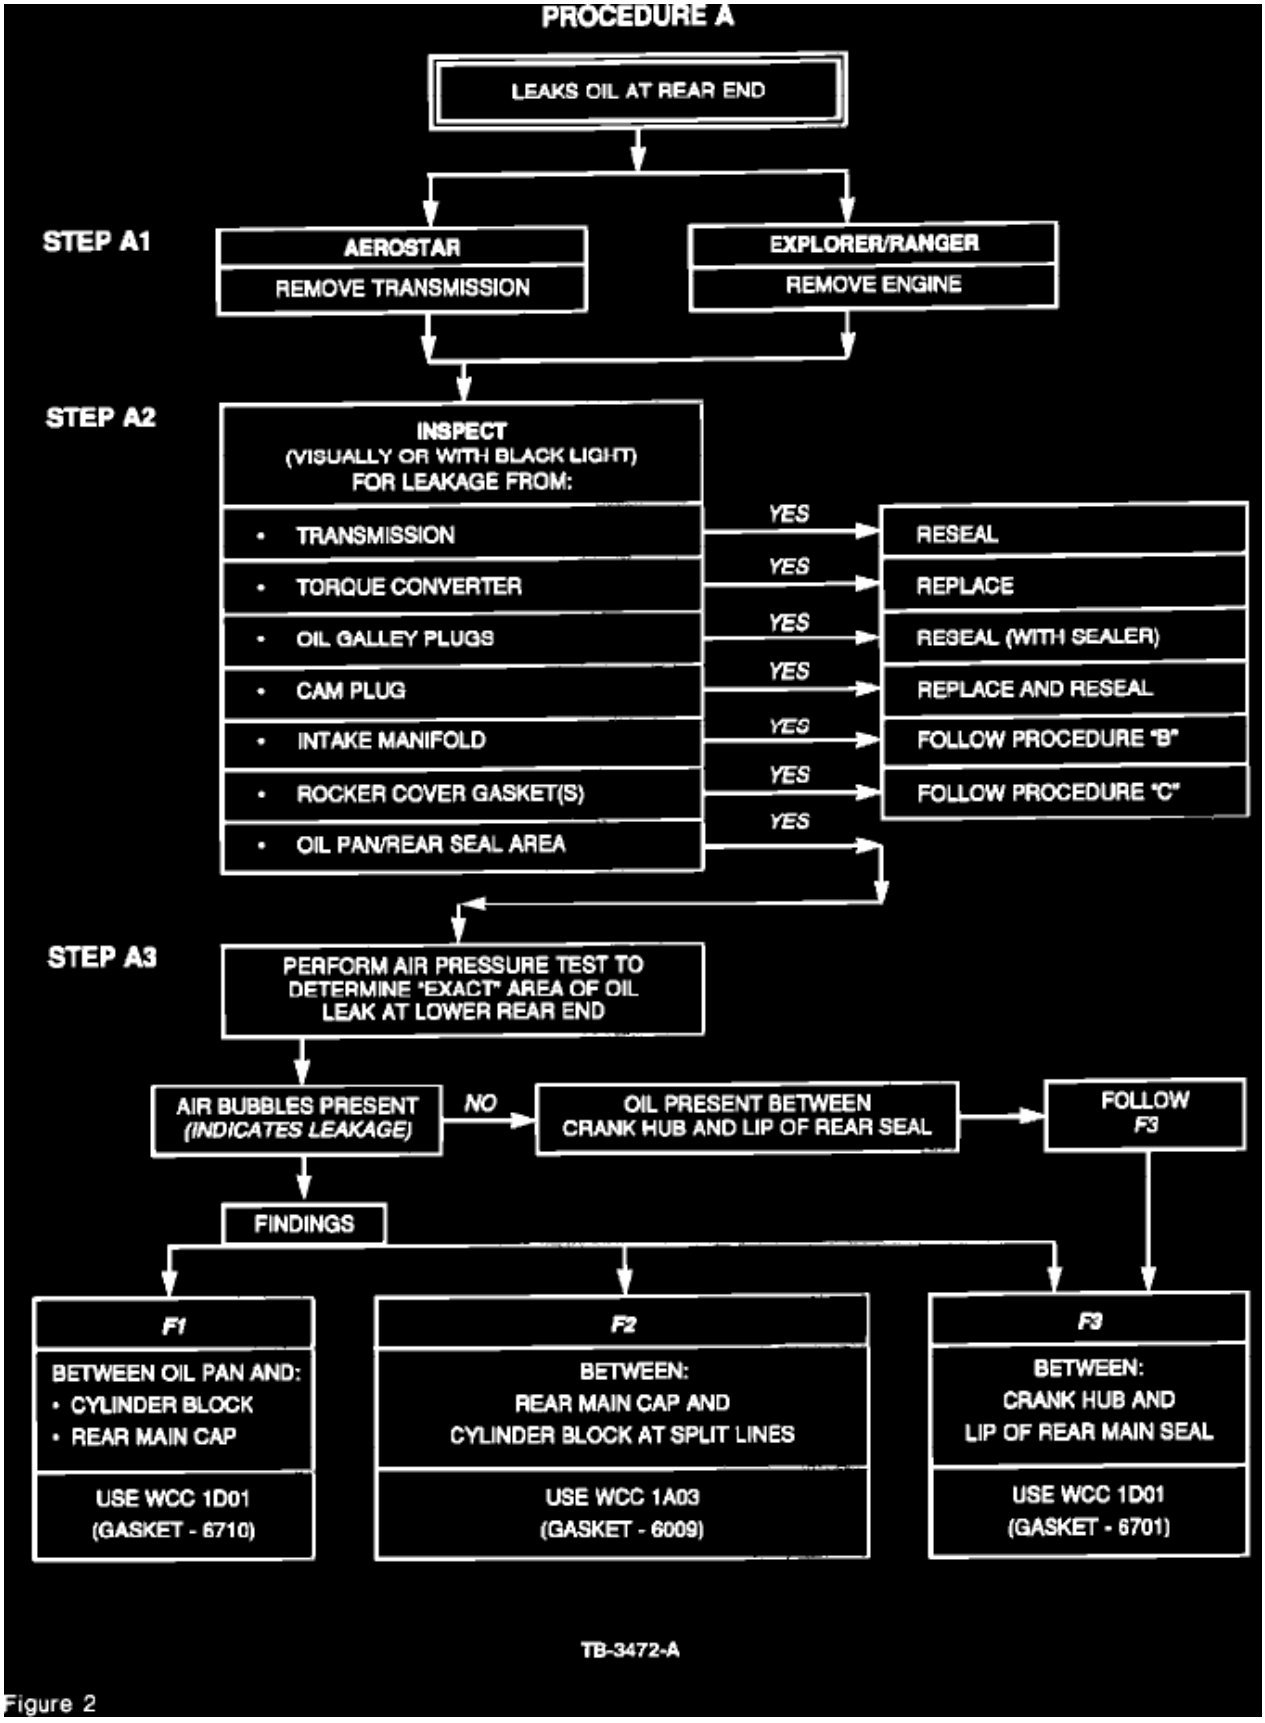
d. Attach the outlet (regulated) hose from the regulator/gauge device to the dipstick.

e. To trap air in the engine, plug any ports and passages (PCV valve, air inlet connection) that will allow air to escape.

f. Slowly open the regulator valve until 1-3 psi of air pressure registers on the gauge.

g. Keeping air pressure applied, brush or squirt a solution of liquid detergent and water or commercially available liquid leak detector (Snoop, Bubbles) to the primary area identified in Step 2 of the block diagram.

^ If the primary area is in the rear seal area, apply the solution to the rear seal, rear cap, rear cap to cylinder block and oil pan gasket areas.



PROCEDURE A
LEAKS OIL AT REAR END
STEP A1
AEROSTAR
REMOVE TRANSMISSION
EXPLORER/RANGER
REMOVE ENGINE
STEP A2
INSPECT
(VISUALLY OR WITH BLACK LIGHT)
FOR LEAKAGE FROM:
• TRANSMISSION
• TORQUE CONVERTER
• OIL GALLEY PLUGS
• CAM PLUG
• INTAKE MANIFOLD
• ROCKER COVER GASKET(S)
• OIL PAN/REAR SEAL AREA
YES
RESEAL
REPLACE
RESEAL (WITH SEALER)
REPLACE AND RESEAL
FOLLOW PROCEDURE "B"
FOLLOW PROCEDURE "C"
STEP A3
PERFORM AIR PRESSURE TEST TO
DETERMINE "EXACT" AREA OF OIL
LEAK AT LOWER REAR END
AIR BUBBLES PRESENT
(INDICATES LEAKAGE)
NO
OIL PRESENT BETWEEN
CRANK HUB AND LIP OF REAR SEAL
FOLLOW
F3
FINDINGS
F1
BETWEEN OIL PAN AND:
• CYLINDER BLOCK
• REAR MAIN CAP
USE WCC 1D01
(GASKET - 6710)
F2
BETWEEN:
REAR MAIN CAP AND
CYLINDER BLOCK AT SPLIT LINES
USE WCC 1A03
(GASKET - 6009)
F3
BETWEEN:
CRANK HUB AND
LIP OF REAR MAIN SEAL
USE WCC 1D01
(GASKET - 6701)
TB-3472-A

Figure 2

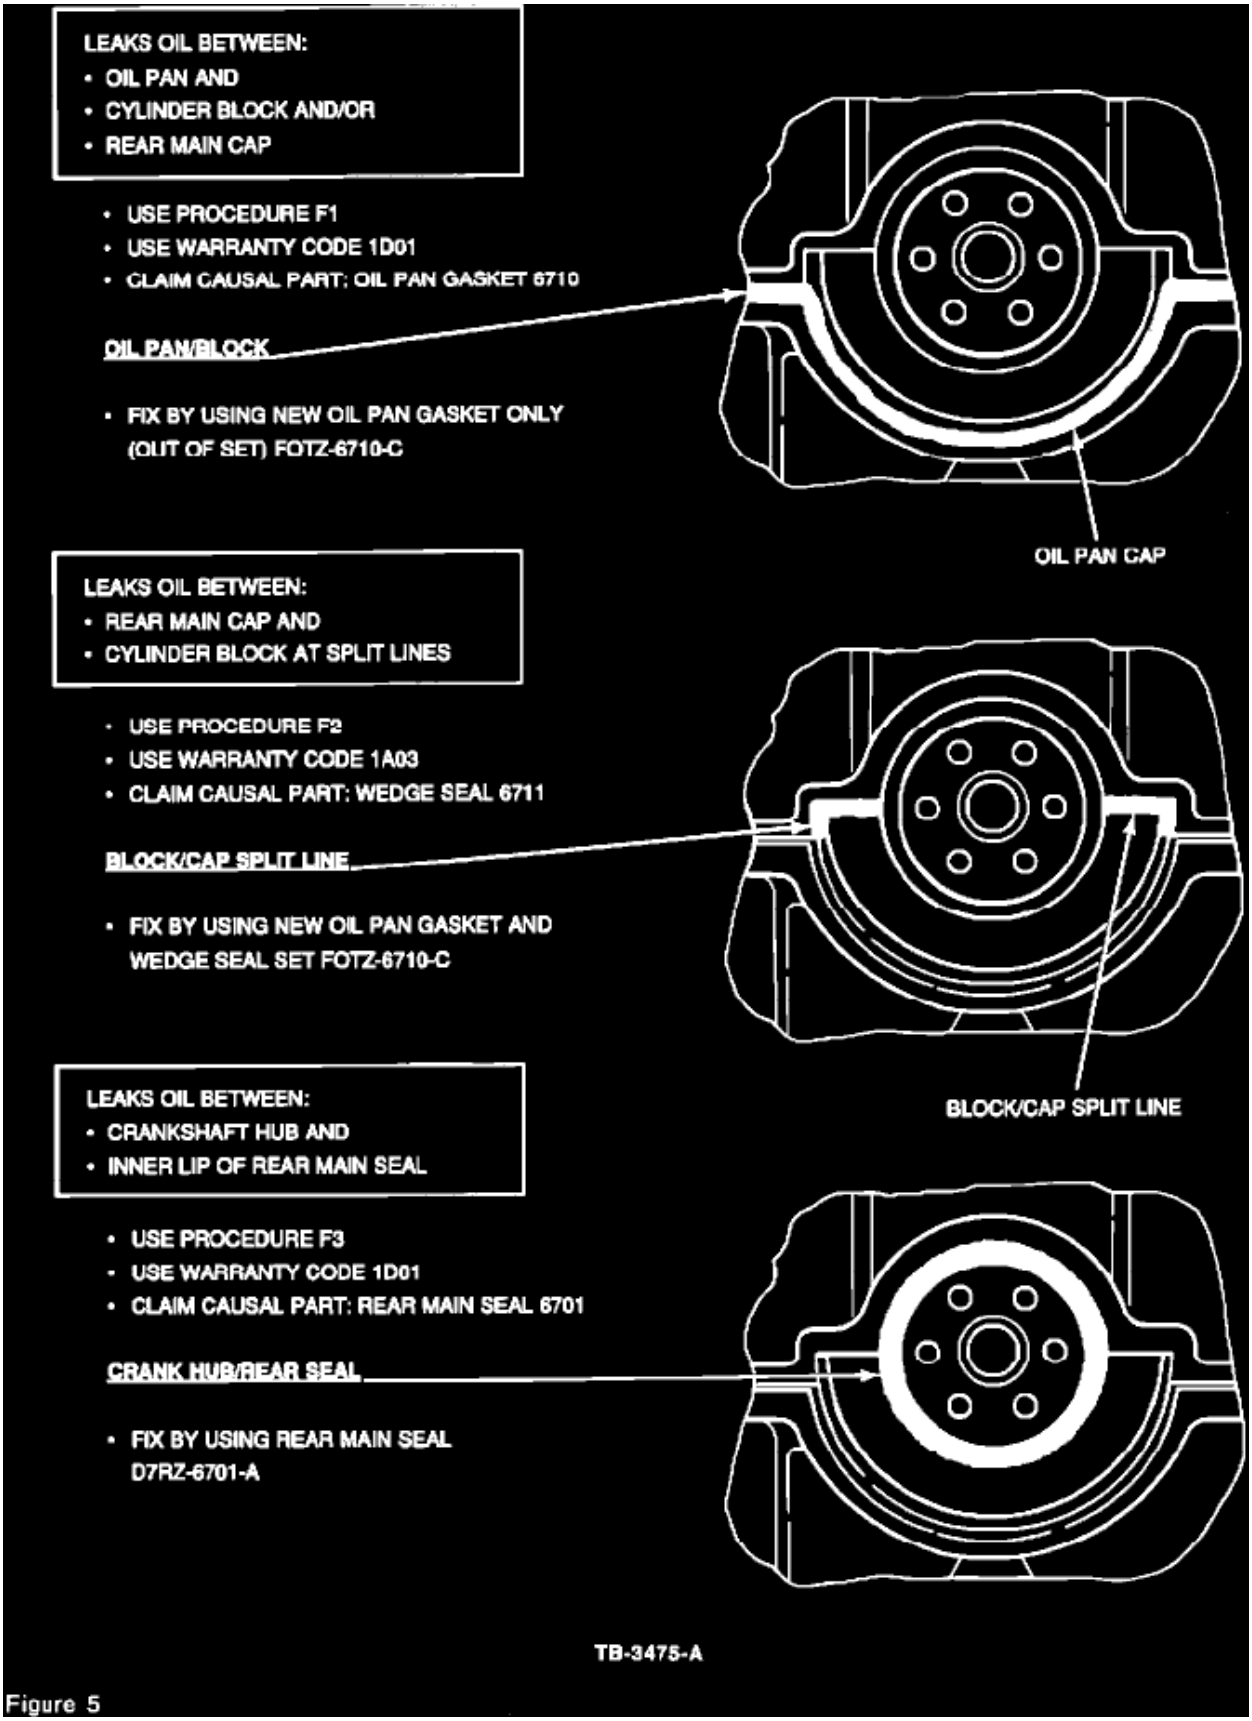


Figure 5

^ If bubbles are detected only at the oil pan gasket, between the oil pan and the cylinder block, or between the oil pan and the rear main cap, only the oil pan gasket needs replacing. Note

Procedure A, Figure 2, Step A3/F1, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A1.

^ If bubbles are detected between the rear main cap and the cylinder block, the rear cap must be removed and resealed. Note Procedure A, Figure 2, Step A3/F2, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A2.

^ If bubbles are detected between the rear seal lip and crank hub, a new rear oil seal will be required. Under certain circumstances, as outlined in the block diagram, it will be necessary to call the 4.OL Hotline. Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Proceed to SERVICE PROCEDURE - REPAIR REAR END OIL LEAK, Procedure A3.

^ If no bubbles are detected, but oil is present in the area between the crank hub and the lip of the rear seal, carefully remove the seal and inspect the crankshaft rear seal journal. (A leak may occur

at the rear seal only when the engine is running.) Note Procedure A, Figure 2, Step A3/F3, and pictorial, Figure 5. Follow repair procedures outlined on the block diagram.

NOTE:

ANY APPEARANCE OF RUST, PITTING, POROSITY, OR NICKS ON THE REAR SEAL JOURNAL WILL CAUSE A LEAK.

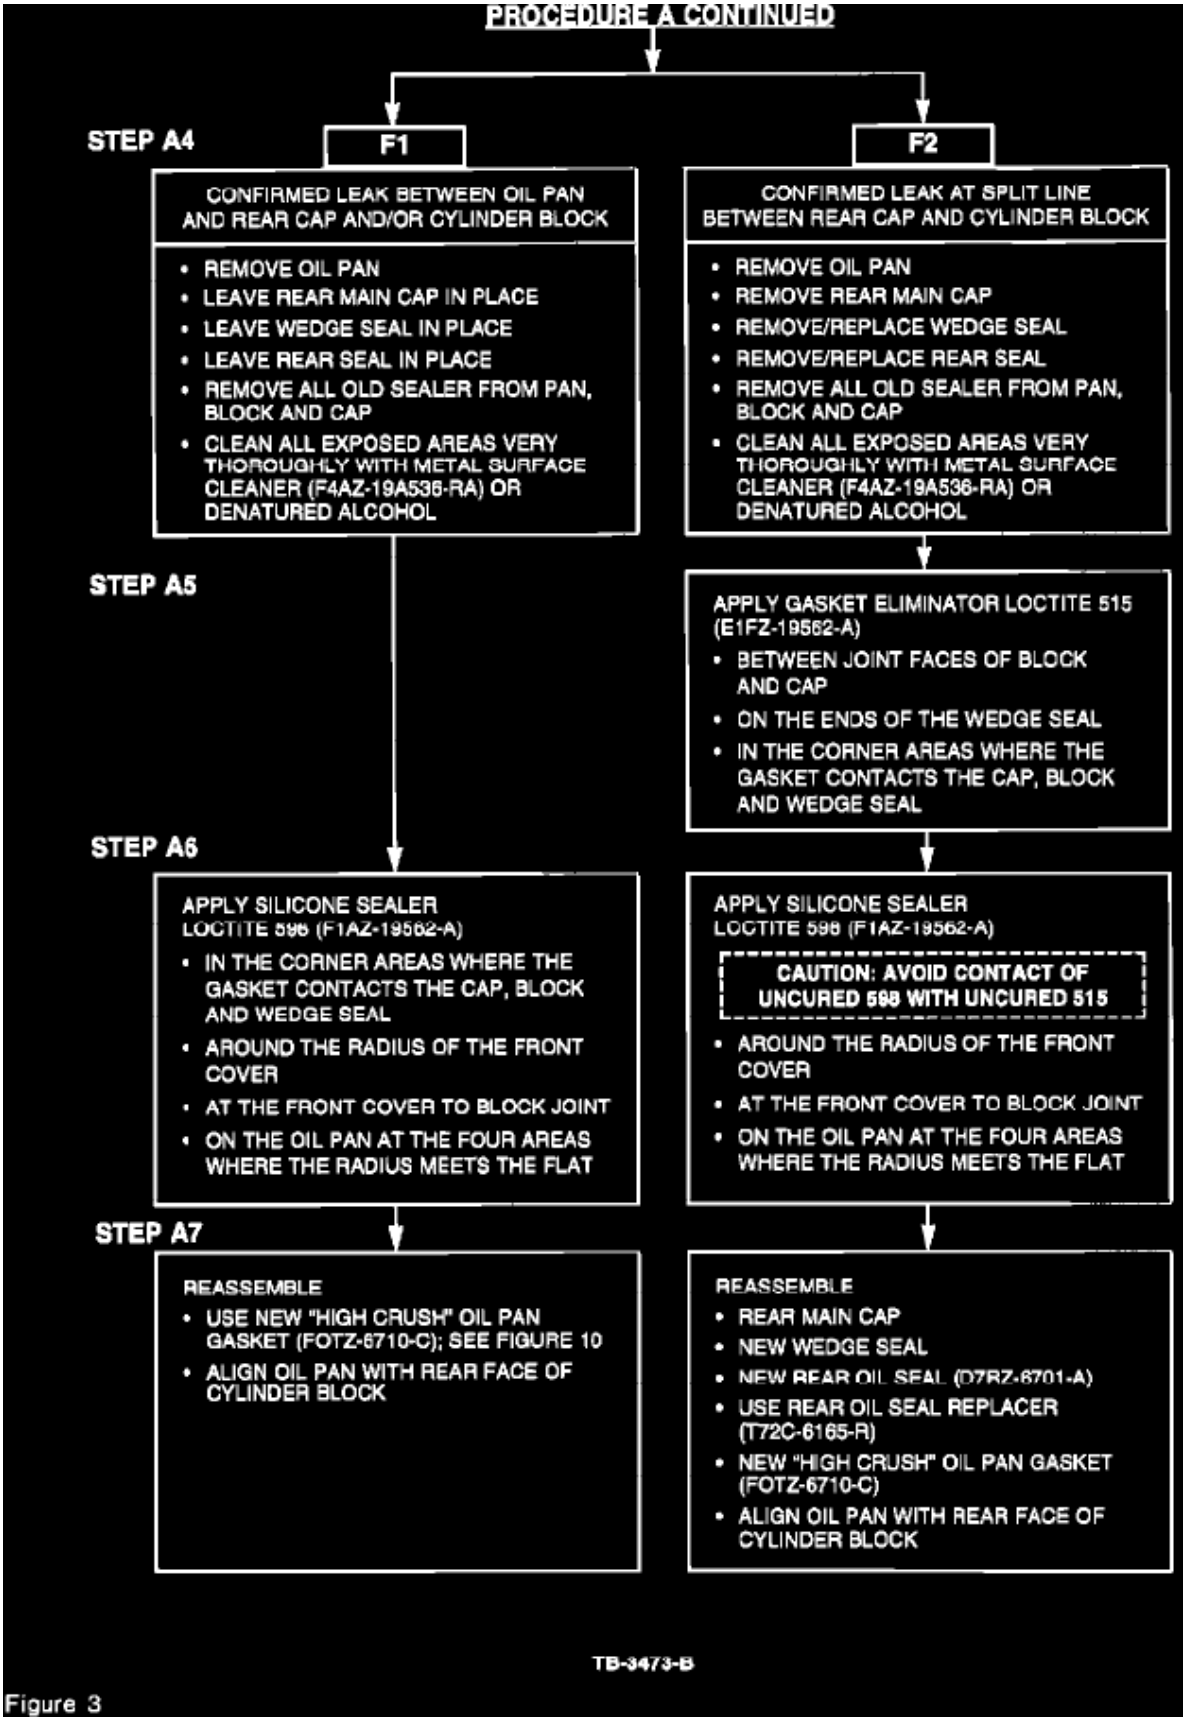
^ If bubbles are detected at the front or rear of the intake manifold gasket, a new intake manifold gasket (FOTZ-9439-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT INTAKE MANIFOLD, PROCEDURE B.

^ If bubbles are detected at the rocker cover rails, new rocker cover gaskets (F3TZ-6584-A) will have to be installed. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT ROCKER COVER RAILS, PROCEDURE C.

^ If bubbles are detected at the front end of the engine, a new front seal (E6TZ-6700-A) or oil pan gasket (FOTZ-6710-C) will be required. Proceed to SERVICE PROCEDURE - REPAIR FOR OIL LEAKS AT THE FRONT END, PROCEDURE D.

Service Procedure - Repair

REAR END OIL LEAK - PROCEDURE A



PROCEDURE A CONTINUED
STEP A4
F1
CONFIRMED LEAK BETWEEN OIL PAN AND REAR CAP AND/OR CYLINDER BLOCK
• REMOVE OIL PAN
• LEAVE REAR MAIN CAP IN PLACE
• LEAVE WEDGE SEAL IN PLACE
• LEAVE REAR SEAL IN PLACE
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
F2
CONFIRMED LEAK AT SPLIT LINE BETWEEN REAR CAP AND CYLINDER BLOCK
• REMOVE OIL PAN
• REMOVE REAR MAIN CAP
• REMOVE/REPLACE WEDGE SEAL
• REMOVE/REPLACE REAR SEAL
• REMOVE ALL OLD SEALER FROM PAN, BLOCK AND CAP
• CLEAN ALL EXPOSED AREAS VERY THOROUGHLY WITH METAL SURFACE CLEANER (F4AZ-19A536-RA) OR DENATURED ALCOHOL
STEP A5
APPLY GASKET ELIMINATOR LOCTITE 515 (E1FZ-19562-A)
• BETWEEN JOINT FACES OF BLOCK AND CAP
• ON THE ENDS OF THE WEDGE SEAL
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
STEP A6
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
• IN THE CORNER AREAS WHERE THE GASKET CONTACTS THE CAP, BLOCK AND WEDGE SEAL
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
APPLY SILICONE SEALER LOCTITE 598 (F1AZ-19562-A)
CAUTION: AVOID CONTACT OF UNCURED 598 WITH UNCURED 515
• AROUND THE RADIUS OF THE FRONT COVER
• AT THE FRONT COVER TO BLOCK JOINT
• ON THE OIL PAN AT THE FOUR AREAS WHERE THE RADIUS MEETS THE FLAT
STEP A7
REASSEMBLE
• USE NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C); SEE FIGURE 10
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
REASSEMBLE
• REAR MAIN CAP
• NEW WEDGE SEAL
• NEW REAR OIL SEAL (D7RZ-6701-A)
• USE REAR OIL SEAL REPLACER (T72C-6165-R)
• NEW "HIGH CRUSH" OIL PAN GASKET (FOTZ-6710-C)
• ALIGN OIL PAN WITH REAR FACE OF CYLINDER BLOCK
TB-3473-B
Figure 3

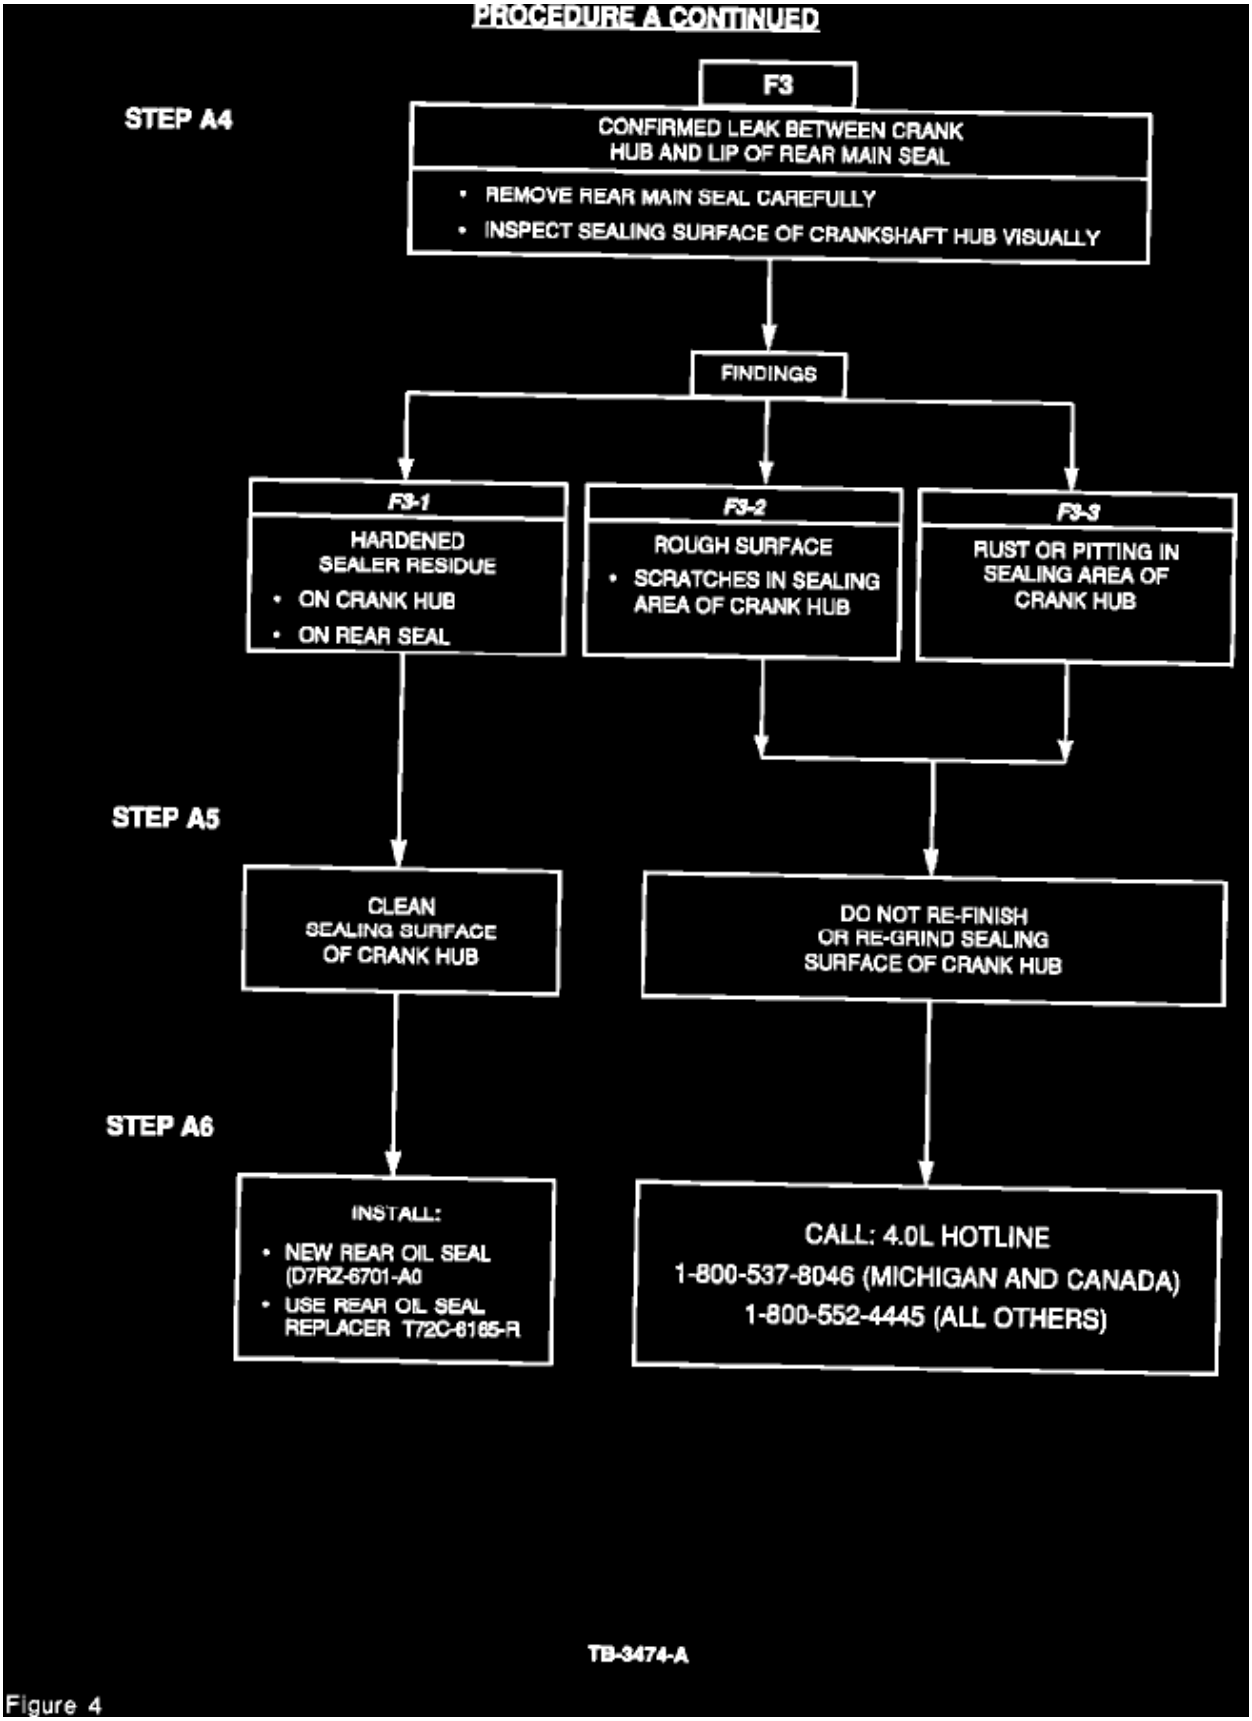


Figure 4

1. Repair procedure for a leak at oil pan gasket between the oil pan and cylinder block, or between the oil pan and the rear main cap. See block diagram Procedure A, Step A4/F1, Figures 3 and 4.

a. Remove the oil pan from the engine and remove the old gasket from the oil pan. Do not remove the rear main cap or wedge seal from the engine.

b. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

c. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap. Take special care to scrape/scratch all the old sealer from the exposed areas of the rear cap, wedge seal and cylinder block. This is a critical sealing area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER BLOCK.

d. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

e. Clean the transmission "BELLHOUSING" area, the rear of the cylinder block and the rear engine plate of ALL oil residue.

f. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corner of the radius areas at the front and rear of the oil pan.

g. Place the oil pan gasket (FOTZ-6710-C) in place in the groove in the oil pan.

h. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the corners where the rear main cap meets the cylinder block, at the corner areas of the radius area on the front cover and the front cover to cylinder block joint.

i. Set the oil pan in place and snug the four (4) pan nuts.

j. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .0100" (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

k. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

2. Repair procedure for a leak between the rear main cap and the cylinder block. See block diagram Procedure A, Step A4/F2.

a. Remove the oil pan, windage tray, oil pump and rear main cap from the engine.

b. Remove the rear main oil seal from the crankshaft and thoroughly inspect the main seal journal of the crankshaft for signs of rust, pitting, nicks or porosity.

c. Clean ALL the oil and old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.

d. Clean ALL the old sealer from the rear main bearing cap USING A SCRAPER AND WIRE WHEEL. The original Loctite sealer used during production assembly becomes extremely hard after it has cured. It is extremely important that ALL the old sealer be removed from the joint faces and grooves.

e. Clean ALL the oil and old sealer from the oil pan sealing area on the cylinder block and rear main cap joint area.

CAUTION:

PREVENT CYLINDER BLOCK CONTAMINATION. ALWAYS USE NECESSARY PRECAUTIONS TO PREVENT OLD SEALER OR GASKET MATERIAL FROM FALLING INTO THE CYLINDER

BLOCK.

f. Clean ALL the oil and old sealer from the "WEDGE SEAL" that fits around the rear main bearing cap in the oil pan gasket groove. Preferably use a new "WEDGE SEAL".

g. After all the parts have been cleaned, they must be wiped down with a cleaner that leaves no residue or film such as Metal Surface Cleaner (F4AZ-19A536-RA) or denatured alcohol.

CAUTION:

NEVER USE CARBURETOR CLEANER OR OTHER PETROLEUM PRODUCTS ON AREAS TO BE SEALED. THEY LEAVE A HYDROCARBON RESIDUE THAT RESISTS THE ADHESIVE ACTION OF SEALANTS. AVOID THE USE OF SOAP AND WATER AS CLEANERS. SOAP FILM RESISTS THE SEALANTS ADHESIVE ACTION.

h. Clean the transmission "BELLHOUSING AREA", the rear of the cylinder block and the rear engine plate of ALL oil residue.

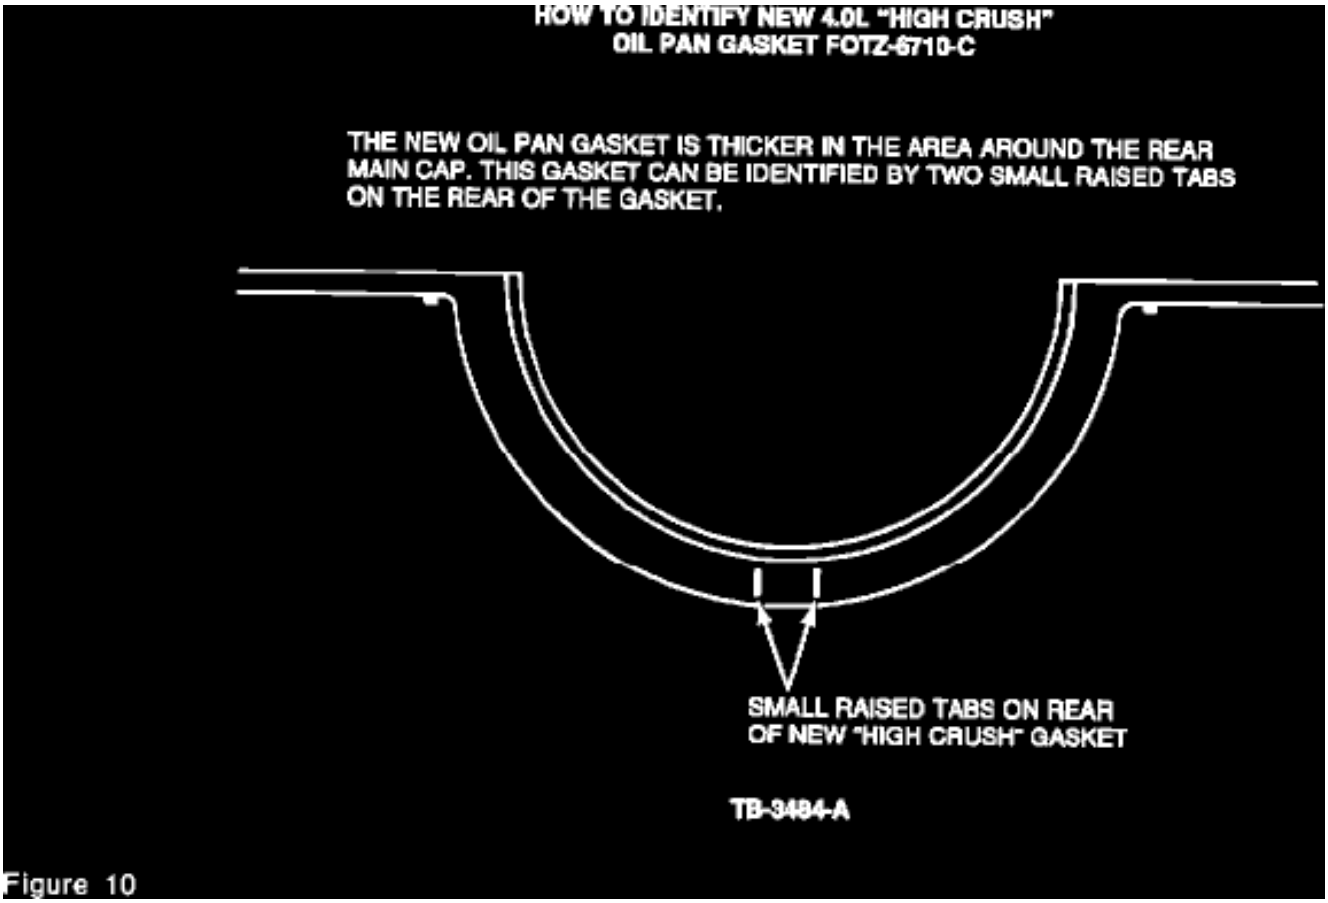

Figure 10

i. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) on the cylinder block along the corners of the rear main bearing cap joint area and on the joint face, approximately 1/2 inch (12.7 mm) from the rear of the block.

j. Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.

k. Align the rear main bearing cap to cylinder block by moving the bearing fore or aft (approx. 1/2 inch (12.7 mm) inward in the rear oil seal bore) so that the rear seal stop of the block and cap line up. This will assure that the rear main oil seal will seat squarely when installed in the bore.

l. Torque the rear main cap bolts to 66-77 lb.ft. (90-104 N-m).

m. Fill the cavities for the "WEDGE SEAL" on both sides of the rear main cap with Ford Gasket Eliminator (E1FZ-19562-A).

n. Place "WEDGE SEAL" in place and use a flat bladed screwdriver to fully seat the "WEDGE SEAL", forcing the excessive sealer out.

o. Place a bead of Ford Gasket Eliminator (E1FZ-19562-A) in the corners of the oil pan gasket groove of the rear main cap where the cap meets the cylinder block.

p. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) at the corner areas of the radius area on the front cover and at the front cover to cylinder block joint.

q. Reinstall the oil pump and windage tray. Torque to 13-15 lb.ft. (17-21 N-m).

r. Place a bead of Ford Silicone Sealer (F1AZ-19562-A) in the oil pan gasket groove at the corners of the radius areas at the front and rear of the oil pan.

s. Place the oil pan gasket (FOTZ-6710-C), Figure 10, in place in the groove in the oil pan.

t. Set the oil pan in place and snug the four (4) oil pan bolts.

u. Align the rear face of the oil pan with the rear face of the cylinder block.

NOTE:

IF THE REAR FACE OF THE OIL PAN CANNOT BE ALIGNED WITHIN .01000 (.254 mm) OF THE REAR FACE OF THE CYLINDER BLOCK, THE APPROPRIATE SHIMS MUST BE USED.

v. Install the remaining oil pan bolts and torque to 5-7 lb.ft. (7-10 N-m).

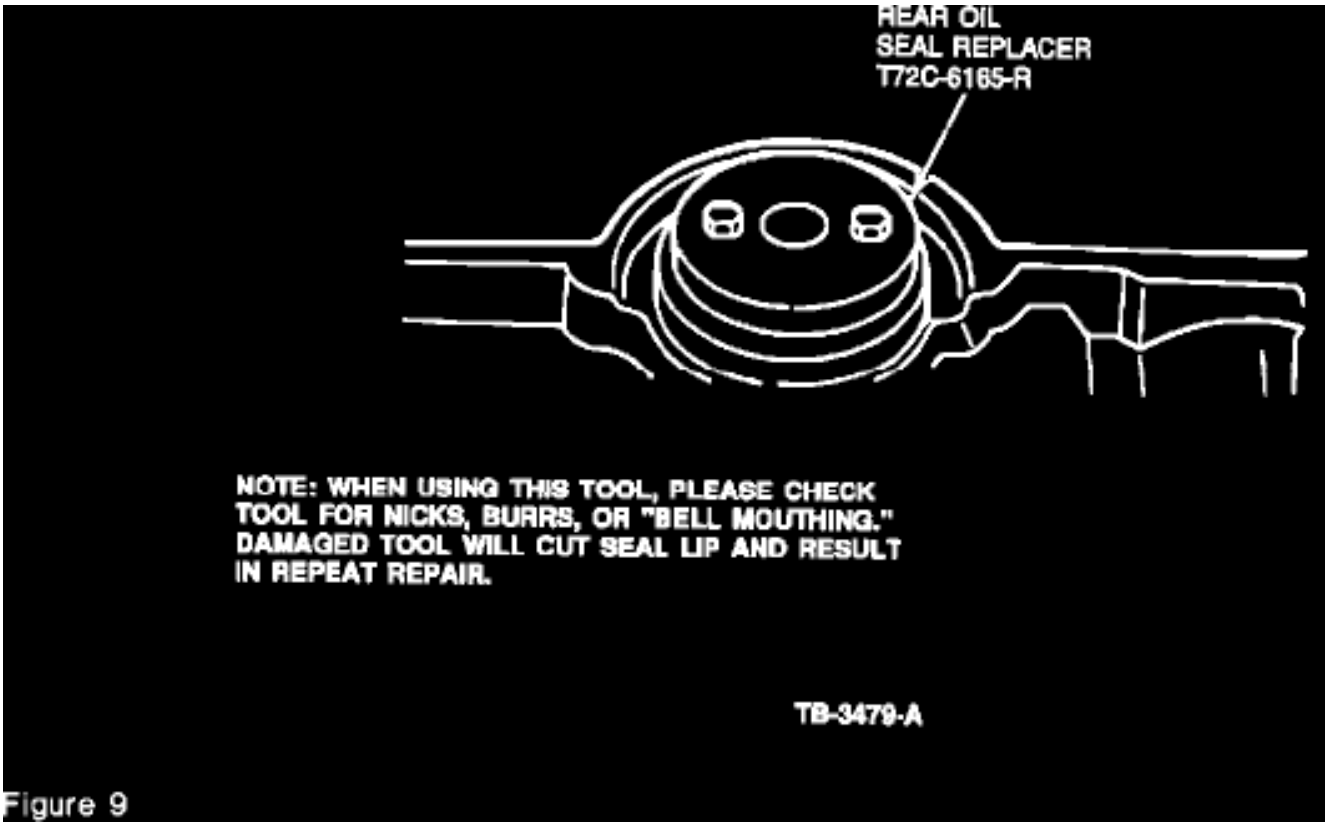

Figure 9

w. Coat the rear main oil seal (D7RZ-6701-A) with oil. Install the rear seal in the seal bore using Rear Oil Seal Replacer T72C-6165-R. This tool uses two flywheel bolts to draw the seal into position. Refer to Figure 9.

CAUTION:

DO NOT USE THE OLD STYLE HAMMER OPERATED TOOL.

3. Repair procedure for a leak between the rear main seal and the crankshaft. See block diagram, Procedure A, Step A4/F3.

a. Any presence of rust on the rear seal journal will cause a leak.

b. Any presence of pitting, porosity or nicks on the rear seal journal will cause a leak.

NOTE:

IF A LEAK IS PRESENT BETWEEN THE REAR MAIN SEAL AND CRANKSHAFT, PLEASE NOTIFY THE 4.0L "HOTLINE" AT (800) 537-8046 OR (800) 552-4445 PRIOR TO ANY ATTEMPT TO REPAIR THIS CONDITION.

Service Procedure - Repair For Oil Leaks At Intake Manifold

PROCEDURE B

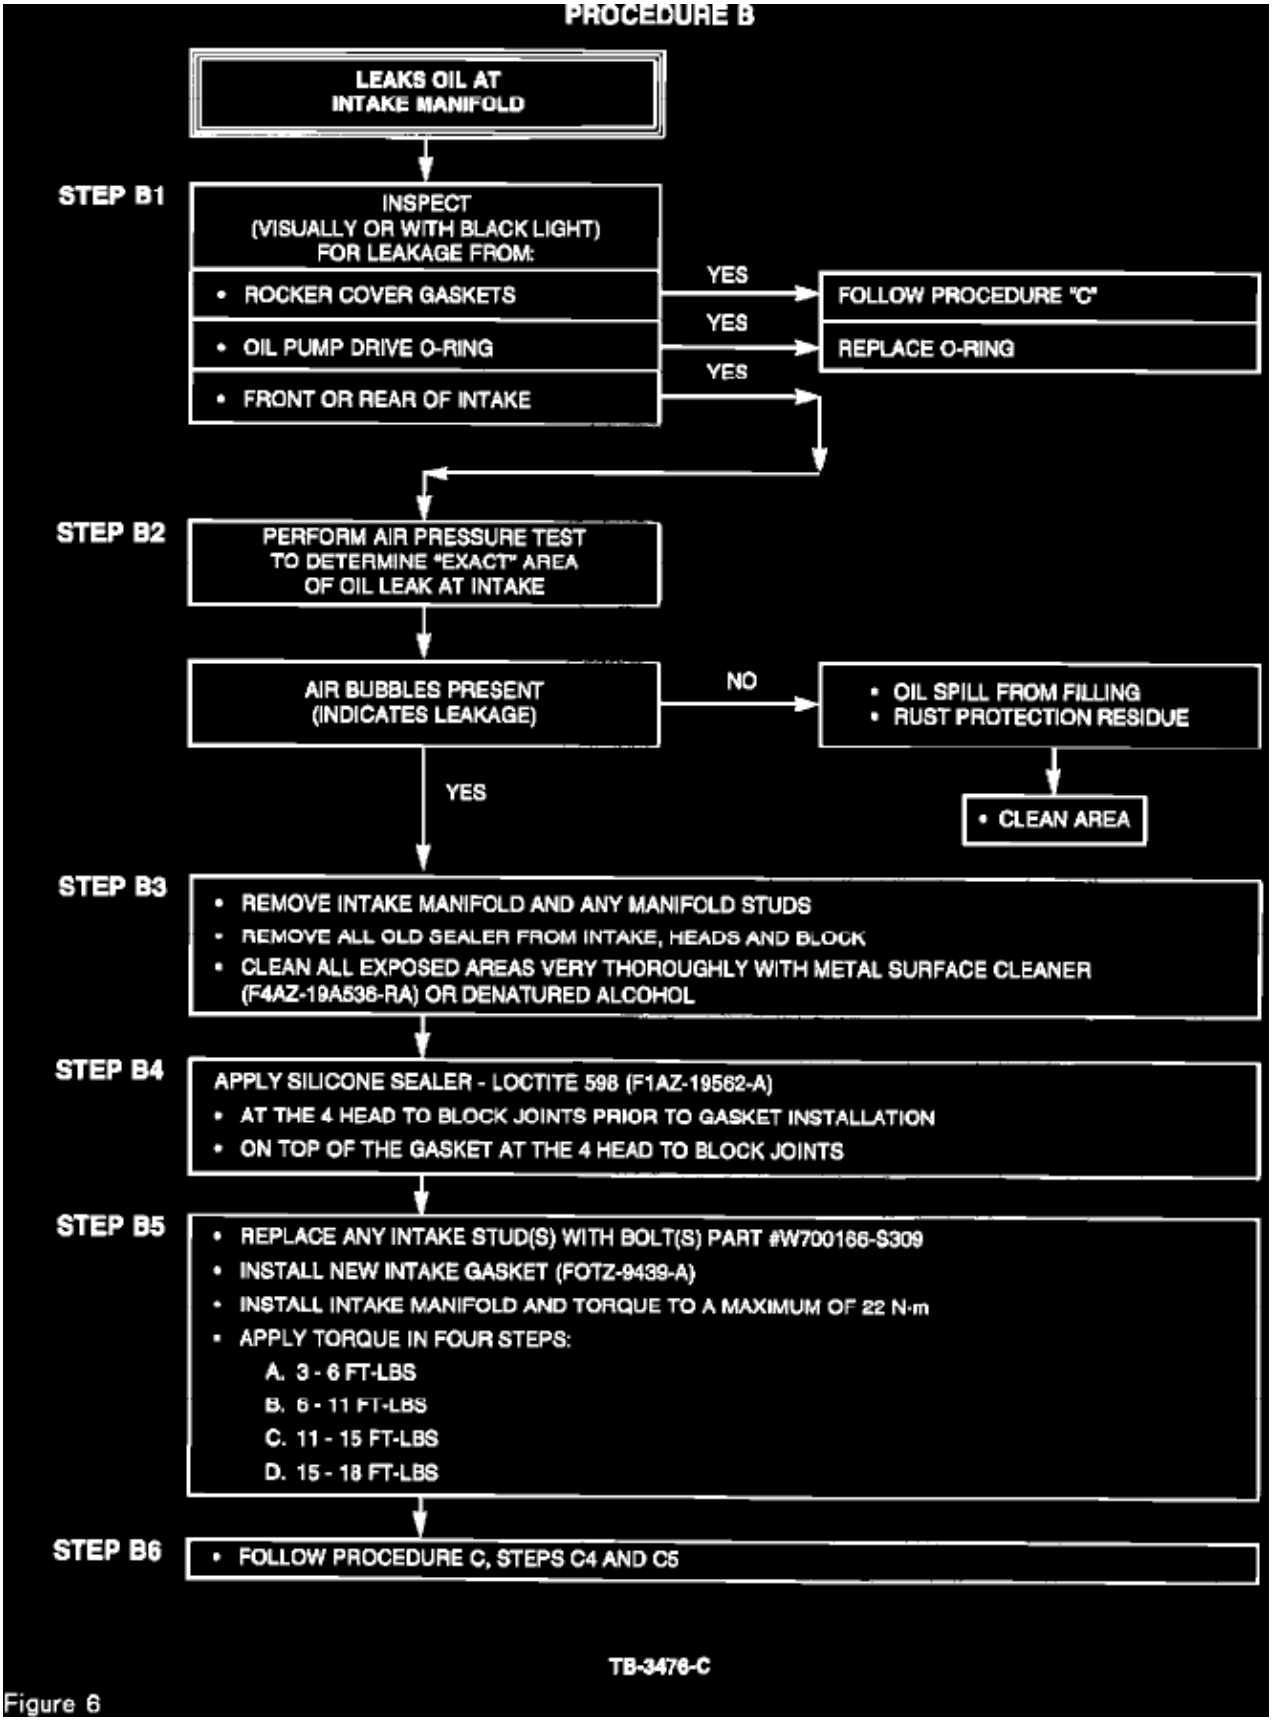

Figure 6

1. If the air pressure test showed no air bubbles, follow Procedure B2 to clean area of oil spill or other contamination.

2. If the air pressure test showed air bubbles present, follow Steps B3 through B6. Refer also to the Service Manual for the applicable year for further information pertinent to removal and installation of the intake manifold.

Service Procedure - Repair For Oil Leaks At Rocker Cover Rails

PROCEDURE C

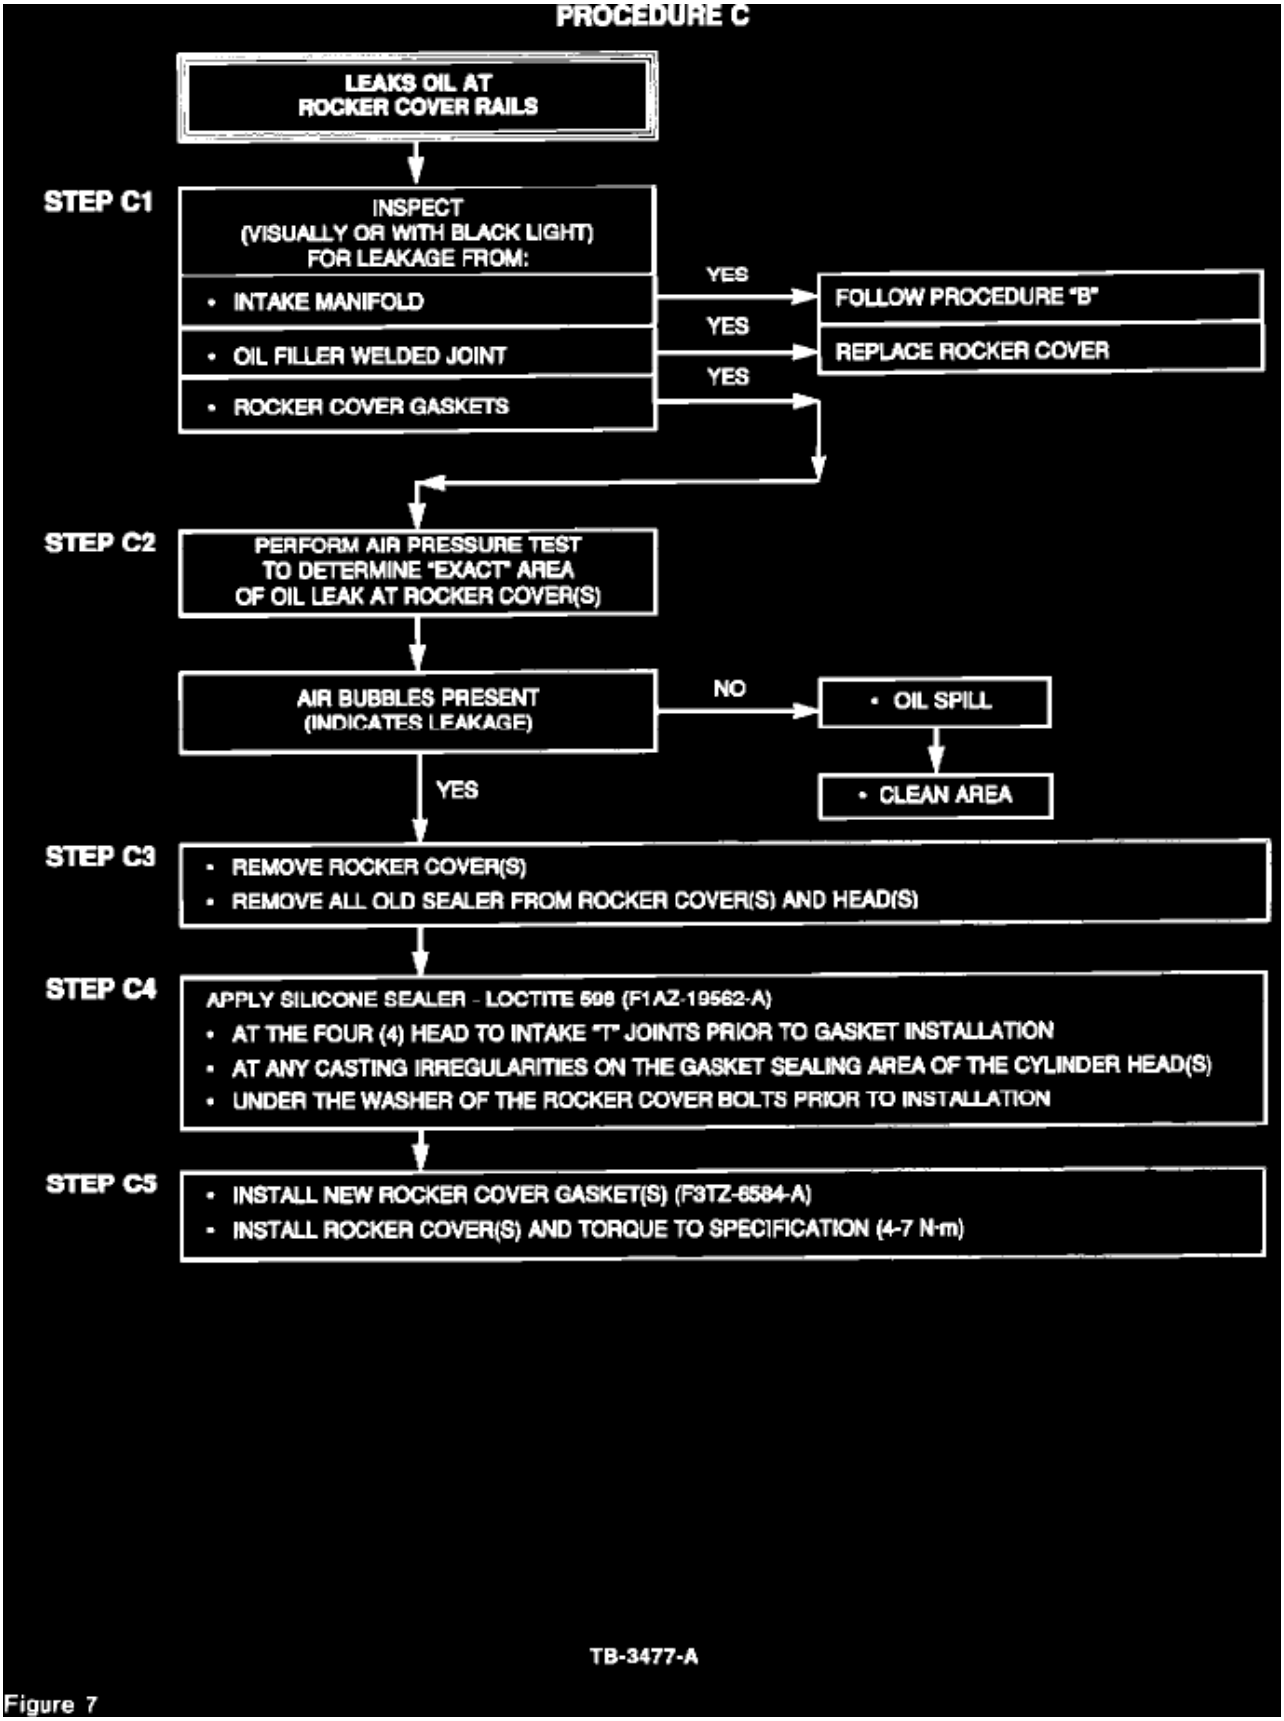

Figure 7

1. If the air pressure test showed no air bubbles, follow Procedure C2 to clean the area of any oil spill.

2. If the air pressure test showed air bubbles present, follow Steps C3 through C5.

Service Procedure - Repair For Oil Leaks At Front End

PROCEDURE D

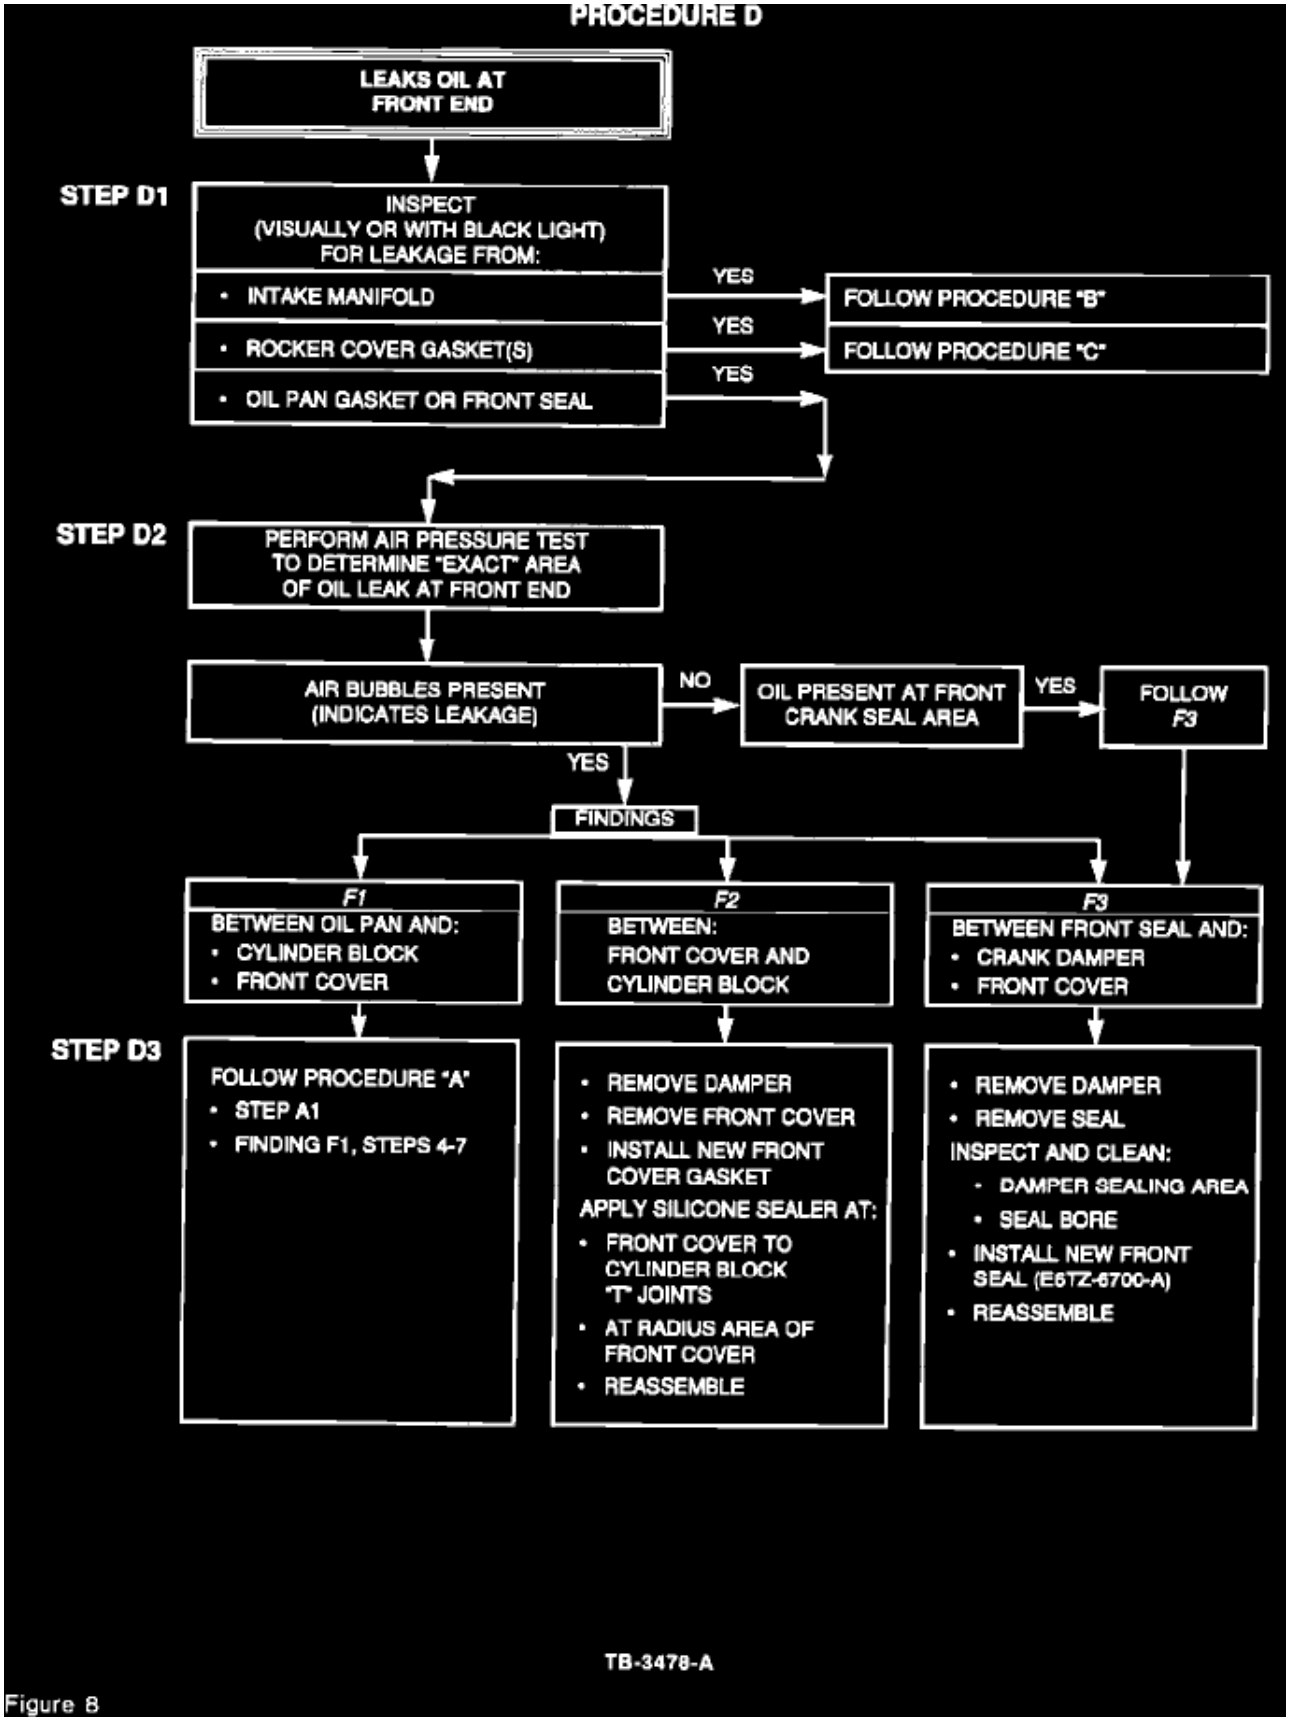

Figure 8

1. If the air pressure test showed no air bubbles, follow Procedure D, F3.

2. If the air pressure test showed air bubbles present, follow Procedure D, F1 or F2 as appropriate.

REMOVAL AND INSTALLATION (Continued)

Valve Rocker Arm Cover and Rocker Arm

Removal

1. Remove spark plug wires using Spark Plug Wire Remover T74P-6666-A or equivalent.
2. Disconnect fuel supply and return lines using Spring Lock Coupling Disconnect Tool T81P-19623-G2, or equivalent and position out of way. Install white "Tell-Tale" rings in male connector to ensure positive indication of proper mating when re-assembling.

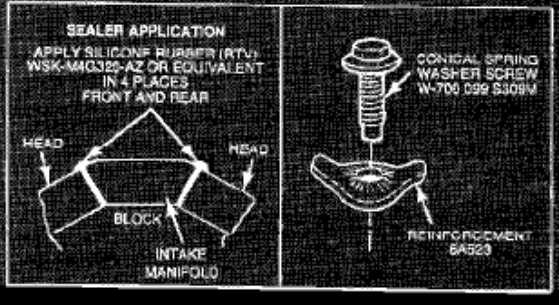
NOTE: Air conditioned vehicles only: Remove dipstick tube and bracket to access LH lifting eye. Remove LH lifting eye.

3. Remove PCV valve hose and breather.
4. Remove rocker arm cover attaching screws and load distribution washers (patch pieces). Ensure the washers are installed in their original position.
5. With a light plastic hammer, tap rocker arm covers to break seal.
6. Remove rocker covers.
7. Remove rocker arm shaft stand attaching bolts by loosening the bolts two turns at a time, in sequence. Lift off rocker arm and shaft assembly and oil baffle.

Removing or Installing Rocker Arm Assembly

Installation

1. Loosen the valve lash adjusting screws a few turns.
2. Apply SF-type engine oil to the assembly to provide initial lubrication.
3. Apply oil baffle and rocker arm shaft assembly to the cylinder head. Guide adjusting screws onto push rods.
4. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
5. Adjust valve lash. Refer to Valve Clearance.
6. Clean all gasket material from cylinder heads, intake manifolds and rocker arm cover gasket surfaces.
7. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head/intake manifold.



REMOVAL AND INSTALLATION (Continued)

8. Install rocker arm covers with new gaskets.
9. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
10. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part # W 700 099 S309M.
11. Tighten screws to a torque of 4.5-5.9 ft. lb. (6-8 N·m).
12. Connect kickdown linkage (automatic transmission only).
13. After ensuring all rocker arm cover load distribution washers (patch pieces) are installed in their original position, tighten rocker arm cover screws to specification.
14. Install spark plug wires.
15. Install PCV valve hose and breather.
16. Position Thermactor air hose and wiring harness in their original places.
17. Connect fuel supply and return lines to fuel rail, ensuring connectors are properly mated by observing white "Tell-Tale" rings displayed when connected.
18. Start engine and check for oil and fuel leaks.

Valve Spring, Retainer and Stem Seal

Broken valve springs or leaking valve stem seals and retainer may be replaced without removing the cylinder head provided damage to the valve or valve seat has not occurred.

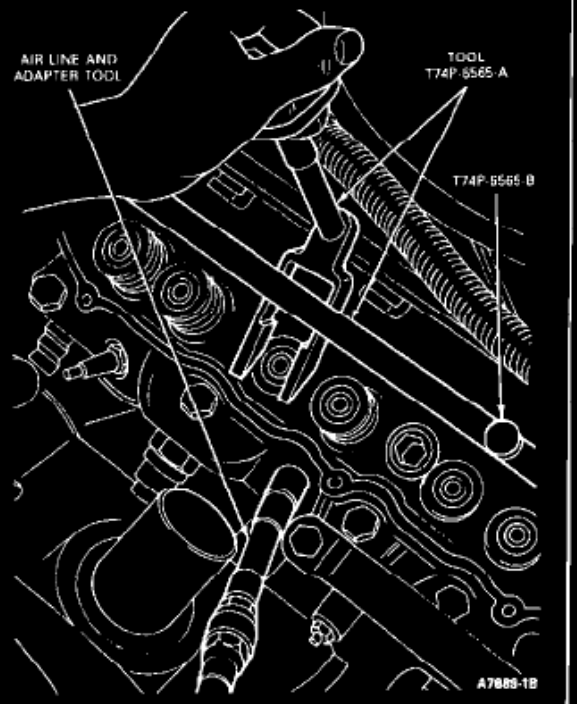
Removal

1. Remove the valve rocker arm cover and valve rocker arm shaft as described under Valve Rocker Arm Cover and Rocker Arm. Remove the applicable spark plug wire and spark plug.
2. Remove both valve push rods of the cylinder to be serviced.
3. Install an air line with an adapter in the spark plug hole.
4. Turn on the air supply. **Air pressure may turn the crankshaft until the piston reaches the bottom of the stroke.**

CAUTION: Engine may turn over when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc.).

Using the Valve Spring Compressor Lever T86P-6565-A and Valve Spring Compressor Bar T74P-6565-B or equivalents, compress the valve spring and remove the valve spring retainer locks, spring retainer and the valve spring. **If air pressure fails to hold the valve in the closed position during this operation, it can be presumed that the valve is not seating or is damaged. If this condition occurs, remove the cylinder head for further inspection.**

Compressing Valve Spring-In Chassis—Typical

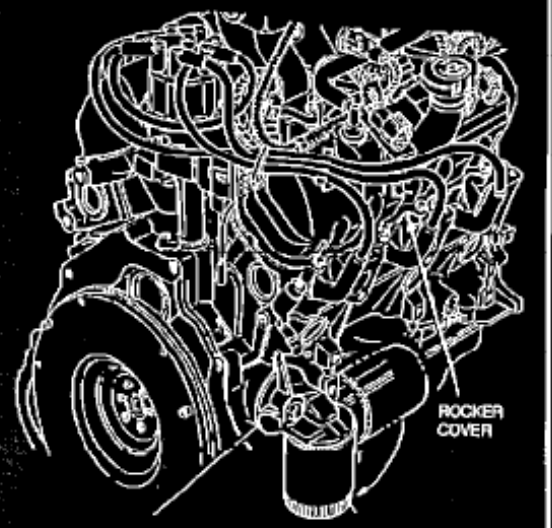


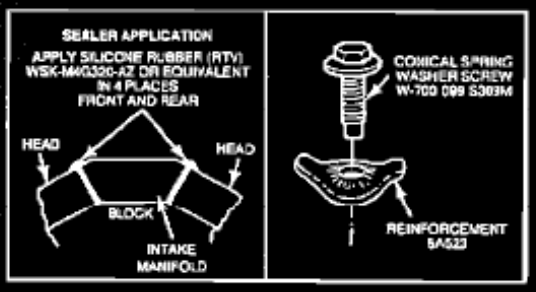
REMOVAL AND INSTALLATION (Continued)

Removing or Installing Rocker Arm Assembly

Installation

1. Loosen the valve lash adjusting screws a few turns.
2. Apply SF-type engine oil to the assembly to provide initial lubrication.
3. Apply oil baffle and rocker arm shaft assembly to the cylinder head. Guide adjusting screws onto push rods.
4. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
5. Adjust valve lash. Refer to Valve Clearance.
6. Clean all gasket material from cylinder heads, intake manifolds and rocker arm cover gasket surfaces.
7. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head/intake manifold.





8. Install rocker arm covers with new gaskets.
9. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
10. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part # W-700 099 S309M.
11. Tighten screws to a torque of 4.5-5.9 ft. lb. (6-8 N·m).
12. Connect kickdown linkage (automatic transmission only).
13. After ensuring all rocker arm cover load distribution washers (patch pieces) are installed in their original position, tighten rocker arm cover screws to specification.
14. Install spark plug wires.
15. Install PCV valve hose and breather.
16. Position Thermactor air hose and wiring harness in their original places.
17. Connect fuel supply and return lines to fuel rail, ensuring connectors are properly mated by observing white "Tell-Tale" rings displayed when connected.
18. Start engine and check for oil and fuel leaks.

Valve Spring, Retainer and Stem Seal

Broken valve springs or leaking valve stem seals and retainer may be replaced without removing the cylinder head provided damage to the valve or valve seat has not occurred.

Removal

1. Remove the valve rocker arm cover and valve rocker arm shaft as described under Valve Rocker Arm Cover and Rocker Arm. Remove the applicable spark plug wire and spark plug.
2. Remove both valve push rods of the cylinder to be serviced.
3. Install an air line with an adapter in the spark plug hole.
4. Turn on the air supply. **Air pressure may turn the crankshaft until the piston reaches the bottom of the stroke.**

CAUTION: Engine may turn over when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc.).

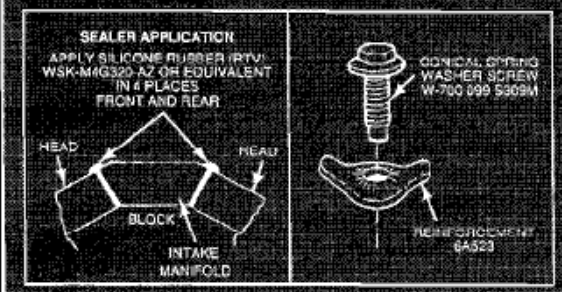
Using the Valve Spring Compressor Lever T86P-6565-A and Valve Spring Compressor Bar T74P-6565-B or equivalents, compress the valve spring and remove the valve spring retainer locks, spring retainer and the valve spring. **If air pressure fails to hold the valve in the closed position during this operation, it can be presumed that the valve is not seating or is damaged. If this condition occurs, remove the cylinder head for further inspection.**

REMOVAL AND INSTALLATION (Continued)

Removing or Installing Rocker Arm Assembly

Installation

1. Loosen the valve lash adjusting screws a few turns.
2. Apply SF-type engine oil to the assembly to provide initial lubrication.
3. Apply oil baffle and rocker arm shaft assembly to the cylinder head. Guide adjusting screws onto push rods.
4. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
5. Adjust valve lash. Refer to Valve Clearance.
6. Clean all gasket material from cylinder heads, intake manifolds and rocker arm cover gasket surfaces.
7. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head/intake manifold.



8. Install rocker arm covers with new gaskets.
9. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
10. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit), Part # W-700 099 S309M.
11. Tighten screws to a torque of 6-8 N·m (4.5-5.9 LB-FT).
12. Connect kickdown linkage (automatic transmission only).
13. After ensuring all rocker arm cover load distribution washers (patch pieces) are installed in their original position, tighten rocker arm cover screws to specification.
14. Install spark plug wires.
15. Install PCV valve hose and breather.
16. Connect the fuel supply quick connect redundant clip over the fuel supply connection. Tighten the fuel return connection specification using care to avoid bending the fuel rail.
17. Start engine and check for oil and fuel leaks.

Valve Spring, Retainer and Stem Seal

Broken valve springs or leaking valve stem seals and retainer may be replaced without removing the cylinder head provided damage to the valve or valve seat has not occurred.

Removal

1. Remove the valve rocker arm cover and valve rocker arm shaft as described under Valve Rocker Arm Cover and Rocker Arm. Remove the applicable spark plug wire and spark plug.
2. Remove both valve push rods of the cylinder to be serviced.
3. Install an air line with an adapter in the spark plug hole.
4. Turn on the air supply. **Air pressure may turn the crankshaft until the piston reaches the bottom of the stroke.**

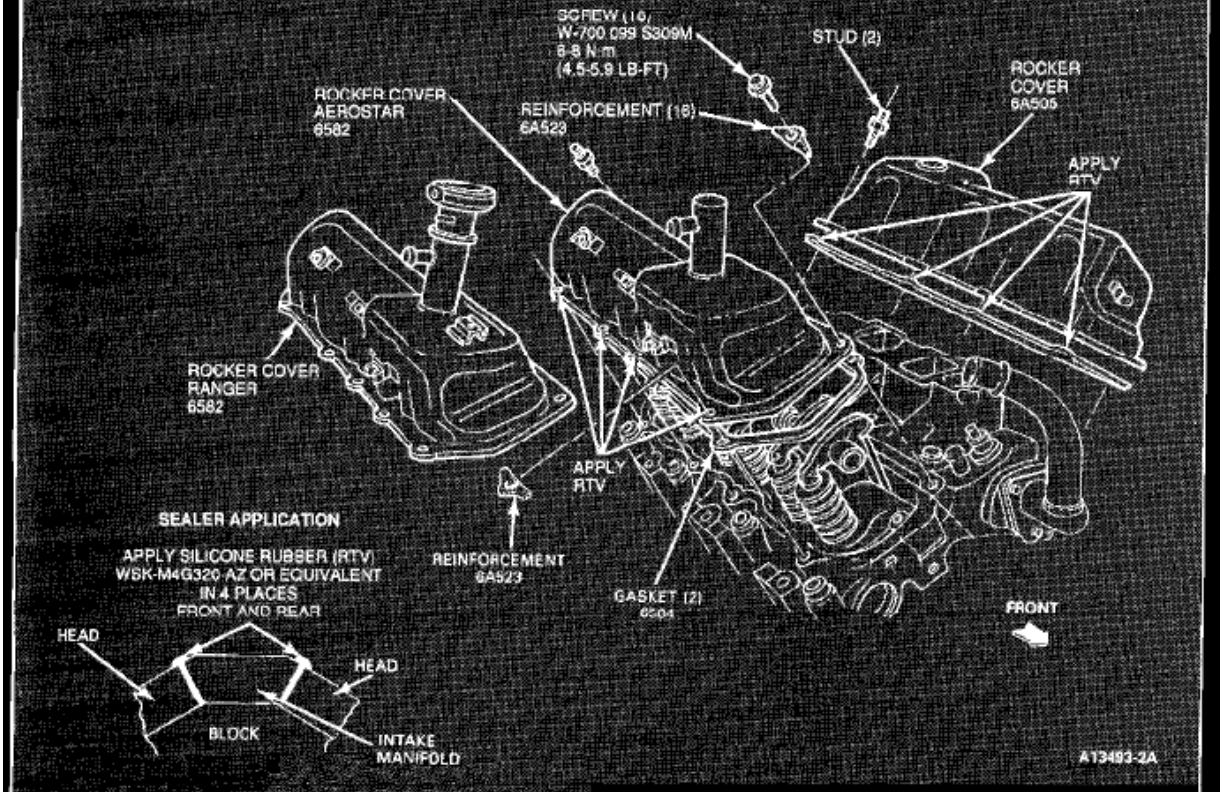
CAUTION: Engine may turn over when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc.).

Using the Valve Spring Compressor Lever T86L-6565-A and Valve Spring Compressor Bar T74P-6565-B or equivalents, compress the valve spring and remove the valve spring retainer locks, spring retainer and the valve spring. **If air pressure fails to hold the valve in the closed position during this operation, it can be presumed that the valve is not seating or is damaged. If this condition occurs, remove the cylinder head for further inspection.**

REMOVAL AND INSTALLATION (Continued)

Installation

1. Apply SF-type engine oil to the valve train assembly to provide initial lubrication.
2. Install rocker arm shaft assembly to the cylinder head. Guide the rocker arms onto push rods.
3. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
4. Clean all gasket material from cylinder heads, intake manifolds, and rocker arm cover gasket surfaces.
5. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head/intake manifold.
6. Install rocker arm covers with new gaskets.
7. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
8. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part #W-700 099 S309M.



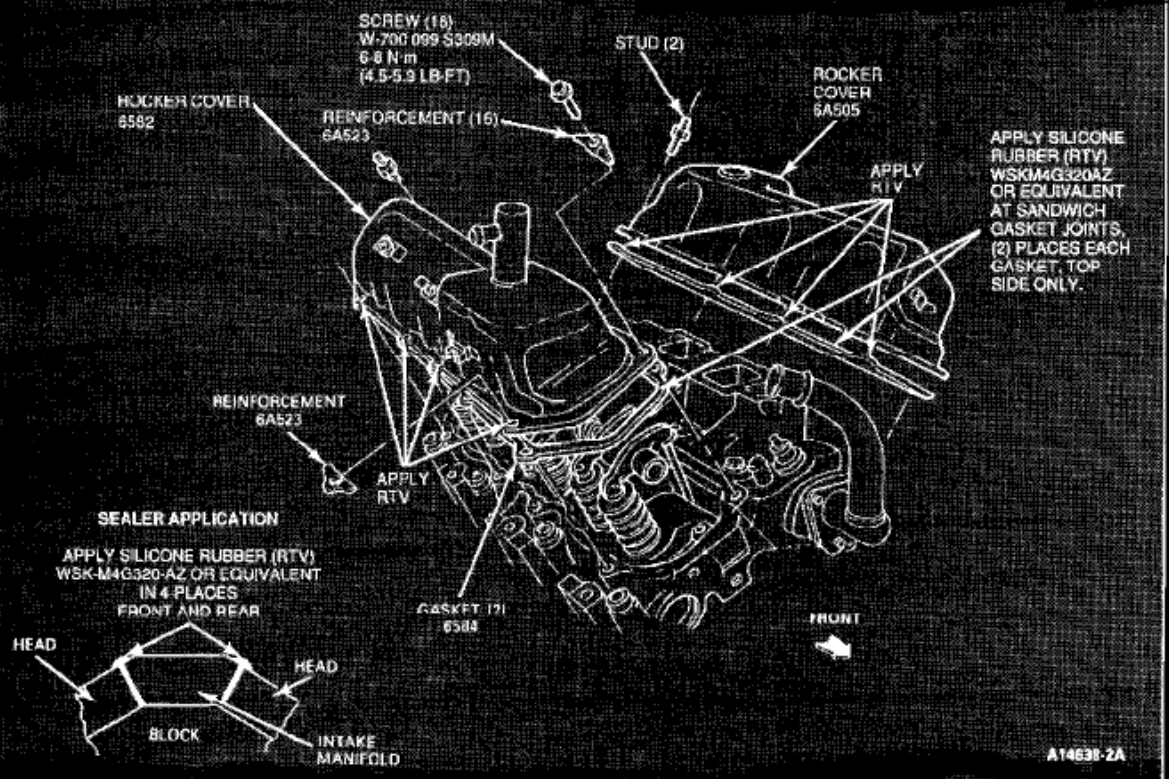
CAUTION: Failure to install a new rocker cover gasket and rocker cover reinforcement pieces will result in oil leaks.

9. Tighten screws to a torque of 6-8 N·m (4.5-5.9 LB-FT).
10. Install upper intake manifold, if removed.
11. On RH side, install the D.I.S. ignition coil and bracket assembly.
12. On RH side, install vacuum hose to the air cleaner and A/C low pressure hose bracket.
13. On RH side, install the upper radiator hose and fill and bleed the cooling system. Refer to section 03-03, Engine Cooling.
14. On RH side, install the alternator and accessory drive belt. Check belt tension. Refer to Section 03-05, Accessory Drive for proper procedure.
15. On RH side, install air inlet duct and oil fill tube hose.
16. Install spark plug wires.
17. Install PCV valve hose and breather.
18. Connect fuel supply and return lines to fuel rail as outlined in Section 03-04D.
19. Start engine and check for oil and fuel leaks.

REMOVAL AND INSTALLATION (Continued)

Installation

1. Apply SF-type engine oil to the valve train assembly to provide initial lubrication.
2. Install rocker arm shaft assembly to the cylinder head. Guide the rocker arms onto push rods.
3. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
4. Clean all gasket material from cylinder heads, intake manifolds, and rocker arm cover gasket surfaces.
5. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T Joints of cylinder head/intake manifold.
6. Install rocker arm covers with new gaskets.
7. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
8. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part # W-700 099 S309M.

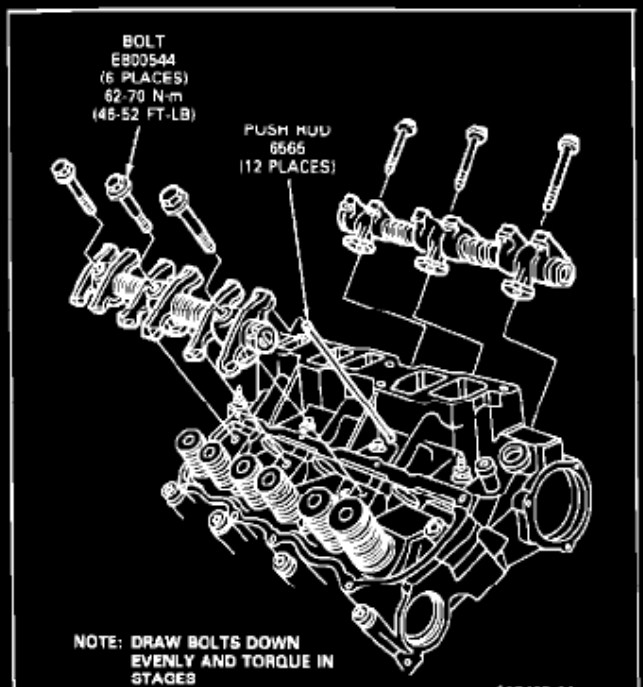


CAUTION: Failure to install a new rocker cover gasket and rocker cover reinforcement pieces will result in oil leaks.

9. Tighten screws to a torque of 6-8 N·m (4.5-5.9 LB-FT).
10. Install upper intake manifold, if removed.
11. On RH side, install the D.I.S. ignition coil and bracket assembly.
12. On RH side, install vacuum hose to the air cleaner and A/C low pressure hose bracket.
13. On RH side, install the upper radiator hose and fill and bleed the cooling system. Refer to section 03-03, Engine Cooling.
14. On RH side, install the alternator and accessory drive belt. Check belt tension. Refer to Section 03-05, Accessory Drive for proper procedure.
15. On RH side, install air inlet duct and oil fill tube hose.
16. Install spark plug wires.
17. Install PCV valve hose and breather.
18. Connect fuel supply and return lines to fuel rail as outlined in Section 03-04D.
19. Start engine and check for oil and fuel leaks.

IN VEHICLE SERVICE (Continued)

6. Remove the accessory drive belt from the alternator.
7. Remove the alternator from the engine.
8. Drain the cooling system.
9. Remove the upper radiator hose from the engine.
10. Remove the D.I.S. ignition coil and bracket assembly.
11. Remove the low pressure A/C hose bracket from the upper intake (if still installed).
12. Remove vacuum hose from the air cleaner.
13. Remove PCV valve hose and breather.
14. Remove rocker arm cover attaching screws and load distribution washers (patch pieces). Ensure the washers are installed in their original position.
15. With a light plastic hammer, tap rocker arm covers to break seal.
16. Remove rocker covers.
17. Remove rocker arm shaft stand attaching bolts by loosening the bolts two turns at a time, in sequence. Lift off rocker arm and shaft assembly.

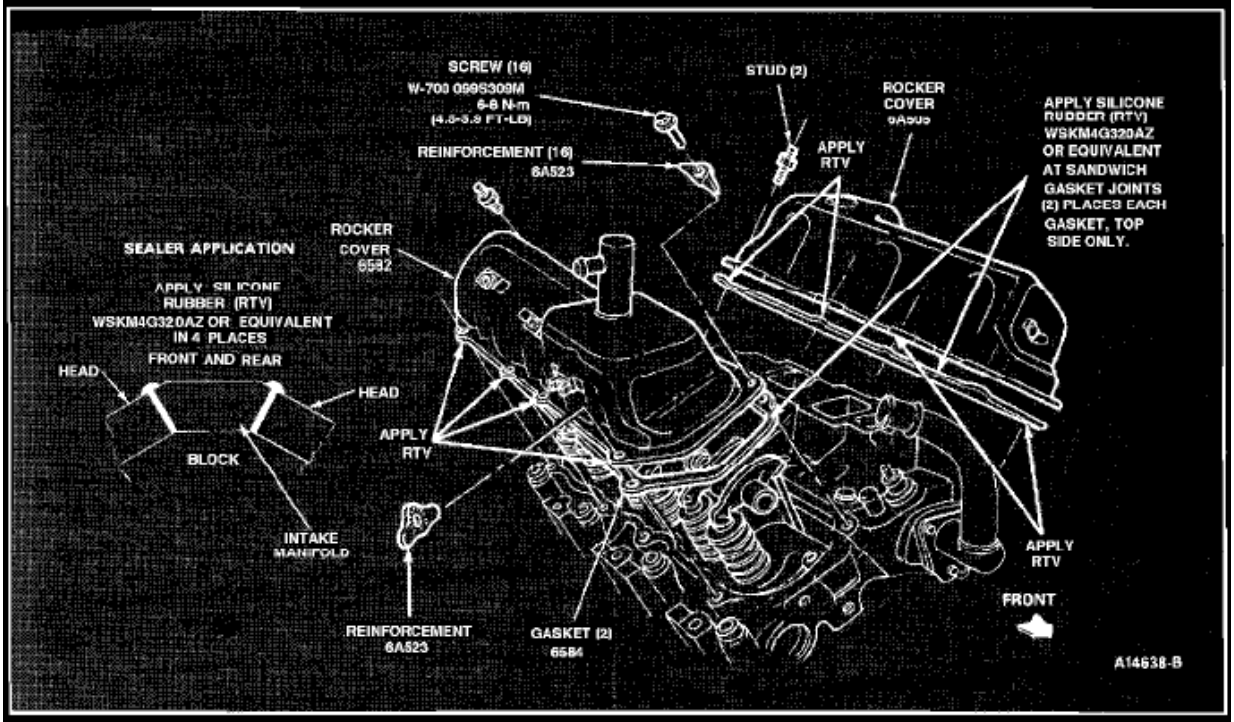


Installation

1. Apply SF-type engine oil to the valve train assembly to provide initial lubrication.
2. Install rocker arm shaft assembly to the cylinder head. Guide the rocker arms onto push rods.
3. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
4. Clean all gasket material from cylinder heads, intake manifolds and rocker arm cover gasket surfaces.
5. Peel the plastic film from the gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head / intake manifold.
6. Install rocker arm covers with new gaskets.

Revised 3/91

IN VEHICLE SERVICE (Continued)



CAUTION: Failure to install a new rocker cover gasket and rocker cover reinforcement pieces will result in oil leaks.

7. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of rocker cover (4 holes each side).
8. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part # W-700-099-S309M.
9. Tighten screws to a torque of 6-8 N·m (4.5-5.9 ft. lb).
10. Install upper intake manifold, if removed.
11. On RH side, install the D.I.S. ignition coil and bracket assembly.
12. On RH side, install vacuum hose to the air cleaner and A / C low pressure hose bracket.
13. On RH side, install the upper radiator hose and fill and bleed the cooling system. Refer to Section 03-03, Engine Cooling.
14. On RH side, install the alternator and accessory drive belt. Check belt tension. Refer to Section 03-05, Accessory Drive for proper procedure.
15. On RH side, install air inlet duct and oil fill tube hose.
16. Install spark plug wires.
17. Install PCV valve hose and breather.
18. Connect fuel supply and return lines to fuel rail as outlined in Section 03-04D.
19. Start engine and check for oil and fuel leaks.

Valve Spring, Retainer and Stem Seal

Broken valve springs or leaking valve stem seals and retainer may be replaced without removing the cylinder head provided damage to the valve or valve seat has not occurred.

Removal

1. Remove the valve rocker arm cover and valve rocker arm shaft as described under Valve Rocker Arm Cover and Rocker Arm. Remove the applicable spark plug wire and spark plug.
2. Remove both valve push rods of the cylinder to be serviced.
3. Install an air line with an adapter in the spark plug hole.

   CAUTION: Engine may turn over when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc.).
4. Turn on the air supply. **Air pressure may turn the crankshaft until the piston reaches the bottom of the stroke.**

REMOVAL AND INSTALLATION (Continued)

Valve Rocker Arm Cover and Rocker Arm

Removal

1. Remove spark plug wires using Spark Plug Wire Remover T74P-6666-A or equivalent.
2. Disconnect fuel supply and return lines using Spring Lock Coupling Disconnect Tool T81P-19623-G2, or equivalent and position out of way. Install white "Tell-Tale" rings in male connector to ensure positive indication of proper mating when re-assembling.

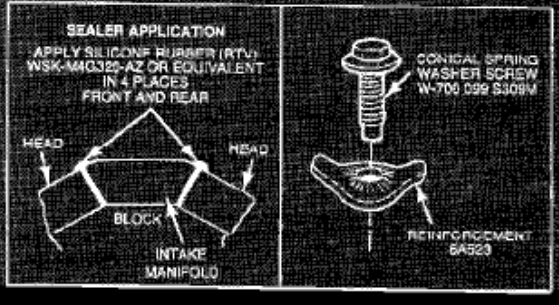
NOTE: Air conditioned vehicles only: Remove dipstick tube and bracket to access LH lifting eye. Remove LH lifting eye.

3. Remove PCV valve hose and breather.
4. Remove rocker arm cover attaching screws and load distribution washers (patch pieces). Ensure the washers are installed in their original position.
5. With a light plastic hammer, tap rocker arm covers to break seal.
6. Remove rocker covers.
7. Remove rocker arm shaft stand attaching bolts by loosening the bolts two turns at a time, in sequence. Lift off rocker arm and shaft assembly and oil baffle.

Removing or Installing Rocker Arm Assembly

Installation

1. Loosen the valve lash adjusting screws a few turns.
2. Apply SF-type engine oil to the assembly to provide initial lubrication.
3. Apply oil baffle and rocker arm shaft assembly to the cylinder head. Guide adjusting screws onto push rods.
4. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
5. Adjust valve lash. Refer to Valve Clearance.
6. Clean all gasket material from cylinder heads, intake manifolds and rocker arm cover gasket surfaces.
7. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head/intake manifold.



REMOVAL AND INSTALLATION (Continued)

8. Install rocker arm covers with new gaskets.
9. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
10. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part # W 700 099 S309M.
11. Tighten screws to a torque of 4.5-5.9 ft. lb. (6-8 N·m).
12. Connect kickdown linkage (automatic transmission only).
13. After ensuring all rocker arm cover load distribution washers (patch pieces) are installed in their original position, tighten rocker arm cover screws to specification.
14. Install spark plug wires.
15. Install PCV valve hose and breather.
16. Position Thermactor air hose and wiring harness in their original places.
17. Connect fuel supply and return lines to fuel rail, ensuring connectors are properly mated by observing white "Tell-Tale" rings displayed when connected.
18. Start engine and check for oil and fuel leaks.

Valve Spring, Retainer and Stem Seal

Broken valve springs or leaking valve stem seals and retainer may be replaced without removing the cylinder head provided damage to the valve or valve seat has not occurred.

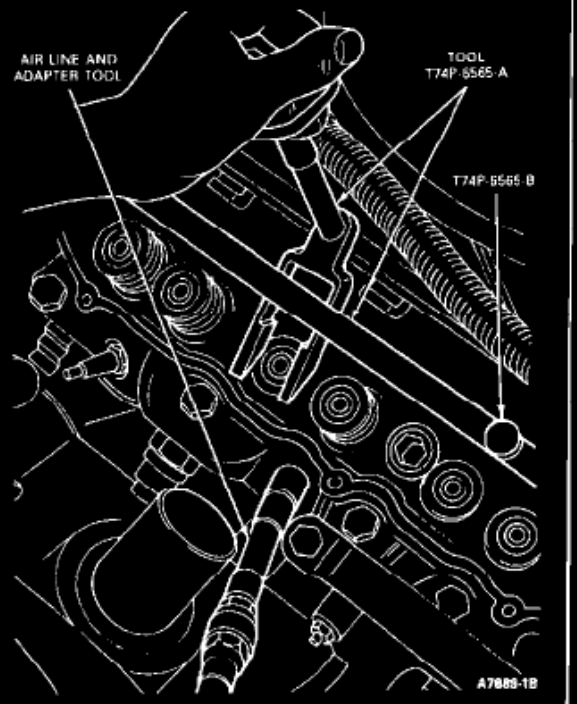
Removal

1. Remove the valve rocker arm cover and valve rocker arm shaft as described under Valve Rocker Arm Cover and Rocker Arm. Remove the applicable spark plug wire and spark plug.
2. Remove both valve push rods of the cylinder to be serviced.
3. Install an air line with an adapter in the spark plug hole.
4. Turn on the air supply. **Air pressure may turn the crankshaft until the piston reaches the bottom of the stroke.**

CAUTION: Engine may turn over when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc.).

Using the Valve Spring Compressor Lever T86P-6565-A and Valve Spring Compressor Bar T74P-6565-B or equivalents, compress the valve spring and remove the valve spring retainer locks, spring retainer and the valve spring. **If air pressure fails to hold the valve in the closed position during this operation, it can be presumed that the valve is not seating or is damaged. If this condition occurs, remove the cylinder head for further inspection.**

Compressing Valve Spring-In Chassis—Typical

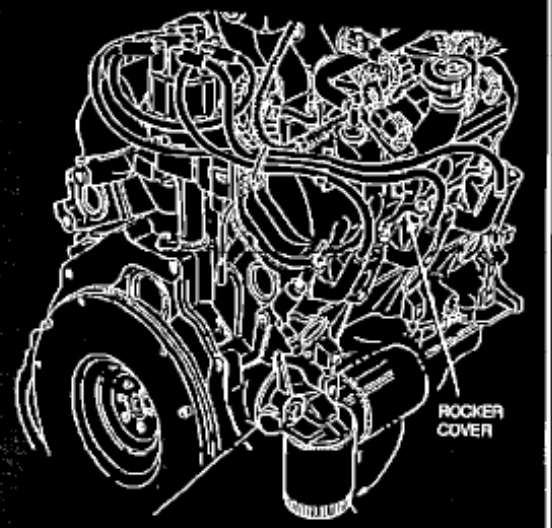


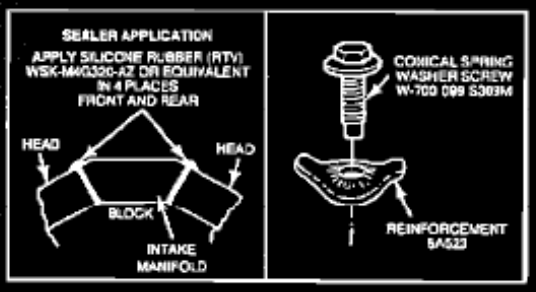
REMOVAL AND INSTALLATION (Continued)

Removing or Installing Rocker Arm Assembly

Installation

1. Loosen the valve lash adjusting screws a few turns.
2. Apply SF-type engine oil to the assembly to provide initial lubrication.
3. Apply oil baffle and rocker arm shaft assembly to the cylinder head. Guide adjusting screws onto push rods.
4. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
5. Adjust valve lash. Refer to Valve Clearance.
6. Clean all gasket material from cylinder heads, intake manifolds and rocker arm cover gasket surfaces.
7. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head/intake manifold.





8. Install rocker arm covers with new gaskets.
9. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
10. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part # W-700 099 S309M.
11. Tighten screws to a torque of 4.5-5.9 ft. lb. (6-8 N·m).
12. Connect kickdown linkage (automatic transmission only).
13. After ensuring all rocker arm cover load distribution washers (patch pieces) are installed in their original position, tighten rocker arm cover screws to specification.
14. Install spark plug wires.
15. Install PCV valve hose and breather.
16. Position Thermactor air hose and wiring harness in their original places.
17. Connect fuel supply and return lines to fuel rail, ensuring connectors are properly mated by observing white "Tell-Tale" rings displayed when connected.
18. Start engine and check for oil and fuel leaks.

Valve Spring, Retainer and Stem Seal

Broken valve springs or leaking valve stem seals and retainer may be replaced without removing the cylinder head provided damage to the valve or valve seat has not occurred.

Removal

1. Remove the valve rocker arm cover and valve rocker arm shaft as described under Valve Rocker Arm Cover and Rocker Arm. Remove the applicable spark plug wire and spark plug.
2. Remove both valve push rods of the cylinder to be serviced.
3. Install an air line with an adapter in the spark plug hole.
4. Turn on the air supply. **Air pressure may turn the crankshaft until the piston reaches the bottom of the stroke.**

CAUTION: Engine may turn over when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc.).

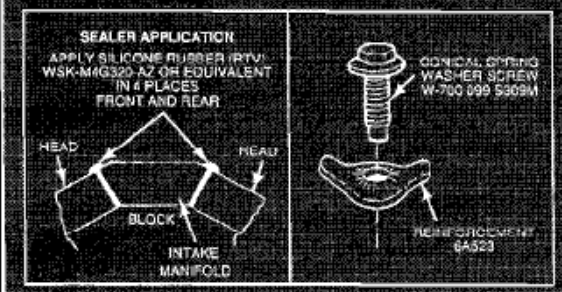
Using the Valve Spring Compressor Lever T86P-6565-A and Valve Spring Compressor Bar T74P-6565-B or equivalents, compress the valve spring and remove the valve spring retainer locks, spring retainer and the valve spring. **If air pressure fails to hold the valve in the closed position during this operation, it can be presumed that the valve is not seating or is damaged. If this condition occurs, remove the cylinder head for further inspection.**

REMOVAL AND INSTALLATION (Continued)

Removing or Installing Rocker Arm Assembly

Installation

1. Loosen the valve lash adjusting screws a few turns.
2. Apply SF-type engine oil to the assembly to provide initial lubrication.
3. Apply oil baffle and rocker arm shaft assembly to the cylinder head. Guide adjusting screws onto push rods.
4. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
5. Adjust valve lash. Refer to Valve Clearance.
6. Clean all gasket material from cylinder heads, intake manifolds and rocker arm cover gasket surfaces.
7. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head/intake manifold.



8. Install rocker arm covers with new gaskets.
9. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
10. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit), Part # W-700 099 S309M.
11. Tighten screws to a torque of 6-8 N·m (4.5-5.9 LB-FT).
12. Connect kickdown linkage (automatic transmission only).
13. After ensuring all rocker arm cover load distribution washers (patch pieces) are installed in their original position, tighten rocker arm cover screws to specification.
14. Install spark plug wires.
15. Install PCV valve hose and breather.
16. Connect the fuel supply quick connect redundant clip over the fuel supply connection. Tighten the fuel return connection specification using care to avoid bending the fuel rail.
17. Start engine and check for oil and fuel leaks.

Valve Spring, Retainer and Stem Seal

Broken valve springs or leaking valve stem seals and retainer may be replaced without removing the cylinder head provided damage to the valve or valve seat has not occurred.

Removal

1. Remove the valve rocker arm cover and valve rocker arm shaft as described under Valve Rocker Arm Cover and Rocker Arm. Remove the applicable spark plug wire and spark plug.
2. Remove both valve push rods of the cylinder to be serviced.
3. Install an air line with an adapter in the spark plug hole.
4. Turn on the air supply. **Air pressure may turn the crankshaft until the piston reaches the bottom of the stroke.**

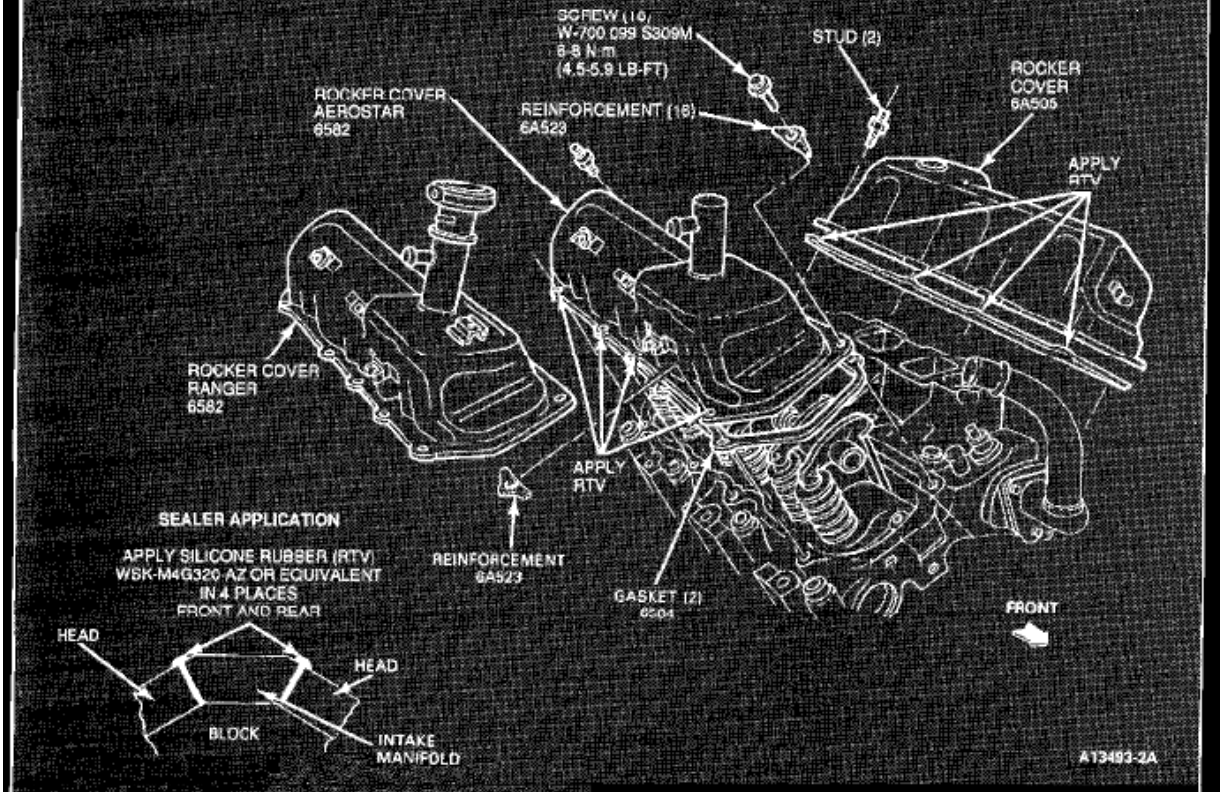
CAUTION: Engine may turn over when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc.).

Using the Valve Spring Compressor Lever T86L-6565-A and Valve Spring Compressor Bar T74P-6565-B or equivalents, compress the valve spring and remove the valve spring retainer locks, spring retainer and the valve spring. **If air pressure fails to hold the valve in the closed position during this operation, it can be presumed that the valve is not seating or is damaged. If this condition occurs, remove the cylinder head for further inspection.**

REMOVAL AND INSTALLATION (Continued)

Installation

1. Apply SF-type engine oil to the valve train assembly to provide initial lubrication.
2. Install rocker arm shaft assembly to the cylinder head. Guide the rocker arms onto push rods.
3. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
4. Clean all gasket material from cylinder heads, intake manifolds, and rocker arm cover gasket surfaces.
5. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head/intake manifold.
6. Install rocker arm covers with new gaskets.
7. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
8. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part #W-700 099 S309M.



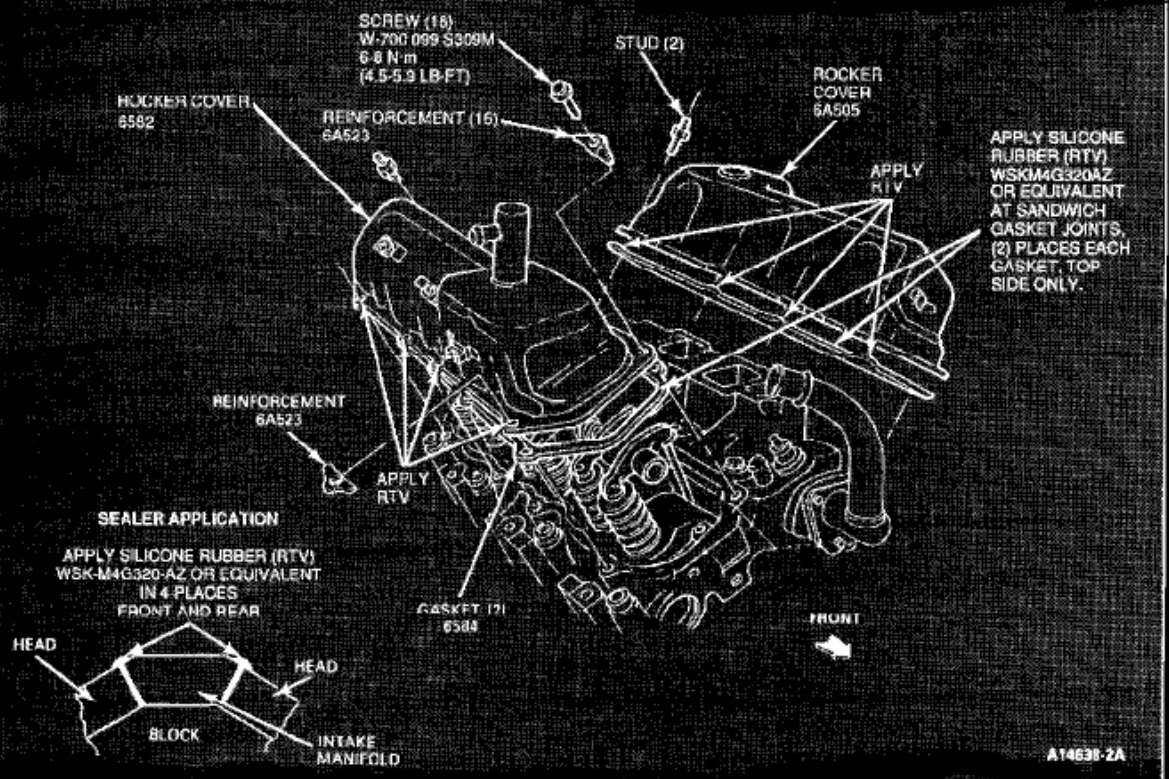
CAUTION: Failure to install a new rocker cover gasket and rocker cover reinforcement pieces will result in oil leaks.

9. Tighten screws to a torque of 6-8 N·m (4.5-5.9 LB-FT).
10. Install upper intake manifold, if removed.
11. On RH side, install the D.I.S. ignition coil and bracket assembly.
12. On RH side, install vacuum hose to the air cleaner and A/C low pressure hose bracket.
13. On RH side, install the upper radiator hose and fill and bleed the cooling system. Refer to section 03-03, Engine Cooling.
14. On RH side, install the alternator and accessory drive belt. Check belt tension. Refer to Section 03-05, Accessory Drive for proper procedure.
15. On RH side, install air inlet duct and oil fill tube hose.
16. Install spark plug wires.
17. Install PCV valve hose and breather.
18. Connect fuel supply and return lines to fuel rail as outlined in Section 03-04D.
19. Start engine and check for oil and fuel leaks.

REMOVAL AND INSTALLATION (Continued)

Installation

1. Apply SF-type engine oil to the valve train assembly to provide initial lubrication.
2. Install rocker arm shaft assembly to the cylinder head. Guide the rocker arms onto push rods.
3. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
4. Clean all gasket material from cylinder heads, intake manifolds, and rocker arm cover gasket surfaces.
5. Peel the plastic film from the new gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T Joints of cylinder head/intake manifold.
6. Install rocker arm covers with new gaskets.
7. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of the rocker cover (4 holes each side).
8. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part # W-700 099 S309M.

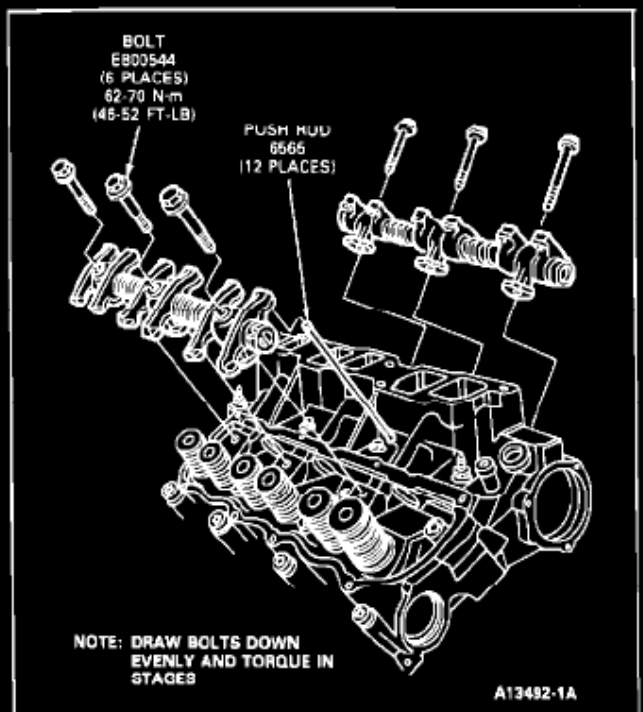


CAUTION: Failure to install a new rocker cover gasket and rocker cover reinforcement pieces will result in oil leaks.

9. Tighten screws to a torque of 6-8 N·m (4.5-5.9 LB-FT).
10. Install upper intake manifold, if removed.
11. On RH side, install the D.I.S. ignition coil and bracket assembly.
12. On RH side, install vacuum hose to the air cleaner and A/C low pressure hose bracket.
13. On RH side, install the upper radiator hose and fill and bleed the cooling system. Refer to section 03-03, Engine Cooling.
14. On RH side, install the alternator and accessory drive belt. Check belt tension. Refer to Section 03-05, Accessory Drive for proper procedure.
15. On RH side, install air inlet duct and oil fill tube hose.
16. Install spark plug wires.
17. Install PCV valve hose and breather.
18. Connect fuel supply and return lines to fuel rail as outlined in Section 03-04D.
19. Start engine and check for oil and fuel leaks.

IN VEHICLE SERVICE (Continued)

6. Remove the accessory drive belt from the alternator.
7. Remove the alternator from the engine.
8. Drain the cooling system.
9. Remove the upper radiator hose from the engine.
10. Remove the D.I.S. ignition coil and bracket assembly.
11. Remove the low pressure A/C hose bracket from the upper intake (if still installed).
12. Remove vacuum hose from the air cleaner.
13. Remove PCV valve hose and breather.
14. Remove rocker arm cover attaching screws and load distribution washers (patch pieces). Ensure the washers are installed in their original position.
15. With a light plastic hammer, tap rocker arm covers to break seal.
16. Remove rocker covers.
17. Remove rocker arm shaft stand attaching bolts by loosening the bolts two turns at a time, in sequence. Lift off rocker arm and shaft assembly.

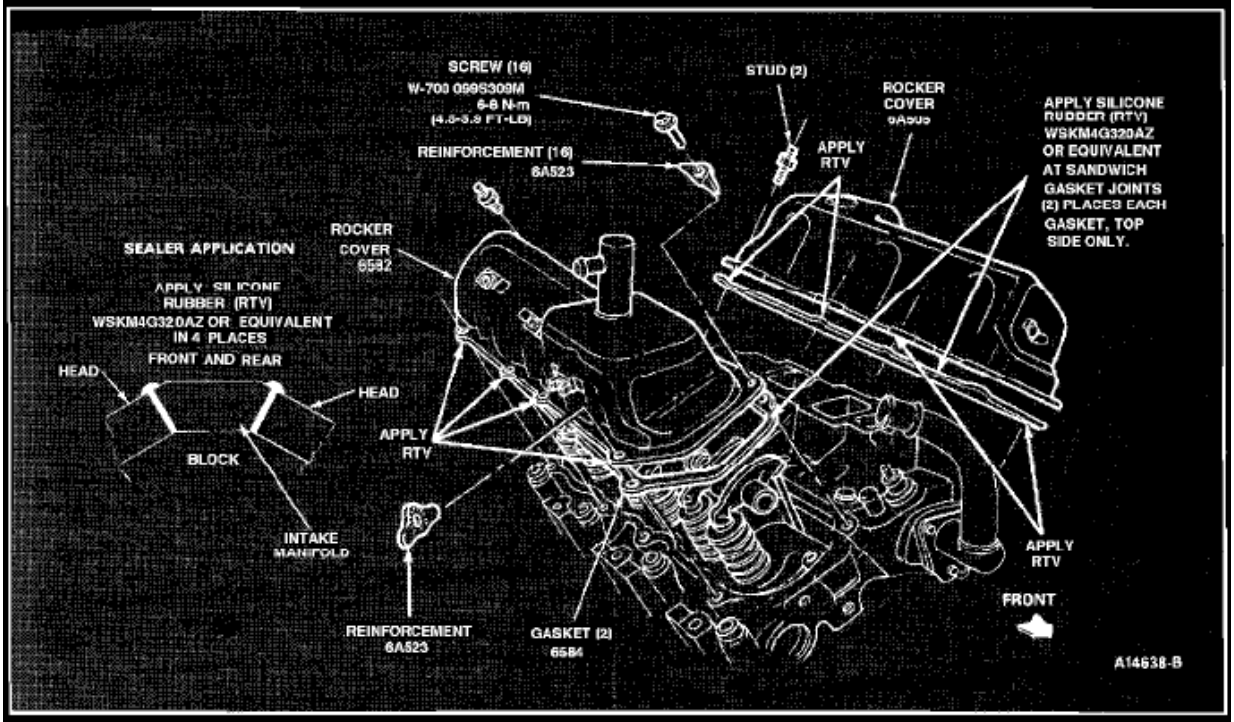


Installation

1. Apply SF-type engine oil to the valve train assembly to provide initial lubrication.
2. Install rocker arm shaft assembly to the cylinder head. Guide the rocker arms onto push rods.
3. Install and tighten rocker arm stand attaching bolts to specifications, two turns at a time, in sequence.
4. Clean all gasket material from cylinder heads, intake manifolds and rocker arm cover gasket surfaces.
5. Peel the plastic film from the gasket and stick the self adhesive side to the rocker cover. Apply RTV (or equivalent) to the T-Joints of cylinder head / intake manifold.
6. Install rocker arm covers with new gaskets.

Revised 3/91

IN VEHICLE SERVICE (Continued)



CAUTION: Failure to install a new rocker cover gasket and rocker cover reinforcement pieces will result in oil leaks.

7. Apply an 8mm ball (approx.) of RTV (or equivalent) to the bolt holes of the exhaust side of rocker cover (4 holes each side).
8. Install patch pieces together with new conical spring washer screws for 2.9L (4.0L initial fit). Part # W-700-099-S309M.
9. Tighten screws to a torque of 6-8 N·m (4.5-5.9 ft. lb).
10. Install upper intake manifold, if removed.
11. On RH side, install the D.I.S. ignition coil and bracket assembly.
12. On RH side, install vacuum hose to the air cleaner and A / C low pressure hose bracket.
13. On RH side, install the upper radiator hose and fill and bleed the cooling system. Refer to Section 03-03, Engine Cooling.
14. On RH side, install the alternator and accessory drive belt. Check belt tension. Refer to Section 03-05, Accessory Drive for proper procedure.
15. On RH side, install air inlet duct and oil fill tube hose.
16. Install spark plug wires.
17. Install PCV valve hose and breather.
18. Connect fuel supply and return lines to fuel rail as outlined in Section 03-04D.
19. Start engine and check for oil and fuel leaks.

Valve Spring, Retainer and Stem Seal

Broken valve springs or leaking valve stem seals and retainer may be replaced without removing the cylinder head provided damage to the valve or valve seat has not occurred.

Removal

1. Remove the valve rocker arm cover and valve rocker arm shaft as described under Valve Rocker Arm Cover and Rocker Arm. Remove the applicable spark plug wire and spark plug.
2. Remove both valve push rods of the cylinder to be serviced.
3. Install an air line with an adapter in the spark plug hole.

   CAUTION: Engine may turn over when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc.).
4. Turn on the air supply. **Air pressure may turn the crankshaft until the piston reaches the bottom of the stroke.**

Camshaft Gear/Sprocket: Service and Repair

REMOVAL

1. Drain the cooling system and crankcase. Remove the oil pan and radiator. 2. Remove the cylinder front cover and water pump, drive belt and crankshaft damper. 3. Remove the camshaft sprocket retaining bolt and the crankshaft sprocket key. 4. Remove the crankshaft and camshaft sprockets with the timing chain.

Timing Chain, Sprockets And Tensioner

5. Remove the timing chain tensioner and guide.

INSTALLATION

1. Install the timing chain guide to the cylinder block with the pin of the guide inserted into the oil hole in the block. Install the two retaining bolts,

and tighten to 10-12 Nm (7-9 ft lb).

2. Position the camshaft so the timing mark will align with the crankshaft. Position the crankshaft so the timing mark will align with the camshaft. 3. Install the crankshaft sprocket, camshaft sprocket and timing chain together. 4. Install the timing chain tensioner with the clip in place to lock the tensioner in the retracted position. Tighten tensioner bolts to 9-11 Nm (7-8 ft lb)

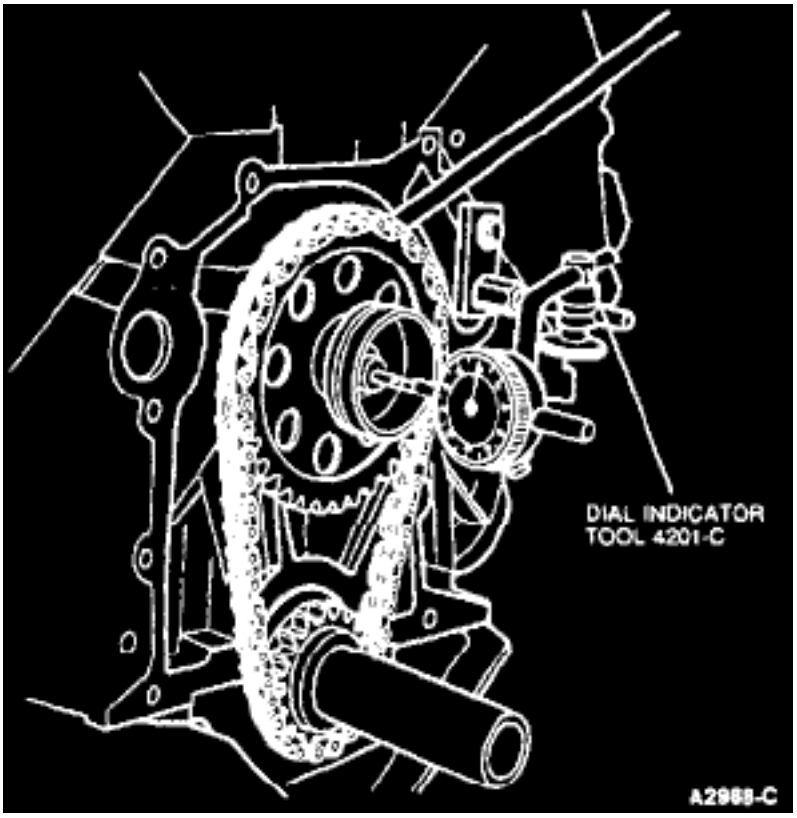
.

Timing Marks

5. Install the crankshaft key and check the timing marks on the crankshaft sprocket and camshaft sprocket for correct alignment.

NOTE: Make sure that the tensioner side of the timing chain is held inward, and that the guide side of the chain is straight and tight.

6. Install the camshaft sprocket retaining bolt, and tighten to 60-68 Nm (44-50 ft lb). 7. Remove the clip from the tensioner assembly.



8. Check the camshaft end play.

Camshaft End Play

CAUTION: Prying against the camshaft gear with the valve train load on the camshaft can break or damage the gear. Therefore, the rocker arm adjusting nuts must be backed off, or the rocker arm and shaft assembly must be loosened sufficiently to free the camshaft. After checking the camshaft end play, adjust the valve clearance.

a. Push camshaft toward rear of engine. Install Dial Indicator TOOL-4201-C or equivalent so indicator point is on camshaft sprocket attaching

screw.

b. Zero dial indicator. Pull camshaft forward and release it. Compare dial indicator reading with specifications. Camshaft end play specification is

0.0203-0.1016 mm (0.0008-0.004 in) and camshaft end play service limit is 0.2286 mm (0.009 in). If end play is excessive, replace camshaft thrust plate.

c. Remove dial indicator. d. After replacing thrust plate, check end play again. If it is still out of specified range, inspect camshaft and cylinder head/cylinder block for

excessive wear.

Timing Chain: Fundamentals and Basics

TIMING CHAIN REPLACEMENT HINTS AND TIPS

- Always replace both the timing chain and both sprockets as a combined unit. -

A worn timing chain will not properly fit the teeth of a new sprocket and will result in a premature failure.

- A new timing chain will rapidly wear away the teeth of an old sprocket.

NOTE: Since the water pump and drive belts will need to be removed during this procedure, it is important to note any related deficiencies prior to starting the procedure. -

Inspect the water pump for signs of leakage and inspect the pulley for any looseness or wobble. If any wobble is detected the water pump should be replaced.

- Inspect the drive belts and replace if necessary.

- Inspect the drive belt idler/tensioner pulleys for looseness and wobble. Replace any pulley which does not spin freely or has any wobble.

- Inspect the cooling fan clutch for proper operation. -

Under cold conditions the clutch should be disengaged, allowing the fan to spin freely.

- Under hot conditions the clutch should tighten up, coupling the fan to the water pump pulley/shaft.

- Rotate the engine to number 1 Top Dead Center prior to removing the timing chain.

NOTE: The alignment marks on the camshaft and crankshaft gears are positioned at number 1 Top Dead Center.

- When removing the water pump, any bolts which show signs of corrosion should be replaced and the holes/threads should be chased or re-tapped.

- Oil pan removal is required to remove the timing cover. Bolts from the oil pan extend through the bottom of the timing cover. Removing the bolts and loosening the remaining pan bolts to remove the timing cover will tend to cause oil leakage from the pan gasket.

NOTE: To prevent leakage, when the oil pan is removed or the bolts are loosened, the gasket should always be replaced.

- When tightening the oil pan bolts always use a torque wrench. Correct sealing requires the gasket to be evenly torqued across its entire sealing surface.

- Do not turn the crankshaft or camshaft with the pulleys off. Using slip joint pliers or pipe wrenches to turn the crankshaft will damage the surface and affect the press fit of the pulley.

- Silicone sealant should be used very sparingly. Excessive sealant which squeezes out on the inside of the gasket can accumulate and restrict the oil pump pickup screen or the coolant heater core.

- Inspect the chain guides and tensioner foot and replace if excessively worn.

NOTE: If the chain guides are worn past 50% of their original thickness the guides may not last the life of the new chain and should be replaced.

- When installing the chain leave the initial slack on the tensioner side, the opposite side should be tight. If any slack is left on the side opposite of the tensioner, upon initially rotating the engine the camshaft/crankshaft alignment will be incorrect.

A13489-1A

Timing Cover: Service and Repair

REMOVAL

1. Remove oil pan. 2. Drain the coolant. Remove the radiator. 3. Remove air conditioner compressor and power steering bracket, if so equipped. 4. Remove alternator and drive belt(s). 5. Remove fan. 6. Remove water pump, heater and radiator hoses. 7. Remove the drive pulley/damper assembly from the crankshaft. 8. Remove the crankshaft position sensor assembly. 9. Remove front cover retaining bolts. If necessary, tap cover lightly with a plastic hammer to break gasket seal. Remove front cover.

INSTALLATION

1. Clean the front cover mating surfaces of gasket material. Apply sealing compound to the gasket surfaces on the cylinder block and back side of the

front cover plate. Install guide sleeves.

2. Apply sealing compound to front cover gasket surface. Place gasket in position on front cover.

Engine Front Cover

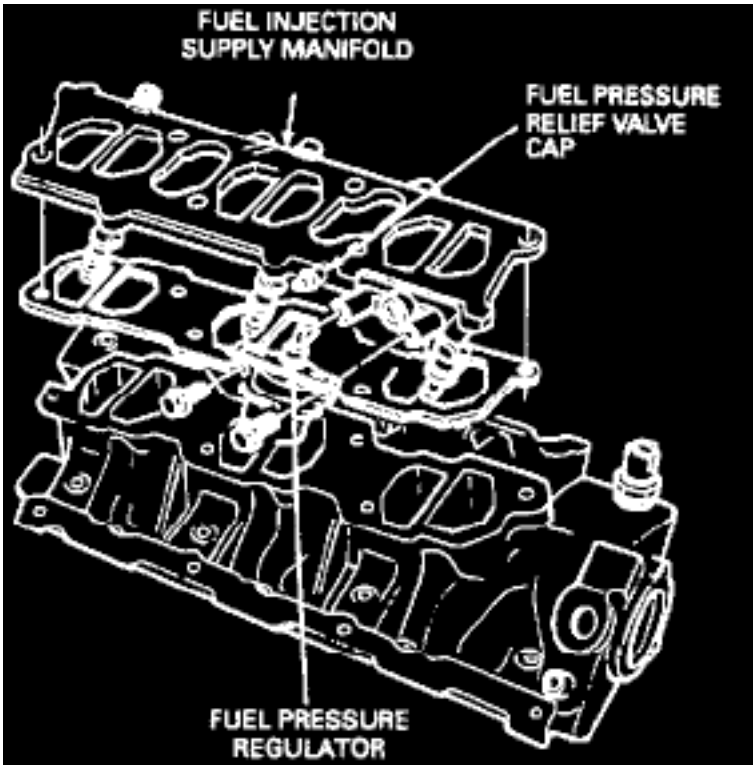
3. Place front cover on engine and start all retaining bolts two or three turns. Note the different bolt lengths. 4. Tighten front cover attaching bolts to 17-21 Nm (13-15 ft lb). 5. Install the crankshaft position sensor. 6. Install belt drive pulley/damper assembly. Tighten attaching bolt to 40-50 Nm (30-37 ft lb), then turn an additional 80-90° tighter. 7. Install oil pan. 8. Install water pump, heater hose, air conditioner compressor, alternator, and drive belt(s). Adjust drive belt tension. 9. Fill and bleed the cooling system.

10. Operate the engine at fast idle speed and check for coolant and oil leaks.

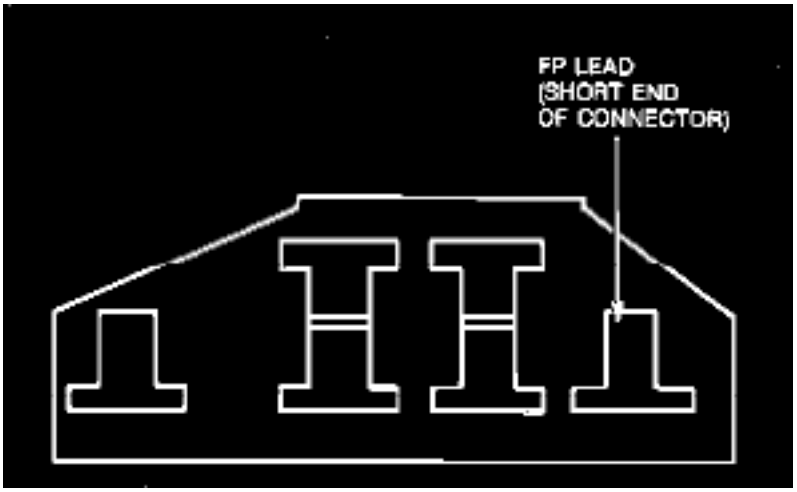
Fuel Pressure: Specifications

Key On Engine Off 35 - 45 psi

Key On Engine Running 30 - 40 psi



Fuel Injection Supply Manifold



Fuel Pressure: Testing and Inspection

STO Connector

STATIC PRESSURE TEST

1. Check for adequate fuel supply. 2. Turn key OFF 3. Install fuel pressure gauge to test port on fuel rail. 4. Install test lead to fuel pump lead of STO test connector. 5. Turn Key On Engine Off (KOEO). 6. Ground test lead to run fuel pump. 7. Check to determine if fuel pressure is within acceptable limits. Refer to SPECIFICATIONS.

a. If pressure is low but greater than 3 psi (indicates fuel pump is running but not enough pressure) check for:

^ Plugged fuel filter

^ Kinked fuel line

^ Low voltage to pump (should be within 0.5 volts of battery voltage at connector).

^ Disconnect the fuel return line and note if fuel is being returned during this low pressure condition. If fuel is being returned, replace the fuel pressure regulator. Reconnect the fuel return line.

b. If pressure is less than 3 psi (pump not running) check for:

^ Defective fuse link

^ Inertia switch open

^ Wiring at fuel pump/tank connector loose or open

^ Fuel pump ground connection at chassis loose or defective

^ Improper fuel pump relay operation

If fuel supply and return lines are OK, and electrical supply and ground are OK, and fuel pressure is still low, replace fuel pump.

DYNAMIC PRESSURE TEST

1. Disconnect and plug the vacuum line to the pressure regulator.

2. Start engine and run at idle. Check to determine if fuel pressure is within acceptable limits.

a. If pressure is low check for:

^ Plugged fuel filter ^ Restricted fuel line ^ Low voltage to pump (should be within 0.5 volts of battery voltage at connector).

3. Reconnect the vacuum line to the regulator.

If fuel supply and return lines are OK, and electrical supply and ground is OK, and fuel pressure is still low, replace fuel pump.

LEAKAGE TEST

1. Momentarily activate fuel pump by grounding test lead. Raise pressure to approximate operating pressure. 2. Remove ground from test lead and note pressure on gauge. Pressure should remain within 2 psi for 3 minutes after lead is ungrounded.

a. If pressure is not maintained check for leaking fuel

^ Lines ^ Connectors ^ Injectors

b. Disconnect fuel return line and plug engine side. Momentarily activate fuel pump by grounding test lead. Raise pressure to approximate

operating pressure. If pressure holds replace regulator and retest. Reconnect the fuel return line.

If pressure is not maintained replace fuel pump.

Engine - Hard Cold Starts/Hesitation/Stalls On Start-Up

Article No. 91-25-7

12/13/91

^ HARD COLD START - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

^ HESITATION/STALLS - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

FORD: 1983-87 EXP 1983-91 ESCORT 1984-90 MUSTANG, THUNDERBIRD 1986-90 TAURUS 1986-91 CROWN VICTORIA 1988-90 TEMPO

LINCOLN-MERCURY: 1983-85 LN7 1983-87 LYNX 1984-88 CAPRI 1984-90 COUGAR 1986-90 CONTINENTAL, MARK VII, SABLE 1986-91 GRAND MARQUIS, TOWN CAR 1988-90 TOPAZ 1991 TRACER

LIGHT TRUCK: 1985-90 BRONCO II, BRONCO 1985-91 ECONOLINE, F-150-350 SERIES 1985-92 RANGER 1986-91 AEROSTAR 1991 EXPLORER

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

SERVICE KIT -9F939-

APPLICATION CHART — EFI PORT FUEL INJECTION ENGINES

MODEL YEAR	CAR APPLICATION	ENGINE
1983-85	ESCORT GT/LYNX, EXP/LN7	1.6L EFI
1986-87	ESCORT GT/LYNX, EXP	1.9L EFI
1988-90	ESCORT GT	1.9L EFI
1991	ESCORT/TRACER	1.9L EFI
1987-90	MUSTANG	2.3L EFI
1984-86	THUNDERBIRD/COUGAR, MUSTANG/CAPRI	2.3L TC
1988-90	TEMPO/TOPAZ	2.3L HO/HSC
1986-90	TAURUS/SABLE	3.0L EFI
1988-90*	TAURUS/SABLE	3.8L EFI
1988-90	THUNDERBIRD/COUGAR	3.8L EFI/SC
1988-90	CONTINENTAL	3.8L EFI
1986-91	CROWN VICTORIA/GRAND MARQUIS, TOWN CAR	5.0L EFI
1986-88	THUNDERBIRD/COUGAR	5.0L EFI
1986-87	CONTINENTAL, MARK VII	5.0L EFI
1986-90	MARK VII LSC, MUSTANG	5.0L HO

MODEL YEAR	LIGHT TRUCK APPLICATION	ENGINE
1985	BRONCO II	2.3L EFI
1985-90**	RANGER	2.3L EFI
1986-87	AEROSTAR	2.3L EFI
1986-92	RANGER/BRONCO II	2.9L EFI
1986-90	AEROSTAR	3.0L EFI
1990-91***	RANGER, EXPLORER, AEROSTAR	4.0L EFI

1989-90	TAURUS	3.0L SHO
1987-90	ECONOLINE	4.9L EFI (WITH REAR HEAT)
1988-90	ECONOLINE	5.8L EFI

NOT APPLICABLE FOR 1991 MODEL YEAR EXCEPT WHERE LISTED
NOT APPLICABLE FOR 1992 MODEL YEAR EXCEPT WHERE LISTED

* CUT OUT HOOD INSULATION PAD, IF NECESSARY, TO AVOID POSSIBLE CONTACT WITH THE IABP SOLENOID.
** 1990 MODEL YEAR BUILT BEFORE 5/90
*** 1991 MODEL YEAR BUILT BEFORE 1/91
**** 1991 MODEL YEAR ALL CALIBRATIONS **EXCEPT** 1-97A-R00, 1-98A-R00, 1-98B-R00, 1-98C-R00, 1-98E-R00 AND 1-98F-R00.

TB-2432-A

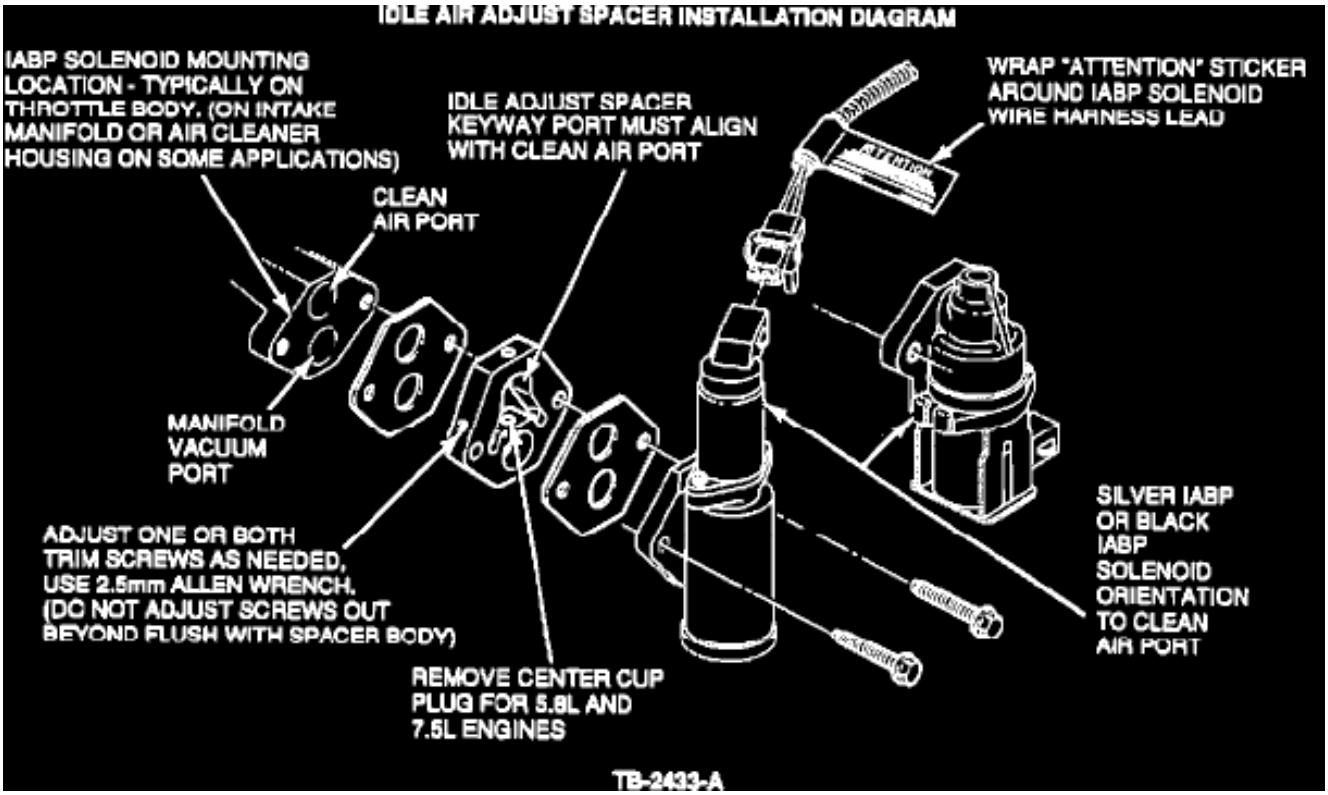
Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.

The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets



^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

Figure 5

The EFI throttle body idle speed adjustment procedures for the various model year passenger cars and light trucks are outlined in step-by-step procedures featured in Figures 3, 4 and 5. Select the appropriate procedure for the vehicle involved and adjust the throttle body idle RPM accordingly, after service kit installation.

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for

cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

Engine - Hard Cold Starts/Hesitation/Stalls On Start-Up

Article No. 91-25-7

12/13/91

^ HARD COLD START - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

^ HESITATION/STALLS - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

FORD: 1983-87 EXP 1983-91 ESCORT 1984-90 MUSTANG, THUNDERBIRD 1986-90 TAURUS 1986-91 CROWN VICTORIA 1988-90 TEMPO

LINCOLN-MERCURY: 1983-85 LN7 1983-87 LYNX 1984-88 CAPRI 1984-90 COUGAR 1986-90 CONTINENTAL, MARK VII, SABLE 1986-91 GRAND MARQUIS, TOWN CAR 1988-90 TOPAZ 1991 TRACER

LIGHT TRUCK: 1985-90 BRONCO II, BRONCO 1985-91 ECONOLINE, F-150-350 SERIES 1985-92 RANGER 1986-91 AEROSTAR 1991 EXPLORER

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

SERVICE KIT -9F939-

TB-2432-A

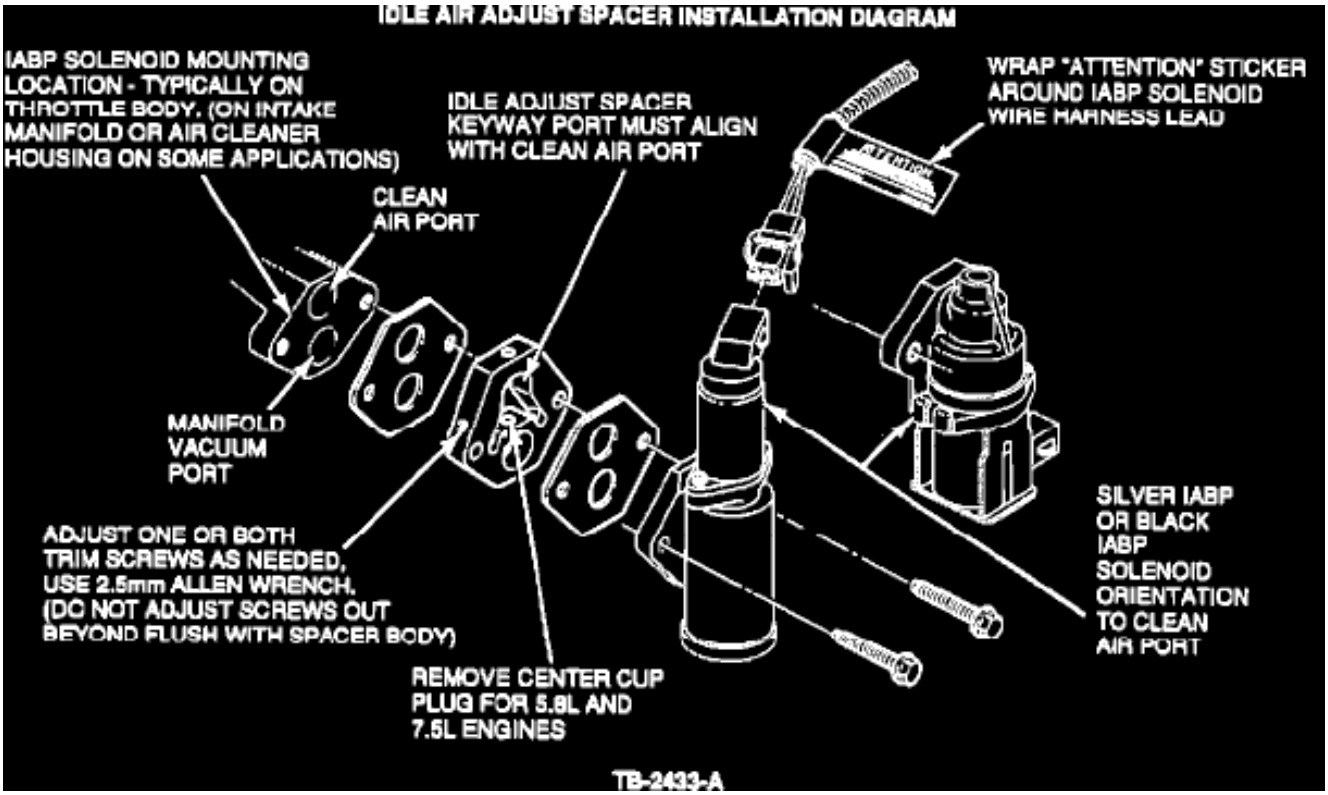
Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.

The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets



^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for

cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

Engine Idle Adjustment Procedures - Revision

ENGINE/EMISSIONS DIAGNOSIS SHOP MANUAL - 1991 - SECTION 9 - IDLE ADJUST PROCEDURES REVISED FOR APPLICATIONS WITHOUT SLUDGE TOLERANT THROTTLE BODY Article No. 90-25B-2 FORD:

1991 PROBE

LIGHT TRUCK: 1991 AEROSTAR, EXPLORER, RANGER

ISSUE: The Idle Adjust Procedures in the 1991 Engine/Emissions Diagnosis Shop Manual have been revised to cover applications that do not have the sludge tolerant throttle body. These are 1991 Aerostar, Explorer, and Ranger trucks with 4.0L engines. The 3.0L Probe has a sludge tolerant throttle body.

ACTION: Refer to the pages following this TSB article for the revised procedures.

NOTE: A SLUDGE TOLERANT THROTTLE BODY IS IDENTIFIED BY A 91TF-AA PREFIX AND SUFFIX IN THE PART NUMBER.

OTHER APPLICABLE ARTICLES: None WARRANTY STATUS: INFORMATION ONLY

Component Descriptions

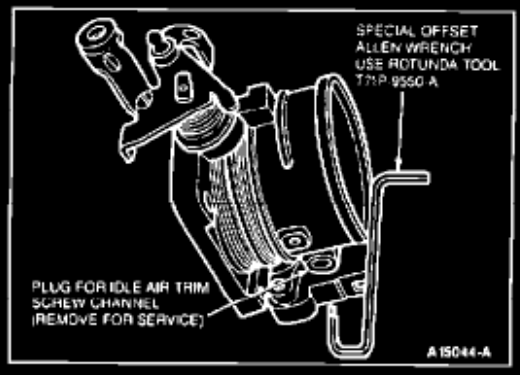

Figure 6

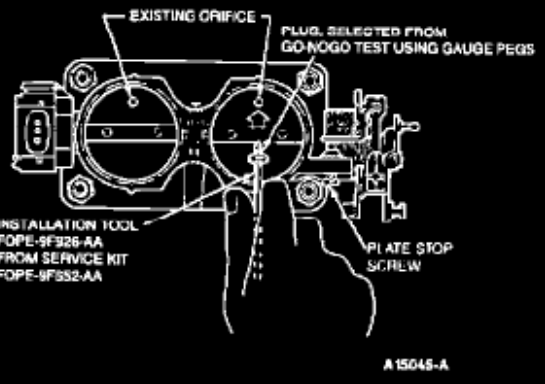

1. Remove air inlet tube(s) from throttle body.
2. Select the proper color plug by using the Go/NoGo gauge pegs included with the service kit FOPE-9F852-AA.
3. Starting with the largest diameter gauge peg, attempt to insert it through the throttle plate orifice.
4. If the gauge peg goes through the orifice, use the corresponding color plug.
   If it does not go through, proceed with the next smaller gauge peg for Go/NoGo Test.

NOTE: It is important that the largest Go/NoGo combination is used to determine the proper plug size.

5. If the smallest gauge peg does not go through the orifice, use the reamer bit and handle included with the service kit to enlarge the plate orifice. Wipe bearing grease on both sides of the plate orifice and on the reamer bit to hold the brass chips. After reaming, wipe the plate clean and then return to Step 3 to determine the proper plug size.
6. Using the installation tool from the service kit, push the plug into the orifice until bottoming out at the throttle plate.
7. Open and snap shut the throttle several times to verify proper plug retention.
8. Reconnect air inlet tube(s).
9. Reset idle rpm per engine requirement using the throttle plate stop screw.

Figure 7

Idle Airflow Adjust Procedure For All EFI and SEFI Systems

- Cooling system filled
- Engine at operating temperature
- Proper fuel pressure and no exhaust smoke
- Heater, A/C, and other accessories OFF
- Correct/clean PCV system if required
- Ignition timing set to specification
- EEC-IV diagnostics have been performed and vehicle malfunction indicated Service output codes have been resolved

Procedure

Choose procedure A, B, C or D from the table below for the engine being serviced. (The applications with self-test idle speed check provisions use procedure 'A' or 'C' and those without use procedure 'B' or 'D' depending on car or truck). An asterisk (*) below shows only applications without sludge tolerant throttle body design.

CAR			TRUCK

See Fig. 5 and 6 for air trim screw location referred to in the attached procedure A.

See Fig. 7 for plug installation (in the plate orifice) procedure referred to in the attached procedures.

Procedure 'A' for Passenger Cars with Self-Test Idle Speed Check Provisions

DELETION

(USE ONLY STEPS MARKED 'X' FOR THE ENGINE BEING SERVICED)	2.5L	3.0L	3.8L	3.8L SC	4.6L 2V	5.0L HO THUNDERBIRD COUGAR
1 Activate engine running self-test	X	X	X	X	X	X
2 After Service Code 11 or 111 has been displayed, wait 4 seconds then quickly unlatch and within 4 seconds latch the STI button	X	X	X	X	X	X
3 A single pulse code indicates the entry mode, then observe the Self-Test Output (STO) of the STAR Tester in Item 4. If adjustment is required in Item 4, refer to possible causes listed in previous section and correct them as required and then continue with this procedure if necessary.	X	X	X	X	X	X
4 (A) Constant tone, solid light or "STO LO" readout means base idle rpm is within range. To exit test, unlatch STI button, then wait four seconds for reinitialization (after 10 minutes it will exit by itself).	X	X	X	X	X	X
(B) Beeping tone, flashing light, or "STO LO" readout at (8 Hz) indicates TP sensor is out of range due to over adjustment; adjustment may be required.	X	X	X	X	X	X
(C) Beeping tone, flashing light, or "STO LO" readout at (4 Hz) indicates base idle rpm is too fast, adjustment is required, go to Step 6.	X	X	X	X	X	X
(D) Beeping tone, flashing light, or "STO LO" readout at (1 Hz) indicates base idle rpm is too slow, adjustment is required, go to Step 5.	X	X	X	X	X	X
5 If rpm is too slow, follow applicable procedure for the engine being serviced.	X	X	X	X	X	X
A. Do not clean the throttle body, turn the air trim screw counter-clockwise until conditions in Step 4(A) are satisfied for air trim location. (See Figure 5 or 6).				X	X	X
B. Do not clean the throttle body. Check for the plate orifice plug. If there is no plug turn screw clockwise until conditions in Step 4(A) are satisfied. If there is a plug from previous service remove plug and then adjust screw in either direction as required. Screw must be in contact with the lever pad after adjustment.	X	X	X			
6 If rpm is too high, follow applicable procedure for the engine being serviced	X	X	X	X	X	X
A. Do not clean the throttle body, turn the air trim screw clockwise until conditions in Step 4(A) are satisfied for air trim screw location (see Figure 5 or 6).				X	X	X
B Turn engine OFF	X	X	X			
a. Block off the orifice in the throttle plate temporarily with tape. If the orifice already has a plug from previous service, go to Step (C)	X	X	X			
b. Restart the engine and check idle speed using Self-Test (mass air packages require air intake hose to be reattached first). If engine stalled, crack open the plate with plate stop screw. (Figure 4)	X	X	X			
c. If rpm continues to be fast, perform test in Step 7 if TPS output code is within range, remove tape, go to Section 2 for other causes. If out of range adjust screw for proper TPS code (lever pad must be in contact with screw after adjustment). If rpm is still fast, terminate this procedure and - go to Section 2 for other possible causes.	X	X	X			
d. However, if rpm drops to or below the desired level, as indicated by Self-Test Output tone, turn the engine off disconnect air cleaner hose, remove the tape.	X	X	X			
e. Install the plug with proper color code depending on throttle plate orifice size - see Fig. 7 for installation procedure.	X	X	X			
f. Reconnect the air cleaner hose - start the engine turn the plate stop screw clockwise (do not turn it counter-clockwise as this may cause the throttle plate to stick at idle) until conditions in Step 4A are satisfied.	X	X	X			
7 Run KOEO Self-Test for proper TPS output code.	X	X	X			
8 Verify the throttle is not stuck in the bore and linkage is not preventing throttle from closing.	X	X	X			
9 On automatic overdrive transmission (AOD) applications check TV pressure adjustment		X	X			

DELETION

Procedure 'D' for Trucks with No Self-Test Idle Speed Check Provisions

USE ONLY STEPS MARKED "X" FOR THE ENGINE BEING SERVICED	2.3L EFI OHC	2.9L EFI	3.0L EFI	4.0L EFI WITH 9ITF-AA THROTTLE BODY	4.0L EFI WITH 9ITF-AA THROTTLE BODY	5.0L EFI (NON-E4OD)	5.8L EFI O/8500 ALL 1991 EXCEPT E-250 B-64K CALIBRATION	7.5L EFI 1991	7.5L EFI 1991 1/2
1 Engine off, disconnect the negative (-) terminal of the battery for five minutes, then reconnect it.	X	X	X	X	X	X	X	X	X

Engine Idle Adjustment Procedures - Revision

ENGINE/EMISSIONS DIAGNOSIS SHOP MANUAL - 1991 - SECTION 9 - IDLE ADJUST PROCEDURES REVISED FOR APPLICATIONS WITHOUT SLUDGE TOLERANT THROTTLE BODY Article No. 90-25B-2 FORD:

1991 PROBE

LIGHT TRUCK: 1991 AEROSTAR, EXPLORER, RANGER

ISSUE: The Idle Adjust Procedures in the 1991 Engine/Emissions Diagnosis Shop Manual have been revised to cover applications that do not have the sludge tolerant throttle body. These are 1991 Aerostar, Explorer, and Ranger trucks with 4.0L engines. The 3.0L Probe has a sludge tolerant throttle body.

ACTION: Refer to the pages following this TSB article for the revised procedures.

NOTE: A SLUDGE TOLERANT THROTTLE BODY IS IDENTIFIED BY A 91TF-AA PREFIX AND SUFFIX IN THE PART NUMBER.

OTHER APPLICABLE ARTICLES: None WARRANTY STATUS: INFORMATION ONLY

Component Descriptions

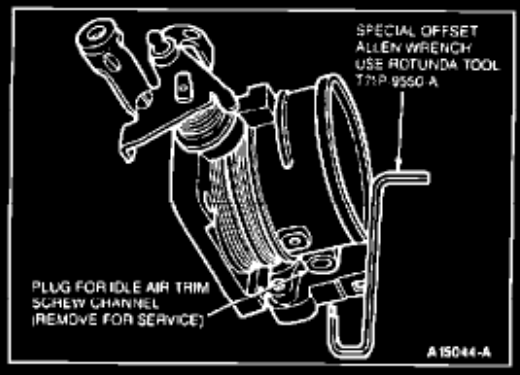

Figure 6

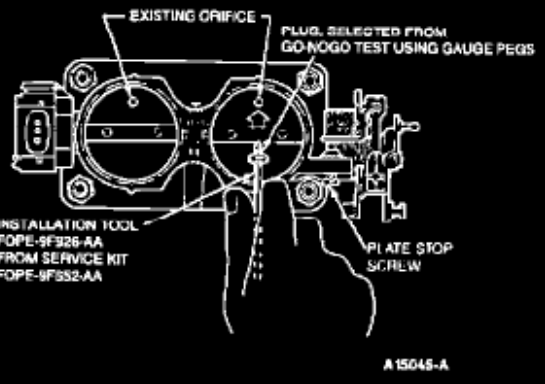

1. Remove air inlet tube(s) from throttle body.
2. Select the proper color plug by using the Go/NoGo gauge pegs included with the service kit FOPE-9F852-AA.
3. Starting with the largest diameter gauge peg, attempt to insert it through the throttle plate orifice.
4. If the gauge peg goes through the orifice, use the corresponding color plug.
   If it does not go through, proceed with the next smaller gauge peg for Go/NoGo Test.

NOTE: It is important that the largest Go/NoGo combination is used to determine the proper plug size.

5. If the smallest gauge peg does not go through the orifice, use the reamer bit and handle included with the service kit to enlarge the plate orifice. Wipe bearing grease on both sides of the plate orifice and on the reamer bit to hold the brass chips. After reaming, wipe the plate clean and then return to Step 3 to determine the proper plug size.
6. Using the installation tool from the service kit, push the plug into the orifice until bottoming out at the throttle plate.
7. Open and snap shut the throttle several times to verify proper plug retention.
8. Reconnect air inlet tube(s).
9. Reset idle rpm per engine requirement using the throttle plate stop screw.

Figure 7

Idle Airflow Adjust Procedure For All EFI and SEFI Systems

- Cooling system filled
- Engine at operating temperature
- Proper fuel pressure and no exhaust smoke
- Heater, A/C, and other accessories OFF
- Correct/clean PCV system if required
- Ignition timing set to specification
- EEC-IV diagnostics have been performed and vehicle malfunction indicated Service output codes have been resolved

Procedure

Choose procedure A, B, C or D from the table below for the engine being serviced. (The applications with self-test idle speed check provisions use procedure 'A' or 'C' and those without use procedure 'B' or 'D' depending on car or truck). An asterisk (*) below shows only applications without sludge tolerant throttle body design.

17 On Automatic Overdrive Transmission (AOD) applications, check TV pressure adjustment.						X			

NOTE 1: On 5.0L and 5.8L, only in Step 9, if you must turn the plate stop screw in, shut engine off, make estimated adjustment. Start engine, repeat Steps 7,8,9.

2/ In Step 16, engine rpm oscillation may be caused by the throttle plate open far enough to expose the canister purge ports. To verify this, disconnect purge port and plug. If the problem is resolved, close the throttle plate just enough to eliminate oscillations.

3/ For 1991 1/2 use procedure 'C'.

Revised 12/90

Idle Speed: By Symptom

Technical Service Bulletin # 91257 Date: 911213

Engine - Hard Cold Starts/Hesitation/Stalls On Start-Up

Article No. 91-25-7

12/13/91

^ HARD COLD START - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

^ HESITATION/STALLS - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

FORD: 1983-87 EXP 1983-91 ESCORT 1984-90 MUSTANG, THUNDERBIRD 1986-90 TAURUS 1986-91 CROWN VICTORIA 1988-90 TEMPO

LINCOLN-MERCURY: 1983-85 LN7 1983-87 LYNX 1984-88 CAPRI 1984-90 COUGAR 1986-90 CONTINENTAL, MARK VII, SABLE 1986-91 GRAND MARQUIS, TOWN CAR 1988-90 TOPAZ 1991 TRACER

LIGHT TRUCK: 1985-90 BRONCO II, BRONCO 1985-91 ECONOLINE, F-150-350 SERIES 1985-92 RANGER 1986-91 AEROSTAR 1991 EXPLORER

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

NOT APPLICABLE FOR 1991 MODEL YEAR EXCEPT WHERE LISTED
NOT APPLICABLE FOR 1992 MODEL YEAR EXCEPT WHERE LISTED

* CUT OUT HOOD INSULATION PAD, IF NECESSARY, TO AVOID POSSIBLE CONTACT WITH THE IABP SOLENOID.
** 1990 MODEL YEAR BUILT BEFORE 5/90
*** 1991 MODEL YEAR BUILT BEFORE 1/91
**** 1991 MODEL YEAR ALL CALIBRATIONS **EXCEPT** 1-97A-R00, 1-98A-R00, 1-98B-R00, 1-98C-R00, 1-98E-R00 AND 1-98F-R00.

TB-2432-A

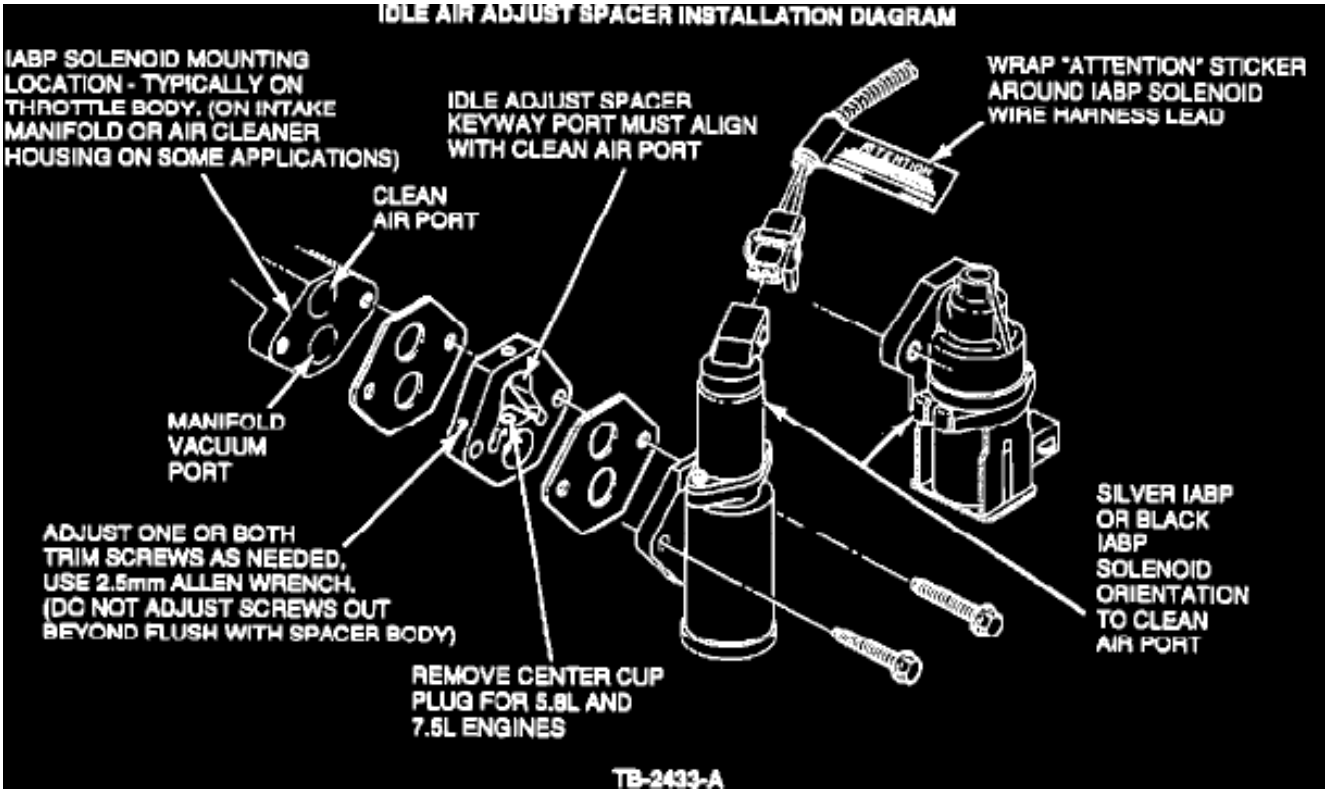
Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.

The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets



^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

Figure 11

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

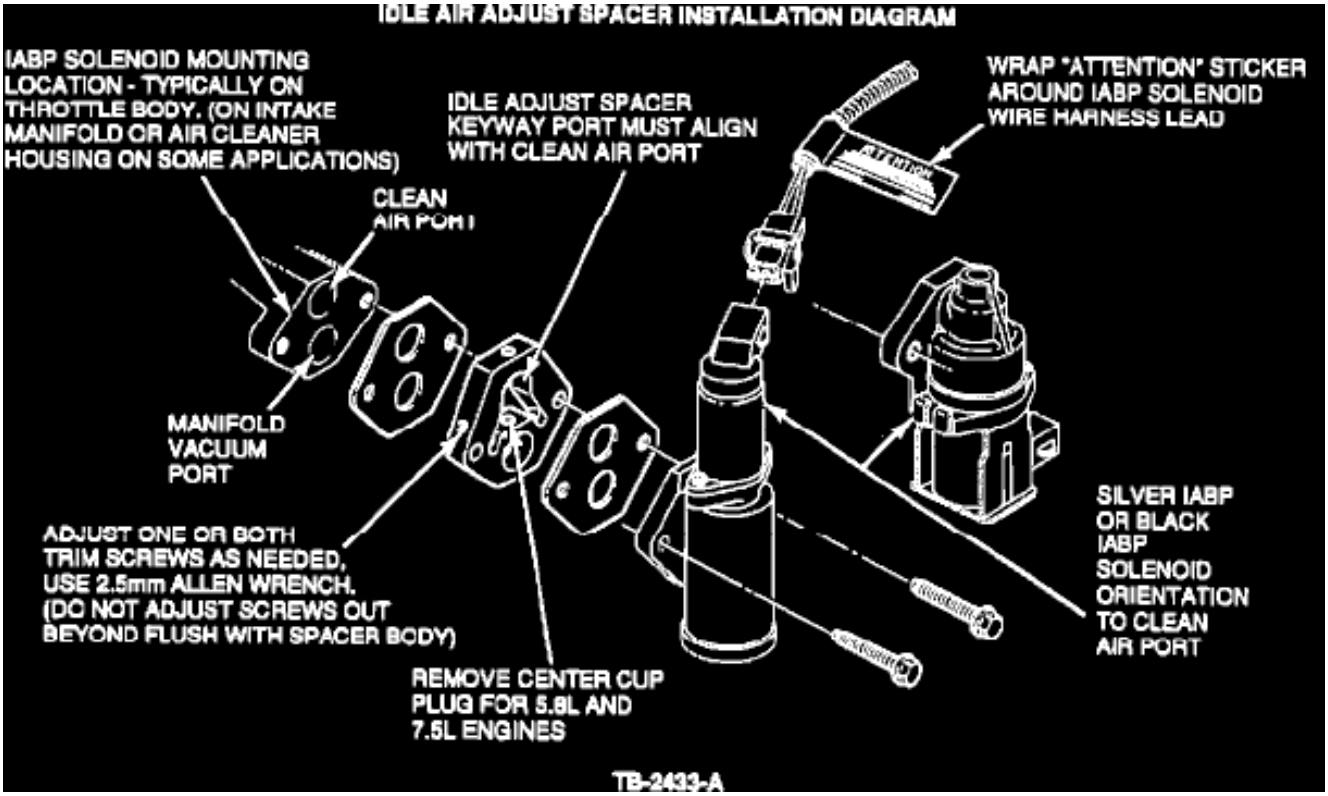
TB-2432-A

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.



The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets

^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

Figure 11

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

DEALER CODING

BASIC PART NO. CONDITION CODE

9E926 49

OASIS CODES: 602300, 607000, 607400, 607700, 608400, 611500, 618400

Idle Speed: Adjustments With 90TF-AA Throttle Body

*** UPDATED BY TSB 9111B4, 6/14/91; TSB 9025B2, 12/90

NOTE: The curb and fast idle speeds are controlled by the Engine Control Assembly (ECA) and the Idle Speed Control Bypass Air Valve (ISC-BPA). The ISC-BPA valve is not adjustable. A large increase or decrease in closed plate airflow from the calibrated level will not allow this device to control the speed.

REMEMBER

A change in idle airflow can occur not only at the throttle body, but other areas as well. You should enter the idle speed procedure only after other possible causes in the following areas are eliminated.

^ Contamination within the idle speed control device

^ Lack of fuel system control (excessively rich or lean)

^ Throttle sticking or binding

^ Engine not reaching operating temperature

^ Incorrect ignition timing

^ Incorrect or clogged PCV system

^ Vacuum leaks (intake manifold, vacuum hoses, vacuum reservoirs, power brake booster etc.

VERIFY

^ Transmission is in PARK (A/T), or NEUTRAL (M/T)

^ Parking brake is applied (automatic brake disconnected where applicable)

^ Wheels blocked

^ Engine at operating temperature

^ Proper fuel pressure and no exhaust smoke

^ Correct and clean PCV system

^ Heater, A/C, and other accessories OFF

^ Ignition timing is set to specification

^ EEC-IV diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved.

STEP 1

With the engine OFF, connect a tachometer, according to manufacturer's instructions. Disconnect the negative (-) terminal of the battery for 5 minutes, then reconnect it.

STEP 2

START the engine and let stabilize for two minutes. Goose the accelerator and let the engine return to idle. Lightly depress and release the accelerator, then let engine idle.

STEP 3

If the engine is not idling properly, turn the engine OFF, and disconnect Idle Speed Control Air Bypass Solenoid.

STEP 4

START and RUN the engine at 2500 rpm for 30 seconds.

STEP 5

Place the transmission is in PARK (A/T), or NEUTRAL (M/T).

STEP 6

Using a tachometer, verify idle rpm is 675 +50/-125 rpm.

RPM TOO LOW a.

Turn the plate stop screw to reach an idle speed of 675 +/- 25 rpm.

NOTE: During engine break-in reduce the idle rpm by 100 rpm. RPM TOO HIGH a.

Turn the plate stop screw clockwise until 675 +/- 25 rpm is achieved.

STEP 7

Turn the engine OFF, and repeat Steps 4, 5, and 6, if necessary.

STEP 8

Run the KOEO Self-Test for proper TPS code output.

STEP 9

Turn the engine OFF, and disconnect the battery for at least 5 minutes.

STEP 10

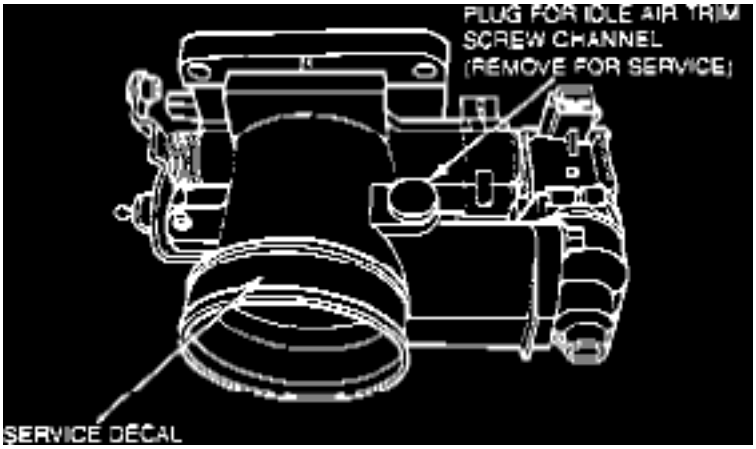
Reconnect the Idle Speed Control Air Bypass Solenoid. Verify the throttle plate is not stuck in the bore, and the linkage is not preventing throttle from closing.

STEP 11

START the engine and idle for two minutes. Goose the accelerator and let the engine return to idle. Lightly depress and release the accelerator, then let engine idle. ^

If idle problem still exists, proceed to DIAGNOSIS AND TESTING PROCEDURES/TESTING PROCEDURES/QUICK TEST AND

DIAGNOSTIC AIDS/VISUAL INSPECTION for other possible causes.



Idle Speed: Adjustments With 91TF-AA Throttle Body

*** UPDATED BY TSB 91-11B-4 6/14/91

NOTE: The curb and fast idle speeds are controlled by the Engine Control Assembly (ECA) and the Idle Speed Control Bypass Air Valve (ISC-BPA). The ISC-BPA valve is not adjustable. A large increase or decrease in closed plate airflow from the calibrated level will not allow this device to control the speed. The idle speed setting procedure has been revised considerably to reflect the expanded application of the Self-Test idle speed options and because the throttle body incorporates an orifice in the throttle plate to control idle airflow as part of the sludge tolerant design.

Air Trim Screw Channel Cover

Throttle bodies with sludge tolerant design (introduced 1991 1/2 model vehicles) are clearly identified with a Yellow/Black decal. This decal warns that the throttle plate stop screw must not be adjusted counterclockwise (backed off), as this will not reduce the engine speed but may cause the throttle plate to stick in the bore. Backing out the screw may be required if the throttle body has been previously serviced (a plug in the throttle plate orifice may be present) or the plate stop screw tampered with (TPS Self-Test output out of range). The decal also warns that the throttle body must NOT be cleaned inside the bore, as this cleaning will impair the sensitive coating. The sludge accumulation will not affect the idle air flow. The cleaning procedure for the ISC-BPA still applies.

REMEMBER

A change in idle airflow can occur not only at the throttle body, but other areas as well. You should enter the idle speed procedure only after other possible causes in the following areas are eliminated.

^ Contamination within the idle speed control device

^ Lack of fuel system control (excessively rich or lean)

^ Throttle sticking or binding

^ Engine not reaching operating temperature

^ Incorrect ignition timing

^ Incorrect or clogged PCV system

^ Vacuum leaks (intake manifold, vacuum hoses, vacuum reservoirs, power brake booster etc.

VERIFY

^ Transmission is in PARK (A/T), or NEUTRAL (M/T)

^ Parking brake is applied (automatic brake disconnected where applicable)

^ Wheels blocked

^ Engine at operating temperature

^ Proper fuel pressure and no exhaust smoke

^ Correct and clean PCV system

^ Heater, A/C, and other accessories OFF

^ Ignition timing is set to specification

^ EEC-IV diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved.

STEP 1

With the engine OFF, connect a tachometer, according to manufacturer's instructions. Disconnect the negative (-) terminal of the battery for 5 minutes, then reconnect it.

STEP 2

START the engine and let stabilize for two minutes. Goose the accelerator and let the engine return to idle. Lightly depress and release the accelerator, then let engine idle.

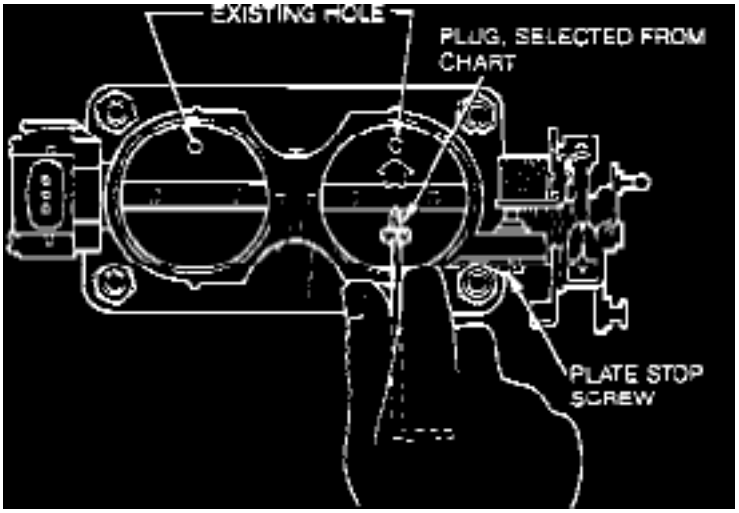
STEP 3

If the engine is not idling properly, turn the engine OFF, and disconnect Idle Speed Control Air Bypass Solenoid.

STEP 4

START and RUN the engine at 2500 rpm for 30 seconds.

STEP 5



Place the transmission is in PARK (A/T), or NEUTRAL (M/T).

STEP 6

Using a tachometer, verify idle rpm is 675 +50/-120 rpm.

Throttle Plate Orifice Plug

NOTE: A plug in the throttle body orifice will decrease idle rpm. Where as an orifice without a plug will increase idle rpm. Orifice plugs and installation tools are available in service kit # FOPZ-9F652-A.

RPM TOO LOW a.

Do not clean the throttle body, check for the plate orifice plug. ^

If there is no plug, turn the screw clockwise to the desired rpm.

^ If there is a plug from previous service, remove the plug, and adjust the screw in either direction as required. NOTE: Screw must be in contact with the lever pad after adjustment.

RPM TOO HIGH a.

Turn the engine OFF.

b. Disconnect air cleaner hose.

c. Temporarily block the orifice in the throttle plate with tape. If the orifice already has a plug from previous service proceed to Step (e).

d. RESTART the engine, and check the idle speed, using a tachometer. NOTE: On vehicles with Mass Air Flow Sensors, reconnect the air intake duct hose before checking rpm. If the engine stalls, crack open the plate stop screw, but DO NOT over adjust.

e. If rpm continues to be fast, perform KOEO Self-Test. ^

If TPS output code is within range, remove tape from throttle plate, and check for other possible causes.

^ If TPS output is out of range, adjust screw for proper TPS code. Lever must be in contact with the screw.

^ If rpm is still fast, terminate this procedure, then check for other possible causes.

f. If rpm drops to 675 or lower, or engine stalls, turn the engine OFF, disconnect the air cleaner hose, and remove tape from throttle plate.

g. Install the plug with proper color code depending on throttle plate orifice size.

h. Reconnect the air cleaner hose. START the engine, and check the idle rpm using a tachometer. Turn the plate stop screw clockwise until 675 +/- 25 rpm is achieved. NOTE: Do not turn the plate stop screw counterclockwise. This may cause the throttle plate to stick at idle.

STEP 7

Turn the engine OFF, and repeat Steps 4, 5, and 6.

STEP 8

Run the KOEO Self-Test for proper TPS code output.

STEP 9

Turn the engine OFF, and disconnect the battery for at least 5 minutes.

STEP 10

Reconnect the Idle Speed Control Air Bypass Solenoid. Verify the throttle plate is not stuck in the bore, and the linkage is not preventing throttle from closing.

STEP 11

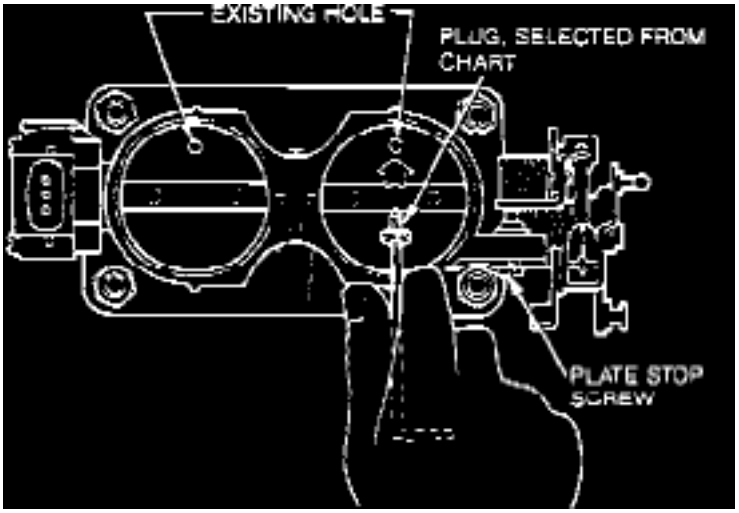
START the engine and idle for two minutes. Goose the accelerator and let the engine return to idle. Lightly depress and release the accelerator, then let engine idle. ^

If idle problem still exists, proceed to DIAGNOSIS AND TESTING PROCEDURES/TESTING PROCEDURES/QUICK TEST AND DIAGNOSTIC AIDS/VISUAL INSPECTION for other possible causes.

PROCEDURES FOR PLUG INSTALLATION

STEP 1

Remove air inlet tube(s) from throttle body.



Throttle Plate Orifice Plug

STEP 2

Select the proper color plug by using the Go/No-Go gauge pegs, included in the service kit (FOPZ-9F652-A).

STEP 3

Starting with the largest diameter gauge peg, attempt to insert through the throttle plate orifice.

STEP 4

If the gauge peg goes through the orifice, use the corresponding color plug. If the gauge peg does not go through, proceed with the next smaller gauge peg for Go/No-Go Test. NOTE: It is important that the largest Go/No-Go combination is used to determine the proper plug size.

STEP 5

If the smallest gauge peg does not go through the orifice, use the reamer bit and handle included with the service kit to enlarge the plate orifice. Wipe bearing grease on both sides of the plate orifice and on the reamer bit to hold the brass chips. After reaming, wipe plate clean and then return to Step 3 to determine the proper plug size.

STEP 6

Using the installation tool from the service kit, push the plug into the orifice until bottoming out at the throttle plate.

STEP 7

Open and snap closed the throttle several times to verify proper plug retention.

STEP 8

Reconnect the air inlet tube(s).

STEP 9

Reset idle rpm per engine requirement using the throttle plate stop screw.

Air Cleaner Fresh Air Duct/Hose: Technical Service Bulletins Engine - Water Entry Through Air Intake System

Article No. 94-3-8

02/09/94

^ AIR INTAKE - 2.9L, 3.0L, 4.0L EFI ENGINES - WATER ENTRY THROUGH AIR INTAKE SYSTEM

^ ENGINE - 2.9L, 3.0L, 4.0L EFI - POSSIBLE INTERNAL DAMAGE FROM WATER ENTRY THROUGH AIR INTAKE SYSTEM

LIGHT TRUCK: 1986-90 BRONCO II 1986-94 RANGER 1991-94 EXPLORER

This article is being republished in its entirety to add 1993-94 4.0L Ranger, 1993-94 3.0L Ranger and 1993-94 4.0L Explorer vehicles.

ISSUE: Reports have been received of internal engine damage caused by water entering the engine through the air intake system. This condition may occur when the vehicle is driven in normal wet conditions, such as water splash/spray from other vehicles, or when driven through shallow water. Improvements were made to the EFI engine air intake systems that have greatly reduced the number of reported incidences.

ACTION: Dealers should be assured that warranty repairs will be covered unless there Is evidence of owner misuse. This warranty repair policy will remain effective unless you are notified that a waterproof air intake system has been released.

OTHER APPLICABLE ARTICLES: NONE SUPERSEDES: 91-21-10 WARRANTY STATUS: INFORMATION ONLY OASIS CODES: 497000, 499000

Fuel Pressure Release: Service and Repair

CAUTION: FUEL SUPPLY LINES ON EFI ENGINES WILL REMAIN PRESSURIZED FOR SOME PERIOD OF TIME AFTER THE ENGINE IS SHUT OFF. THIS PRESSURE MUST BE RELIEVED BEFORE SERVICING OF THE FUEL SYSTEM IS BEGUN.

FUEL SYSTEM PRESSURE RELIEF - EFI ENGINES

Before opening the fuel system on vehicles with EFI engines, relieve fuel pressure as follows: 1. Locate and disconnect the electrical connection to either the fuel pump relay, the inertia switch or the in-line high pressure fuel pump.

2. Crank engine for approximately ten seconds.

Note: Engine may start and run for a short time. If so, crank engine an additional 5 seconds after engine stalls.

3. Re-connect the electrical connector that was disconnected in step 1 and disconnect battery ground cable.

Alternative Method

Some EFI vehicles have a port (fitting) on the fuel rail used for measuring fuel pressure. If so equipped, use the following method: -

Install fuel pressure relief tool No. T80L-9974-B or equivalent to measuring port on engine fuel rail.

- Position drain hose in suitable container, then depress relief button.

Octane Adjust	Pinpoint Test	KP

Note

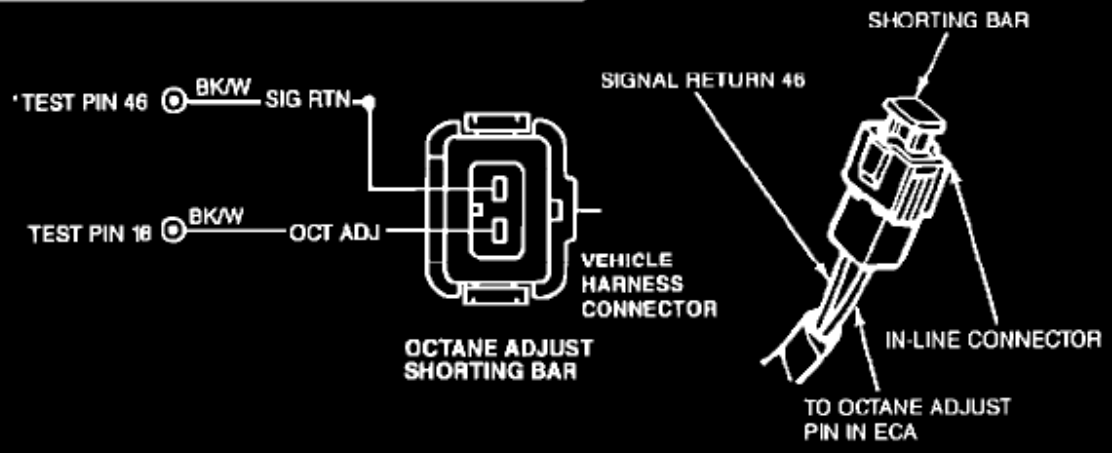
You should enter this Pinpoint Test only when directed here from Quick Test Step 7.0.

Remember

This Pinpoint Test is intended to diagnose only the following:

- Harness circuits: Signal Return, Octane Adjust
- Octane shorting bar connector

Pinpoint Test Schematic



OCTANE ADJUST SHORTING BAR LOCATIONS

APPLICATION	LOCATION
2.3L EFI Truck	Passenger side of fender apron, taped to the self-test connector.
3.0L SEFI SHO	Driver side of engine, tie wrapped to a bracket above the transmission.
3.8L SEFI SC	Passenger side of engine between shock tower mount and firewall next to self-test connector.

*TEST PINS LOCATED ON BREAKOUT BOX.
ALL HARNESS CONNECTORS VIEWED INTO MATING SURFACE.

A9686-D

NOTE: Use a higher octane grade of fuel to address the spark knock concern.
DO NOT remove the Octane Adjust shorting bar unless you have been directed by an application specific Technical Service Bulletin.

Octane Adjust

Pinpoint Test **KP**

Octane Adjust Shorting Bar Locations

Application	Location
1.9L MA SEFI	Near EEC-IV power relay, fuel pump relay and processor in passenger compartment.
2.3L EFI Truck	Passenger side of fender apron, taped to the Self-Test connector.
3.0L SEFI SHO	Driver side of engine, tie wrapped to a bracket above the transmission.
3.8L SEFI SC	Passenger side of engine between shock tower mount and firewall next to Self-Test connector.
4.0L MA EFI Aerostar	Driver side, engine cowl near windshield wiper motor take-out (alongside MAP take-out).
4.0L MA EFI Ranger/ Bronco II	Passenger side of fender apron, taped to the Self-Test connector.

DELETION

Revised 5/91

Octane Adjust

Pinpoint Test **KP**

TEST STEP	RESULT ▶	ACTION TO TAKE
KP1 VISUALLY INSPECT OCTANE ADJUST IN-LINE CONNECTOR SERVICE CODE 57/341		
Service Code 57/341 indicates Octane Adjust shorting bar is not in or the OCT ADJ circuit is open. • Key off. • Visually inspect Octane Adjust in-line connector. • **Is the shorting bar removed?**	Yes ▶ No ▶	GO to KP2. GO to KP4.
KP2 CHECK FOR MODIFICATION DECAL		
• Is there a modification decal attached to the vehicle indicating that the Octane Adjust shorting bar was removed?	Yes ▶ No ▶	Testing complete. If vehicle has spark knock concern, GO to Section 2. GO to KP3.
KP3 CHECK FOR SERVICE CODE 57/341		
• Replace Octane Adjust shorting bar. • Key off. • Activate self-test. • **Is service code 57/341 present?**	Yes ▶ No ▶	GO to KP4. Testing complete. EEC system OK.
KP4 CHECK CONTINUITY OF OCTANE ADJUST CIRCUIT		
NOTE: There should be continuity from OCT ADJ circuit thru the in-line connector and shorting bar to SIG RTN circuit. • Key off. • Disconnect processor 60 pin connector. Inspect for damaged or pushed out pins, corrosion, loose wires, etc. Service as necessary. • Install breakout box, leave processor disconnected. • Measure resistance between Test Pin 46 and OCT ADJ Test Pin at the breakout box (see schematic for appropriate OCT ADJ circuit test pin). • **Is the resistance less than 5 ohms?**	Yes ▶ No ▶	REPLACE processor. REMOVE breakout box. RERUN Quick Test. SERVICE open OCT ADJ circuit or shorting bar or SIG RTN circuit. REMOVE breakout box. RERUN Quick Test.

Octane Adjust

Pinpoint Test **KP**

TEST STEP	RESULT	ACTION TO TAKE
KP5 CHECK FOR SERVICE CODE 11 • Start engine and idle vehicle at operating temperature. • Key off. • Activate self-test. • Key on, engine off. • **Is service code 11 or 111 present?**	Yes ▶ No ▶	GO to KP6. **For service code 57/341:** GO to KP1. **For all other codes:** RETURN to Quick Test.
KP6 VERIFY IN-LINE CONNECTOR SHORTING BAR IS INSTALLED • Key off. • Visually inspect Octane Adjust in-line connector. • **Is shorting bar installed?**	Yes ▶ No ▶	GO to KP8. GO to KP7.
KP7 CHECK FOR MODIFICATION DECAL • Is there a modification decal attached to the vehicle indicating that the Octane Adjust shorting bar was removed?	Yes ▶ No ▶	GO to KP10. REPLACE shorting bar. GO to Section 2 to address spark knock concern.
KP8 CHECK FOR TSB • Is there a Technical Service Bulletin (TSB) authorizing the removal of the Octane Adjust shorting bar?	Yes ▶ No ▶	GO to KP9. GO to Section 2 to address spark knock concern.
KP9 REMOVE SHORTING BAR • Remove shorting bar only if there is a TSB authorization. • Drive vehicle to verify spark knock. • **Is spark knock present?**	Yes ▶ No ▶	GO to KP10. Testing complete. EEC system OK.

Octane Adjust	Pinpoint Test	KP

TEST STEP	RESULT ▶	ACTION TO TAKE
KP10 CHECK OCTANE ADJUST CIRCUIT FOR A SHORT TO GROUND • Key off. • Breakout box installed, processor disconnected. • Measure resistance between OCT ADJ circuit at the in-line connector and Test Pin 40/60 at the breakout box. • **Is each resistance greater than 10,000 ohms?**	Yes ▶	GO to KP11.
	No ▶	SERVICE short circuit. REMOVE breakout box. If spark knock is still present, GO to Section 2.
KP11 CHECK PROCESSOR INTEGRITY • Key off. • Shorting bar removed because of TSB authorization. • Breakout box installed, processor connected. • Key on. • Measure voltage between Octane Adjust circuit and Test Pin 40/60 at the breakout box. • **Is voltage greater than 4.0 volts?**	Yes ▶	REMOVE breakout box. If spark knoock is still present, GO to Section 2.
	No ▶	REPLACE processor. REMOVE breakout box. If spark knock is still present, GO to Section 2.

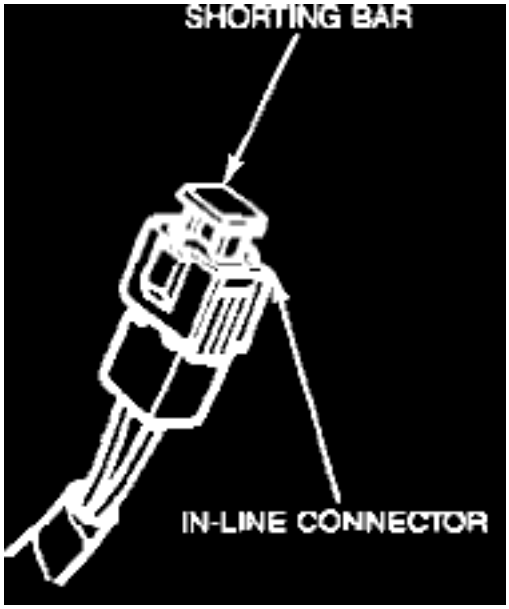
Ignition Timing Connector: Locations

Component Location

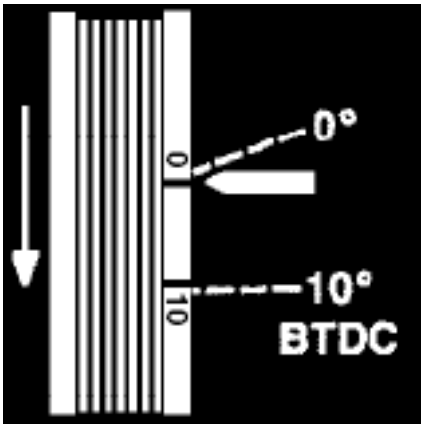
The SPOUT connector (SAW check connector C127) is located at the RH front of the engine compartment in front of the battery.



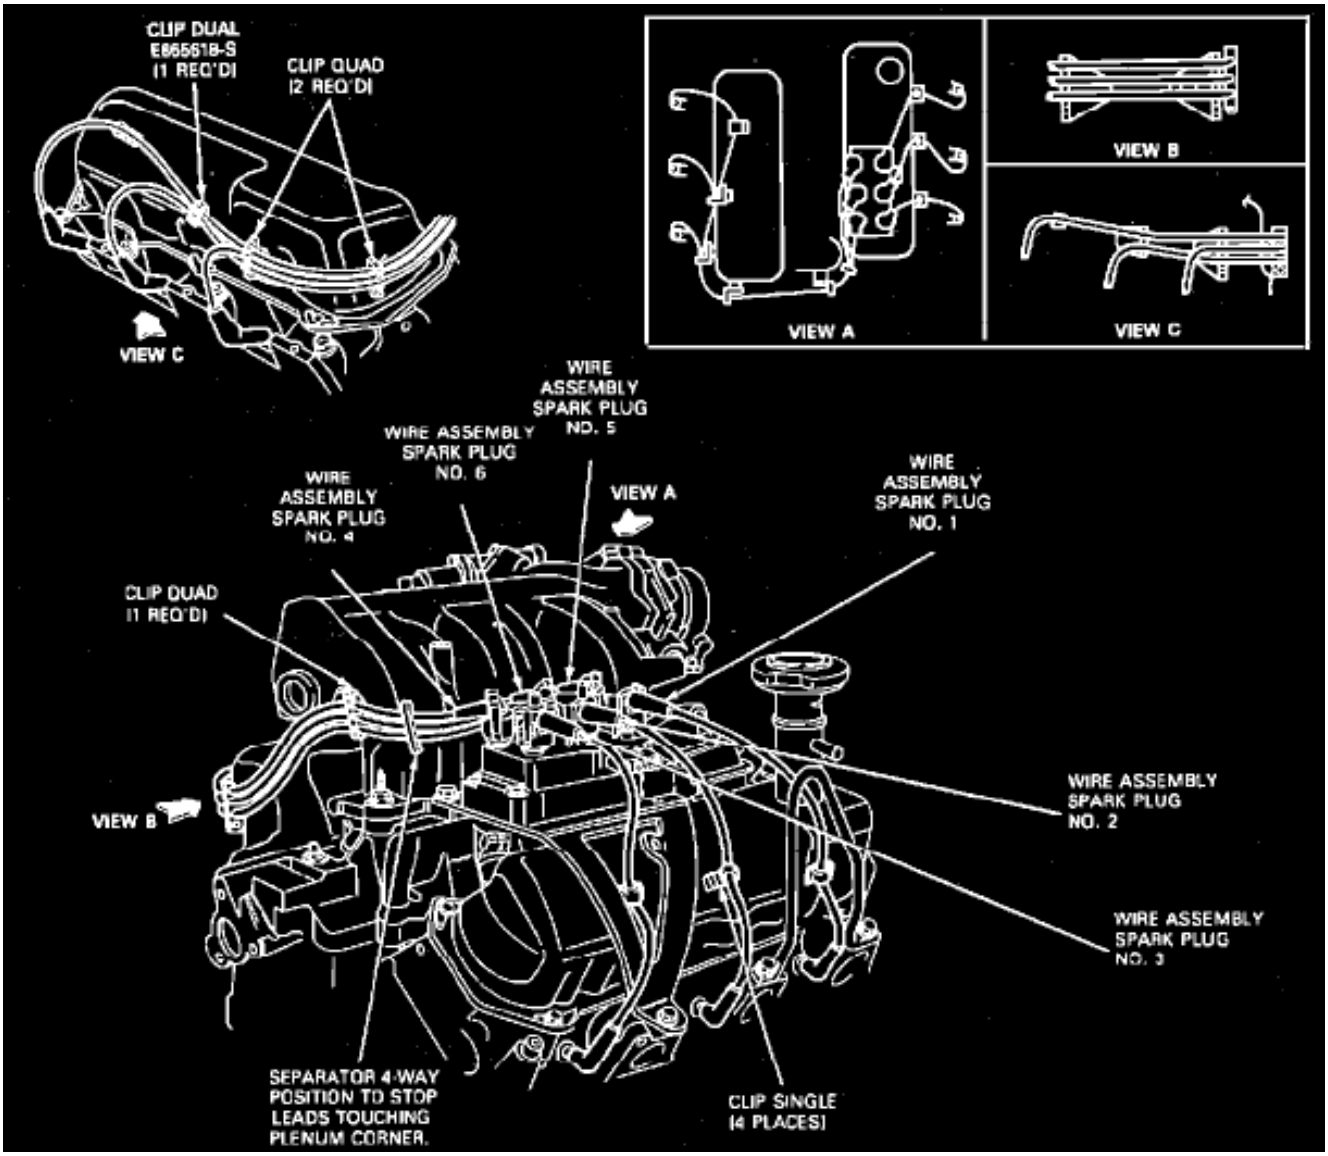
Ignition Timing Connector: Description and Operation

In-line Connector With Shorting Bar

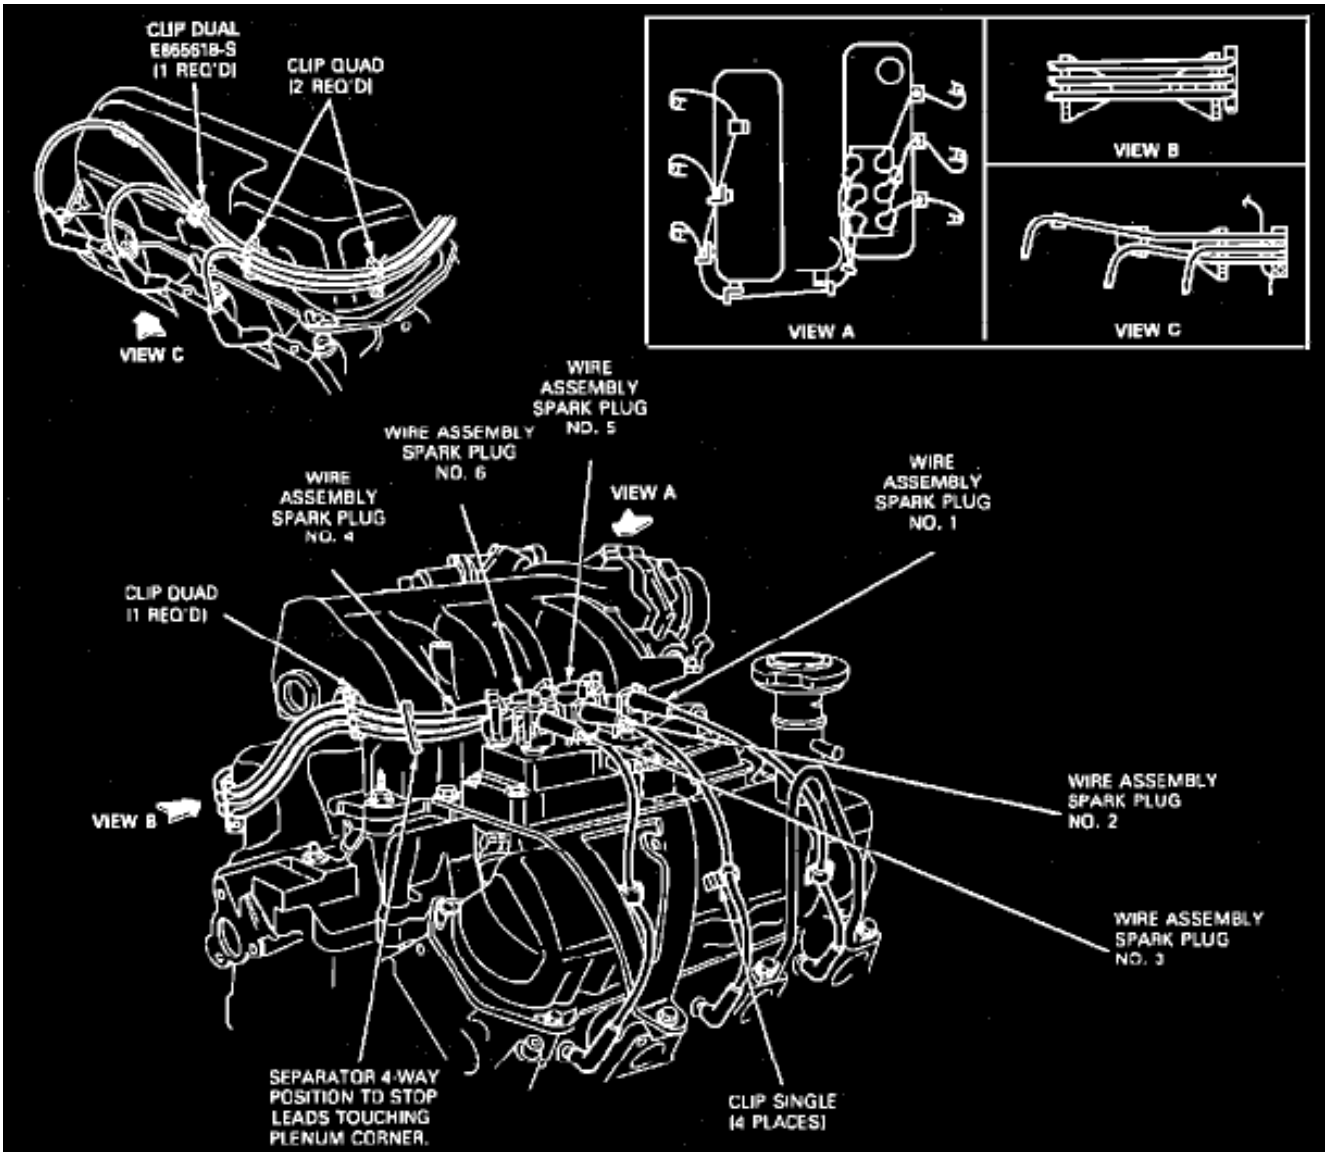
The octane adjustment switch is used to retard the ignition timing three to four degrees. When the switch jumper is INSTALLED, the timing is normal. With the jumper REMOVED, the timing is retarded. This is done to allow for optimum spark advance for effective combustion of the air/fuel mixture.



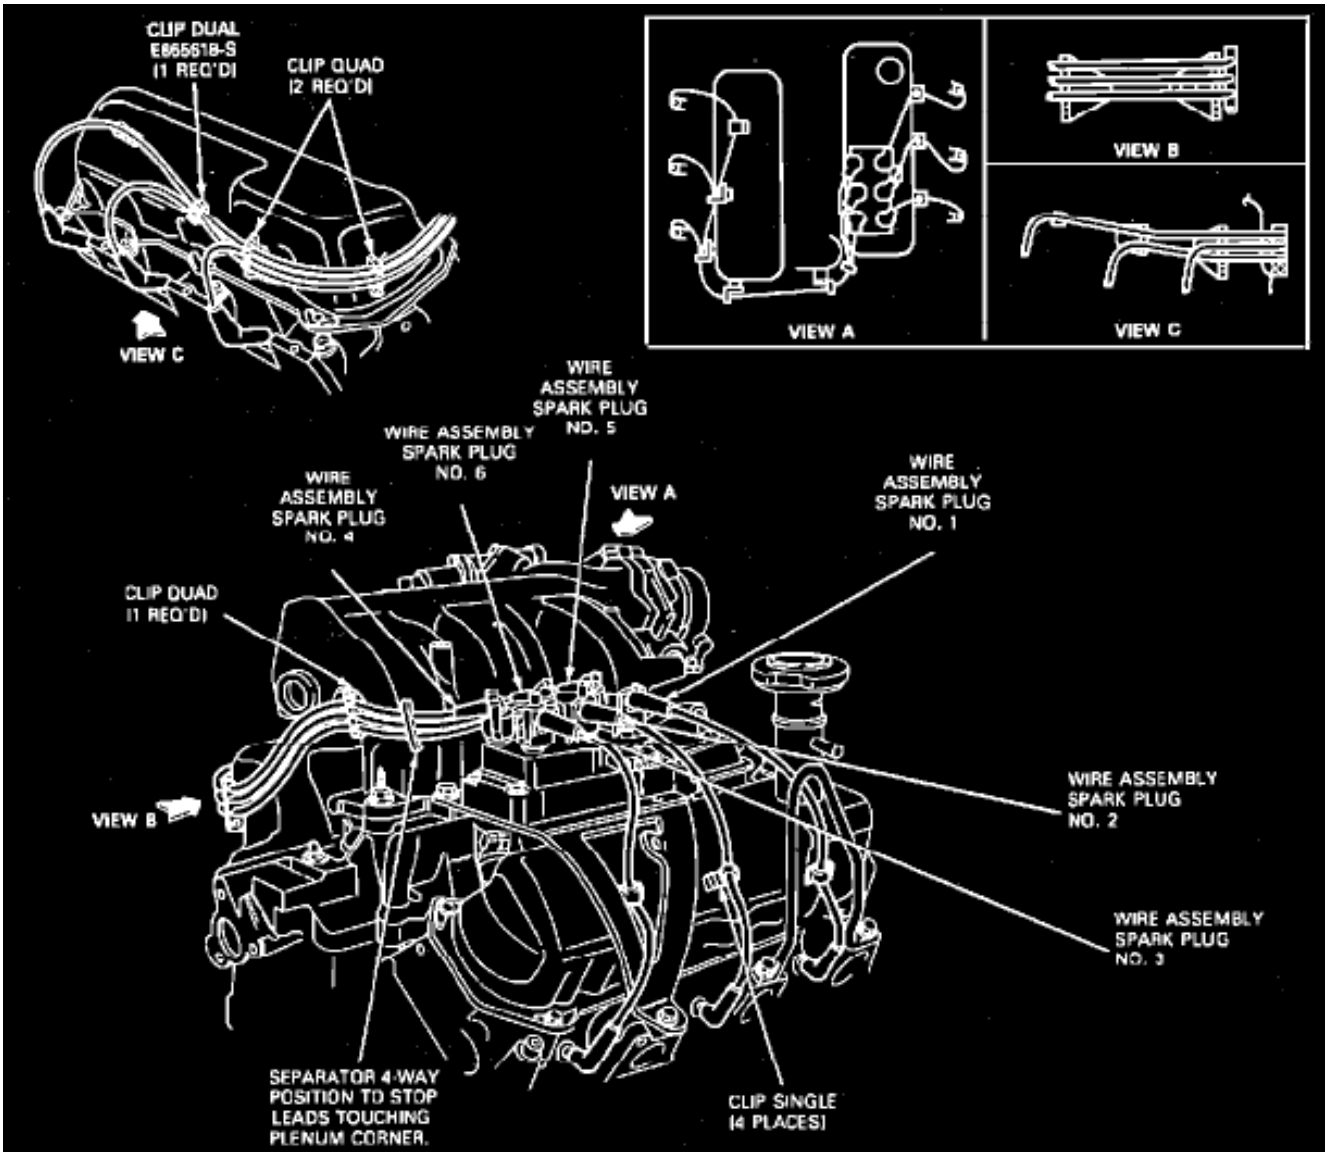
Timing Marks



Spark Plug Wire Assembly



Spark Plug Wire Assembly



Ignition Cable: Service and Repair

Spark Plug Wire Assembly

Removal:

1. When removing spark plug wires from the spark plugs, use the spark plug wire remover T74P-6666-A or equivalent. Grasp and twist the boot back and forth on the plug insulator to free the boot.

2. Use the special tool or equivalent to pull the boot from the plug. Do not pull on the wire directly, as it may become separated from the connector inside the boot.

3. To remove the wires from the coil pack, squeeze the locking tabs of the coil wire retainer and remove using a twisting and pulling motion. Do not pull on the wire.

INSTALLATION:

CAUTION: Proper installation of spark plug wires is critical to vehicle operation. If one spark plug wire is not properly installed on the spark plug or ignition coil, both spark plugs connected to that coil may not fire under load.

1. Whenever a high tension wire is removed for any reason from a spark plug or ignition coil, or a new high tension wire is installed, Silicone Dielectric Compound D7AZ-19A331-A or equivalent must be applied to the boot prior to installation. Using a small tool, coat the entire interior surface of the boot.

2. Install each wire on the proper ignition coil terminal. The terminal cylinder numbers are identified on the ignition coil pack. Ensure that both coil boot retainer locking tabs have engaged.

3. Remove the wire retaining brackets from the old wiring set and install the brackets on the new wires in the same position. Install the wires and retaining brackets on the engine.

4. Connect the wires to the proper Spark plugs.

Spark Plug: Customer Interest Engine - Loss of Power At High Engine Speeds

Article No. 92-3-8

01/29/92

LOSS OF POWER - 4.0L - AT HIGH ENGINE SPEEDS BETWEEN 3800 AND 4700 RPM - CANADIAN VEHICLES

LIGHT TRUCK: 1990-92 RANGER 1991-92 EXPLORER

ISSUE: A loss of power may occur at engine speeds between 3800 and 4700 RPM under wide open throttle. After several months use, this can be caused by an interaction between MMT (octane enhancer additive in Canadian fuel) contaminated spark plugs and the EDIS (Electronic Distributorless Ignition System) module. A check engine light concern may be present with Self-Test Codes 18 (212 three digit code) and 45 in continuous memory.

ACTION: If service is required, confirm the concern and, if necessary, replace the EDIS module and spark plugs. Refer to the following procedure for service details.

1. Confirm the customer concern by accelerating the vehicle at wide open throttle from 3000 RPM to 4700 RPM with the transmission in second gear.

^ If the vehicle exhibits a loss of power (caused by fuel shutoff of one of the fuel banks) in this RPM range, follow Steps 2 and 3.

^ Otherwise, follow the Powertrain Control/Emissions Diagnosis Manual's diagnostic procedures.

NOTE:

FUEL SHUTOFF (REV. LIMITER) AT 4850 RPM FOR AUTOMATICS AND 5200 RPM FOR MANUAL TRANSMISSIONS IS NORMAL AND SHOULD NOT BE CONFUSED WITH THIS CONCERN.

2. Replace all the spark plugs.

3. Replace the EDIS module (F1TZ-12KO72-B).

NOTE:

THIS MODULE WILL ELIMINATE THE PREMATURE FUEL SHUTOFF CONCERN. THE RED DEPOSITS ON THE SPARK PLUGS WILL STILL OCCUR AFTER TIME. THIS IS CONSIDERED NORMAL FOR THIS TYPE OF FUEL.

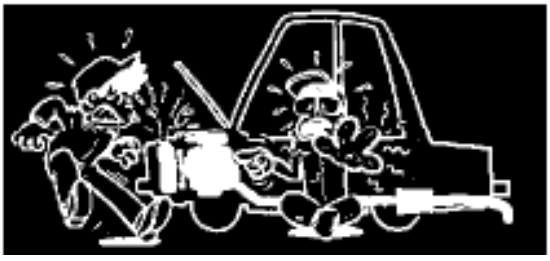
THIS DRAWING IS MEANT TO ILLUSTRATE A
PRINCIPLE AND MAY NOT MATCH THE WATER
PUMP ON THIS VEHICLE.



Water Pump: Testing and Inspection Verifying Water Pump Problem

VERIFYING WATER PUMP PROBLEM

Check for Loose Water Pump Pulley

As the pump shaft seals and bearings wear with age the pulley/shaft may develop a wobble or lateral runout.

- With the engine off and the key removed from the ignition, attempt to move the pulley from side to side and back and forth. There should be no detectable movement. The pulley should turn smoothly, with no rough spots.

- The water pump should be replaced if any pulley wobble is detected. If the water pump is not replaced the pump shaft may eventually seize or break.

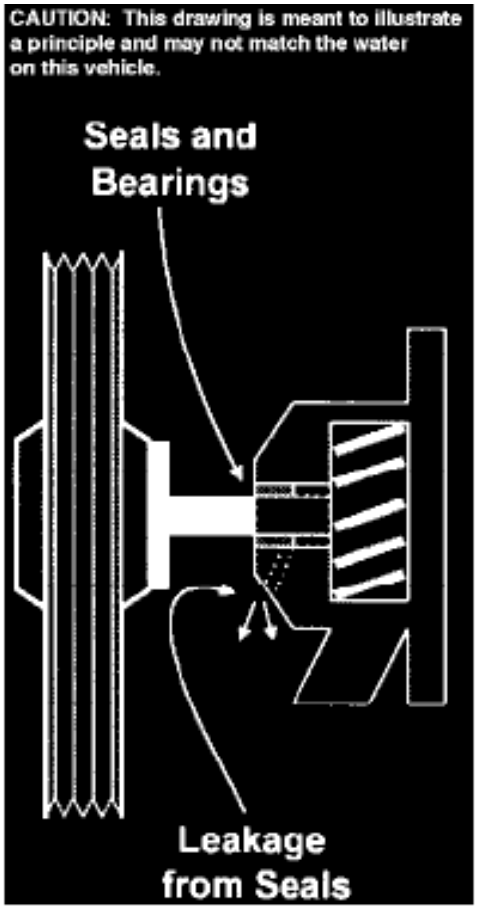
NOTE: Incorrect belt tension (too tight) may cause premature wear of the bearings and seals.

WARNING: Never remove a radiator cap while the engine is hot. Severe personal injury may result.

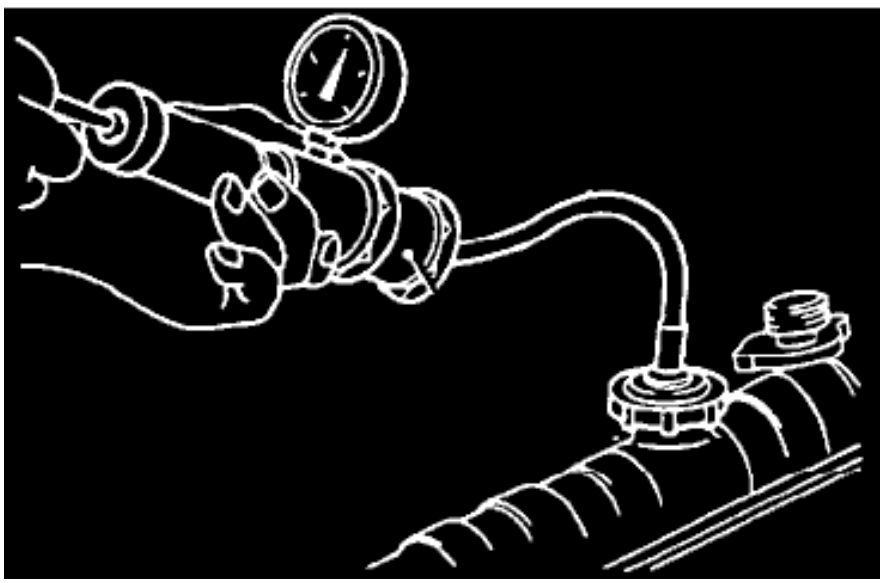
Inspect for Leakage

1. With the engine "OFF" and cold:

- Check coolant level and refill if necessary.



CAUTION: This drawing is meant to illustrate a principle and may not match the water on this vehicle.
Seals and Bearings
Leakage from Seals



- Inspect the water pump for leakage. Closely check the following areas: -

Inspection (weep) hole.

- Pump shaft.

- Gasket.

2. Pressurize the cooling system with a pressure tester and again check for leaks. Do not exceed the rated pressure of the radiator cap.

NOTE: If any leaks are found, verify that they are not originating from a component near or above the water pump (i.e. thermostat, loose radiator hoses, intake gasket, engine coolant temperature sensor)

CAUTION: When finished, immediately re-install the radiator cap.

3. If no leaks are found, start and warm the engine until the thermostat opens. Stop the engine and check for fresh leakage around the water pump

shaft.

NOTE: Occasionally water pumps will only leak around the shaft seals while the shaft is rotating.

Water Pump: Testing and Inspection After Repairs Operational Check

COOLING SYSTEM OPERATIONAL CHECK

IMPORTANT: Always verify the operation of the thermostat and cooling fan prior to driving the vehicle after a cooling system repair.

HOW

- With the cooling system filled with coolant and the radiator cap installed, start the engine and allow the coolant to warm up.

- The upper radiator hose should remain cool to the touch until the coolant within the engine block and head has reached the thermostat opening temperature.

-

The thermostat opening should be indicated by a rapid warm up of the upper radiator hose.

- If upper hose gradually warms up, the thermostat may be stuck open (assuming the engine is started cold)

- If the coolant temperature reaches the normal operating temperature (as indicated by the temperature gauge) before the upper hose becomes warm, the engine should be turned off, and the cooling system allowed to cool down. The thermostat may be stuck closed and should be removed and tested.

WARNING: Never remove a radiator cap while the engine is hot. Severe personal injury may result.

- After the cooling system has warmed up, turn off the engine, and verify the cooling fan clutch has engaged. -

The clutch should offer resistance when attempting to rotate the fan by hand.

- When the engine is cold the fan should spin freely on the clutch.

WHY

Thermostat Closed, Cold Engine - With the thermostat closed, coolant flow through the radiator is blocked forcing the coolant to re-circulate through the block and head. This allows for a rapid warm up. During this time there should be little or no coolant flow through the upper radiator hose.

Thermostat Open, Warm Engine - Once the coolant has reached normal operating temperature, the thermostat begins to open, allowing coolant flow through the upper hose and into the radiator. The thermostat will continue to regulate the amount of coolant flow to the radiator to maintain a "Minimum" operating temperature.

Water Pump: Testing and Inspection After Repairs Leak Check

AFTER REPAIRS LEAK CHECK

PURPOSE

Initially fill the cooling system and check for leaks prior to starting the engine and bleeding the system. Although the system will not be completely full, any leaks which are detected may be fixed before the engine and cooling system are hot.

NOTE: It is much easier to repair a leak on a cold engine than on a hot engine.

HOW

- Fill the cooling system until the radiator is full.

- Apply pressure to the system with a pressure tester.

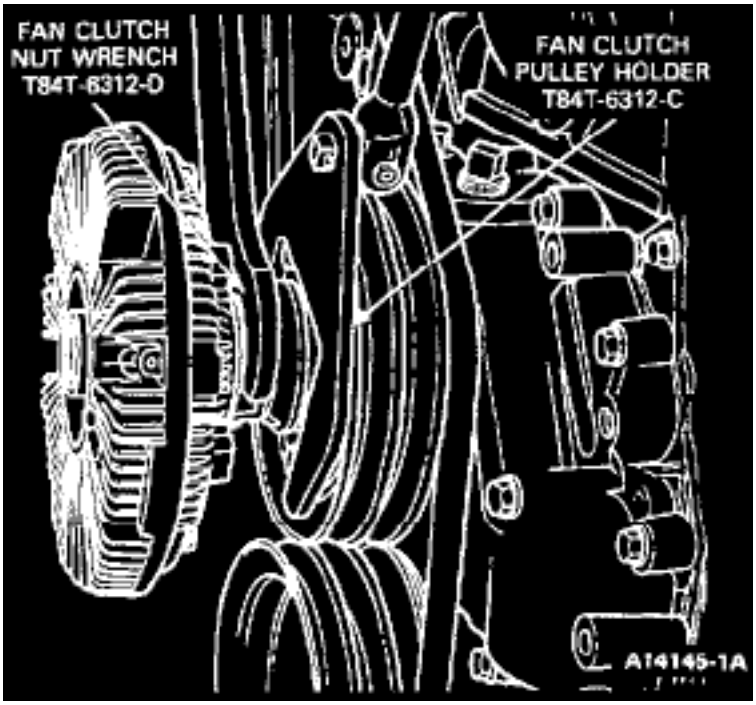
- Carefully check for leaks around: -

All hoses and clamps.

- Water pump sealing surfaces.

- Any cooling system component which was removed or replaced.

- If no leaks are detected continue with the fill and bleed procedure.



Water Pump: Service and Repair Removal

REMOVAL

1. Drain the coolant. Detach the radiator lower hose and the heater return hose from the water pump.

Fan Clutch Tools

2. Remove fan and clutch assembly using Fan Clutch Pulley Holder T84T-6312-C and Fan Clutch Nut Wrench T84T-6312-D or equivalents. 3. Loosen the alternator mounting bolts and remove the belt. Vehicles with A/C, remove alternator and bracket. 4. Remove the water pump pulley. 5. Remove the water pump assembly attaching bolts and remove water pump assembly.

Water Pump: Service and Repair Installation

INSTALLATION

1. Remove all gasket material from the sealing surfaces on front cover and water pump assembly. Apply sealer to both sides of the new gasket and

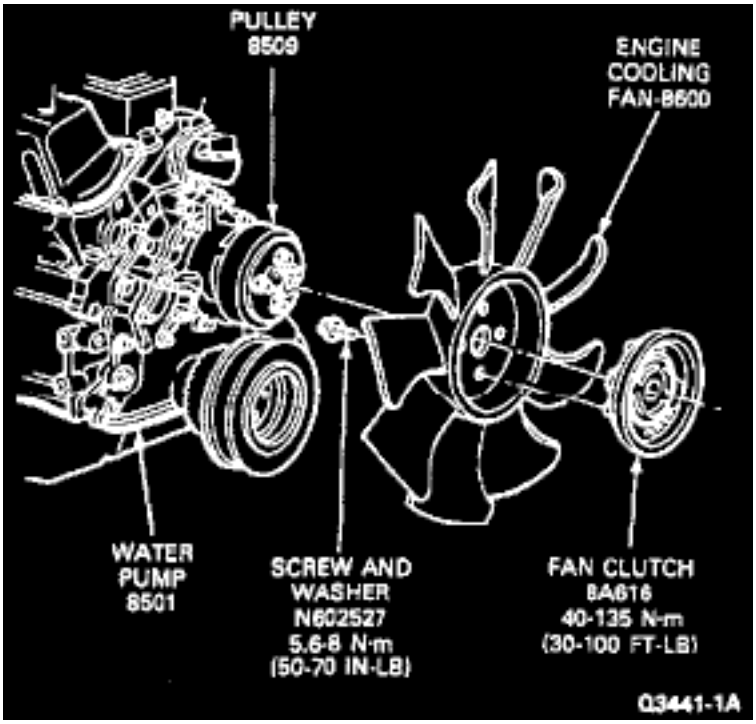
place the gasket on the water pump.

2. Position the water pump assembly to the front cover with two bolts finger-tight. Tighten all water pump assembly attaching bolts to 8.5-12 Nm

(6-9 ft lb).

Drive Belt Routing

3. Install water pump pulley. Tighten bolts to 24-30 Nm (18-23 ft lb). With A/C, install bracket and alternator. Install belt and adjust tension. 4. Connect both hoses to water pump and tighten hose clamps. Fill and bleed cooling system.



Fan And Clutch

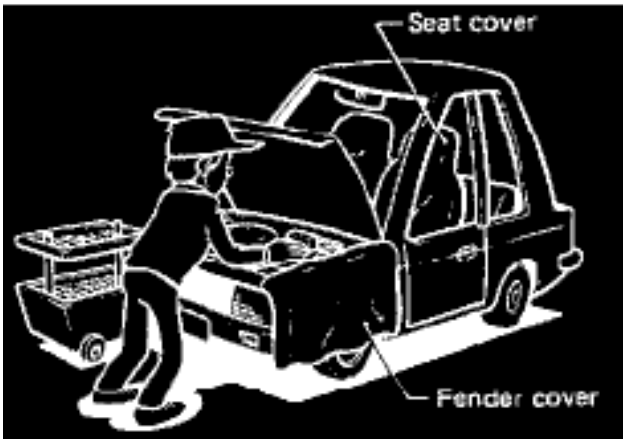
5. Install fan and clutch assembly using Fan Clutch Pulley Holder T84T-6312-C and Fan Clutch Nut Wrench T84T-6312-D or equivalents. Tighten

to 40-135 Nm (30-100 ft lb).

6. Start the engine and check for leaks.

T84T-6312-C

T84T-6312-D



Seat cover
Fender cover

Water Pump: Tools and Equipment

RECOMMENDED TOOLS

Fan Clutch Holding Tool

Fan Clutch Wrench

- Fan clutch wrenches, necessary for removing fan clutch: -

Clutch Holding Tool, T84T-6312-C

- Fan Clutch Nut Wrench, T84T-6312-D

- Drip pan - For draining coolant.

- Gasket scraper.

-

Torque Wrenches: -

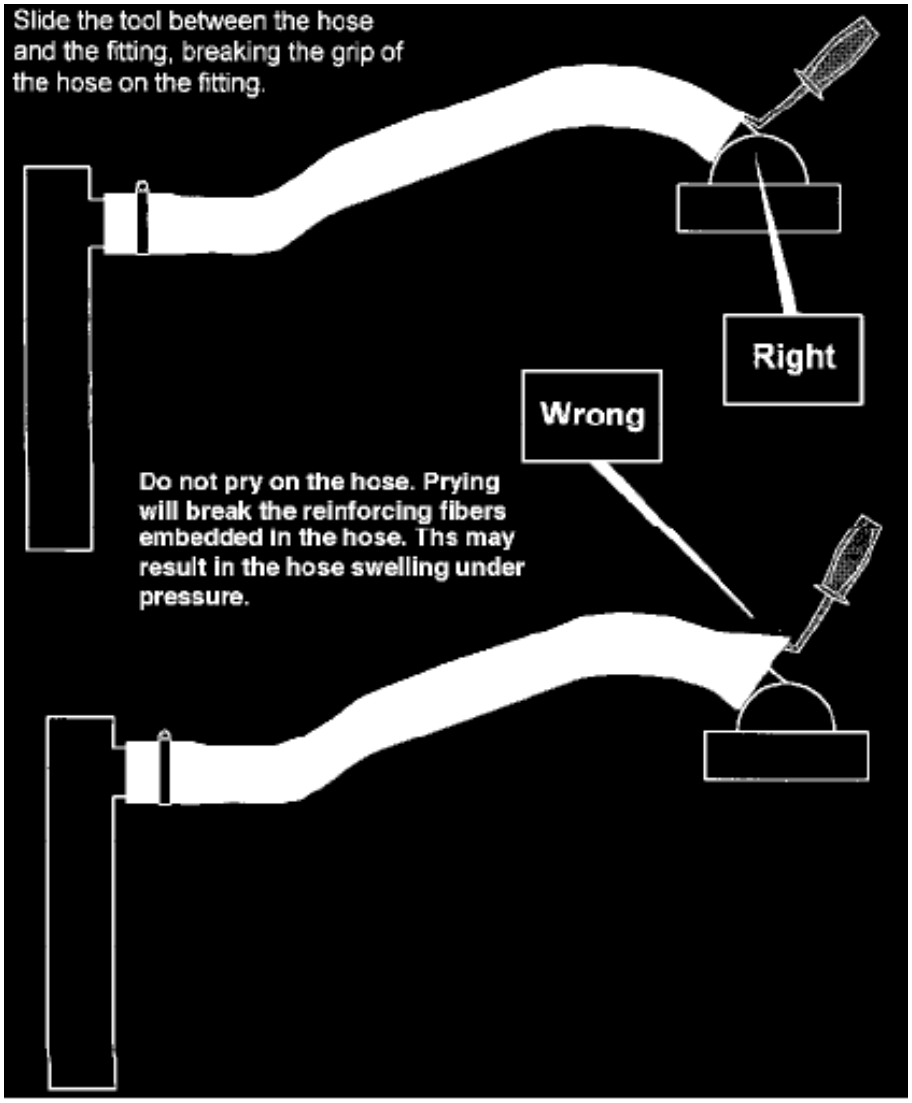
Low Range (0-50 ft-lb) for covers and brackets.

- High Range (0-150 ft-lb) for fan clutch.

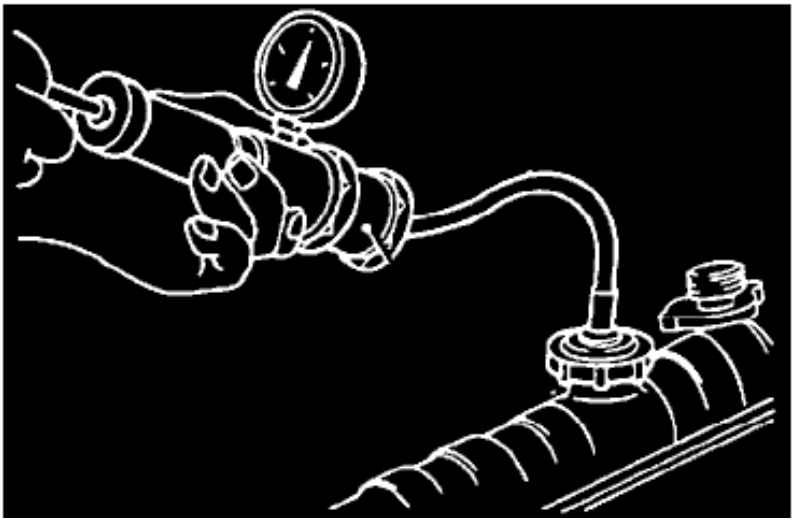
- Full set of Metric sockets and wrenches.

- Fender covers.

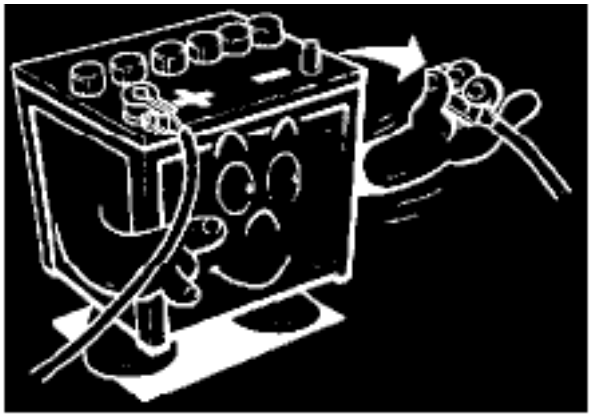
OPTIONAL

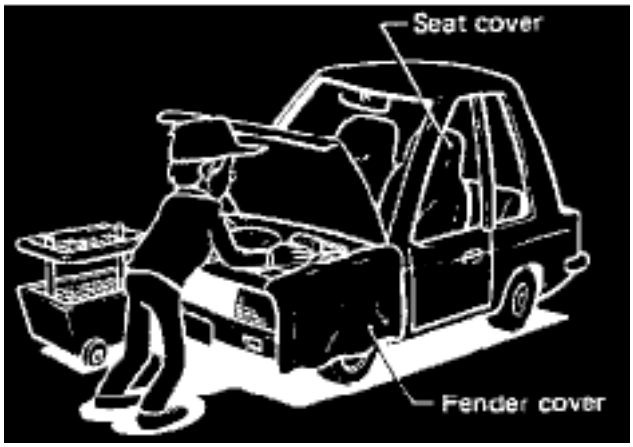


Slide the tool between the hose and the fitting, breaking the grip of the hose on the fitting.
Right
Wrong
Do not pry on the hose. Prying will break the reinforcing fibers embedded in the hose. Ths may result in the hose swelling under pressure.



- Radiator hose removal tool.
- Cooling system pressure tester.





Water Pump: Fundamentals and Basics Initial Preparations

INITIAL PREPARATIONS

Disconnect Battery

When working near or around the cooling fan or drive belts, accidentally engaging the starter or cooling fan can result in serious personal injury.

The negative battery terminal should be disconnected prior to commencing work and should not be reconnected until after the water pump is installed and the engine is ready to restart.

Fender Covers

Fender covers will prevent damage to the vehicles finish while performing the job.

NOTE: A fender cover folded over the radiator will prevent accidental damage to the radiator. The radiator can be easily damaged should a wrench slip off of a bolt while working on the water pump.

Coolant Drip Pan

Pre-position a drip pan under the vehicle to prevent any incidental spills.

Water Pump: Fundamentals and Basics Gasket Removal and Inspection

REMOVAL

- Remove all traces of the old gasket material. It only takes a very small amount of left over material to cause the new gasket to leak.

- Never reuse gaskets. After a gasket has been initially installed and removed it will no longer be able to compensate for the varying expansion rates of the water pump and block. An old gasket may seal initially but as the engine heats up cools down, the old gasket will be prone to leakage.

- When removing the gasket with a gasket scraper, be very careful not to gouge the sealing surface. Very small scratches in the sealing surface are likely to leak.

HINT: Always sharpen your gasket scraper prior to starting a job. A dull scraper is more likely to slip and gouge the sealing surface.

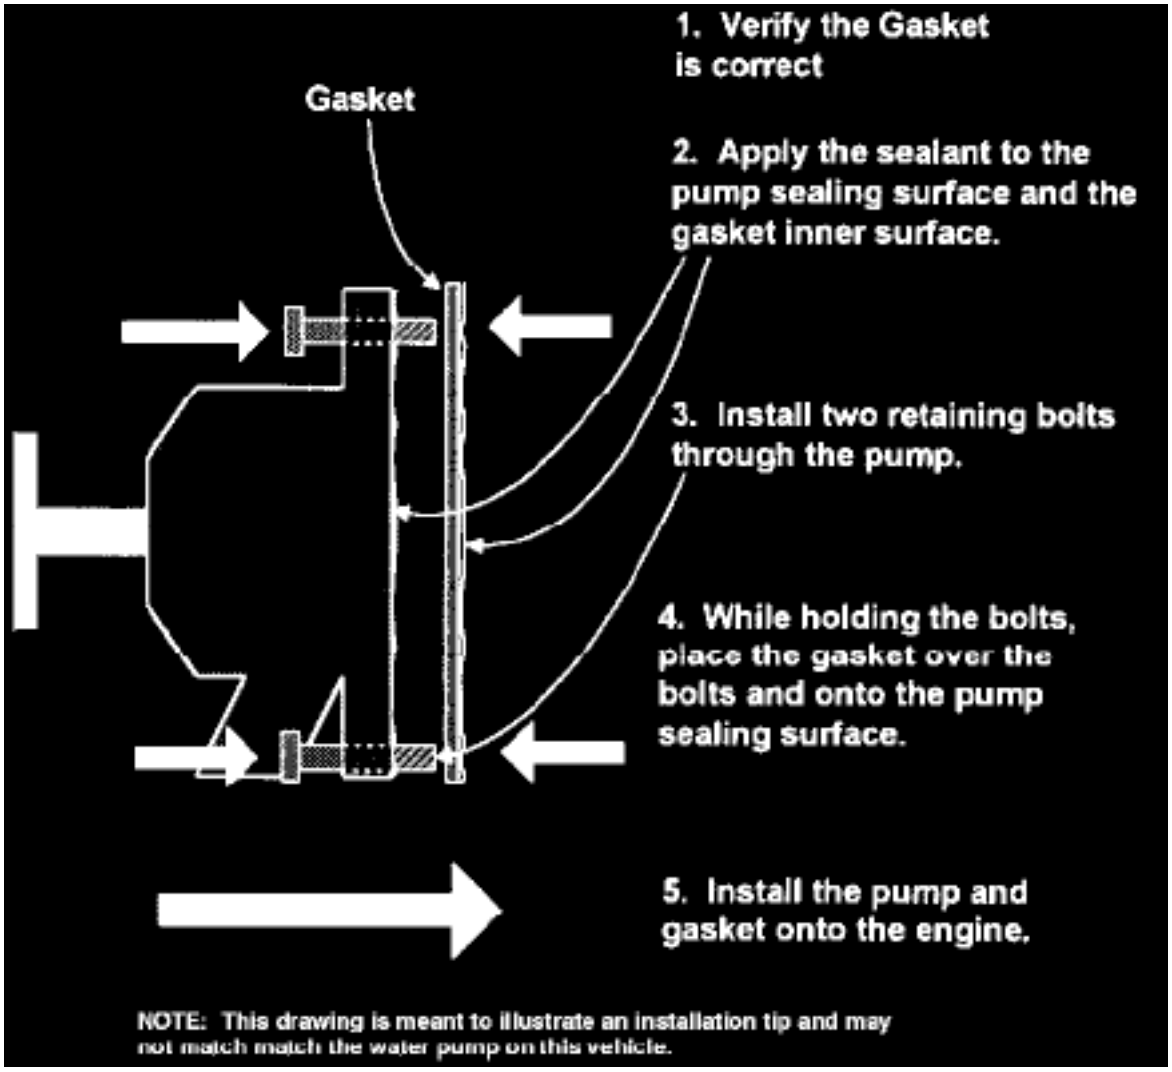
- If you are using a buffing wheel to clean the gasket surface, be very careful not to burn the surface.

CAUTION: Buffing wheels can rapidly remove metal from the sealing surface, be very careful and check your work frequently.

INSPECTION

- Verify the timing cover has not been damaged by the impeller. If a worn out water pump (shaft wobbles) is operated over a length of time the impeller (which also wobbles inside the pump) may wear into the timing cover. If the timing cover shows any signs of wear it should be replace.

- Verify the gasket sealing surfaces are free of all gasket material, dirt, gouges, and contaminants (such as coolant or oil).



Water Pump: Fundamentals and Basics Installation Tips and Hints

WATER PUMP INSTALLATION NOTES

- Compare the old pump to the new pump and verify: -

Shaft lengths match exactly.

- Retaining bolt holes match exactly.

-

Install the fan retaining studs into the shaft flange prior to installing the pump. The studs are much easier to install with the pump out of the vehicle.

- Prior to applying the sealant to the gasket and pump, practice installing the pump to the engine. If any problems are encountered they will be easier to solve without the silicone applied.

- Verify the retaining bolts and bolt holes have clean threads. Re-tap or chase the threads as necessary.

-

To simplify the gasket installation process and minimize errors, install the gasket as follows:

1. Verify the gasket is correct. 2. Apply the sealant to the pump sealing surface and the gasket inner surface. Apply only a light film of sealant to the sealing surfaces.

CAUTION: Excess sealant will squeeze out on the inside of the pump and may block the radiator or heater core coolant passages.

3. Install two retaining bolts through the pump.

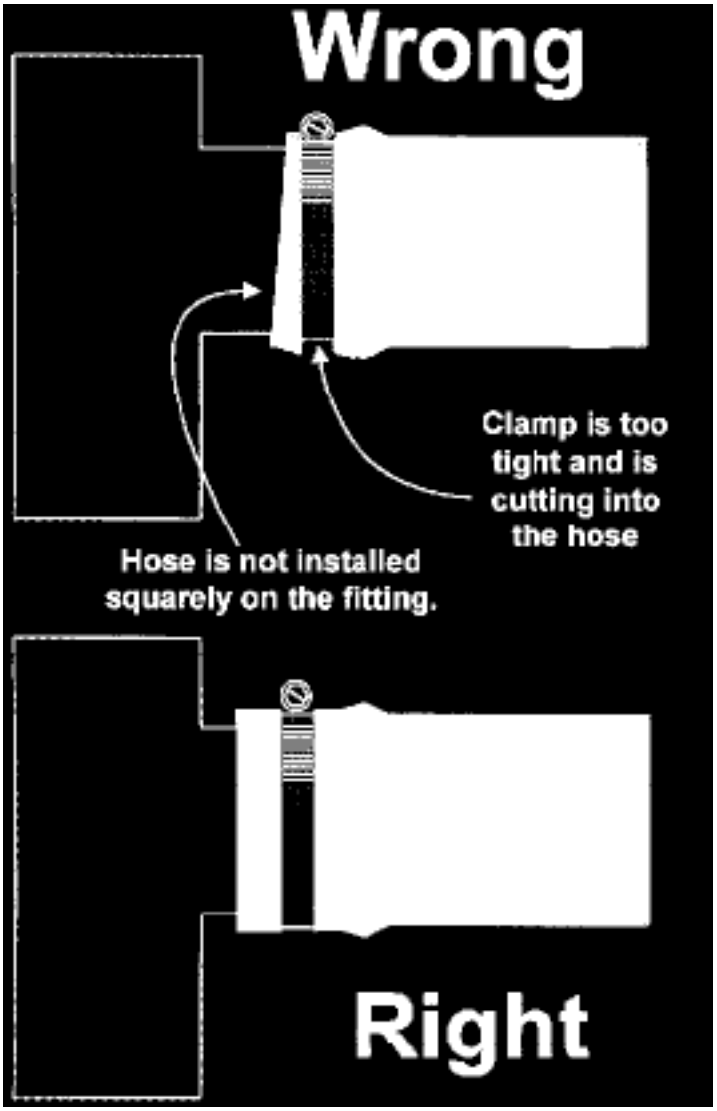
NOTE: This will help maintain the correct alignment of gasket in the next step.

4. While holding the bolts, place the gasket over the bolts and onto the pump sealing surface. 5. Install the pump and gasket onto the engine.

-

Do not over tighten the retaining bolts, use a torque wrench to properly tighten the bolts to the correct specification.

CAUTION: Water pump retaining bolts may be easily broken or stripped, do not tighten the retaining bolts with an air wrench or impact gun.



- When tightening hose clamps: -

Position the hose squarely on the fitting.

- Verify the hose clamp is clear of the retaining rim on the fitting. Do not over tighten the clamps.

- While working on the cooling system it is a good habit to clean the radiator and A/C condenser fins of bugs and dirt. This build up of debris can seriously reduce the cooling ability of the system.

Water Pump: Fundamentals and Basics Recommended Parts

RECOMMENDED PARTS

- New water pump and gasket.

- RTV sealant (for sealing water pump gasket).

- Engine Coolant: See: Cooling System/Specifications/Capacity Specifications

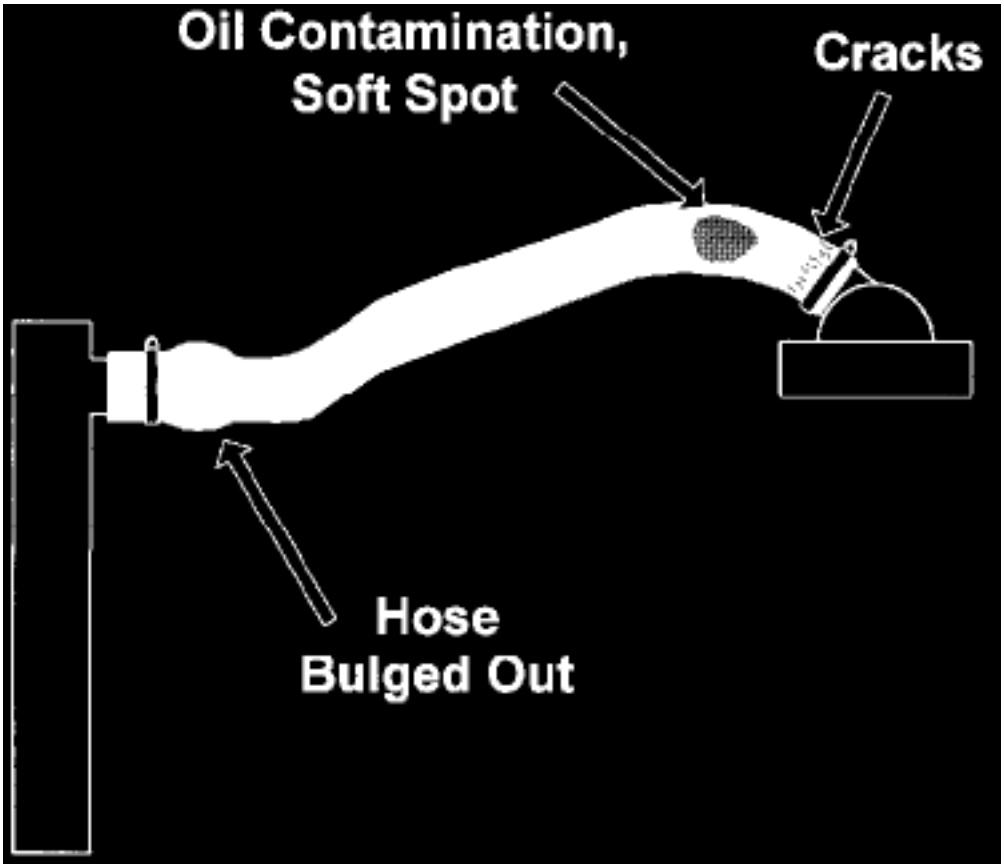
NOTE: For optimum performance, use 50/50 mixture of high quality ethylene glycol coolant and water.

OPTIONAL, PENDING INSPECTION

- Radiator hoses.

- Drive belts.

- Hose clamps.



Water Pump: Fundamentals and Basics Removal Tips and Hints

WATER PUMP REMOVAL TIPS AND HINTS

FROZEN AND BROKEN BOLTS

Frozen and broken bolts are often a major problem when removing water pumps. Coolant can seep into the bolt holes resulting in corrosion and frozen bolts. Prior to starting the job, spray all water pump retaining bolts with a penetrating oil.

Upon removal, any bolt or nut which shows signs of corrosion should be replaced. The threads of the associated bolt hole should be re-tapped or chased.

COOLANT HOSES

Inspect the hoses for the following: -

Cracks, especially near the hose clamps.

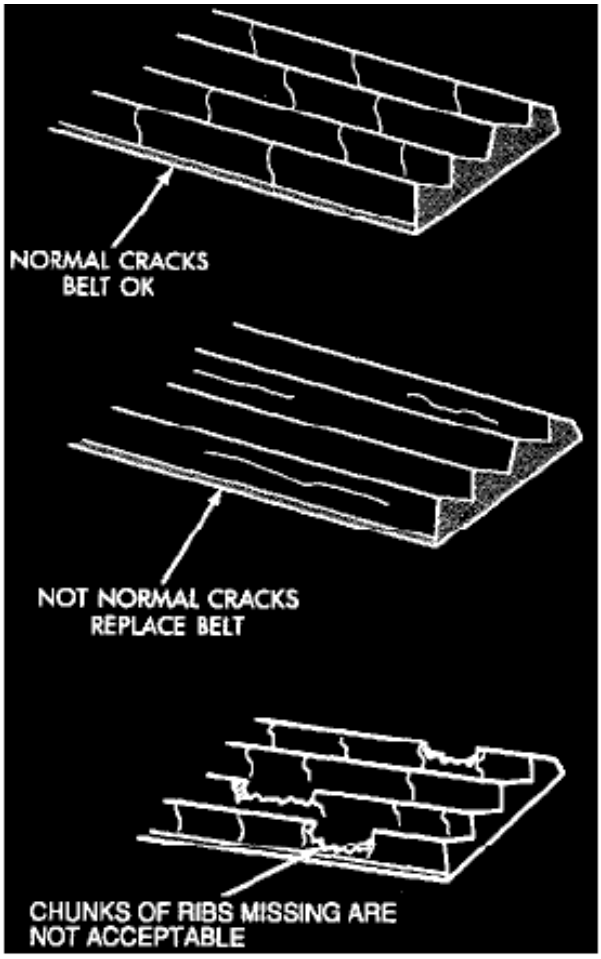
- Swelling, look for areas of the hose that appear unnaturally bulged outwards.

NOTE: This is often caused by improper removal techniques.

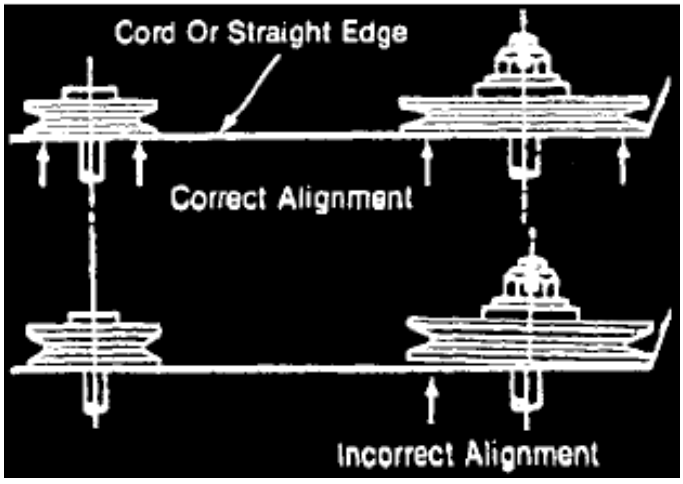
- Oil contamination and soft spots - Oil contamination breaks down the structure of the rubber and significantly weakens the hose.

NOTE: The oil leak should be fixed prior to replacing the hose.

- Hard or brittle hoses, as the hoses age the rubber looses its resiliency and becomes brittle. The hoses need to be able to flex to compensate for the movement of the engine.



NORMAL CRACKS
BELT OK
NOT NORMAL CRACKS
REPLACE BELT
CHUNKS OF RIBS MISSING ARE
NOT ACCEPTABLE



Cord Or Straight Edge
Correct Alignment
Incorrect Alignment

DRIVE BELTS

- Small cracks that run across that run across the ribbed surface of the belt from rib to rib , are considered normal, These are not reasons to replace the belt.

- If chunks of belt material are missing between the cracks, the belt should be replaced.

- Cracks running along the rib (not across) are not normal. Any belts with cracks running along the rib should be replaced.

- Replace the belt if it has excessive wear, frayed cords or severe glazing.

Drive Pulleys

- Verify the pulleys have no side to side wobble, and rotate freely. Replace if necessary.

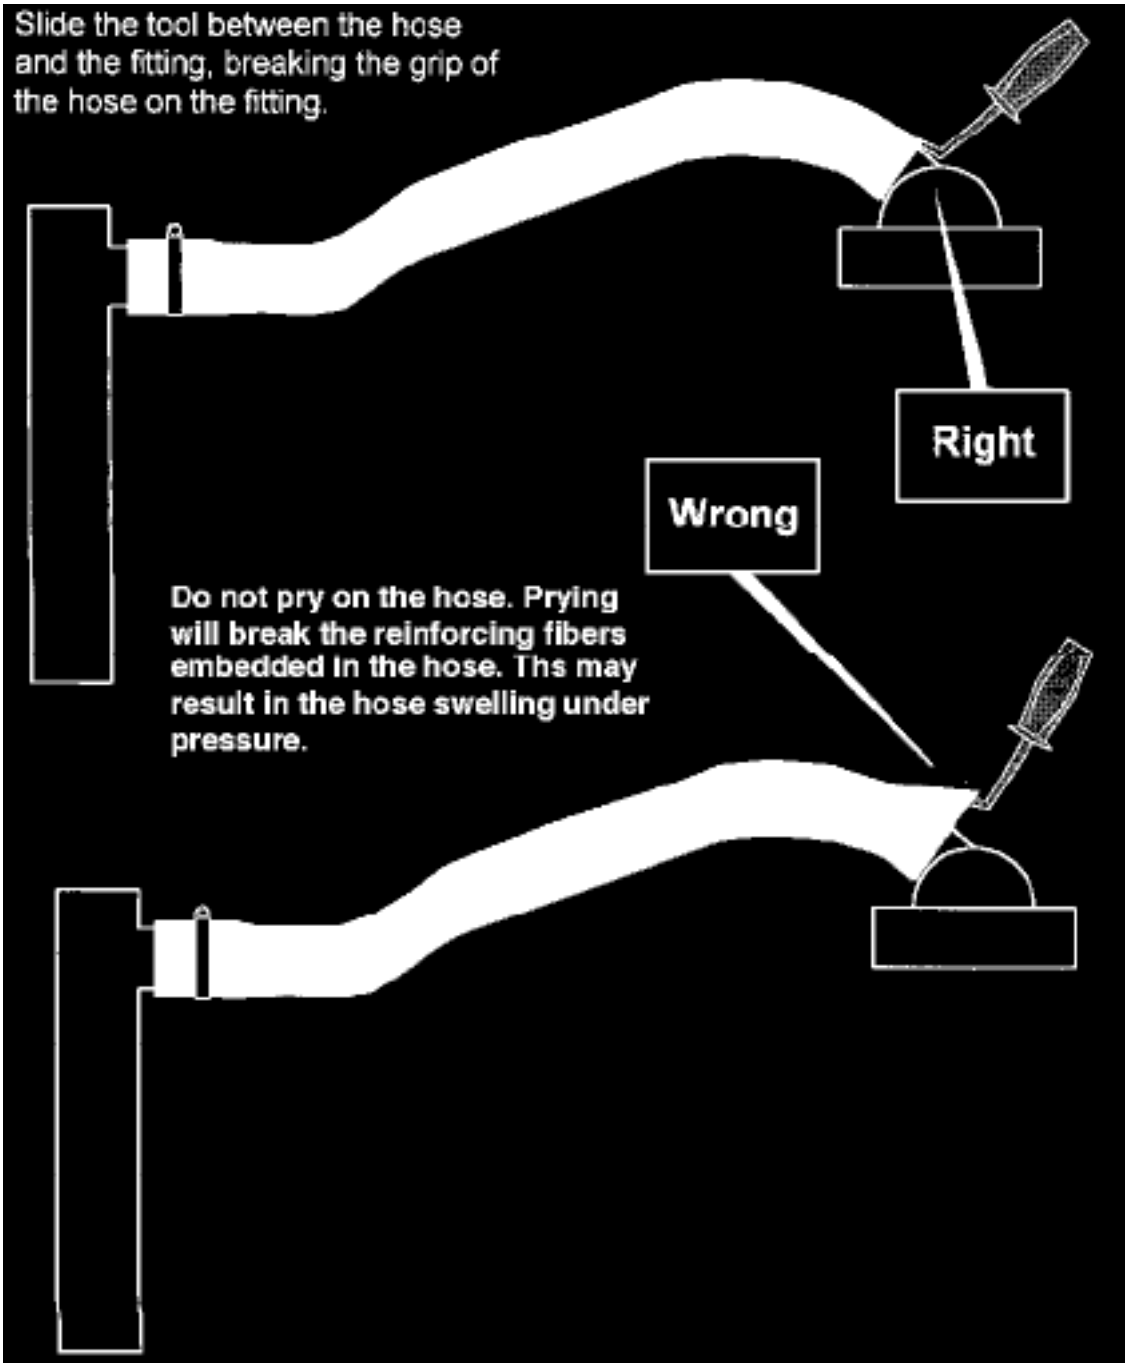
- Verify the pulleys are properly aligned. Adjust or replace as necessary.

Belt Removal

Do not attempt to bump the drive belts off with the starter. This practice can damage the belt, pulley, and technician. Removing the belt by relaxing the tension will allow you to correctly adjust the tension when installing the belt.

DRIP PAN

Prior to removing any hose or the water pump, place a large drip pan under the engine. Although the coolant may be drained from the radiator, there is still a large amount of residual coolant trapped in the hoses and water pump.



HOSE REMOVAL

- Prior to pulling the hose from the fitting, rotate/twist the hose on the fitting to break the grip of any corrosion present.

- If the hose is to be replaced, it may be quicker to cut hose from the fitting.

CAUTION: When cutting the hose be careful not to damage the fitting.

- A radiator hose removal tool may help free up stubborn hoses.

CAUTION: -

Do not use any device to pry the hose off of the fitting.

- If at any time a tearing or ripping sound is heard (though the hose appears fine) the hose should be replaced. The sound is coming from the internal reinforcing fibers embedded in the hose. Once the fibers have been broken the hose will be subject to swelling and rupture when pressure is applied.

WATER PUMP REMOVAL

After removing the retaining bolts the water pump may still be stuck to the engine. The original gasket sealant may cause the pump to firmly stick to engine. A few soft blows from a rubber mallet or block of wood will generally loosen the pump.

CAUTION: -

Verify that ALL of the retaining bolts are removed.

- Do not pry between the pump and the gasket. This may damage the pump sealing surface.

- Upon breaking the seal, a large amount of coolant trapped in the block will generally pour out from the water pump opening. Be sure to have a drip pan prepositioned.

MERKUR: 1989 SCORPIO, XR4TI

This article is being republished in its entirety to update the model year coverage.

ISSUE This TSB article describes Ford Motor Company's position on the use of propylene glycol-based engine coolants.

ACTION

Ford Motor Company does not recommend nor endorse the use of engine coolants made with propylene glycol in Ford vehicles. Ford Motor Company currently recommends the use of ethylene glycol-based engine coolants.

Published information suggests that engine coolants made with propylene glycol may provide engine cooling performance equivalent to engine coolants made with ethylene glycol. However, different brands of engine coolant provide varying corrosion protection for the cooling system. Ford does not have performance data for the multitude of engine coolants available in the aftermarket and therefore cannot recommend the use of any coolant except those sold by Ford Customer Service Division. Consult the vehicle's Owner's Guide to determine the appropriate Ford Customer Service Division coolant for the vehicle.

Furthermore, claims of toxicological and environmental advantages of propylene glycol over ethylene glycol may be misleading. When significant new information is developed, Ford will review this policy.

Ford Motor Company specifications recommend that vehicles be maintained using certain ethylene glycol-based engine coolants. Those specifications do not refer to engine coolants made with propylene glycol. Although the Ford New Vehicle Limited Warranty is not automatically voided upon the use of a coolant made with propylene glycol, if such use results in damage to the vehicle or its components, the cost of repairing the damage would not be covered by the Ford New Vehicle Limited Warranty.

This TSB is being republished in its entirety to include warranty information when using recycled coolant

ISSUE: Ford Motor Company authorizes the use of recycled engine coolant that, when properly processed and reinhibited, meets Ford specification ESE-M97B44-A. At this time, the Rotunda Coolant Recycler (181-00003) process is the only approved coolant recycling method available through Ford that is capable of producing recycled engine coolant that meets Ford specification ESE-M97B44-A.

ACTION: Refer to the following Service Procedure for coolant processing and reinhibiting using Rotunda Coolant Recycler (181-00003).

NOTE:

WHILE TESTING SHOWS THAT RECYCLED ENGINE COOLANT CAN PROVIDE ACCEPTABLE PERFORMANCE, THE COOLANT PRODUCED FROM ROTUNDA EQUIPMENT IS INTENDED FOR USE WITHIN DEALERSHIPS ON WARRANTY AND CUSTOMER PAY REPAIRS ONLY AND NOT INTENDED FOR RETAIL SALE. THERE ARE REGULATORY, PACKAGING AND LABELING CONCERNS

ASSOCIATED WITH THE RETAIL SALE OF CHEMICAL PRODUCTS.

CAUTION:

THE REINHIBITOR CHEMICALS PROVIDED WITH THIS EQUIPMENT ARE NOT APPROPRIATE FOR USE ON MEDIUM/HEAVY TRUCK APPLICATIONS.

WARNING:

ROTUNDA PREMIUM COOLANT REINHIBITORS # 1 AND # 2 HAVE BEEN SPECIFICALLY FORMULATED TO WORK WITH ROTUNDA COOLANT RECYCLER (181-00003).

USE OF ANY OTHER CHEMICAL ADDITIVES WITH THIS SYSTEM WILL VOID ALL WARRANTIES FOR THE EQUIPMENT AND FOR THE FINAL COOLANT PRODUCT.

SERVICE PROCEDURE

DIRECTIONS FOR PROCESSING USED ENGINE COOLANT WITH ROTUNDA COOLANT RECYCLER

1. Close the drain valve on the unit.

2. Open the fill valve.

3. Pour used engine coolant into the funnel on the side of the unit.

NOTE:

MAXIMUM CAPACITY 15 25 GALLONS (95 L).

4. Insert the outlet hoses of the recycler into clean, properly labeled containers. One (1) container is for the outlet process water and the other container is for distilled ethylene glycol.

5. Push the "ON" switch on the front to start the operation. The unit will process 1 gallon (3.8 L) per hour of operation and will automatically shut off when cycle is complete.

6. Add reinhibitor following the directions in this article.

7. Open the drain valve to drain the residue from the distillation vessel. Dispose of residue in accordance with all local. state and federal regulations.

ADDING REINHIBITOR CHEMICALS

1. Process the coolant according to the directions listed in this article

2. Thoroughly mix 4 fl oz (118 ml) of Reinhibitor # 1 to each gallon of distilled ethylene glycol.

3. Thoroughly mix 4 fl oz (118 ml) of Reinhibitor # 2 to each gallon of distilled ethylene glycol.

4. Mix well.

5. Check the pH level of the coolant. The pH level must be between 9 and 11.

6. Add enough water to the concentrated coolant to produce a 50/50 mixture of coolant and water.

NOTE:

THE CONCENTRATED COOLANT MUST BE MIXED WITH WATER TO MEET THE NECESSARY ENGINE FREEZE PROTECTION.

7. Check the coolant freeze point of the 50% coolant solution. Freeze point should be -34°F (-37°C).

Consult the Rotunda Coolant Recycler Manual for more detailed operating instructions. Call 1-800-ROTUNDA, 8 AM to 8 PM EST, for inquiries regarding the Rotunda Coolant Recycler and to order the Reinhibitor (187-R0001).

PART NUMBER PART NAME

Rotunda # 187-R0001 Rotunda Premium Coolant Reinhibitor

WARRANTY CLAIMS: Dealer can claim recycled engine coolant by Ford approved process via a warranty repair on an 1863 claim as follows:

Part Number: RECCOOL (not a valid part number, but it is recognized on an 1863 claim).

Quantity: Indicate the number of QUARTS of recycled coolant used.

Coolant: Technical Service Bulletins Cooling System - Proper Fluid Concentrations

Article No. 93-1-10

01/05/93

COOLING SYSTEM - PROPER FLUID CONCENTRATIONS

FORD: 1988 EXP 1988-93 CROWN VICTORIA, ESCORT, FESTIVA, MUSTANG, TAURUS, TEMPO, THUNDERBIRD 1989-93 PROBE

LINCOLN-MERCURY: 1988-89 TRACER 1988-92 MARK VII 1988-93 CONTINENTAL, COUGAR, GRAND MARQUIS, SABLE, TOPAZ, TOWN CAR 1991-93 CAPRI, TRACER 1993 MARK VIII

MERKUR: 1988-89 XR4TI 1988-90 SCORPIO

LIGHT TRUCK: 1988-90 BRONCO II 1988-93 AEROSTAR, BRONCO, ECONOLINE, F SUPER DUTY, F-150-350 SERIES, RANGER 1991-93 EXPLORER 1993 VILLAGER

ISSUE: It is important to confirm the coolant fluid concentration during any repair of a vehicle's cooling system. A 50/50 concentration of Ford cooling system fluid, or an equivalent solution meeting Ford specifications, and water is best for all normal operating conditions.

ACTION: Check the coolant fluid concentration and use a 50/50 solution concentration for optimum results.

CAUTION: IF THE CONCENTRATION IS ALLOWED TO VARY TO ANY LARGE EXTENT EITHER WAY, COOLING SYSTEM CONCERNS CAN RESULT. IF THE COOLING SYSTEM FLUID LEVEL IS BELOW THE 50/50 CONCENTRATION, OVERHEATING CAN OCCUR. CONCENTRATIONS ABOVE 50/50 CAN CONTRIBUTE TO EXCESSIVE AND EVEN PREMATURE FAILURE OF THE WATER PUMP (MORE IS NOT BETTER).

1. Obtain a balanced mixture ratio of 50/50 cooling system fluid to water. Premix the two fluids in a separate container by adding equal volumes of coolant and water.

2. Be aware that overfilling of the coolant system is just as bad as not maintaining the proper coolant concentration level. If the coolant system is overfilled, and the system is allowed to expand dropping the excess coolant past the expansion tank, many of the vital coolant additives will be lost out the overflow pipe. This reduces the protection to the engine.

3. Pour in only enough coolant as specified for the system, and top off as necessary.

NOTE: TOP OFF ONLY WITH A PREMIXED 50/50 SOLUTION.

4. Check the coolant concentration, once the coolant system has been properly filled, to be sure that it is truly within the allowed tolerance range.

a. Use only a hand held refractometer such as a Rotunda Optical Antifreeze/Battery Tester # 021-00046 or equivalent to verify results. The acceptable coolant/water concentration range is: Minimum (45/55); Maximum (60/40).

b. If the coolant system is found to be low on coolant, top off only from a premixed solution.

c. If a weak concentration is found, add straight coolant sparingly until concentration readings are within acceptable levels.

d. If too strong a concentration is found, remove a small volume of coolant, and add water sparingly until coolant readings again fall within the specified levels.

NOTE: MAKE SURE THE COOLANT IS THOROUGHLY MIXED BEFORE TAKING READINGS.

A cooling system is only as effective as the condition of the system coolant.

^ USE ONLY FORD COOLING SYSTEM FLUID OR AN EQUIVALENT SOLUTION MEETING FORD SPECIFICATIONS.

^ FOR ADDITIONAL INFORMATION, SEE THE APPROPRIATE VEHICLE SERVICE MANUAL OR OWNER GUIDE.

LIGHT TRUCK: 1991 EXPLORER, RANGER

ISSUE: High engine coolant temperature may be indicated by a full-scale reading on the instrument panel gauge or by engine coolant boiling during operation in high ambient temperatures. These conditions occur because the earlier production fan and clutches were unable to satisfactorily handle the extra load demands.

ACTION: Install new fan and clutch assemblies with improved cooling capacity characteristics. Refer to the 1991 Aerostar, Explorer, Ranger Shop Manual, Section 03-05, for service details.

NOTE: MAKE SURE THE VEHICLE WAS BUILT BETWEEN 9/9/90 AND 10/15/90.

Coolant Temperature Sensor/Switch (For Computer): Description and Operation

Engine Coolant Temperature Sensor

The Engine Coolant Temperature (ECT) sensor is threaded into a coolant passage with the sensing bulb extending into the coolant. The ECT sensor is a negative temperature coefficient sensor, meaning that as the temperature of the sensor increases, the resistance will decrease. As the resistance value changes, the signal sensed by the Engine Control Assembly (ECA) also changes. The ECA reads the varying sensor resistance and determines the engine operating temperature, using this information to optimize the air/fuel mixture and ignition timing. The ECT sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

ISSUE: Temperature Sender F1SZ-10884-A with a build date code prior to 2774 (277th day of 1994) should be purged from your inventory and returned to your facing PDC. These parts are being made obsolete because of an incorrect crimp during assembly. Installing these parts on a vehicle could result in early loss of temperature sender function.

ACTION: Remove and return the suspect parts from your dealership's inventory. The obsolete parts should be withdrawn from your inventory and returned to your facing PDC within 30 days of this TSB.

NOTE:

USE TSB ARTICLE 93-24-8 FOR DIAGNOSIS PROCEDURE IN DETERMINING IF LOW GAUGE READINGS COULD BE ASSOCIATED WITH A TEMPERATURE SENDER CONCERN.

1. Perform 100% sort of all stock on hand.

2. Suspect stock has a build date code prior to 2774. Usable stock will have a build date code of 2774 or later.

NOTE:

DATE CODES ARE LOCATED ON THE SIDE OF THE SENDER HEX.

3. Usable stock can be returned to your inventory and released for normal sales.

4. Return suspect part (F1SZ-10884-A) to your facing PDC using the least expensive transportation.

5. If claim is processed electronically via DOES II, use return code "GB"; otherwise, complete a separate paper claim form FPS-340 using return code "J".

6. In the Remarks Section, write "Returned per TSB 95-13-2".

LIMITS

^ The returns must be received within 30 days from the date of this TSB.

^ Returns are restricted to the subject parts.

^ The parts returned must have been purchased from FCSD in accordance with Policy and Procedure Bulletin 4000.

CREDIT

Credit for parts and prepaid freight costs will be issued.

Replacement stock is available for ordering

Heater Core: Service and Repair

Heater Core

REMOVAL

1. Drain cooling system. See: Service and Repair 2. Disconnect hoses from heater core. Plug hoses and core openings to prevent leakage of residual coolant. 3. Working inside the passenger compartment, remove screws attaching heater core access cover and remove the cover. 4. Pull the heater core rearward and down to remove from the plenum.

INSTALLATION

1. Position heater core and seal in the plenum opening. 2. Install heater core access cover. 3. Attach heater hoses to core tubes. Do not overtighten clamps. 4. Refill cooling system. 5. Check system for proper operation.

Temperature Gauge: Customer Interest Temperature Gauge - Fluctuation/Inaccurate

Article No. 95-18-5

09/11/95

TEMPERATURE GAUGE - FLUCTUATING AND/OR INACCURATE HIGH READINGS

FORD: 1990-94 TAURUS, THUNDERBIRD 1991-93 TEMPO 1991-94 ESCORT

LINCOLN-MERCURY: 1990-94 COUGAR SABLE 1991-93 TOPAZ 1991-94 TRACER

LIGHT TRUCK: 1990-91 AEROSTAR 1990-94 RANGER 1991-94 EXPLORER

This TSB article is being republished in its entirety to correct model year application and revise the part descriptions.

ISSUE: Some vehicles may show temperature gauge fluctuations and/or inaccurate (high) readings (affected engines are 3.0L/4.0L Ranger. 4.0L Explore and 1.9L Escort/Tracer). The inaccurate (high) readings may result in a customer concern with the perception of engine overheating. This is caused by Gauge/Sender design characteristics which create a sensitive gauge indication.

ACTION: Replace the gauge and sender with a new Temperature Indication Service Kit. Refer to the following for Additional Concerns and Service Procedure for details.

ADDITIONAL CONCERNS

Please verify the following two (2) concerns before implementing the fix for the above concern.

1. Perform cooling system diagnosis per TSB 93-24-8.

2. Vehicles built from 1/1/93 to 4/1/93 may experience high temperature gauge indications which may have been due to the installation of improperly manufactured temperature sending units. The customer concern is that the gauge indication is beyond the letter "L" in the word "NORMAL". If this condition occurs, inspect the temperature sender for an "A3" stamped date code on the hex of the sending unit. If an "A3" unit is found, replace with "NON-A3" service stock.

3. 1993 Taurus/Sable 3.8L vehicles built 8/16/93 to 8/31/93 may have high temperature gauge readings caused by an incorrect temperature sending unit installed at the assembly plant. The incorrect temperature sending unit can be identified by a blue insulator around the terminal. The correct temperature sending unit has a green insulator. If a temperature sending unit with a blue insulator is found, replace it with an F1SZ-10884-A.

4. Explorer 4.0L vehicles with date code 2204 to 2274 should not be used. Any other date code outside this is acceptable even with an "A3" stamp.

NOTE:

DATE CODES ARE BASED ON THE JULIAN DATE CODE SYSTEM. THE LAST NUMBER DENOTES THE YEAR THAT THE PART WAS MANUFACTURED. FOR EXAMPLE, 2274 (1994 PART) AND 2275 (1995 PART). ANY 1995 PART MAY BE USED.

TEMPERATURE INDICATION SERVICE KIT PROCEDURE

NOTE:

THIS PROCEDURE IS PERFORMED AFTER THE ABOVE TWO (2) STEPS HAVE BEEN DONE.

The installation of the service kit will result in a pointer indicating in the approximate center of the "NORMAL" band while providing protection for a boil-over condition.

The service kit consists of:

PART NUMBER	PART NAME
F4CZ-10E922-A	Temperature Indication Kit - Base (Escort/Tracer 1.9L)
F4CZ-10E922-B	Temperature Indication Kit - With Tachometer (Escort/Tracer - 1.9L)

OASIS CODES: 204000, 204200, 206000, 402000

Temperature Gauge: Description and Operation

CONSTANT VOLTAGE REGULATOR GAUGE SYSTEM (CVR)

This temperature indicating system consists of a sending unit, located on the cylinder head, electrical temperature gauge and an instrument voltage regulator. As engine temperature increases or decreases, the resistance of the sending unit changes, in turn controlling current flow to the gauge. When engine temperature is low, the resistance of the sending unit is high, restricting current flow to the gauge, in turn indicating low engine temperature. As engine temperature increases, the resistance of the ending unit decreases, permitting an increased current flow to the gauge, resulting in an increased temperature reading.

MAGNETIC GAUGE SYSTEM

Fig. 8 Magnetic Guage

The magnetic gauge movement consists of three primary coils, one of which is wound at a 90° angle to the other two. The coils form a magnetic field which varies in direction according to the variable resistance of the sender unit which is connected between two of them. A primary magnet which is attached to a shaft and pointer rotates and aligns to this primary field resulting in pointer position. The bobbin/coil assembly is pressed into a metal housing which is attached to the instrument cluster, Fig. 8. These gauges require no adjustments, calibrations or maintenance. This gauge system does not use an IVR.

TEST STEP		RESULT ▶	ACTION TO TAKE
A1	TEMPERATURE OR OIL GAUGE INOPERATIVE		
	• Check complaint.	Gauge pointer does not move ▶	GO to Step A2.
		Gauge pointer moves ▶	GO to Step B1.

TEST STEP		RESULT ▶	ACTION TO TAKE
A2	VERIFY POWER TO CLUSTER		
	• With ignition on, observe other gauges and warning lamps for proper operation. If necessary, use voltmeter or test light to verify voltage at B+ terminal of cluster connector.	Other gauges and warning lamps operate correctly: voltage present at cluster ▶	GO to Step B1.
		Other gauges and warning lamps do not operate correctly: no voltage present at cluster ▶	SERVICE wiring to cluster.

TEST STEP		RESULT ▶	ACTION TO TAKE
B1	TESTING SENDER CIRCUIT AT LOW		
	• Insert test box in sender circuit. Disconnect connector at sender and connect test box to cluster side of connector. Set box to LOW (73 ohms).	Temperature gauge reads around the C band ▶	GO to Step B2.
		Oil reads at or below L band ▶	GO to Step B3
		Pointer does not move ▶	GO to Step B4.
B2	TESTING TEMPERATURE SENDER CIRCUIT AT HIGH		
	• TEMPERATURE GAUGE • Set test box to HIGH (9.7 ohms).	Temperature gauge reads around the H grad ▶	REPLACE sender.
		Temperature gauge does not read around the H grad ▶	GO to Step B4.
B3	TESTING ON CABLE SENDER CIRCUIT AT HIGH		
	• OIL GAUGE • Set test box to 0 ohms (short circuit).	Oil gauge reads MID SCALE or slightly above ▶	REPLACE switch.
		Oil gauge does not read MID SCALE or slightly above ▶	GO to Step B4.
B4	CHECK SENDER CIRCUIT WIRING		
	• Check sender circuit wiring and cluster flexible circuit for shorts or open with ohmmeter.	Wiring and flex circuit OK ▶	REPLACE gauge. GO to A1.
		Wiring shorted or open. Flex circuit damaged ▶	REPAIR wiring / flex circuit. GO to A1.

Temperature Gauge: Pinpoint Tests

Fig. 11 Troubleshooting Chart

Fig. 11 Troubleshooting Chart

Fig. 12 Troubleshooting Chart

Temperature Gauge: Component Tests and General Diagnostics

CONSTANT VOLTAGE REGULATOR GAUGE SYSTEM (CVR)

1. Disconnect battery ground cable and remove gauge from vehicle.

2. Connect ohmmeter between gauge terminals and read coil winding resistance.

3. An upward movement of ohmmeter needle from 10 ohms to 14 ohms is normal, as test current of ohmmeter causes a temperature rise in gauge coil windings.

4. If ohmmeter reads below 10 ohms or above 14 ohms, gauge is defective.

MAGNETIC GAUGE SYSTEM

1. Ensure voltage is present at fuse panel and cluster.

2. Install gauge tester tool No. 021-00055 or equivalent, following manufacturer's instructions. This tester can be used on the CVR or Magnetic Gauge systems.

Temperature Gauge: Tools and Equipment

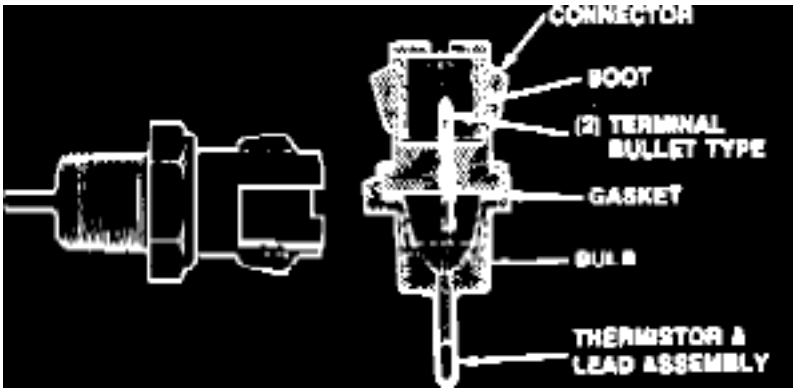
Tester tool No. 021-00055 or equivalent should be used to diagnose these type gauges.

Temperature Warning Lamp/Indicator: Description and Operation

A bimetal temperature switch located in the cylinder head controls operation of a temperature indicator light with a red lens. If engine cooling system is not functioning properly and coolant temperature exceeds a predetermined value, warning light will illuminate.

Temperature Warning Lamp/Indicator: Testing and Inspection

If the red light is not lit when engine is being cranked, check for a burned out bulb, open in light circuit, or a defective ignition switch. If red light is lit when engine is running, check wiring between light and switch for a ground, defective temperature switch, or overheated cooling system. As a test circuit to check whether the red bulb is functioning properly, a wire which is connected to the ground terminal of the ignition switch is tapped into its circuit. When the ignition is in ``Start'' (engine cranking) position, ground terminal is grounded inside the switch and the red bulb will be lit. When engine is started and the ignition switch is in the On position, test circuit is opened and bulb is then controlled by the temperature switch.



Coolant Temperature Sensor/Switch (For Computer): Description and Operation

Engine Coolant Temperature Sensor

The Engine Coolant Temperature (ECT) sensor is threaded into a coolant passage with the sensing bulb extending into the coolant. The ECT sensor is a negative temperature coefficient sensor, meaning that as the temperature of the sensor increases, the resistance will decrease. As the resistance value changes, the signal sensed by the Engine Control Assembly (ECA) also changes. The ECA reads the varying sensor resistance and determines the engine operating temperature, using this information to optimize the air/fuel mixture and ignition timing. The ECT sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

1. Remove BOTH existing temperature sender and temperature gauge from the vehicle.

NOTE:

REFER TO SECTION 13, CONVENTIONAL INSTRUMENT CLUSTER, OF THE APPROPRIATE SERVICE MANUAL FOR TEMPERATURE GAUGE REMOVAL AND INSTALLATION INSTRUCTIONS. REFER TO SECTION 03-03, COOLING SYSTEM, OF THE APPROPRIATE SERVICE MANUAL FOR TEMPERATURE SENDER REMOVAL AND INSTALLATION PROCEDURES.

2. Install BOTH service kit temperature sender and temperature gauge into the vehicle.

NOTE:

THE SERVICE KIT TEMPERATURE SENDER AND TEMPERATURE GAUGE MUST BE USED TOGETHER.

TEMPERATURE GAUGE - FLUCTUATING AND/OR INACCURATE HIGH READINGS

FORD: 1990-94 TAURUS, THUNDERBIRD 1991-93 TEMPO 1991-94 ESCORT

LINCOLN-MERCURY: 1990-94 COUGAR SABLE 1991-93 TOPAZ 1991-94 TRACER

LIGHT TRUCK: 1990-91 AEROSTAR 1990-94 RANGER 1991-94 EXPLORER

This TSB article is being republished in its entirety to correct model year application and revise the part descriptions.

ISSUE: Some vehicles may show temperature gauge fluctuations and/or inaccurate (high) readings (affected engines are 3.0L/4.0L Ranger. 4.0L Explore and 1.9L Escort/Tracer). The inaccurate (high) readings may result in a customer concern with the perception of engine overheating. This is caused by Gauge/Sender design characteristics which create a sensitive gauge indication.

ACTION: Replace the gauge and sender with a new Temperature Indication Service Kit. Refer to the following for Additional Concerns and Service Procedure for details.

ADDITIONAL CONCERNS

Please verify the following two (2) concerns before implementing the fix for the above concern.

1. Perform cooling system diagnosis per TSB 93-24-8.

2. Vehicles built from 1/1/93 to 4/1/93 may experience high temperature gauge indications which may have been due to the installation of improperly manufactured temperature sending units. The customer concern is that the gauge indication is beyond the letter "L" in the word "NORMAL". If this condition occurs, inspect the temperature sender for an "A3" stamped date code on the hex of the sending unit. If an "A3" unit is found, replace with "NON-A3" service stock.

3. 1993 Taurus/Sable 3.8L vehicles built 8/16/93 to 8/31/93 may have high temperature gauge readings caused by an incorrect temperature sending unit installed at the assembly plant. The incorrect temperature sending unit can be identified by a blue insulator around the terminal. The correct temperature sending unit has a green insulator. If a temperature sending unit with a blue insulator is found, replace it with an F1SZ-10884-A.

4. Explorer 4.0L vehicles with date code 2204 to 2274 should not be used. Any other date code outside this is acceptable even with an "A3" stamp.

NOTE:

DATE CODES ARE BASED ON THE JULIAN DATE CODE SYSTEM. THE LAST NUMBER DENOTES THE YEAR THAT THE PART WAS MANUFACTURED. FOR EXAMPLE, 2274 (1994 PART) AND 2275 (1995 PART). ANY 1995 PART MAY BE USED.

TEMPERATURE INDICATION SERVICE KIT PROCEDURE

NOTE:

THIS PROCEDURE IS PERFORMED AFTER THE ABOVE TWO (2) STEPS HAVE BEEN DONE.

The installation of the service kit will result in a pointer indicating in the approximate center of the "NORMAL" band while providing protection for a boil-over condition.

The service kit consists of:

PART NUMBER	PART NAME
F4CZ-10E922-A	Temperature Indication Kit - Base (Escort/Tracer 1.9L)
F4CZ-10E922-B	Temperature Indication Kit - With Tachometer (Escort/Tracer - 1.9L)
F43Z-10E922-A	Temperature Indication Kit - Base (Tempo/Topaz)
F46Z-10E922-A	Temperature Indication Kit - With Tachometer (Tempo/Topaz)
F4DZ-10E922-A	Temperature Indication Kit - Base (Taurus)
F44Z-10E922-A	Temperature Indication Kit - With Tachometer (Taurus/Sable)
F4SZ-10E922-A	Temperature Indication Kit - Base (Thunderbird/Cougar)
F4SZ-10E922-B	Temperature Indication Kit - With Tachometer (Thunderbird/Cougar)
F47Z-10E922-A	Temperature Indication Kit Without Tachometer (Ranger - 3.0L And 4.0L Engines)
F47Z-10E922-B	Temperature Indication Kit - With Tachometer (Explorer - 4.0L, Ranger - 3.0L And 4.0L Engines)
F49Z-10E922-A	Temperature Indication Kit (Aerostar)

^ Instructions

^ Temperature Gauge

^ Temperature Sender

The instructions will contain the following steps:

1. Remove BOTH existing temperature sender and temperature gauge from the vehicle.

NOTE:

REFER TO SECTION 13, CONVENTIONAL INSTRUMENT CLUSTER, OF THE APPROPRIATE SERVICE MANUAL FOR TEMPERATURE GAUGE REMOVAL AND INSTALLATION INSTRUCTIONS. REFER TO SECTION 03-03, COOLING SYSTEM, OF THE APPROPRIATE SERVICE MANUAL FOR TEMPERATURE SENDER REMOVAL AND INSTALLATION PROCEDURES.

2. Install BOTH service kit temperature sender and temperature gauge into the vehicle.

NOTE:

THE SERVICE KIT TEMPERATURE SENDER AND TEMPERATURE GAUGE MUST BE USED TOGETHER.

Temperature Gauge: Description and Operation

CONSTANT VOLTAGE REGULATOR GAUGE SYSTEM (CVR)

This temperature indicating system consists of a sending unit, located on the cylinder head, electrical temperature gauge and an instrument voltage regulator. As engine temperature increases or decreases, the resistance of the sending unit changes, in turn controlling current flow to the gauge. When engine temperature is low, the resistance of the sending unit is high, restricting current flow to the gauge, in turn indicating low engine temperature. As engine temperature increases, the resistance of the ending unit decreases, permitting an increased current flow to the gauge, resulting in an increased temperature reading.

MAGNETIC GAUGE SYSTEM

Fig. 8 Magnetic Guage

The magnetic gauge movement consists of three primary coils, one of which is wound at a 90° angle to the other two. The coils form a magnetic field which varies in direction according to the variable resistance of the sender unit which is connected between two of them. A primary magnet which is attached to a shaft and pointer rotates and aligns to this primary field resulting in pointer position. The bobbin/coil assembly is pressed into a metal housing which is attached to the instrument cluster, Fig. 8. These gauges require no adjustments, calibrations or maintenance. This gauge system does not use an IVR.

TEST STEP		RESULT ▶	ACTION TO TAKE
A1	TEMPERATURE OR OIL GAUGE INOPERATIVE		
	• Check complaint.	Gauge pointer does not move ▶	GO to Step A2.
		Gauge pointer moves ▶	GO to Step B1.

TEST STEP		RESULT ▶	ACTION TO TAKE
A2	VERIFY POWER TO CLUSTER		
	• With ignition on, observe other gauges and warning lamps for proper operation. If necessary, use voltmeter or test light to verify voltage at B+ terminal of cluster connector.	Other gauges and warning lamps operate correctly: voltage present at cluster ▶	GO to Step B1.
		Other gauges and warning lamps do not operate correctly: no voltage present at cluster ▶	SERVICE wiring to cluster.

TEST STEP		RESULT ▶	ACTION TO TAKE
B1	TESTING SENDER CIRCUIT AT LOW		
	• Insert test box in sender circuit. Disconnect connector at sender and connect test box to cluster side of connector. Set box to LOW (73 ohms).	Temperature gauge reads around the C band ▶	GO to Step B2.
		Oil reads at or below L band ▶	GO to Step B3
		Pointer does not move ▶	GO to Step B4.
B2	TESTING TEMPERATURE SENDER CIRCUIT AT HIGH		
	• TEMPERATURE GAUGE • Set test box to HIGH (9.7 ohms).	Temperature gauge reads around the H grad ▶	REPLACE sender.
		Temperature gauge does not read around the H grad ▶	GO to Step B4.
B3	TESTING ON CABLE SENDER CIRCUIT AT HIGH		
	• OIL GAUGE • Set test box to 0 ohms (short circuit).	Oil gauge reads MID SCALE or slightly above ▶	REPLACE switch.
		Oil gauge does not read MID SCALE or slightly above ▶	GO to Step B4.
B4	CHECK SENDER CIRCUIT WIRING		
	• Check sender circuit wiring and cluster flexible circuit for shorts or open with ohmmeter.	Wiring and flex circuit OK ▶	REPLACE gauge. GO to A1.
		Wiring shorted or open. Flex circuit damaged ▶	REPAIR wiring / flex circuit. GO to A1.

Temperature Gauge: Pinpoint Tests

Fig. 11 Troubleshooting Chart

Fig. 11 Troubleshooting Chart

Fig. 12 Troubleshooting Chart

Temperature Gauge: Component Tests and General Diagnostics

CONSTANT VOLTAGE REGULATOR GAUGE SYSTEM (CVR)

1. Disconnect battery ground cable and remove gauge from vehicle.

2. Connect ohmmeter between gauge terminals and read coil winding resistance.

3. An upward movement of ohmmeter needle from 10 ohms to 14 ohms is normal, as test current of ohmmeter causes a temperature rise in gauge coil windings.

4. If ohmmeter reads below 10 ohms or above 14 ohms, gauge is defective.

MAGNETIC GAUGE SYSTEM

1. Ensure voltage is present at fuse panel and cluster.

2. Install gauge tester tool No. 021-00055 or equivalent, following manufacturer's instructions. This tester can be used on the CVR or Magnetic Gauge systems.

Temperature Gauge: Tools and Equipment

Tester tool No. 021-00055 or equivalent should be used to diagnose these type gauges.

Temperature Warning Lamp/Indicator: Description and Operation

A bimetal temperature switch located in the cylinder head controls operation of a temperature indicator light with a red lens. If engine cooling system is not functioning properly and coolant temperature exceeds a predetermined value, warning light will illuminate.

Temperature Warning Lamp/Indicator: Testing and Inspection

If the red light is not lit when engine is being cranked, check for a burned out bulb, open in light circuit, or a defective ignition switch. If red light is lit when engine is running, check wiring between light and switch for a ground, defective temperature switch, or overheated cooling system. As a test circuit to check whether the red bulb is functioning properly, a wire which is connected to the ground terminal of the ignition switch is tapped into its circuit. When the ignition is in ``Start'' (engine cranking) position, ground terminal is grounded inside the switch and the red bulb will be lit. When engine is started and the ignition switch is in the On position, test circuit is opened and bulb is then controlled by the temperature switch.

LIGHT TRUCK: 1984-94 BRONCO, ECONOLINE, F-150-350 SERIES, RANGER 1985-90 BRONCO II 1986-94 AEROSTAR 1988-94 F SUPER DUTY 1991-94 EXPLORER

This TSB article is being republished in its entirety to include 1994 model year vehicles.

ISSUE: Engine performance concerns such as hesitation or stall, rough idle, and/or poor fuel economy may be caused by the thermostat stuck in an open position or opening at a temperature lower than specified.

ACTION:

COOLING SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE SOURCE	ACTION
• Engine fails to reach normal operating temperature	• Coolant level	• Check level in radiator and coolant recovery reservoir.
	• Leakage	• Check for leaks using pressure test.
• Low gauge reading	• Thermostat operation	• Check thermostat. Refer to "Thermostat Diagnosis" procedure.
	• Temperature gauge or sending unit	• Check gauge and gauge sender. Refer to Service Manual Section 13-01.
• Poor heater/defroster performance	• Coolant level	• Check level in radiator and coolant recovery reservoir.
	• Leakage	• Check for leaks using pressure test.
	• Thermostat operation	• Check Thermostat. Refer to "Thermostat Diagnosis" procedure.
	• Blend door operation	• Check blend door for binding and proper operation.
	• Mode door operation	• Check mode door for binding and proper operation.
	• Blower fan operation	• Check blower fan for proper operation and control.
	• Heater core plugged	• Flush cooling system.

Use the following "Cooling System Diagnosis" procedure to diagnose a cooling system that may not be reaching normal operating temperature. Follow the "Thermostat Diagnosis" procedure to determine if the thermostat may be at fault. Check the thermostat without removing it from the vehicle by using Rotunda Service Coolant Temperature Monitor Harness 007-00064.

A new cooling system diagnosis procedure has been developed for engines that do not reach normal operating temperature. A new thermostat diagnosis procedure also has been developed, using a new service coolant temperature monitor harness.

NOTE: THIS PROCEDURE WILL DIAGNOSE ONLY COOLING SYSTEMS THAT MAY NOT BE REACHING NORMAL OPERATING TEMPERATURE. IT WILL NOT DIAGNOSE A THERMOSTAT THAT CAUSES AN ENGINE OVERHEAT CONDITION.

NOTE: THE ESCORT/TRACER SPECIFIC APPLICATION FOR THIS ARTICLE IS AS FOLLOWS:

^ 1983-1990 Escort 1.9L and 1.6L

^ 1991-1994 Escort 1.9L

^ 1991-1994 Tracer 1.9L Only

THERMOSTAT DIAGNOSIS

NOTE: DISCONNECTING THE POWERTRAIN CONTROL MODULE (PCM) TO ATTACH A BREAKOUT BOX OR AN EEC IV MONITOR WILL ERASE THE ADAPTIVE LEARNING FROM MEMORY AND MAY "HIDE" A DRIVE CONCERN TEMPORARILY UNTIL THE ADAPTIVE LEARNING IS RE-LEARNED.

NOTE: THIS PROCEDURE IS MOST ACCURATE IF PERFORMED INDOORS AT LESS THAN 100~F (38~C) AMBIENT TEMPERATURE. THIS TEST MAY BE PERFORMED WITH OR WITHOUT THE HOOD OPEN AND WITH THE ENGINE WARM OR COLD.

CAUTION: ALWAYS VENT THE EXHAUST TO THE OUTSIDE WHEN PERFORMING THIS TEST.

1. Check the coolant level in the radiator and coolant recovery reservoir.

2. With the key in the "off" position, proceed as follows:

a. Remove the engine coolant temperature (ECT) sensor harness connector.

b. Attach Rotunda Service Coolant Temperature Monitor Harness 007-00064 as a jumper between the PCM and the ECT.

c. Attach Rotunda 73 Digital Multimeter 105-00051 or equivalent to the thermostat monitor harness. Voltage values (0-5vdc) may now be

VOLTAGES AND CORRESPONDING TEMPERATURES							
ECT (volts)	3.00	2.01	1.01	0.75	0.59	0.50	0.40
Coolant Temperature (°F)	71	109	159	180	195	206	221
Coolant Temperature (°C)	22	43	71	82	91	97	105

monitored while the sensor retains its connection to the wiring harness.

NOTE: A ROTUNDA NEW GENERATION STAR TESTER (NGS) 007-00500 OR THE ROTUNDA SERVICE BAY DIAGNOSTIC SYSTEM (SBDS) 001-00001 MAY BE USED TO MONITOR THE ECT ON VEHICLES EQUIPPED WITH DATA COMMUNICATIONS LINK (DCL). THE SBDS SEQUENCE TO USE FOR THE SCREEN IS "TOOLBOX - ELECTRONIC ENGINE CONTROL AND DCL - ITEM".

3. Vehicles equipped with electric engine cooling fan(s) must have a fan running during this test (high or low speed may be used). Two methods may be used to turn the fan(s) on:

a. Disconnect the A/C compressor clutch power supply and turn the climate control to A/C "ON". Or

b. Disconnect the power supply to the cooling fan and supply 12 volts direct to the fan connector from the battery.

NOTE: A GROUND MAY BE REQUIRED FOR SOME APPLICATIONS.

4. Place transmission in "park" or "neutral".

NOTE: RUNNING THIS TEST WITH THE VEHICLE IN GEAR OR WITH THE A/C COMPRESSOR CLUTCH ENGAGED (RUNNING) WILL CAUSE IMPROPER DIAGNOSIS

5. Start the engine and allow to idle throughout this test:

a. Allow engine to run for 2 minutes, then record ECT voltage.

b. From now on, record ECT voltage every 60 seconds.

c. When the ECT voltage trend changes direction or changes only slightly (0.03 volts or less) from the previous reading, record this as the thermostat opening voltage.

d. Use the "Voltage and Corresponding Temperature Chart" shown to obtain actual coolant temperatures.

6. If the opening voltage is GREATER than 0.75 volts (less than 18~ F/ 82~ C), or 0.85 volts (170~ F/ 77~ C) for 2.3L HSC engine only, replace the thermostat. Refer to the dealer Master Parts Catalog for correct thermostat usage.

7. If the thermostat opening voltage is LESS than 0.75 volts (greater than 180~ F/ 82~ C), or 0.85 volts (170~ F/ 77~ C) for 2.3L HSC engine only, the thermostat is good and should NOT be replaced. The "Cooling System Diagnosis Chart" should be referenced for further instructions.

NOTE: The 10~ F opening temperature difference for the 2.3L HSC engine is due to the ECT sensor location.

OTHER APPLICABLE ARTICLES: NONE SUPERSEDES: 93-14-4 WARRANTY STATUS: INFORMATION ONLY OASIS CODES: 208000, 208100, 402000, 608000, 608400, 609000, 609400, 611000, 611500, 622000, 690000

Thermostat: Testing and Inspection

The thermostat should be replaced only after the following tests have been performed:

1. Heat Test

89° C (192° F) Thermostat

Immerse the removed thermostat in a 89°C (192°F) solution of antifreeze and water mixture. An 89°C (192°F) thermostat should open to 0.08 mm (0.0003 inch). When immersed in a 100° C (212° F) solution, the thermostat should open to 3.2 mm (1/8 inch).

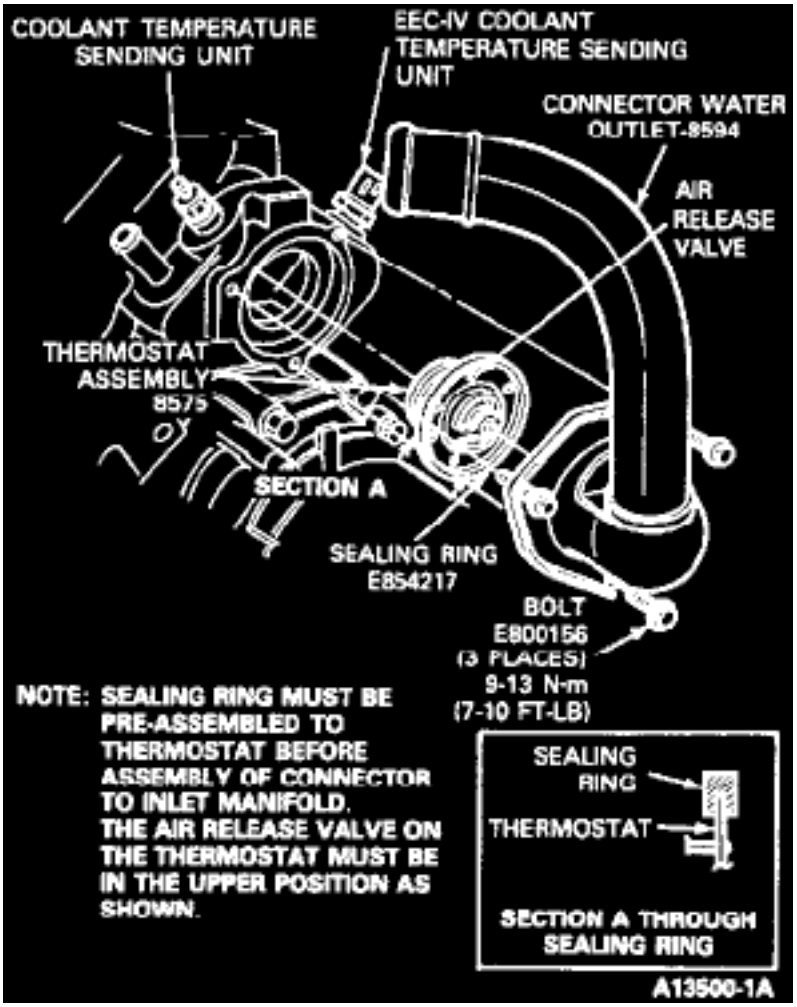
92° C (197° F) Thermostat

A 92°C (197°F) thermostat immersed in a 92°C (197°F) solution of antifreeze and water should open to O.O8 mm (0.0003 inch), when immersed in the 100° C (212° F) solution, the thermostat should open 3.2 mm (1/8 inch).

2. Visual Test

a. If heat is not available, the thermostat should be checked for leakage. This is done by holding the thermostat up to a lighted background.

Leakage of light around the thermostat valve (thermostat at room temperature) indicates that the thermostat should be replaced with an original equipment, approved thermostat. Some thermostats have a small leakage notch at one location on the perimeter of the thermostat valve which is considered normal.



Thermostat: Service and Repair

REMOVAL

1. Perform this operation on a cool engine to prevent injury from hot coolant. 2. Drain cooling system. 3. Disconnect negative battery terminal and set aside. 4. Remove air cleaner air duct assembly from throttle body and air cleaner. 5. Remove upper radiator hose from thermostat housing. 6. Remove three attaching bolts from housing. 7. Remove housing and thermostat.

INSTALLATION

1. Clean gasket mating surfaces with scraper or appropriate tool. Use care not to gouge aluminum components.

Thermostat And Housing

NOTE: Make sure the sealing ring is properly installed on the thermostat.

2. Install thermostat into housing making sure the air release valve is in the up position. 3. Install thermostat housing assembly and new gasket. Tighten attaching bolts to 9-13 Nm (7-10 ft lb). 4. Install upper radiator hose. Tighten clamp securely. 5. Fill and bleed cooling system with specified

coolant and proper mixture. 6. Install air cleaner air duct assembly. Tighten clamps securely. 7. Connect negative ground cable.

WARNING: Do not stand in line with or near radiator fan when engine is running.

8. Run engine and check for coolant leaks.

Thermostat Housing: Specifications

Thermostat Housing Assembly Attaching Bolts ..... 9-13 Nm (7-10 ft lb)

THIS DRAWING IS MEANT TO ILLUSTRATE A PRINCIPLE AND MAY NOT MATCH THE WATER PUMP ON THIS VEHICLE.

Water Pump: Testing and Inspection Verifying Water Pump Problem

VERIFYING WATER PUMP PROBLEM

Check for Loose Water Pump Pulley

As the pump shaft seals and bearings wear with age the pulley/shaft may develop a wobble or lateral runout.

- With the engine off and the key removed from the ignition, attempt to move the pulley from side to side and back and forth. There should be no detectable movement. The pulley should turn smoothly, with no rough spots.

- The water pump should be replaced if any pulley wobble is detected. If the water pump is not replaced the pump shaft may eventually seize or break.

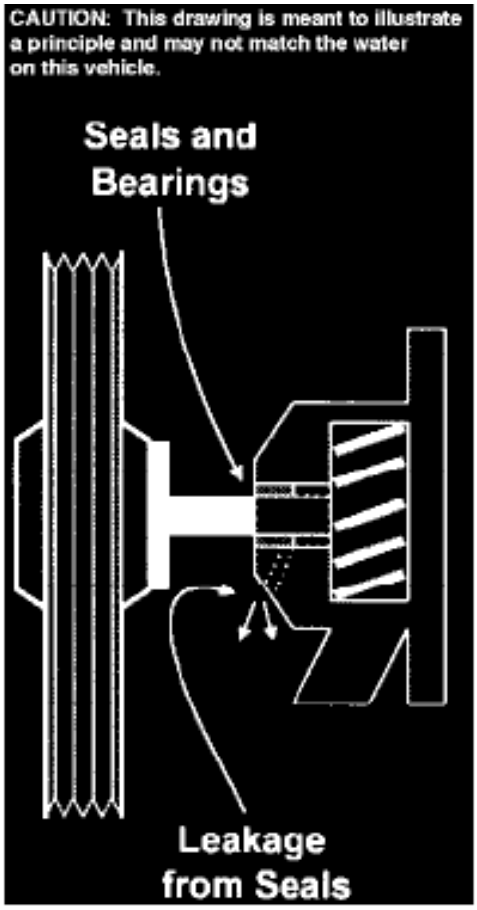
NOTE: Incorrect belt tension (too tight) may cause premature wear of the bearings and seals.

WARNING: Never remove a radiator cap while the engine is hot. Severe personal injury may result.

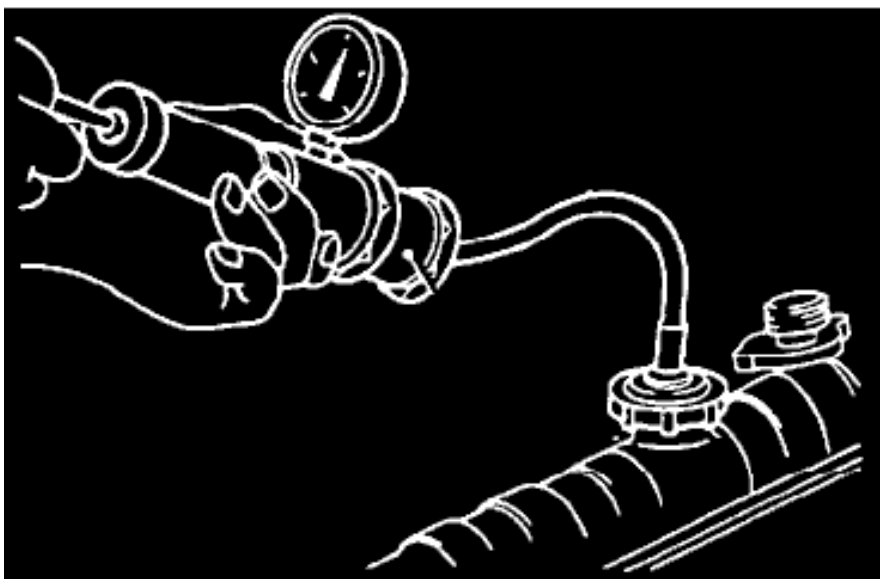
Inspect for Leakage

1. With the engine "OFF" and cold:

- Check coolant level and refill if necessary.



CAUTION: This drawing is meant to illustrate a principle and may not match the water on this vehicle.
Seals and Bearings
Leakage from Seals



- Inspect the water pump for leakage. Closely check the following areas: -

Inspection (weep) hole.

- Pump shaft.

- Gasket.

2. Pressurize the cooling system with a pressure tester and again check for leaks. Do not exceed the rated pressure of the radiator cap.

NOTE: If any leaks are found, verify that they are not originating from a component near or above the water pump (i.e. thermostat, loose radiator hoses, intake gasket, engine coolant temperature sensor)

CAUTION: When finished, immediately re-install the radiator cap.

3. If no leaks are found, start and warm the engine until the thermostat opens. Stop the engine and check for fresh leakage around the water pump

shaft.

NOTE: Occasionally water pumps will only leak around the shaft seals while the shaft is rotating.

Water Pump: Testing and Inspection After Repairs Operational Check

COOLING SYSTEM OPERATIONAL CHECK

IMPORTANT: Always verify the operation of the thermostat and cooling fan prior to driving the vehicle after a cooling system repair.

HOW

- With the cooling system filled with coolant and the radiator cap installed, start the engine and allow the coolant to warm up.

- The upper radiator hose should remain cool to the touch until the coolant within the engine block and head has reached the thermostat opening temperature.

-

The thermostat opening should be indicated by a rapid warm up of the upper radiator hose.

- If upper hose gradually warms up, the thermostat may be stuck open (assuming the engine is started cold)

- If the coolant temperature reaches the normal operating temperature (as indicated by the temperature gauge) before the upper hose becomes warm, the engine should be turned off, and the cooling system allowed to cool down. The thermostat may be stuck closed and should be removed and tested.

WARNING: Never remove a radiator cap while the engine is hot. Severe personal injury may result.

- After the cooling system has warmed up, turn off the engine, and verify the cooling fan clutch has engaged. -

The clutch should offer resistance when attempting to rotate the fan by hand.

- When the engine is cold the fan should spin freely on the clutch.

WHY

Thermostat Closed, Cold Engine - With the thermostat closed, coolant flow through the radiator is blocked forcing the coolant to re-circulate through the block and head. This allows for a rapid warm up. During this time there should be little or no coolant flow through the upper radiator hose.

Thermostat Open, Warm Engine - Once the coolant has reached normal operating temperature, the thermostat begins to open, allowing coolant flow through the upper hose and into the radiator. The thermostat will continue to regulate the amount of coolant flow to the radiator to maintain a "Minimum" operating temperature.

Water Pump: Testing and Inspection After Repairs Leak Check

AFTER REPAIRS LEAK CHECK

PURPOSE

Initially fill the cooling system and check for leaks prior to starting the engine and bleeding the system. Although the system will not be completely full, any leaks which are detected may be fixed before the engine and cooling system are hot.

NOTE: It is much easier to repair a leak on a cold engine than on a hot engine.

HOW

- Fill the cooling system until the radiator is full.

- Apply pressure to the system with a pressure tester.

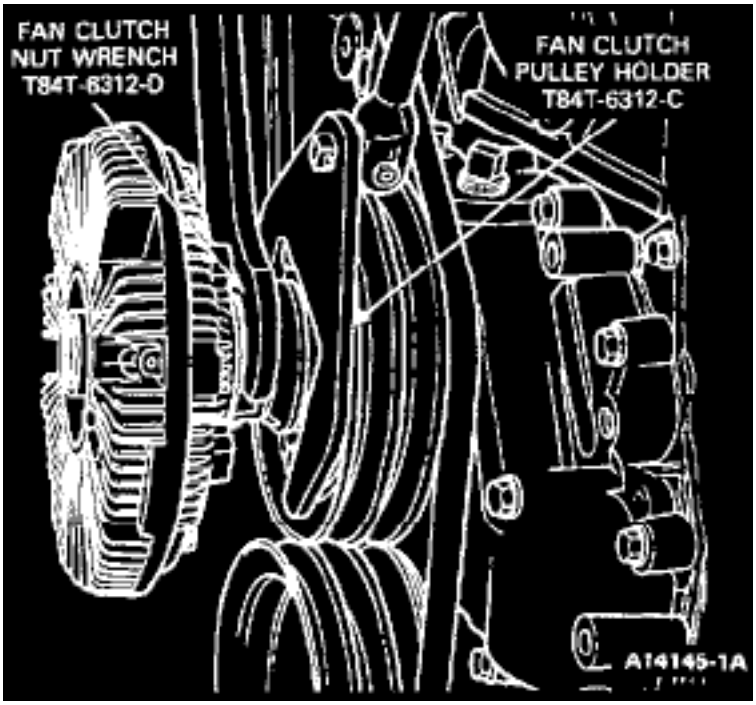
- Carefully check for leaks around: -

All hoses and clamps.

- Water pump sealing surfaces.

- Any cooling system component which was removed or replaced.

- If no leaks are detected continue with the fill and bleed procedure.



Water Pump: Service and Repair Removal

REMOVAL

1. Drain the coolant. Detach the radiator lower hose and the heater return hose from the water pump.

Fan Clutch Tools

2. Remove fan and clutch assembly using Fan Clutch Pulley Holder T84T-6312-C and Fan Clutch Nut Wrench T84T-6312-D or equivalents. 3. Loosen the alternator mounting bolts and remove the belt. Vehicles with A/C, remove alternator and bracket. 4. Remove the water pump pulley. 5. Remove the water pump assembly attaching bolts and remove water pump assembly.

Water Pump: Service and Repair Installation

INSTALLATION

1. Remove all gasket material from the sealing surfaces on front cover and water pump assembly. Apply sealer to both sides of the new gasket and

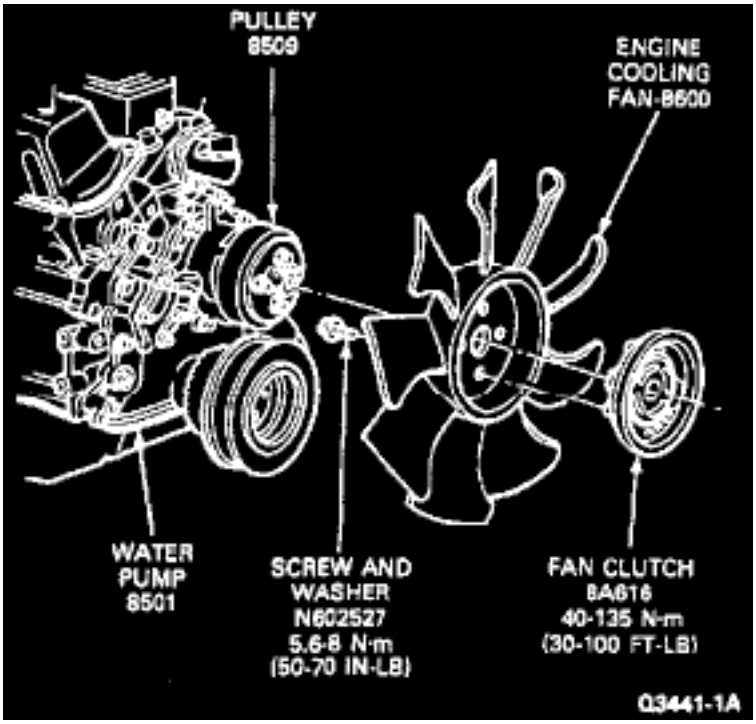
place the gasket on the water pump.

2. Position the water pump assembly to the front cover with two bolts finger-tight. Tighten all water pump assembly attaching bolts to 8.5-12 Nm

(6-9 ft lb).

Drive Belt Routing

3. Install water pump pulley. Tighten bolts to 24-30 Nm (18-23 ft lb). With A/C, install bracket and alternator. Install belt and adjust tension. 4. Connect both hoses to water pump and tighten hose clamps. Fill and bleed cooling system.



Fan And Clutch

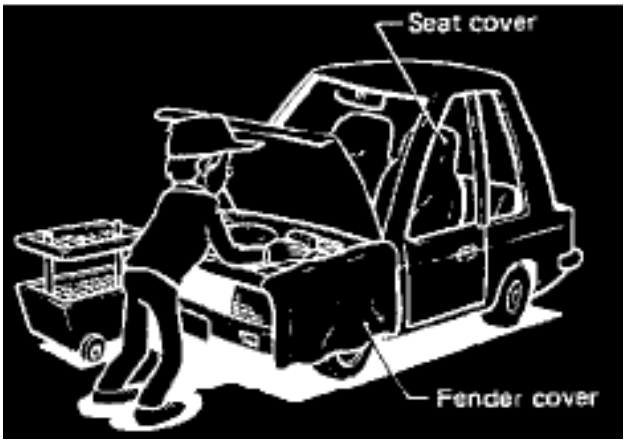
5. Install fan and clutch assembly using Fan Clutch Pulley Holder T84T-6312-C and Fan Clutch Nut Wrench T84T-6312-D or equivalents. Tighten

to 40-135 Nm (30-100 ft lb).

6. Start the engine and check for leaks.

T84T-6312-C

T84T-6312-D



Seat cover
Fender cover

Water Pump: Tools and Equipment

RECOMMENDED TOOLS

Fan Clutch Holding Tool

Fan Clutch Wrench

- Fan clutch wrenches, necessary for removing fan clutch: -

Clutch Holding Tool, T84T-6312-C

- Fan Clutch Nut Wrench, T84T-6312-D

- Drip pan - For draining coolant.

- Gasket scraper.

-

Torque Wrenches: -

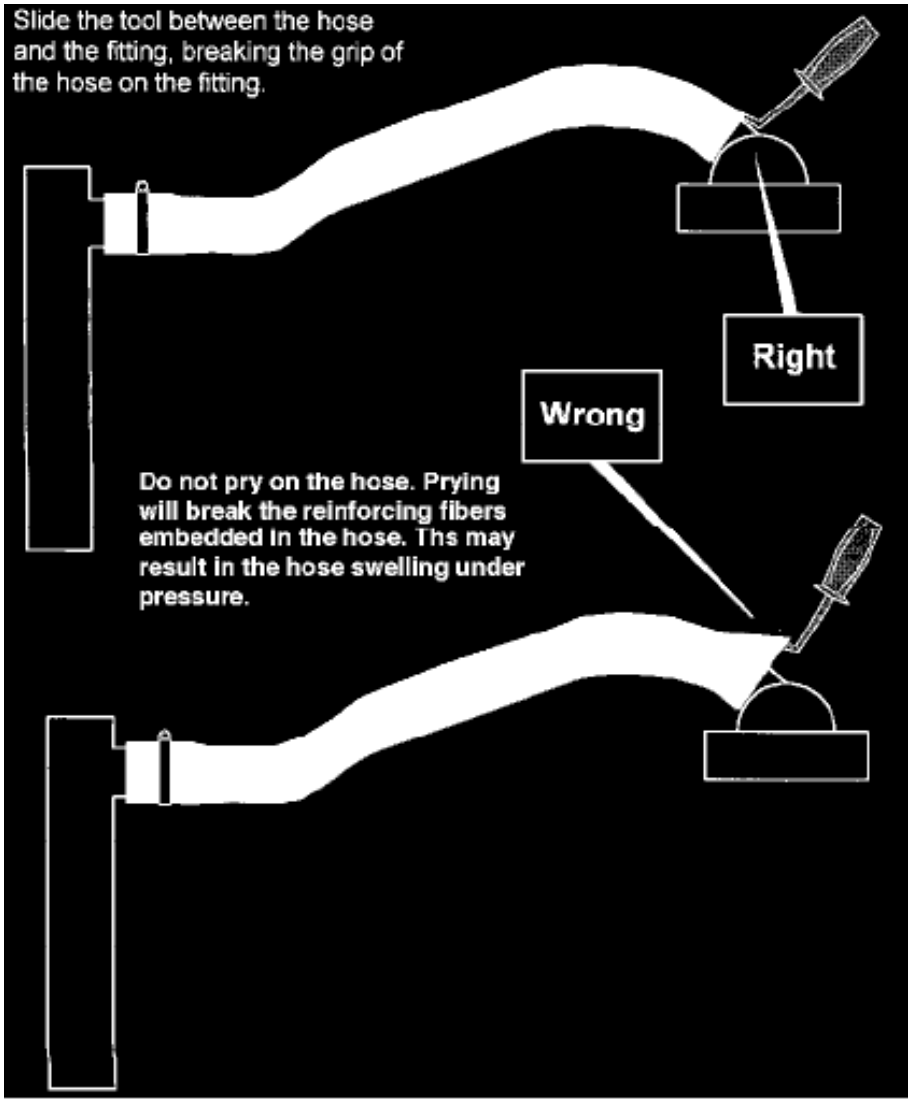
Low Range (0-50 ft-lb) for covers and brackets.

- High Range (0-150 ft-lb) for fan clutch.

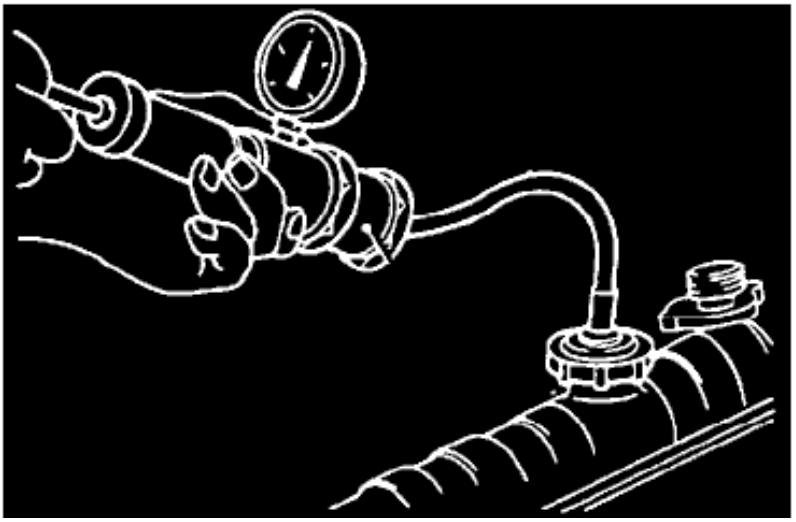
- Full set of Metric sockets and wrenches.

- Fender covers.

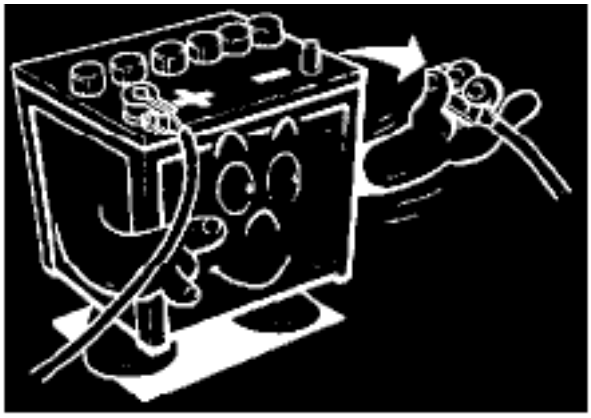
OPTIONAL

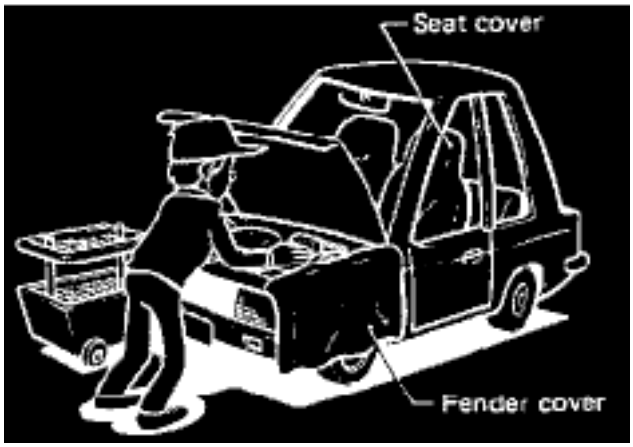


Slide the tool between the hose and the fitting, breaking the grip of the hose on the fitting.
Right
Wrong
Do not pry on the hose. Prying will break the reinforcing fibers embedded in the hose. Ths may result in the hose swelling under pressure.



- Radiator hose removal tool.
- Cooling system pressure tester.





Water Pump: Fundamentals and Basics Initial Preparations

INITIAL PREPARATIONS

Disconnect Battery

When working near or around the cooling fan or drive belts, accidentally engaging the starter or cooling fan can result in serious personal injury.

The negative battery terminal should be disconnected prior to commencing work and should not be reconnected until after the water pump is installed and the engine is ready to restart.

Fender Covers

Fender covers will prevent damage to the vehicles finish while performing the job.

NOTE: A fender cover folded over the radiator will prevent accidental damage to the radiator. The radiator can be easily damaged should a wrench slip off of a bolt while working on the water pump.

Coolant Drip Pan

Pre-position a drip pan under the vehicle to prevent any incidental spills.

Water Pump: Fundamentals and Basics Gasket Removal and Inspection

REMOVAL

- Remove all traces of the old gasket material. It only takes a very small amount of left over material to cause the new gasket to leak.

- Never reuse gaskets. After a gasket has been initially installed and removed it will no longer be able to compensate for the varying expansion rates of the water pump and block. An old gasket may seal initially but as the engine heats up cools down, the old gasket will be prone to leakage.

- When removing the gasket with a gasket scraper, be very careful not to gouge the sealing surface. Very small scratches in the sealing surface are likely to leak.

HINT: Always sharpen your gasket scraper prior to starting a job. A dull scraper is more likely to slip and gouge the sealing surface.

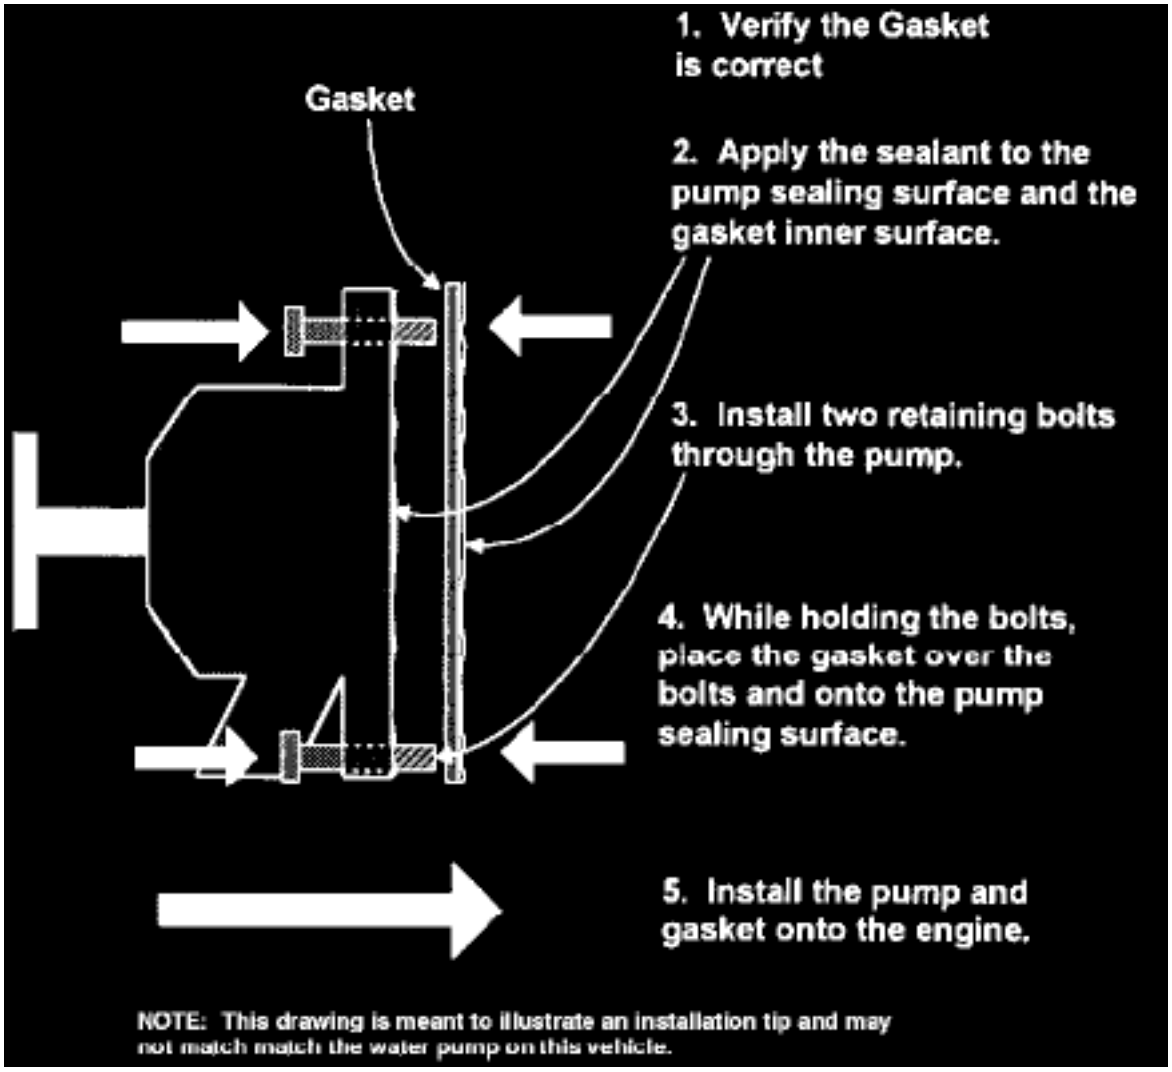
- If you are using a buffing wheel to clean the gasket surface, be very careful not to burn the surface.

CAUTION: Buffing wheels can rapidly remove metal from the sealing surface, be very careful and check your work frequently.

INSPECTION

- Verify the timing cover has not been damaged by the impeller. If a worn out water pump (shaft wobbles) is operated over a length of time the impeller (which also wobbles inside the pump) may wear into the timing cover. If the timing cover shows any signs of wear it should be replace.

- Verify the gasket sealing surfaces are free of all gasket material, dirt, gouges, and contaminants (such as coolant or oil).



Water Pump: Fundamentals and Basics Installation Tips and Hints

WATER PUMP INSTALLATION NOTES

- Compare the old pump to the new pump and verify: -

Shaft lengths match exactly.

- Retaining bolt holes match exactly.

-

Install the fan retaining studs into the shaft flange prior to installing the pump. The studs are much easier to install with the pump out of the vehicle.

- Prior to applying the sealant to the gasket and pump, practice installing the pump to the engine. If any problems are encountered they will be easier to solve without the silicone applied.

- Verify the retaining bolts and bolt holes have clean threads. Re-tap or chase the threads as necessary.

-

To simplify the gasket installation process and minimize errors, install the gasket as follows:

1. Verify the gasket is correct. 2. Apply the sealant to the pump sealing surface and the gasket inner surface. Apply only a light film of sealant to the sealing surfaces.

CAUTION: Excess sealant will squeeze out on the inside of the pump and may block the radiator or heater core coolant passages.

3. Install two retaining bolts through the pump.

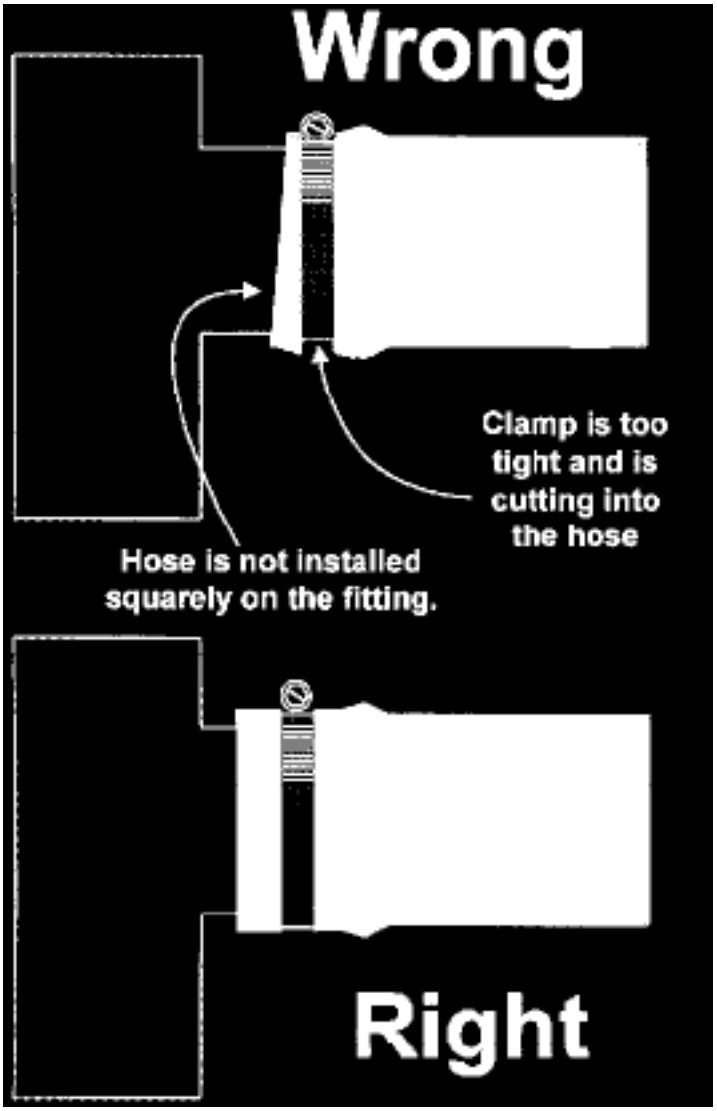
NOTE: This will help maintain the correct alignment of gasket in the next step.

4. While holding the bolts, place the gasket over the bolts and onto the pump sealing surface. 5. Install the pump and gasket onto the engine.

-

Do not over tighten the retaining bolts, use a torque wrench to properly tighten the bolts to the correct specification.

CAUTION: Water pump retaining bolts may be easily broken or stripped, do not tighten the retaining bolts with an air wrench or impact gun.



- When tightening hose clamps: -

Position the hose squarely on the fitting.

- Verify the hose clamp is clear of the retaining rim on the fitting. Do not over tighten the clamps.

- While working on the cooling system it is a good habit to clean the radiator and A/C condenser fins of bugs and dirt. This build up of debris can seriously reduce the cooling ability of the system.

Water Pump: Fundamentals and Basics Recommended Parts

RECOMMENDED PARTS

- New water pump and gasket.

- RTV sealant (for sealing water pump gasket).

- Engine Coolant: See: Specifications/Capacity Specifications

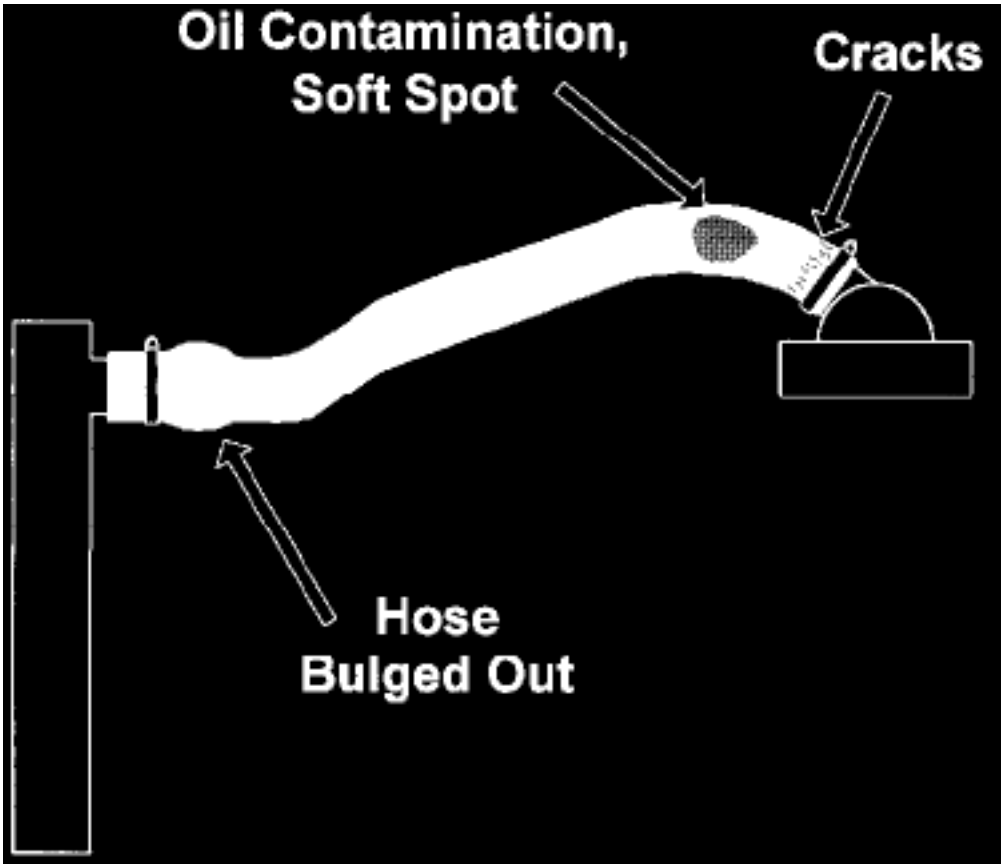
NOTE: For optimum performance, use 50/50 mixture of high quality ethylene glycol coolant and water.

OPTIONAL, PENDING INSPECTION

- Radiator hoses.

- Drive belts.

- Hose clamps.



Water Pump: Fundamentals and Basics Removal Tips and Hints

WATER PUMP REMOVAL TIPS AND HINTS

FROZEN AND BROKEN BOLTS

Frozen and broken bolts are often a major problem when removing water pumps. Coolant can seep into the bolt holes resulting in corrosion and frozen bolts. Prior to starting the job, spray all water pump retaining bolts with a penetrating oil.

Upon removal, any bolt or nut which shows signs of corrosion should be replaced. The threads of the associated bolt hole should be re-tapped or chased.

COOLANT HOSES

Inspect the hoses for the following: -

Cracks, especially near the hose clamps.

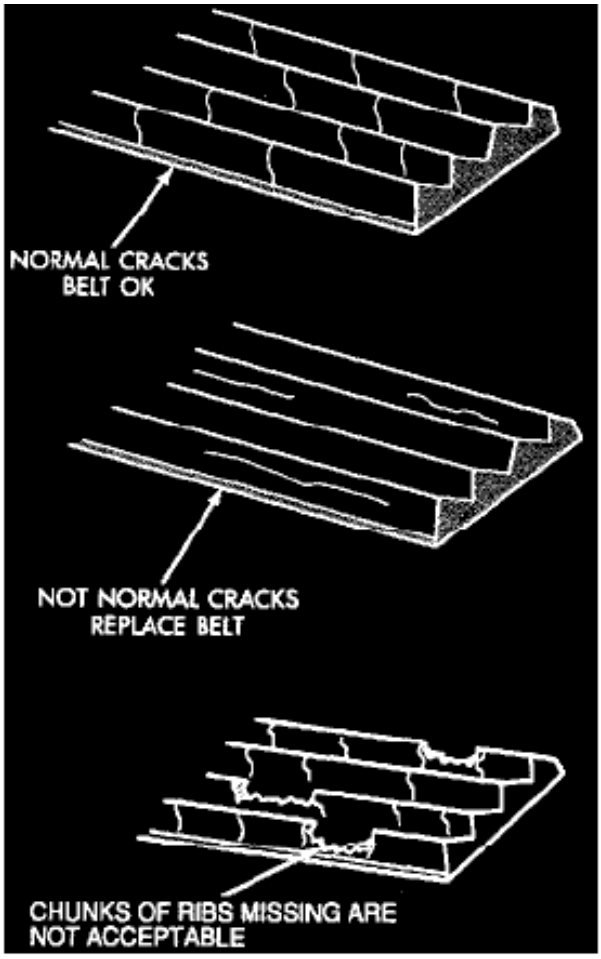
- Swelling, look for areas of the hose that appear unnaturally bulged outwards.

NOTE: This is often caused by improper removal techniques.

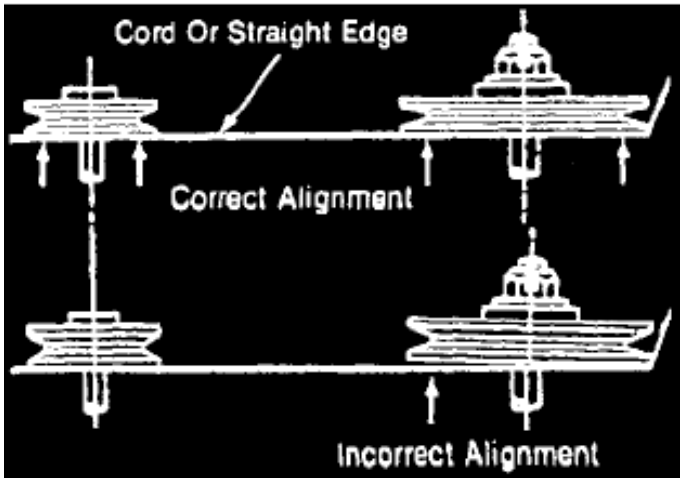
- Oil contamination and soft spots - Oil contamination breaks down the structure of the rubber and significantly weakens the hose.

NOTE: The oil leak should be fixed prior to replacing the hose.

- Hard or brittle hoses, as the hoses age the rubber looses its resiliency and becomes brittle. The hoses need to be able to flex to compensate for the movement of the engine.



NORMAL CRACKS
BELT OK
NOT NORMAL CRACKS
REPLACE BELT
CHUNKS OF RIBS MISSING ARE
NOT ACCEPTABLE



Cord Or Straight Edge
Correct Alignment
Incorrect Alignment

DRIVE BELTS

- Small cracks that run across that run across the ribbed surface of the belt from rib to rib , are considered normal, These are not reasons to replace the belt.

- If chunks of belt material are missing between the cracks, the belt should be replaced.

- Cracks running along the rib (not across) are not normal. Any belts with cracks running along the rib should be replaced.

- Replace the belt if it has excessive wear, frayed cords or severe glazing.

Drive Pulleys

- Verify the pulleys have no side to side wobble, and rotate freely. Replace if necessary.

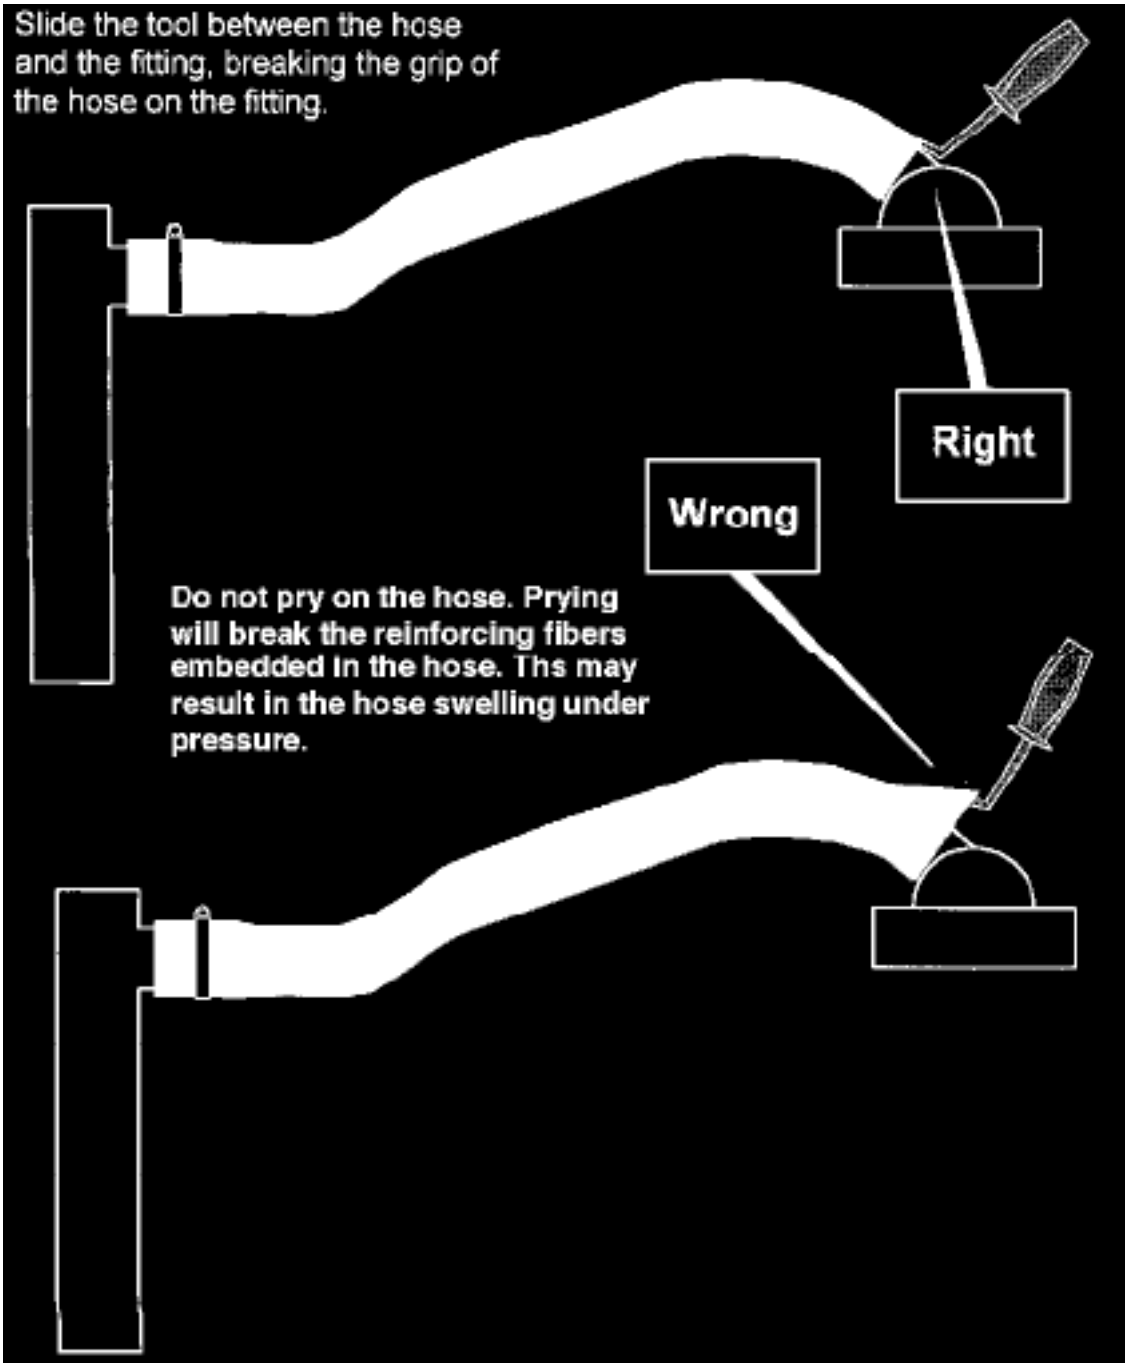
- Verify the pulleys are properly aligned. Adjust or replace as necessary.

Belt Removal

Do not attempt to bump the drive belts off with the starter. This practice can damage the belt, pulley, and technician. Removing the belt by relaxing the tension will allow you to correctly adjust the tension when installing the belt.

DRIP PAN

Prior to removing any hose or the water pump, place a large drip pan under the engine. Although the coolant may be drained from the radiator, there is still a large amount of residual coolant trapped in the hoses and water pump.



HOSE REMOVAL

- Prior to pulling the hose from the fitting, rotate/twist the hose on the fitting to break the grip of any corrosion present.

- If the hose is to be replaced, it may be quicker to cut hose from the fitting.

CAUTION: When cutting the hose be careful not to damage the fitting.

- A radiator hose removal tool may help free up stubborn hoses.

CAUTION: -

Do not use any device to pry the hose off of the fitting.

- If at any time a tearing or ripping sound is heard (though the hose appears fine) the hose should be replaced. The sound is coming from the internal reinforcing fibers embedded in the hose. Once the fibers have been broken the hose will be subject to swelling and rupture when pressure is applied.

WATER PUMP REMOVAL

After removing the retaining bolts the water pump may still be stuck to the engine. The original gasket sealant may cause the pump to firmly stick to engine. A few soft blows from a rubber mallet or block of wood will generally loosen the pump.

CAUTION: -

Verify that ALL of the retaining bolts are removed.

- Do not pry between the pump and the gasket. This may damage the pump sealing surface.

- Upon breaking the seal, a large amount of coolant trapped in the block will generally pour out from the water pump opening. Be sure to have a drip pan prepositioned.

Catalytic Converter: Customer Interest Exhaust System - Sulfur Odor

Article No. 93-24-19

11/24/93

EXHAUST - 4.0L - SULFUR ODOR

LIGHT TRUCK: 1990-93 RANGER 1991-93 EXPLORER

This TSB article is being republished in its entirety to correct the model application.

CALIBRATION: 0-58A-R00, 0-58P-R00, 1-58A-R10, 1-58P-R10, 2-58A-R00, 2-58P-R00, 0-58B-R00, 0-58R-R00, 1-58B-R10, 1-58R-R10, 2-58B-R00, 2-58R-R00

WARNING: THIS MODIFICATION IS AUTHORIZED ONLY FOR THE LISTED ENGINE. PERFORMING THIS MODIFICATION ON OTHER ENGINE CALIBRATIONS IS UNAUTHORIZED AND COULD CREATE LIABILITY UNDER APPLICABLE FEDERAL OR LOCAL LAWS.

ISSUE: An objectionable exhaust sulfur odor may be experienced during various driving conditions. This may be caused by the operating strategy of the EEC IV processor or by the catalytic converter, depending on the particular application.

ACTION: Use the following procedure to determine if a new EEC IV processor or a new catalytic converter is required. Vehicles previously serviced by TSB 93-3-17 may already have had the processor changed.

1. Perform the diagnostic procedure in the 1993 Powertrain Control/Emissions Diagnosis Service Manual, Page 2A-73. Service as required.

2. If the vehicle is a 1991-1992 Explorer with automatic transmission and the sulfur odor still exists:

a. Verify the processor part number. If not already updated, install a new EEC IV processor. Refer to the EEC IV Processor Application Chart contained in this TSB article for correct parts usage.

NOTE: THE BAP SENSOR IS NOT REQUIRED WITH THE NEW POWERTRAIN CONTROL MODULE BUT MAY REMAIN CONNECTED WITHOUT INTERFERENCE.

b. For 1991 models only, in addition to the standard entries on the Authorized Modifications Decal, write in the following instructions: "USE 1992 POWERTRAIN CONTROL/EMISSION DIAGNOSIS SERVICE MANUAL".

3. If the vehicle is:

a. a 1991-1992 Explorer with manual transmission,

b. a 1993 California Ranger/Explorer (automatic or manual transmission), or

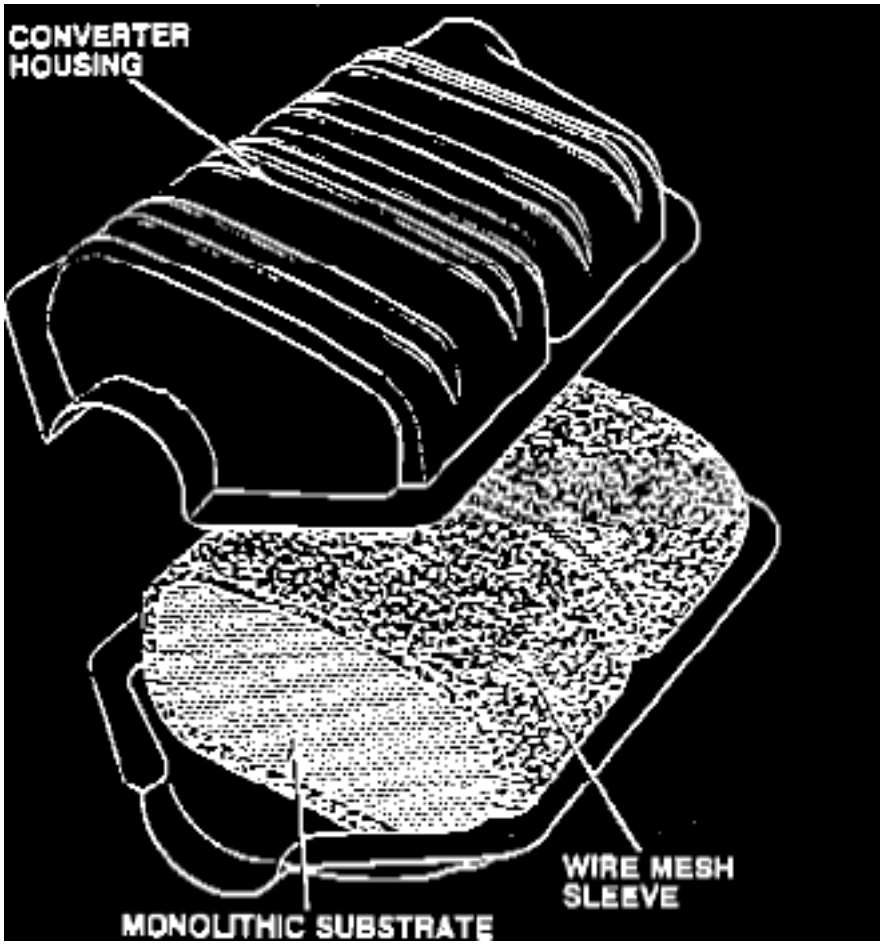
Exhaust System w/Catalytic Converter



Catalytic Converter: Description and Operation

The Catalytic Converter is mounted under the vehicles body within the exhaust system, and is designed to convert harmful exhaust gas pollutants, Carbon Monoxide (CO), Hydrocarbons (HC), and Oxides of Nitrogen (NOx) to harmless by-products of Nitrogen (N), Carbon Dioxide (CO2) and water vapor (H2O) through a catalytic chemical reaction.

Single Brick Catalytic Converter

Two types of converters in use today are the Conventional Oxidation Converter (COC) and Oxidation-Reduction Converter. Both consists of two stamped aluminum or stainless steel pieces welded together to form a round or oval housing.

Oval-type converters contain tiny pellets that are impregnated with the catalyzing element(s). Although this type of converter is known to create a fair amount of exhaust restriction, it is less expensive to manufacture and in some vehicle models contaminated pellets may be replaced. The round-type converter contains one or more ceramic monolithic honeycomb substrates. The substrate bricks or beds are impregnated with the catalyzing element(s), then covered by a wire mesh sleeve for insulation and protection from shock and severe jolts. A diffuser inside the shell allows the exhaust gases to flow uniformly over the entire area of the substrate.

THE OXIDATION REACTION

In order to change HC and CO into harmless materials, the catalytic elements (platinum and palladium) start an oxidation, or burning, reaction in the catalytic converter. Oxidation is the addition of oxygen to an element or compound. If there is not already enough oxygen in the exhaust, a secondary air supply system is incorporated into the vehicle's design for additional air injection. During the oxidation process, Oxygen (O2) mixes with the excess HC and CO to form H2O and CO2. During the oxidation reaction process, considerable heat (900~F to 1,600~F) is generated. Caution should be taken while working on or around the catalytic converter and other exhaust system components.

THE REDUCTION REACTION

Reduction is the opposite of oxidation, or the chemical removal of oxygen from a material. The reduction reaction changes NOx to harmless nitrogen (N) and (CO2) by chemically moving the oxygen from the NOx compound to the CO compound. The catalytic elements required for the reduction process are platinum and rhodium.

The Three-Way Catalytic Converter (TWC) is designed to reduce all three exhaust pollutants, but works best to reduce NOx when the CO level of the exhaust is between 0.8 and 1.5 percent. As the CO level increases or decreases from that percentage, the 3-way converters efficiency decreases. Exhaust gas first passes through the catalyst, where NOx is reduced to N2 and CO2; then through the catalyst where HC and CO are changed to H2O and CO2. The Light-Off Catalytic Converter (LOC) is a single bed oxidation-type converter, and is mounted to the exhaust manifold ahead of the main converter. The LOC primarily used in controlling HC and CO emissions during cold engine warm-up, while the main converter has not yet reached operating temperature. Heat from the exhaust manifold rapidly warms the LOC in order to start the Oxidation Process, which is then continued at the main converter. The Light-Off Catalytic Converter is also referred to as a Pre-Cat or a Mini-Cat by other vehicle manufacturers.

Catalytic Converter: Testing and Inspection

NOTE: A blocked or restricted exhaust system usually results in loss or lack of power or popping through the intake. Verify that this condition is not caused by ignition or timing problems, then proceed with diagnosis.

1. Visually inspect exhaust system for collapsed pipes, holes and cracks. Replace any damaged components.

2. Attach vacuum gauge to intake manifold vacuum source.

3. Connect a tachometer.

4. START engine and observe vacuum gauge needle.

5. Gradually increase the engine rpm to 2000 with the transmission in NEUTRAL. NOTE: The vacuum gauge reading may be normal when the engine is first started and idled. However, excessive restriction in the exhaust system will cause the vacuum gauge needle to drop to a low point even while the engine is idling.

6. Decrease rpm to idle speed. With the engine rpm at 2000, did manifold vacuum reach above 16 inches? If so, there is no restriction within the exhaust system. Refer to Diagnosis by Symptom/Lack of Power. If not, proceed to next step.

7. With vacuum gauge and tachometer still in place.

8. Gradually increase the engine rpm from base idle to 2000 rpm with the transmission in NEUTRAL.

9. While maintaining increased engine rpm, observe the RATE of speed of the vacuum gauge needle as it falls and rises. NOTE: a.

On a non-restricted system the needle will drop to zero and then quickly return to the normal setting without delay.

b. On a restricted system, as the engine rpm is increased to 2000 the vacuum gauge needle will slowly drop to zero and slowly rise to normal.

c. The rate of speed at which the vacuum gauge needle returns to the normal setting is much slower on a restricted system than on a non-restricted system.

10. Decrease engine rpm to base idle.

11. Was needle return rate much slower than that of a non-restricted system? If not, there is no restriction within the exhaust system. Refer to LACK OF POWER/DIAGNOSIS BY SYMPTOM. If so, proceed to next step.

12. Turn OFF engine.

13. Disconnect exhaust system at the muffler(s).

14. Repeat vacuum test.

15. Did manifold vacuum reach above 16". If so, replace muffler(s). If not, proceed to next step.

16. Turn OFF engine.

17. Disconnect exhaust system at catalytic converter(s).

18. Repeat vacuum test.

19. Did manifold vacuum reach above 16". If so, replace converter(s). If not, proceed to next step.

20. Turn OFF engine.

21. Disconnect exhaust system at exhaust manifold(s).

22. Repeat vacuum test.

23. Did manifold vacuum reach above 16". If so, restriction is located between exhaust manifold(s) and catalytic converter(s). If not, proceed to next step.

24. Remove the exhaust manifold(s) and inspect the ports for casting flash by dropping a length of chain into each port. NOTE: Do not use a wire or a lamp to check ports. The restriction may be large enough for the wire or light to pass through but small enough to cause excessive back pressure at high rpm.

25. Is a restriction present? If so, remove casting flash or replace exhaust manifold. If not, refer to LACK OF POWER/DIAGNOSIS BY SYMPTOM.

Engine Control Module: Customer Interest Exhaust System - Sulfur Odor

Article No. 93-24-19

11/24/93

EXHAUST - 4.0L - SULFUR ODOR

LIGHT TRUCK: 1990-93 RANGER 1991-93 EXPLORER

This TSB article is being republished in its entirety to correct the model application.

CALIBRATION: 0-58A-R00, 0-58P-R00, 1-58A-R10, 1-58P-R10, 2-58A-R00, 2-58P-R00, 0-58B-R00, 0-58R-R00, 1-58B-R10, 1-58R-R10, 2-58B-R00, 2-58R-R00

WARNING: THIS MODIFICATION IS AUTHORIZED ONLY FOR THE LISTED ENGINE. PERFORMING THIS MODIFICATION ON OTHER ENGINE CALIBRATIONS IS UNAUTHORIZED AND COULD CREATE LIABILITY UNDER APPLICABLE FEDERAL OR LOCAL LAWS.

ISSUE: An objectionable exhaust sulfur odor may be experienced during various driving conditions. This may be caused by the operating strategy of the EEC IV processor or by the catalytic converter, depending on the particular application.

ACTION: Use the following procedure to determine if a new EEC IV processor or a new catalytic converter is required. Vehicles previously serviced by TSB 93-3-17 may already have had the processor changed.

1. Perform the diagnostic procedure in the 1993 Powertrain Control/Emissions Diagnosis Service Manual, Page 2A-73. Service as required.

2. If the vehicle is a 1991-1992 Explorer with automatic transmission and the sulfur odor still exists:

a. Verify the processor part number. If not already updated, install a new EEC IV processor. Refer to the EEC IV Processor Application Chart contained in this TSB article for correct parts usage.

NOTE: THE BAP SENSOR IS NOT REQUIRED WITH THE NEW POWERTRAIN CONTROL MODULE BUT MAY REMAIN CONNECTED WITHOUT INTERFERENCE.

b. For 1991 models only, in addition to the standard entries on the Authorized Modifications Decal, write in the following instructions: "USE 1992 POWERTRAIN CONTROL/EMISSION DIAGNOSIS SERVICE MANUAL".

3. If the vehicle is:

a. a 1991-1992 Explorer with manual transmission,

b. a 1993 California Ranger/Explorer (automatic or manual transmission), or

Pin locations given for reference only. Probing 60 pin connector with DVOM probe will result in permanent damage to the pin connectors. Always probe as directed, using the Breakout Box.

ECA Connector Pin Identification

Engine Control Module: Description and Operation Electronic Control Assembly (ECA)

The Electronic Control Assembly (ECA) receives ignition ground and Profile Ignition Pickup (PIP) signals from the EDIS module then generates a Spark Angle Word (SAW) output signal based on fuel, air and other sensor information. An IDM signal is received from the EDIS module to determine if a failure mode should be recorded. For diagnosis and testing of the ECA refer to "COMPUTERIZED ENGINE CONTROLS".

Engine Control Module: Description and Operation Failure Mode Effects Management

PURPOSE

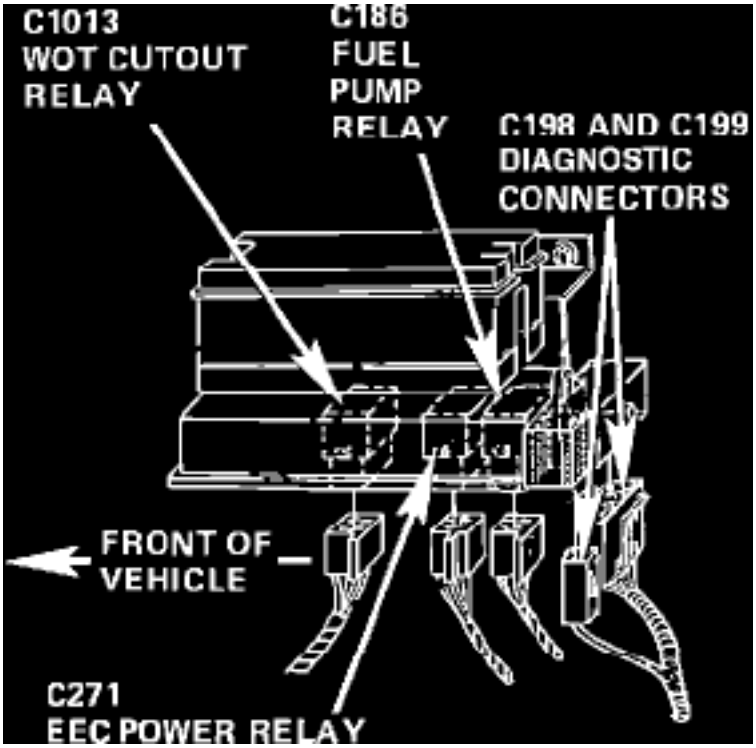
Operating mode that attempts to keep the vehicle driveable in the event of certain Electronic Engine Control (EEC) or ignition system failures.

Engine Control Module: Service and Repair

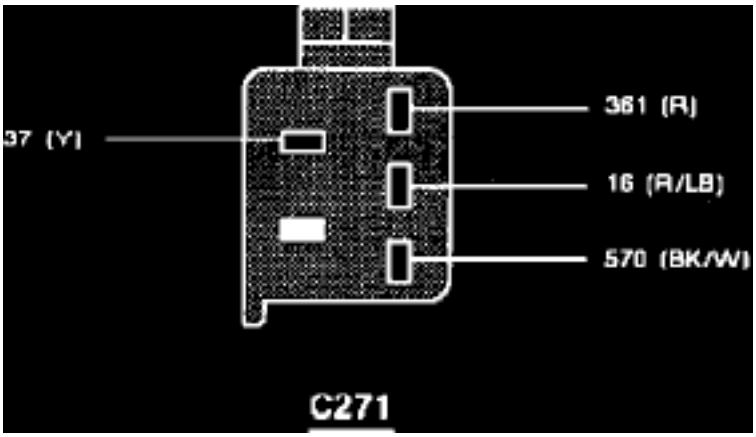
The processor stores data about vehicle operating conditions and uses this information to compensate for component tolerances. When an emission related component is replaced, Keep Alive Memory (KAM) should be cleared to erase the data stored by the processor from the original component.

1. With the ignition switch OFF, disconnect the negative battery cable for a minimum of five minutes, then reconnect the cable.

2. Operate the vehicle for a minimum of ten miles to allow the Engine Control Assembly (ECA) to relearn values for optimum driveability and performance. NOTE: Distance varies with vehicle application.



Relay And Diagnostic Connectors



EEC-IV Power Relay Connector

Main Relay (Computer/Fuel System): Description and Operation

The Engine Control Assembly (ECA) receives its operating voltage from the Electronic Engine Control (EEC) power relay. When the ignition switch is turned ON, the normally OPEN contact points of the relay CLOSE and supply power to the ECA. The control coil circuit of the relay contains a diode, wired in series, to prevent relay operation if the battery polarity is reversed, preventing damage to the ECA.

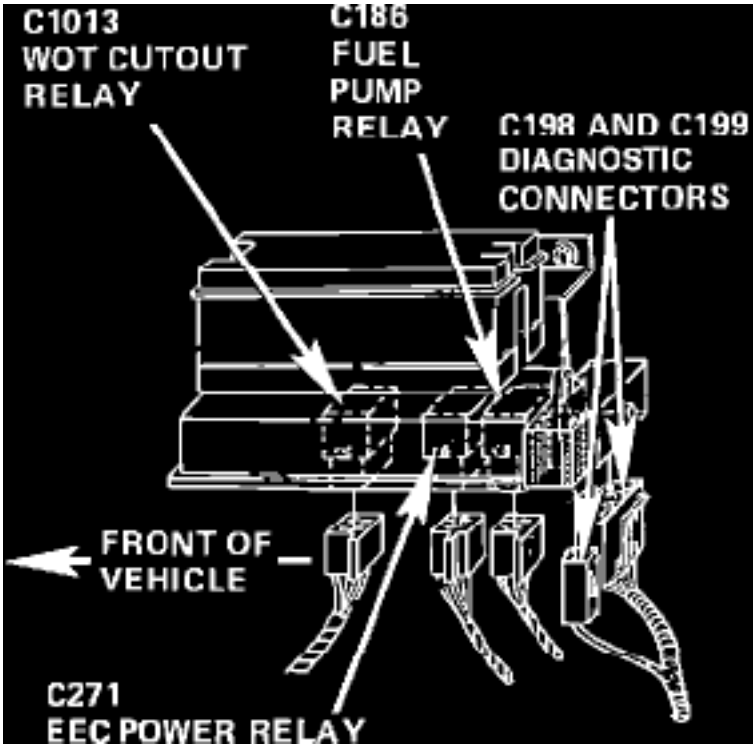
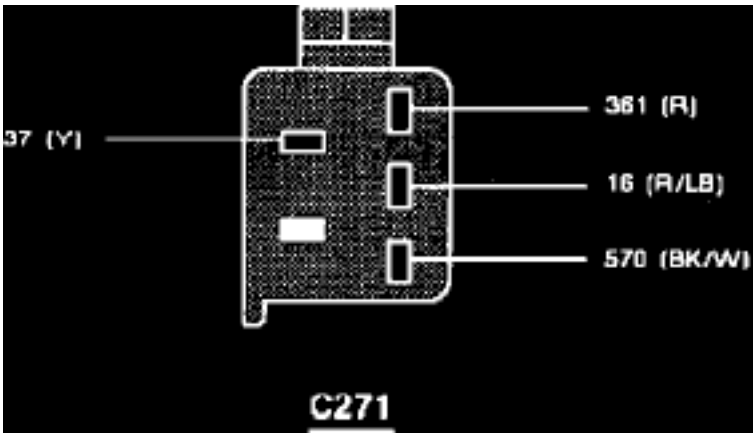
Fuel Pump Relay Connector

Fuel Pump Relay: Description and Operation

When the ignition switch is turned ON, the Electronic Engine Control (EEC) power relay is ENERGIZED, providing power to the fuel pump relay. Fuel pump power is provided through the fuel pump relay contacts and an inertia switch. If the ignition switch is not turned to the START position in approximately one second, a timer circuit in the Engine Control Assembly (ECA) will open the ground circuit to the fuel pump relay, causing the fuel pump relay contacts to OPEN. This action stops the power supply to the fuel pump. When the ignition switch is turned to the START position, the ECA closes the ground circuit to the fuel pump relay, resuming operation of the fuel pump. After the engine switch is returned to the ON position, power to the fuel pump is supplied through the fuel pump relay. The ECA monitors engine speed and OPENS the fuel pump relay ground circuit if the engine speed drops below 120 rpm.



Relay And Diagnostic Connectors



EEC-IV Power Relay Connector

Main Relay (Computer/Fuel System): Description and Operation

The Engine Control Assembly (ECA) receives its operating voltage from the Electronic Engine Control (EEC) power relay. When the ignition switch is turned ON, the normally OPEN contact points of the relay CLOSE and supply power to the ECA. The control coil circuit of the relay contains a diode, wired in series, to prevent relay operation if the battery polarity is reversed, preventing damage to the ECA.

Ignition Control Module: Customer Interest Engine - Loss of Power At High Engine Speeds

Article No. 92-3-8

01/29/92

LOSS OF POWER - 4.0L - AT HIGH ENGINE SPEEDS BETWEEN 3800 AND 4700 RPM - CANADIAN VEHICLES

LIGHT TRUCK: 1990-92 RANGER 1991-92 EXPLORER

ISSUE: A loss of power may occur at engine speeds between 3800 and 4700 RPM under wide open throttle. After several months use, this can be caused by an interaction between MMT (octane enhancer additive in Canadian fuel) contaminated spark plugs and the EDIS (Electronic Distributorless Ignition System) module. A check engine light concern may be present with Self-Test Codes 18 (212 three digit code) and 45 in continuous memory.

ACTION: If service is required, confirm the concern and, if necessary, replace the EDIS module and spark plugs. Refer to the following procedure for service details.

1. Confirm the customer concern by accelerating the vehicle at wide open throttle from 3000 RPM to 4700 RPM with the transmission in second gear.

^ If the vehicle exhibits a loss of power (caused by fuel shutoff of one of the fuel banks) in this RPM range, follow Steps 2 and 3.

^ Otherwise, follow the Powertrain Control/Emissions Diagnosis Manual's diagnostic procedures.

NOTE:

FUEL SHUTOFF (REV. LIMITER) AT 4850 RPM FOR AUTOMATICS AND 5200 RPM FOR MANUAL TRANSMISSIONS IS NORMAL AND SHOULD NOT BE CONFUSED WITH THIS CONCERN.

2. Replace all the spark plugs.

3. Replace the EDIS module (F1TZ-12KO72-B).

NOTE:

THIS MODULE WILL ELIMINATE THE PREMATURE FUEL SHUTOFF CONCERN. THE RED DEPOSITS ON THE SPARK PLUGS WILL STILL OCCUR AFTER TIME. THIS IS CONSIDERED NORMAL FOR THIS TYPE OF FUEL.

LIGHT TRUCK: 1990-94 AEROSTAR, RANGER 1991-94 EXPLORER

ISSUE: Some vehicles may have a disconnect of the Ignition Control Module (ICM) connector or moisture buildup within the connector. This can cause hard to start/no start, rough idle, or "check engine light" illumination concerns. The improved gasket and connector retainer that are currently used in production are now available for service of prior model distributorless ignition systems.

ACTION: Install new Connector Sleeve Retainer Clip and a current production seal (gasket). The clip assembles in between the connector beams and the ICM which will prevent accidental disconnects. The new seal is a "solid silicone" gasket that provides improved resistance to moisture entry into the connector. Refer to the ICM Connector Harness Wire Service kit (F5CZ-14A411-AA) for service details (I.S. 6621).

LIGHT TRUCK: 1990-92 RANGER 1991-92 EXPLORER

ISSUE: A loss of power may occur at engine speeds between 3800 and 4700 RPM under wide open throttle. After several months use, this can be caused by an interaction between MMT (octane enhancer additive in Canadian fuel) contaminated spark plugs and the EDIS (Electronic Distributorless Ignition System) module. A check engine light concern may be present with Self-Test Codes 18 (212 three digit code) and 45 in continuous memory.

ACTION: If service is required, confirm the concern and, if necessary, replace the EDIS module and spark plugs. Refer to the following procedure for service details.

1. Confirm the customer concern by accelerating the vehicle at wide open throttle from 3000 RPM to 4700 RPM with the transmission in second gear.

^ If the vehicle exhibits a loss of power (caused by fuel shutoff of one of the fuel banks) in this RPM range, follow Steps 2 and 3.

^ Otherwise, follow the Powertrain Control/Emissions Diagnosis Manual's diagnostic procedures.

NOTE:

FUEL SHUTOFF (REV. LIMITER) AT 4850 RPM FOR AUTOMATICS AND 5200 RPM FOR MANUAL TRANSMISSIONS IS NORMAL AND SHOULD NOT BE CONFUSED WITH THIS CONCERN.

2. Replace all the spark plugs.

3. Replace the EDIS module (F1TZ-12KO72-B).

NOTE:

THIS MODULE WILL ELIMINATE THE PREMATURE FUEL SHUTOFF CONCERN. THE RED DEPOSITS ON THE SPARK PLUGS WILL STILL OCCUR AFTER TIME. THIS IS CONSIDERED NORMAL FOR THIS TYPE OF FUEL.

LIGHT TRUCK: 1990-94 AEROSTAR, RANGER 1991-94 EXPLORER

ISSUE: Some vehicles may have a disconnect of the Ignition Control Module (ICM) connector or moisture buildup within the connector. This can cause hard to start/no start, rough idle, or "check engine light" illumination concerns. The improved gasket and connector retainer that are currently used in production are now available for service of prior model distributorless ignition systems.

ACTION: Install new Connector Sleeve Retainer Clip and a current production seal (gasket). The clip assembles in between the connector beams and the ICM which will prevent accidental disconnects. The new seal is a "solid silicone" gasket that provides improved resistance to moisture entry into the connector. Refer to the ICM Connector Harness Wire Service kit (F5CZ-14A411-AA) for service details (I.S. 6621).

Ignition Control Module: Description and Operation

Module And Pin-Out

The EDIS module receives the Variable Reluctance Sensor (VRS) signal from the crankshaft sensor and the Spark Advance Word (SAW) signal from the EEC IV module. During normal operation, Profile Ignition Pickup (PIP) is sent to the EEC IV module from the EDIS module, providing base timing and RPM information. The VRS signal provides the EDIS module with the information required to synchronize the ignition coils for proper firing sequence. The Spark Angle Word (SAW) signal is a pulse width modulated signal and contains the optimum spark timing information. Spark angle is determined by the EDIS module using a zero excess dwell control routine.

Ignition Control Module: Service and Repair

REMOVAL:

Ignition Module

1. Disconnect both battery cables, then remove the battery from the vehicle. 2. Disconnect the electrical connector from the ignition module.

NOTE: To disconnect the module connector, push on the connector where it says PUSH, then slide the connector from the module.

3. Remove the ignition module retaining bolt and remove the module by sliding the assembly up until it is released from the teardrop shaped hole in

the sheet metal.

INSTALLATION:

1. Place the module on the sheet metal so the retaining rivet passes through the hole, then slide the module down into position. Install the retaining

bolt. Torque to 22-31 in lb (2.2-3.5 Nm).

2. Connect the electrical connector to the module. 3. Install the battery and cables.

ISSUE This TSB article is a diagnostic procedure to address vehicles that exhibit lean driveability symptoms and may or may not have any Diagnostic Trouble Codes (DTCs) stored in memory.

ACTION Follow the diagnostic procedures described in the following Service Tip. The revised diagnostic procedure is a more accurate means of diagnosing the symptoms.

SERVICE TIP

MASS AIR FLOW (MAF) DISCUSSION

MAF sensors can get contaminated from a variety of sources: dirt, oil, silicon, spider webs, potting compound from the sensor itself, etc. When a MAF sensor gets contaminated, it skews the transfer function such that the sensor over-estimates air flow at idle (causes the fuel system to go rich) and under-estimates air flow at high air flows (causes fuel system to go lean). This means Long Term Fuel Trims will learn lean (negative) corrections at idle and learn rich (positive) corrections at higher air flows.

If vehicle is driven at Wide Open Throttle (WOT) or high loads, the fuel system normally goes open loop rich to provide maximum power. If the MAF sensor is contaminated, the fuel system will actually be lean because of under-estimated air flow. During open loop fuel operation, the vehicle applies Long Term Fuel Trim corrections that have been learned during closed loop operation. These corrections are often lean corrections learned at lower air flows. This combination of under-estimated air flow and lean fuel trim corrections can result in spark knock/detonation and lack of power concerns at WOT and high loads.

One of the indicators for diagnosing this condition is barometric pressure. Barometric pressure (BARO) is inferred by the Powertrain Control Module (PCM) software at part throttle and WOT (there is no actual BARO sensor on MAF-equipped vehicles, except for the 3.8L Supercharged engine). At high air flows, a contaminated MAF sensor will under-estimate air flow coming into the engine, hence the PCM infers that the vehicle is operating at a higher altitude. The BARO reading is stored in Keep Alive Memory (KAM) after it is updated. Other indicators are Long Term Fuel Trim and MAF

voltage at idle.

NOTE

THE FOLLOWING PROCEDURE MAY ALSO BE USED TO DIAGNOSE VEHICLES THAT DO NOT HAVE FUEL SYSTEM/HO2S SENSOR DTCS.

Symptoms

^ Lack of Power

^ Spark Knock/Detonation

^ Buck/Jerk

^ Hesitation/Surge on Acceleration

^ Malfunction Indicator Lamp (MIL) Illuminated -

DTCs P0171, P0172, P0174, P0175 may be stored in memory

OBDII DTCs

^ P0171, P0174 (Fuel system lean, Bank 1 or 2)

^ P0172, P0175, (Fuel system rich, Bank 1 or 2)

^ P1130, P1131, P1132, (HO2S11 lack of switching, Bank 1)

^ P1150, P1151, P1152, (HO2S21 lack of switching, Bank 2)

OBDI DTCs

^ 181, 189 (Fuel system lean, Bank 1 or 2)

^ 179, 188 (Fuel system rich, Bank 1 or 2)

^ 171, 172, 173 (HO2S11 lack of switching, Bank 1)

^ 175, 176, 177 (HO2S21 lack of switching, Bank 2)

^ 184, 185 (MAF higher/lower than expected)

^ 186, 187 (Injector pulse width higher/lower than expected)

NOTE:

DO NOT DISCONNECT THE BATTERY. IT WILL ERASE KEEP ALIVE MEMORY AND RESET LONG TERM FUEL TRIM AND BARO TO THEIR STARTING/BASE VALUES. THE BARO PARAMETER IDENTIFICATION DISPLAY (PID) IS USED FOR THIS DIAGNOSTIC PROCEDURE. ALL OBDII APPLICATIONS HAVE THIS PID AVAILABLE. THERE ARE SOME OBDI VEHICLES THAT DO NOT HAVE THE BARO PID, FOR THESE VEHICLES OMIT THE BARO CHECK AND REFER ONLY TO STEPS 2, 3, AND 4 IN THE DIAGNOSTIC PROCEDURE.

BAROMETRIC PRESSURE REFERENCE

Barometric Pressure (in. Hg.)	Barometric Pressure (kPa)	BARO/MAP PID (Hz)	Altitude above sea level (ft)
3.5	11.8	89.3	
5	16.9	92.8	
10	33.8	104.6	
15	50.7	117.0	14,000
20	67.5	129.6	10,000
21	70.9	132.5	9,000
22	74.3	135.4	8,000
23	77.7	138.3	7,000
24	81.1	141.1	6,000
25	84.4	144.0	5,000
26	87.8	146.9	4,000
27	91.2	149.8	3,000
28	94.6	152.8	2,000
29	97.9	155.8	1,000
30	101.3	158.9	0 (sea level)
31	104.7	162.0	
31.875	107.7	164.7	

1. Look at the BARO PID. Refer to the Barometric Pressure Reference Chart in this article. At sea level, BARO should read about 159 Hz (29.91 in. Hg). As a reference, Denver, Colorado at 1524 meters (5000 ft.) altitude should be about 144 Hz (24.88 in.Hg). Normal learned BARO variability is up to +/- 6 Hz (+/- 2 in. Hg.). If BARO indicates a higher altitude than you are not at (7 or more Hz lower than expected), you may have MAF contamination. If available, Service Bay Diagnostic System (SBDS) has a Manifold Absolute Pressure (MAP) sensor that can be used as a barometric pressure reference. Use "MAP/BARO" test under "Powertrain," "Testers and Meters." Ignore the hookup screen. Connect GP2 to the reference MAP on the following screen.

NOTE

REMEMBER THAT MOST WEATHER SERVICES REPORT A LOCAL BAROMETRIC PRESSURE THAT HAS BEEN CORRECTED TO SEA LEVEL. THE BARO PID, ON THE OTHER HAND, REPORTS THE ACTUAL BAROMETRIC PRESSURE FOR THE ALTITUDE THE VEHICLE IS BEING OPERATED IN. LOCAL WEATHER CONDITIONS (HIGH AND LOW PRESSURE AREAS) WILL CHANGE THE LOCAL BAROMETRIC PRESSURE BY SEVERAL INCHES OF MERCURY (+/- 3 Hz, +/- 1 in. Hg.).

NOTE

BARO IS UPDATED ONLY WHEN THE VEHICLE IS AT HIGH THROTTLE OPENINGS. THEREFORE, A VEHICLE WHICH IS DRIVEN DOWN FROM A HIGHER ALTITUDE MAY NOT HAVE HAD AN OPPORTUNITY TO UPDATE THE BARO VALUE IN KAM. IF YOU ARE NOT CONFIDENT THAT BARO HAS BEEN UPDATED, PERFORM THREE OR FOUR HEAVY, SUSTAINED ACCELERATIONS AT GREATER THAN HALF-THROTTLE TO ALLOW BARO TO UPDATE.

2. On a fully warmed up engine, look at Long Term Fuel Trim at idle, in Neutral, A/C off, (LONGFT1 and/or LONGFT2 PIDs). If it is more negative than -12%, the fuel system has learned lean corrections which may be due to the MAF sensor over-estimating air flow at idle. Note that both Banks 1 and 2 will exhibit negative corrections for 2-bank system. If only one bank of a 2-bank system has negative corrections, the MAF sensor is probably not contaminated.

3. On a fully warmed up engine, look at MAF voltage at idle, in Neutral, A/C off (MAF V PID). If it's 30% greater than the nominal MAF V voltage listed in the Powertrain Control/Emissions Diagnosis (PC/ED) Diagnostic Value Reference Charts for your vehicle, or greater than 1.1 volts as a rough guide, the MAF sensor is over-estimating air flow at idle.

4. If at least tow of the previous three steps are true, proceed to disconnect the MAF sensor connector. This puts the vehicle into Failure Mode and Effects Management (FMEM). In FMEM mode, air flow is inferred by using rpm and throttle position instead of reading the MAF sensor. (In addition, the BARO value is reset to a base/unlearned value.) If the lean driveability symptoms go away, the MAF sensor is probably contaminated and should be replaced. If the lean driveability symptoms do not go away, go to the PC/ED Service Manual for the appropriate diagnostics.

NOTE

DUE TO INCREASINGLY STRINGENT EMISSION/OBDII REQUIREMENTS, IT IS POSSIBLE FOR SOME VEHICLES WITH MAF SENSOR CONTAMINATION TO SET FUEL SYSTEM DTCs AND ILLUMINATE THE MIL WITH NO DRIVEABILITY CONCERNS. DISCONNECTING THE MAF ON THESE VEHICLES WILL, THEREFORE, PRODUCE NO IMPROVEMENTS IN DRIVEABILITY. IN THESE CASES, IF THE BARO, LONGFT1, LONGFT2, AND MAF V PIDs INDICATE THAT THE MAF IS CONTAMINATED, PROCEED TO REPLACE THE MAF SENSOR.

After replacing the MAF sensor, disconnect the vehicle battery (5 minutes, minimum to reset KAM, or on newer vehicles, use the "KAM Reset" feature on the New Generation Star (NGS) Tester and verify that the lean driveability symptoms are gone.

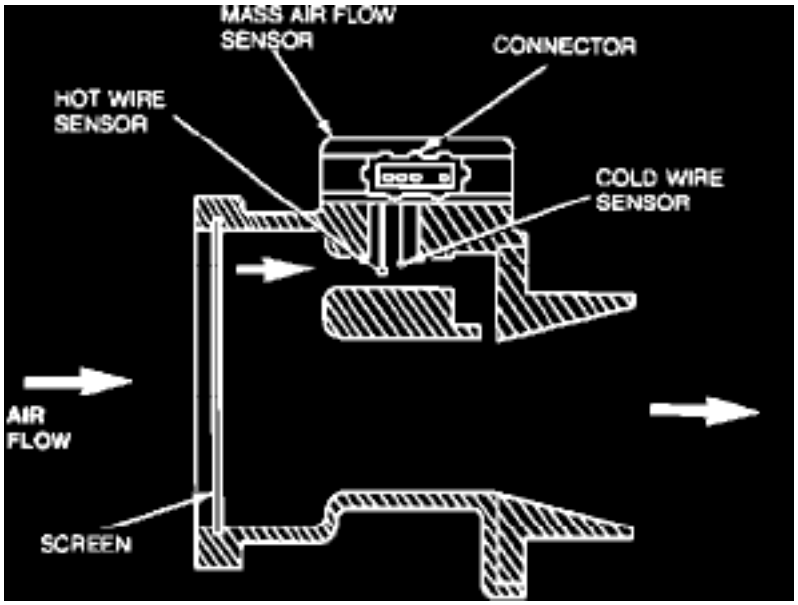
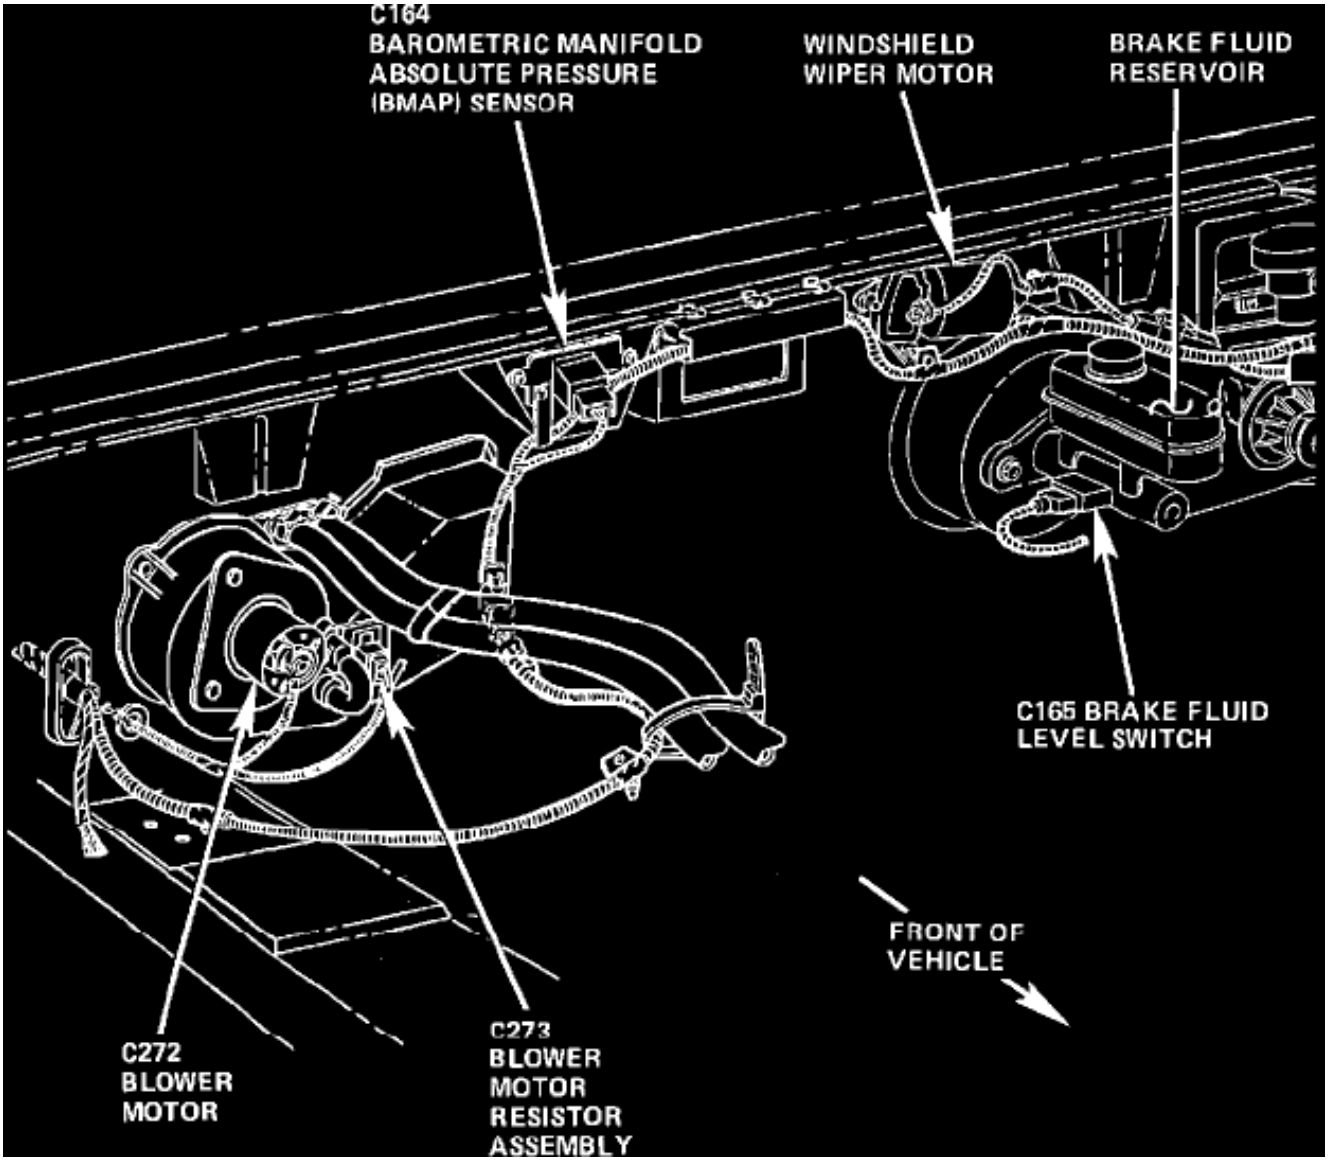
Mass Air Flow (MAF) Sensor



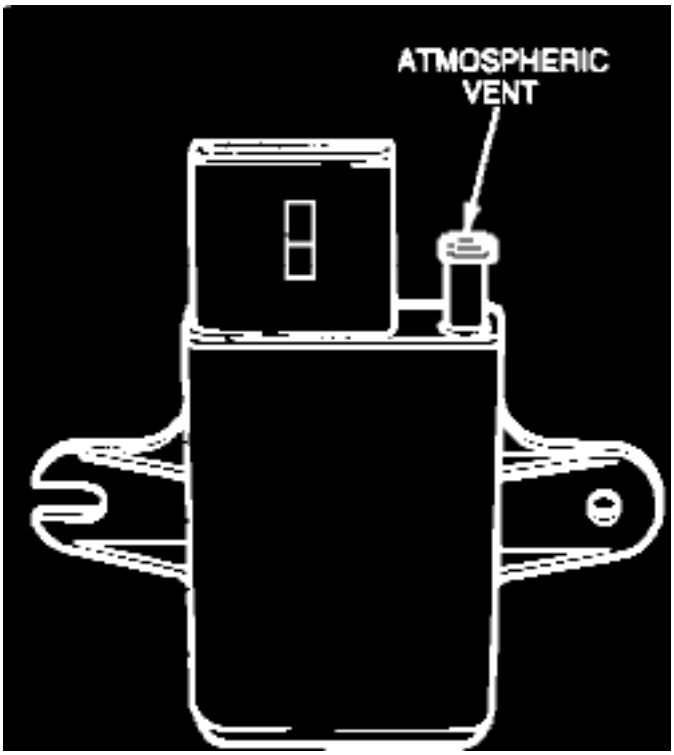
Mass Air Flow (MAF) Sensor: Description and Operation

Mass Air Flow Sensor

The Mass AirFlow (MAF) sensor, located between the air filter and the throttle body, is used to measure the mass of the air entering the engine due to volumetric displacement. The MAF sensor operates on the principle that if a mass is maintained at a constant temperature above the ambient environment, then the thermal loss is proportional to the mass flow of the cooling medium it is subjected to. The electronic module of the MAF sensor heats a wire element to 392°F (200°C) above ambient temperature. As air passes through the sensor, the air cools the wire element. The MAF sensor supplies more power to the wire to keep it at a constant temperature difference. When a drop in power useage occurs, the MAF sends a signal to the Engine Control Assembly (ECA) indicating the drop. The signal increases with the airflow into the engine.



Barometric/manifold Absolute Pressure (BMAP) Sensor



Barometric Pressure Sensor: Description and Operation

Barometric Pressure Sensor

The Barometric Pressure (BP) sensor is a frequency generating device that produces a varying signal depending on the amount of atmospheric (barometric) pressure. The Engine Control Assembly (ECA) monitors the frequency emitted from the BP sensor and converts the signal to atmospheric pressure. The ECA uses this reading to update the barometric pressure value stored in RAM memory. The ECA uses the input from the BP sensor to optimize the air/fuel ratio, ignition timing adjustment, and EGR flow control. The BP sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

Coolant Temperature Sensor/Switch (For Computer): Description and Operation

Engine Coolant Temperature Sensor

The Engine Coolant Temperature (ECT) sensor is threaded into a coolant passage with the sensing bulb extending into the coolant. The ECT sensor is a negative temperature coefficient sensor, meaning that as the temperature of the sensor increases, the resistance will decrease. As the resistance value changes, the signal sensed by the Engine Control Assembly (ECA) also changes. The ECA reads the varying sensor resistance and determines the engine operating temperature, using this information to optimize the air/fuel mixture and ignition timing. The ECT sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

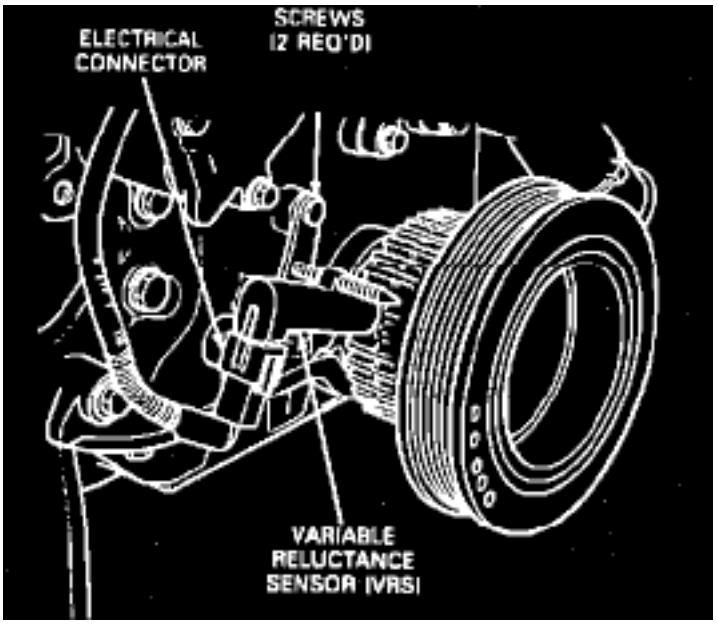
Crankshaft Position Sensor: Description and Operation

Crankshaft Timing Sensor

The crankshaft timing sensor is a variable reluctance type sensor. It is triggered by a 35 tooth trigger wheel tooth configuration machined into the rear of the crankshaft dampener. The signal generated by this sensor is called a Variable Reluctance Sensor (VRS) signal. The VRS signal provides the base timing and rpm information to the EDIS module. Base timing is set at 10° and is not adjustable.



Crankshaft Position Sensor: Service and Repair

Variable Reluctance (Crankshaft Position) Sensor

REMOVAL:

1. Disconnect the negative battery cable.

2. Disconnect the sensor electrical connector from the wiring harness.

3. Remove the Variable Reluctance (Crankshaft Position) Sensor mounting bolts and remove the sensor.

INSTALLATION:

1. Position the Variable Reluctance (Crankshaft Position) Sensor assembly on the engine.

2. Install the two sensor attaching bolts and tighten to specified torque. (SEE SPECIFICATIONS/MECHANICAL)

3. Route the sensor wiring harness and connect the electrical connector to the sensor.

4. Connect the negative battery cable.

This TSB article is being republished in its entirety to update model applicability and to revise the part number of the Low Volatility Sealant.

ISSUE: EGO sensors can be contaminated if volatile types of silicone are used when servicing the engine. Volatile silicones can migrate throughout the system during the first one hundred hours of service. They are commonly found in liquid "silicone rubber" sealants and gasket material. These products are commonly sold in tubes and caulking-type cartridges.

ACTION: When service is performed on the engine, only use new low volatility silicone sealant (F1AZ-19662-A) where specified. Also replace the contaminated EGO sensor if required.

CAUTION: DO NOT SUBSTITUTE CONVENTIONAL SILICONE RUBBER SEALANTS WHEN LOW VOLATILITY SILICONE SEALANT IS SPECIFIED.

Oxygen Sensor: Description and Operation

Heated Oxygen Sensor

The Heated Exhaust Gas Oxygen (HEGO) sensor is threaded into the exhaust manifold with a sampling tip extending into the exhaust stream. The sensor is a zirconium dioxide ceramic thimble with platinum surface electrodes. The ceramic thimble is oxygen ion conductive and generates voltage due to the oxygen content difference between the atmosphere and the exhaust gas. The sensor will generate a voltage signal between 0 volts (lean condition) and 1.1 volts (rich condition). The ECU reads this signal to achieve an air/fuel ratio of 14.7:1 when operating in CLOSED LOOP. The HEGO sensor must operate above 600°F. To quickly heat up the sensor, a heating element is incorporated into the sensor. The HEGO sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

Oxygen Sensor: Service and Repair

The oxygen sensor has a permanently attached wire and connector. This should not be removed, since the removal will affect proper operation of the oxygen sensor.

1. Disconnect electrical connector from oxygen sensor.

2. Using a suitable oxygen sensor wrench, carefully remove the sensor from exhaust manifold or pipe. The oxygen sensor may be difficult to remove when engine temperature is below 120°F. CAUTION: Excessive force may damage threads in exhaust manifold or pipe.

3. If a new sensor is being used, install the new sensor into the manifold or pipe.

4. If an old sensor is being reused, coat threads with anti-seize compound, then install the sensor into the manifold or pipe.

5. Torque the oxygen sensor to 30-36 lb. ft. (40-50 N-m), and reconnect the electrical connector.

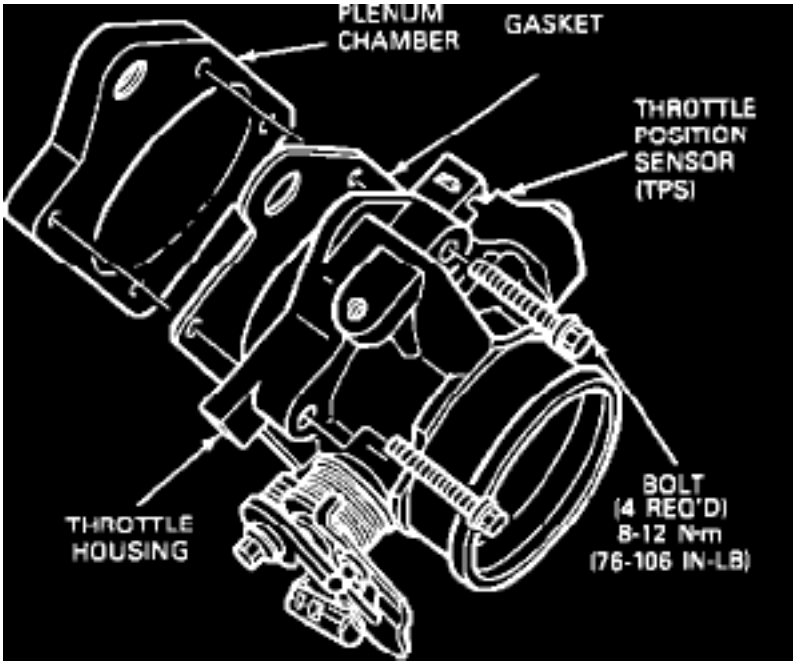
Throttle Position Sensor: Locations

Engine Compartment Components.

Top LH Front Of Engine

Applicable to: 4.0L/V6-244



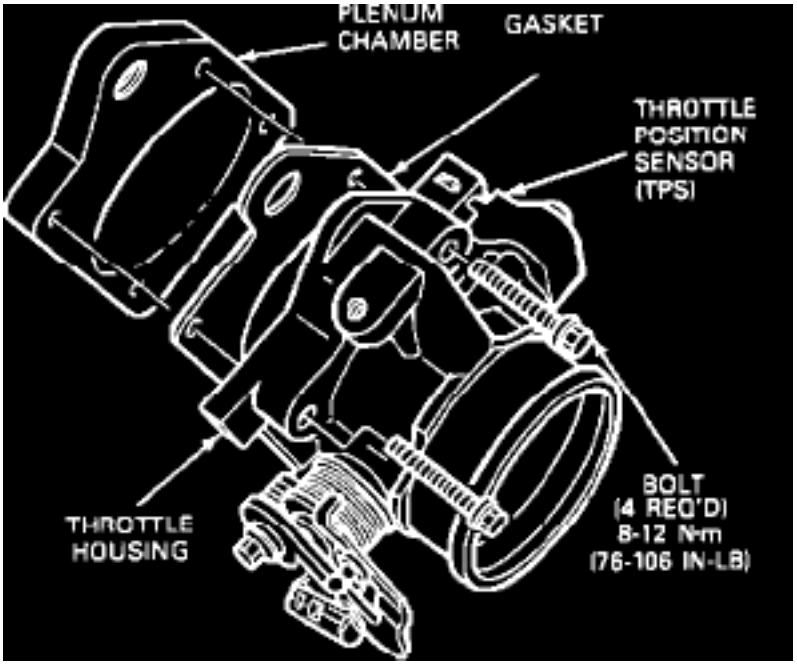
Throttle Position Sensor: Description and Operation

Throttle Body Assembly

The Throttle Position (TP) sensor, mounted on the throttle body, is a potentiometer that monitors throttle plate angle and sends a signal to the Engine Control Assembly (ECA). The TP sensor contains a pivot arm that moves along a curved resistor. One of the sensor leads supplies a five (5) volt reference signal (sent by the ECA) to the resistor. The second lead is used to ground the resistor. The third lead is for the voltage signal to the ECA. As the throttle plates move, the pivot arm moves along the curved resistor and receives a varying voltage signal. The ECA reads this signal and converts it into throttle plate angle. The voltage signal ranges from approximately one (1) volt at idle to approximately five (5) volts at wide open throttle. The TP sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

Throttle Position Sensor: Adjustments

The Throttle Position (TP) sensor is non-adjustable. If the voltage readings are out of range, the sensor must be replaced.



Throttle Position Sensor: Service and Repair

Throttle Body Assembly

1. Disconnect the Throttle Position (TP) sensor from the wiring harness.

2. If reinstalling the same TP sensor, mark the position of the TP sensor by scribing a mark on the sensor and throttle body.

3. Remove the TP sensor retaining screws, then remove the TP sensor and gasket.

4. Install a new gasket and the TP sensor, positioning the throttle position sensor so that the connector is facing rearward. Rotate the TP sensor clockwise to align the scribe mark (from step 2).

5. Install the TP sensor retaining screws, tightening to 11-16 lb. in. (1.2-1.8 N-m).

6. Connect the TP sensor electrical connector.

NOTE: The TP sensor is not adjustable.

Wire Color Code Identification

NOTE: Whenever a wire is labeled with two colors; the first color listed is the basic color of the wire, and the second color is the tracer marking of the wire. If the second color is followed by by a D, the tracer is dots. If the second color is followed by an H, the tracer is hash marks.

For example: BR/O is a brown wire with an orange stripe, R/Y D is a red wire with yellow dots and BK/W H is a black wire with white hash marks.

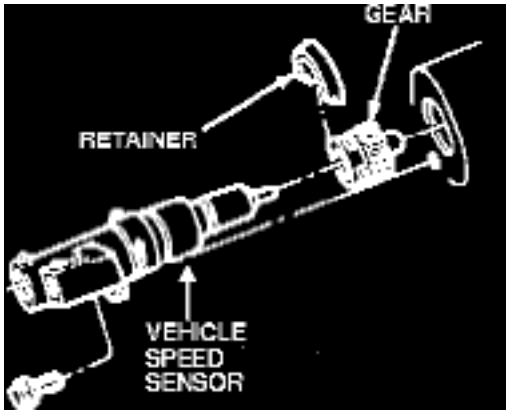
Vehicle Speed Sensor



Vehicle Speed Sensor: Description and Operation

Vehicle Speed Sensor

The Vehicle Speed Sensor (VSS) is a magnetic pulse generator driven by the transmission speedometer gear. The VSS produces 16 AC signals per revolution and sends this signal to the Engine Control Unit (ECA). The ECA converts this signal to a vehicle speed value and stores that value in RAM memory. The ECA uses this value to aid in controlling torque converter lock-up, coolant fan control, vehicle speed control, air/fuel ratio, and igniting timing.

Vehicle Speed Sensor: Service and Repair

1. Separate electrical connector leading to the amplifier assembly.

2. Disconnect upper and lower speedometer cables at the speed sensor. Remove speed sensor.

3. Reverse procedure to install.

ISSUE This TSB article is a diagnostic procedure to address vehicles that exhibit lean driveability symptoms and may or may not have any Diagnostic Trouble Codes (DTCs) stored in memory.

ACTION Follow the diagnostic procedures described in the following Service Tip. The revised diagnostic procedure is a more accurate means of diagnosing the symptoms.

SERVICE TIP

MASS AIR FLOW (MAF) DISCUSSION

MAF sensors can get contaminated from a variety of sources: dirt, oil, silicon, spider webs, potting compound from the sensor itself, etc. When a MAF sensor gets contaminated, it skews the transfer function such that the sensor over-estimates air flow at idle (causes the fuel system to go rich) and under-estimates air flow at high air flows (causes fuel system to go lean). This means Long Term Fuel Trims will learn lean (negative) corrections at idle and learn rich (positive) corrections at higher air flows.

If vehicle is driven at Wide Open Throttle (WOT) or high loads, the fuel system normally goes open loop rich to provide maximum power. If the MAF sensor is contaminated, the fuel system will actually be lean because of under-estimated air flow. During open loop fuel operation, the vehicle applies Long Term Fuel Trim corrections that have been learned during closed loop operation. These corrections are often lean corrections learned at lower air flows. This combination of under-estimated air flow and lean fuel trim corrections can result in spark knock/detonation and lack of power concerns at WOT and high loads.

One of the indicators for diagnosing this condition is barometric pressure. Barometric pressure (BARO) is inferred by the Powertrain Control Module (PCM) software at part throttle and WOT (there is no actual BARO sensor on MAF-equipped vehicles, except for the 3.8L Supercharged engine). At high air flows, a contaminated MAF sensor will under-estimate air flow coming into the engine, hence the PCM infers that the vehicle is operating at a higher altitude. The BARO reading is stored in Keep Alive Memory (KAM) after it is updated. Other indicators are Long Term Fuel Trim and MAF

voltage at idle.

NOTE

THE FOLLOWING PROCEDURE MAY ALSO BE USED TO DIAGNOSE VEHICLES THAT DO NOT HAVE FUEL SYSTEM/HO2S SENSOR DTCS.

Symptoms

^ Lack of Power

^ Spark Knock/Detonation

^ Buck/Jerk

^ Hesitation/Surge on Acceleration

^ Malfunction Indicator Lamp (MIL) Illuminated -

DTCs P0171, P0172, P0174, P0175 may be stored in memory

OBDII DTCs

^ P0171, P0174 (Fuel system lean, Bank 1 or 2)

^ P0172, P0175, (Fuel system rich, Bank 1 or 2)

^ P1130, P1131, P1132, (HO2S11 lack of switching, Bank 1)

^ P1150, P1151, P1152, (HO2S21 lack of switching, Bank 2)

OBDI DTCs

^ 181, 189 (Fuel system lean, Bank 1 or 2)

^ 179, 188 (Fuel system rich, Bank 1 or 2)

^ 171, 172, 173 (HO2S11 lack of switching, Bank 1)

^ 175, 176, 177 (HO2S21 lack of switching, Bank 2)

^ 184, 185 (MAF higher/lower than expected)

^ 186, 187 (Injector pulse width higher/lower than expected)

NOTE:

DO NOT DISCONNECT THE BATTERY. IT WILL ERASE KEEP ALIVE MEMORY AND RESET LONG TERM FUEL TRIM AND BARO TO THEIR STARTING/BASE VALUES. THE BARO PARAMETER IDENTIFICATION DISPLAY (PID) IS USED FOR THIS DIAGNOSTIC PROCEDURE. ALL OBDII APPLICATIONS HAVE THIS PID AVAILABLE. THERE ARE SOME OBDI VEHICLES THAT DO NOT HAVE THE BARO PID, FOR THESE VEHICLES OMIT THE BARO CHECK AND REFER ONLY TO STEPS 2, 3, AND 4 IN THE DIAGNOSTIC PROCEDURE.

BAROMETRIC PRESSURE REFERENCE

Barometric Pressure (in. Hg.)	Barometric Pressure (kPa)	BARO/MAP PID (Hz)	Altitude above sea level (ft)
3.5	11.8	89.3	
5	16.9	92.8	
10	33.8	104.6	
15	50.7	117.0	14,000
20	67.5	129.6	10,000
21	70.9	132.5	9,000
22	74.3	135.4	8,000
23	77.7	138.3	7,000
24	81.1	141.1	6,000
25	84.4	144.0	5,000
26	87.8	146.9	4,000
27	91.2	149.8	3,000
28	94.6	152.8	2,000
29	97.9	155.8	1,000
30	101.3	158.9	0 (sea level)
31	104.7	162.0	
31.875	107.7	164.7	

1. Look at the BARO PID. Refer to the Barometric Pressure Reference Chart in this article. At sea level, BARO should read about 159 Hz (29.91 in. Hg). As a reference, Denver, Colorado at 1524 meters (5000 ft.) altitude should be about 144 Hz (24.88 in.Hg). Normal learned BARO variability is up to +/- 6 Hz (+/- 2 in. Hg.). If BARO indicates a higher altitude than you are not at (7 or more Hz lower than expected), you may have MAF contamination. If available, Service Bay Diagnostic System (SBDS) has a Manifold Absolute Pressure (MAP) sensor that can be used as a barometric pressure reference. Use "MAP/BARO" test under "Powertrain," "Testers and Meters." Ignore the hookup screen. Connect GP2 to the reference MAP on the following screen.

NOTE

REMEMBER THAT MOST WEATHER SERVICES REPORT A LOCAL BAROMETRIC PRESSURE THAT HAS BEEN CORRECTED TO SEA LEVEL. THE BARO PID, ON THE OTHER HAND, REPORTS THE ACTUAL BAROMETRIC PRESSURE FOR THE ALTITUDE THE VEHICLE IS BEING OPERATED IN. LOCAL WEATHER CONDITIONS (HIGH AND LOW PRESSURE AREAS) WILL CHANGE THE LOCAL BAROMETRIC PRESSURE BY SEVERAL INCHES OF MERCURY (+/- 3 Hz, +/- 1 in. Hg.).

NOTE

BARO IS UPDATED ONLY WHEN THE VEHICLE IS AT HIGH THROTTLE OPENINGS. THEREFORE, A VEHICLE WHICH IS DRIVEN DOWN FROM A HIGHER ALTITUDE MAY NOT HAVE HAD AN OPPORTUNITY TO UPDATE THE BARO VALUE IN KAM. IF YOU ARE NOT CONFIDENT THAT BARO HAS BEEN UPDATED, PERFORM THREE OR FOUR HEAVY, SUSTAINED ACCELERATIONS AT GREATER THAN HALF-THROTTLE TO ALLOW BARO TO UPDATE.

2. On a fully warmed up engine, look at Long Term Fuel Trim at idle, in Neutral, A/C off, (LONGFT1 and/or LONGFT2 PIDs). If it is more negative than -12%, the fuel system has learned lean corrections which may be due to the MAF sensor over-estimating air flow at idle. Note that both Banks 1 and 2 will exhibit negative corrections for 2-bank system. If only one bank of a 2-bank system has negative corrections, the MAF sensor is probably not contaminated.

3. On a fully warmed up engine, look at MAF voltage at idle, in Neutral, A/C off (MAF V PID). If it's 30% greater than the nominal MAF V voltage listed in the Powertrain Control/Emissions Diagnosis (PC/ED) Diagnostic Value Reference Charts for your vehicle, or greater than 1.1 volts as a rough guide, the MAF sensor is over-estimating air flow at idle.

4. If at least tow of the previous three steps are true, proceed to disconnect the MAF sensor connector. This puts the vehicle into Failure Mode and Effects Management (FMEM). In FMEM mode, air flow is inferred by using rpm and throttle position instead of reading the MAF sensor. (In addition, the BARO value is reset to a base/unlearned value.) If the lean driveability symptoms go away, the MAF sensor is probably contaminated and should be replaced. If the lean driveability symptoms do not go away, go to the PC/ED Service Manual for the appropriate diagnostics.

NOTE

DUE TO INCREASINGLY STRINGENT EMISSION/OBDII REQUIREMENTS, IT IS POSSIBLE FOR SOME VEHICLES WITH MAF SENSOR CONTAMINATION TO SET FUEL SYSTEM DTCs AND ILLUMINATE THE MIL WITH NO DRIVEABILITY CONCERNS. DISCONNECTING THE MAF ON THESE VEHICLES WILL, THEREFORE, PRODUCE NO IMPROVEMENTS IN DRIVEABILITY. IN THESE CASES, IF THE BARO, LONGFT1, LONGFT2, AND MAF V PIDs INDICATE THAT THE MAF IS CONTAMINATED, PROCEED TO REPLACE THE MAF SENSOR.

After replacing the MAF sensor, disconnect the vehicle battery (5 minutes, minimum to reset KAM, or on newer vehicles, use the "KAM Reset" feature on the New Generation Star (NGS) Tester and verify that the lean driveability symptoms are gone.

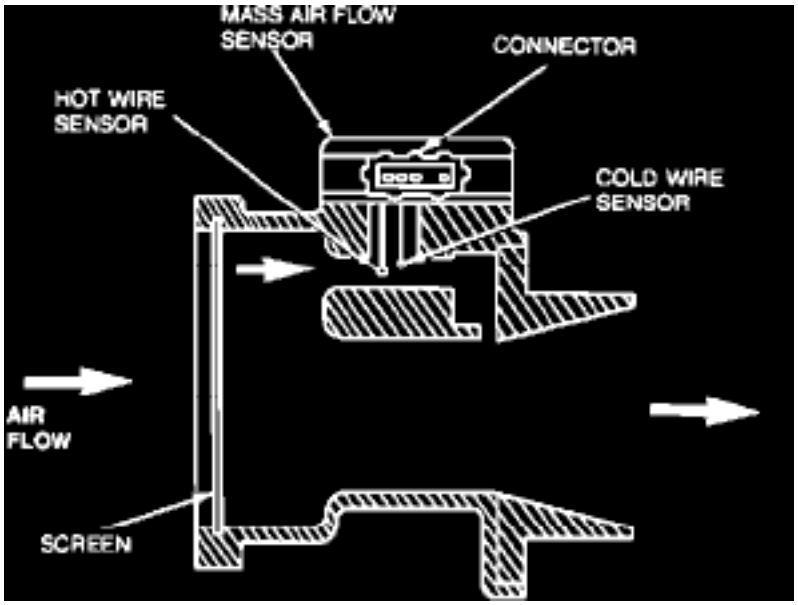
Mass Air Flow (MAF) Sensor



Mass Air Flow (MAF) Sensor: Description and Operation

Mass Air Flow Sensor

The Mass AirFlow (MAF) sensor, located between the air filter and the throttle body, is used to measure the mass of the air entering the engine due to volumetric displacement. The MAF sensor operates on the principle that if a mass is maintained at a constant temperature above the ambient environment, then the thermal loss is proportional to the mass flow of the cooling medium it is subjected to. The electronic module of the MAF sensor heats a wire element to 392°F (200°C) above ambient temperature. As air passes through the sensor, the air cools the wire element. The MAF sensor supplies more power to the wire to keep it at a constant temperature difference. When a drop in power useage occurs, the MAF sends a signal to the Engine Control Assembly (ECA) indicating the drop. The signal increases with the airflow into the engine.

Fuel Pump Inertia Switch: Description and Operation

Typical Inertia Fuel Shut-Off Switch

The inertia switch is used to open the power circuit to the fuel pump, or the control circuit to the fuel pump relay, in case of an accident. The inertia switch must be manually reset by pushing the reset button located on top of the inertia switch.

Operation of the inertia switch is as follows:

A steel ball is held in place by a magnet. When a sharp impact occurs, the ball breaks loose from the magnet, rolls up a conical ramp and strikes a target plate, which opens the electrical contacts.

Fuel Pump Inertia Switch: Service and Repair

TO RESET SWITCH 1.

Turn ignition switch to OFF.

2. Check for leaking fuel in the engine compartment, fuel lines and tank(s).

3. If no fuel leak is apparent, reset the switch by pushing the reset button on the top of the switch.

4. Turn ignition switch to START for a few seconds, then to OFF.

5. Again, check for leaking fuel.

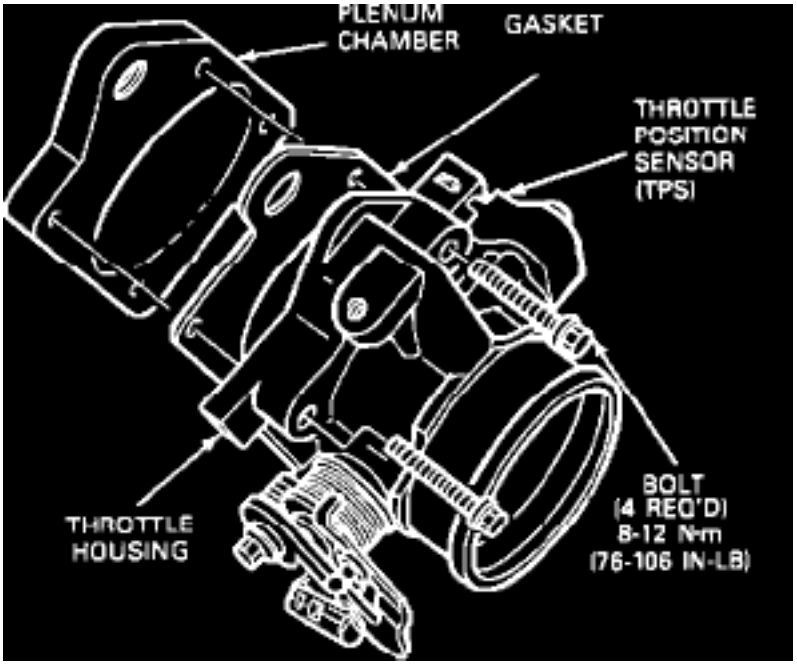
Throttle Position Sensor: Locations

Engine Compartment Components.

Top LH Front Of Engine

Applicable to: 4.0L/V6-244



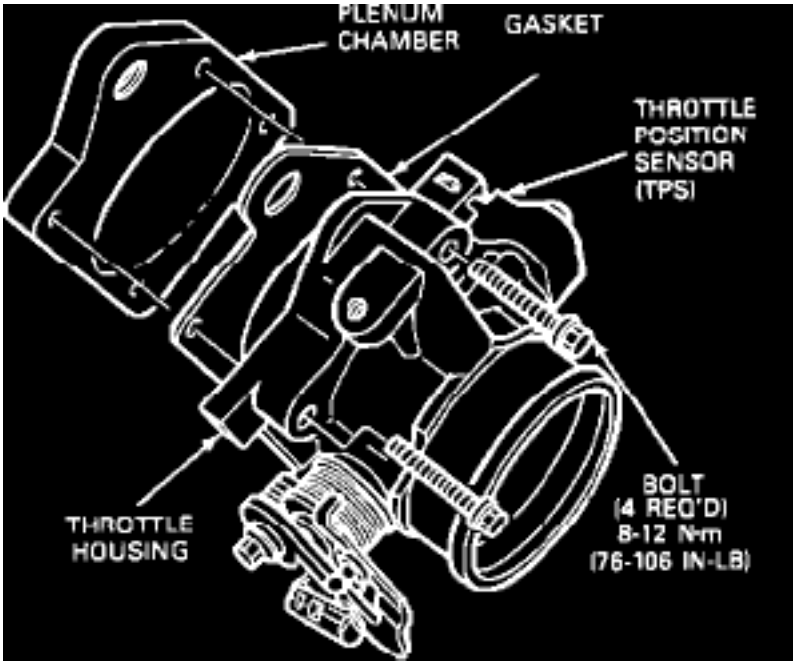
Throttle Position Sensor: Description and Operation

Throttle Body Assembly

The Throttle Position (TP) sensor, mounted on the throttle body, is a potentiometer that monitors throttle plate angle and sends a signal to the Engine Control Assembly (ECA). The TP sensor contains a pivot arm that moves along a curved resistor. One of the sensor leads supplies a five (5) volt reference signal (sent by the ECA) to the resistor. The second lead is used to ground the resistor. The third lead is for the voltage signal to the ECA. As the throttle plates move, the pivot arm moves along the curved resistor and receives a varying voltage signal. The ECA reads this signal and converts it into throttle plate angle. The voltage signal ranges from approximately one (1) volt at idle to approximately five (5) volts at wide open throttle. The TP sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

Throttle Position Sensor: Adjustments

The Throttle Position (TP) sensor is non-adjustable. If the voltage readings are out of range, the sensor must be replaced.



Throttle Position Sensor: Service and Repair

Throttle Body Assembly

1. Disconnect the Throttle Position (TP) sensor from the wiring harness.

2. If reinstalling the same TP sensor, mark the position of the TP sensor by scribing a mark on the sensor and throttle body.

3. Remove the TP sensor retaining screws, then remove the TP sensor and gasket.

4. Install a new gasket and the TP sensor, positioning the throttle position sensor so that the connector is facing rearward. Rotate the TP sensor clockwise to align the scribe mark (from step 2).

5. Install the TP sensor retaining screws, tightening to 11-16 lb. in. (1.2-1.8 N-m).

6. Connect the TP sensor electrical connector.

NOTE: The TP sensor is not adjustable.

Wire Color Code Identification

NOTE: Whenever a wire is labeled with two colors; the first color listed is the basic color of the wire, and the second color is the tracer marking of the wire. If the second color is followed by by a D, the tracer is dots. If the second color is followed by an H, the tracer is hash marks.

For example: BR/O is a brown wire with an orange stripe, R/Y D is a red wire with yellow dots and BK/W H is a black wire with white hash marks.

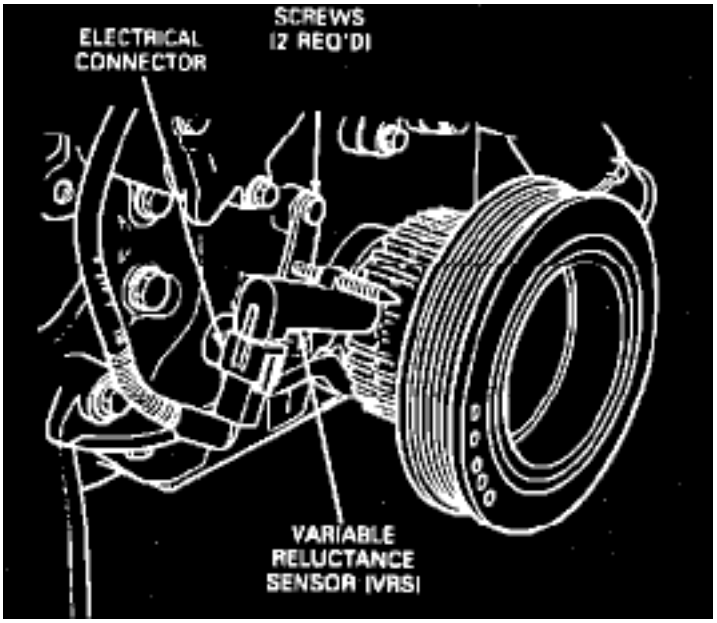
Crankshaft Position Sensor: Description and Operation

Crankshaft Timing Sensor

The crankshaft timing sensor is a variable reluctance type sensor. It is triggered by a 35 tooth trigger wheel tooth configuration machined into the rear of the crankshaft dampener. The signal generated by this sensor is called a Variable Reluctance Sensor (VRS) signal. The VRS signal provides the base timing and rpm information to the EDIS module. Base timing is set at 10° and is not adjustable.



Crankshaft Position Sensor: Service and Repair

Variable Reluctance (Crankshaft Position) Sensor

REMOVAL:

1. Disconnect the negative battery cable.

2. Disconnect the sensor electrical connector from the wiring harness.

3. Remove the Variable Reluctance (Crankshaft Position) Sensor mounting bolts and remove the sensor.

INSTALLATION:

1. Position the Variable Reluctance (Crankshaft Position) Sensor assembly on the engine.

2. Install the two sensor attaching bolts and tighten to specified torque. (SEE SPECIFICATIONS/MECHANICAL)

3. Route the sensor wiring harness and connect the electrical connector to the sensor.

4. Connect the negative battery cable.

Ignition Switch: Customer Interest Instrument Cluster Warning Lights - Dimly Lit

Article No. 93-24-10

11/24/93

^ LAMP - MALFUNCTION OF FOUR PIN LOW OIL LEVEL RELAY - VEHICLES BUILT AFTER 8/1/92 OR 1983-1993 VEHICLES THAT HAVE HAD SERVICE REPLACEMENT IGNITION SWITCHES AFTER 8/1/92

^ LAMPS - INSTRUMENT CLUSTER WARNING LIGHTS DIMLY LIT - VEHICLES BUILT AFTER 8/1/92 OR 1983-1993 VEHICLES THAT HAVE HAD SERVICE REPLACEMENT IGNITION SWITCHES AFTER 8/1/92

FORD: 1983 FAIRMONT 1983-89 CROWN VICTORIA, ESCORT 1983-93 MUSTANG, THUNDERBIRD 1983-94 PROBE 1984-86 LTD 1984-94 TEMPO

LINCOLN-MERCURY: 1983 LN7, ZEPHYR 1983-87 CONTINENTAL, LYNX 1983-89 GRAND MARQUIS, TOWN CAR 1983-93 COUGAR 1984-86 CAPRI, MARQUIS 1984-94 TOPAZ

LIGHT TRUCK: 1983-91 BRONCO 1983-93 ECONOLINE, F-150-350 SERIES, RANGER 1986-91 AEROSTAR 1991-93 EXPLORER

ISSUE: The instrument cluster warning light(s) may be dimly lit or there may be a malfunction of the four pin low oil relay on vehicles so equipped. This could be due to the ignition switch.

ACTION:

If the vehicle displays the subject symptoms and meets the following conditions, replace the ignition switch. Refer to the appropriate Car or Light Truck Service Manual (Section 13-04 for 1983-1990 Cars, Section 11-04 for 1991-1993 Cars and Section 13-05 for 1983-1990 Light Trucks, Section 11-05 for 1991-1993 Light Trucks) for removal and installation procedures. Refer to the Parts Block in this article for correct parts usage.

CONDITIONS

^ The vehicle has 14401 wiring attached to the P2 terminal of the ignition switch. Refer to the wiring schematic and/or Electrical And Vacuum Troubleshooting Manual (EVTM) for the concern vehicle.

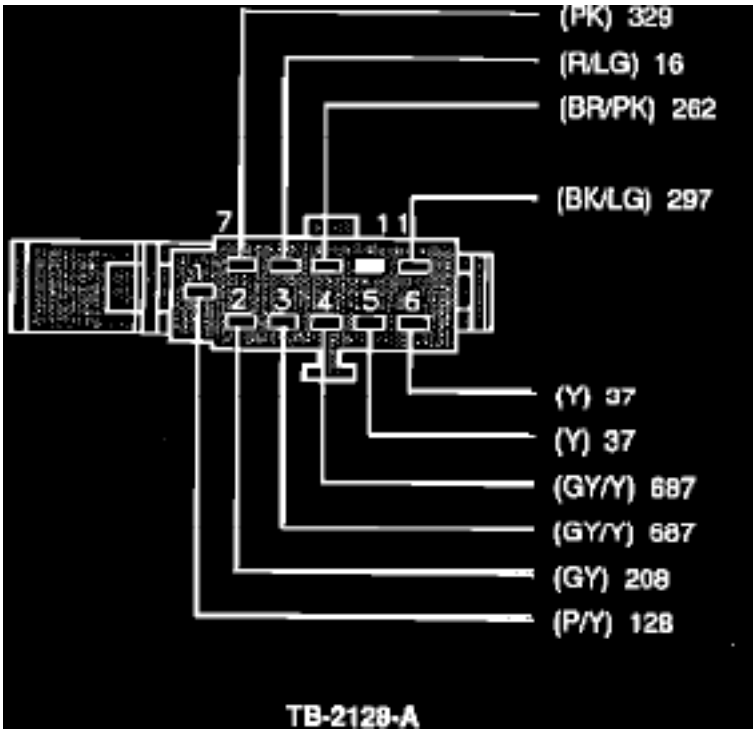
OASIS CODES: 201000, 201100, 206000



Ignition Switch: Customer Interest Engine - Hard Start/No Start When Cold

Article No. 91-13-9

06/26/91

^ HARD START - 4.0L - COLD ENGINE

^ NO START - 4.0L - COLD ENGINE

^ IGNITION SWITCH BOUNCE - HARD OR NO START - 4.0L COLD ENGINE

LIGHT TRUCK: 1990-91 RANGER 1991 EXPLORER

ISSUE: A hard start or no start condition may occur when the engine is cold. The engine may not start without cycling the key to the OFF position and back to START. Ignition switch bounce (loss of electrical continuity between contacts) may cause the EDIS module to recycle several times or to lock-up and not allow a start at all.

ACTION: Install a new ignition switch containing synthetic lubricant which reduces the amount of bounce. Also, install a new wiring connector containing a new material that is compatible with the new synthetic lubricant. Refer to the following procedure for service details.

REMOVAL

1. Disconnect the battery power.

2. Remove the trim panel. Refer to the 1990-91 Ranger/Explorer Shop Manual, Section 11-04B, for removal procedure.

3. Turn the lock cylinder to the RUN position.

4. Remove the two (2) nuts on the ignition switch.

5. Separate the connector from ignition switch by gently prying on the ears of the connector and pulling apart firmly.

6. Disengage the terminals from the existing connector. Discard the connector.

Figure 1

7. Insert terminal into proper locations in new connector (F2TZ-14489-A), Figure 1.

INSTALLATION

1. Remove the spring clip from the new switch (F2TZ-11572-A). This clip keeps the switch in the correct position during shipment.

2. Press the new connector (F2TZ-14489-A) onto the terminals of the ignition switch. Be sure the tabs lock securely.

3. Locate the switch on the weld studs on the steering column.

NOTE: THE END OF THE ACTUATOR ROD MUST FIT IN THE HOLE ON THE SLIDER.

4. Install the nuts on the weld stud. Tighten to 4.45-7.24 N-m (39-64 lb.in.).

5. Connect the battery terminal.

6. Check the switch operation. If necessary, adjust it. Refer to the 1990-91 Aerostar, Explorer, Ranger Truck Shop Manual, Section 11-04B, for adjustment procedure.

7. Install the trim panel.

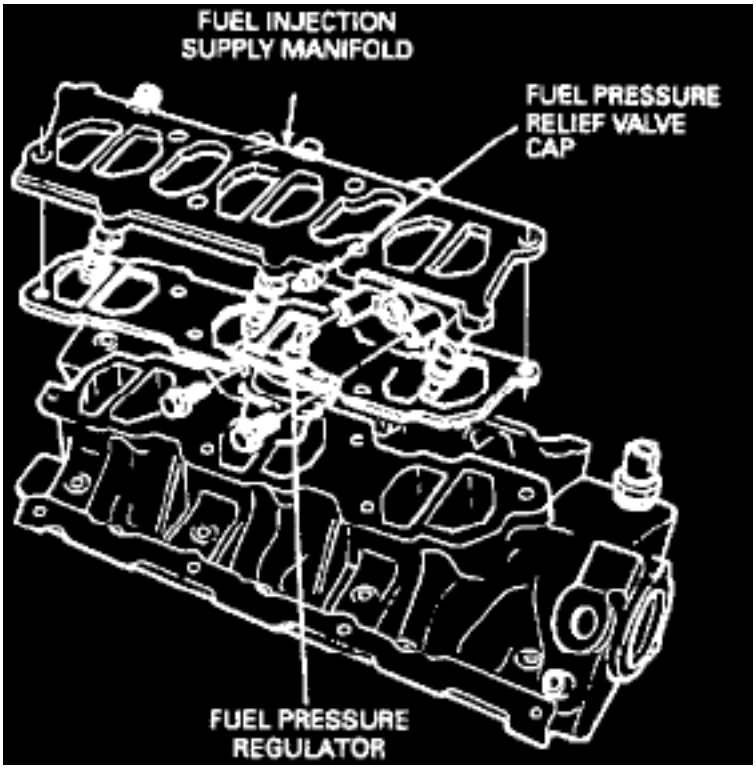
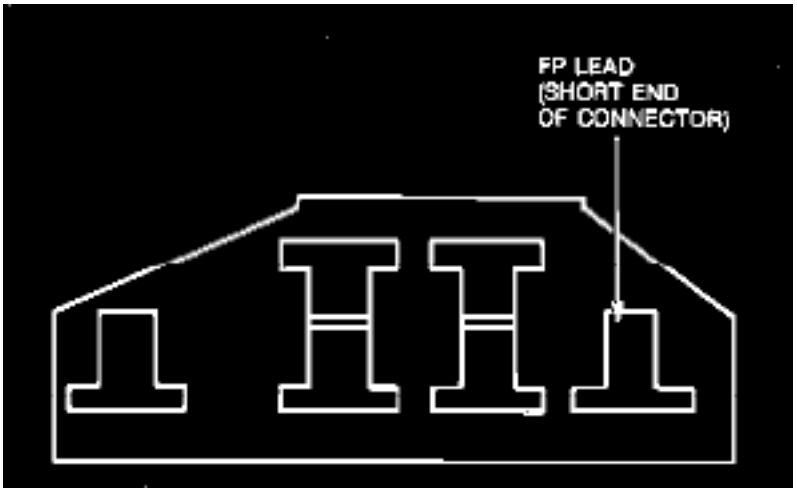
Fuel Pressure: Specifications

Key On Engine Off 35 - 45 psi

Key On Engine Running 30 - 40 psi



Fuel Injection Supply Manifold



Fuel Pressure: Testing and Inspection

STO Connector

STATIC PRESSURE TEST

1. Check for adequate fuel supply. 2. Turn key OFF 3. Install fuel pressure gauge to test port on fuel rail. 4. Install test lead to fuel pump lead of STO test connector. 5. Turn Key On Engine Off (KOEO). 6. Ground test lead to run fuel pump. 7. Check to determine if fuel pressure is within acceptable limits. Refer to SPECIFICATIONS.

a. If pressure is low but greater than 3 psi (indicates fuel pump is running but not enough pressure) check for:

^ Plugged fuel filter

^ Kinked fuel line

^ Low voltage to pump (should be within 0.5 volts of battery voltage at connector).

^ Disconnect the fuel return line and note if fuel is being returned during this low pressure condition. If fuel is being returned, replace the fuel pressure regulator. Reconnect the fuel return line.

b. If pressure is less than 3 psi (pump not running) check for:

^ Defective fuse link

^ Inertia switch open

^ Wiring at fuel pump/tank connector loose or open

^ Fuel pump ground connection at chassis loose or defective

^ Improper fuel pump relay operation

If fuel supply and return lines are OK, and electrical supply and ground are OK, and fuel pressure is still low, replace fuel pump.

DYNAMIC PRESSURE TEST

1. Disconnect and plug the vacuum line to the pressure regulator.

2. Start engine and run at idle. Check to determine if fuel pressure is within acceptable limits.

a. If pressure is low check for:

^ Plugged fuel filter ^ Restricted fuel line ^ Low voltage to pump (should be within 0.5 volts of battery voltage at connector).

3. Reconnect the vacuum line to the regulator.

If fuel supply and return lines are OK, and electrical supply and ground is OK, and fuel pressure is still low, replace fuel pump.

LEAKAGE TEST

1. Momentarily activate fuel pump by grounding test lead. Raise pressure to approximate operating pressure. 2. Remove ground from test lead and note pressure on gauge. Pressure should remain within 2 psi for 3 minutes after lead is ungrounded.

a. If pressure is not maintained check for leaking fuel

^ Lines ^ Connectors ^ Injectors

b. Disconnect fuel return line and plug engine side. Momentarily activate fuel pump by grounding test lead. Raise pressure to approximate

operating pressure. If pressure holds replace regulator and retest. Reconnect the fuel return line.

If pressure is not maintained replace fuel pump.

Engine - Hard Cold Starts/Hesitation/Stalls On Start-Up

Article No. 91-25-7

12/13/91

^ HARD COLD START - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

^ HESITATION/STALLS - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

FORD: 1983-87 EXP 1983-91 ESCORT 1984-90 MUSTANG, THUNDERBIRD 1986-90 TAURUS 1986-91 CROWN VICTORIA 1988-90 TEMPO

LINCOLN-MERCURY: 1983-85 LN7 1983-87 LYNX 1984-88 CAPRI 1984-90 COUGAR 1986-90 CONTINENTAL, MARK VII, SABLE 1986-91 GRAND MARQUIS, TOWN CAR 1988-90 TOPAZ 1991 TRACER

LIGHT TRUCK: 1985-90 BRONCO II, BRONCO 1985-91 ECONOLINE, F-150-350 SERIES 1985-92 RANGER 1986-91 AEROSTAR 1991 EXPLORER

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.
