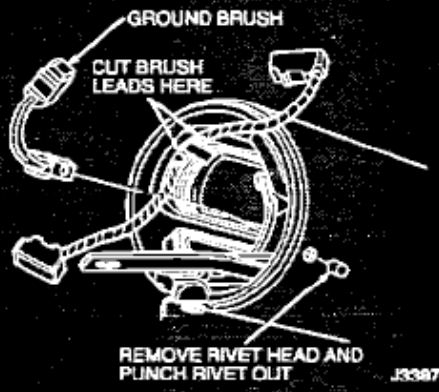
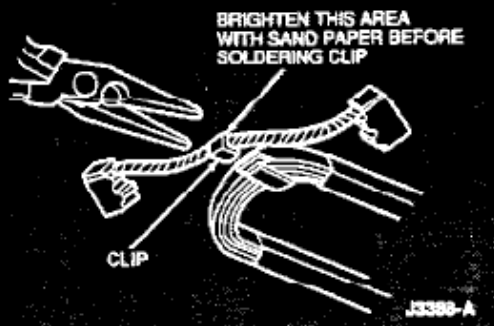
6. Remove drive end housing and plunger lever return spring.



7. Remove starter drive plunger lever pivot pin and lever and remove armature.
8. Ground brushes. Remove rivet head with file or chisel and remove rivet with 1/8 inch punch.
9. Cut brush leads from field coils as close to field connection point as possible.
10. Clean and inspect starter motor.
11. Position new field brush lead on field coil connection. Position and crimp clip provided with brushes to hold brush lead to connection. Solder lead clip and connection together using rosin core solder. Use a 300 watt iron.



12. Rivet ground brush leads to frame with rivets provided in brush kit.
13. Clean commutator with 00 or 000 sandpaper.
14. Install armature in starter frame.
15. Install starter drive gear plunger lever to frame and starter drive assembly and install pivot pin.
16. Install brush holder and insert brushes in holder and install brush springs.
17. Install brush end plate.
18. Install two through bolts to starter frame.
19. Install starter drive plunger lever cover and tighten retainer screw.
20. Connect starter to a battery to check operation.

Armature Replacement

1. Remove plunger lever cover.
2. Remove through bolts, pivot pin, drive end housing, drive plunger lever return spring and brush end plate.
3. Remove starter gear plunger lever. Remove brushes and lift out brush holder.
4. Remove armature. If starter drive gear assembly is being reused, remove stop ring retainer and stop ring from end of armature shaft. Remove drive gear assembly.
5. Place drive gear assembly on new armature with a new stop ring, thrust washer and retainer.
6. Install armature in starter frame.
7. Position drive gear plunger lever to frame and drive gear assembly.
8. Partially fill drive end housing bearing bore with grease (approximately 1/4 full). Position drive plunger lever return spring, and drive end housing to starter frame. Ensure stop ring retainer is seated properly in drive housing. Install pivot pin.
9. Install brush holder and insert brushes in holder. Install brush springs. Positive brush leads should be positioned in their respective slots to prevent grounding.

DISASSEMBLY AND ASSEMBLY (Continued)

10. Install brush end plate. (Be certain end plate insulator is positioned properly on end plate).
11. Install two through bolts to starter frame. Tighten to 6-9 N·m (55-80 lb-in).
12. Install plunger lever cover and tighten retaining screw.
13. Check the starter no-load current draw. The starter no-load current draw specification is 80 amps.

SPECIFICATIONS

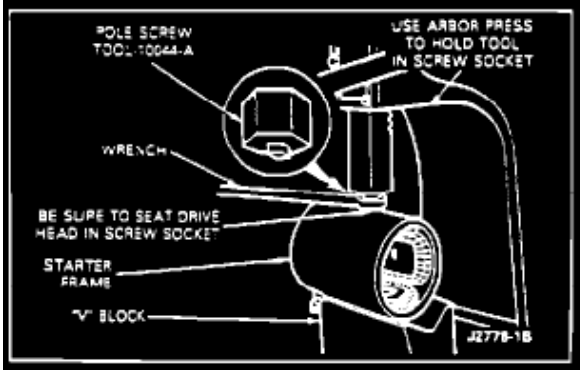

FIG. 9 Pole Shoe Screw Removal

9. Install brush end plate. Ensure end plate insulator is positioned properly on end plate.
10. Install two through bolts to starter frame. Tighten to 6.21-8.47 N·m (55-75 in-lb).
11. Secure starter in a vise. Connect starter to a battery to check its operation.

Starter Motor Brushes Replacement — 4-Inch Starter

1. Remove starter drive plunger lever cover.
2. Remove the two through bolts from the starter.
3. Remove the brush end plate.
4. Remove brush spring and pull brushes loose from brush holder.
5. Remove brush holder.
6. Remove the drive end housing and the plunger lever return spring.

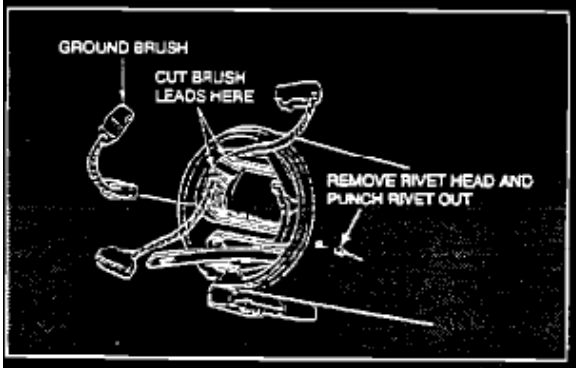

FIG. 10 Brush Removal

7. Remove the starter drive plunger lever pivot pin and lever and remove the armature.
8. Ground brushes: Remove rivet head with file or chisel and remove rivet with 1/8" punch.
9. Cut the brush leads from the field coils as close to the field connection point as possible.
10. Clean and inspect the starter motor.
11. Position the new field brush lead on the field coil connection. Position and crimp the clip provided with the brushes to hold the brush lead to the connection. Solder the lead clip and connection together using rosin core solder. Use a 300 watt iron.

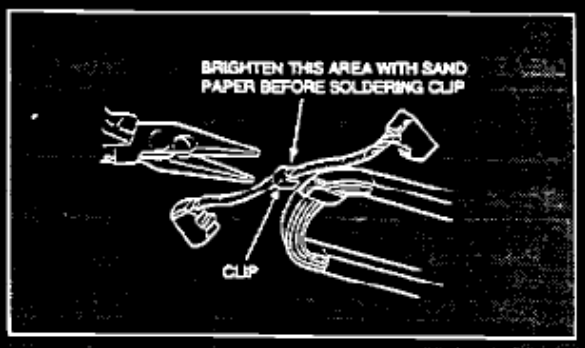

FIG. 11 Brush Installation

12. Rivet the ground brush leads to the frame with rivets provided in the brush kit.
13. Clean the commutator with 00 or 000 sandpaper.
14. Install the armature in the starter frame.
15. Install the starter drive gear plunger lever to the frame and starter drive assembly and install the pivot pin.
16. Install brush holder and insert brushes in holder and install brush springs.
17. Install the brush end plate.
18. Install the two through bolts to the starter frame.
19. Install starter drive plunger lever cover and tighten retainer screw.
20. Connect the starter to a battery and check operation.

Armature Replacement

1. Remove starter drive plunger lever cover retainer screw and remove cover.
2. Remove pivot pin retaining starter plunger lever.
3. Remove through bolts, drive end housing, plunger lever, drive plunger lever return spring, and brush end plate. Remove brushes and lift out brush holder.
4. Remove armature. If starter drive assembly is being reused, remove stop ring from end of armature shaft, and remove drive.

DISASSEMBLY AND ASSEMBLY (Continued)

11. Position end plate to frame. Install and tighten through bolts to 6.21-8.47 N·m (55-75 in-lb). Do not pinch brush leads when installing end plate. Install pivot pin.
12. Position drive plunger lever cover and fasten to frame with cover screw.
13. Check starter no-load current draw.

Starter Drive Replacement

1. Remove starter plunger cover.
2. Remove pivot pin retaining starter plunger lever.
3. Loosen through bolts enough to allow removal of drive end housing and lever return spring. Remove lever.
4. Remove thrust washer, drive stop ring retainer and stop ring from end of armature shaft and remove drive assembly.
5. Apply a thin coating of Lubriplate 777 or equivalent on armature shaft splines. Install drive assembly on armature shaft and install a new stop ring.
6. Position starter gear plunger lever on the starter frame. **Ensure lever properly engages drive flange.**
7. Install a new stop ring retainer and thrust washer. Partially fill drive end housing bearing bore with Grease ESB-M1C63-A or equivalent (approximately 1/4 full). Position lever return spring and drive end housing to starter frame. Tighten through bolts to 6.21-8.47 N·m (55-75 in-lb). Install pivot pin.
8. Position starter drive plunger lever cover on starter. Tighten attaching screw.

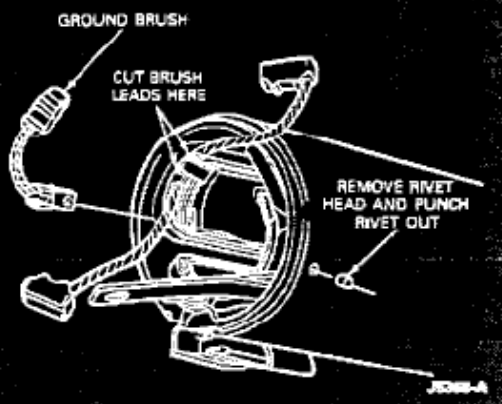
Brush Replacement

Replace starter brushes when they are worn to 6.35mm (1/4 inch). Always install a complete set of new brushes.

1. Remove the two through-bolts from starter frame.
2. Remove brush end plate, brush springs and brushes from holder.
3. Remove ground brush attaching screws or rivets from frame and remove brushes.
4. Cut insulated brush leads from field coils, as close to field connection point as possible.
5. Check plastic brush holder for cracks or broken mounting pads. Replace if necessary.
6. Position new insulated field brush lead on field coil connection. Position and crimp clip provided with brushes to hold brush lead to connection. Solder lead, clip, and connection together using a 300-watt iron and rosin core solder.
7. Install ground brush leads to frame with attaching screws or rivets.
8. Install brush holder and insert brushes in holder. Install brush springs. Positive brush leads should be positioned in their respective slots in brush holder to prevent potential grounding.
9. Install brush end plate. Ensure end plate insulator is positioned properly on end plate.
10. Install two through bolts to starter frame. Tighten to 6.21-8.47 N·m (55-75 in-lb).
11. Secure starter in a vise. Connect starter to a battery to check its operation.

Starter Motor Brushes Replacement

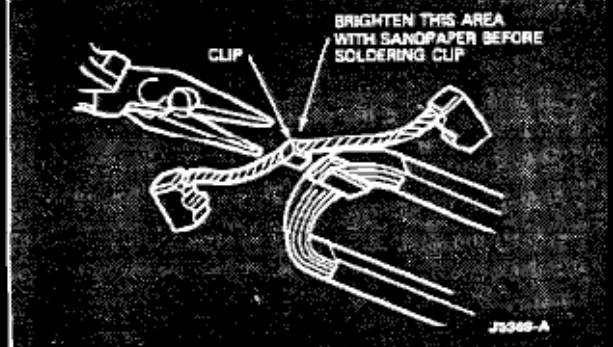
1. Remove starter drive plunger lever cover.
2. Remove the two through bolts from the starter.
3. Remove the brush end plate.
4. Remove brush spring and pull brushes loose from brush holder.
5. Remove brush holder.
6. Remove the drive end housing and the plunger lever return spring.
7. Remove the starter drive plunger lever pivot pin and lever and remove the armature.
8. Remove ground brush rivet head with the file or chisel and remove rivet with 1/8 inch punch.
9. Cut the brush leads from the field coils as close to the field connection point as possible.



10. Clean and inspect the starter motor.
11. Position the new field brush lead on the field coil connection. Position and crimp the clip provided with the brushes to hold the brush lead to the connection. Solder the lead clip and connection together using rosin core solder. Use a 300 watt iron.
12. Rivet the ground brush leads to the frame with rivets provided in the brush kit.
13. Clean the commutator with 00 or 000 sandpaper.
14. Install the armature in the starter frame.
15. Install the starter drive gear plunger lever to the frame and starter drive assembly and install the pivot pin.
16. Install brush holder and insert brushes in holder and install brush springs.
17. Install the brush end plate.

DISASSEMBLY AND ASSEMBLY (Continued)

18. Install the two through bolts to the starter frame.
19. Install starter drive plunger lever cover and tighten retainer screw.
20. Connect the starter to a battery to check operation.



Armature Replacement

1. Remove starter drive plunger lever cover retainer screw and remove cover.
2. Remove pivot pin retaining starter plunger lever.
3. Remove through bolts, drive end housing, plunger lever, drive plunger lever return spring, and brush end plate. Remove brushes and lift out brush holder.
4. Remove armature. If starter drive assembly is being reused, remove stop ring from end of armature shaft, and remove drive.
5. Place drive assembly on new armature with a new stop ring, retainer and thrust washer.
6. Install armature in starter frame.
7. Position drive plunger lever to frame and drive assembly. Ensure lever properly engages drive flange.
8. Partially fill drive end housing bearing bore with Grease ESB-M1C83-A or equivalent (approximately 1/4 full). Position drive lever return spring, and drive end housing to starter frame. Ensure stop ring retainer is seated properly in drive housing.
9. Install brush holder and insert brushes in holder. Install brush springs. Positive brush leads should be positioned in their respective slots to prevent grounding.
10. Install brush end plate. Ensure end plate insulator is positioned properly on end plate.
11. Install two through bolts to starter frame. Tighten to 6.21-6.47 N·m (55-75 in-lb). Install pivot pin.
12. Install starter drive plunger lever cover and tighten retaining screw.
13. Check starter no-load current draw with starter secure in vise during test.

SPECIFICATIONS

Refer to the following chart.

Starter Motor								Starter Brushes			
Motor Diameter		Current Draw Under Normal Load	Normal Engine Cranking Speed	Min. Stall Torque @ 5 Volts		Max. Load	No Load	Mfg. Length		Spring Tension	
mm	Inches	Amps	RPM	N·m	Lb-Ft	Amps	Amps	mm	Inches	N	oz.

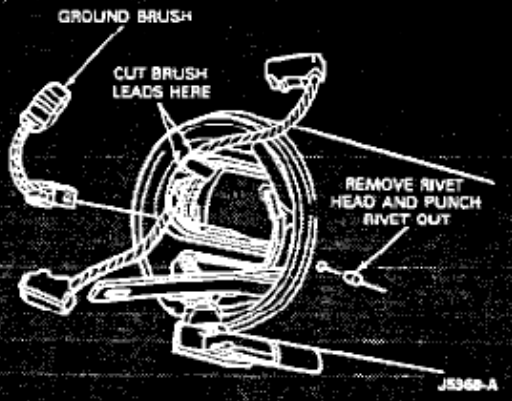
Revised 5/92

DISASSEMBLY AND ASSEMBLY (Continued)

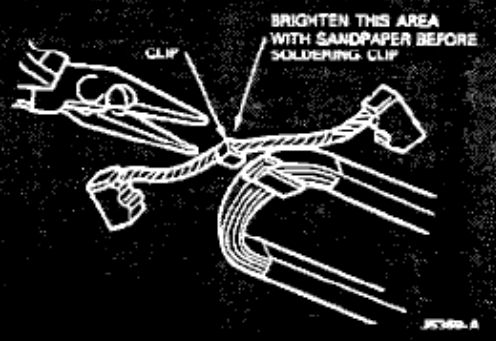
7. Install a new stop-ring retainer. Partially fill the drive end housing bearing bore with Multi-Purpose Grease D0AZ-19584-AA (ESR-M1C159-A or ESB-M1C93-A) or equivalent (approximately 1/4 full). Position the starter drive plunger lever return spring and drive end housing to the starter frame. Tighten the through bolts to 6.21-8.47 N·m (55-75 in-lb).
8. Position the starter drive plunger lever cover, with its gasket, on the starter. Tighten the attaching screw.

Starter Motor Brushes Replacement

1. Remove starter drive plunger lever cover.
2. Remove the two through bolts from the starter.
3. Remove the brush end plate.
4. Remove brush spring and pull brushes loose from brush holder.
5. Remove brush holder.
6. Remove the drive end housing and the plunger lever return spring.
7. Remove the starter drive plunger lever pivot pin and lever and remove the armature.
8. Remove ground brush rivet head with the file or chisel and remove rivet with 1/8 inch punch.
9. Cut the brush leads from the field coils as close to the field connection point as possible.



10. Clean and inspect the starter motor.
11. Position the new field brush lead on the field coil connection. Position and crimp the clip provided with the brushes to hold the brush lead to the connection. Solder the lead clip and connection together using rosin core solder. Use a 300 watt iron.
12. Rivet the ground brush leads to the frame with rivets provided in the brush kit.
13. Clean the commutator with 00 or 000 sandpaper.
14. Install the armature in the starter frame.
15. Install the starter drive gear plunger lever to the frame and starter drive assembly and install the pivot pin.
16. Install brush holder and insert brushes in holder and install brush springs.
17. Install the brush end plate.
18. Install the two through bolts to the starter frame.
19. Install starter drive plunger lever cover and tighten retainer screw.
20. Connect the starter to a battery to check operation.



Armature Replacement

1. Remove starter drive plunger lever cover and retaining screw.
2. Remove the through bolts, pivot pin, drive end housing, drive plunger lever return spring, and brush end plate.
3. Remove starter gear plunger lever. Remove brushes and lift out brush holder.
4. Remove the armature. If the starter drive gear assembly is being reused, remove the stop ring from the end of the armature shaft, and remove the drive gear assembly.
5. Place the drive gear assembly on the new armature with a new stop ring.
6. Install the armature in the starter frame.
7. Position the drive gear plunger lever to the frame and drive gear assembly.
8. Partially fill the drive end housing bearing bore with Multi-Purpose Grease D0AZ-19584-AA (ESR-M1C159-A or ESB-M1C93-A) or equivalent (approximately 1/4 full). Position the drive plunger lever return spring and the drive end housing to the starter frame. Ensure the stop ring retainer is seated properly in the drive housing.
9. Install brush holder. Insert brushes in holder and install brush springs. Positive brush leads should be positioned in their respective slots to prevent grounding.
10. Install the brush end plate (be certain end plate insulator is positioned properly on end plate).
11. Install the two through bolts to the starter frame. Tighten to 6.21-8.47 N·m (55-75 in-lb). Install pivot pin.
12. Install starter drive plunger lever cover and tighten retaining screw.

DISASSEMBLY AND ASSEMBLY (Continued)

13. Check the starter no-load current draw.

SPECIFICATIONS

Refer to the following chart.

POSITIVE ENGAGEMENT STARTER

Positive Engagement Starter Motor				Starter Brushes				
Dia. mm (Inches)	Current Draw Under Normal Load (Amps)	Normal Engine Cranking Speed (RPM)	Current Draw No. Load (Amps)	Mfg. Length mm (Inches)	Wear Limit mm (Inches)	Spring Tension kg (Ounces)	Through Bolt Torque N-m (In-Lbs)	Mounting Bolt Torque N-m (Ft-Lbs)

Starter Drive/Bendix: Technical Service Bulletins Starter Solenoids and Drives - Obsolete Parts Return

Article No. 93-26-12

^ SERVICE PARTS RETURN OF OBSOLETE STARTER SOLENOIDS AND STARTER MOTOR DRIVES - ALL SOLENOIDS, BUT ONLY STARTER DRIVES WITH PACKAGING DATE CODES BEFORE "01 1693"

^ SERVICE STARTER - SERVICE PARTS RETURN OF OBSOLETE STARTER SOLENOIDS AND STARTER MOTOR DRIVES - ALL SOLENOIDS, BUT ONLY STARTER DRIVES WITH PACKAGING DATE CODES BEFORE "011693"

FORD: 1989-94 THUNDERBIRD 1990-94 CROWN VICTORIA, TAURUS 1991-94 TEMPO

LINCOLN-MERCURY: 1989-94 COUGAR, TOWN CAR 1990 MARK VII 1990-94 GRAND MARQUIS, SABLE 1991 TOPAZ

LIGHT TRUCK: 1990 BRONCO 1990-94 AEROSTAR, F-150-350 SERIES 1991-94 RANGER 1992-94 ECONOLINE

ISSUE: Improved starter solenoid and starter drives replace the obsolete parts.

ACTION: Remove the obsolete parts from your dealership's inventory. All of the starter solenoids (E90Z-11390-B) regardless of build date and the obsolete starter drives (F2TZ-11002-A and F2TZ-11002-C) with packaging date codes before "011693" should be returned to your facing PDC within thirty

(30) days of this TSB.

1. Sort dealership stock of F2TZ-11002-A and F2TZ-11002-C. Receivals with a packaging date code of 011693 or later will contain OK stock and may be released for normal sale.

2. Packaging date codes before 011693 are suspect and should be rejected and returned to your facing PDC using the least expensive transportation.

3. If claim is processed electronically using DOES II, use return code "GB"; otherwise, complete a separate paper claim form FPS-340 using return code "J".

4. In the "Remarks" section, write "Returned Per TSB 93-26-12".

5. Issue Form 291 to reject suspect stock.

LIMITS

^ The returns must be received within 30 days from the date of this TSB.

^ Returns are restricted to the subject parts.

^ The parts must have been purchased from FCSD in accordance with Policy And Procedure Bulletin 4000.

CREDIT Credit for parts and prepaid freight costs will be issued.

NOTE: THE PART NUMBER HAS NOT BEEN CHANGED. OBSOLETE STOCK CAN ONLY BE DETERMINED VIA PACKAGING DATE

CODE. DO NOT RETURN PARTS HAVING PACKAGING DATE CODES OF "011693" OR LATER.

NOTE: REPLACEMENT STOCK IS AVAILABLE FOR ORDERING IMMEDIATELY.

Circuit Breaker: Testing and Inspection

The 6 amp circuit breaker is located in the fuse panel. Two separate tests are necessary to check for correct circuit breaker operation. Remove circuit breaker from fuse panel and connect tester leads to circuit breaker.

TEST 1

1. Short tester leads together and adjust current draw until it equals circuit breaker rating.

2. Connect circuit breaker to tester.

3. Leave circuit breaker connected to tester for ten minutes, holding current reading on tester at rated current. If circuit breaker opens before ten minutes has elapsed, replace circuit breaker.

TEST 2

1. Short tester leads together and adjust current draw until it is twice the rated current.

2. Connect circuit breaker to tester, holding current reading on tester at twice the rated current.

3. If tester reading does not drop to zero within 30 seconds, replace circuit breaker.

This TSB article is being republished in its entirety to update the applicable model years.

ISSUE: Electrical system concerns that are due to diode failure may be serviced with an approved Ford service diode. Some electrical diodes used in early production vehicles are color coded for the purpose of size identification while others are stamped with a manufacture number. All Ford service diodes and current production diodes are identified by manufacture number.

ACTION: If service is required, refer to the appropriate model/year Electrical and Vacuum Troubleshooting Manual (EVTM) to determine the size and location of the diode(s). Refer to the following Electrical Diode Application Chart for the correct service part number.

NOTE:

IF THE DIODE REQUIRING REPLACEMENT DOES NOT HAVE THE SAME RATING AS LISTED IN THE APPLICATION CHART, USE THE NEXT HIGHER RATED DIODE.

PRODUCTION IDENTIFICATION		
Old Design	Current Design	Service Part Identification
1.0 Amp-200V (color gray)	1.0 Amp-200V (stamped 1N4003)	1.0 Amp-400V E8DZ-10C912-A (stamped 1N4004)
1.0 Amp-50V (color black)	1.0 Amp-400V (stamped 1N4004)	1.0 Amp 400V E8DZ-10C912-A (stamped 1N4004)
3.0 Amp-50V (color orange)	6.0 Amp-400V (stamped MR754)	6.0 Amp-400V E8DZ-10C912-B (stamped MR754)
6.0 Amp-400V (color blue)	6.0 Amp-400V (stamped MR754)	6.0 Amp-400V E8DZ-10C912-B (stamped MR754)

TSB 01-7-3 is being republished in its entirety to update the model year coverage and vehicle line coverage.

ISSUE

A "whining"/"buzzing" noise in the speakers of the entertainment radio or two-way radio on vehicles with an in-tank electric fuel pump may be caused by electrical noise from the fuel pump.

ACTION

Install an electronic noise Radio Frequency Interference (RFI) Filter (F1PZ-18B925-A) on the fuel pump inside the fuel tank. Refer to the following Test Procedure to confirm that the concern exists, then refer to the Service Procedure for repair details.

PART NUMBER	PART NAME
F1PZ-18B925-A	Radio Frequency Interference (RFI) Filter
95873-S101	Bundling Strap
F5AZ-14A099-AA	Heat Shrink Tubing

NOTE

IF THE VEHICLE HAS AN ELECTRONIC RETURNLESS FUEL SYSTEM, DO NOT INSTALL A RFI FILTER INLINE TO THE FUEL PUMP . ONLY VEHICLES WITH MECHANICAL RETURNLESS FUEL SYSTEMS (PRESSURE REGULATOR IN THE TANK), OR SYSTEMS WITH THE PRESSURE REGULATOR ON THE FUEL RAIL SHOULD BE APPROVED FOR THE RFI FILTER INSTALLATION.

NOTE

SOME LIGHT TRUCKS REQUIRE ONE (1) RFI FILTER FOR EACH IN-TANK ELECTRIC FUEL PUMP ON MULTI-TANK VEHICLES.

NOTE

THIS TSB DOES NOT INCLUDE TAURUS FLEXIBLE FUEL VEHICLES (FFVS) OR 1999 RANGER 3.0L FFVS.

TEST PROCEDURE

Fuel pump radio noise is relatively constant and changes only slightly with vehicle speed. If the frequency of the noise varies or the noise comes and goes with the vehicle speed, then it is not the fuel pump and this fix will not be effective. The following procedure will help determine if the fuel pump is the cause of the radio noise:

1. Turn on the radio before the key is turned on (assuming the radio will operate without the ignition key - you may need to put the ignition key in the Accessory position).

2. Turn the ignition key to the Run position (do not start the engine).

3. The fuel pump should run for about 1 second with the key in the Run position with the engine not running. Listen for noise in the radio. If noise is present while the pump is running and stops when the pump stops, then the noise is being generated by the pump and this procedure should help.

OASIS CODES: 205000, 207000, 404000, 702000, 702300

Service Procedure

1. Remove the fuel pump sender assembly from the fuel tank. Refer to the appropriate model year Workshop Manual for removal procedure.

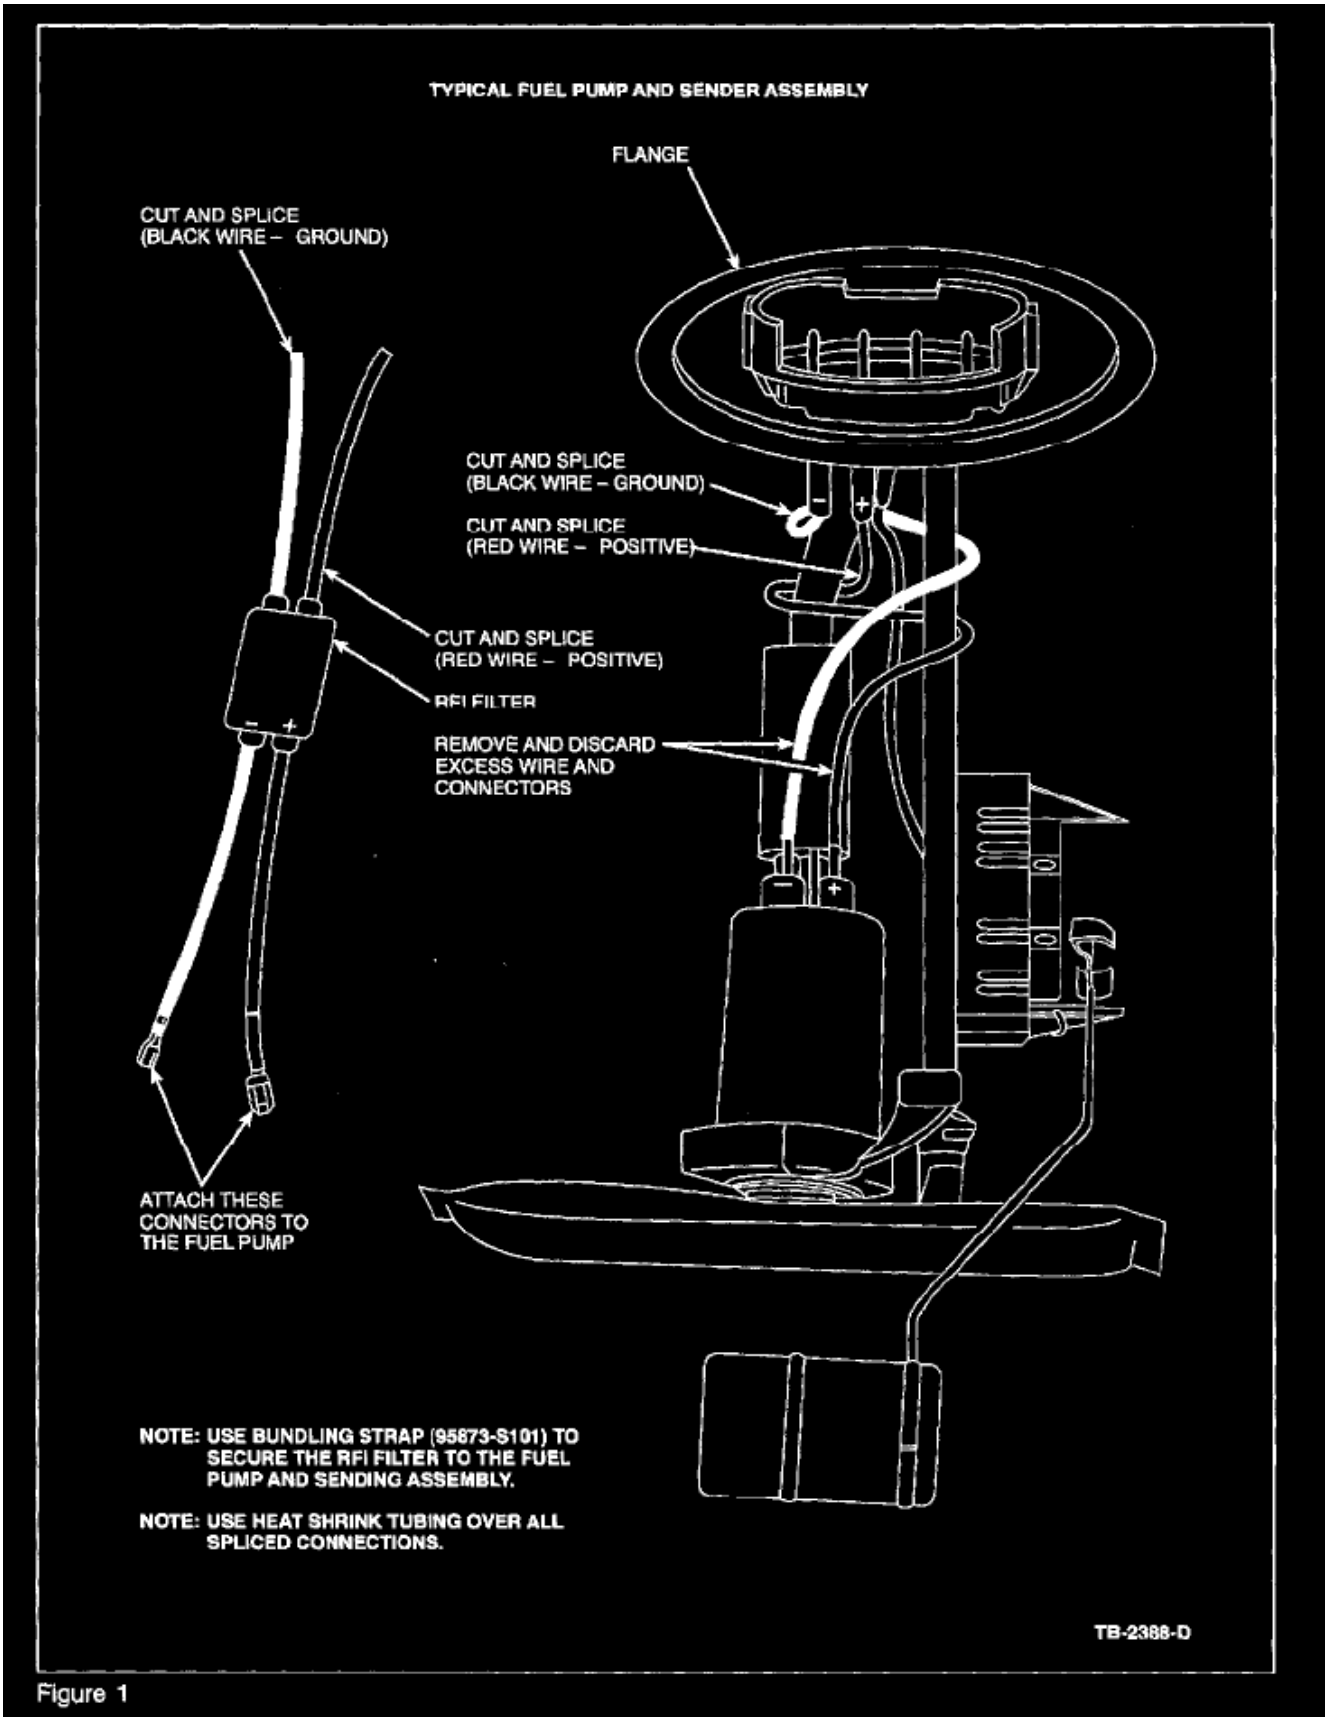

Figure 1

2. On vehicles without a fuel delivery module, remove the negative and positive connectors from the fuel pump, Figure 1.

a. Cut the wires to the fuel pump 76 mm (3") from the flange of the fuel pump and discard the wires.

b. Connect the RFI filter connectors to the spade terminal on the fuel pump.

c. Cut and solder both the red and black wires of the RFI filter to the red and black wires of the flange. Use Heat Shrink Tubing (F5AZ-14A099-AA) over the solder connections.

NOTE

HEAT SHRINK TUBING MUST BE USED OVER ALL SOLDERED CONNECTIONS MADE PER THIS TSB. USE SUFFICIENT TUBING (ABOUT 50 mm (2 ")) OF THE SPECIFIED TYPE TO ENTIRELY COVER EACH SOLDERED CONNECTION AND SHRINK APPROPRIATELY TO PREVENT EXPOSURE OF THE CONNECTIONS.

NOTE

FOR SOME VEHICLES WITH EXTREMELY LONG FUEL PUMP GROUND WIRE CIRCUITS, IT MAY BE NECESSARY TO SHORTEN THE GROUND WIRE TO A POINT CLOSE TO THE FUEL TANK. IF THE GROUND IS MOVED, BE SURE IT IS SECURE AND PROTECTED FROM CORROSION SINCE IT IS THE OPERATING GROUND FOR THE PUMP. CHECK SERVICE LITERATURE (EVTM, ETC.) FOR GROUND LOCATIONS.

WARNING

ALL SOLDERING AND HEAT SHRINKING MUST BE COMPLETED AWAY FROM THE FUEL TANK AREA. USE A SOLDERING IRON ONLY FOR SOLDERING AND HEAT GUN ONLY FOR APPLYING SHRINK TUBING.

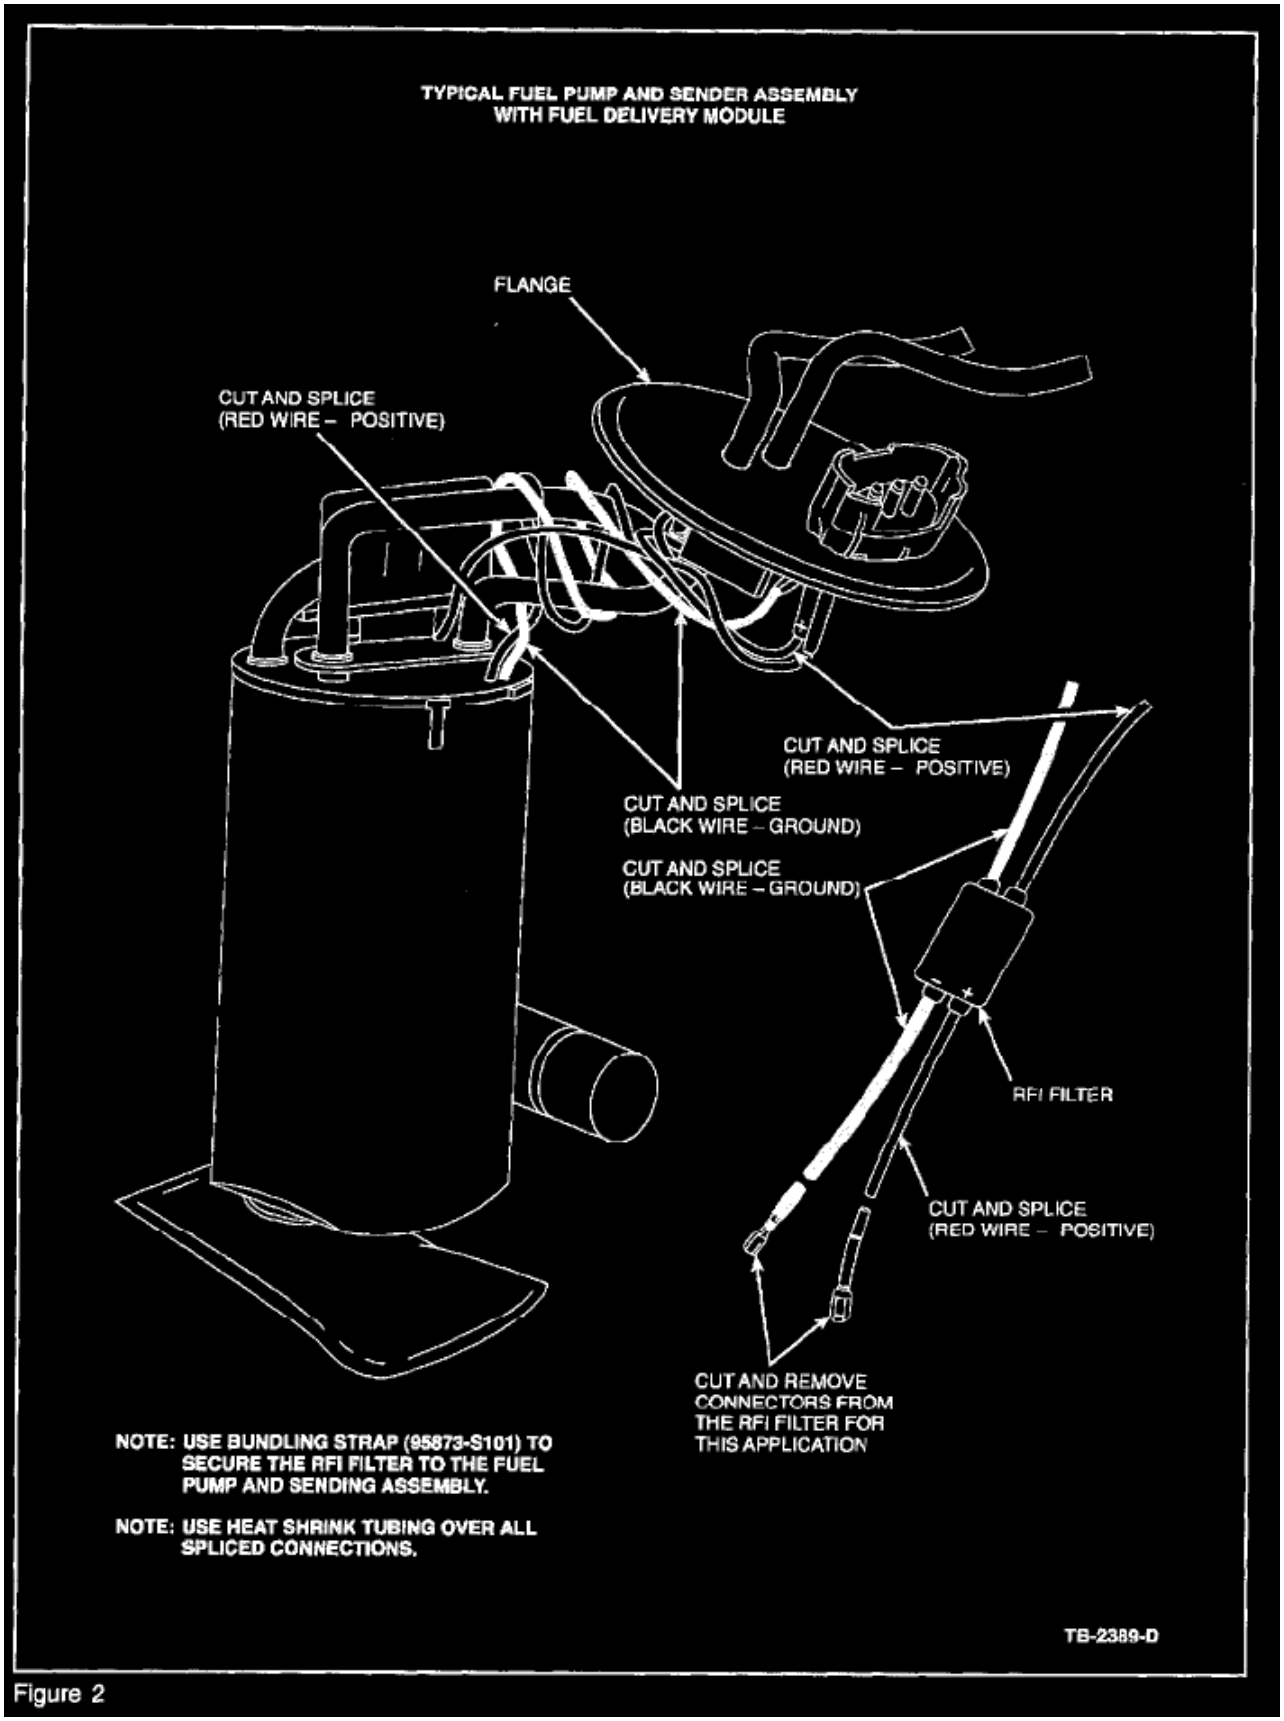

Figure 2

3. On light trucks and compact trucks with a fuel delivery module, cut the fuel pump wires to the fuel delivery module 50 mm (2") from the flange and discard the wires, Figure 2.

a. Cut the connectors from the RFI filter and solder wires to the fuel delivery module (red to red and black to black). Use heat shrink tubing over solder connections.

b. Solder wires from the RFI filter to the flange wires (red to red and black to black). Use heat shrink tubing over soldered connections.

NOTE

HEAT SHRINK TUBING MUST BE USED OVER ALL SOLDERED CONNECTIONS MADE PER THIS TSB. USE SUFFICIENT TUBING (ABOUT 50 mm (2 ")) OF THE SPECIFIED TYPE TO ENTIRELY COVER EACH SOLDERED CONNECTION AND SHRINK APPROPRIATELY TO PREVENT EXPOSURE OF THE CONNECTIONS.

NOTE

FOR SOME VEHICLES WITH EXTREMELY LONG FUEL PUMP GROUND WIRE CIRCUITS, IT MAY BE NECESSARY TO SHORTEN THE GROUND WIRE TO A POINT CLOSE TO THE FUEL TANK. IF THE GROUND IS MOVED, BE SURE IT IS SECURE AND PROTECTED FROM CORROSION SINCE IT IS THE OPERATING GROUND FOR THE PUMP. CHECK SERVICE LITERATURE (EVTM, ETC.) FOR GROUND LOCATIONS.

WARNING

ALL SOLDERING AND HEAT SHRINKING MUST BE COMPLETED AWAY FROM THE FUEL TANK AREA. USE A SOLDERING IRON ONLY FOR SOLDERING AND HEAT GUN ONLY FOR APPLYING SHRINK TUBING.

4. Secure the RFI filter to the fuel pump and sender assembly with a Bundling Strap (95873-S101) to prevent rattling in the tank, Figures 1 and 2.

5. Reinstall the fuel pump sender assembly into the fuel tank.

CAUTION

INSTALL NEW GASKETS WHEN REINSTALLING SENDER TO PREVENT LEAKS. REFER TO THE PARTS CATALOG FOR PROPER APPLICATIONS.

6. Check the appropriate Electrical and Vacuum Troubleshooting Manual (EVTM) (or other service literature) for the location of the fuel pump ground. If ground is more than 0.9m (3 ') from the tank, cut wire and ground fuel pump end within 0.9m (3 ') of the tank to prevent ground wire from acting as an antenna. Be sure ground is secure and protected from corrosion since it is the operating ground for the fuel pump.

7. Install the fuel tank in the vehicle as outlined in the appropriate Service or Workshop Manual.

IF THE GROUND IS MOVED, BE SURE IT IS SECURE AND PROTECTED FROM CORROSION SINCE IT IS THE OPERATING GROUND FOR THE PUMP. CHECK SERVICE LITERATURE (EVTM, ETC.) FOR GROUND LOCATIONS.

WARNING

ALL SOLDERING AND HEAT SHRINKING MUST BE COMPLETED AWAY FROM THE FUEL TANK AREA. USE A SOLDERING IRON ONLY FOR SOLDERING AND HEAT GUN ONLY FOR APPLYING SHRINK TUBING.

4. Secure the RFI filter to the fuel pump and sender assembly with a Bundling Strap (95873-S101) to prevent rattling in the tank, Figures 1 and 2.

5. Reinstall the fuel pump sender assembly into the fuel tank.

CAUTION

INSTALL NEW GASKETS WHEN REINSTALLING SENDER TO PREVENT LEAKS. REFER TO THE PARTS CATALOG FOR PROPER APPLICATIONS.

6. Check the appropriate Electrical and Vacuum Troubleshooting Manual (EVTM) (or other service literature) for the location of the fuel pump ground. If ground is more than 0.9m (3 ') from the tank, cut wire and ground fuel pump end within 0.9m (3 ') of the tank to prevent ground wire from acting as an antenna. Be sure ground is secure and protected from corrosion since it is the operating ground for the fuel pump.

7. Install the fuel tank in the vehicle as outlined in the appropriate Service or Workshop Manual.

Power Distribution

The alternator is connected to maxi-fuses within the power distribution box which is then connected together with the Battery at the starter relay hot terminal. Circuits and components are protected by maxi-fuses. Low power circuits are also protected by fuses.

The Ignition Switch and Main Light Switch are powered at all times, as are Fuses 1, 4, 8, 10 and Circuit Breaker 12 in the Fuse Panel. The other fuses are powered through the Ignition Switch or the Main Light Switch.

Position 3 is not used and is covered by Circuit Breaker 2.

Wire Color Code Identification

NOTE: Whenever a wire is labeled with two colors; the first color listed is the basic color of the wire, and the second color is the tracer marking of the wire. If the second color is followed by by a D, the tracer is dots. If the second color is followed by an H, the tracer is hash marks.

For example: BR/O is a brown wire with an orange stripe, R/Y D is a red wire with yellow dots and BK/W H is a black wire with white hash marks.

Circuit Breaker: Testing and Inspection

The 6 amp circuit breaker is located in the fuse panel. Two separate tests are necessary to check for correct circuit breaker operation. Remove circuit breaker from fuse panel and connect tester leads to circuit breaker.

TEST 1

1. Short tester leads together and adjust current draw until it equals circuit breaker rating.

2. Connect circuit breaker to tester.

3. Leave circuit breaker connected to tester for ten minutes, holding current reading on tester at rated current. If circuit breaker opens before ten minutes has elapsed, replace circuit breaker.

TEST 2

1. Short tester leads together and adjust current draw until it is twice the rated current.

2. Connect circuit breaker to tester, holding current reading on tester at twice the rated current.

3. If tester reading does not drop to zero within 30 seconds, replace circuit breaker.

ISSUE: Electrical system concerns that are due to diode failure may be serviced with an approved Ford service diode. Some electrical diodes used in early production vehicles are color coded for the purpose of size identification while others are stamped with a manufacture number. All Ford service diodes and current production diodes are identified by manufacture number.

ACTION: If service is required, refer to the appropriate model/year Electrical and Vacuum Troubleshooting Manual (EVTM) to determine the size and location of the diode(s). Refer to the following Electrical Diode Application Chart for the correct service part number.

NOTE:

IF THE DIODE REQUIRING REPLACEMENT DOES NOT HAVE THE SAME RATING AS LISTED IN THE APPLICATION CHART, USE THE NEXT HIGHER RATED DIODE.

TSB 01-7-3 is being republished in its entirety to update the model year coverage and vehicle line coverage.

ISSUE

A "whining"/"buzzing" noise in the speakers of the entertainment radio or two-way radio on vehicles with an in-tank electric fuel pump may be caused by electrical noise from the fuel pump.

ACTION

Install an electronic noise Radio Frequency Interference (RFI) Filter (F1PZ-18B925-A) on the fuel pump inside the fuel tank. Refer to the following Test Procedure to confirm that the concern exists, then refer to the Service Procedure for repair details.

PART NUMBER	PART NAME
F1PZ-18B925-A	Radio Frequency Interference (RFI) Filter
95873-S101	Bundling Strap
F5AZ-14A099-AA	Heat Shrink Tubing

NOTE

IF THE VEHICLE HAS AN ELECTRONIC RETURNLESS FUEL SYSTEM, DO NOT INSTALL A RFI FILTER INLINE TO THE FUEL PUMP . ONLY VEHICLES WITH MECHANICAL RETURNLESS FUEL SYSTEMS (PRESSURE REGULATOR IN THE TANK), OR SYSTEMS WITH THE PRESSURE REGULATOR ON THE FUEL RAIL SHOULD BE APPROVED FOR THE RFI FILTER INSTALLATION.

NOTE

SOME LIGHT TRUCKS REQUIRE ONE (1) RFI FILTER FOR EACH IN-TANK ELECTRIC FUEL PUMP ON MULTI-TANK VEHICLES.

NOTE

THIS TSB DOES NOT INCLUDE TAURUS FLEXIBLE FUEL VEHICLES (FFVS) OR 1999 RANGER 3.0L FFVS.

TEST PROCEDURE

Fuel pump radio noise is relatively constant and changes only slightly with vehicle speed. If the frequency of the noise varies or the noise comes and goes with the vehicle speed, then it is not the fuel pump and this fix will not be effective. The following procedure will help determine if the fuel pump is the cause of the radio noise:

1. Turn on the radio before the key is turned on (assuming the radio will operate without the ignition key - you may need to put the ignition key in the Accessory position).

2. Turn the ignition key to the Run position (do not start the engine).

3. The fuel pump should run for about 1 second with the key in the Run position with the engine not running. Listen for noise in the radio. If noise is present while the pump is running and stops when the pump stops, then the noise is being generated by the pump and this procedure should help.

DEALER CODING

CONDITION

BASIC PART NO. CODE

18B925 42

OASIS CODES: 205000, 207000, 404000, 702000, 702300

Service Procedure

1. Remove the fuel pump sender assembly from the fuel tank. Refer to the appropriate model year Workshop Manual for removal procedure.

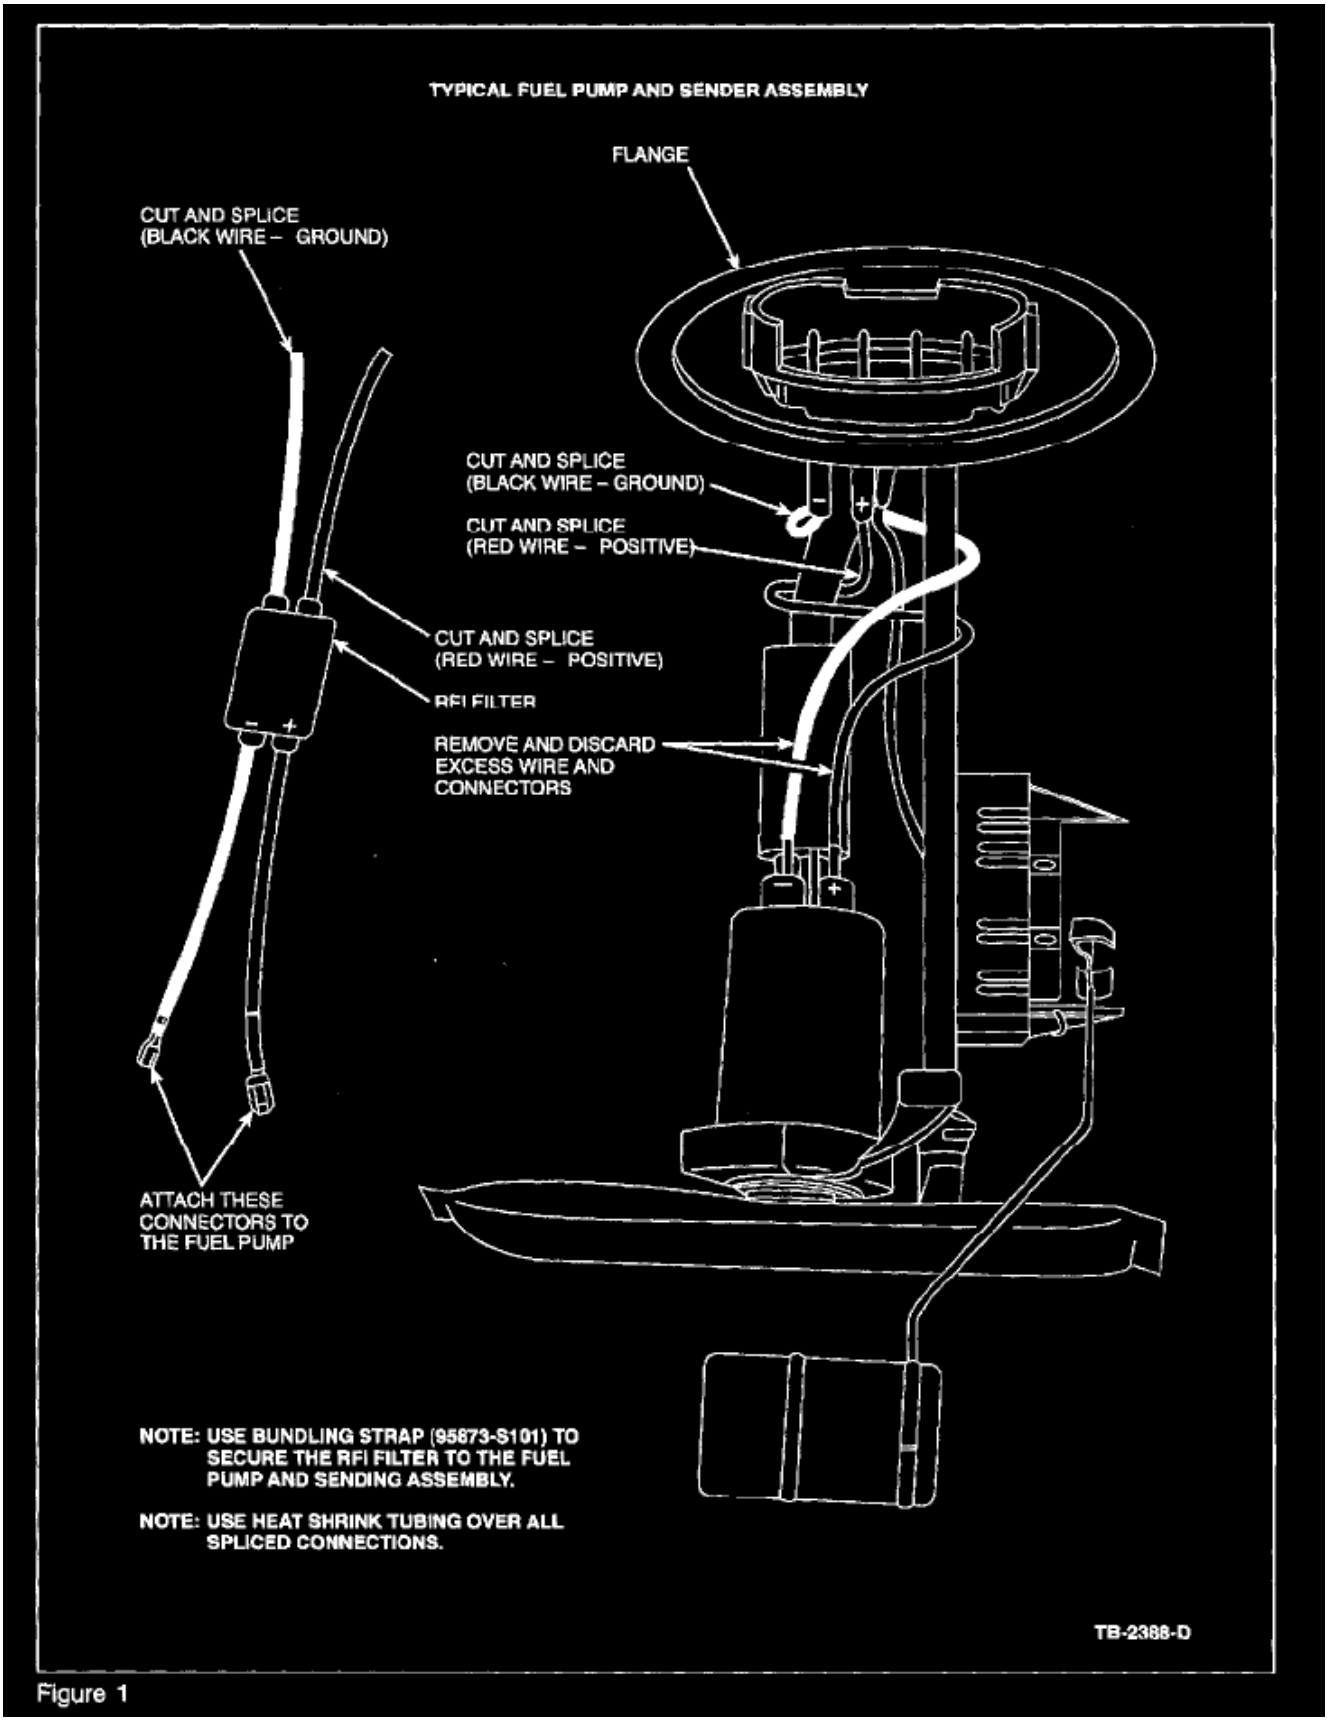

Figure 1

2. On vehicles without a fuel delivery module, remove the negative and positive connectors from the fuel pump, Figure 1.

a. Cut the wires to the fuel pump 76 mm (3") from the flange of the fuel pump and discard the wires.

b. Connect the RFI filter connectors to the spade terminal on the fuel pump.

c. Cut and solder both the red and black wires of the RFI filter to the red and black wires of the flange. Use Heat Shrink Tubing (F5AZ-14A099-AA) over the solder connections.

NOTE

HEAT SHRINK TUBING MUST BE USED OVER ALL SOLDERED CONNECTIONS MADE PER THIS TSB. USE SUFFICIENT TUBING (ABOUT 50 mm (2 ")) OF THE SPECIFIED TYPE TO ENTIRELY COVER EACH SOLDERED CONNECTION AND SHRINK APPROPRIATELY TO PREVENT EXPOSURE OF THE CONNECTIONS.

NOTE

FOR SOME VEHICLES WITH EXTREMELY LONG FUEL PUMP GROUND WIRE CIRCUITS, IT MAY BE NECESSARY TO SHORTEN THE GROUND WIRE TO A POINT CLOSE TO THE FUEL TANK. IF THE GROUND IS MOVED, BE SURE IT IS SECURE AND PROTECTED FROM CORROSION SINCE IT IS THE OPERATING GROUND FOR THE PUMP. CHECK SERVICE LITERATURE (EVTM, ETC.) FOR GROUND LOCATIONS.

WARNING

ALL SOLDERING AND HEAT SHRINKING MUST BE COMPLETED AWAY FROM THE FUEL TANK AREA. USE A SOLDERING IRON ONLY FOR SOLDERING AND HEAT GUN ONLY FOR APPLYING SHRINK TUBING.

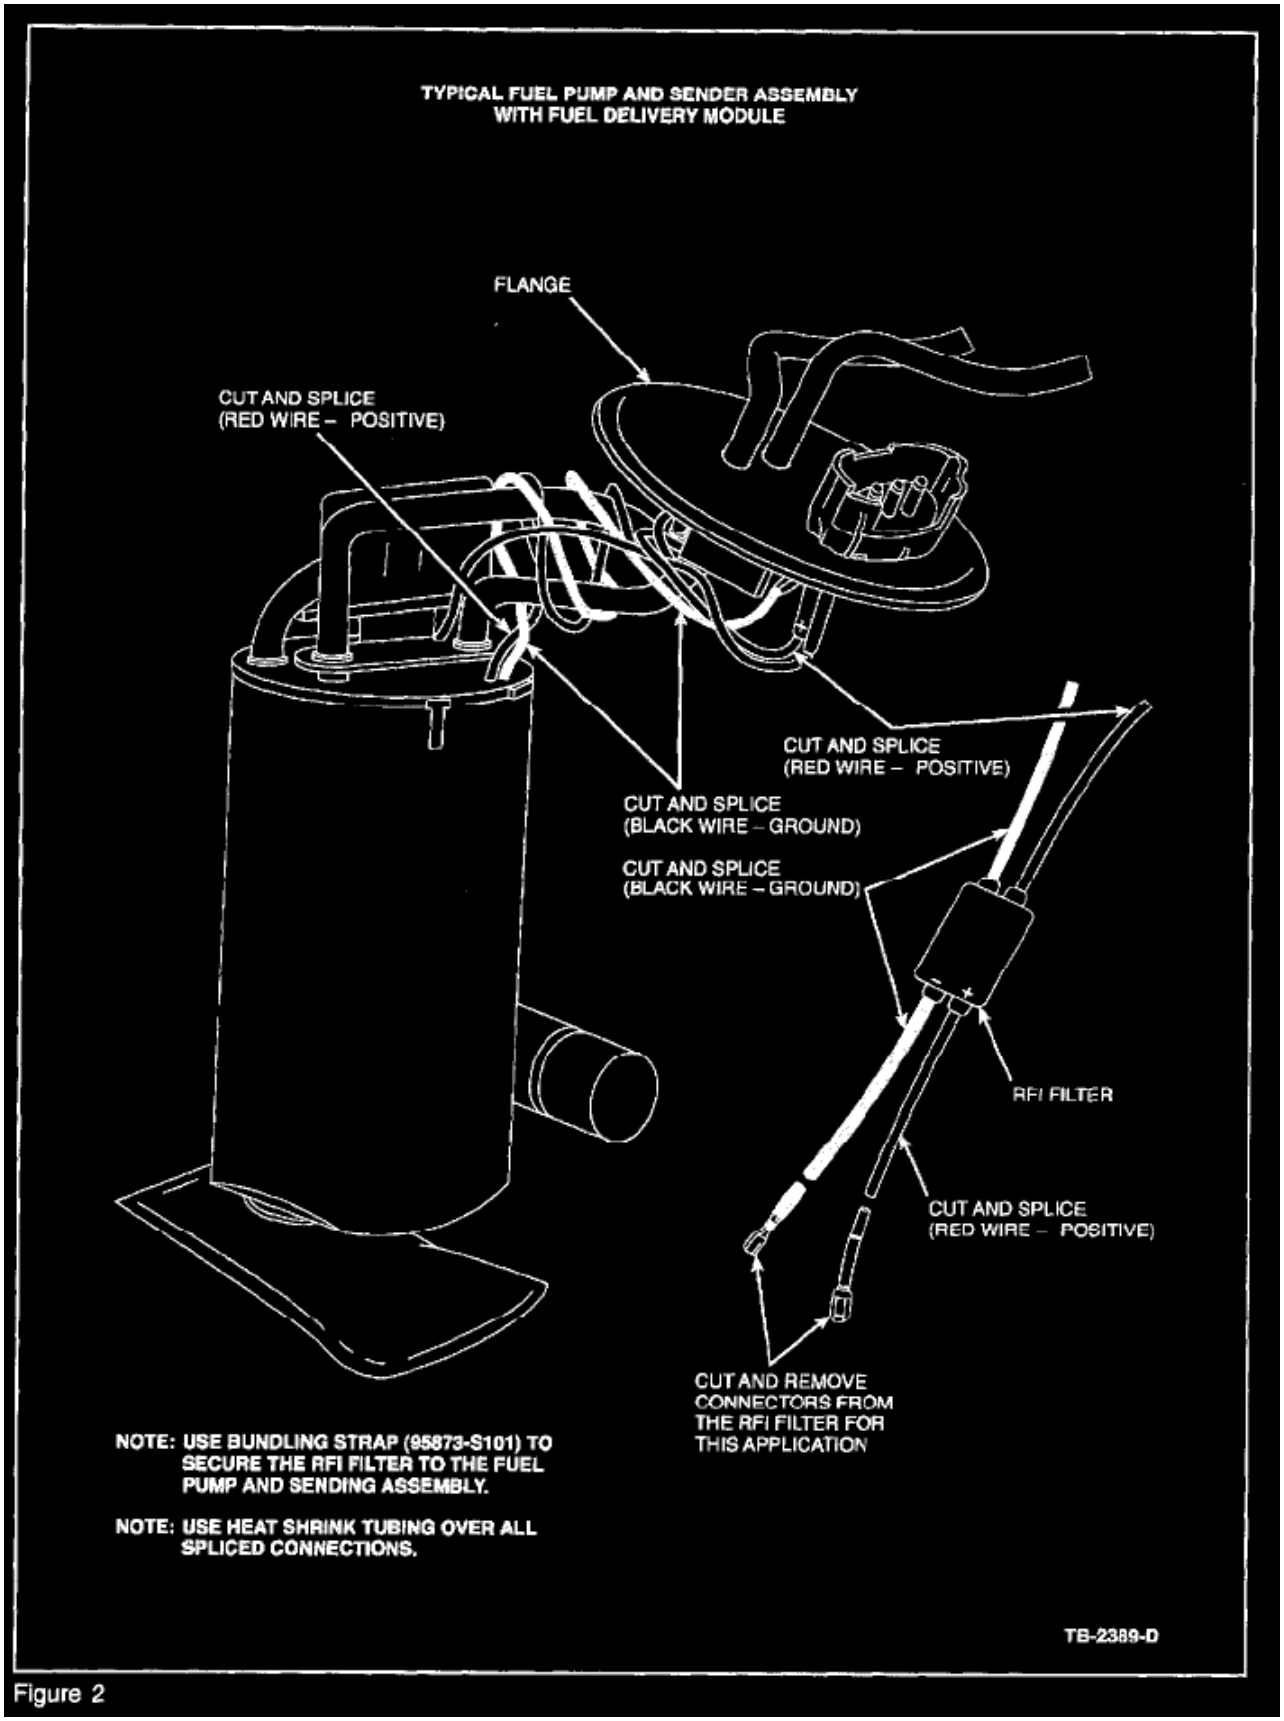

Figure 2

3. On light trucks and compact trucks with a fuel delivery module, cut the fuel pump wires to the fuel delivery module 50 mm (2") from the flange and discard the wires, Figure 2.

a. Cut the connectors from the RFI filter and solder wires to the fuel delivery module (red to red and black to black). Use heat shrink tubing over solder connections.

b. Solder wires from the RFI filter to the flange wires (red to red and black to black). Use heat shrink tubing over soldered connections.

NOTE

HEAT SHRINK TUBING MUST BE USED OVER ALL SOLDERED CONNECTIONS MADE PER THIS TSB. USE SUFFICIENT TUBING (ABOUT 50 mm (2 ")) OF THE SPECIFIED TYPE TO ENTIRELY COVER EACH SOLDERED CONNECTION AND SHRINK APPROPRIATELY TO PREVENT EXPOSURE OF THE CONNECTIONS.

NOTE

FOR SOME VEHICLES WITH EXTREMELY LONG FUEL PUMP GROUND WIRE CIRCUITS, IT MAY BE NECESSARY TO SHORTEN THE GROUND WIRE TO A POINT CLOSE TO THE FUEL TANK. IF THE GROUND IS MOVED, BE SURE IT IS SECURE AND PROTECTED FROM CORROSION SINCE IT IS THE OPERATING GROUND FOR THE PUMP. CHECK SERVICE LITERATURE (EVTM, ETC.) FOR GROUND LOCATIONS.

WARNING

ALL SOLDERING AND HEAT SHRINKING MUST BE COMPLETED AWAY FROM THE FUEL TANK AREA. USE A SOLDERING IRON ONLY FOR SOLDERING AND HEAT GUN ONLY FOR APPLYING SHRINK TUBING.

4. Secure the RFI filter to the fuel pump and sender assembly with a Bundling Strap (95873-S101) to prevent rattling in the tank, Figures 1 and 2.

5. Reinstall the fuel pump sender assembly into the fuel tank.

CAUTION

INSTALL NEW GASKETS WHEN REINSTALLING SENDER TO PREVENT LEAKS. REFER TO THE PARTS CATALOG FOR PROPER APPLICATIONS.

6. Check the appropriate Electrical and Vacuum Troubleshooting Manual (EVTM) (or other service literature) for the location of the fuel pump ground. If ground is more than 0.9m (3 ') from the tank, cut wire and ground fuel pump end within 0.9m (3 ') of the tank to prevent ground wire from acting as an antenna. Be sure ground is secure and protected from corrosion since it is the operating ground for the fuel pump.

7. Install the fuel tank in the vehicle as outlined in the appropriate Service or Workshop Manual.

TSB 01-7-3 is being republished in its entirety to update the model year coverage and vehicle line coverage.

ISSUE

A "whining"/"buzzing" noise in the speakers of the entertainment radio or two-way radio on vehicles with an in-tank electric fuel pump may be caused by electrical noise from the fuel pump.

ACTION

Install an electronic noise Radio Frequency Interference (RFI) Filter (F1PZ-18B925-A) on the fuel pump inside the fuel tank. Refer to the following Test Procedure to confirm that the concern exists, then refer to the Service Procedure for repair details.

PART NUMBER	PART NAME
F1PZ-18B925-A	Radio Frequency Interference (RFI) Filter
95873-S101	Bundling Strap
F5AZ-14A099-AA	Heat Shrink Tubing

NOTE

IF THE VEHICLE HAS AN ELECTRONIC RETURNLESS FUEL SYSTEM, DO NOT INSTALL A RFI FILTER INLINE TO THE FUEL PUMP . ONLY VEHICLES WITH MECHANICAL RETURNLESS FUEL SYSTEMS (PRESSURE REGULATOR IN THE TANK), OR SYSTEMS WITH THE PRESSURE REGULATOR ON THE FUEL RAIL SHOULD BE APPROVED FOR THE RFI FILTER INSTALLATION.

NOTE

SOME LIGHT TRUCKS REQUIRE ONE (1) RFI FILTER FOR EACH IN-TANK ELECTRIC FUEL PUMP ON MULTI-TANK VEHICLES.

NOTE

THIS TSB DOES NOT INCLUDE TAURUS FLEXIBLE FUEL VEHICLES (FFVS) OR 1999 RANGER 3.0L FFVS.

TEST PROCEDURE

Fuel pump radio noise is relatively constant and changes only slightly with vehicle speed. If the frequency of the noise varies or the noise comes and goes with the vehicle speed, then it is not the fuel pump and this fix will not be effective. The following procedure will help determine if the fuel pump is the cause of the radio noise:

1. Turn on the radio before the key is turned on (assuming the radio will operate without the ignition key - you may need to put the ignition key in the Accessory position).

2. Turn the ignition key to the Run position (do not start the engine).

3. The fuel pump should run for about 1 second with the key in the Run position with the engine not running. Listen for noise in the radio. If noise is present while the pump is running and stops when the pump stops, then the noise is being generated by the pump and this procedure should help.

Service Procedure

1. Remove the fuel pump sender assembly from the fuel tank. Refer to the appropriate model year Workshop Manual for removal procedure.

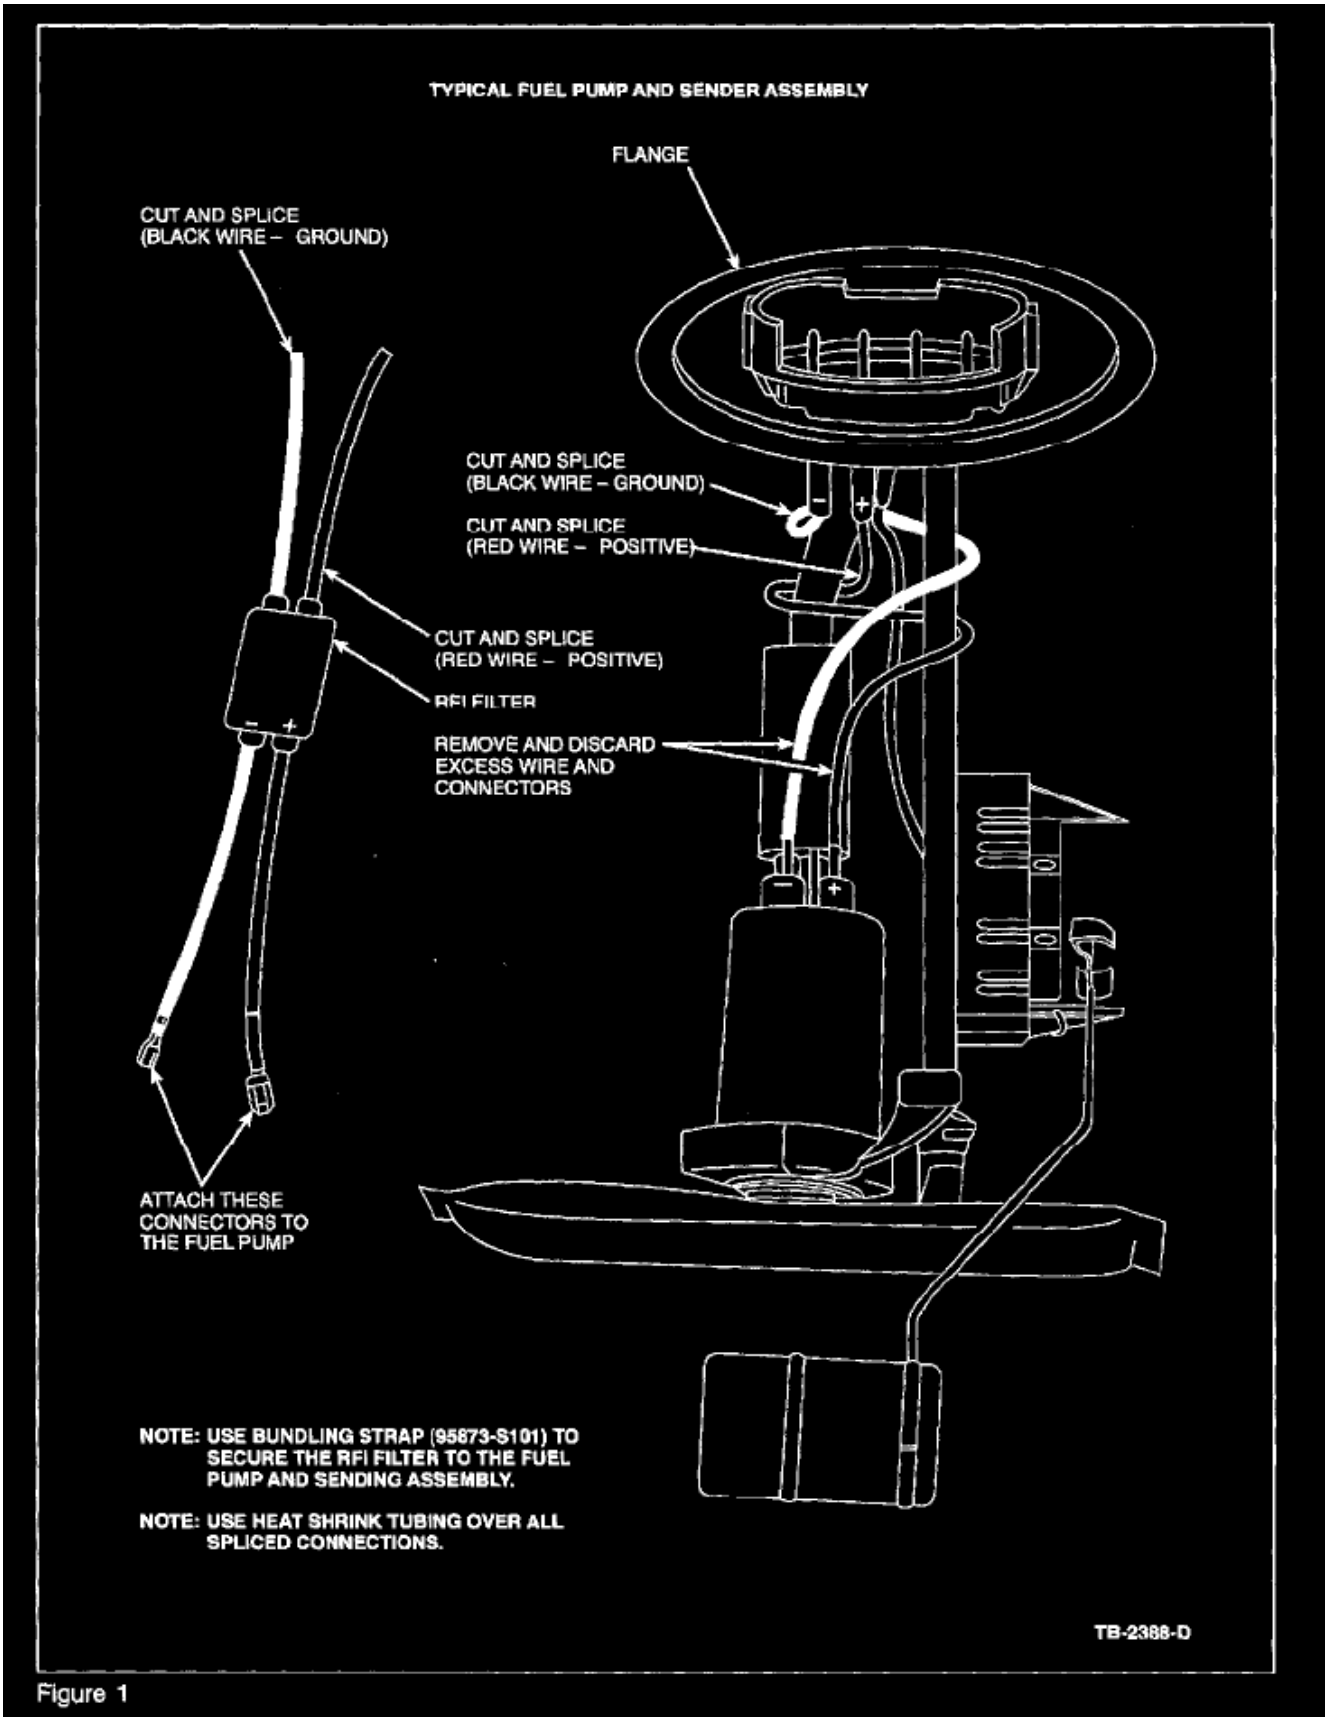

Figure 1

2. On vehicles without a fuel delivery module, remove the negative and positive connectors from the fuel pump, Figure 1.

a. Cut the wires to the fuel pump 76 mm (3") from the flange of the fuel pump and discard the wires.

b. Connect the RFI filter connectors to the spade terminal on the fuel pump.

c. Cut and solder both the red and black wires of the RFI filter to the red and black wires of the flange. Use Heat Shrink Tubing (F5AZ-14A099-AA) over the solder connections.

NOTE

HEAT SHRINK TUBING MUST BE USED OVER ALL SOLDERED CONNECTIONS MADE PER THIS TSB. USE SUFFICIENT TUBING (ABOUT 50 mm (2 ")) OF THE SPECIFIED TYPE TO ENTIRELY COVER EACH SOLDERED CONNECTION AND SHRINK APPROPRIATELY TO PREVENT EXPOSURE OF THE CONNECTIONS.

NOTE

FOR SOME VEHICLES WITH EXTREMELY LONG FUEL PUMP GROUND WIRE CIRCUITS, IT MAY BE NECESSARY TO SHORTEN THE GROUND WIRE TO A POINT CLOSE TO THE FUEL TANK. IF THE GROUND IS MOVED, BE SURE IT IS SECURE AND PROTECTED FROM CORROSION SINCE IT IS THE OPERATING GROUND FOR THE PUMP. CHECK SERVICE LITERATURE (EVTM, ETC.) FOR GROUND LOCATIONS.

WARNING

ALL SOLDERING AND HEAT SHRINKING MUST BE COMPLETED AWAY FROM THE FUEL TANK AREA. USE A SOLDERING IRON ONLY FOR SOLDERING AND HEAT GUN ONLY FOR APPLYING SHRINK TUBING.

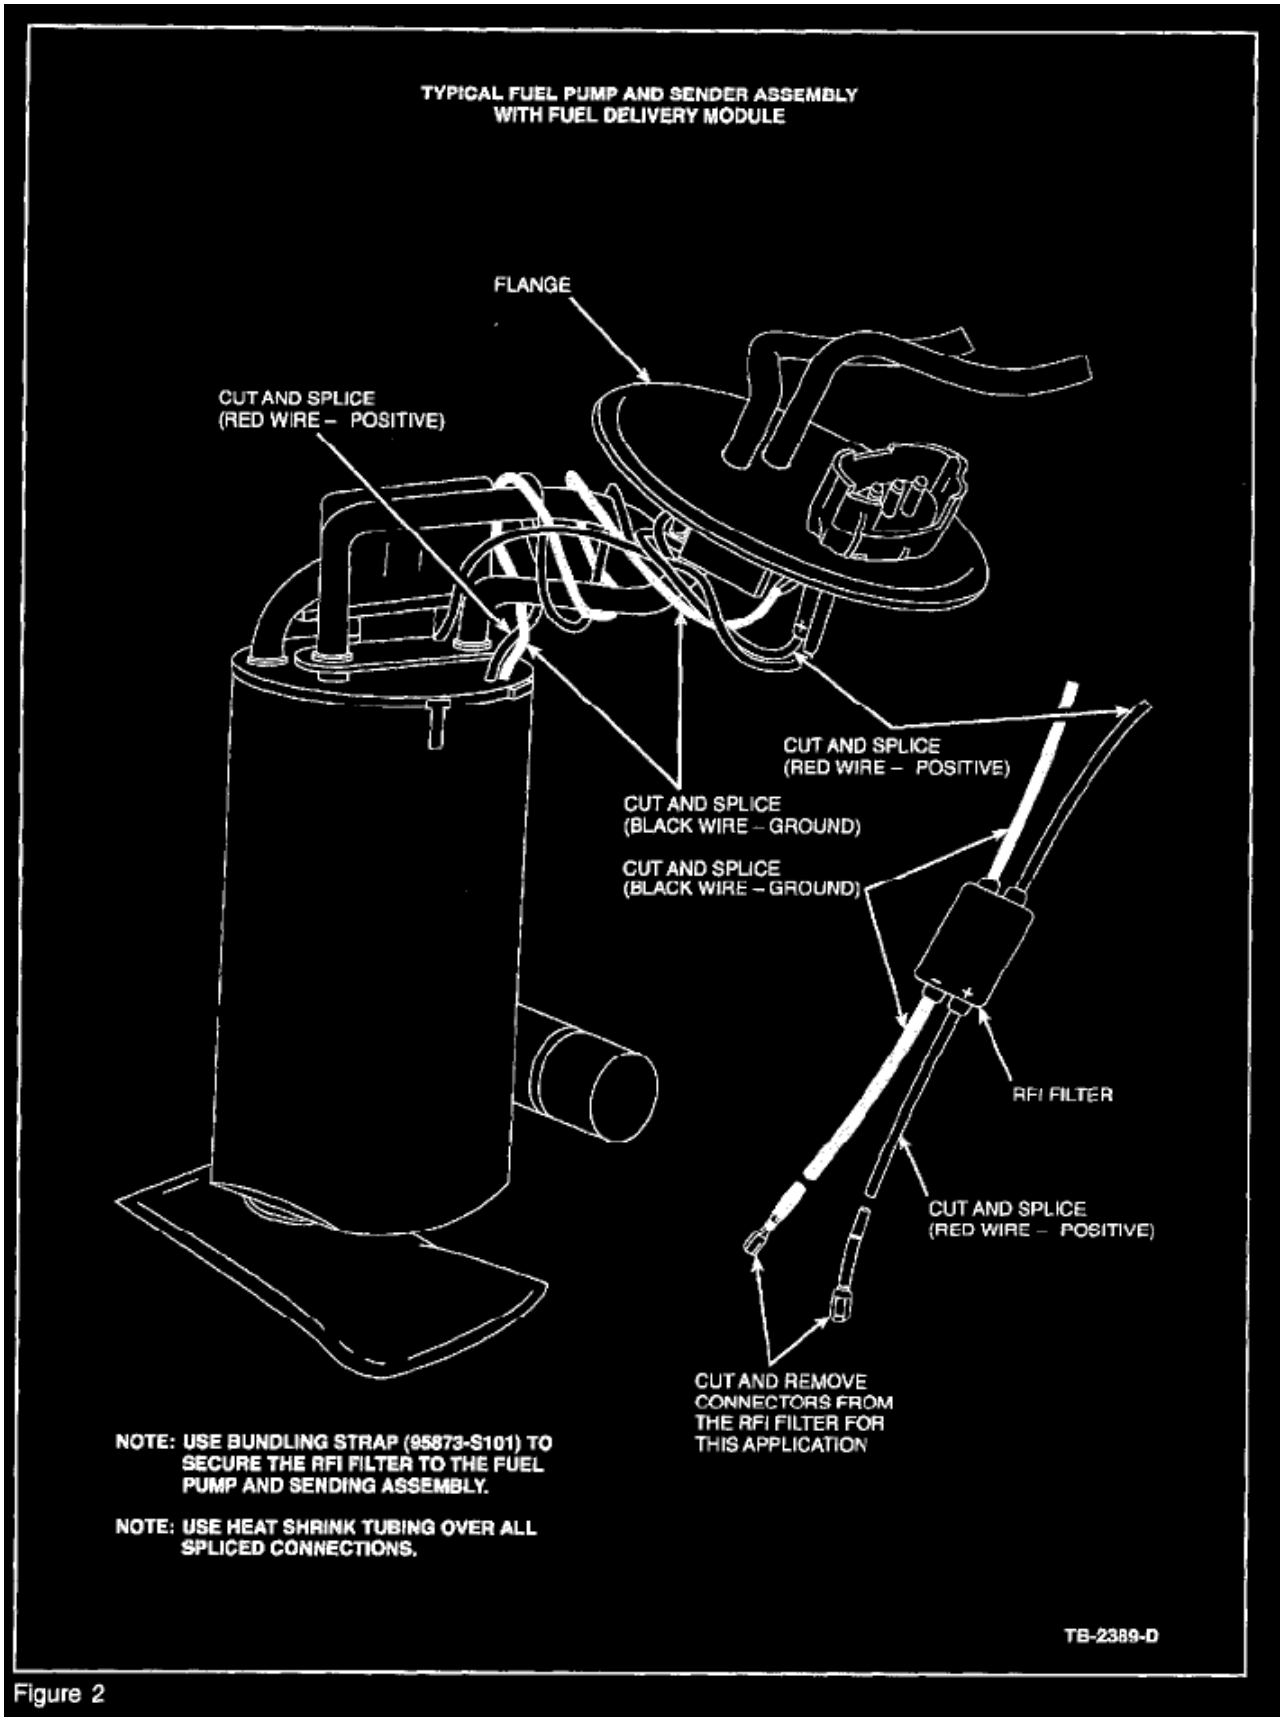

Figure 2

3. On light trucks and compact trucks with a fuel delivery module, cut the fuel pump wires to the fuel delivery module 50 mm (2") from the flange and discard the wires, Figure 2.

a. Cut the connectors from the RFI filter and solder wires to the fuel delivery module (red to red and black to black). Use heat shrink tubing over solder connections.

b. Solder wires from the RFI filter to the flange wires (red to red and black to black). Use heat shrink tubing over soldered connections.

NOTE

HEAT SHRINK TUBING MUST BE USED OVER ALL SOLDERED CONNECTIONS MADE PER THIS TSB. USE SUFFICIENT TUBING (ABOUT 50 mm (2 ")) OF THE SPECIFIED TYPE TO ENTIRELY COVER EACH SOLDERED CONNECTION AND SHRINK APPROPRIATELY TO PREVENT EXPOSURE OF THE CONNECTIONS.

OASIS CODES: 205000, 207000, 404000, 702000, 702300

Service Procedure

1. Remove the fuel pump sender assembly from the fuel tank. Refer to the appropriate model year Workshop Manual for removal procedure.

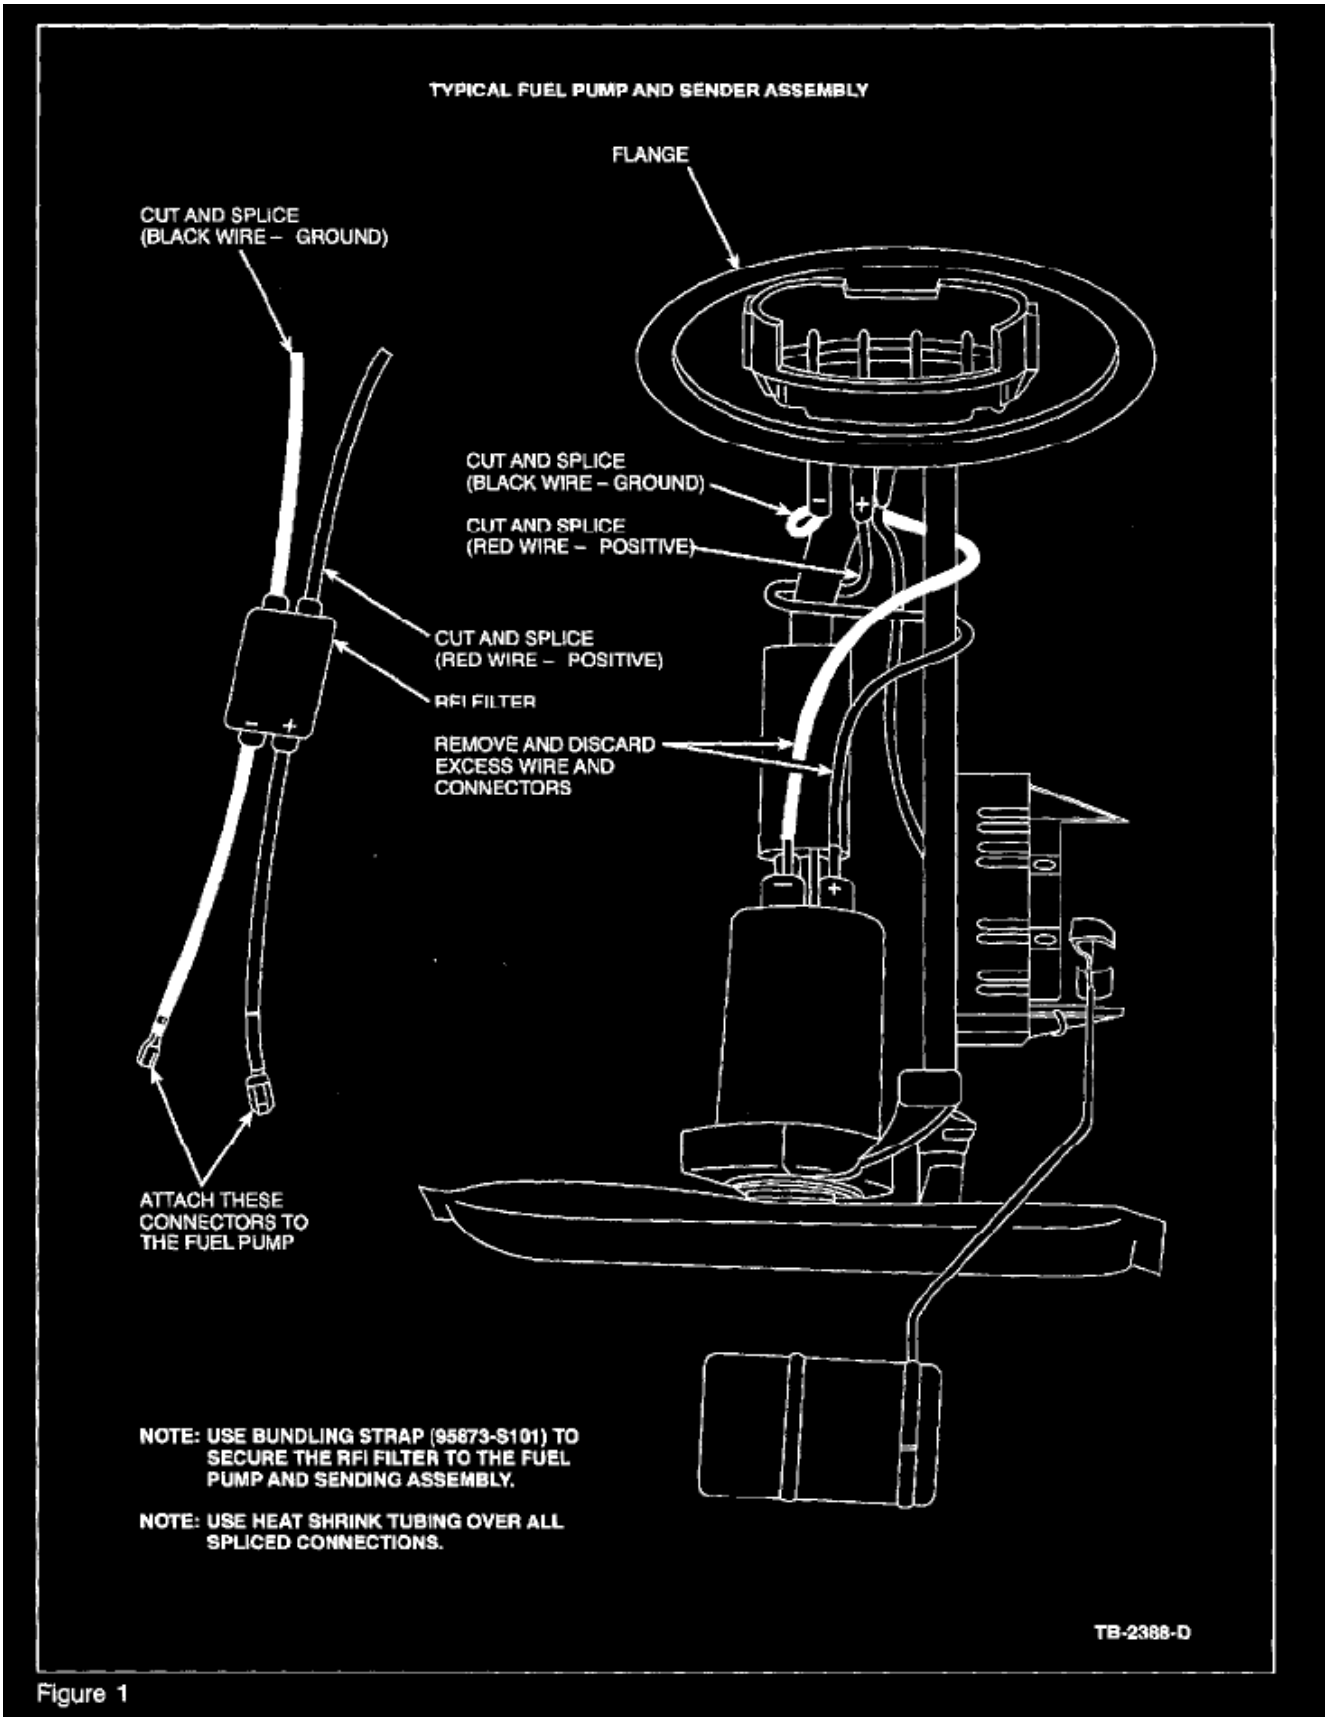

Figure 1

2. On vehicles without a fuel delivery module, remove the negative and positive connectors from the fuel pump, Figure 1.

a. Cut the wires to the fuel pump 76 mm (3") from the flange of the fuel pump and discard the wires.

b. Connect the RFI filter connectors to the spade terminal on the fuel pump.

c. Cut and solder both the red and black wires of the RFI filter to the red and black wires of the flange. Use Heat Shrink Tubing (F5AZ-14A099-AA) over the solder connections.

NOTE

HEAT SHRINK TUBING MUST BE USED OVER ALL SOLDERED CONNECTIONS MADE PER THIS TSB. USE SUFFICIENT TUBING (ABOUT 50 mm (2 ")) OF THE SPECIFIED TYPE TO ENTIRELY COVER EACH SOLDERED CONNECTION AND SHRINK APPROPRIATELY TO PREVENT EXPOSURE OF THE CONNECTIONS.

NOTE

FOR SOME VEHICLES WITH EXTREMELY LONG FUEL PUMP GROUND WIRE CIRCUITS, IT MAY BE NECESSARY TO SHORTEN THE GROUND WIRE TO A POINT CLOSE TO THE FUEL TANK. IF THE GROUND IS MOVED, BE SURE IT IS SECURE AND PROTECTED FROM CORROSION SINCE IT IS THE OPERATING GROUND FOR THE PUMP. CHECK SERVICE LITERATURE (EVTM, ETC.) FOR GROUND LOCATIONS.

WARNING

ALL SOLDERING AND HEAT SHRINKING MUST BE COMPLETED AWAY FROM THE FUEL TANK AREA. USE A SOLDERING IRON ONLY FOR SOLDERING AND HEAT GUN ONLY FOR APPLYING SHRINK TUBING.

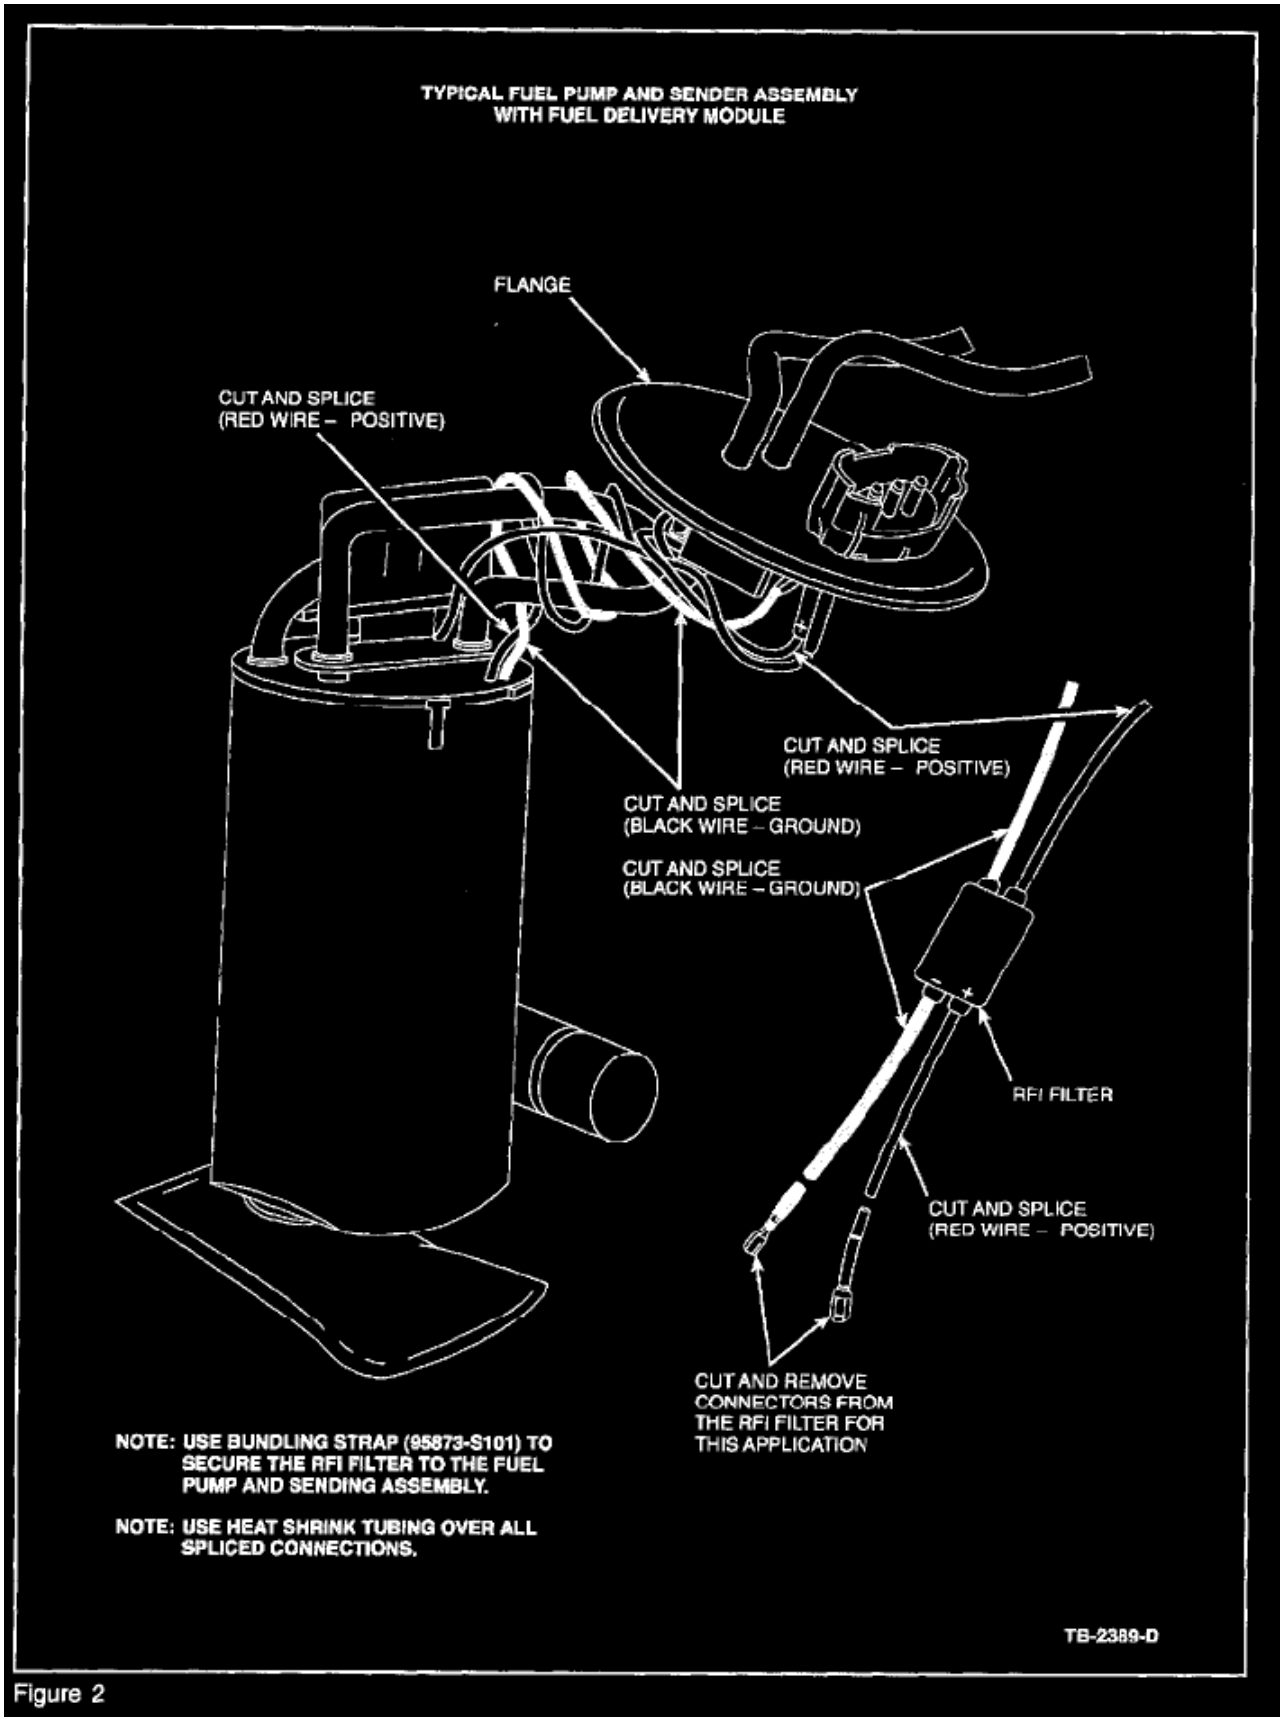

Figure 2

3. On light trucks and compact trucks with a fuel delivery module, cut the fuel pump wires to the fuel delivery module 50 mm (2") from the flange and discard the wires, Figure 2.

a. Cut the connectors from the RFI filter and solder wires to the fuel delivery module (red to red and black to black). Use heat shrink tubing over solder connections.

b. Solder wires from the RFI filter to the flange wires (red to red and black to black). Use heat shrink tubing over soldered connections.

NOTE

HEAT SHRINK TUBING MUST BE USED OVER ALL SOLDERED CONNECTIONS MADE PER THIS TSB. USE SUFFICIENT TUBING (ABOUT 50 mm (2 ")) OF THE SPECIFIED TYPE TO ENTIRELY COVER EACH SOLDERED CONNECTION AND SHRINK APPROPRIATELY TO PREVENT EXPOSURE OF THE CONNECTIONS.

NOTE

FOR SOME VEHICLES WITH EXTREMELY LONG FUEL PUMP GROUND WIRE CIRCUITS, IT MAY BE NECESSARY TO SHORTEN THE GROUND WIRE TO A POINT CLOSE TO THE FUEL TANK. IF THE GROUND IS MOVED, BE SURE IT IS SECURE AND PROTECTED FROM CORROSION SINCE IT IS THE OPERATING GROUND FOR THE PUMP. CHECK SERVICE LITERATURE (EVTM, ETC.) FOR GROUND LOCATIONS.

WARNING

ALL SOLDERING AND HEAT SHRINKING MUST BE COMPLETED AWAY FROM THE FUEL TANK AREA. USE A SOLDERING IRON ONLY FOR SOLDERING AND HEAT GUN ONLY FOR APPLYING SHRINK TUBING.

4. Secure the RFI filter to the fuel pump and sender assembly with a Bundling Strap (95873-S101) to prevent rattling in the tank, Figures 1 and 2.

5. Reinstall the fuel pump sender assembly into the fuel tank.

CAUTION

INSTALL NEW GASKETS WHEN REINSTALLING SENDER TO PREVENT LEAKS. REFER TO THE PARTS CATALOG FOR PROPER APPLICATIONS.

6. Check the appropriate Electrical and Vacuum Troubleshooting Manual (EVTM) (or other service literature) for the location of the fuel pump ground. If ground is more than 0.9m (3 ') from the tank, cut wire and ground fuel pump end within 0.9m (3 ') of the tank to prevent ground wire from acting as an antenna. Be sure ground is secure and protected from corrosion since it is the operating ground for the fuel pump.

7. Install the fuel tank in the vehicle as outlined in the appropriate Service or Workshop Manual.

TSB 01-7-3 is being republished in its entirety to update the model year coverage and vehicle line coverage.

ISSUE

A "whining"/"buzzing" noise in the speakers of the entertainment radio or two-way radio on vehicles with an in-tank electric fuel pump may be caused by electrical noise from the fuel pump.

ACTION

Install an electronic noise Radio Frequency Interference (RFI) Filter (F1PZ-18B925-A) on the fuel pump inside the fuel tank. Refer to the following Test Procedure to confirm that the concern exists, then refer to the Service Procedure for repair details.

PART NUMBER	PART NAME
F1PZ-18B925-A	Radio Frequency Interference (RFI) Filter
95873-S101	Bundling Strap
F5AZ-14A099-AA	Heat Shrink Tubing

NOTE

IF THE VEHICLE HAS AN ELECTRONIC RETURNLESS FUEL SYSTEM, DO NOT INSTALL A RFI FILTER INLINE TO THE FUEL PUMP . ONLY VEHICLES WITH MECHANICAL RETURNLESS FUEL SYSTEMS (PRESSURE REGULATOR IN THE TANK), OR SYSTEMS WITH THE PRESSURE REGULATOR ON THE FUEL RAIL SHOULD BE APPROVED FOR THE RFI FILTER INSTALLATION.

NOTE

SOME LIGHT TRUCKS REQUIRE ONE (1) RFI FILTER FOR EACH IN-TANK ELECTRIC FUEL PUMP ON MULTI-TANK VEHICLES.

NOTE

THIS TSB DOES NOT INCLUDE TAURUS FLEXIBLE FUEL VEHICLES (FFVS) OR 1999 RANGER 3.0L FFVS.

TEST PROCEDURE

Fuel pump radio noise is relatively constant and changes only slightly with vehicle speed. If the frequency of the noise varies or the noise comes and goes with the vehicle speed, then it is not the fuel pump and this fix will not be effective. The following procedure will help determine if the fuel pump is the cause of the radio noise:

1. Turn on the radio before the key is turned on (assuming the radio will operate without the ignition key - you may need to put the ignition key in the Accessory position).

2. Turn the ignition key to the Run position (do not start the engine).

3. The fuel pump should run for about 1 second with the key in the Run position with the engine not running. Listen for noise in the radio. If noise is present while the pump is running and stops when the pump stops, then the noise is being generated by the pump and this procedure should help.

DEALER CODING

CONDITION

BASIC PART NO. CODE

18B925 42

OASIS CODES: 205000, 207000, 404000, 702000, 702300

Service Procedure

1. Remove the fuel pump sender assembly from the fuel tank. Refer to the appropriate model year Workshop Manual for removal procedure.

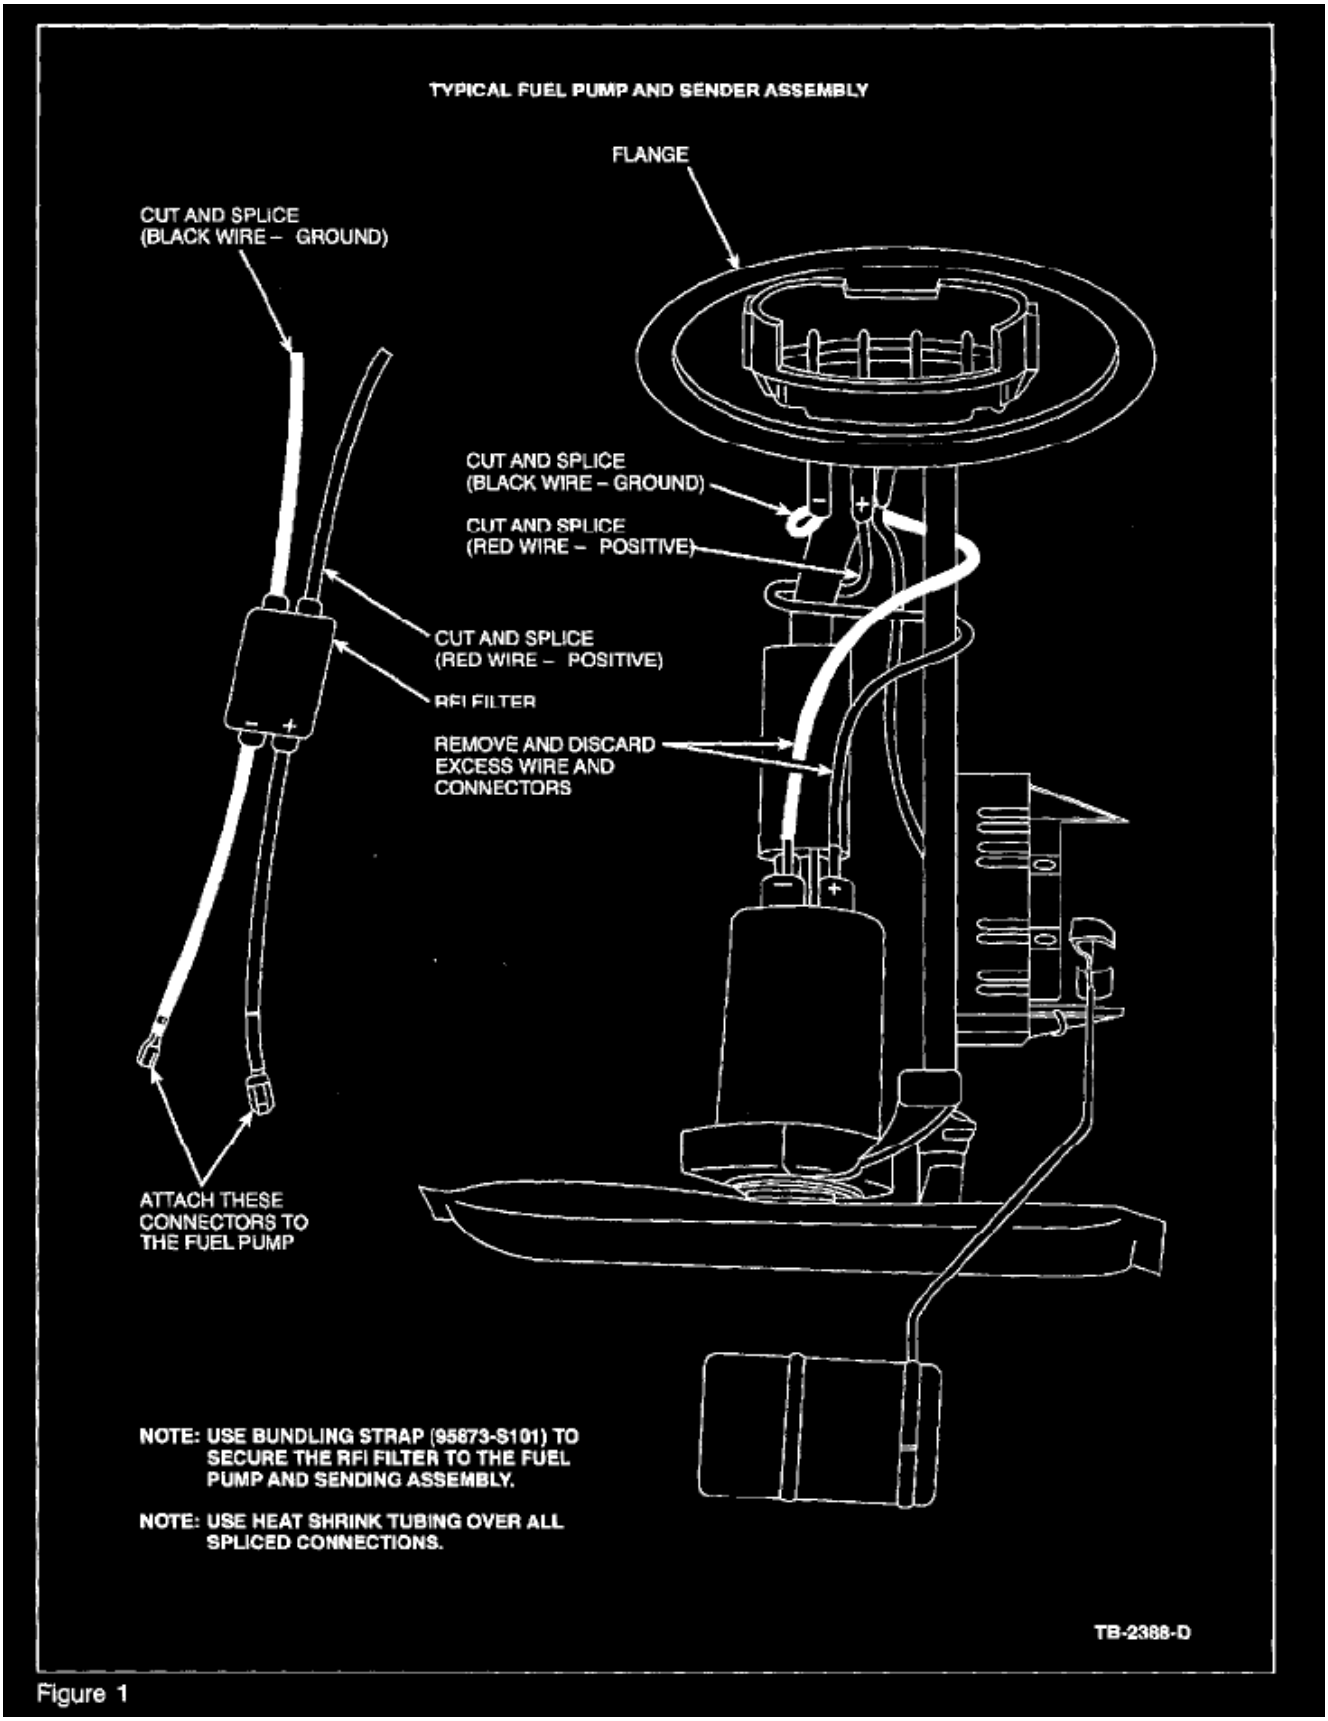

Figure 1

2. On vehicles without a fuel delivery module, remove the negative and positive connectors from the fuel pump, Figure 1.

a. Cut the wires to the fuel pump 76 mm (3") from the flange of the fuel pump and discard the wires.

b. Connect the RFI filter connectors to the spade terminal on the fuel pump.

c. Cut and solder both the red and black wires of the RFI filter to the red and black wires of the flange. Use Heat Shrink Tubing (F5AZ-14A099-AA) over the solder connections.

NOTE

HEAT SHRINK TUBING MUST BE USED OVER ALL SOLDERED CONNECTIONS MADE PER THIS TSB. USE SUFFICIENT TUBING (ABOUT 50 mm (2 ")) OF THE SPECIFIED TYPE TO ENTIRELY COVER EACH SOLDERED CONNECTION AND SHRINK APPROPRIATELY TO PREVENT EXPOSURE OF THE CONNECTIONS.

NOTE

FOR SOME VEHICLES WITH EXTREMELY LONG FUEL PUMP GROUND WIRE CIRCUITS, IT MAY BE NECESSARY TO SHORTEN THE GROUND WIRE TO A POINT CLOSE TO THE FUEL TANK. IF THE GROUND IS MOVED, BE SURE IT IS SECURE AND PROTECTED FROM CORROSION SINCE IT IS THE OPERATING GROUND FOR THE PUMP. CHECK SERVICE LITERATURE (EVTM, ETC.) FOR GROUND LOCATIONS.

WARNING

ALL SOLDERING AND HEAT SHRINKING MUST BE COMPLETED AWAY FROM THE FUEL TANK AREA. USE A SOLDERING IRON ONLY FOR SOLDERING AND HEAT GUN ONLY FOR APPLYING SHRINK TUBING.

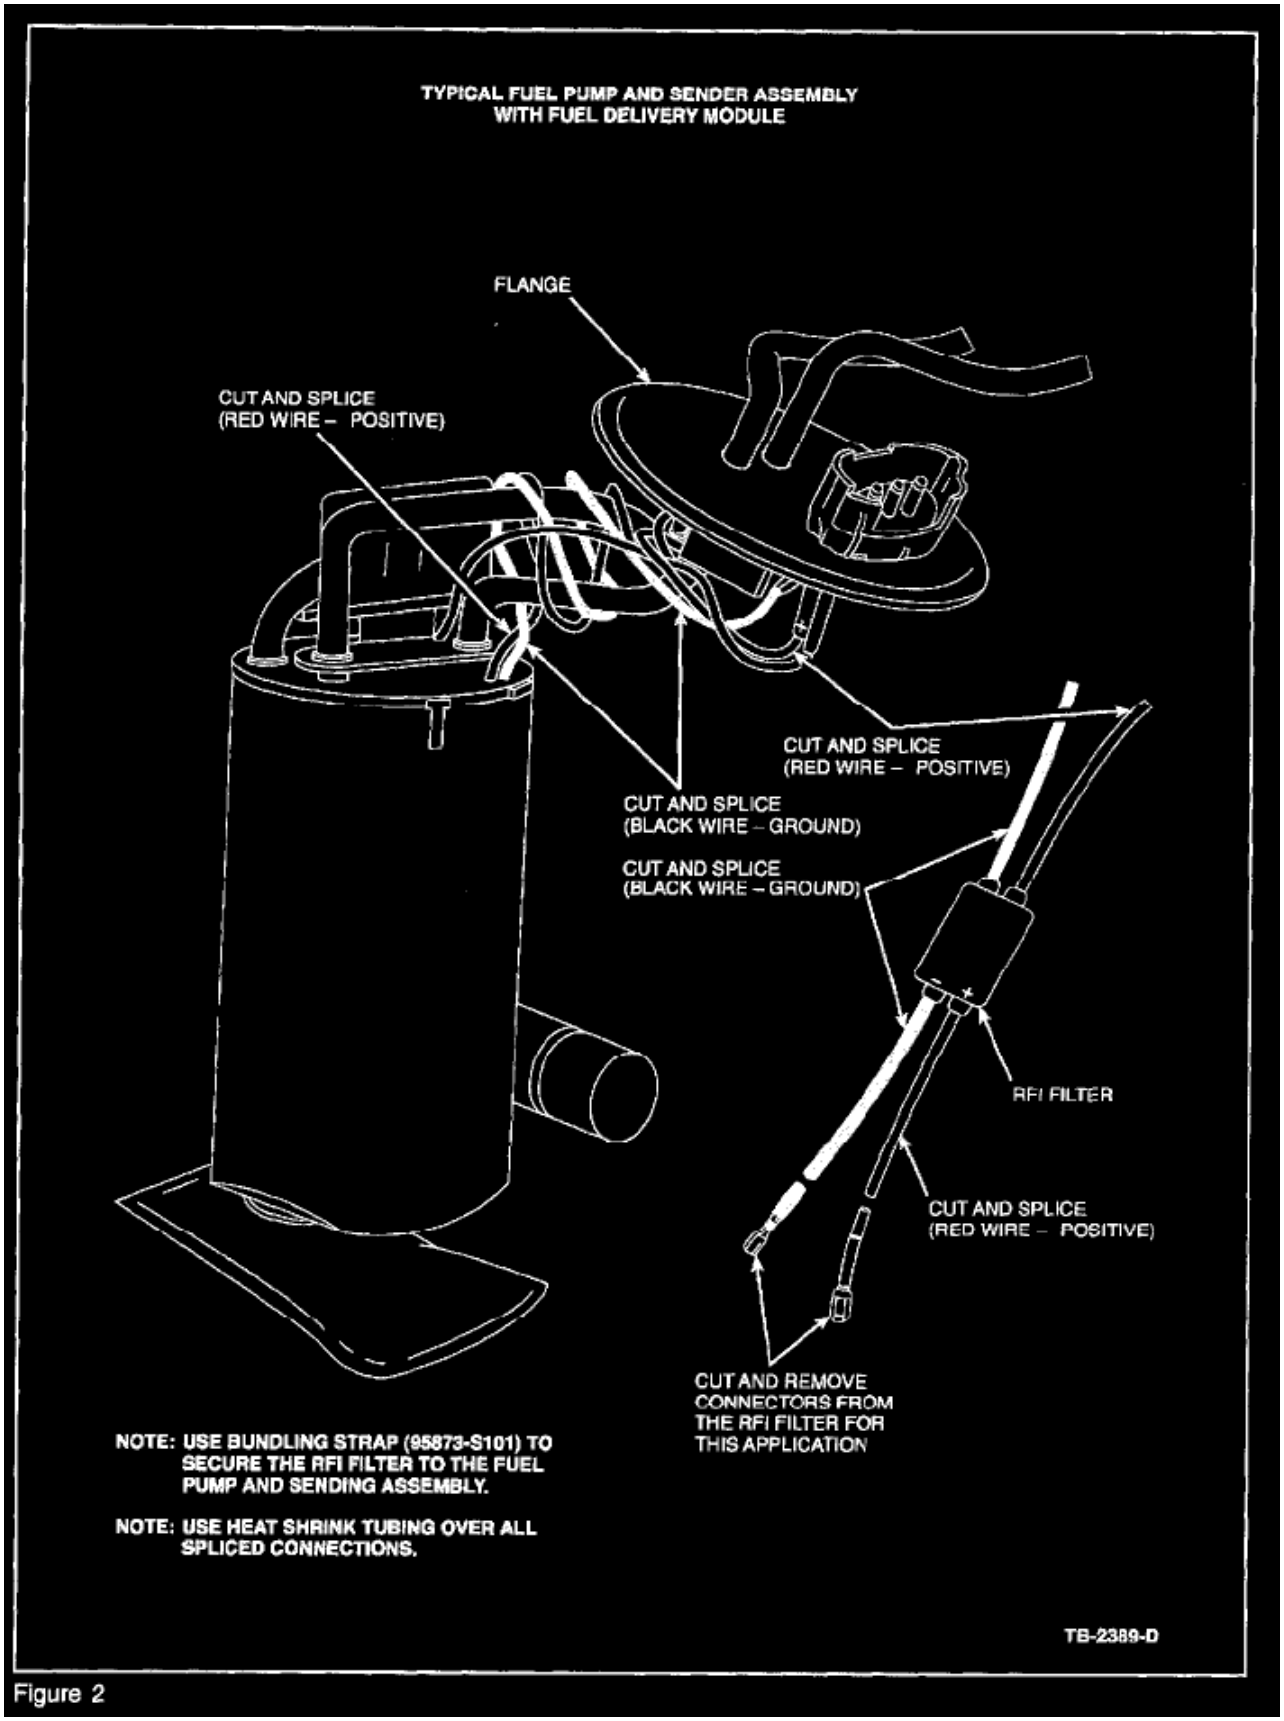

Figure 2

3. On light trucks and compact trucks with a fuel delivery module, cut the fuel pump wires to the fuel delivery module 50 mm (2") from the flange and discard the wires, Figure 2.

a. Cut the connectors from the RFI filter and solder wires to the fuel delivery module (red to red and black to black). Use heat shrink tubing over solder connections.

b. Solder wires from the RFI filter to the flange wires (red to red and black to black). Use heat shrink tubing over soldered connections.

NOTE

HEAT SHRINK TUBING MUST BE USED OVER ALL SOLDERED CONNECTIONS MADE PER THIS TSB. USE SUFFICIENT TUBING (ABOUT 50 mm (2 ")) OF THE SPECIFIED TYPE TO ENTIRELY COVER EACH SOLDERED CONNECTION AND SHRINK APPROPRIATELY TO PREVENT EXPOSURE OF THE CONNECTIONS.

NOTE

FOR SOME VEHICLES WITH EXTREMELY LONG FUEL PUMP GROUND WIRE CIRCUITS, IT MAY BE NECESSARY TO SHORTEN THE GROUND WIRE TO A POINT CLOSE TO THE FUEL TANK. IF THE GROUND IS MOVED, BE SURE IT IS SECURE AND PROTECTED FROM CORROSION SINCE IT IS THE OPERATING GROUND FOR THE PUMP. CHECK SERVICE LITERATURE (EVTM, ETC.) FOR GROUND LOCATIONS.

WARNING

ALL SOLDERING AND HEAT SHRINKING MUST BE COMPLETED AWAY FROM THE FUEL TANK AREA. USE A SOLDERING IRON ONLY FOR SOLDERING AND HEAT GUN ONLY FOR APPLYING SHRINK TUBING.

4. Secure the RFI filter to the fuel pump and sender assembly with a Bundling Strap (95873-S101) to prevent rattling in the tank, Figures 1 and 2.

5. Reinstall the fuel pump sender assembly into the fuel tank.

CAUTION

INSTALL NEW GASKETS WHEN REINSTALLING SENDER TO PREVENT LEAKS. REFER TO THE PARTS CATALOG FOR PROPER APPLICATIONS.

6. Check the appropriate Electrical and Vacuum Troubleshooting Manual (EVTM) (or other service literature) for the location of the fuel pump ground. If ground is more than 0.9m (3 ') from the tank, cut wire and ground fuel pump end within 0.9m (3 ') of the tank to prevent ground wire from acting as an antenna. Be sure ground is secure and protected from corrosion since it is the operating ground for the fuel pump.

7. Install the fuel tank in the vehicle as outlined in the appropriate Service or Workshop Manual.

Electronic Noise Suppressor: Locations

Power Distribution

The alternator is connected to maxi-fuses within the power distribution box which is then connected together with the Battery at the starter relay hot terminal. Circuits and components are protected by maxi-fuses. Low power circuits are also protected by fuses.

The Ignition Switch and Main Light Switch are powered at all times, as are Fuses 1, 4, 8, 10 and Circuit Breaker 12 in the Fuse Panel. The other fuses are powered through the Ignition Switch or the Main Light Switch.

Position 3 is not used and is covered by Circuit Breaker 2.

Wire Color Code Identification

NOTE: Whenever a wire is labeled with two colors; the first color listed is the basic color of the wire, and the second color is the tracer marking of the wire. If the second color is followed by by a D, the tracer is dots. If the second color is followed by an H, the tracer is hash marks.

For example: BR/O is a brown wire with an orange stripe, R/Y D is a red wire with yellow dots and BK/W H is a black wire with white hash marks.

Vehicle - Pull Or Drift Diagnostics/Service Procedures

Article No. 98-5A-22

03/18/98

^ BRAKES - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

^ STEERING - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

LIGHT TRUCK: 1988-94 RANGER 1991-94 EXPLORER

ISSUE: A comprehensive pull and drift diagnostic procedure has been developed to assist technicians with vehicle service.

ACTION: Use the following Service Procedure to resolve drift and pull concerns.

Proceed with the Pull and Drift Diagnostic Procedure it the pull or drift is not significantly reduced or where there is a case of steady state drift (no braking).

A Diagnostic Check List has been provided at the end of this article to use with this procedure.

NOTE:

THIS TSB ARTICLE SHOULD BE READ COMPLETELY BEFORE PERFORMING DIAGNOSTICS OR REPAIRS.

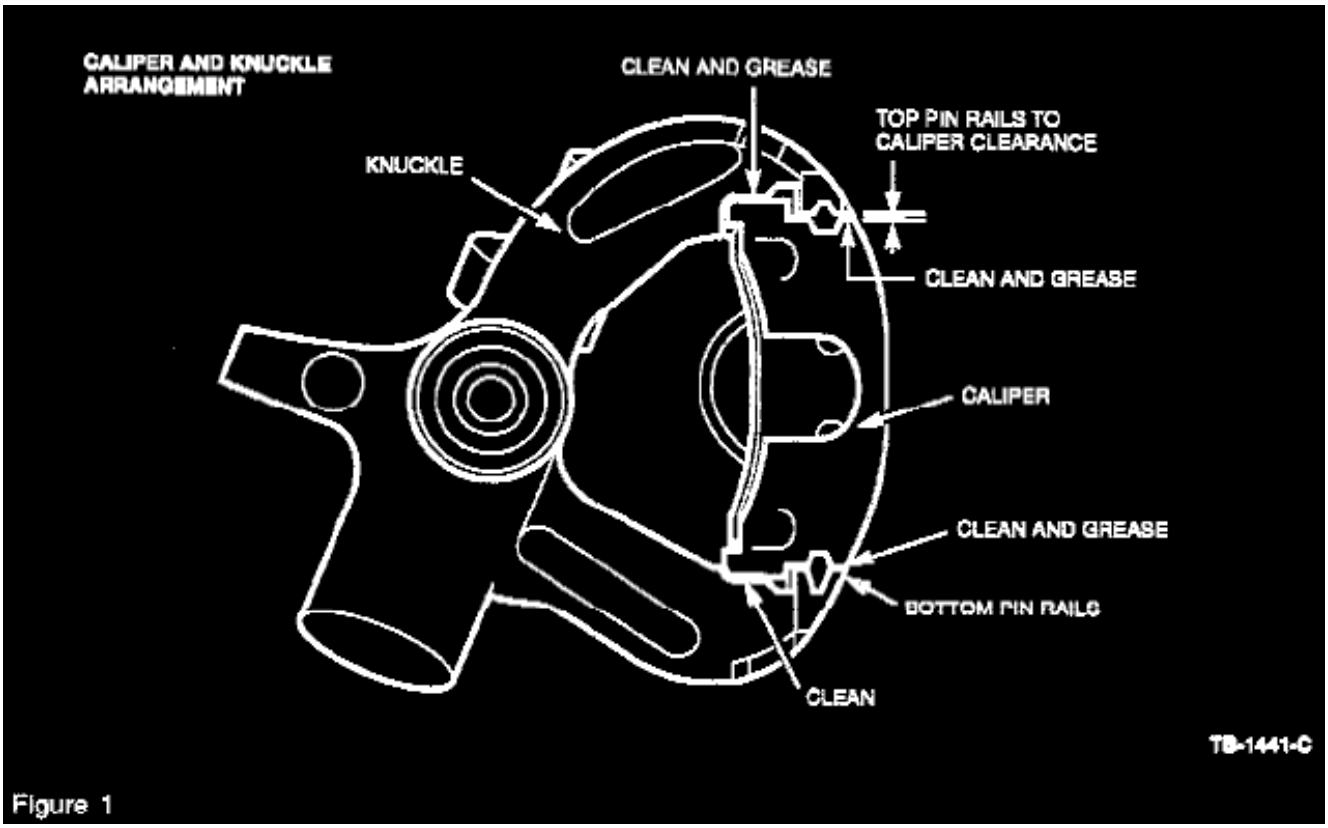

Figure 1

OASIS CODES: 301000, 303000

Service Procedure

1. Check and adjust brake pad clearances and caliper knuckle clearances as follows:

a. Remove the pins from the caliper.

b. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails. Clearance should be a minimum of 0.3B mm (0.015").

c. If the clearance is insufficient, replace the caliper and measure again. If clearance concern still exists, replace the knuckle.

NOTE:

CHECK THE CLEARANCE ON THE NEW KNUCKLE BEFORE INSTALLATION.

d. After measuring the caliper/knuckle for proper clearances, remove both calipers and inner pad assemblies.

e. Remove the anti-rattle clip from the inner pad.

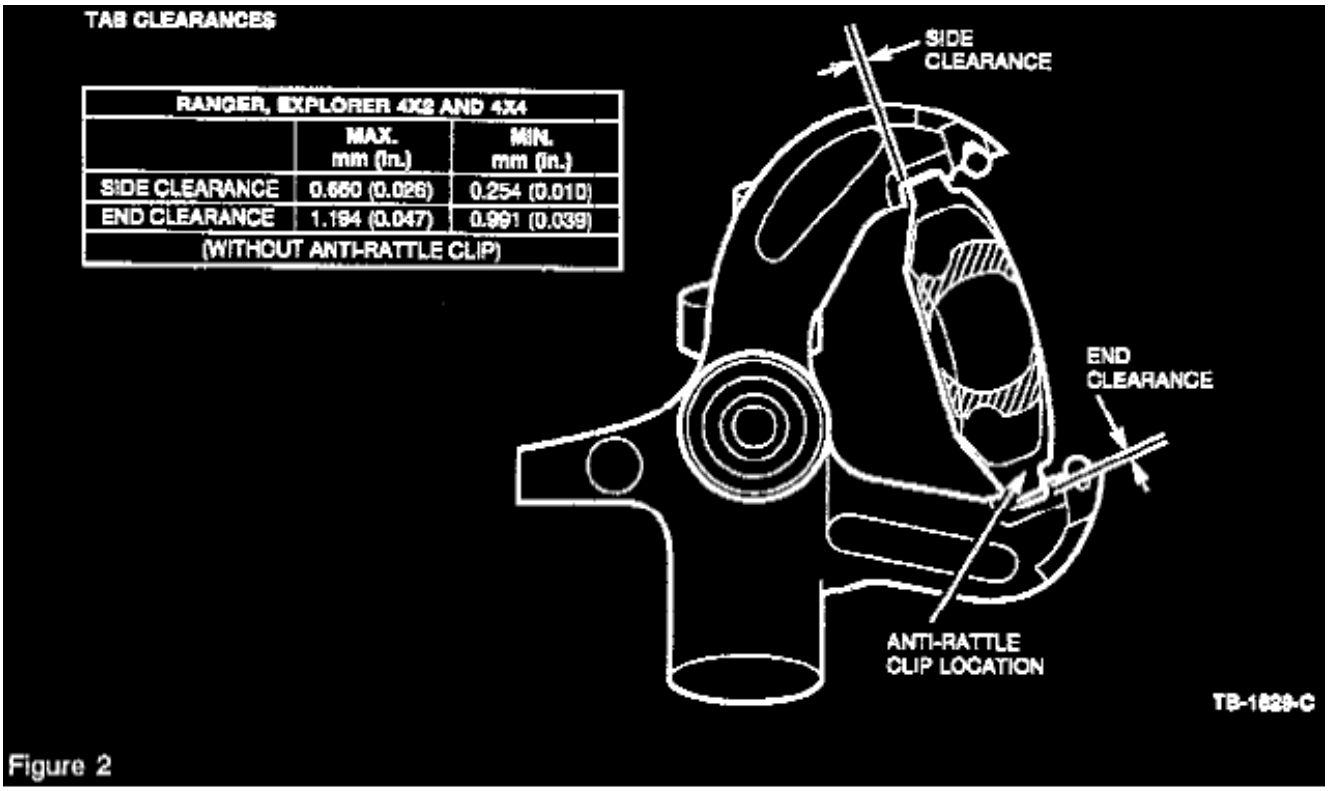

Figure 2

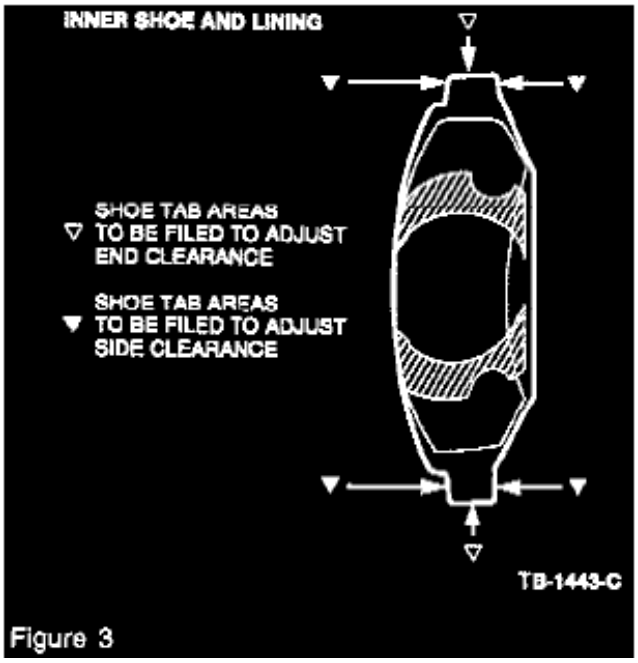

Figure 3

f. Reinstall pad and check the side and end clearances with a feeler gauge (Figure 2).

g. If the pad clearances are within specification, go to Step 1h. If the pad clearances are not to the required dimensions, file the steel backing plate. File material at ends of shoes, removing equal amounts from both sides or ends (Figure 3).

CAUTION:

DO NOT GRIND THE STEEL BACKING PLATE. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

h. Check the tab clearances and install anti-rattle clip on the lower pad tab (Figure 2).

CAUTION:

MAKE SURE THE LUBRICANT DOES NOT GET ON THE ROTORS, LININGS, OR ON THE CALIPER PISTON BOOTS.

2. During reassembly:

^ Clean the caliper slide surfaces of corrosion, contamination, and burrs with a wire brush or portable wire wheel

^ Polish with crocus cloth

^ Lubricate and corrosion protect by applying a light coat of Silicone Brake Caliper Grease and Dielectric Compound (D7AZ-19A331-A), or equivalent meeting Ford specification ESE-M1C171-A, to the inner knuckle top and bottom pad groove and caliper rails (Figure 1)

^ Replace the caliper pins with new Caliper Pins (F2TZ-2C150-A)

NOTE:

THE EXPLORER IS ALREADY EQUIPPED WITH THE NEW RADIUS ARM BUSHINGS.

3. Inspect the right and left side radius arm bushings for cracking, splitting, or wear. Replace the right and left side arm bushings with new Radius Arm Bushings (F1TZ-3B203-B), medium brown color, if necessary. Refer to the appropriate Service Manual, Section 04-01C, for service details.

Pull/Drift Diagnostic Procedure

The Pull/Drift Diagnostic Procedure should be used if the pull or drift is not significantly reduced with the service procedure or in cases of a steady state drift (no braking).

Test drive the vehicle with the customer to understand his/her pull or drift concern. Many customers will call a clear vision concern a pull or drift because the steering wheel is not straight.

Pull or drifts come from various sources, each with a particular set of symptoms. Careful road test evaluation usually will pinpoint which cause (or causes) is present.

Road Test

It is important to test drive the vehicle with the customer to UNDERSTAND HIS OR HER CONCERN.

Complete the road test before beginning any repairs since you may have multiple causes that need to be identified.

^ The road test should be done on a flat, straight road and should be done in both directions to account for wind

^ Tire pressure should be checked and adjusted, if necessary

^ A second person in the vehicle during the road test is helpful. Unless otherwise directed, the second person must remain in the front RH passenger location

^ On vehicles with automatic locking hubs, it is necessary to drive 6 meters (20 feet) forward and then backward to unlock the hubs

ROAD TEST	RESULT	ACTION
Maintain a steady speed of 80-89 km/h (50-55 mph). **DO NOT BRAKE.**	Is there a steady state pull? If no, go to the next Step.	**See Diagnostic Procedure 1** - Tire mismatch or tire pressure concern.
While stopped, have second person move to the LH rear passenger location. Maintain 80-89 km/h (50-55 mph).	Any change in pull? If no change, go to next Step.	**See Diagnostic Procedure 2** - Caster split.
Make sure front hubs are unlocked (if equipped). Accelerate the vehicle - decelerate the vehicle using **engine braking only.**	Any changes in the pull? Does it pull one way on acceleration and another way on deceleration? If no, go to next Step.	**See Diagnostic Procedure 3** - Possible limited slip rear axle and tire circumference.
Maintain a steady speed of 80-89 km/h (50-55 mph). Put the vehicle in Neutral and shut off the engine.	Does the pull go away? If no, go to the next Step.	**See Diagnostic Procedure 4** - Steering gear valve off center.
Stop the vehicle along the highway. Rotate the wheel full left. Proceed with road test.	Does the pull get better or worse? Stop the vehicle; rotate the wheel full right. Does the pull change - better or worse? If no, go to next Step.	**See Diagnostic Procedure 5** - Possible Rubber Ball Socket (RBS) memory steer.
In a safe clear area, while firmly holding the steering wheel, apply the brakes moderately hard, but not to the point of engaging Rear Anti-lock Brake System (RABS).	Does the vehicle's heading change during brake application? If no, go to next Step.	**See Diagnostic Procedure 6** - Possible brake imbalance.
Disconnect the fluid level sensor (disable RABS). Brake the vehicle from 80 km/h (50 mph).	Does the vehicle pull with anti-lock disconnected? If no, go to next Step.	**See Diagnostic Procedure 6** - Possible inadequate rear brake application.
Brake the vehicle hard, to the point of lock-up (RABS disabled).	Do both rears lock? Do both wheels lock at the same time?	**See Diagnostic Procedure 6** - Possible unequal rear brake application.

NOTE:

IT IS POSSIBLE THAT THE VEHICLE MAY HAVE MULTIPLE SYMPTOMS. A ROAD TEST/CAUSE CHART.

NOTE:

RECONNECT THE FLUID LEVEL SENSOR AFTER ROAD TEST.

Diagnostic Procedure # 1 - Tire Mismatch

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the Diagnostic Procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to Regular Production Option (RPO) list and set tire psi to the correct value

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only

Set tire pressure to value on the certification label.

1. Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Tire Pull - Swap the front tires from side-to-side and road test. If the concern is not corrected, continue with next Step.

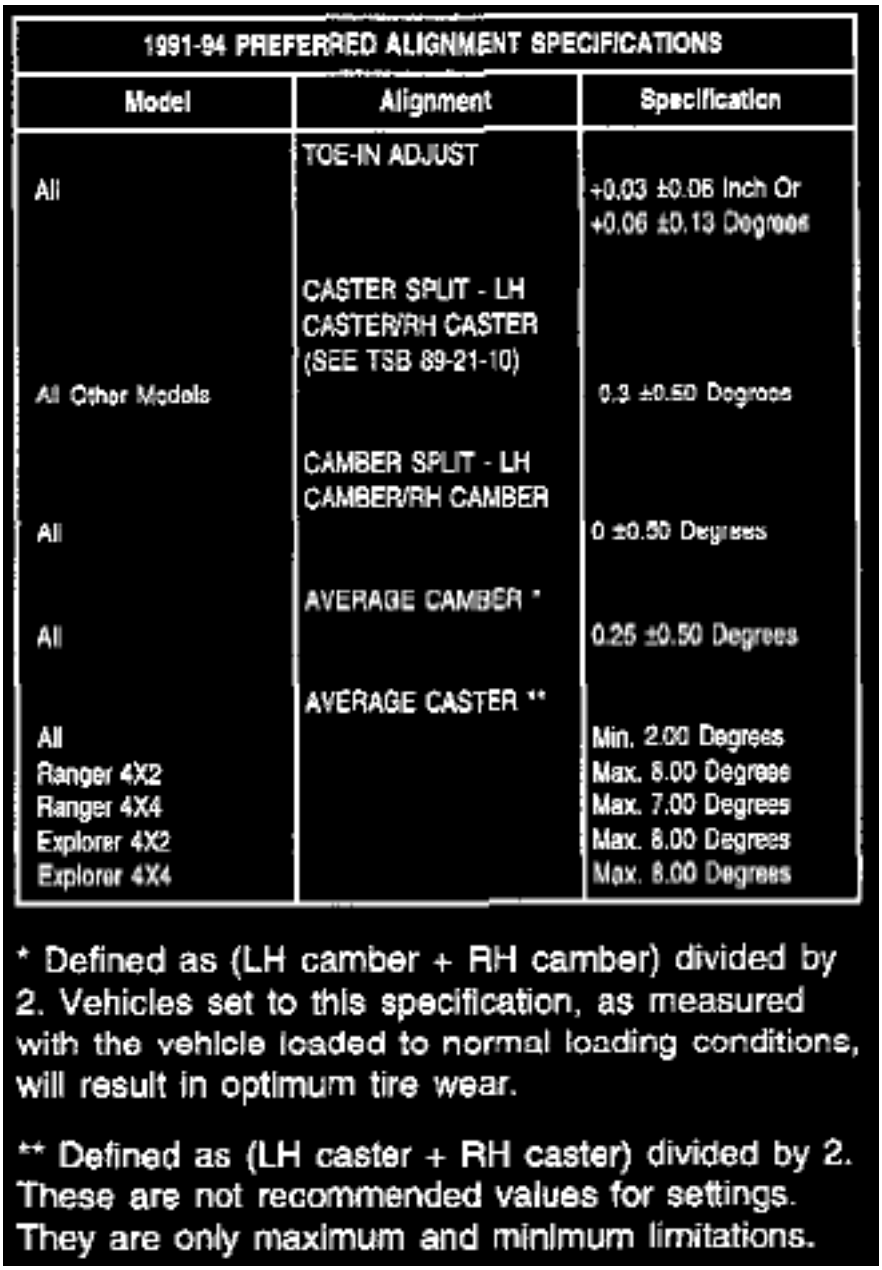
3. Tire Pull - Swap rear tires from side-to-side and road test. If the concern is not corrected, continue with next Step.

4. Tire Pull - Swap front tires from front to rear. Set the tire pressure to the required pressure for the new front and rear positions, then road test.

NOTE:

ON REAR LIMITED SLIP AXLE (FRONT HUB UNLOCKED) DRIFT CONCERNS, IT MAY BE NECESSARY TO MEASURE TIRE CIRCUMFERENCE AND PLACE A MATCHED SET OF TIRES ON THE REAR AXLE.

Diagnostic Procedure # 2 - Alignment



1991-94 PREFERRED ALIGNMENT SPECIFICATIONS

Model	Alignment	Specification
All	TOE-IN ADJUST	+0.03 ±0.06 Inch Or +0.06 ±0.13 Degrees
All Other Models	CASTER SPLIT - LH CASTER/RH CASTER (SEE TSB 89-21-10)	0.3 ±0.50 Degrees
All	CAMBER SPLIT - LH CAMBER/RH CAMBER	0 ±0.50 Degrees
All	AVERAGE CAMBER *	0.25 ±0.50 Degrees
All	AVERAGE CASTER **	Min. 2.00 Degrees
Ranger 4X2		Max. 8.00 Degrees
Ranger 4X4		Max. 7.00 Degrees
Explorer 4X2		Max. 8.00 Degrees
Explorer 4X4		Max. 8.00 Degrees

* Defined as (LH camber + RH camber) divided by 2. Vehicles set to this specification, as measured with the vehicle loaded to normal loading conditions, will result in optimum tire wear.

** Defined as (LH caster + RH caster) divided by 2. These are not recommended values for settings. They are only maximum and minimum limitations.

Wheel Alignment - Measure the front wheel alignment. For out-of-specification vehicles, align to the "1991-94 Preferred Alignment Specifications" stated in this article.

^ Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels

^ Do not adjust wheel alignment to correct for brake pull if the vehicle does not have pull during non-brake applications

^ Set the tire pressure to the specification on the certification label

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the Diagnostic Procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to RPO list and set tire pressure to the correct value

^ IF THE TIRES AND WHEELS DO NOT MATCH CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only

Drive vehicle after alignment is performed.

^ Vehicles which exceed the maximum average caster value shown above may result in shimmy concerns

^ Vehicles operated below the minimum average caster value shown can result in wander and poor steering returnability concerns

If the vehicle is not within these minimum and maximum average caster values, or if the vehicle has experienced any of these listed steering/handling concerns, the average caster should be set in accordance with ride height/caster chart in the Service Manual.

Diagnostic Procedure # 3 - Tires

1. Spin the front tires to be sure that the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Measure tire circumference of all four (4) tires; put the two (2) closest circumference tires on the rear axle. Tire pressure must be equal on all tires.

Diagnostic Procedure # 4 - Steering Gear Valve Off Center

Rotary Valve Centering Check: To confirm that you are looking at a steering gear valve concern, lift the front wheels off the ground.

^ The vehicle should be raised so that there is no interference with the steering linkage

^ The front wheels should also spin freely

With the wheels in a straight ahead position, start the engine and observe any steering wheel or linkage movement when the engine is started. If any movement is observed, continue with the rotary valve centering check.

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Install a 0-13,790 kPa (0-2000 psi) pressure gauge (Rotunda 014-00207, Power Steering Analyzer) in the pressure line between the power steering pump outlet port 1 and the integral steering gear inlet port. Make sure the valve on the gauge is fully open.

3. Check the fluid level in the reservoir. Add Premium Power Steering Fluid F7AZ-3F823-AA or equivalent meeting Ford specification ESW-M2C33-F, if necessary.

4. Start the engine and turn the steering wheel from stop-to-stop to bring the steering lubricant to normal operating temperature. Turn off the engine and recheck the fluid level. Add Premium Power Steering Fluid F7AZ-3F823-AA or equivalent meeting Ford specification ESW-M2C33-F, if necessary.

5. With the engine running at approximately 1000 rpm and the steering wheel centered, attach a b-in torque wrench to the steering wheel nut. Apply sufficient torque in each direction to get a gauge reading of 1723 kPa (250 psi).

6. The torque wrench readings should be the same in both directions at 1723 kPa (250 psi). If the difference between the readings exceeds 0.68 N.m (6 lb-in), remove the steering gear and replace the shaft and control assembly.

7. Remove the pressure gauge installed in Step 2.

Diagnostic Procedure # 5 - RBS Linkage

If the RBS linkage is determined to have wind up or memory steer, replace RBS linkage with greaseable steel linkage.

NOTE:

ALL SERVICE PART STEERING LINKAGE IS THE GREASEABLE STEEL SOCKET TYPE

Diagnostic Procedure # 6 - Brake Imbalance

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Check for front wheel rotational drag with warm/hot brakes.

a. Make a series of 10 stops from speeds of 48 km/h (30 mph).

b. Make the 10 stops with no more than 30 second intervals between stops. This generally will induce a maximum pull if there is a drift/pull concern.

c. Raise the front end of the vehicle so that both tires are off the ground.

d. Rotate the front wheels by hand.

NOTE:

FOR ALL 4-WHEEL-DRIVE VEHICLES, MAKE SURE THE HUBS ARE DISENGAGED.

Both tires should rotate about the same amount, with little brake drag occuring. Some brake drag will naturally be present for each size of vehicle.

3. If the vehicle has excess brake drag, proceed as follows:

a. Open the bleed screw on the affected wheel to check for residual pressure in the brake lines. If there is a squirt of brake fluid out of the bleeder screw and the drag is reduced or eliminated, the master cylinder may not be allowing the brake fluid to return to the reservoir.

b. Check the master cylinder push rod adjustment. Refer to the appropriate Service Manual, Section 06-06, for service details.

c. Check the brake pedal to determine if it is fully returning.

4. Remove both calipers and check piston retraction using a C-clamp and wooden block. The piston should easily move back into the bore under the force of the clamp. Rebuild or replace as needed.

5. If Steps 1 through 4 have not determined the concern, swap rotors and linings from side-to-side.

NOTE:

SHOE TAB CLEARANCES SHOULD BE CHECKED AND MODIFIED IF NEEDED. REFER TO FIGURE 2.

6. Test drive the vehicle with 10 or more stops from 64 km/h (40 mph) before evaluating for brake drift. If there is no change in drift while braking, it may be assumed the concern is not the result of

the front brakes.

7. Check the rear brakes. Remove the rear wheels and brake drums.

a. Check for contaminants (i.e., grease, axle lube, leaking brake fluid, etc.).

b. Check for broken components, frozen parking brake cables or improperly installed parts.

c. Check the cage diameter using the Brake Shoe Adjustment Gauge (D81L-1103-A). If either side is out-of-specification, check for proper function of the adjusting mechanism and repair or replace as required.

d. Check the rear wheel cylinders by the following method.

^ Replace one of the brake drums

^ Have another person apply the brakes and watch for movement of one of the brake shoes on the other wheel

^ Reapply the brakes while holding in place the shoe that moved. The opposite shoe should now move. If no movement is observed, repair or replace the wheel cylinder

^ Reinstall the drum and repeat the procedure for the other rear brake

8. If the condition still exists, swap rear shoes from side-to-side and drive the vehicle. If the drift is significantly reduced, replace the rear linings. If the pull/drift is not significantly reduced, go to Service Procedure # 7.

Diagnostic Procedure # 7 - Miscellaneous

Check for loose, damaged or excessively worn parts. Visually inspect the front suspension for loose or worn components (i.e., ball joints, radius arm bushings, radius arm attachments at the axle and frame, alignment adjusters, steering linkage, etc.). Repair or replace as required.

Diagnostic Check List

NOTE:

THE FOLLOWING CHECK LIST SHOULD BE COMPLETED AFTER EACH STEP OF THE DIAGNOSTIC WHERE APPLICABLE.

SERVICE PROCEDURE

1. Checking clearances

___ Caliper-to-knuckle clearance.

___ Inner shoe side and end clearance.

2. Lubrication of components

___ Lubrication of the caliper rails and inner knuckle pad grooves.

3. Radius arm bushings

___ Replacement of right and left side radius arm bushings.

DIAGNOSTIC PROCEDURE

1. Tire mismatch

____ Unlocked hubs check.

____ Front tires swapped side-to-side.

____ Rear tires swapped side-to-side.

____ Front-to-rear tire swap.

2. Alignment

____ Unlocked hubs check.

____ Toe changed to ____.

___ Caster changed and split is ____.

___ Camber changed and split is ____.

3. Tire circumference

____ Unlocked hubs check.

___ Tire circumference checked and two (2) closest circumference tires swapped to rear axle.

4. Steering gear valve

____ Unlocked hubs check.

____ Install pressure gauge.

____ Check fluid level with engine off and on.

___ Apply torque to the steering wheel nut and check gauge readings.

___ Replaced the shaft and control assembly.

____ Removed the pressure gauge.

5. RABS linkage

____ Replaced the RBS linkage.

6. Brake imbalance

____ Unlocked hubs check.

____ Front wheel rotational drag check.

____ Master cylinder check.

____ Piston retraction check.

____ Rotors and linings swapped from side-to-side.

____ Rear brakes checked.

___ Rear drums and shoes swapped from side-to-side.

7. Miscellaneous

___ Check for loose, damaged or worn parts.

Technical Service Bulletin # 98-5A-22 Date: 980318

Vehicle - Pull Or Drift Diagnostics/Service Procedures

Article No. 98-5A-22

03/18/98

^ BRAKES - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

^ STEERING - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

LIGHT TRUCK: 1988-94 RANGER 1991-94 EXPLORER

ISSUE: A comprehensive pull and drift diagnostic procedure has been developed to assist technicians with vehicle service.

ACTION: Use the following Service Procedure to resolve drift and pull concerns.

Proceed with the Pull and Drift Diagnostic Procedure it the pull or drift is not significantly reduced or where there is a case of steady state drift (no braking).

A Diagnostic Check List has been provided at the end of this article to use with this procedure.

NOTE:

THIS TSB ARTICLE SHOULD BE READ COMPLETELY BEFORE PERFORMING DIAGNOSTICS OR REPAIRS.

PART NUMBER PART NAME

F7AZ-3F823-A Premium Power Steering Fluid

ROAD TEST - FRONT W6

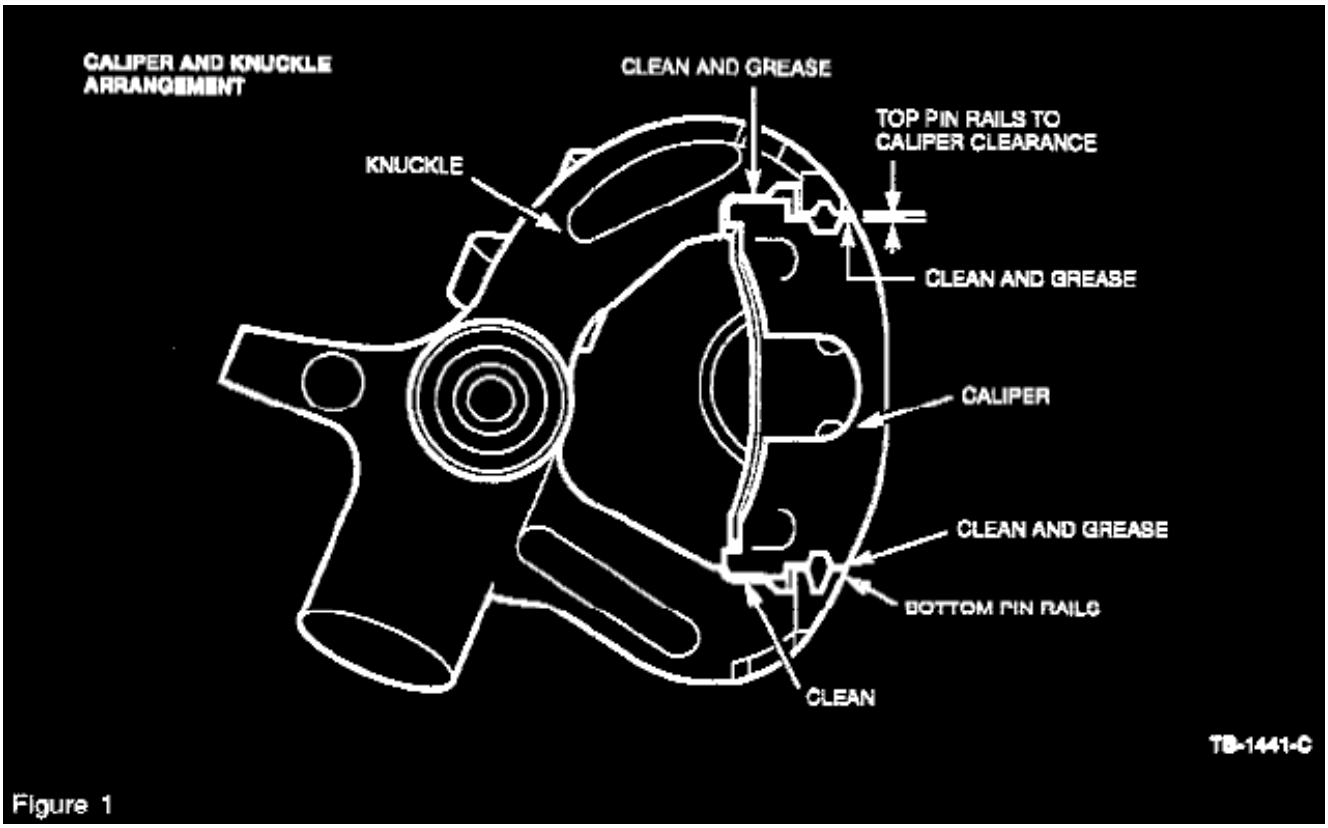

Figure 1

OASIS CODES: 301000, 303000

Service Procedure

1. Check and adjust brake pad clearances and caliper knuckle clearances as follows:

a. Remove the pins from the caliper.

b. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails. Clearance should be a minimum of 0.3B mm (0.015").

c. If the clearance is insufficient, replace the caliper and measure again. If clearance concern still exists, replace the knuckle.

NOTE:

CHECK THE CLEARANCE ON THE NEW KNUCKLE BEFORE INSTALLATION.

d. After measuring the caliper/knuckle for proper clearances, remove both calipers and inner pad assemblies.

e. Remove the anti-rattle clip from the inner pad.

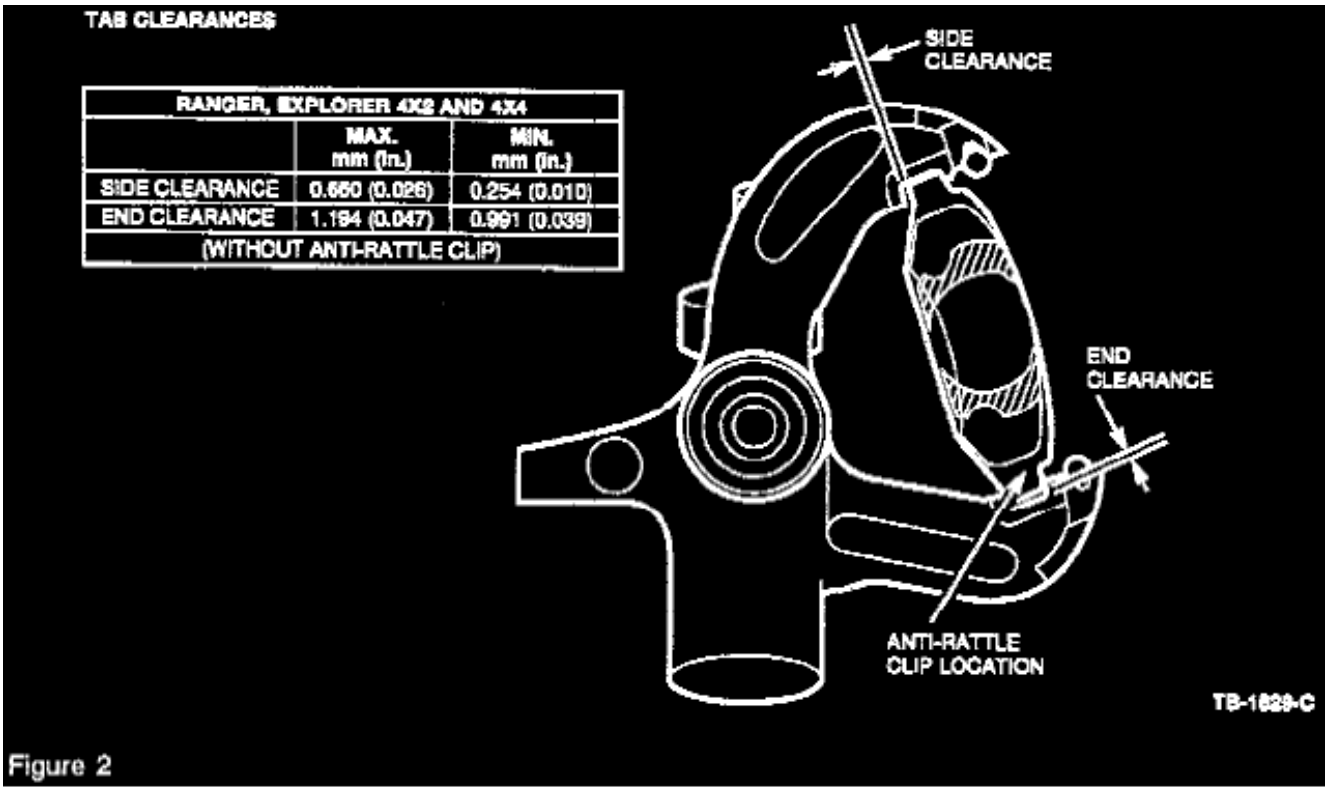

Figure 2

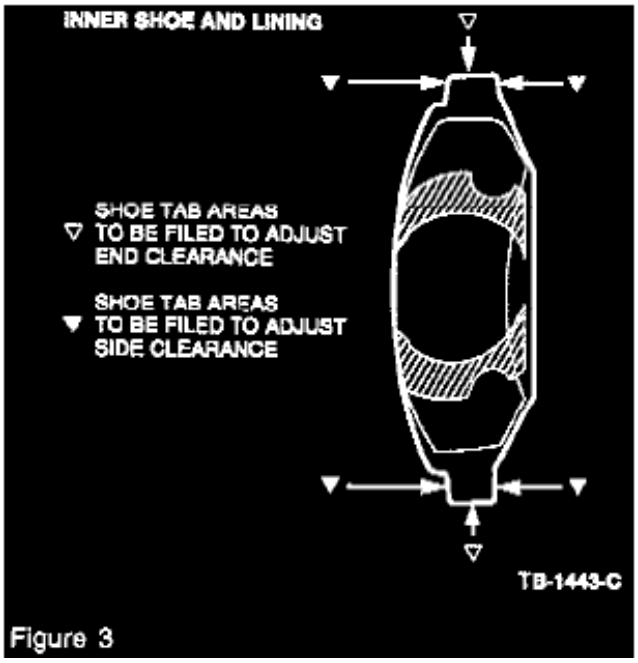

Figure 3

f. Reinstall pad and check the side and end clearances with a feeler gauge (Figure 2).

g. If the pad clearances are within specification, go to Step 1h. If the pad clearances are not to the required dimensions, file the steel backing plate. File material at ends of shoes, removing equal amounts from both sides or ends (Figure 3).

CAUTION:

DO NOT GRIND THE STEEL BACKING PLATE. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

h. Check the tab clearances and install anti-rattle clip on the lower pad tab (Figure 2).

CAUTION:

MAKE SURE THE LUBRICANT DOES NOT GET ON THE ROTORS, LININGS, OR ON THE CALIPER PISTON BOOTS.

2. During reassembly:

^ Clean the caliper slide surfaces of corrosion, contamination, and burrs with a wire brush or portable wire wheel

^ Polish with crocus cloth

^ Lubricate and corrosion protect by applying a light coat of Silicone Brake Caliper Grease and Dielectric Compound (D7AZ-19A331-A), or equivalent meeting Ford specification ESE-M1C171-A, to the inner knuckle top and bottom pad groove and caliper rails (Figure 1)

^ Replace the caliper pins with new Caliper Pins (F2TZ-2C150-A)

NOTE:

THE EXPLORER IS ALREADY EQUIPPED WITH THE NEW RADIUS ARM BUSHINGS.

3. Inspect the right and left side radius arm bushings for cracking, splitting, or wear. Replace the right and left side arm bushings with new Radius Arm Bushings (F1TZ-3B203-B), medium brown color, if necessary. Refer to the appropriate Service Manual, Section 04-01C, for service details.

Pull/Drift Diagnostic Procedure

The Pull/Drift Diagnostic Procedure should be used if the pull or drift is not significantly reduced with the service procedure or in cases of a steady state drift (no braking).

Test drive the vehicle with the customer to understand his/her pull or drift concern. Many customers will call a clear vision concern a pull or drift because the steering wheel is not straight.

Pull or drifts come from various sources, each with a particular set of symptoms. Careful road test evaluation usually will pinpoint which cause (or causes) is present.

Road Test

It is important to test drive the vehicle with the customer to UNDERSTAND HIS OR HER CONCERN.

Complete the road test before beginning any repairs since you may have multiple causes that need to be identified.

^ The road test should be done on a flat, straight road and should be done in both directions to account for wind

^ Tire pressure should be checked and adjusted, if necessary

^ A second person in the vehicle during the road test is helpful. Unless otherwise directed, the second person must remain in the front RH passenger location

^ On vehicles with automatic locking hubs, it is necessary to drive 6 meters (20 feet) forward and then backward to unlock the hubs

ROAD TEST	RESULT	ACTION
Maintain a steady speed of 80-89 km/h (50-55 mph). **DO NOT BRAKE.**	Is there a steady state pull? If no, go to the next Step.	**See Diagnostic Procedure 1** - Tire mismatch or tire pressure concern.
While stopped, have second person move to the LH rear passenger location. Maintain 80-89 km/h (50-55 mph).	Any change in pull? If no change, go to next Step.	**See Diagnostic Procedure 2** - Caster split.
Make sure front hubs are unlocked (if equipped). Accelerate the vehicle - decelerate the vehicle using **engine braking only.**	Any changes in the pull? Does it pull one way on acceleration and another way on deceleration? If no, go to next Step.	**See Diagnostic Procedure 3** - Possible limited slip rear axle and tire circumference.
Maintain a steady speed of 80-89 km/h (50-55 mph). Put the vehicle in Neutral and shut off the engine.	Does the pull go away? If no, go to the next Step.	**See Diagnostic Procedure 4** - Steering gear valve off center.
Stop the vehicle along the highway. Rotate the wheel full left. Proceed with road test.	Does the pull get better or worse? Stop the vehicle; rotate the wheel full right. Does the pull change - better or worse? If no, go to next Step.	**See Diagnostic Procedure 5** - Possible Rubber Ball Socket (RBS) memory steer.
In a safe clear area, while firmly holding the steering wheel, apply the brakes moderately hard, but not to the point of engaging Rear Anti-lock Brake System (RABS).	Does the vehicle's heading change during brake application? If no, go to next Step.	**See Diagnostic Procedure 6** - Possible brake imbalance.
Disconnect the fluid level sensor (disable RABS). Brake the vehicle from 80 km/h (50 mph).	Does the vehicle pull with anti-lock disconnected? If no, go to next Step.	**See Diagnostic Procedure 6** - Possible inadequate rear brake application.
Brake the vehicle hard, to the point of lock-up (RABS disabled).	Do both rears lock? Do both wheels lock at the same time?	**See Diagnostic Procedure 6** - Possible unequal rear brake application.

NOTE:

IT IS POSSIBLE THAT THE VEHICLE MAY HAVE MULTIPLE SYMPTOMS. A ROAD TEST/CAUSE CHART.

NOTE:

RECONNECT THE FLUID LEVEL SENSOR AFTER ROAD TEST.

Diagnostic Procedure # 1 - Tire Mismatch

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the Diagnostic Procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to Regular Production Option (RPO) list and set tire psi to the correct value

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only

Set tire pressure to value on the certification label.

1. Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Tire Pull - Swap the front tires from side-to-side and road test. If the concern is not corrected, continue with next Step.

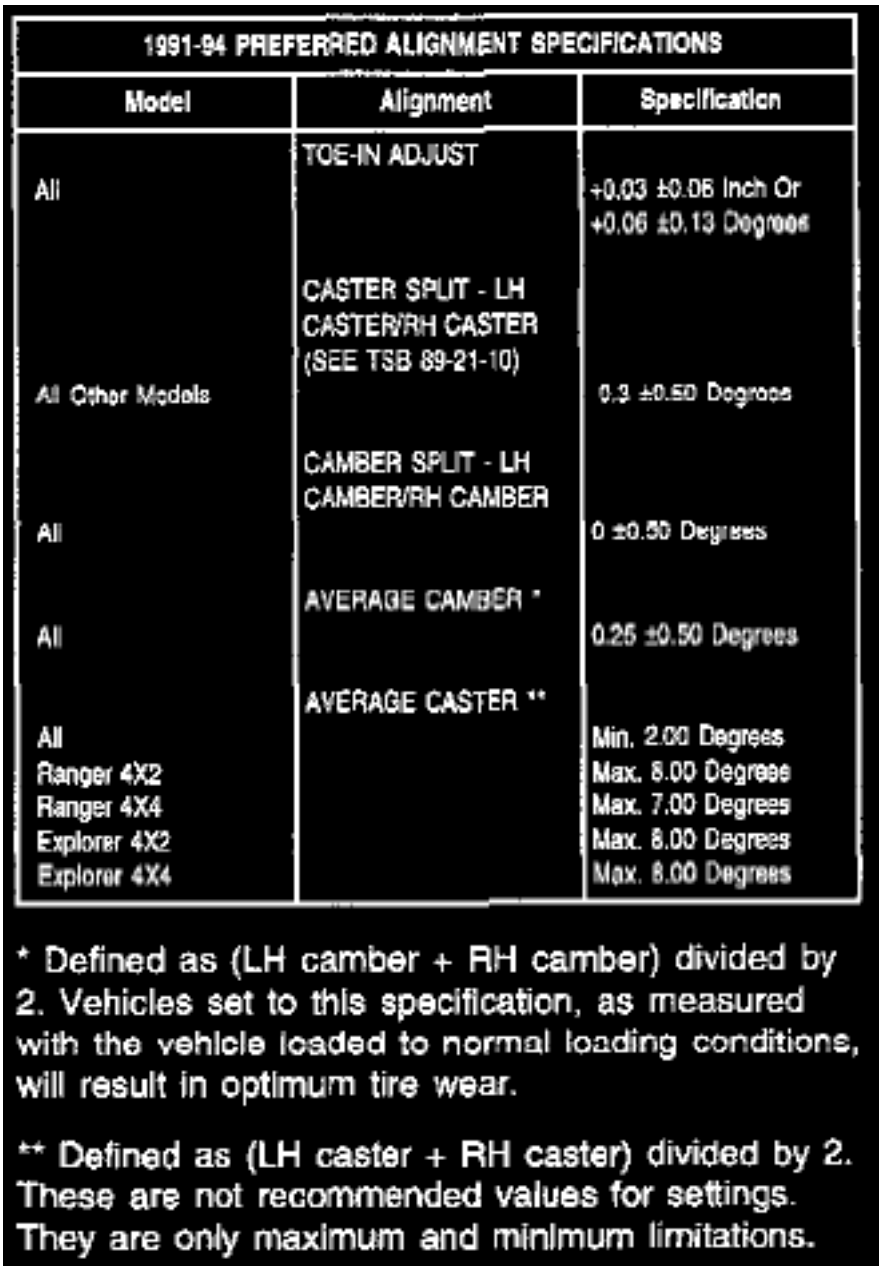
3. Tire Pull - Swap rear tires from side-to-side and road test. If the concern is not corrected, continue with next Step.

4. Tire Pull - Swap front tires from front to rear. Set the tire pressure to the required pressure for the new front and rear positions, then road test.

NOTE:

ON REAR LIMITED SLIP AXLE (FRONT HUB UNLOCKED) DRIFT CONCERNS, IT MAY BE NECESSARY TO MEASURE TIRE CIRCUMFERENCE AND PLACE A MATCHED SET OF TIRES ON THE REAR AXLE.

Diagnostic Procedure # 2 - Alignment



1991-94 PREFERRED ALIGNMENT SPECIFICATIONS

Model	Alignment	Specification
All	TOE-IN ADJUST	+0.03 ±0.06 Inch Or +0.06 ±0.13 Degrees
All Other Models	CASTER SPLIT - LH CASTER/RH CASTER (SEE TSB 89-21-10)	0.3 ±0.50 Degrees
All	CAMBER SPLIT - LH CAMBER/RH CAMBER	0 ±0.50 Degrees
All	AVERAGE CAMBER *	0.25 ±0.50 Degrees
All	AVERAGE CASTER **	Min. 2.00 Degrees
Ranger 4X2		Max. 8.00 Degrees
Ranger 4X4		Max. 7.00 Degrees
Explorer 4X2		Max. 8.00 Degrees
Explorer 4X4		Max. 8.00 Degrees

* Defined as (LH camber + RH camber) divided by 2. Vehicles set to this specification, as measured with the vehicle loaded to normal loading conditions, will result in optimum tire wear.

** Defined as (LH caster + RH caster) divided by 2. These are not recommended values for settings. They are only maximum and minimum limitations.

Wheel Alignment - Measure the front wheel alignment. For out-of-specification vehicles, align to the "1991-94 Preferred Alignment Specifications" stated in this article.

^ Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels

^ Do not adjust wheel alignment to correct for brake pull if the vehicle does not have pull during non-brake applications

^ Set the tire pressure to the specification on the certification label

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the Diagnostic Procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to RPO list and set tire pressure to the correct value

^ IF THE TIRES AND WHEELS DO NOT MATCH CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only

Drive vehicle after alignment is performed.

^ Vehicles which exceed the maximum average caster value shown above may result in shimmy concerns

^ Vehicles operated below the minimum average caster value shown can result in wander and poor steering returnability concerns

If the vehicle is not within these minimum and maximum average caster values, or if the vehicle has experienced any of these listed steering/handling concerns, the average caster should be set in accordance with ride height/caster chart in the Service Manual.

Diagnostic Procedure # 3 - Tires

1. Spin the front tires to be sure that the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Measure tire circumference of all four (4) tires; put the two (2) closest circumference tires on the rear axle. Tire pressure must be equal on all tires.

Diagnostic Procedure # 4 - Steering Gear Valve Off Center

Rotary Valve Centering Check: To confirm that you are looking at a steering gear valve concern, lift the front wheels off the ground.

^ The vehicle should be raised so that there is no interference with the steering linkage

^ The front wheels should also spin freely

With the wheels in a straight ahead position, start the engine and observe any steering wheel or linkage movement when the engine is started. If any movement is observed, continue with the rotary valve centering check.

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Install a 0-13,790 kPa (0-2000 psi) pressure gauge (Rotunda 014-00207, Power Steering Analyzer) in the pressure line between the power steering pump outlet port 1 and the integral steering gear inlet port. Make sure the valve on the gauge is fully open.

3. Check the fluid level in the reservoir. Add Premium Power Steering Fluid F7AZ-3F823-AA or equivalent meeting Ford specification ESW-M2C33-F, if necessary.

4. Start the engine and turn the steering wheel from stop-to-stop to bring the steering lubricant to normal operating temperature. Turn off the engine and recheck the fluid level. Add Premium Power Steering Fluid F7AZ-3F823-AA or equivalent meeting Ford specification ESW-M2C33-F, if necessary.

5. With the engine running at approximately 1000 rpm and the steering wheel centered, attach a b-in torque wrench to the steering wheel nut. Apply sufficient torque in each direction to get a gauge reading of 1723 kPa (250 psi).

6. The torque wrench readings should be the same in both directions at 1723 kPa (250 psi). If the difference between the readings exceeds 0.68 N.m (6 lb-in), remove the steering gear and replace the shaft and control assembly.

7. Remove the pressure gauge installed in Step 2.

Diagnostic Procedure # 5 - RBS Linkage

If the RBS linkage is determined to have wind up or memory steer, replace RBS linkage with greaseable steel linkage.

NOTE:

ALL SERVICE PART STEERING LINKAGE IS THE GREASEABLE STEEL SOCKET TYPE

Diagnostic Procedure # 6 - Brake Imbalance

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Check for front wheel rotational drag with warm/hot brakes.

a. Make a series of 10 stops from speeds of 48 km/h (30 mph).

b. Make the 10 stops with no more than 30 second intervals between stops. This generally will induce a maximum pull if there is a drift/pull concern.

c. Raise the front end of the vehicle so that both tires are off the ground.

d. Rotate the front wheels by hand.

NOTE:

FOR ALL 4-WHEEL-DRIVE VEHICLES, MAKE SURE THE HUBS ARE DISENGAGED.

Both tires should rotate about the same amount, with little brake drag occuring. Some brake drag will naturally be present for each size of vehicle.

3. If the vehicle has excess brake drag, proceed as follows:

a. Open the bleed screw on the affected wheel to check for residual pressure in the brake lines. If there is a squirt of brake fluid out of the bleeder screw and the drag is reduced or eliminated, the master cylinder may not be allowing the brake fluid to return to the reservoir.

b. Check the master cylinder push rod adjustment. Refer to the appropriate Service Manual, Section 06-06, for service details.

c. Check the brake pedal to determine if it is fully returning.

4. Remove both calipers and check piston retraction using a C-clamp and wooden block. The piston should easily move back into the bore under the force of the clamp. Rebuild or replace as needed.

5. If Steps 1 through 4 have not determined the concern, swap rotors and linings from side-to-side.

NOTE:

SHOE TAB CLEARANCES SHOULD BE CHECKED AND MODIFIED IF NEEDED. REFER TO FIGURE 2.

6. Test drive the vehicle with 10 or more stops from 64 km/h (40 mph) before evaluating for brake drift. If there is no change in drift while braking, it may be assumed the concern is not the result of

the front brakes.

7. Check the rear brakes. Remove the rear wheels and brake drums.

a. Check for contaminants (i.e., grease, axle lube, leaking brake fluid, etc.).

b. Check for broken components, frozen parking brake cables or improperly installed parts.

c. Check the cage diameter using the Brake Shoe Adjustment Gauge (D81L-1103-A). If either side is out-of-specification, check for proper function of the adjusting mechanism and repair or replace as required.

d. Check the rear wheel cylinders by the following method.

^ Replace one of the brake drums

^ Have another person apply the brakes and watch for movement of one of the brake shoes on the other wheel

^ Reapply the brakes while holding in place the shoe that moved. The opposite shoe should now move. If no movement is observed, repair or replace the wheel cylinder

^ Reinstall the drum and repeat the procedure for the other rear brake

8. If the condition still exists, swap rear shoes from side-to-side and drive the vehicle. If the drift is significantly reduced, replace the rear linings. If the pull/drift is not significantly reduced, go to Service Procedure # 7.

Diagnostic Procedure # 7 - Miscellaneous

Check for loose, damaged or excessively worn parts. Visually inspect the front suspension for loose or worn components (i.e., ball joints, radius arm bushings, radius arm attachments at the axle and frame, alignment adjusters, steering linkage, etc.). Repair or replace as required.

Diagnostic Check List

NOTE:

THE FOLLOWING CHECK LIST SHOULD BE COMPLETED AFTER EACH STEP OF THE DIAGNOSTIC WHERE APPLICABLE.

SERVICE PROCEDURE

1. Checking clearances

___ Caliper-to-knuckle clearance.

___ Inner shoe side and end clearance.

2. Lubrication of components

___ Lubrication of the caliper rails and inner knuckle pad grooves.

3. Radius arm bushings

___ Replacement of right and left side radius arm bushings.

DIAGNOSTIC PROCEDURE

1. Tire mismatch

____ Unlocked hubs check.

____ Front tires swapped side-to-side.

____ Rear tires swapped side-to-side.

____ Front-to-rear tire swap.

2. Alignment

____ Unlocked hubs check.

____ Toe changed to ____.

___ Caster changed and split is ____.

___ Camber changed and split is ____.

3. Tire circumference

____ Unlocked hubs check.

___ Tire circumference checked and two (2) closest circumference tires swapped to rear axle.

4. Steering gear valve

____ Unlocked hubs check.

____ Install pressure gauge.

____ Check fluid level with engine off and on.

___ Apply torque to the steering wheel nut and check gauge readings.

___ Replaced the shaft and control assembly.

____ Removed the pressure gauge.

5. RABS linkage

____ Replaced the RBS linkage.

6. Brake imbalance

____ Unlocked hubs check.

____ Front wheel rotational drag check.

____ Master cylinder check.

____ Piston retraction check.

____ Rotors and linings swapped from side-to-side.

____ Rear brakes checked.

___ Rear drums and shoes swapped from side-to-side.

7. Miscellaneous

___ Check for loose, damaged or worn parts.

Alignment: By Symptom

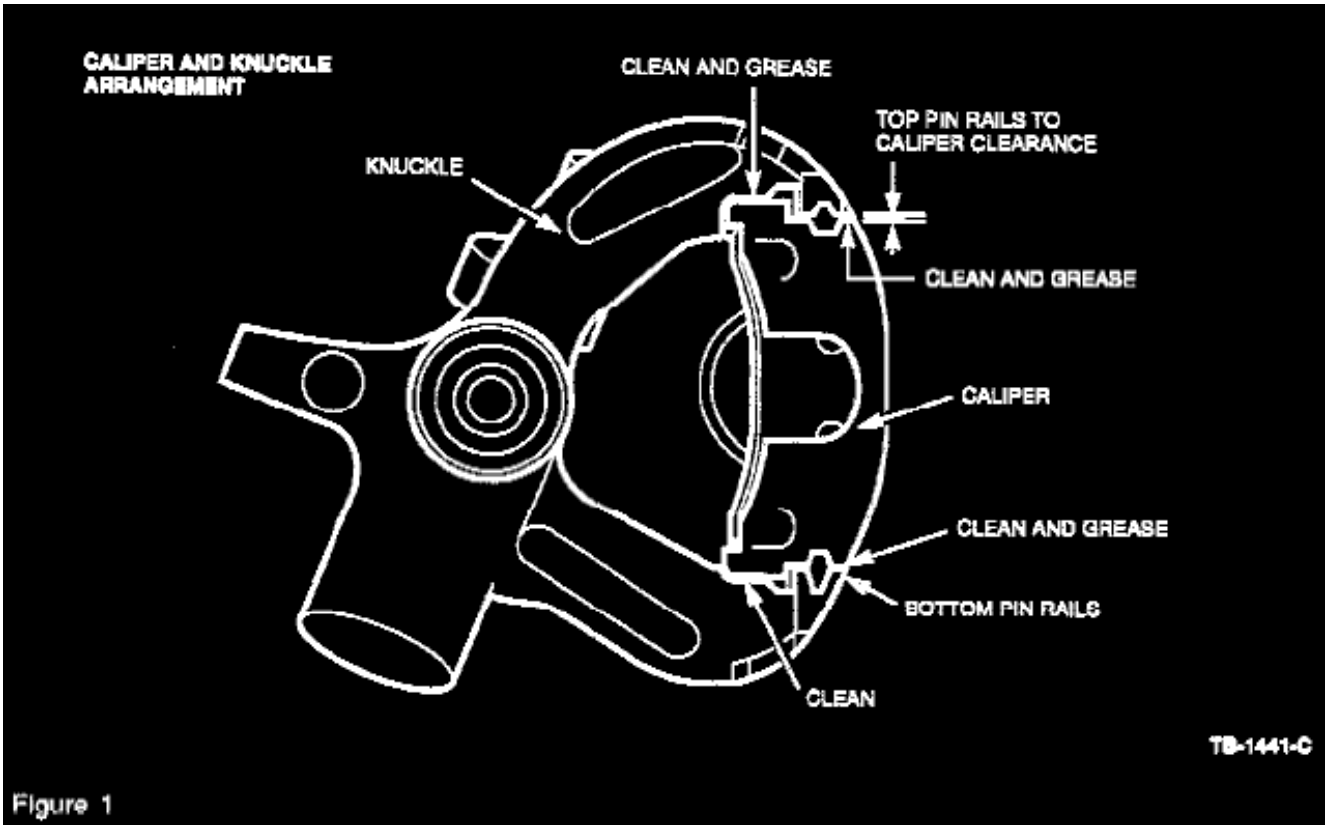

Figure 1

PROCEDURE 6 - 2005 42

PROCEDURE 7 - FRONT W6

ROAD TEST - FRONT W6

OASIS CODES: 301000, 303000

Service Procedure

1. Check and adjust brake pad clearances and caliper knuckle clearances as follows:

a. Remove the pins from the caliper.

b. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails. Clearance should be a minimum of 0.3B mm (0.015").

c. If the clearance is insufficient, replace the caliper and measure again. If clearance concern still exists, replace the knuckle.

NOTE:

CHECK THE CLEARANCE ON THE NEW KNUCKLE BEFORE INSTALLATION.

d. After measuring the caliper/knuckle for proper clearances, remove both calipers and inner pad assemblies.

e. Remove the anti-rattle clip from the inner pad.

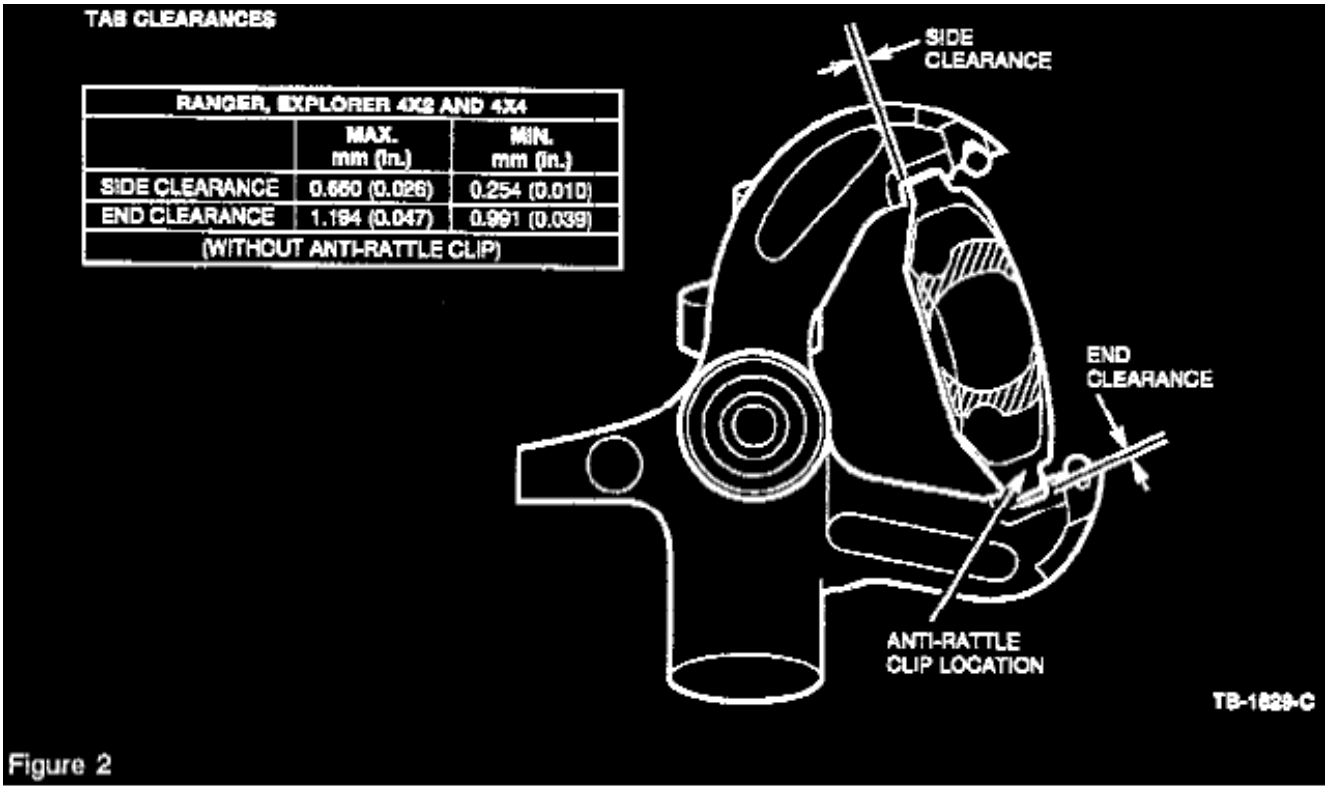

Figure 2

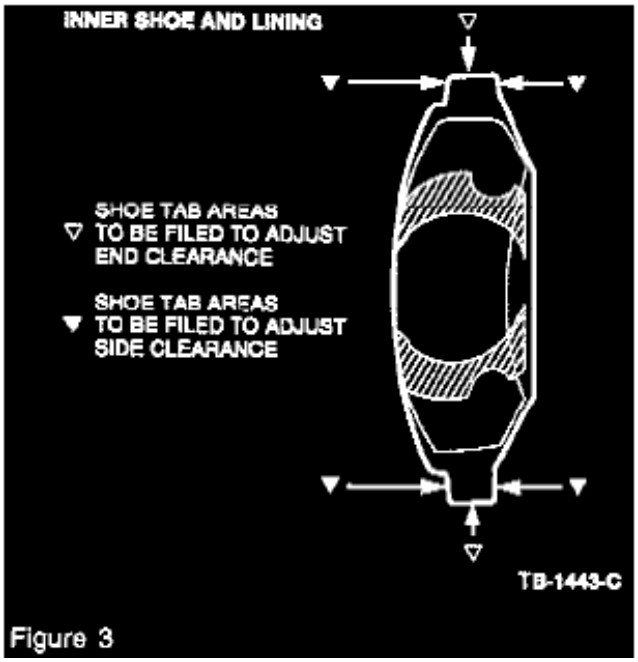

Figure 3

f. Reinstall pad and check the side and end clearances with a feeler gauge (Figure 2).

g. If the pad clearances are within specification, go to Step 1h. If the pad clearances are not to the required dimensions, file the steel backing plate. File material at ends of shoes, removing equal amounts from both sides or ends (Figure 3).

CAUTION:

DO NOT GRIND THE STEEL BACKING PLATE. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

h. Check the tab clearances and install anti-rattle clip on the lower pad tab (Figure 2).

CAUTION:

MAKE SURE THE LUBRICANT DOES NOT GET ON THE ROTORS, LININGS, OR ON THE CALIPER PISTON BOOTS.

2. During reassembly:

^ Clean the caliper slide surfaces of corrosion, contamination, and burrs with a wire brush or portable wire wheel

^ Polish with crocus cloth

^ Lubricate and corrosion protect by applying a light coat of Silicone Brake Caliper Grease and Dielectric Compound (D7AZ-19A331-A), or equivalent meeting Ford specification ESE-M1C171-A, to the inner knuckle top and bottom pad groove and caliper rails (Figure 1)

^ Replace the caliper pins with new Caliper Pins (F2TZ-2C150-A)

NOTE:

THE EXPLORER IS ALREADY EQUIPPED WITH THE NEW RADIUS ARM BUSHINGS.

3. Inspect the right and left side radius arm bushings for cracking, splitting, or wear. Replace the right and left side arm bushings with new Radius Arm Bushings (F1TZ-3B203-B), medium brown color, if necessary. Refer to the appropriate Service Manual, Section 04-01C, for service details.

Pull/Drift Diagnostic Procedure

The Pull/Drift Diagnostic Procedure should be used if the pull or drift is not significantly reduced with the service procedure or in cases of a steady state drift (no braking).

Test drive the vehicle with the customer to understand his/her pull or drift concern. Many customers will call a clear vision concern a pull or drift because the steering wheel is not straight.

Pull or drifts come from various sources, each with a particular set of symptoms. Careful road test evaluation usually will pinpoint which cause (or causes) is present.

Road Test

It is important to test drive the vehicle with the customer to UNDERSTAND HIS OR HER CONCERN.

Complete the road test before beginning any repairs since you may have multiple causes that need to be identified.

^ The road test should be done on a flat, straight road and should be done in both directions to account for wind

^ Tire pressure should be checked and adjusted, if necessary

^ A second person in the vehicle during the road test is helpful. Unless otherwise directed, the second person must remain in the front RH passenger location

^ On vehicles with automatic locking hubs, it is necessary to drive 6 meters (20 feet) forward and then backward to unlock the hubs

ROAD TEST	RESULT	ACTION
Maintain a steady speed of 80-89 km/h (50-55 mph). **DO NOT BRAKE.**	Is there a steady state pull? If no, go to the next Step.	**See Diagnostic Procedure 1** - Tire mismatch or tire pressure concern.
While stopped, have second person move to the LH rear passenger location. Maintain 80-89 km/h (50-55 mph).	Any change in pull? If no change, go to next Step.	**See Diagnostic Procedure 2** - Caster split.
Make sure front hubs are unlocked (if equipped). Accelerate the vehicle - decelerate the vehicle using **engine braking only.**	Any changes in the pull? Does it pull one way on acceleration and another way on deceleration? If no, go to next Step.	**See Diagnostic Procedure 3** - Possible limited slip rear axle and tire circumference.
Maintain a steady speed of 80-89 km/h (50-55 mph). Put the vehicle in Neutral and shut off the engine.	Does the pull go away? If no, go to the next Step.	**See Diagnostic Procedure 4** - Steering gear valve off center.
Stop the vehicle along the highway. Rotate the wheel full left. Proceed with road test.	Does the pull get better or worse? Stop the vehicle; rotate the wheel full right. Does the pull change - better or worse? If no, go to next Step.	**See Diagnostic Procedure 5** - Possible Rubber Ball Socket (RBS) memory steer.
In a safe clear area, while firmly holding the steering wheel, apply the brakes moderately hard, but not to the point of engaging Rear Anti-lock Brake System (RABS).	Does the vehicle's heading change during brake application? If no, go to next Step.	**See Diagnostic Procedure 6** - Possible brake imbalance.
Disconnect the fluid level sensor (disable RABS). Brake the vehicle from 80 km/h (50 mph).	Does the vehicle pull with anti-lock disconnected? If no, go to next Step.	**See Diagnostic Procedure 6** - Possible inadequate rear brake application.
Brake the vehicle hard, to the point of lock-up (RABS disabled).	Do both rears lock? Do both wheels lock at the same time?	**See Diagnostic Procedure 6** - Possible unequal rear brake application.

NOTE:

IT IS POSSIBLE THAT THE VEHICLE MAY HAVE MULTIPLE SYMPTOMS. A ROAD TEST/CAUSE CHART.

NOTE:

RECONNECT THE FLUID LEVEL SENSOR AFTER ROAD TEST.

Diagnostic Procedure # 1 - Tire Mismatch

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the Diagnostic Procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to Regular Production Option (RPO) list and set tire psi to the correct value

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only

Set tire pressure to value on the certification label.

1. Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Tire Pull - Swap the front tires from side-to-side and road test. If the concern is not corrected, continue with next Step.

3. Tire Pull - Swap rear tires from side-to-side and road test. If the concern is not corrected, continue with next Step.

4. Tire Pull - Swap front tires from front to rear. Set the tire pressure to the required pressure for the new front and rear positions, then road test.

NOTE:

ON REAR LIMITED SLIP AXLE (FRONT HUB UNLOCKED) DRIFT CONCERNS, IT MAY BE NECESSARY TO MEASURE TIRE CIRCUMFERENCE AND PLACE A MATCHED SET OF TIRES ON THE REAR AXLE.

Diagnostic Procedure # 2 - Alignment

1991-94 PREFERRED ALIGNMENT SPECIFICATIONS

Model	Alignment	Specification
All	TOE-IN ADJUST	+0.03 ±0.06 Inch Or +0.06 ±0.13 Degrees
All Other Models	CASTER SPLIT - LH CASTER/RH CASTER (SEE TSB 89-21-10)	0.3 ±0.50 Degrees
All	CAMBER SPLIT - LH CAMBER/RH CAMBER	0 ±0.50 Degrees
All	AVERAGE CAMBER *	0.25 ±0.50 Degrees
All Ranger 4X2 Ranger 4X4 Explorer 4X2 Explorer 4X4	AVERAGE CASTER **	Min. 2.00 Degrees Max. 8.00 Degrees Max. 7.00 Degrees Max. 8.00 Degrees Max. 8.00 Degrees

* Defined as (LH camber + RH camber) divided by 2. Vehicles set to this specification, as measured with the vehicle loaded to normal loading conditions, will result in optimum tire wear.

** Defined as (LH caster + RH caster) divided by 2. These are not recommended values for settings. They are only maximum and minimum limitations.

Wheel Alignment - Measure the front wheel alignment. For out-of-specification vehicles, align to the "1991-94 Preferred Alignment Specifications" stated in this article.

^ Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels

^ Do not adjust wheel alignment to correct for brake pull if the vehicle does not have pull during non-brake applications

^ Set the tire pressure to the specification on the certification label

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the Diagnostic Procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to RPO list and set tire pressure to the correct value

^ IF THE TIRES AND WHEELS DO NOT MATCH CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only

Drive vehicle after alignment is performed.

^ Vehicles which exceed the maximum average caster value shown above may result in shimmy concerns

^ Vehicles operated below the minimum average caster value shown can result in wander and poor steering returnability concerns

If the vehicle is not within these minimum and maximum average caster values, or if the vehicle has experienced any of these listed steering/handling concerns, the average caster should be set in accordance with ride height/caster chart in the Service Manual.

Diagnostic Procedure # 3 - Tires

1. Spin the front tires to be sure that the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Measure tire circumference of all four (4) tires; put the two (2) closest circumference tires on the rear axle. Tire pressure must be equal on all tires.

Diagnostic Procedure # 4 - Steering Gear Valve Off Center

Rotary Valve Centering Check: To confirm that you are looking at a steering gear valve concern, lift the front wheels off the ground.

^ The vehicle should be raised so that there is no interference with the steering linkage

^ The front wheels should also spin freely

With the wheels in a straight ahead position, start the engine and observe any steering wheel or linkage movement when the engine is started. If any movement is observed, continue with the rotary valve centering check.

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Install a 0-13,790 kPa (0-2000 psi) pressure gauge (Rotunda 014-00207, Power Steering Analyzer) in the pressure line between the power steering pump outlet port 1 and the integral steering gear inlet port. Make sure the valve on the gauge is fully open.

3. Check the fluid level in the reservoir. Add Premium Power Steering Fluid F7AZ-3F823-AA or equivalent meeting Ford specification ESW-M2C33-F, if necessary.

4. Start the engine and turn the steering wheel from stop-to-stop to bring the steering lubricant to normal operating temperature. Turn off the engine and recheck the fluid level. Add Premium Power Steering Fluid F7AZ-3F823-AA or equivalent meeting Ford specification ESW-M2C33-F, if necessary.

5. With the engine running at approximately 1000 rpm and the steering wheel centered, attach a b-in torque wrench to the steering wheel nut. Apply sufficient torque in each direction to get a gauge reading of 1723 kPa (250 psi).

6. The torque wrench readings should be the same in both directions at 1723 kPa (250 psi). If the difference between the readings exceeds 0.68 N.m (6 lb-in), remove the steering gear and replace the shaft and control assembly.

7. Remove the pressure gauge installed in Step 2.

Diagnostic Procedure # 5 - RBS Linkage

If the RBS linkage is determined to have wind up or memory steer, replace RBS linkage with greaseable steel linkage.

NOTE:

ALL SERVICE PART STEERING LINKAGE IS THE GREASEABLE STEEL SOCKET TYPE

Diagnostic Procedure # 6 - Brake Imbalance

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Check for front wheel rotational drag with warm/hot brakes.

a. Make a series of 10 stops from speeds of 48 km/h (30 mph).

b. Make the 10 stops with no more than 30 second intervals between stops. This generally will induce a maximum pull if there is a drift/pull concern.

c. Raise the front end of the vehicle so that both tires are off the ground.

d. Rotate the front wheels by hand.

NOTE:

FOR ALL 4-WHEEL-DRIVE VEHICLES, MAKE SURE THE HUBS ARE DISENGAGED.

Both tires should rotate about the same amount, with little brake drag occuring. Some brake drag will naturally be present for each size of vehicle.

3. If the vehicle has excess brake drag, proceed as follows:

a. Open the bleed screw on the affected wheel to check for residual pressure in the brake lines. If there is a squirt of brake fluid out of the bleeder screw and the drag is reduced or eliminated, the master cylinder may not be allowing the brake fluid to return to the reservoir.

b. Check the master cylinder push rod adjustment. Refer to the appropriate Service Manual, Section 06-06, for service details.

c. Check the brake pedal to determine if it is fully returning.

4. Remove both calipers and check piston retraction using a C-clamp and wooden block. The piston should easily move back into the bore under the force of the clamp. Rebuild or replace as needed.

5. If Steps 1 through 4 have not determined the concern, swap rotors and linings from side-to-side.

NOTE:

SHOE TAB CLEARANCES SHOULD BE CHECKED AND MODIFIED IF NEEDED. REFER TO FIGURE 2.

6. Test drive the vehicle with 10 or more stops from 64 km/h (40 mph) before evaluating for brake drift. If there is no change in drift while braking, it may be assumed the concern is not the result of the front brakes.

7. Check the rear brakes. Remove the rear wheels and brake drums.

a. Check for contaminants (i.e., grease, axle lube, leaking brake fluid, etc.).

b. Check for broken components, frozen parking brake cables or improperly installed parts.

c. Check the cage diameter using the Brake Shoe Adjustment Gauge (D81L-1103-A). If either side is out-of-specification, check for proper function of the adjusting mechanism and repair or replace as required.

d. Check the rear wheel cylinders by the following method.

^ Replace one of the brake drums

^ Have another person apply the brakes and watch for movement of one of the brake shoes on the other wheel

^ Reapply the brakes while holding in place the shoe that moved. The opposite shoe should now move. If no movement is observed, repair or replace the wheel cylinder

^ Reinstall the drum and repeat the procedure for the other rear brake

8. If the condition still exists, swap rear shoes from side-to-side and drive the vehicle. If the drift is significantly reduced, replace the rear linings. If the pull/drift is not significantly reduced, go to Service Procedure # 7.

Diagnostic Procedure # 7 - Miscellaneous

Check for loose, damaged or excessively worn parts. Visually inspect the front suspension for loose or worn components (i.e., ball joints, radius arm bushings, radius arm attachments at the axle and frame, alignment adjusters, steering linkage, etc.). Repair or replace as required.

Diagnostic Check List

NOTE:

THE FOLLOWING CHECK LIST SHOULD BE COMPLETED AFTER EACH STEP OF THE DIAGNOSTIC WHERE APPLICABLE.

SERVICE PROCEDURE

1. Checking clearances

___ Caliper-to-knuckle clearance.

___ Inner shoe side and end clearance.

2. Lubrication of components

___ Lubrication of the caliper rails and inner knuckle pad grooves.

3. Radius arm bushings

___ Replacement of right and left side radius arm bushings.

DIAGNOSTIC PROCEDURE

1. Tire mismatch

____ Unlocked hubs check.

____ Front tires swapped side-to-side.

____ Rear tires swapped side-to-side.

____ Front-to-rear tire swap.

2. Alignment

____ Unlocked hubs check.

____ Toe changed to ____.

___ Caster changed and split is ____.

___ Camber changed and split is ____.

3. Tire circumference

____ Unlocked hubs check.

___ Tire circumference checked and two (2) closest circumference tires swapped to rear axle.

4. Steering gear valve

____ Unlocked hubs check.

____ Install pressure gauge.

____ Check fluid level with engine off and on.

___ Apply torque to the steering wheel nut and check gauge readings.

___ Replaced the shaft and control assembly.

____ Removed the pressure gauge.

5. RABS linkage

____ Replaced the RBS linkage.

6. Brake imbalance

____ Unlocked hubs check.

____ Front wheel rotational drag check.

____ Master cylinder check.

____ Piston retraction check.

____ Rotors and linings swapped from side-to-side.

____ Rear brakes checked.

___ Rear drums and shoes swapped from side-to-side.

7. Miscellaneous

___ Check for loose, damaged or worn parts.

PROCEDURE 5 - FRONT W6

PROCEDURE 6 - 2005 42

PROCEDURE 7 - FRONT W6

ROAD TEST - FRONT W6

OASIS CODES: 301000, 303000

Service Procedure

1. Check and adjust brake pad clearances and caliper knuckle clearances as follows:

a. Remove the pins from the caliper.

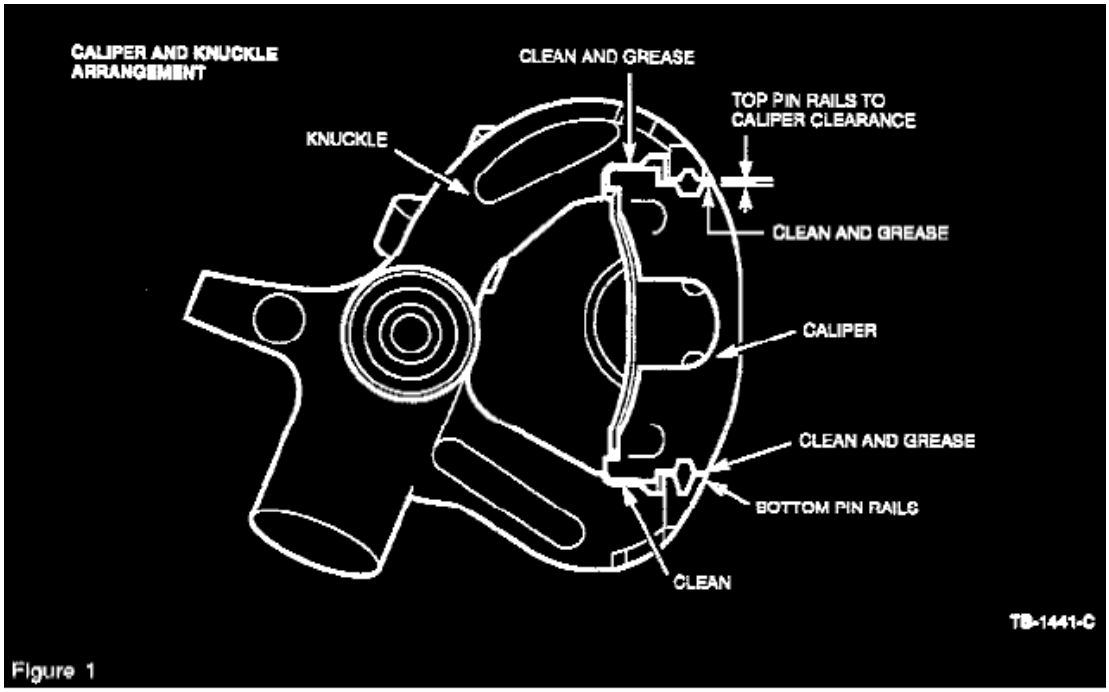

Figure 1

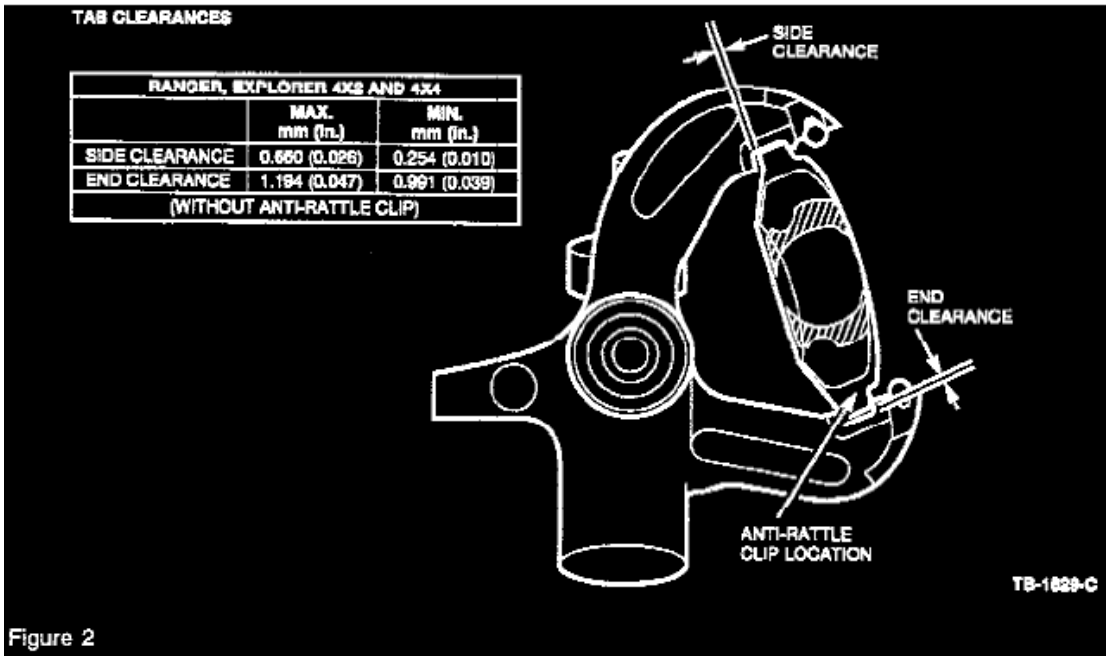

Figure 2

b. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails. Clearance should be a minimum of 0.3B mm (0.015").

c. If the clearance is insufficient, replace the caliper and measure again. If clearance concern still exists, replace the knuckle.

NOTE:

CHECK THE CLEARANCE ON THE NEW KNUCKLE BEFORE INSTALLATION.

d. After measuring the caliper/knuckle for proper clearances, remove both calipers and inner pad assemblies.

e. Remove the anti-rattle clip from the inner pad.

f. Reinstall pad and check the side and end clearances with a feeler gauge (Figure 2).

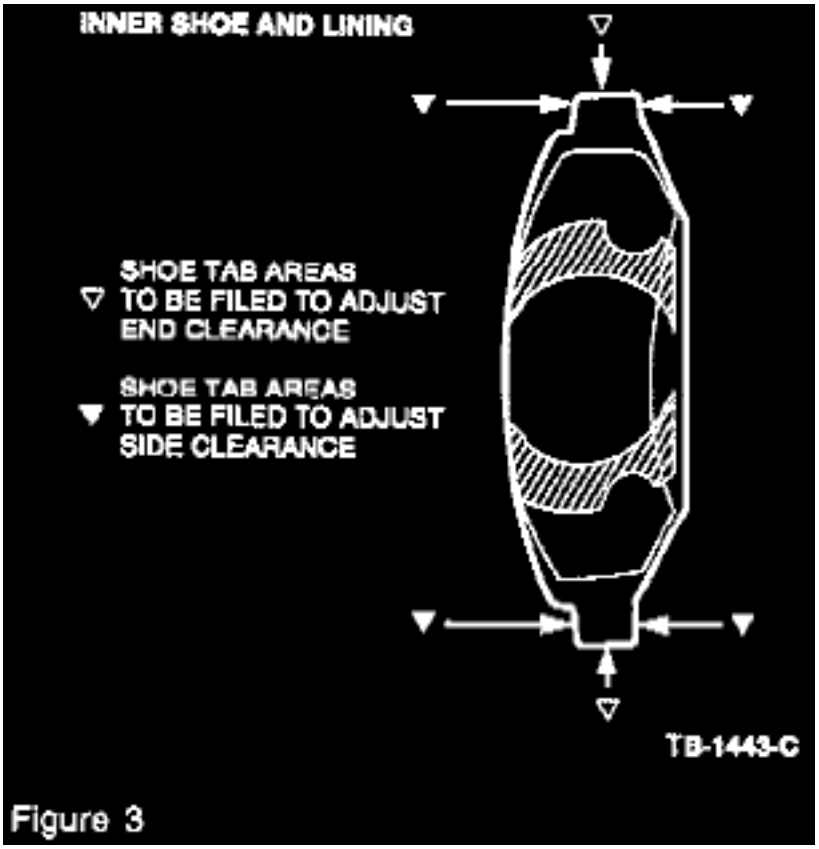

Figure 3

g. If the pad clearances are within specification, go to Step 1h. If the pad clearances are not to the required dimensions, file the steel backing plate. File material at ends of shoes, removing equal amounts from both sides or ends (Figure 3).

CAUTION:

DO NOT GRIND THE STEEL BACKING PLATE. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

h. Check the tab clearances and install anti-rattle clip on the lower pad tab (Figure 2).

CAUTION:

MAKE SURE THE LUBRICANT DOES NOT GET ON THE ROTORS, LININGS, OR ON THE CALIPER PISTON BOOTS.

2. During reassembly:

^ Clean the caliper slide surfaces of corrosion, contamination, and burrs with a wire brush or portable wire wheel

^ Polish with crocus cloth

^ Lubricate and corrosion protect by applying a light coat of Silicone Brake Caliper Grease and Dielectric Compound (D7AZ-19A331-A), or equivalent meeting Ford specification ESE-M1C171-A, to the inner knuckle top and bottom pad groove and caliper rails (Figure 1)

^ Replace the caliper pins with new Caliper Pins (F2TZ-2C150-A)

NOTE:

THE EXPLORER IS ALREADY EQUIPPED WITH THE NEW RADIUS ARM BUSHINGS.

3. Inspect the right and left side radius arm bushings for cracking, splitting, or wear. Replace the right and left side arm bushings with new Radius Arm Bushings (F1TZ-3B203-B), medium brown color, if necessary. Refer to the appropriate Service Manual, Section 04-01C, for service details.

Pull/Drift Diagnostic Procedure

The Pull/Drift Diagnostic Procedure should be used if the pull or drift is not significantly reduced with the service procedure or in cases of a steady state drift (no braking).

Test drive the vehicle with the customer to understand his/her pull or drift concern. Many customers will call a clear vision concern a pull or drift because the steering wheel is not straight.

Pull or drifts come from various sources, each with a particular set of symptoms. Careful road test evaluation usually will pinpoint which cause (or causes) is present.

Road Test

It is important to test drive the vehicle with the customer to UNDERSTAND HIS OR HER CONCERN.

Complete the road test before beginning any repairs since you may have multiple causes that need to be identified.

^ The road test should be done on a flat, straight road and should be done in both directions to account for wind

^ Tire pressure should be checked and adjusted, if necessary

ROAD TEST	RESULT	ACTION
Maintain a steady speed of 80-89 km/h (50-55 mph). **DO NOT BRAKE.**	Is there a steady state pull? If no, go to the next Step.	**See Diagnostic Procedure 1** - Tire mismatch or tire pressure concern.
While stopped, have second person move to the LH rear passenger location. Maintain 80-89 km/h (50-55 mph).	Any change in pull? If no change, go to next Step.	**See Diagnostic Procedure 2** - Caster split.
Make sure front hubs are unlocked (if equipped). Accelerate the vehicle - decelerate the vehicle using **engine braking only.**	Any changes in the pull? Does it pull one way on acceleration and another way on deceleration? If no, go to next Step.	**See Diagnostic Procedure 3** - Possible limited slip rear axle and tire circumference.
Maintain a steady speed of 80-89 km/h (50-55 mph). Put the vehicle in Neutral and shut off the engine.	Does the pull go away? If no, go to the next Step.	**See Diagnostic Procedure 4** - Steering gear valve off center.
Stop the vehicle along the highway. Rotate the wheel full left. Proceed with road test.	Does the pull get better or worse? Stop the vehicle; rotate the wheel full right. Does the pull change - better or worse? If no, go to next Step.	**See Diagnostic Procedure 5** - Possible Rubber Ball Socket (RBS) memory steer.
In a safe clear area, while firmly holding the steering wheel, apply the brakes moderately hard, but not to the point of engaging Rear Anti-lock Brake System (RABS).	Does the vehicle's heading change during brake application? If no, go to next Step.	**See Diagnostic Procedure 6** - Possible brake imbalance.
Disconnect the fluid level sensor (disable RABS). Brake the vehicle from 80 km/h (50 mph).	Does the vehicle pull with anti-lock disconnected? If no, go to next Step.	**See Diagnostic Procedure 6** - Possible inadequate rear brake application
Brake the vehicle hard, to the point of lock-up (RABS disabled).	Do both rears lock? Do both wheels lock at the same time?	**See Diagnostic Procedure 6** - Possible unequal rear brake application.

^ A second person in the vehicle during the road test is helpful. Unless otherwise directed, the second person must remain in the front RH passenger location

^ On vehicles with automatic locking hubs, it is necessary to drive 6 meters (20 feet) forward and then backward to unlock the hubs

NOTE:

IT IS POSSIBLE THAT THE VEHICLE MAY HAVE MULTIPLE SYMPTOMS. A ROAD TEST/CAUSE CHART.

NOTE:

RECONNECT THE FLUID LEVEL SENSOR AFTER ROAD TEST.

Diagnostic Procedure # 1 - Tire Mismatch

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the Diagnostic Procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to Regular Production Option (RPO) list and set tire psi to the correct value

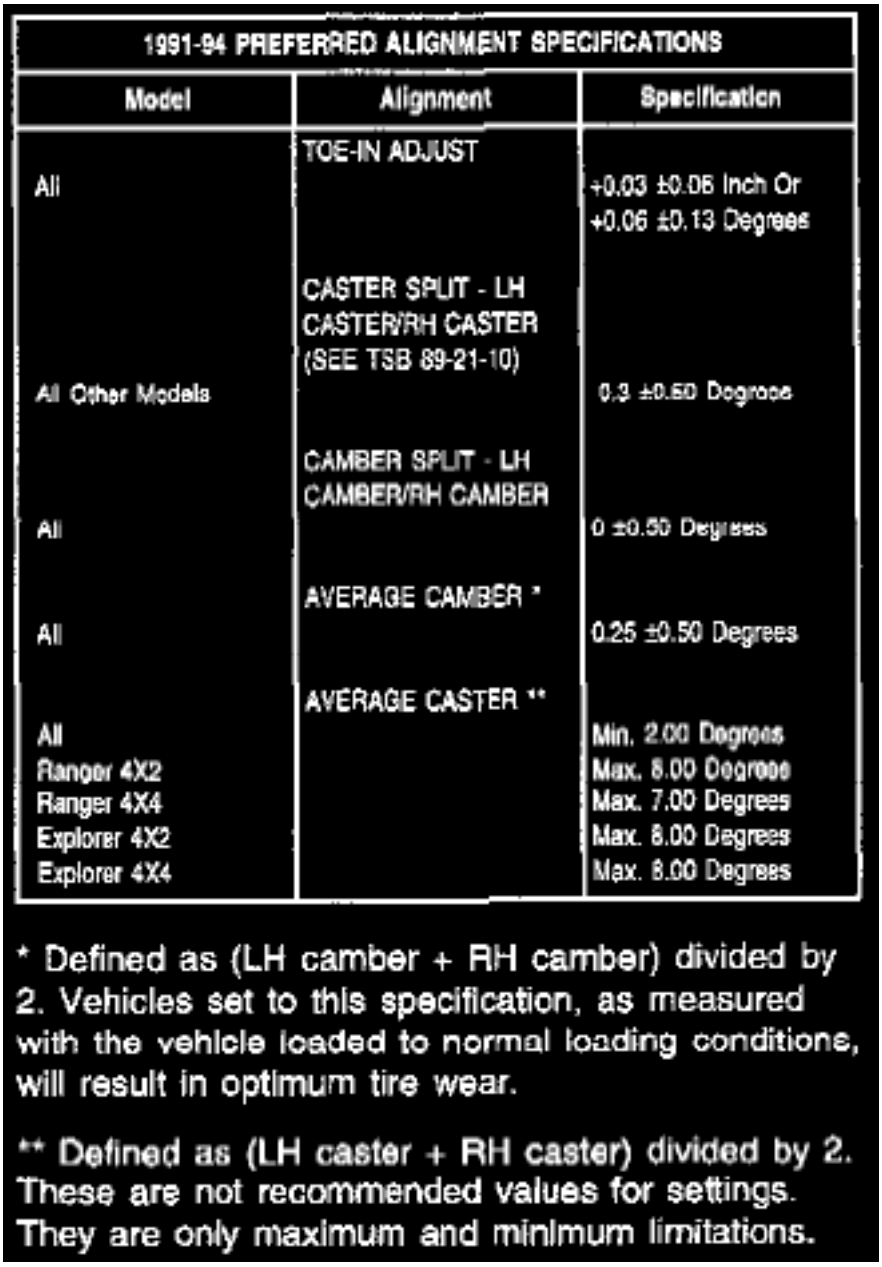
^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only

Set tire pressure to value on the certification label.

1. Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Tire Pull - Swap the front tires from side-to-side and road test. If the concern is not corrected, continue with next Step.

3. Tire Pull - Swap rear tires from side-to-side and road test. If the concern is not corrected, continue with next Step.



1991-94 PREFERRED ALIGNMENT SPECIFICATIONS		
Model	Alignment	Specification
All	TOE-IN ADJUST	+0.03 ±0.06 Inch Or +0.06 ±0.13 Degrees
All Other Models	CASTER SPLIT - LH CASTER/RH CASTER (SEE TSB 89-21-10)	0.3 ±0.50 Degrees
All	CAMBER SPLIT - LH CAMBER/RH CAMBER	0 ±0.50 Degrees
All	AVERAGE CAMBER *	0.25 ±0.50 Degrees
All Ranger 4X2 Ranger 4X4 Explorer 4X2 Explorer 4X4	AVERAGE CASTER **	Min. 2.00 Degrees Max. 8.00 Degrees Max. 7.00 Degrees Max. 8.00 Degrees Max. 8.00 Degrees

* Defined as (LH camber + RH camber) divided by 2. Vehicles set to this specification, as measured with the vehicle loaded to normal loading conditions, will result in optimum tire wear.

** Defined as (LH caster + RH caster) divided by 2. These are not recommended values for settings. They are only maximum and minimum limitations.

4. Tire Pull - Swap front tires from front to rear. Set the tire pressure to the required pressure for the new front and rear positions, then road test.

NOTE:

ON REAR LIMITED SLIP AXLE (FRONT HUB UNLOCKED) DRIFT CONCERNS, IT MAY BE NECESSARY TO MEASURE TIRE CIRCUMFERENCE AND PLACE A MATCHED SET OF TIRES ON THE REAR AXLE.

Diagnostic Procedure # 2 - Alignment

Wheel Alignment - Measure the front wheel alignment. For out-of-specification vehicles, align to the "1991-94 Preferred Alignment Specifications" stated in this article.

^ Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels

^ Do not adjust wheel alignment to correct for brake pull if the vehicle does not have pull during non-brake applications

^ Set the tire pressure to the specification on the certification label

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the Diagnostic Procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to RPO list and set tire pressure to the correct value

^ IF THE TIRES AND WHEELS DO NOT MATCH CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only

Drive vehicle after alignment is performed.

^ Vehicles which exceed the maximum average caster value shown above may result in shimmy concerns

^ Vehicles operated below the minimum average caster value shown can result in wander and poor steering returnability concerns

If the vehicle is not within these minimum and maximum average caster values, or if the vehicle has experienced any of these listed steering/handling concerns, the average caster should be set in accordance with ride height/caster chart in the Service Manual.

Diagnostic Procedure # 3 - Tires

1. Spin the front tires to be sure that the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Measure tire circumference of all four (4) tires; put the two (2) closest circumference tires on the rear axle. Tire pressure must be equal on all tires.

Diagnostic Procedure # 4 - Steering Gear Valve Off Center

Rotary Valve Centering Check: To confirm that you are looking at a steering gear valve concern, lift the front wheels off the ground.

^ The vehicle should be raised so that there is no interference with the steering linkage

^ The front wheels should also spin freely

With the wheels in a straight ahead position, start the engine and observe any steering wheel or linkage movement when the engine is started. If any movement is observed, continue with the rotary valve centering check.

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Install a 0-13,790 kPa (0-2000 psi) pressure gauge (Rotunda 014-00207, Power Steering Analyzer) in the pressure line between the power steering pump outlet port 1 and the integral steering gear inlet port. Make sure the valve on the gauge is fully open.

3. Check the fluid level in the reservoir. Add Premium Power Steering Fluid F7AZ-3F823-AA or equivalent meeting Ford specification ESW-M2C33-F, if necessary.

4. Start the engine and turn the steering wheel from stop-to-stop to bring the steering lubricant to normal operating temperature. Turn off the engine and recheck the fluid level. Add Premium Power Steering Fluid F7AZ-3F823-AA or equivalent meeting Ford specification ESW-M2C33-F, if necessary.

5. With the engine running at approximately 1000 rpm and the steering wheel centered, attach a b-in torque wrench to the steering wheel nut. Apply sufficient torque in each direction to get a gauge reading of 1723 kPa (250 psi).

6. The torque wrench readings should be the same in both directions at 1723 kPa (250 psi). If the difference between the readings exceeds 0.68 N.m (6 lb-in), remove the steering gear and replace the shaft and control assembly.

7. Remove the pressure gauge installed in Step 2.

Diagnostic Procedure # 5 - RBS Linkage

If the RBS linkage is determined to have wind up or memory steer, replace RBS linkage with greaseable steel linkage.

NOTE:

ALL SERVICE PART STEERING LINKAGE IS THE GREASEABLE STEEL SOCKET TYPE

Diagnostic Procedure # 6 - Brake Imbalance

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Check for front wheel rotational drag with warm/hot brakes.

a. Make a series of 10 stops from speeds of 48 km/h (30 mph).

b. Make the 10 stops with no more than 30 second intervals between stops. This generally will induce a maximum pull if there is a drift/pull concern.

c. Raise the front end of the vehicle so that both tires are off the ground.

d. Rotate the front wheels by hand.

NOTE:

FOR ALL 4-WHEEL-DRIVE VEHICLES, MAKE SURE THE HUBS ARE DISENGAGED.

Both tires should rotate about the same amount, with little brake drag occuring. Some brake drag will naturally be present for each size of vehicle.

3. If the vehicle has excess brake drag, proceed as follows:

a. Open the bleed screw on the affected wheel to check for residual pressure in the brake lines. If there is a squirt of brake fluid out of the bleeder screw and the drag is reduced or eliminated, the master cylinder may not be allowing the brake fluid to return to the reservoir.

b. Check the master cylinder push rod adjustment. Refer to the appropriate Service Manual, Section 06-06, for service details.

c. Check the brake pedal to determine if it is fully returning.

4. Remove both calipers and check piston retraction using a C-clamp and wooden block. The piston should easily move back into the bore under the force of the clamp. Rebuild or replace as needed.

5. If Steps 1 through 4 have not determined the concern, swap rotors and linings from side-to-side.

NOTE:

SHOE TAB CLEARANCES SHOULD BE CHECKED AND MODIFIED IF NEEDED. REFER TO FIGURE 2.

6. Test drive the vehicle with 10 or more stops from 64 km/h (40 mph) before evaluating for brake drift. If there is no change in drift while braking, it may be assumed the concern is not the result of the front brakes.

7. Check the rear brakes. Remove the rear wheels and brake drums.

a. Check for contaminants (i.e., grease, axle lube, leaking brake fluid, etc.).

b. Check for broken components, frozen parking brake cables or improperly installed parts.

c. Check the cage diameter using the Brake Shoe Adjustment Gauge (D81L-1103-A). If either side is out-of-specification, check for proper function of the adjusting mechanism and repair or replace as required.

d. Check the rear wheel cylinders by the following method.

^ Replace one of the brake drums

^ Have another person apply the brakes and watch for movement of one of the brake shoes on the other wheel

^ Reapply the brakes while holding in place the shoe that moved. The opposite shoe should now move. If no movement is observed, repair or replace the wheel cylinder

^ Reinstall the drum and repeat the procedure for the other rear brake

8. If the condition still exists, swap rear shoes from side-to-side and drive the vehicle. If the drift is significantly reduced, replace the rear linings. If the pull/drift is not significantly reduced, go to Service Procedure # 7.

Diagnostic Procedure # 7 - Miscellaneous

Check for loose, damaged or excessively worn parts. Visually inspect the front suspension for loose or worn components (i.e., ball joints, radius arm bushings, radius arm attachments at the axle and frame, alignment adjusters, steering linkage, etc.). Repair or replace as required.

Diagnostic Check List

NOTE:

THE FOLLOWING CHECK LIST SHOULD BE COMPLETED AFTER EACH STEP OF THE DIAGNOSTIC WHERE APPLICABLE.

SERVICE PROCEDURE

1. Checking clearances

___ Caliper-to-knuckle clearance.

___ Inner shoe side and end clearance.

2. Lubrication of components

___ Lubrication of the caliper rails and inner knuckle pad grooves.

3. Radius arm bushings

___ Replacement of right and left side radius arm bushings.

DIAGNOSTIC PROCEDURE

1. Tire mismatch

____ Unlocked hubs check.

____ Front tires swapped side-to-side.

____ Rear tires swapped side-to-side.

____ Front-to-rear tire swap.

2. Alignment

____ Unlocked hubs check.

____ Toe changed to ____.

___ Caster changed and split is ____.

___ Camber changed and split is ____.

3. Tire circumference

____ Unlocked hubs check.

___ Tire circumference checked and two (2) closest circumference tires swapped to rear axle.

4. Steering gear valve

____ Unlocked hubs check.

____ Install pressure gauge.

____ Check fluid level with engine off and on.

___ Apply torque to the steering wheel nut and check gauge readings.

___ Replaced the shaft and control assembly.

____ Removed the pressure gauge.

5. RABS linkage

____ Replaced the RBS linkage.

6. Brake imbalance

____ Unlocked hubs check.

____ Front wheel rotational drag check.

____ Master cylinder check.

____ Piston retraction check.

____ Rotors and linings swapped from side-to-side.

____ Rear brakes checked.

___ Rear drums and shoes swapped from side-to-side.

7. Miscellaneous

___ Check for loose, damaged or worn parts.

TOP VIEW OF CAMBER/CASTER ADJUSTER
(POSITION SLOT IN AXLE TO OBTAIN DESIRED ALIGNMENT)

Alignment: Service and Repair Camber

Fig. 2 Caster/Camber Variation Chart.

Caster and camber adjustment is possible with adjusters available in 1/2°, 1° and 1-1/2° increments. One adjuster is used to adjust both caster and camber.

1. Measure caster and camber, noting difference between specification and actual measurement.

2. Select correct service adjuster, Fig. 2. Select adjuster that will bring alignment to specifications with the smallest side to side variation.

3. Remove front wheel and tire assembly.

4. On 4 x 4 models equipped with Dana 35 axle, remove caster/camber adjuster snap ring.

5. On all models, Remove upper ball joint pinch bolt, then using removal tool No. T64P-3590-F or D81T-3010-B or equivalent, remove adjuster.

6. Install new adjuster, then using suitable 1-1/2 inch socket rotate adjuster to specified position.

7. Install ball joint pinch bolt torquing to 48-65 ft. lbs., install snap ring.

8. Install front wheel and tire assembly, then recheck alignment.

TOP VIEW OF CAMBER/CASTER ADJUSTER (POSITION SLOT IN AXLE TO OBTAIN DESIRED ALIGNMENT)

Alignment: Service and Repair Caster

Fig. 2 Caster/Camber Variation Chart.

Caster and camber adjustment is possible with adjusters available in 1/2°, 1° and 1-1/2° increments. One adjuster is used to adjust both caster and camber.

1. Measure caster and camber, noting difference between specification and actual measurement.

2. Select correct service adjuster, Fig. 2. Select adjuster that will bring alignment to specifications with the smallest side to side variation.

3. Remove front wheel and tire assembly.

4. On 4 x 4 models equipped with Dana 35 axle, remove caster/camber adjuster snap ring.

5. On all models, Remove upper ball joint pinch bolt, then using removal tool No. T64P-3590-F or D81T-3010-B or equivalent, remove adjuster.

6. Install new adjuster, then using suitable 1 1/2 inch socket rotate adjuster to specified position.

7. Install ball joint pinch bolt torquing to 48-65 ft. lbs., install snap ring.

8. Install front wheel and tire assembly, then recheck alignment.

Alignment: Service and Repair Preliminary Inspection

Inspect the following components, adjust, repair or replace as required prior to performing front wheel alignment.

1. Inflate tires to cold specifications.

2. Ensure front tires are of same size, ply rating and load rating.

3. Inspect for excessive wheel bearing endplay.

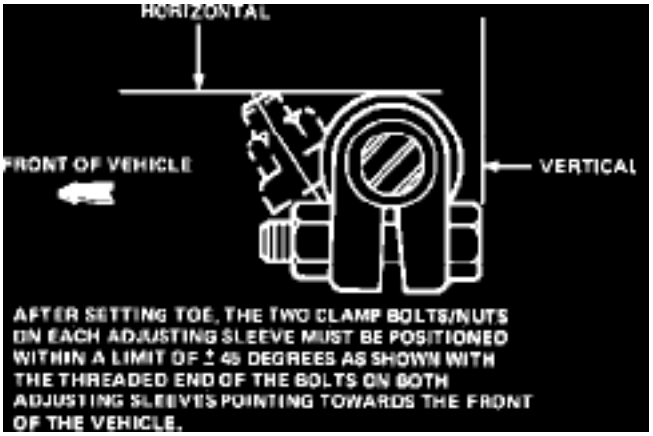
4. Inspect for worn or damaged spindle ball joints.

5. Inspect steering gear mounting bolts for proper torque.

6. Inspect radius arm or bent or damaged condition.

7. Inspect radius arm to frame bushings for looseness or wear.

8. Inspect suspension components for wear or damage.



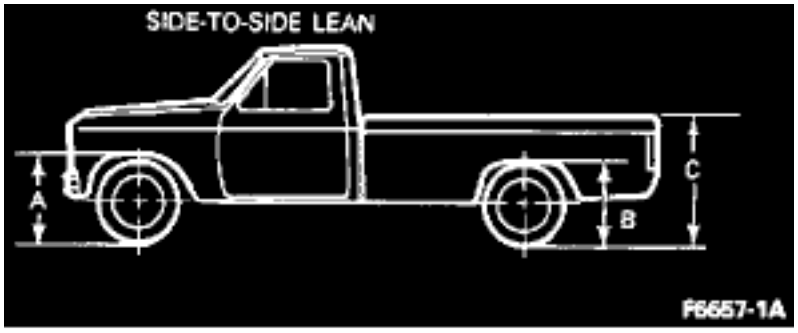
Alignment: Service and Repair Toe

Fig. 4 Toe-In Adjustment

1. Loosen clamp bolts at each end of spindle connecting rod tube, then rotate the sleeve until correct toe alignment of {1/32} inch is obtained.

2. Center clamps between adjustment sleeve nibs, then position bolts horizontally with clamps nuts positioned as shown in Fig. 4.

3. Recheck toe-in adjustment, then check that steering wheel spokes are properly positioned and adjust as necessary.



EXAMPLES

Ranger 4x2 Vehicle	Ranger 4x4 and Explorer Vehicle
Measured LH Ride Height 4-1/2"	Measured LH Ride Height 4-1/2"
Measured RH Ride Height 4"	Measured RH Ride Height 4-5/8"
Revised RH Ride Height 4-1/4"	—
Side to Side Difference 1/4"	Side to Side Difference 1/8"
Since the difference is larger than 1/8", one suspension shim would be added to the low right shim.	Since the difference does not exceed 1/8", no shim is to be used on the front suspension. The front lean may be caused by a rear lean condition.

CF3559-C

Alignment: Service and Repair Vehicle Lean Correction

Front Lean

Measure the left and right front ride heights as shown in the illustration.

Compute the difference between left and right ride heights as shown with the examples. If the difference exceeds 3-9 mm (1/8-3/8 inch) and is LESS than 19 mm (3/4 inch), measured at the wheel house opening to ground, add one shim to the side of the vehicle that is low. The shim is to be placed under the lower spring seat; service shim (part number 389117-S2) can be used without a front stabilizer bar. If there is a computed side-to-side difference of 19 mm (3/4 inch) or MORE in the left/right wheel house openings, remove the high side spring from the vehicle and compare it with a service replacement part having the same part number.

If the free height of the original equipment spring exceeds the free height of the service part by 13 mm (1/2 inch), install the service part in this location. If the free height is less than 13 mm (1/2 inch), remove the low side spring. Compare the service spring to both of the original springs and select the two springs most evenly matched. Install the higher spring at the low side.

NOTE: Changing front ride height by adding the service shim also affects caster angles. Adding the 4.5 mm thick shim (Part 389117-S2 or equivalent) may reduce caster by up to 0.40 degrees on the side the shim is added.

Rear Lean

A side-to-side lean at the rear of the vehicle can be adjusted by approximately 6 mm (1/4 inch) by installing a shim between the rear spring and axle on the low side of the vehicle. A "low at the rear" vehicle can be raised approximately 6 mm (1/4 inch) by installation of one shim on each side. Use the following procedure to install the shim (E37A-5742-AA). 1. Raise the vehicle until the weight is off the rear springs but with the tires still touching the floor. 2. Loosen the spring U-bolts to allow the axle to separate from the spring approximately 13 mm (1/2 inch). 3. Position the shim (E37A-5742-AA) between the spring and the spring seat with the tie bolt head through the hole in the shim.

Position the shim between the rear spring and axle spacer. Tape may be used to hold the shim in position.

4. Make sure the spring leaves are properly aligned and the spring U-bolts contact the edges of the spring assembly or axle seat. 5. Tighten the spring U-bolt sufficiently and make sure the spring bolt head extends through shim into axle seat hole. 6. Tighten the U-bolt nuts to 88-102 N.m (65-75 ft-lb).

Front Steering Knuckle: Service and Repair

1. Remove spindle then the shaft and joint assembly as described previously.

2. If tie rod has not been removed, remove cotter pin and nut and disconnect tie rod from steering arm.

3. Remove cotter pin and loosen nut on top ball joint stud. Loosen bottom nut inside knuckle, then remove top nut.

4. Break spindle loose from ball stud, then remove camber adjuster. Mark position of adjuster for assembly reference.

5. Install steering knuckle in suitable soft jawed vise, then remove snap ring from lower ball joint socket.

6. Press ball joints from steering knuckle using C-Frame tool No. T74P-4635-C with ball joint remover tool No. T83T-3050-A, or equivalent.

7. Reverse procedure to install. The lower ball joint must be installed first. Install spindle to steering knuckle, and tighten nuts to 54-68 N-m (40-50 ft-lbs). Tighten attaching bolts to specifications.

Year	Component	Torque/Ft. Lbs.

③ – 1991, 40-63 ft. lbs., 1992, 39-53 ft. lbs.

Tightening Specifications

Power Steering Pump: Testing and Inspection

When performing the following test, extreme care must be used. Some system pressures can exceed 1500 psi. Ensure test equipment is in good condition and correctly connected. Installation of the analyzer at the pump outlet is preferred. If it is difficult to attach the analyzer at the pump, it may be installed at any convenient location between the pump and gear. The following test procedure used in conjunction with Power Steering Analyzer tool No. D79L-33610-A (Rotunda Model 014-00207) or equivalent provides a method for checking the complete power steering system. The power steering analyzer can be used to determine the cause of hard steering and/or lack of assist problems. Contamination of the power steering system fluid may cause permanent damage to the gauges and instruments incorporated in the analyzer. The analyzer provides readouts for the following:

a. System backpressure.

b. Pump flow.

c. Steering gear internal leakage.

d. Power steering control valve and cylinder internal leakage.

The interpretation of the above readouts will determine which of the following conditions or components are the cause of the problem:

a. Restriction in hoses or fittings.

b. Control valve and cylinder.

c. Sticking gear valve.

d. Insufficient pump cam pack.

e. Sticking relief valve.

f. Binding condition in suspension system.

To perform the power steering system pressure test, proceed as follows:

1. Connect the analyzer into the steering system by removing the pressure fitting from the pump and connecting it to the appropriate adapter of the analyzer.

2. Thread the other adapter of the analyzer into the pump.

3. Connect the analyzer to the adapters, then torque connections to 15 ft. lbs.

4. Add power steering fluid to pump as necessary, then start engine and run for approximately two minutes with engine at idle.

5. Record the flow, if flow is less than specifications, the power steering pump may require repair.

6. Record the pressure at 170°. If the pressure is above 150 psi, check hoses for restrictions or the steering gear.

7. Partially close the gate valve to build up 740 psi for C2 pumps, 620 psi for Saginaw pumps. Record flow (gallons/min @ 170°). If the flow drops to a level lower than the value specified, disassemble the pump and replace the cam pack. If the pressure plates are cracked and worn, replace them.

8. Completely close and partially open the gate valve three times. Do not allow the valve to remain closed for more than five seconds. Record the pressure and compare to specifications. If the

pressure recorded is lower than the minimum specification, replace the control valve. If the pressure recorded is greater than specified, the flow control valve in the pump should be removed and cleaned or replaced.

9. Increase the engine speed from idle to approximately 1500 RPM. Record the flow (gallons/minute). If the flow varies more than one gallon/minute from the flow recorded in Step 5, the flow control valve in the pump should be removed and cleaned or replaced.

10. Turn the steering wheel to the left and right stops. Record the pressure (psi) and flow (gallons/min.) at the stops. The pressure developed at both stops should be nearly the same as the maximum pump output pressure recorded in Step 8. At the same time, the flow should drop below 0.5 gallons/min. If the pressure does not reach maximum output or the flow does not drop below specified valve, excessive internal leakage is occurring. Remove and disassemble the steering gear and remove the control valve. Repair or replace components as necessary.

11. Turn the steering wheel slightly in both directions and release quickly while watching the pressure gauge. The needle should move from normal backpressure reading and snap back as the wheel is released. If the system is severely contaminated, both gear hoses, control valve, and pump must be completely disassembled and cleaned before reassembly. If problem still exists, check ball joints and steering linkage.

Power Steering Pump: Service and Repair Removal and Installation

1. Disconnect battery ground cable.

2. Drain power steering pump reservoir, disconnect return hose at reservoir, then drain into suitable container.

3. Remove drive belts.

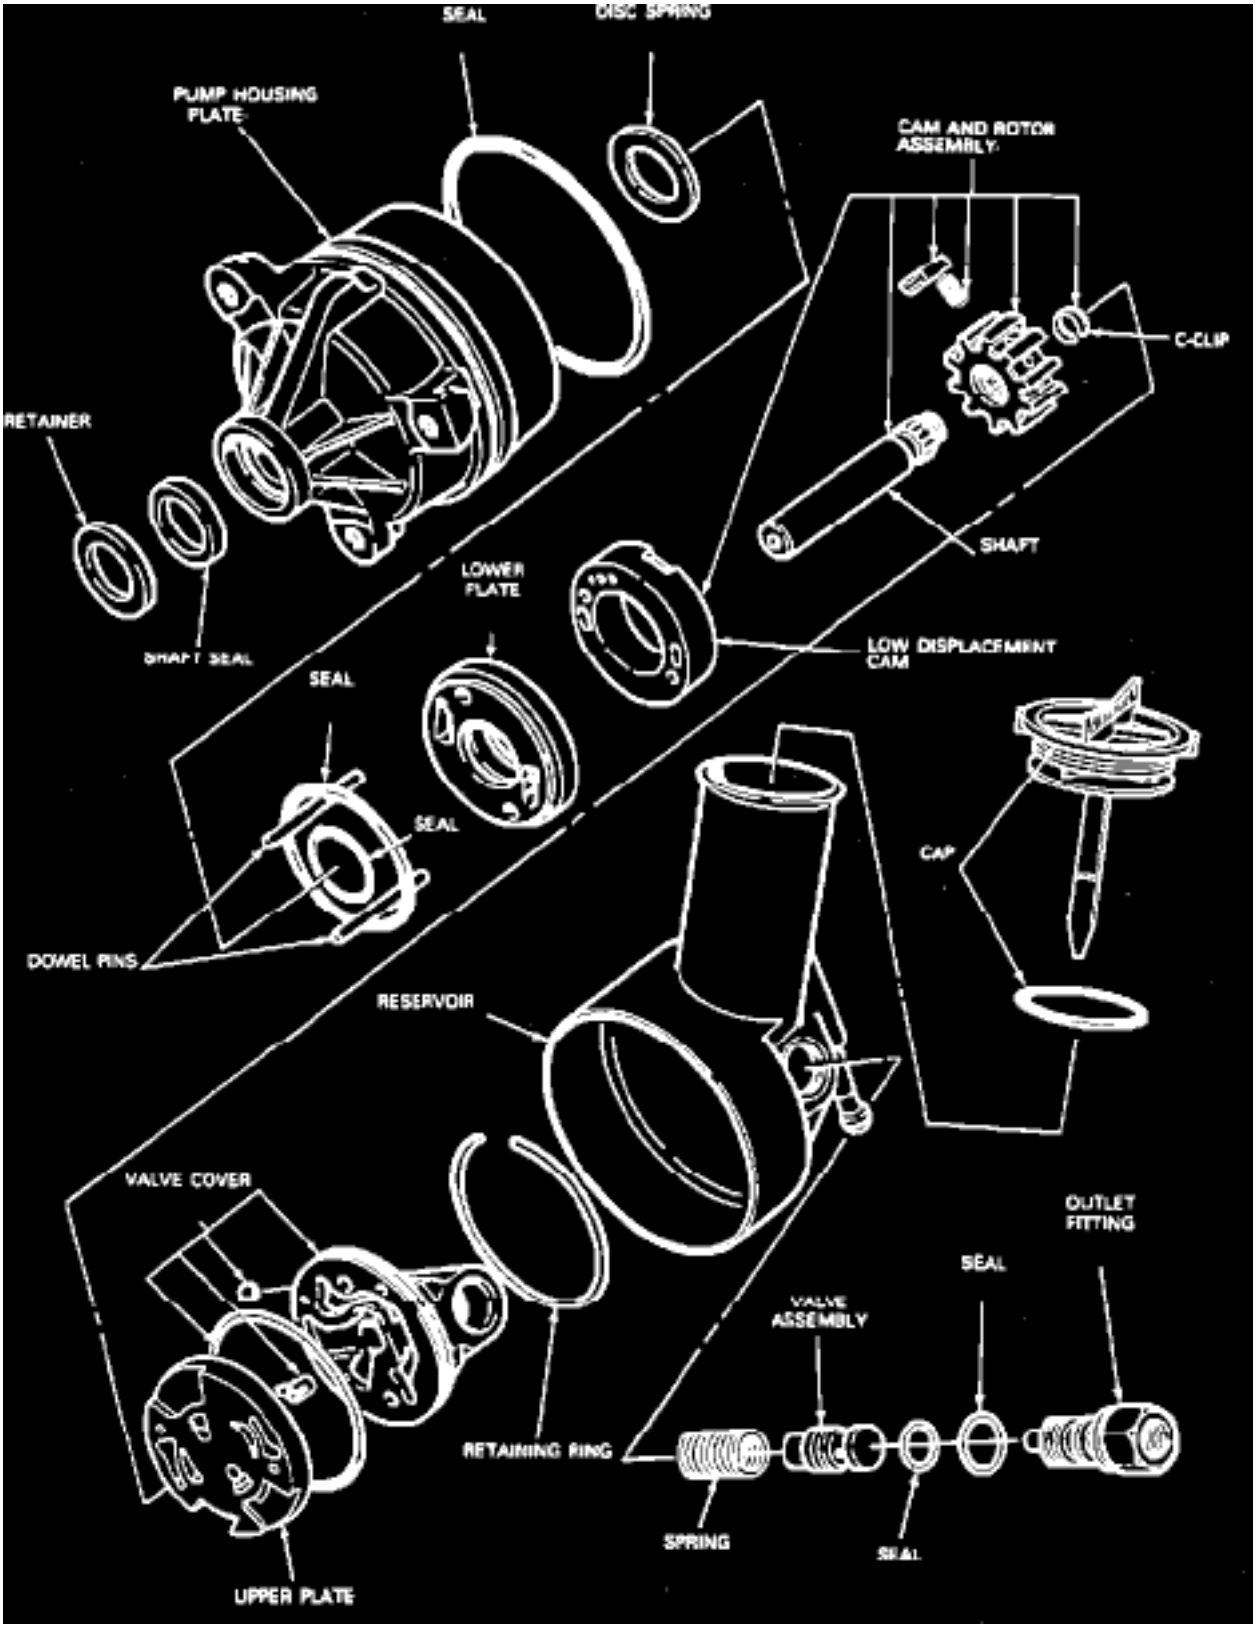
4. Remove oil dipstick tube, as required.

5. Remove power steering pump bracket support brace, if equipped.

6. Using power steering pump pulley removal tool No. T69L-10300-B or equivalent, hold pulley and rotate tool nut counterclockwise to remove. Do not apply in and out pressure as internal thrust area damage may occur.

7. Remove pump to bracket attaching bolts, then remove pump.

8. Reverse procedure to install.



Power Steering Pump: Service and Repair Disassembly

Fig. 2 Positioning Pump In C-Clamp

Fig. 3 Removing Valve Cover Retaining Ring

1. Remove pulley from pump.

2. Remove outlet fitting, flow control valve and flow control valve spring from pump, then remove reservoir, Fig. 1.

3. Place a suitable C-clamp in a vise.

4. Position lower support plate (part No. T78P-3733-A2) over pump rotor shaft.

5. Install upper compressor plate (part No. T78P-3733-A1) into upper portion of C-clamp.

6. While holding compressor tool, place pump assembly into C-clamp with rotor shaft facing downward, Fig. 2.

7. Tighten C-clamp until a slight bottoming of valve cover is observed.

8. Through small hole located on side of pump housing, insert a suitable drift and push inward on valve cover snap ring. While pushing inward on snap ring, place a screwdriver under snap ring edge and remove ring from housing, Fig. 3.

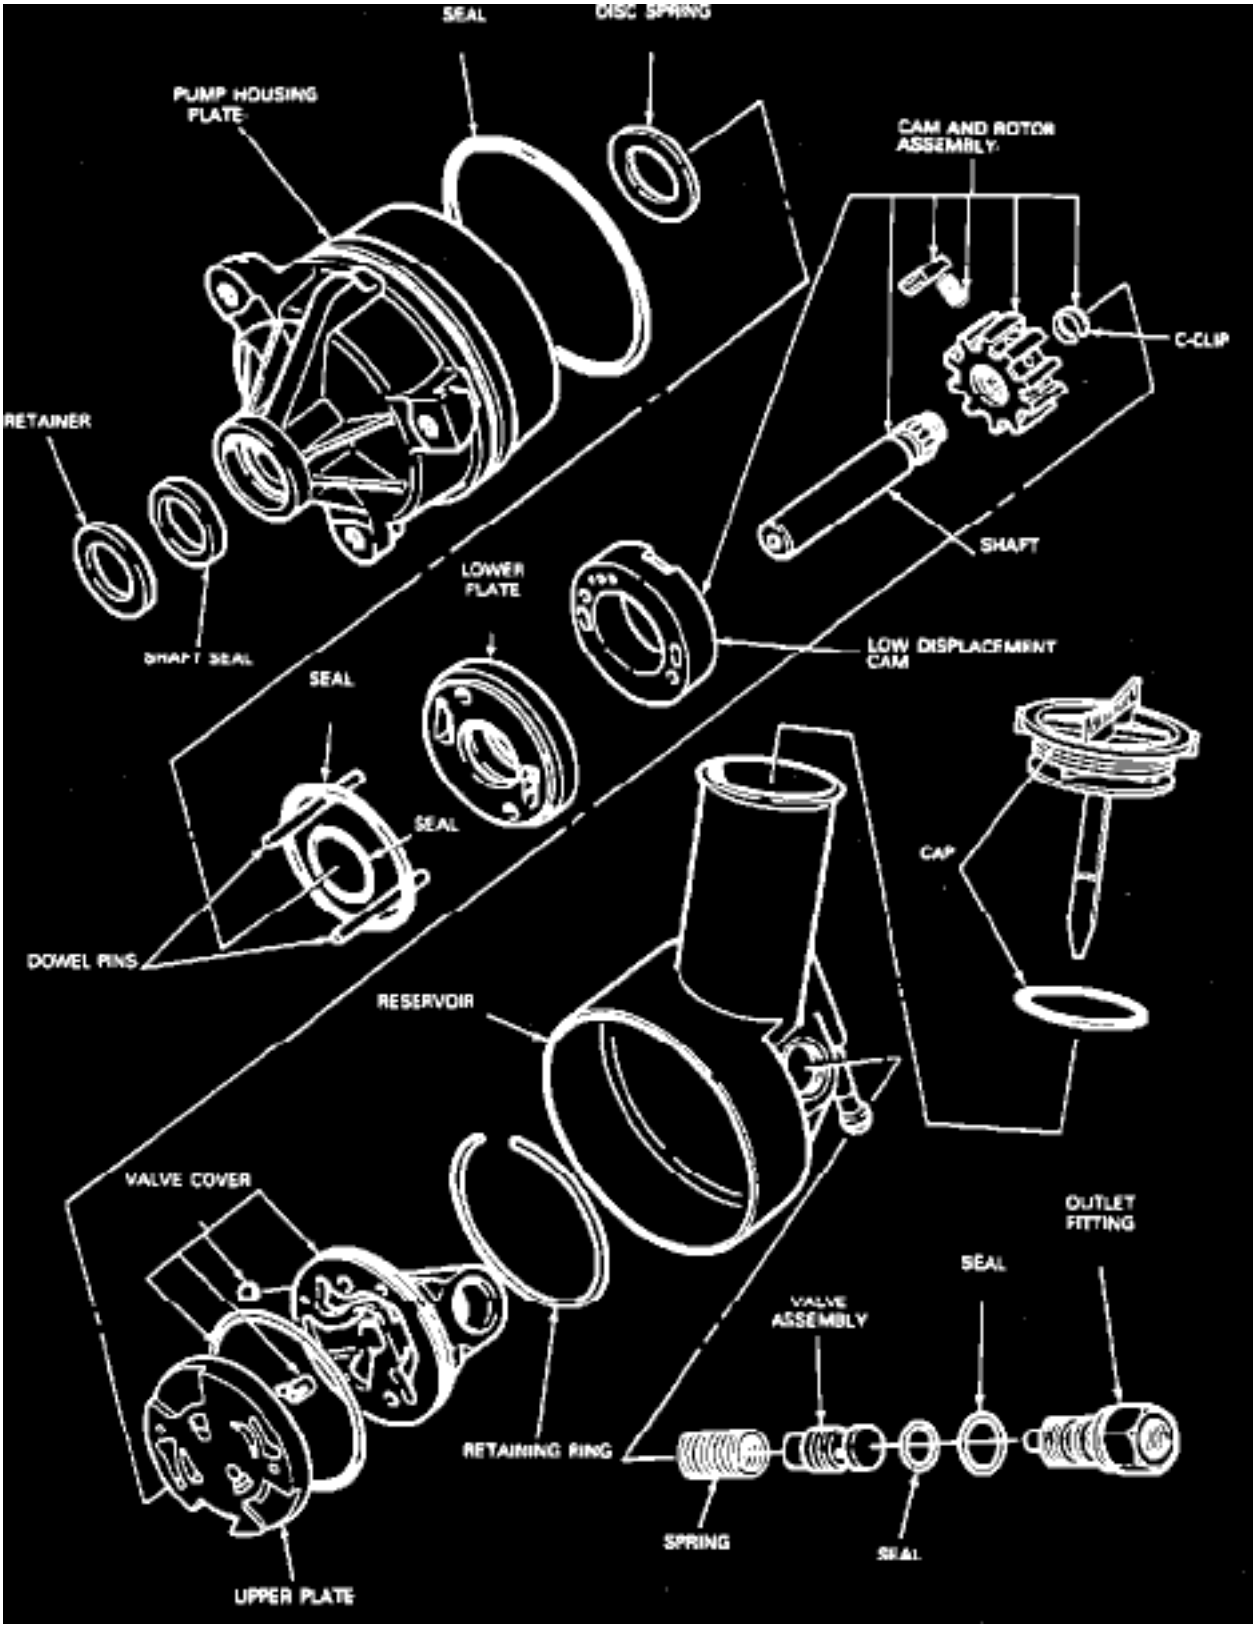
9. Loosen C-clamp and remove upper compressor plate (part No. T78P-3733-A2), then remove pump assembly.

10. Remove pump valve cover and O-ring.

11. Remove rotor shaft, upper plate, cam and rotor assembly and two dowel pins.

12. Remove lower plate and spring, by tapping housing on a flat surface.

13. Using a suitable screwdriver, remove rotor shaft seal.



Power Steering Pump: Service and Repair Assembly

INSERT A SPRING INTO THE
ROTOR SPRING POCKET

USE ONE OF THE SLIPPERS
TO COMPRESS THE SPRING
AND INSTALL THE SLIPPER

Fig. 4 Installing Slipper Springs

Fig. 5 Installing Slippers

1. Position rotor on rotor shaft splines with triangle detent on rotor counterbore facing upward.

2. Install snap ring into groove on end of rotor shaft, Fig. 1.

3. Position insert cam over rotor. Ensure recessed notch on insert cam is facing upward.

4. With rotor extended upward approximately half out of cam, insert spring into rotor picket, Fig. 4.

5. Use a slipper to compress spring, then install slipper with groove facing cam, Fig. 5.

6. Perform steps 4 and 5 on slipper cavity beneath opposite inlet recess.

7. While holding cam stationary, index rotor left or right one space and install another spring and slipper until all ten rotor cavities have been filled. Ensure rotor springs and slippers remain in position while turning.

8. Apply Loctite (part No. 242 or 271) adhesive or equivalent to outside diameter of seal and Lockquick NF or T primer or equivalent to seal bore in housing. Install rotor shaft seal using seal installer tool No. T78P-3733-A3. Using a plastic mallet, drive seal into bore until properly seated.

9. Position pump plate on flat surface with pulley side facing downward.

PRESSURE CHANNEL IN THE VALVE COVER FITS

LUG ON THE ALUMINUM HOUSING
PLACE DOWEL PINS
THROUGH THESE HOLES
RECESSED CAM INLET PORTS
TRIANGLE DETENT IN
ROTOR COUNTERBORE
MUST FACE UPWARDS

10. Install two dowel pins and spring into housing. Spring must be inserted with dished surface facing upward.

11. Lubricate inner and outer O-ring seals with power steering fluid, then install seals on lower pressure plate.

12. Install lower pressure plate into housing and over dowel pin with O-ring seals facing toward front of pump. Position assembly on C-clamp. Place seal installer tool No. T78P-3733-A3 into rotor shaft hole and press on lower plate lightly until it bottoms in pump housing. This will seat outer O-ring seal.

Fig. 6 Assembling Cam, Slippers And Rotor

Fig. 7 Installing Upper Pressure Plate

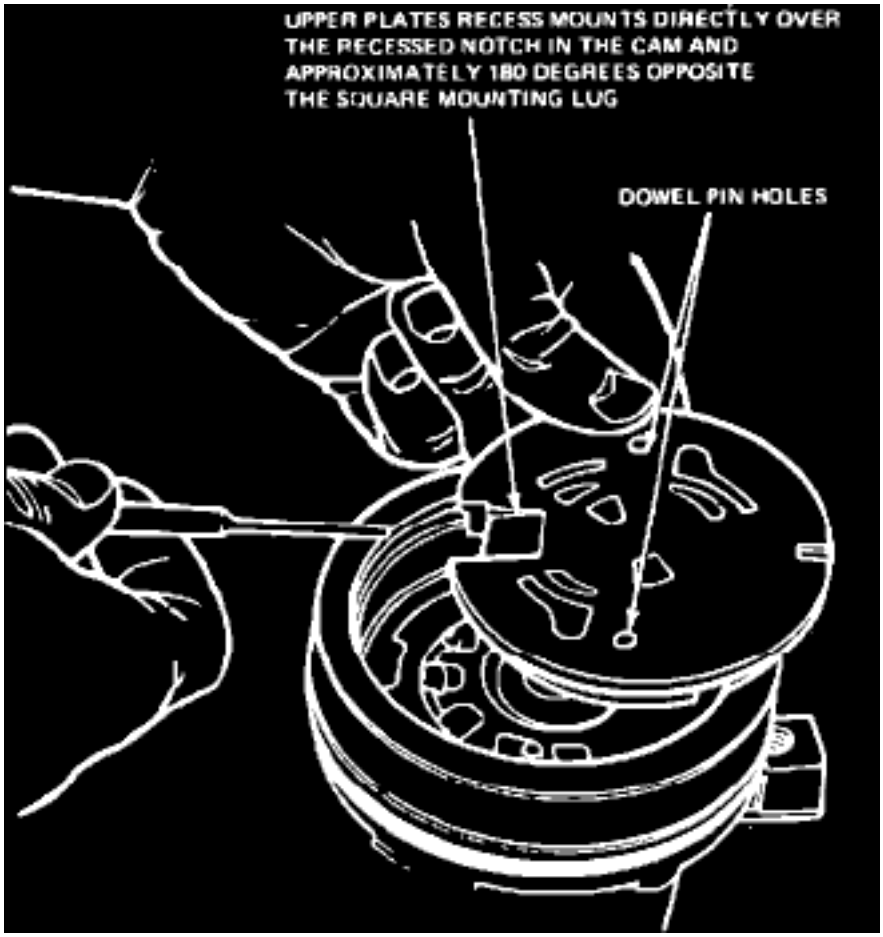

Fig. 8 Installing Valve Cover

13. Install cam, rotor, rotor and slippers and rotor shaft assembly into pump housing over dowel pins. When installing assembly into pump housing, stepped holes must be used for dowel pins and notch in cam insert must be toward reservoir and approximately 180° opposite square mounting lug on housing, Fig. 6.

14. Position upper pressure plate over dowel pins with recess directly over recessed notch on cam insert and approximately 180° opposite square mounting lug, Fig. 7.

15. Lubricate O-ring seal with power steering fluid. Then, position O-ring on valve cover. Ensure plastic baffle is securely in position on valve cover. A coat of petroleum jelly may be used to hold baffle in position.

16. Insert valve cover over dowel pins. Ensure outlet fitting hole in valve cover is aligned with square mounting lug on housing, Fig. 8.

17. Place assembly in C-clamp and compress valve cover into pump housing until snap ring groove on housing is exposed.

18. Install valve cover snap ring in pump housing. Ensure snap ring ends are near access hole in pump housing.

19. Remove pump assembly from C-clamp.

20. Lubricate O-ring seal with power steering fluid, then place seal on pump housing.

21. Install reservoir on pump housing.

22. Install flow control valve and spring into valve cover.

23. Lubricate O-ring seals with power steering fluid, then place seals on outlet fitting.

24. Install outlet fitting on valve cover. Torque outlet fitting to 25-34 ft. lbs. Use care not to cock flow control valve when installing. Do not force valve forward otherwise damage to housing may result.

Ford Ranger 4wd Workshop Manual (V6-245 4.0L (1991))

Tilt Wheel Pivot: Customer Interest Steering Column - Rattles

Article No. 91-11-15

05/30/91

^ STEERING COLUMN - RATTLES - TILT LEVER

^ RATTLE - STEERING COLUMN - TILT LEVER

LIGHT TRUCK: 1989-90 BRONCO II 1989-91 RANGER 1991 EXPLORER

ISSUE: Rattles in the steering column may be caused by the tilt lever spring becoming dislocated.

ACTION: Install a new tilt lever spring and spring cap. Refer to the following procedure for service details.

REMOVAL

1. Disconnect the battery ground cable.

2. Remove the steering wheel. Refer to the Compact Truck Shop Manual Section 11-04B for service procedure details.

3. Remove the plastic collar from the tilt flange.

4. Move the tilt flange to its upper most position.

5. Remove the tilt lever cap and spring.

INSTALLATION

1. Insert the shaft of the tilt lever cap into the tilt lever spring with a twisting motion, until the spring touches the head of the cap. The barbs on the shaft of the cap will hold the spring in place.

2. Pull the tilt lever up as far as possible. While holding the lever in this position, insert the spring and cap assembly into the hole in the tilt flange below the tilt lever. Release the lever.

3. Actuate the tilt lever several times to ensure the cap and spring assembly are seated correctly.

4. Move the tilt flange to its center position.

5. Install the plastic collar on the tilt flange.

6. Install the steering wheel. Refer to the Compact Truck Shop Manual, Section 11-04B, for service procedure details.

7. Connect the battery cable.

OASIS CODES: 303000, 702300

Sector Shaft: Adjustments Pitman Shaft Overcenter Preload

CHECK

1. Disconnect pitman arm at ball stud and remove horn pad from steering wheel.

2. Turn steering wheel from one extreme to the other while counting total number of turns. Turn wheel back one half the number of turns so gear is centered.

3. Place inch lbs. torque wrench on steering wheel nut. Rotate steering shaft 90° either way across center. Observe highest reading. Overcenter preload should be within specifications listed at end of section.

ADJUST

1. Remove steering gear from vehicle.

2. Torque sector shaft cover bolts to 32-40 ft. lbs.

3. Loosen worm bearing adjuster plug locknut and tighten worm bearing adjuster nut until all endplay has been removed. Lubricate worm shaft seal with drop of power steering fluid.

4. Rotate worm shaft from one extreme to the other while counting total number of turns. Turn worm shaft back halfway to center gear.

5. Using inch pound torque wrench, rotate worm shaft approximately 90° across center. Highest reading should be within specifications listed at end of section. Turn sector shaft adjusting screw until proper specification is obtained.

6. Hold sector shaft adjusting screw and torque locknut to 25 ft. lbs.

Sector Shaft: Adjustments Worm Bearing Preload

CHECK

Before checking worm gear preload, check to ensure intermediate shaft flex coupling is not distorted and steering column is aligned.

1. Remove pitman arm from ball stud.

2. Lubricate worm shaft seal with drop of power steering fluid.

3. Remove horn pad assembly from steering wheel and turn wheel slowly to either stop.

4. Using suitable inch pound wrench on steering wheel nut, measure torque required to turn steering wheel 1-1/2 turns at a constant speed. If required torque exceeds specifications listed at end of section, readjust worm gear preload.

ADJUST

1. Remove steering gear from vehicle.

2. Torque sector shaft cover bolts to 32-40 ft. lbs.

3. Loosen worm bearing adjuster plug locknut and tighten worm bearing adjuster nut until all endplay has been removed. Lubricate worm shaft seal with drop of power steering fluid.

4. Turn worm shaft to full right position. Using inch pound wrench mounted on steering wheel nut, measure left turn torque required to rotate worm shaft 1-1/2 turns. If torque requirements exceed specifications listed at end of section, tighten or loosen adjusting nut until proper preload is obtained. After adjustment is completed, torque locknut to 166-187 ft. lbs.

Steering Wheel: Service and Repair

REMOVAL

1. Disconnect battery ground cable (two ground cables on diesel engines).

2. From underside of steering wheel, remove screws attaching horn pad to steering wheel spokes.

3. Lift up steering wheel pad, then disconnect horn wires and electrical connectors from pad.

4. Remove steering wheel attaching bolt and damper, if equipped.

5. Remove steering wheel using steering wheel remover T67L-3600-A or equivalent, Do not use a knock-off type wheel puller or strike end of steering shaft, as damage will result.

INSTALLATION

1. Position steering wheel on end of steering shaft, aligning mark and flats on steering wheel with mark and flats on steering shaft, and ensuring that straight ahead steering wheel position corresponds with straight ahead position of front wheels.

2. If equipped, install damper and align locators with hole in wheel hub.

3. Install steering wheel attaching bolt and torque to 23-33 ft. lbs.

4. Connect horn wires and electrical connectors, then install horn pad.

5. Connect battery ground cable (two ground cables on diesel engines), then check steering column for proper operation.

4X2 MODELS

1. Remove front spring, radius arm, wheel spindle and I-beam.

2. Remove four attaching nuts and two bolts and retainer assemblies. Remove axle pivot bracket, Figs. 11 through 14.

3. Reverse procedure to install. Position axle pivot bracket to frame and install forward and rearward bolts and retainer assemblies from inside of pivot bracket out through crossmember. Loosely install four nuts on outside of crossmember (two forward and two rearward). Torque nuts to 70-90 ft. lbs. Use nut N8802073-S2 or install one .20 inch thick hardened washer under each nut if a standard nut is used.

Fig. 15 Right Axle Pivot Bracket Replacement. 4x4 Models

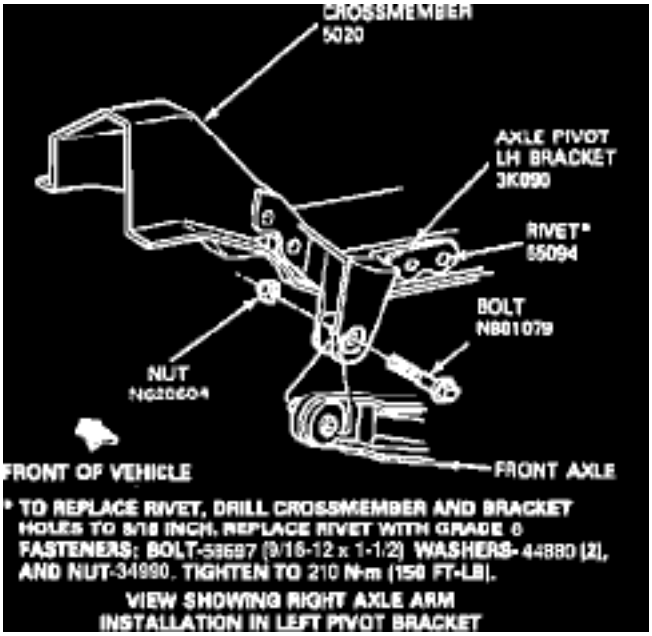

Fig. 16 Left Axle Pivot Bracket Replacement. 4x4 Models

4X4 MODELS

1. Remove coil spring and radius arm as described previously.

2. Remove front drive axle.

3. To remove right pivot bracket, remove upper bolt and retainer, then the side bolt and retainer, Fig. 15. Remove and discard lower bolt and retainer, then remove pivot bracket from crossmember.

4. To remove left pivot bracket, drill out rivets so that mounting holes in bracket and crossmember are 9/16 inch in diameter, then remove the bracket, Fig. 16.

5. Reverse procedure to install. Refer to Figs. 15 and 16, for replacement hardware.

I-Beam Axle: Service and Repair Axle Pivot Bushing

Fig. 17 Axle Pivot Bushing Removal. 4x2 Models

Fig. 18 Axle Pivot Bushing Installation. 4x2 Models

2X4 MODELS

1. Remove front coil spring as outlined in this chapter.

2. For left I-beam axle, remove axle pivot bolt and nut and pull left I-beam axle down until bushing is exposed. For right I-beam axle, entire right I-beam axle must be removed. Refer to FRONT I-BEAM AXLE.

3. Install forcing screw T78P-5638-A1, bushing remover T80T-5638-A2, spacer T82T-3006-A4 and receiver cup T78P-5638-A3 onto pivot bushing. Turn forcing screw and remove pivot bushing, Fig. 17.

4. Reverse procedure to install. Refer to Fig. 18. Lower vehicle and with weight on suspension and tighten pivot bushing and nut to specifications.

Fig. 3 Axle Pivot Bushing Removal

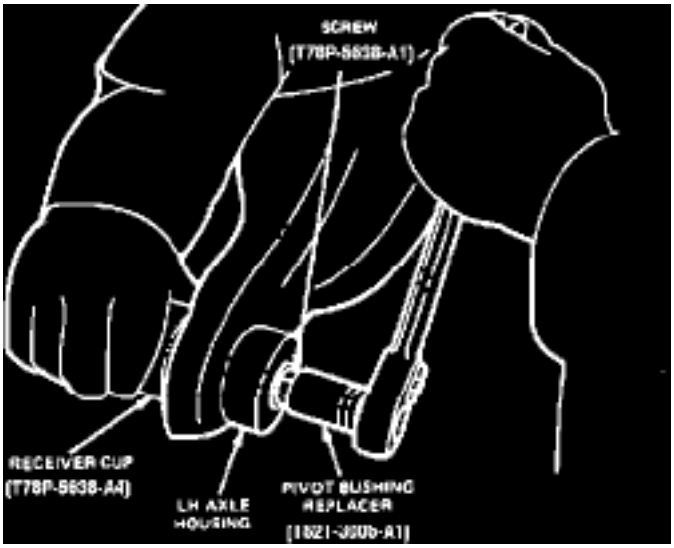

Fig. 4 Axle Pivot Bushing Installation

4X4 MODELS

1. Remove front axle assembly as described previously.

2. Remove pivot bushing from axle housing, Fig. 3.

3. Install bushing in axle housing, Fig. 4, then flare the bushing to prevent movement. Complete installation by crimping bushing lip.

I-Beam Axle: Service and Repair Front Axle Assembly (4X4)

1. Raise and support vehicle. Install jack stands under radius arm brackets.

2. Disconnect driveshaft from front axle yoke, then remove front wheels.

3. Remove disc brake calipers and position aside. Do not let caliper hang down on brake hose.

4. Remove stabilizer bar and links.

5. Disconnect steering linkage from spindle by removing the cotter pin and retaining nut.

6. Place a jack under axle arm assembly and compress the coil spring, then remove nut which retains bottom of spring to axle arm.

7. Lower axle until all spring tension is released, then remove the coil spring, spacer, seat and stud. The axle assembly must be supported when removing spring and not be permitted to hang by the brake hose. If the length of the brake hose is not sufficient to provide adequate clearance for spring removal, the disc brake caliper must be removed. If so, do not suspend caliper by brake hose.

8. Disconnect shock absorber from radius arm bracket, then remove the bracket and radius arm.

9. Remove pivot bolt securing right hand axle arm to crossmember.

10. Remove clamps from axle shaft slip yoke and axle shaft, then slide rubber boot over yoke.

11. Disconnect right driveshaft from slip yoke assembly, then lower jack and remove right axle arm assembly.

12. Position another jack under differential housing, then remove bolt securing left axle arm to crossmember and remove left axle arm assembly.

13. Reverse procedure to install. Tighten attaching nuts and bolts to specifications.

Component	Torque/Ft. Lbs.
Axle Pivot Bolt	120–150
Axle Pivot Bracket To Frame Nut	70–92
Axle Stud	190–230
Bearing Cap Bolts	47–67
Carrier To Axle Arm Bolts	35–53
Carrier Shear Bolt	75–95
Front Driveshaft U-Bolt Nuts	8–15
Lower Ball Joint Nut	①
Lower Shock Absorber To Radius Arm Nut	42–72
Lower Spring Seat Nut	70–100
Radius Arm Bracket Front Bolt	27–37
Radius Arm Bracket Lower Bolt	160–220
Ring Gear Bolts	70–90
Upper Ball Joint Nut	①
Wheel Lug Nuts	100

①— On 1987-89, first torque nut on lower stud to 40 ft. lbs., then torque nut on upper stud to 85-100 ft. lbs. Complete tightening sequence by torquing lower nut to 95-110 ft. lbs.; 1990-92, lower joint to 95-110 ft. lbs., upper to 85-100 ft. lbs.

Tightening Specifications

Ball Joint: Testing and Inspection Ball Joint, Lower

1. Raise and support vehicle, then place safety stands under I-Beam axle beneath coil spring.

2. Grasp lower edge of tire and move wheel in and out, observe lower spindle arm and lower part of axle jaw.

3. If movement between lower spindle arm and lower spindle jaw is greater than 1/32 inch, replace lower ball joint.

4. Grasp upper edge of tire and move tire in and out, observe movement between upper spindle arm and upper part of axle jaw.

5. If movement is between upper part of axle jaw and upper spindle arm is greater than 1/32 inch, replace upper ball joint.

Ball Joint: Testing and Inspection Ball Joint, Upper

1. Raise and support vehicle, then place safety stands under I-Beam axle beneath coil spring.

2. Grasp lower edge of tire and move wheel in and out, observe lower spindle arm and lower part of axle jaw.

3. If movement between lower spindle arm and lower spindle jaw is greater than 1/32 inch, replace lower ball joint.

4. Grasp upper edge of tire and move tire in and out, observe movement between upper spindle arm and upper part of axle jaw.

5. If movement is between upper part of axle jaw and upper spindle arm is greater than 1/32 inch, replace upper ball joint.

Ball Joint: Service and Repair

1. Remove spindle then the shaft and joint assembly as described previously.

2. If tie rod has not been removed, remove cotter pin and nut and disconnect tie rod from steering arm.

3. Remove cotter pin and loosen nut on top ball joint stud. Loosen bottom nut inside knuckle, then remove top nut.

4. Break spindle loose from ball stud, then remove camber adjuster. Mark position of adjuster for assembly reference.

5. Install steering knuckle in suitable soft jawed vise, then remove snap ring from lower ball joint socket.

6. Press ball joints from steering knuckle using C-Frame tool No. T74P-4635-C with ball joint remover tool No. T83T-3050-A, or equivalent.

7. Reverse procedure to install. The lower ball joint must be installed first. Tighten attaching bolts to specifications in SPECIFICATIONS/MECHANICAL SPECIFICATIONS.

Driveshaft - Boom/Vibration At 20-65 MPH

Article No. 97-21-16

10/13/97

^ NOISE - "BOOM" WHEN DRIVING 32-105 KM/H (20-65 MPH) - SUPERCAB MODELS ONLY

^ VIBRATION WHEN DRIVING 32-105 KM/H (20-65 MPH) - SUPERCAB MODELS ONLY

^ DRIVESHAFT - "BOOM" VIBRATION WHEN DRIVING 32-105 KM/H (20-65 MPH)-SUPERCAB MODELS ONLY

LIGHT TRUCK: 1989-97 RANGER

This TSB article is being republished in its entirety to remove mention of build dates in title.

ISSUE: A driveline "boom" or vibration may be experienced when driving 32-105 km/h (20-65 mph) in some vehicles. This may occur because of driveline sensitivity of the vehicle.

Service Procedure

NOTE:

BEFORE DIAGNOSING A 4-WHEEL-DRIVE VEHICLE, MAKE SURE IT IS IN 2WD AND THE FRONT HUBS ARE UNLOCKED.

1. On smooth pavement, drive the vehicle at a constant speed and feel for the "float" condition:

a. This is the narrow, neutral range where the driveline can be said to "float" because neither accel nor decel forces are being applied to the driveline.

b. It is important to accurately identify vehicle behavior in "float" mode because the diagnostic routine to be used will depend on Noise/Vibration/Harshness (NVH) characteristics during float.

c. It may be necessary to drive the vehicle several minutes before the sensation can be clearly identified.

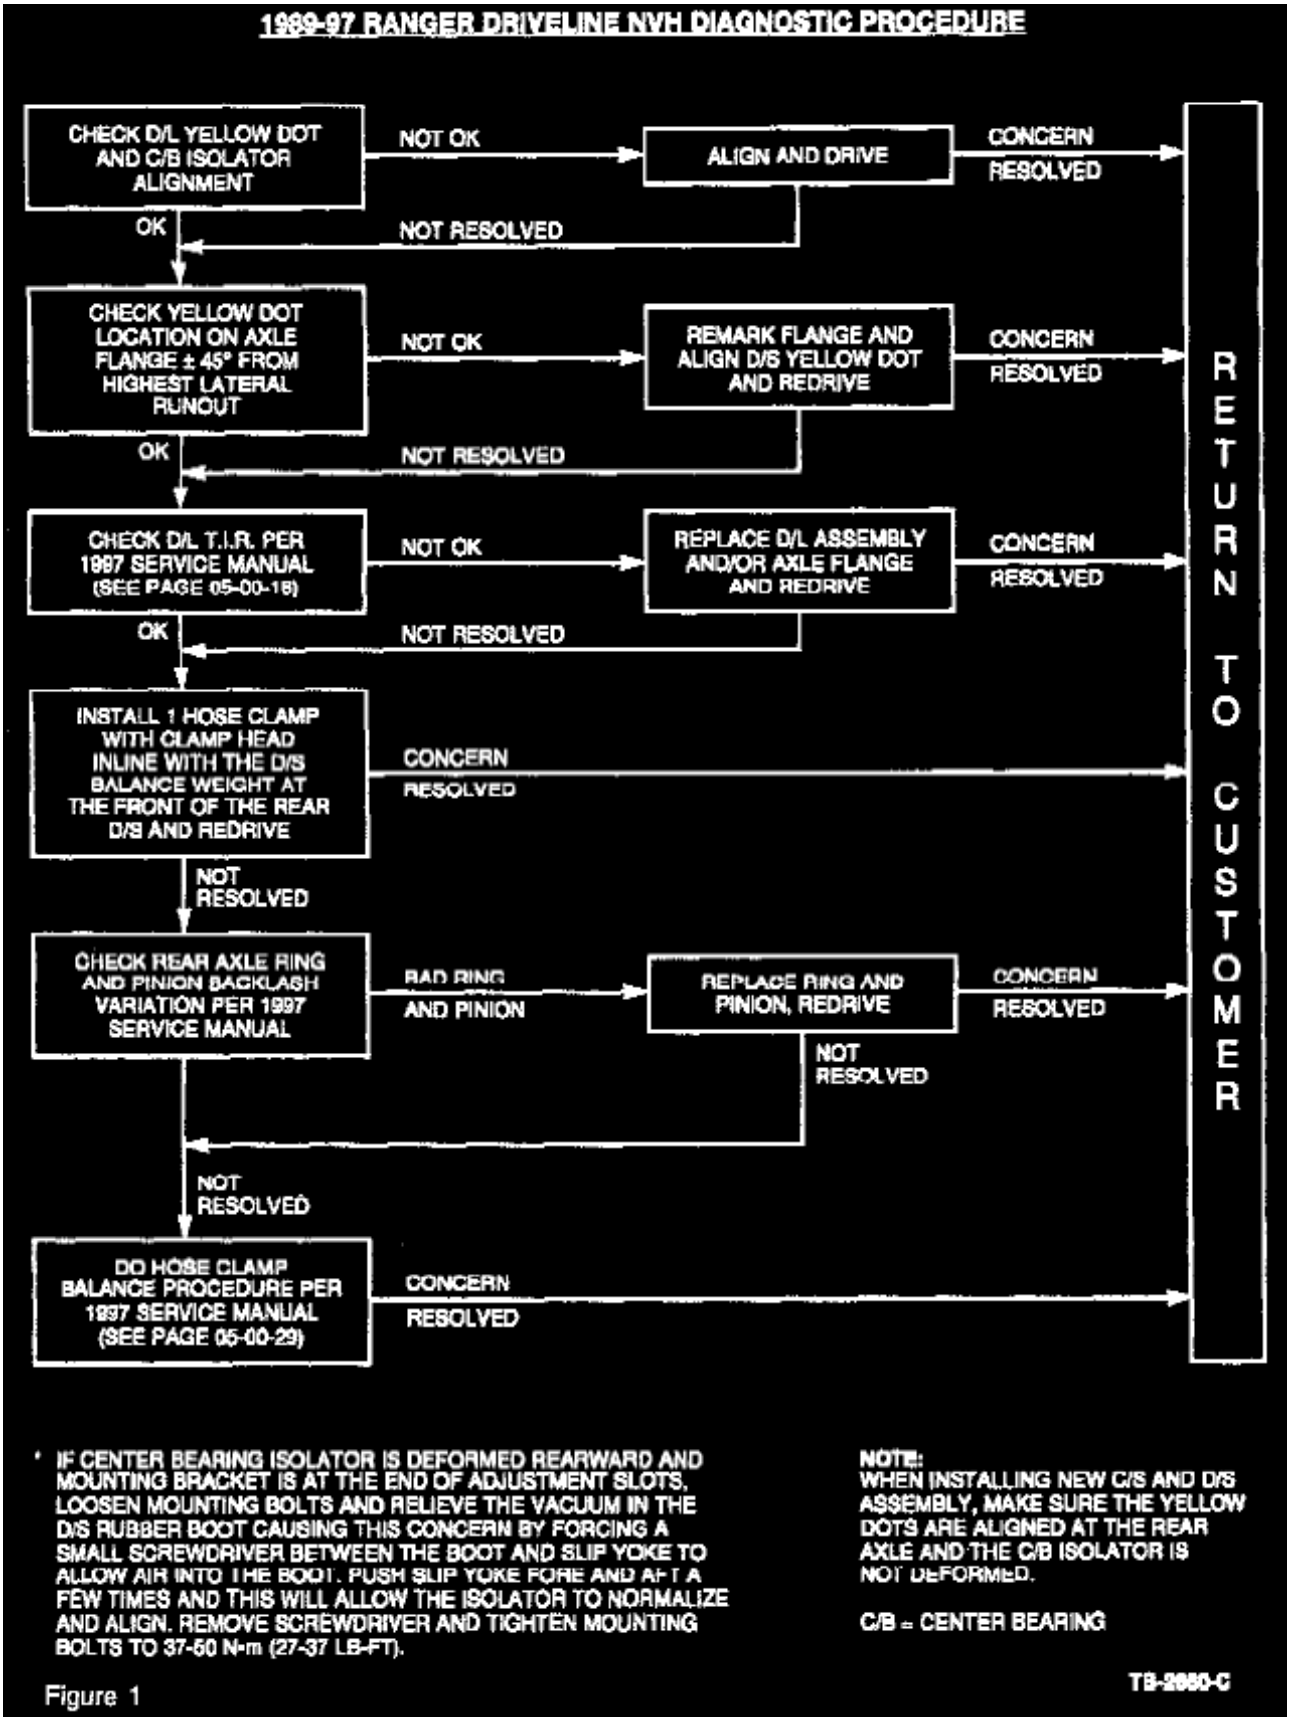

Figure 1

2. Perform the Driveline NVH Diagnostic Procedure shown in Figure 1 BEFORE replacing any components.

Vibration

Vibration, technically, is a high-frequency trembling, shaking or grounding condition, felt or heard, that is constant or variable in level and occurs during a portion of the total operating speed range. The types of vibrations that can be felt in the vehicle can be divided into three groups:

^ Vibrations of various unbalanced rotating parts of the vehicle

^ Body and frame vibrations excited by the powertrain, wind or road inputs

^ Tip-in moans or resonance vibrations from stressed engine or exhaust system mounts

If vibration is gone, check the front driveshaft, transfer case, front axle, or halfshafts for loose components. Refer to the 1997 Ranger Service Manual, Section 05-03B, for details.

NOTE:

DRIVING A 4-WHEEL-DRIVE VEHICLE WITH THE REAR DRIVESHAFT REMOVED FURTHER CONFIRMS ANY VIBRATION CONCERNS WITH THE FRONT DRIVE SYSTEM.

These vehicle vibrations can also be subdivided into those that occur at low speeds and those that are most noticeable at higher speeds. Since the dividing line between low and higher speed vibrations is not clear, there will be vibrations that overlap the two ranges.

Typical Low Speed Vibrations (less than 72 km/h (45 mph))

^ Exhaust vibration

^ Engine harshness

^ Driveline vibration due to improper driveline angles

^ Power steering pump disturbances

^ Air conditioner compressor or drive belt vibrations

^ Takeoff shudder (clutch or driveline problems)

^ Brake roughness or harshness

^ Driveline roughness

^ Clutch torsion vibration

^ Driveline slip-yoke or U-joints

Typical High Speed Vibrations (above than 72 km/h (45 mph))

^ Axle and companion flange runout or imbalance

^ Driveshaft imbalance

^ Excessive tire-wheel and drum assembly imbalance

^ Tire roughness due to high non-uniformity (force variation) or out-of-balance condition

^ Rear axle pinion gear pitch line runout

^ Excessive tire and wheel run out

^ Worn suspension components

^ Front end accessory vibrations

^ Exhaust vibration - Exhaust vibration is greatly reduced in Ranger exhaust systems de-coupled by a flexible coupling and mounted with blade and block hangers

Driveshaft Vibrates

1. Road test vehicle to determine critical vibration points. Note road speed, engine rpm and shift lever positions at which vibration occurs.

2. Stop vehicle and run engine with clutch depressed (automatic transmission in Neutral) through critical speed ranges determined in Step 1 of Driveshaft Vibrates.

3. If vibration is gone, the driveshaft must be balanced as described in the 1997 Ranger Service Manual, Page 05-00-29.

Component Test

Driveline Vibration

^ Driveline vibration exhibits a higher frequency and lower amplitude than does high-speed shake

^ Driveline vibration is directly related to the speed of the vehicle and is usually noticed at speeds of 72 km/h (45 mph) or higher

^ Driveline vibration can be perceived as a tremor in the floor pan or is heard as a rumble, hum or boom

^ Driveline vibration can exist in all drive modes, but may exhibit different symptoms depending upon whether the vehicle is accelerating, decelerating, floating or coasting. If the vibration is

particularly noticeable during acceleration or deceleration, especially at lower speeds, then driveline angle should be checked

^ Driveline vibration can be duplicated by supporting the axle upon a hoist or upon jackstands, though the brakes may need to be applied lightly in order to simulate road resistance. Refer to the 1997 Ranger Service Manual, Page 05-00-15, Steps 1-10

Driveshaft Runout and Balance

Vibration or shudder which is noticeable either on fast acceleration, when coasting, or when using the engine for braking, may be caused by the rear axle housing being loose on the rear suspension, improper tire balance, improper driveline installation, or driveline balance.

If driveshaft components are replaced and shaft vibration is encountered after installation, disconnect and remove the driveshaft. Rotate the rear axle companion flange 180 degrees; then, reconnect the driveshaft to the driveshaft slip-yoke and reinstall in vehicle. If the vibration persists, disconnect the driveshaft at the rear axle companion flange. Rotate the rear axle companion flange 180 degrees and reconnect the driveshaft to the rear axle companion flange.

If rotating the driveshaft 180 degrees does not eliminate vibration, the driveshaft may be balanced by referring to the 1997 Ranger Service Manual, Page 05-00-29, Steps 1-9, for details.

Slip-Yoke Spline

Vehicle noise and vibration can be caused by a seized driveshaft slip-yoke spline. The service resolution to minimize driveshaft slip-yoke spline contamination and ultimate seizure can be found in the 1997 Ranger Service Manual, Page 05-00-32, Steps 1-11.

Driveline Angularity

Driveline angularity is the angular relationship between the engine crankshaft, the driveshaft and the rear axle pinion. Factors determining driveline angularity include ride height (rear spring) and engine mounts.

Low speed vibration, less than 72 km/h (45 mph), especially when the vehicle is subjected to heavy acceleration or deceleration, is an indication of improper driveline angles. When these conditions exist, check the universal joints for proper seating, mounting and operation.

Center Bearing, Supercab 4X2 and 4X4

1. Unbolt the center bearing mount and spin the bearing. If bearing does not rotate freely it must be replaced.

2. Inspect the rubber insulator for evidence of hardening, cracking or deterioration before removing shaft. Replace if damaged. Refer to the 1997 Ranger Workshop Manual, Pages 05-01-14 and -15, for center bearing and rubber insulator service.

NOTE:

IF DRIVESHAFT AND COUPLING SHAFT ARE REMOVED, MAKE SURE THE YOKE IS REINSTALLED ON THE COUPLING SHAFT IN THE SAME ORIENTATION AS IT WAS ORIGINALLY INSTALLED. THE ORIENTATION IS CRITICAL SO THAT PROPER DRIVESHAFT BALANCE AND UNIVERSAL JOINT PHASING IS MAINTAINED. TORQUE THE ATTACHING NUT TO 136-163 N.m (100-120 LB-FT).

NOTE:

THE DRIVESHAFTS CONTAINED IN THIS TSB ARTICLE ARE THE MOST RECENT RELEASED FOR SERVICE. REFER TO OTHER TSB ARTICLES LISTED FOR 1993 AND PRIOR MODELS.

Ford Ranger 4wd Workshop Manual (V6-245 4.0L (1991))
Ford Workshop Manuals > Steering and Suspension > Suspension > Cross-Member > Component Information > Technical Service Bulletins > Customer Interest for Cross-Member: > 94813 > Apr > 94 > Frame/Crossmember - Snapping/Popping Noise

Cross-Member: Customer Interest Frame/Crossmember - Snapping/Popping Noise

Article No. 94-8-13

^ FRAME - # 1 CROSSMEMBER - RIVET REPLACEMENT

^ NOISE - "POPPING/CREAKING" SOUNDS - FRAME # 1 CROSSMEMBER

LIGHT TRUCK: 1980-94 BRONCO, F-150-350 SERIES 1988-94 F SUPER DUTY, F-47

This TSB article is being republished in its entirety to add certain 1992/94 model year vehicles, to revise the nut specified in the article and its torque specification, and to expand the diagnostic and repair procedures contained in the article.

ISSUE:

A "popping/creaking" sound may come from the area of the # 1 crossmember attachment to the left frame rail. This occurs because of a slip/stick motion at a loose rivet in the lower flange of the frame near the steering gear. The rivet could be either a standard cold head rivet in light duty applications or a "huck" rivet, which has the appearance of a large "pop" Civet.

ACTION:

Use the following diagnostic procedure to determine if the noise is originating in this rivet area. If so, replace the rivet with a nut, bolt and washer assembly. The revised parts increase the clamp load at the joint, minimizing the motion that causes the noise. Refer to the following procedure for service details.

SOURCES OF VARIOUS FRONT UNDERBODY NOISES:

Various front underbody noises may originate from several different sources. Several noises have been misdiagnosed as # 1 crossmember rivet "pop/creak" because the noise tends to propagate to the shock tower area and the shock tower area acts as an amplifier such that the noises all appear to be coming from that area. Other underbody areas that produce similar noises include:

^ loose or improperly seated shock tower rivets

^ loose or misaligned transmission crossmembers

^ loose radius arm brackets

^ loose axle pivot brackets

Other service bulletins have been published to address the proper repair of these concerns.

DESCRIPTION OF # 1 CROSSMEMBER NOISES:

"Pop/creak" - A metal-to-metal rubbing motion which slip/sticks when a twist is induced into the frame.

DIAGNOSTIC PROCEDURE:

1. INTERVIEW THE CUSTOMER:

a. Understand the customer's description of the noise and of the conditions under which it is heard.

b. Road test the vehicle with the customer to fully understand where, how and when the noise occurs.

2. DUPLICATE THE NOISE CONCERN:

a. Drive the vehicle around for at least 15 minutes to warm-up and stress the frame joints, so that any frame noise is more likely to be repeatable in the garage.

b. Test the following situations:

^ Can the noise be duplicated while stationary and on dry pavement by repeatedly turning the steering wheel from steering stop to steering stop?

^ Can the noise be repeated while on the hoist without the suspension loaded by repeatedly turning the steering wheel from steering stop to steering stop?

Typically, the twist in the frame can be induced by turning the steering wheel back and forth from steering stop to steering stop to duplicate the noise at the # 1 crossmember attachment. IF THE NOISE IS NOT DUPLICATED UNDER ONE OF THESE SITUATIONS, INVESTIGATE OTHER AREAS FOR THE NOISE BEFORE PROCEEDING TO REPAIR THE # 1 CROSSMEMBER RIVET.

3. INSPECT FRAME BOLTS FOR PROPER INSTALLATION TORQUE:

a. Inspect and tighten all front end components which bolt to the frame to confirm they are at the proper torque. This includes, but is not limited to:

^ Radius arm bracket bolts - 135 +/- 20 N-m (100 +/- 15 lb.ft.)

^ Axle pivot bracket bolts (torques vary by model - refer to the appropriate light truck Service Manual for proper torque specifications)

^ Bumper bracket bolts - (refer to the appropriate light truck Service Manual for proper torque specifications)

b. Inspect the transmission crossmember for proper alignment and bolt torques. If misaligned:

^ Loosen all transmission crossmember fasteners (including to the transmission).

^ Lift the transmission to remove any load on the crossmember.

^ Lift and reposition the transmission crossmember to be centered on the frame attachment holes.

^ Tighten all frame fasteners to the 63 +/- 9 N-m (46 +/- 7 lb.ft.).

^ Lower the transmission and tighten fasteners to 95 +/- 15 N-m (70 +/- 11 lb.ft.).

4. TEST DRIVE THE VEHICLE

Road test the vehicle again to duplicate the concern. If the noise is still present, continue.

5. INSPECT THE FRAME RIVETS

a. Repeat Step 2 to duplicate the noise in the garage.

b. Use a stethoscope or chassis ears to isolate the area of the chassis that the noise appears to be originating from. Areas to check include the shock tower rivets and all # 1 crossmember rivets.

6. SERVICE THE VEHICLE

a. If the noise appears to be from the lower left-front # 1 crossmember fastener, follow the procedure outlined below.

b. If the noise appears to be coming from another rivet (other than the lower left front # 1 crossmember rivet), refer to TSB 93-6-10 for the proper rivet repair procedure.

LOWER LEFT FRONT # 1 CROSSMEMBER RIVET REPLACEMENT:

NOTE:

THIS SERVICE PROCEDURE DOES NOT APPLY TO STEERING GEAR LINER REPLACEMENT. REFER TO TSB 90-11-10 FOR STEERING GEAR LINER REPAIR PROCEDURE.

1. Remove damaged or loose COLD HEAD RIVETS:

a. Drill a 1/8" (3.175 mm) hole through the rivet.

b. Redrill the same hole through the shank of the rivet with a 3/8" (9.525 mm) drill.

c. Remove the rivet head with an air chisel.

d. Drive out the rivet with a punch and hammer.

2. Remove damaged or loose "HUCK" RIVETS:

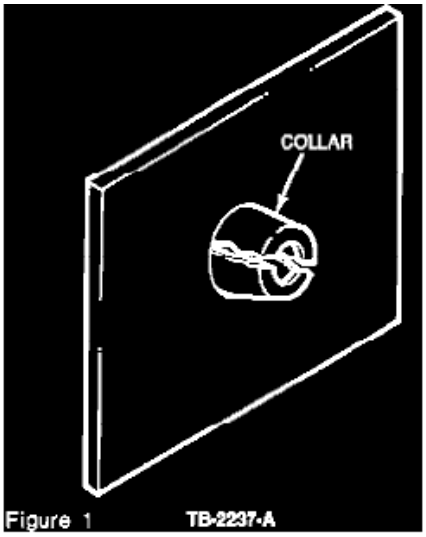

Figure 1 TB-2237-A

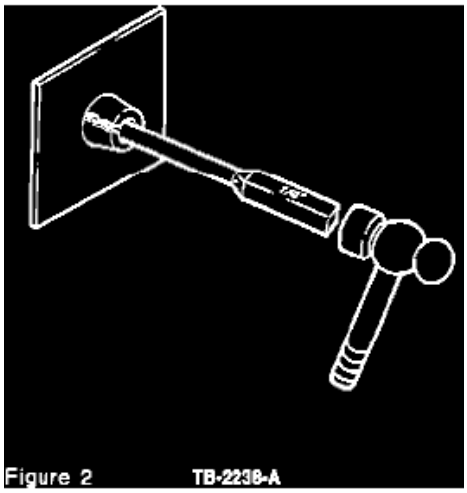

Figure 2 TB-2238-A

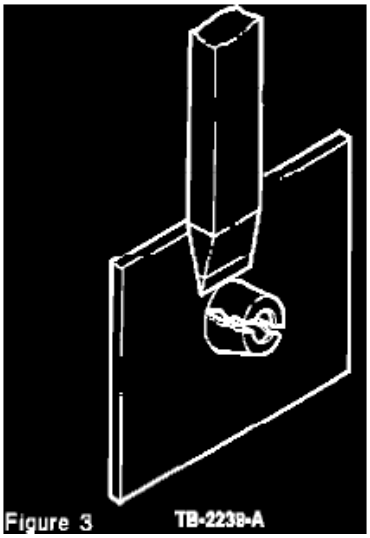

Figure 3 TB-2238-A

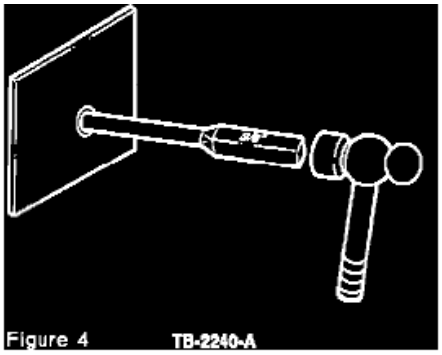
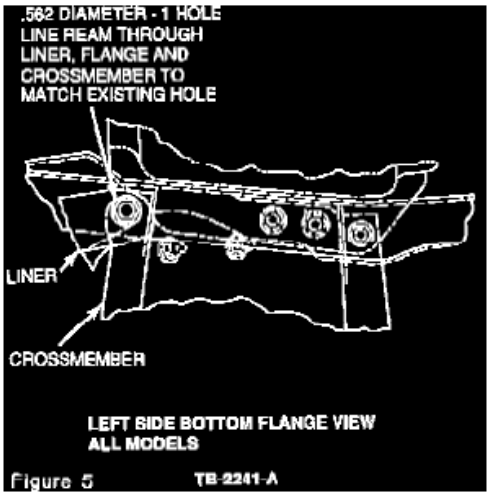
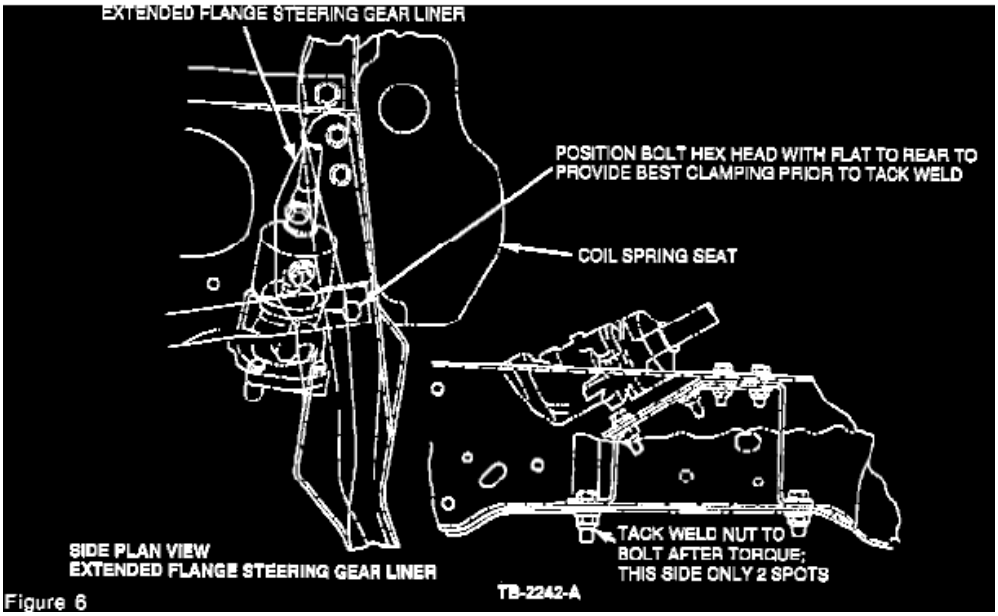
a. Use a flat chisel and hammer (or air chisel) to split the exposed collar of the huck fastener, Figure 1.

b. Knock the rivet pin out of the blind side with a 1/4" (6.35 mm) drift punch and hammer, Figure 2.

c. Cut the rivet's head off with a hammer and flat chisel, Figure 3.







d. Knock the sleeve out of the blind side with a 3/8" (9.525 mm) drift punch and hammer, Figure 4.

CAUTION:

REMOVAL OF THE FASTENER WITH A CUTTING TORCH IS NOT RECOMMENDED BECAUSE OF PROBABLE DAMAGE TO THE FRAME STRUCTURE.

3. Line ream the existing hole through the liner, frame flange and crossmember to 9/16" (14.228 mm), Figure 5.

4. Install a 9/16" Grade 8 nut (34990-S4), bolt (58698-S2) and washer (44880-S2), with nut/washer on the bottom, Figure 6.

a. Push the bolt into place using a brazing rod to hold the bolt.

PART NUMBER	PART NAME	CLASS
34990-S4	Nut 9/16 - 12 Hex (Pkg. 5)	RG
44880-S2	Washer 9/16 (Pkg. 12)	BG
58698-S2	Bolt 9/16-12 x 1.75" (Pkg. 4)	BG

b. Slide the bolt into the opening between the front face of the crossmember and frame liner.

c. Tighten the nut to 140 4-3 lb.ft. (190 4-4 N-m) and tack weld the nut to the bolt after tightening.

CAUTION:

DO NOT WELD THE NUT/WASHER TO THE FRAME.

Driveshaft - Boom/Vibration At 20-65 MPH

Article No. 97-21-16

10/13/97

^ NOISE - "BOOM" WHEN DRIVING 32-105 KM/H (20-65 MPH) - SUPERCAB MODELS ONLY

^ VIBRATION WHEN DRIVING 32-105 KM/H (20-65 MPH) - SUPERCAB MODELS ONLY

^ DRIVESHAFT - "BOOM" VIBRATION WHEN DRIVING 32-105 KM/H (20-65 MPH)-SUPERCAB MODELS ONLY

LIGHT TRUCK: 1989-97 RANGER

This TSB article is being republished in its entirety to remove mention of build dates in title.

ISSUE: A driveline "boom" or vibration may be experienced when driving 32-105 km/h (20-65 mph) in some vehicles. This may occur because of driveline sensitivity of the vehicle.

ACTION: Follow the Diagnostic Chart in this TSB article. Install revised design components as required to provide better isolation and improved driveline angles to resolve the concern. Refer to

the following Service Procedure for details.

NOTE:

THE SERVICE REPLACEMENT DRIVESHAFTS CONTAINED IN THIS TSB ARTICLE WILL NOT FIT VEHICLES EQUIPPED WITH A MITSUBISHI MANUAL TRANSMISSION. IF DRIVESHAFT REPLACEMENT IS REQUIRED ON MITSUBISHI EQUIPPED MODELS, REFER TO THE PARTS CATALOG FOR CORRECT APPLICATION.

Service Procedure

NOTE:

BEFORE DIAGNOSING A 4-WHEEL-DRIVE VEHICLE, MAKE SURE IT IS IN 2WD AND THE FRONT HUBS ARE UNLOCKED.

1. On smooth pavement, drive the vehicle at a constant speed and feel for the "float" condition:

a. This is the narrow, neutral range where the driveline can be said to "float" because neither accel nor decel forces are being applied to the driveline.

b. It is important to accurately identify vehicle behavior in "float" mode because the diagnostic routine to be used will depend on Noise/Vibration/Harshness (NVH) characteristics during float.

c. It may be necessary to drive the vehicle several minutes before the sensation can be clearly identified.

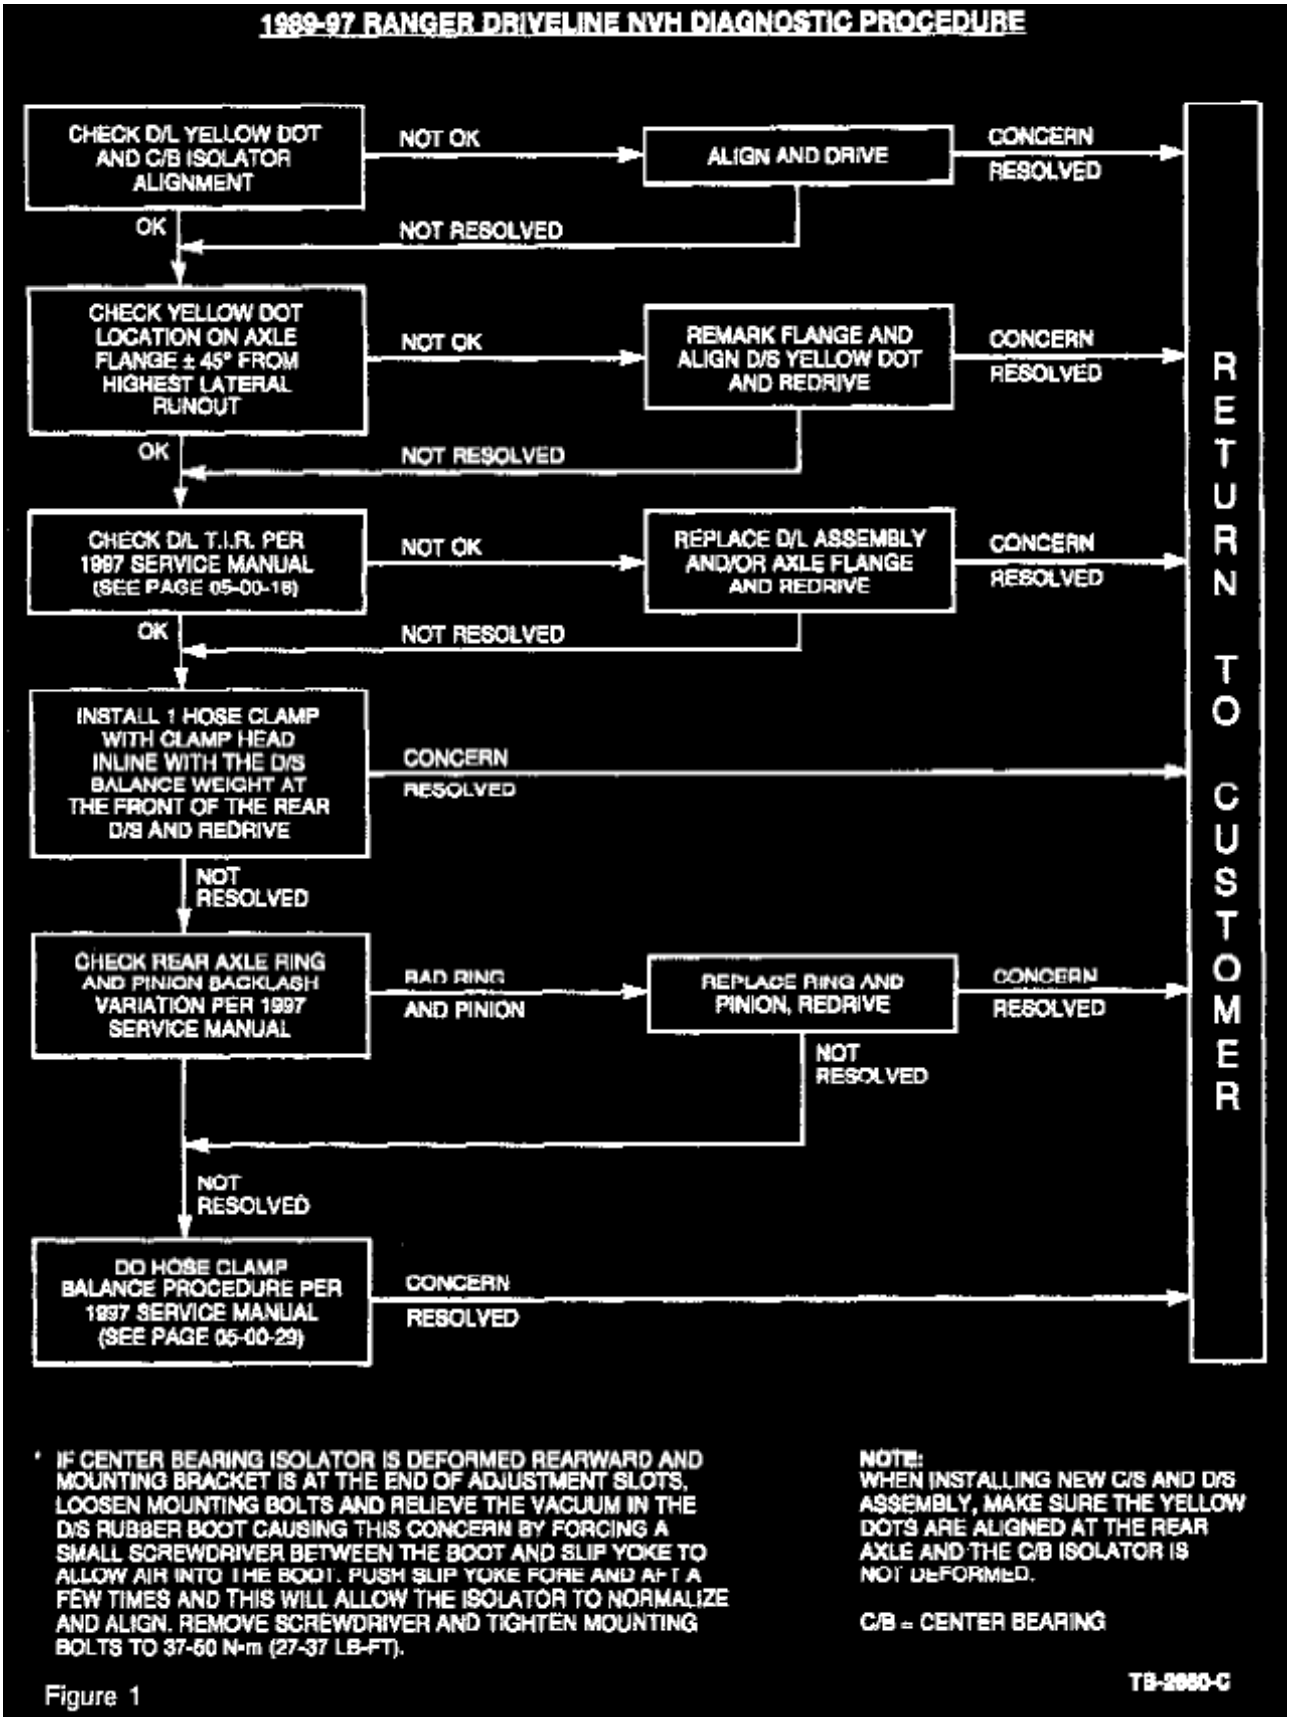

Figure 1

2. Perform the Driveline NVH Diagnostic Procedure shown in Figure 1 BEFORE replacing any components.

Vibration

Vibration, technically, is a high-frequency trembling, shaking or grounding condition, felt or heard, that is constant or variable in level and occurs during a portion of the total operating speed range. The types of vibrations that can be felt in the vehicle can be divided into three groups:

^ Vibrations of various unbalanced rotating parts of the vehicle

^ Body and frame vibrations excited by the powertrain, wind or road inputs

^ Tip-in moans or resonance vibrations from stressed engine or exhaust system mounts

If vibration is gone, check the front driveshaft, transfer case, front axle, or halfshafts for loose components. Refer to the 1997 Ranger Service Manual, Section 05-03B, for details.

NOTE:

DRIVING A 4-WHEEL-DRIVE VEHICLE WITH THE REAR DRIVESHAFT REMOVED FURTHER CONFIRMS ANY VIBRATION CONCERNS WITH THE FRONT DRIVE SYSTEM.

These vehicle vibrations can also be subdivided into those that occur at low speeds and those that are most noticeable at higher speeds. Since the dividing line between low and higher speed vibrations is not clear, there will be vibrations that overlap the two ranges.

Typical Low Speed Vibrations (less than 72 km/h (45 mph))

^ Exhaust vibration

^ Engine harshness

^ Driveline vibration due to improper driveline angles

^ Power steering pump disturbances

^ Air conditioner compressor or drive belt vibrations

^ Takeoff shudder (clutch or driveline problems)

^ Brake roughness or harshness

^ Driveline roughness

^ Clutch torsion vibration

^ Driveline slip-yoke or U-joints

Typical High Speed Vibrations (above than 72 km/h (45 mph))

^ Axle and companion flange runout or imbalance

^ Driveshaft imbalance

^ Excessive tire-wheel and drum assembly imbalance

^ Tire roughness due to high non-uniformity (force variation) or out-of-balance condition

^ Rear axle pinion gear pitch line runout

^ Excessive tire and wheel run out

^ Worn suspension components

^ Front end accessory vibrations

^ Exhaust vibration - Exhaust vibration is greatly reduced in Ranger exhaust systems de-coupled by a flexible coupling and mounted with blade and block hangers

Driveshaft Vibrates

1. Road test vehicle to determine critical vibration points. Note road speed, engine rpm and shift lever positions at which vibration occurs.

2. Stop vehicle and run engine with clutch depressed (automatic transmission in Neutral) through critical speed ranges determined in Step 1 of Driveshaft Vibrates.

3. If vibration is gone, the driveshaft must be balanced as described in the 1997 Ranger Service Manual, Page 05-00-29.

Component Test

Driveline Vibration

^ Driveline vibration exhibits a higher frequency and lower amplitude than does high-speed shake

^ Driveline vibration is directly related to the speed of the vehicle and is usually noticed at speeds of 72 km/h (45 mph) or higher

^ Driveline vibration can be perceived as a tremor in the floor pan or is heard as a rumble, hum or boom

^ Driveline vibration can exist in all drive modes, but may exhibit different symptoms depending upon whether the vehicle is accelerating, decelerating, floating or coasting. If the vibration is

particularly noticeable during acceleration or deceleration, especially at lower speeds, then driveline angle should be checked

^ Driveline vibration can be duplicated by supporting the axle upon a hoist or upon jackstands, though the brakes may need to be applied lightly in order to simulate road resistance. Refer to the 1997 Ranger Service Manual, Page 05-00-15, Steps 1-10

Driveshaft Runout and Balance

Vibration or shudder which is noticeable either on fast acceleration, when coasting, or when using the engine for braking, may be caused by the rear axle housing being loose on the rear suspension, improper tire balance, improper driveline installation, or driveline balance.

If driveshaft components are replaced and shaft vibration is encountered after installation, disconnect and remove the driveshaft. Rotate the rear axle companion flange 180 degrees; then, reconnect the driveshaft to the driveshaft slip-yoke and reinstall in vehicle. If the vibration persists, disconnect the driveshaft at the rear axle companion flange. Rotate the rear axle companion flange 180 degrees and reconnect the driveshaft to the rear axle companion flange.

If rotating the driveshaft 180 degrees does not eliminate vibration, the driveshaft may be balanced by referring to the 1997 Ranger Service Manual, Page 05-00-29, Steps 1-9, for details.

Slip-Yoke Spline

Vehicle noise and vibration can be caused by a seized driveshaft slip-yoke spline. The service resolution to minimize driveshaft slip-yoke spline contamination and ultimate seizure can be found in the 1997 Ranger Service Manual, Page 05-00-32, Steps 1-11.

Driveline Angularity

Driveline angularity is the angular relationship between the engine crankshaft, the driveshaft and the rear axle pinion. Factors determining driveline angularity include ride height (rear spring) and engine mounts.

Low speed vibration, less than 72 km/h (45 mph), especially when the vehicle is subjected to heavy acceleration or deceleration, is an indication of improper driveline angles. When these conditions exist, check the universal joints for proper seating, mounting and operation.

Center Bearing, Supercab 4X2 and 4X4

1. Unbolt the center bearing mount and spin the bearing. If bearing does not rotate freely it must be replaced.

2. Inspect the rubber insulator for evidence of hardening, cracking or deterioration before removing shaft. Replace if damaged. Refer to the 1997 Ranger Workshop Manual, Pages 05-01-14 and -15, for center bearing and rubber insulator service.

NOTE:

IF DRIVESHAFT AND COUPLING SHAFT ARE REMOVED, MAKE SURE THE YOKE IS REINSTALLED ON THE COUPLING SHAFT IN THE SAME ORIENTATION AS IT WAS ORIGINALLY INSTALLED. THE ORIENTATION IS CRITICAL SO THAT PROPER DRIVESHAFT BALANCE AND UNIVERSAL JOINT PHASING IS MAINTAINED. TORQUE THE ATTACHING NUT TO 136-163 N.m (100-120 LB-FT).

NOTE:

THE DRIVESHAFTS CONTAINED IN THIS TSB ARTICLE ARE THE MOST RECENT RELEASED FOR SERVICE. REFER TO OTHER TSB ARTICLES LISTED FOR 1993 AND PRIOR MODELS.

Cross-Member: All Technical Service Bulletins Frame/Crossmember - Snapping/Popping Noise

Article No. 94-8-13

^ FRAME - # 1 CROSSMEMBER - RIVET REPLACEMENT

^ NOISE - "POPPING/CREAKING" SOUNDS - FRAME # 1 CROSSMEMBER

LIGHT TRUCK: 1980-94 BRONCO, F-150-350 SERIES 1988-94 F SUPER DUTY, F-47

This TSB article is being republished in its entirety to add certain 1992/94 model year vehicles, to revise the nut specified in the article and its torque specification, and to expand the diagnostic and repair procedures contained in the article.

ISSUE:

A "popping/creaking" sound may come from the area of the # 1 crossmember attachment to the left frame rail. This occurs because of a slip/stick motion at a loose rivet in the lower flange of the frame near the steering gear. The rivet could be either a standard cold head rivet in light duty applications or a "huck" rivet, which has the appearance of a large "pop" Civet.

ACTION:

Use the following diagnostic procedure to determine if the noise is originating in this rivet area. If so, replace the rivet with a nut, bolt and washer assembly. The revised parts increase the clamp load at the joint, minimizing the motion that causes the noise. Refer to the following procedure for service details.

SOURCES OF VARIOUS FRONT UNDERBODY NOISES:

Various front underbody noises may originate from several different sources. Several noises have been misdiagnosed as # 1 crossmember rivet "pop/creak" because the noise tends to propagate to the shock tower area and the shock tower area acts as an amplifier such that the noises all appear to be coming from that area. Other underbody areas that produce similar noises include:

^ loose or improperly seated shock tower rivets

^ loose or misaligned transmission crossmembers

^ loose radius arm brackets

^ loose axle pivot brackets

Other service bulletins have been published to address the proper repair of these concerns.

DESCRIPTION OF # 1 CROSSMEMBER NOISES:

"Pop/creak" - A metal-to-metal rubbing motion which slip/sticks when a twist is induced into the frame.

DIAGNOSTIC PROCEDURE:

1. INTERVIEW THE CUSTOMER:

a. Understand the customer's description of the noise and of the conditions under which it is heard.

b. Road test the vehicle with the customer to fully understand where, how and when the noise occurs.

2. DUPLICATE THE NOISE CONCERN:

a. Drive the vehicle around for at least 15 minutes to warm-up and stress the frame joints, so that any frame noise is more likely to be repeatable in the garage.

b. Test the following situations:

^ Can the noise be duplicated while stationary and on dry pavement by repeatedly turning the steering wheel from steering stop to steering stop?

^ Can the noise be repeated while on the hoist without the suspension loaded by repeatedly turning the steering wheel from steering stop to steering stop?

Typically, the twist in the frame can be induced by turning the steering wheel back and forth from steering stop to steering stop to duplicate the noise at the # 1 crossmember attachment. IF THE NOISE IS NOT DUPLICATED UNDER ONE OF THESE SITUATIONS, INVESTIGATE OTHER AREAS FOR THE NOISE BEFORE PROCEEDING TO REPAIR THE # 1 CROSSMEMBER RIVET.

3. INSPECT FRAME BOLTS FOR PROPER INSTALLATION TORQUE:

a. Inspect and tighten all front end components which bolt to the frame to confirm they are at the proper torque. This includes, but is not limited to:

^ Radius arm bracket bolts - 135 +/- 20 N-m (100 +/- 15 lb.ft.)

^ Axle pivot bracket bolts (torques vary by model - refer to the appropriate light truck Service Manual for proper torque specifications)

^ Bumper bracket bolts - (refer to the appropriate light truck Service Manual for proper torque specifications)

b. Inspect the transmission crossmember for proper alignment and bolt torques. If misaligned:

^ Loosen all transmission crossmember fasteners (including to the transmission).

^ Lift the transmission to remove any load on the crossmember.

^ Lift and reposition the transmission crossmember to be centered on the frame attachment holes.

^ Tighten all frame fasteners to the 63 +/- 9 N-m (46 +/- 7 lb.ft.).

^ Lower the transmission and tighten fasteners to 95 +/- 15 N-m (70 +/- 11 lb.ft.).

4. TEST DRIVE THE VEHICLE

Road test the vehicle again to duplicate the concern. If the noise is still present, continue.

5. INSPECT THE FRAME RIVETS

a. Repeat Step 2 to duplicate the noise in the garage.

b. Use a stethoscope or chassis ears to isolate the area of the chassis that the noise appears to be originating from. Areas to check include the shock tower rivets and all # 1 crossmember rivets.

6. SERVICE THE VEHICLE

a. If the noise appears to be from the lower left-front # 1 crossmember fastener, follow the procedure outlined below.

b. If the noise appears to be coming from another rivet (other than the lower left front # 1 crossmember rivet), refer to TSB 93-6-10 for the proper rivet repair procedure.

LOWER LEFT FRONT # 1 CROSSMEMBER RIVET REPLACEMENT:

NOTE:

THIS SERVICE PROCEDURE DOES NOT APPLY TO STEERING GEAR LINER REPLACEMENT. REFER TO TSB 90-11-10 FOR STEERING GEAR LINER REPAIR PROCEDURE.

1. Remove damaged or loose COLD HEAD RIVETS:

a. Drill a 1/8" (3.175 mm) hole through the rivet.

b. Redrill the same hole through the shank of the rivet with a 3/8" (9.525 mm) drill.

c. Remove the rivet head with an air chisel.

d. Drive out the rivet with a punch and hammer.

2. Remove damaged or loose "HUCK" RIVETS:

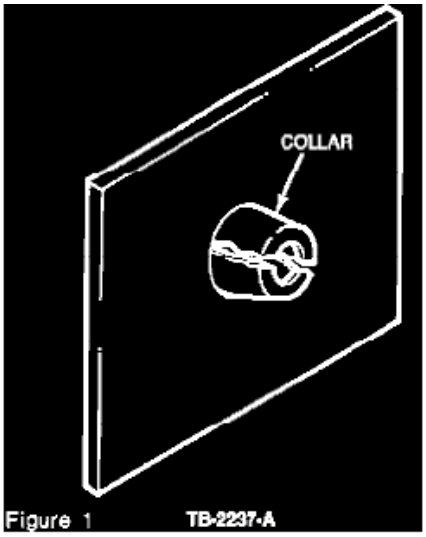

Figure 1 TB-2237-A

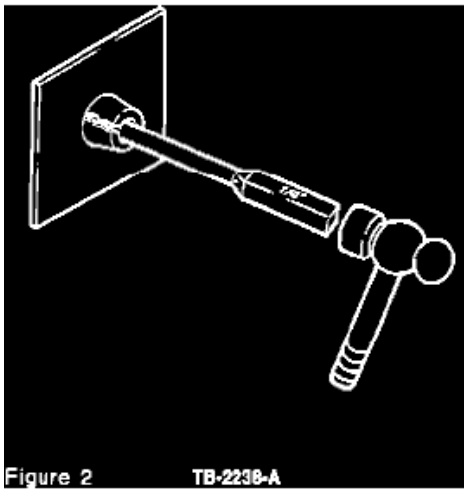

Figure 2 TB-2238-A

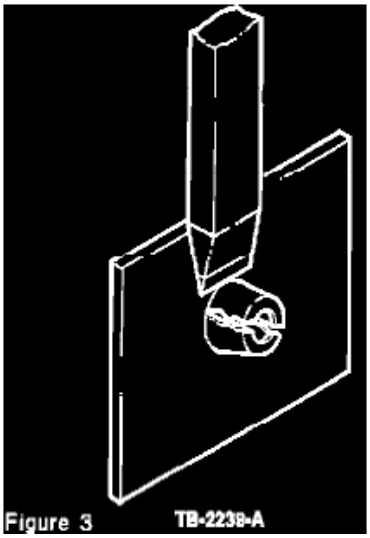

Figure 3 TB-2238-A

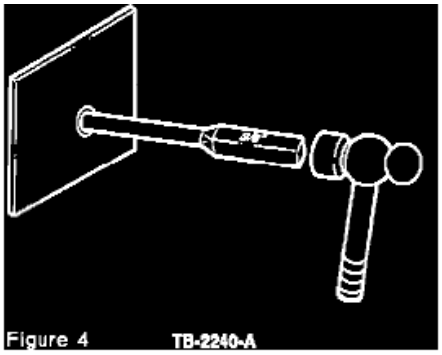
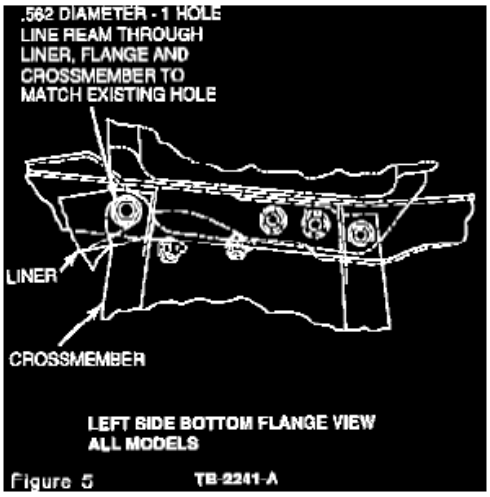
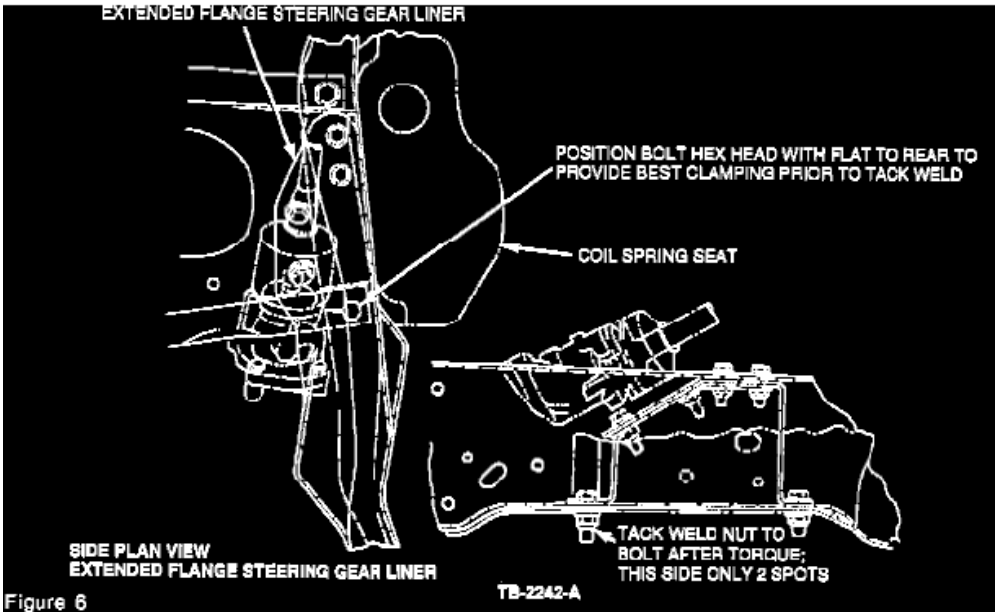
a. Use a flat chisel and hammer (or air chisel) to split the exposed collar of the huck fastener, Figure 1.

b. Knock the rivet pin out of the blind side with a 1/4" (6.35 mm) drift punch and hammer, Figure 2.

c. Cut the rivet's head off with a hammer and flat chisel, Figure 3.







d. Knock the sleeve out of the blind side with a 3/8" (9.525 mm) drift punch and hammer, Figure 4.

CAUTION:

REMOVAL OF THE FASTENER WITH A CUTTING TORCH IS NOT RECOMMENDED BECAUSE OF PROBABLE DAMAGE TO THE FRAME STRUCTURE.

3. Line ream the existing hole through the liner, frame flange and crossmember to 9/16" (14.228 mm), Figure 5.

4. Install a 9/16" Grade 8 nut (34990-S4), bolt (58698-S2) and washer (44880-S2), with nut/washer on the bottom, Figure 6.

a. Push the bolt into place using a brazing rod to hold the bolt.

PART NUMBER	PART NAME	CLASS
34990-S4	Nut 9/16 - 12 Hex (Pkg. 5)	RG
44880-S2	Washer 9/16 (Pkg. 12)	BG
58698-S2	Bolt 9/16-12 x 1.75" (Pkg. 4)	BG

b. Slide the bolt into the opening between the front face of the crossmember and frame liner.

c. Tighten the nut to 140 4-3 lb.ft. (190 4-4 N-m) and tack weld the nut to the bolt after tightening.

CAUTION:

DO NOT WELD THE NUT/WASHER TO THE FRAME.

DEALER CODING

BASIC PART NO. CONDITION CODE

5005 56

OASIS CODES: 305000, 390000, 702000, 702100

Front Steering Knuckle: Service and Repair

1. Remove spindle then the shaft and joint assembly as described previously.

2. If tie rod has not been removed, remove cotter pin and nut and disconnect tie rod from steering arm.

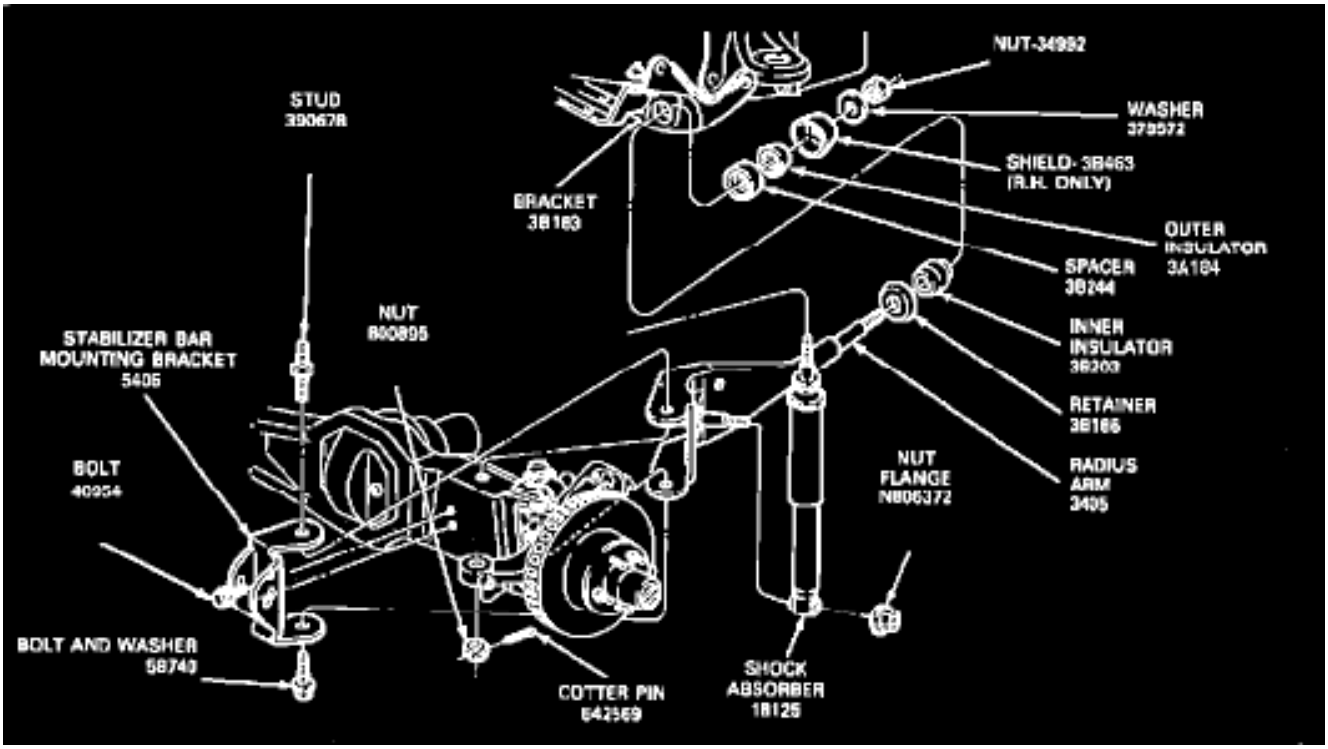
3. Remove cotter pin and loosen nut on top ball joint stud. Loosen bottom nut inside knuckle, then remove top nut.

4. Break spindle loose from ball stud, then remove camber adjuster. Mark position of adjuster for assembly reference.

5. Install steering knuckle in suitable soft jawed vise, then remove snap ring from lower ball joint socket.

6. Press ball joints from steering knuckle using C-Frame tool No. T74P-4635-C with ball joint remover tool No. T83T-3050-A, or equivalent.

7. Reverse procedure to install. The lower ball joint must be installed first. Install spindle to steering knuckle, and tighten nuts to 54-68 N-m (40-50 ft-lbs). Tighten attaching bolts to specifications.



Radius Arm Bushing: Service and Repair

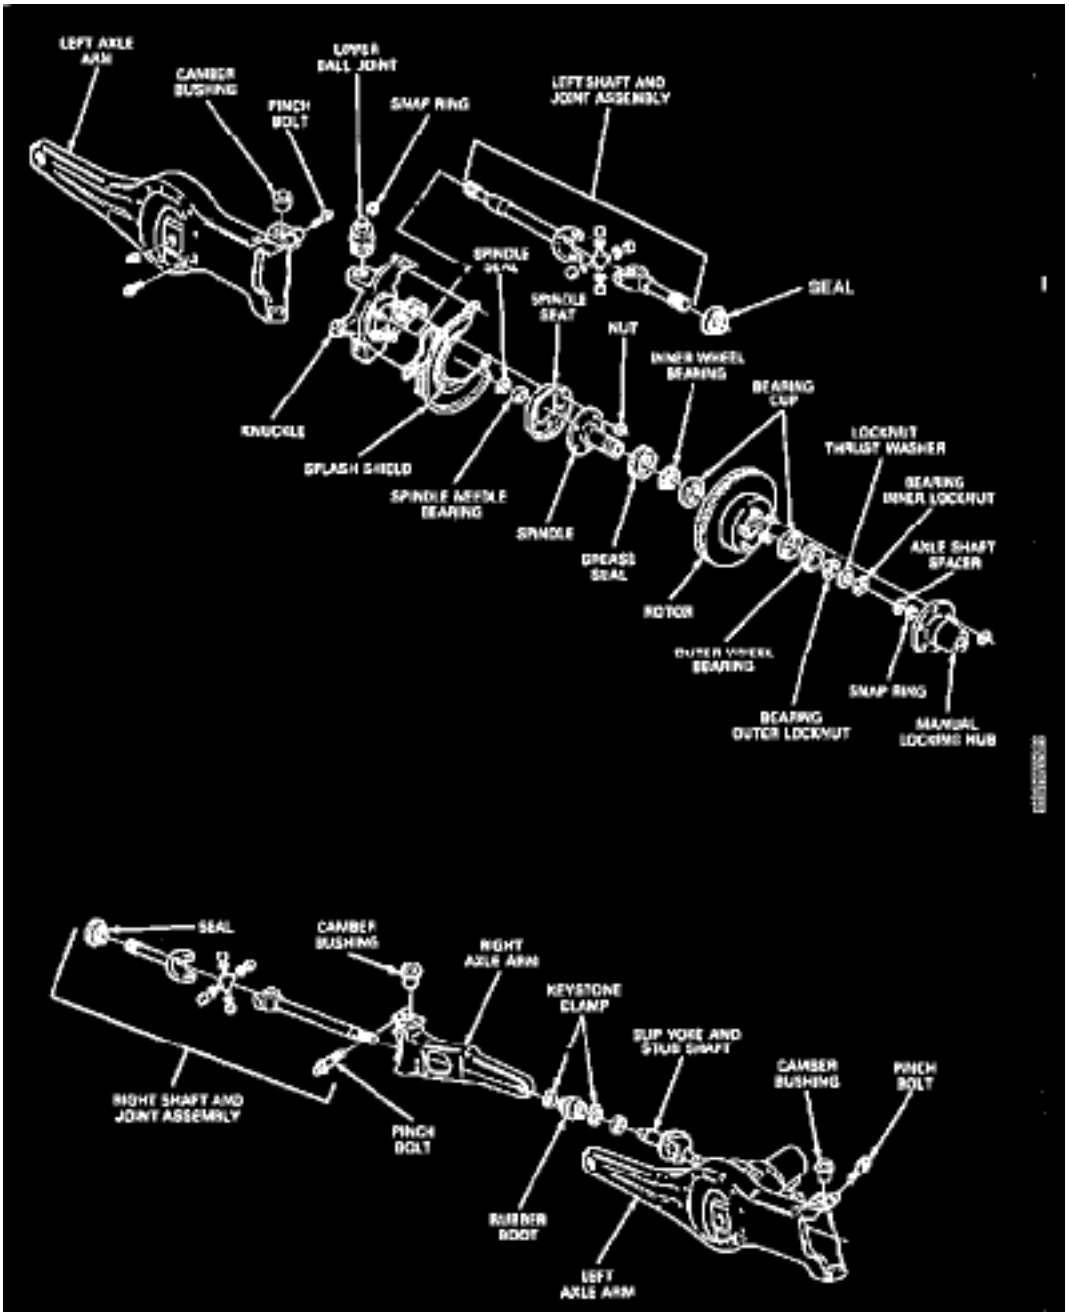
Fig. 10 Radius Arm Replacement. 4x4 Models

1. Loosen axle pivot bolt and upper shock absorber pivot bolt and compress shock.

2. Remove nut and washer attaching radius arm to radius arm bracket. Remove outer insulator and spacer, Fig. 10.

3. Move radius arm and axle assembly forward out of radius arm bracket. Remove inner insulator and retainer.

4. Reverse procedure to install. Tighten upper shock bolt, axle pivot bolt and nut to specifications.



Spindle: Service and Repair

Fig. 1 Exploded View Of Spindle, Shaft & Joint Assembly

1. Raise and support vehicle. Remove front wheels.

2. Remove disc brake caliper, hub locks, wheel bearings and locknuts, then the hub, rotor and outer wheel bearing cone, Fig. 1.

3. Remove and discard grease seal from rotor using slide hammer tool No. T50T-100-A and grease seal remover tool No. 1175-AC or equivalents.

4. Using bearing cup puller tool No. D78P-1225-B or equivalent, remove inner wheel bearing, then the inner and outer bearing cups.

5. Remove spindle to steering knuckle attaching nuts, then break spindle loose from knuckle and remove splash shield.

6. Remove shaft and joint assembly from right side of vehicle by pulling assembly out of carrier.

7. Remove and discard clamp from shaft and joint assembly and the stub shaft on right side of carrier. Slide rubber boot onto stub shaft, then pull shaft and joint assembly from stub shaft splines.

8. Install spindle, on second step, in suitable soft jawed vise.

9. Remove oil seal and needle bearing from spindle using bearing remover tool No. T50T-100-A and grease seal remover tool No. 1175-AC, or equivalent. Remove oil seal from shaft, if necessary.

10. Reverse procedure to install. Tighten spindle to steering knuckle attaching nuts to 54-68 N-m (40-50 ft-lbs).

Suspension Spring (Coil / Leaf): Customer Interest Rear Suspension - Low Ride Height When Loaded

Article No. 92-6-13

March 11, 1992

SUSPENSION - REAR - LOW ATTITUDE WHEN LOADED AT OR NEAR GVWR - 4X2 REGULAR CAB, SUPER CAB AND 4X4 REGULAR CAB MODELS

LIGHT TRUCK: 1989-91 RANGER

ISSUE: The vehicle may ride low in the rear when loaded at or near GVWR. This condition is caused by poorly computed camber dimensions for the springs.

ACTION: Install a rear spring shim (F1TZ-5W536-A) to each rear spring. Refer to the following procedure for service details.

On 1991 vehicles only, check the part number prefix located on either the bottom side of the last spring leaf near the center bolt or on the bottom side of the spring clip.

^ If the part number prefix is F17A, do NOT add a rear spring shim.

^ Confirm that the height and weight is as specified in the Body Builder's Specification Book and the vehicle is not overloaded.

4X2 MODELS

1. Remove the U-bolts attaching the springs to the axle.

2. Install the rear spring shim (F1TZ-5W536-A) between each spring and the axle.

3. Make sure the tab on the rear spring shim fits into the hole on the axle.

4. Install new longer U-bolts (N807321-S56) and nuts (N620483-S150) to secure the springs to the axle.

5. Tighten the U-bolts to 65-80 lb.ft. (88-108 N-m)

6. Readjust headlights on the vehicle.

4X4 MODELS

1. Remove the U-bolts attaching the springs to the axle.

2. Install the rear spring shims (F1TZ-5W536-A) between each spring and the spacer.

3. Make sure the tab on the rear spring shim fits into the hole on the spacer.

4. Install new longer U-bolts (E9TZ-5705-C) and nuts (N620483-S150) to secure the springs to the axle.

5. Tighten the U-bolts to 65-80 lb.ft. (88-108 N-m).

6. Readjust headlights on the vehicle.

Suspension Spring (Coil / Leaf): Service and Repair Coil Spring

Fig. 7 Coil Spring Replacement. 4x2 Models

4X2 MODELS

1. Raise and support front of vehicle. Support axle.

2. Remove lower retainer nut and lower retainer, Fig. 7. Lower axle until it hangs unsupported.

3. Insert pry bar between axles and force appropriate I-beam axle down far enough to allow spring to be lifted over bolt in lower spring seat. Rotate spring until retainer on upper spring seat is cleared. Remove spring. The axle must be supported when replacing spring and not be permitted to hang by the brake hose. If the length of the brake hose is not sufficient to permit spring replacement, it will be necessary to remove the disc brake caliper. Do not suspend caliper by brake hose, if removed.

4. Reverse procedure to install. Install bolt in axle arm and tighten nut all the way down. Install top of spring into upper spring seat and rotate into position. Raise axle until spring is seated in lower spring upper seat. Install lower retainer and nut.

Fig. 8 Coil Spring Replacement. 4x4 Models

4X4 MODELS

1. Raise and support front of vehicle. Support axle with a suitable jack so the spring is compressed.

2. Remove shock absorber to radius arm attaching bolt, then remove shock absorber from bracket.

3. Remove spring lower retainer attaching nut, then the retainer.

4. Lower axle until all spring tension is released, then remove spring by rotating upper coil out of tabs in upper spring seat, Fig. 8.

5. Remove spacer and seat from spring and the stud from axle assembly, if necessary. The axle must be supported when replacing spring and not be permitted to hang by the brake hose. If the length of the brake hose is not sufficient to permit spring replacement, it will be necessary to remove the disc brake caliper. Do not suspend caliper by brake hose, if removed.

6. Reverse procedure to install.

Suspension Strut / Shock Absorber: Service and Repair Front Air Shock Absorber

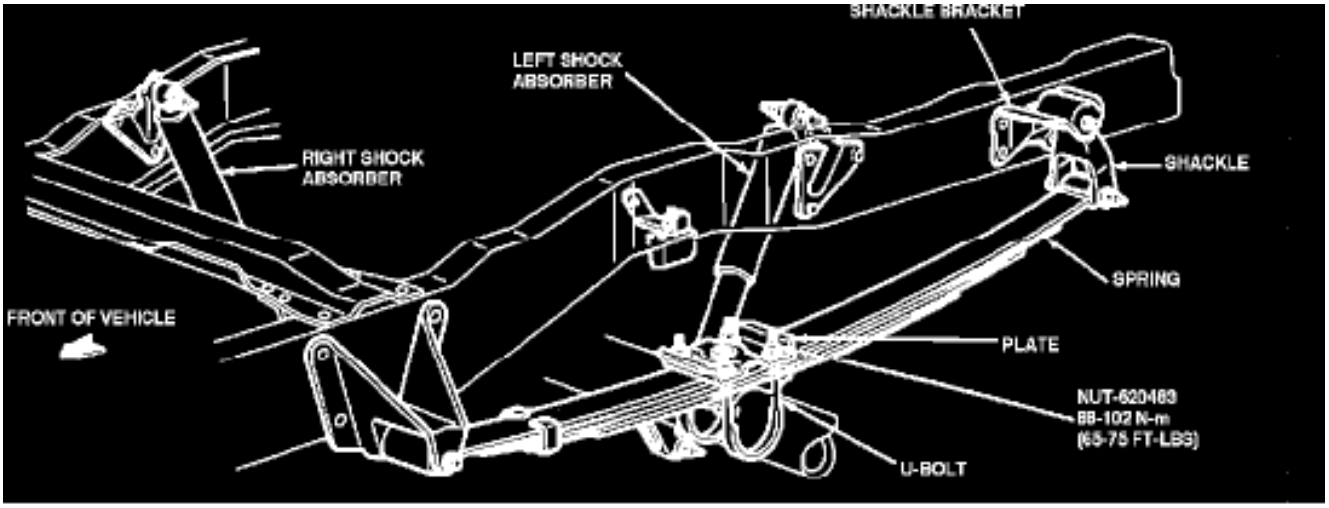
Fig. 4 Shock Absorber Replacement. 4x2 Models

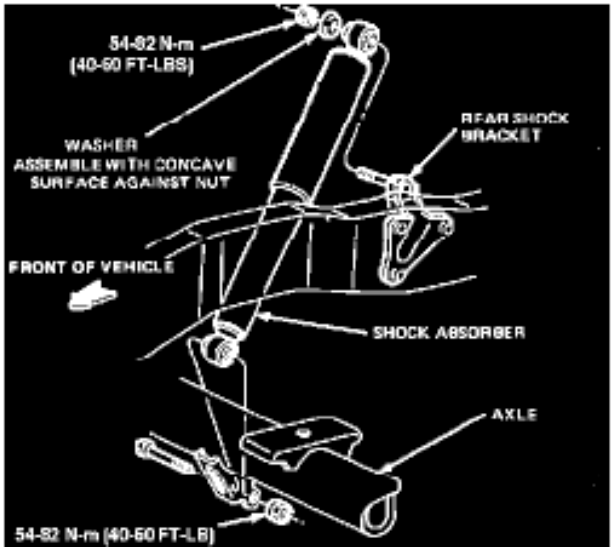
Fig. 5 Shock Absorber Replacement. 4x4 Models

1. Remove nut and washer from shock absorber at spring seat, Figs. 4 and 5.

2. Remove nut and bolt from shock absorber at radius arm and lower shock bracket. Slightly compress shock and remove.

3. Reverse procedure to install.





Suspension Strut / Shock Absorber: Service and Repair Rear

Fig. 3 Rear Suspension

Fig. 4 Shock Absorber Replacement

1. Raise vehicle and support rear axle.

2. Remove lower attaching bolt and nut from shock absorber, then swing lower end free from mounting bracket.

3. Disconnect shock absorber from upper mounting, then remove shock from vehicle, Figs. 3 and 4.

4. Reverse procedure to install.

Wheel Bearing: Specifications

TORQUE SPECIFICATIONS

Bearing Inner Locknut - Manual Locking Hub* Torque Limits - ..... 47 Nm (35 ft lb)

Bearing Outer Locknut - Manual Locking Hub Torque Limits - ..... 203 Nm (150 ft lb)

Bearing Nut - Automatic Locknut Hub* Torque Limits - ..... 47 Nm (35 ft lb)

Wheel Lug Nuts** Torque Limits - ..... 135 Nm (100 ft lb)

NOTES:

* After tightening to specified torque, back off the nut 1/4 turn (90°). After backing off the nut, retighten to 1.8 Nm (16 in lb)

** Torque specifications are for clean, dry bolt and nut threads. Never use oil or grease on studs or nuts.

Wheel Bearing: Adjustments With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

1. Raise the vehicle and install safety stands. 2. Remove the wheel lugnuts and the wheel and tire assembly. 3. Remove the retainer washers from the lugnut studs. Remove the automatic locking hub assembly from the spindle. 4. Remove the snap ring from the end of the spindle shaft.

Axle Shaft Spacer

5. Remove the axle shaft spacer. 6. Pull cam assembly off the wheel bearing adjusting nut and remove the two plastic thrust spacers from the adjusting nut.

CAUTION: Do not pry on the plastic cam or thrust spacers during removal. Prying may damage the cam or spacers.

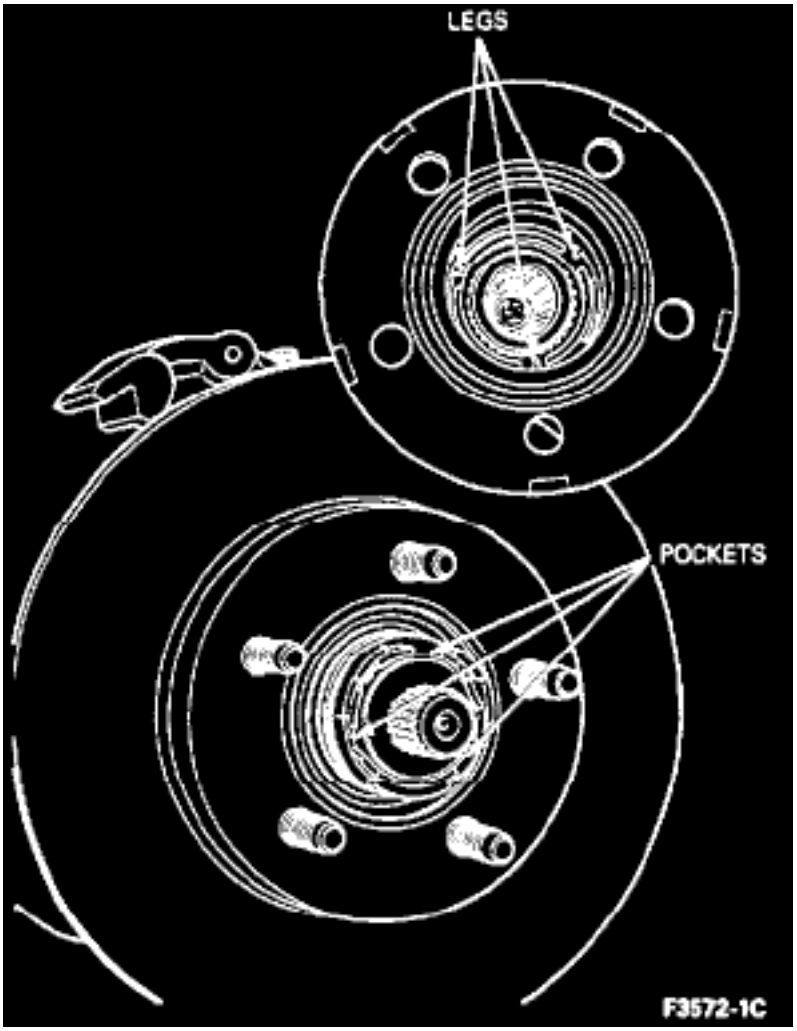
Cam Assembly And Locking Key

7. Using a magnet, remove the locking key.

NOTICE: If required, rotate the adjusting nut slightly to relieve pressure against the locking key, before the key can be removed.

CAUTION: To prevent damage to the spindle threads, look into the spindle keyway under the adjusting nut and remove the separate locking key before removing the adjusting nut.

8. Loosen the wheel bearing adjusting nut from the spindle using a 2-3/8 inch hex locknut wrench.



9. While rotating the hub and rotor assembly, tighten the wheel bearing adjusting nut to 47 Nm (35 ft lb) to seat the bearings. Spin the rotor and back

off the nut one-quarter turn (90 degrees).

10. Retighten the adjusting nut to 1.8 Nm (16 in lb) using a torque wrench. 11. Make sure the final end play of the wheel on the spindle is 0.00-0.08mm (0.000-0.003 inch). 12. Align the closest lug in the wheel bearing adjusting nut with the center of the spindle keyway slot. Advance the nut to the next lug if required.

Install the separate locking key in the spindle keyway under the adjusting nut.

WARNING: Extreme care must be taken when aligning the spindle nut adjustment lug with the center of the spindle keyway slot to prevent damage to the separate locking key. the wheel and tire assembly may come off while the vehicle is in motion if the key is damaged.

13. Install the two thrust spacers and push or press the cam assembly onto the locknut by lining up the key in the fixed cam with the spindle keyway.

CAUTION: Extreme care must be taken when aligning the fixed cam key with the spindle keyway to prevent damage to the fixed cam.

14. Install the axle shaft spacer. 15. Clip the snap ring onto the end of the spindle shaft.

Automatic Locking Hub Installation

16. Install the automatic locking hub assembly over the spindle. Align three hub assembly legs with three pockets in cam assembly. Install the retainer

washers.

17. Install the wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb).

Wheel Bearing: Adjustments With Manual Locking Hubs

Fig. 5 Manual Locking Hub

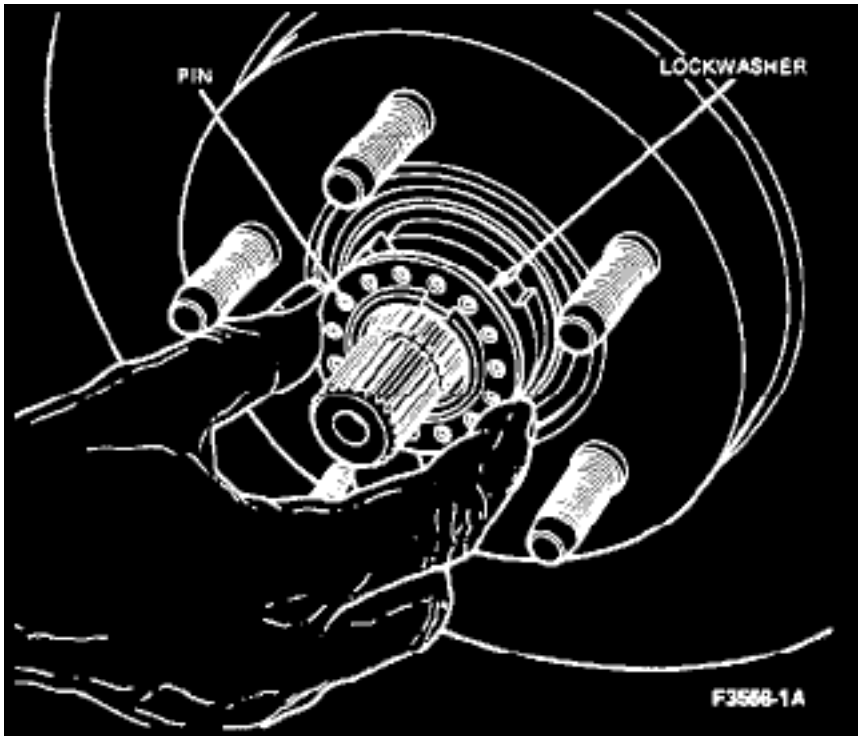
1. Raise the vehicle and install safety stands. 2. Remove the wheel and tire assembly. 3. Remove the retainer washers from the lugnut studs and the manual locking hub assembly from the spindle. 4. Remove the snap ring from the end of the spindle shaft.

Axle Shaft Spacer

5. Remove the axle shaft spacer.

Locknut Wrench

6. Remove the outer wheel bearing locknut from the spindle using a hub locknut wrench. Engage tool tabs into locknut slots.



Locknut Washer

7. Remove locknut washer from spindle. 8. Tighten the inner locknut to 47 Nm (35 ft lb) while turning the rotor in the opposite direction to seat bearings. 9. Spin the rotor and back off the inner locknut one-quarter turn. Retighten the inner locknut to 1.8 Nm (16 in lb).

10. Install the lockwasher on the spindle. 11. Install the outer wheel bearing locknut using locknut wrench. Tighten locknut to 203 Nm (150 ft lb). 12. Check the end play of the wheel and tire assembly on the spindle. Final end play should be 0.02-0.08 mm (0.001-0.003 inch). 13. Install the axle shaft spacer. 14. Clip the snap ring onto the end of the spindle shaft. 15. Install the manual hub assembly over the spindle. Install the retainer washers. 16. Install the wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb).

ISSUE: The use of a power impact wrench to install wheel nuts provides minimal torque control. Undertightening may allow the lug nuts to loosen, and can result in the wheel separating from the vehicle. Overtightening of wheel nuts may cause brake rotor distortion that could result in a brake shudder. Overtightening may cause distortion of the wheel. This can result in a change in the diameter of the center (axle) hole and make it difficult to remove from the axle it is mounted on or difficult or impossible to install on another axle with a smaller center hole diameter.

ACTION: Use a manual torque wrench to tighten wheel nuts. Refer to the approriate Shop Manual for specific torque values.

Wheel Hub: Service and Repair Removal

With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

1. Raise the vehicle and install safety stands. 2. Remove the wheel lugnuts and the wheel and tire assembly. 3. Remove the brake caliper and secure to the underbody to prevent damage to the brake hose. It is not necessary to disconnect the hose from the

caliper. Do not let the caliper hang with its weight on the brake hose or the hose may become stretched, twisted or ruptured.

4. Remove the retainer washers from the lugnut studs. Remove the automatic locking hub assembly from the spindle. 5. Remove the snap ring from the end of the spindle shaft.

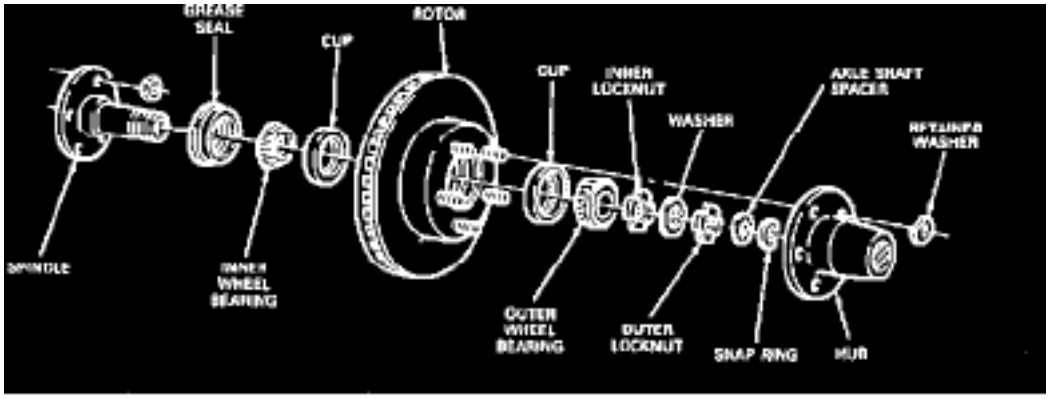
Axle Shaft Spacer

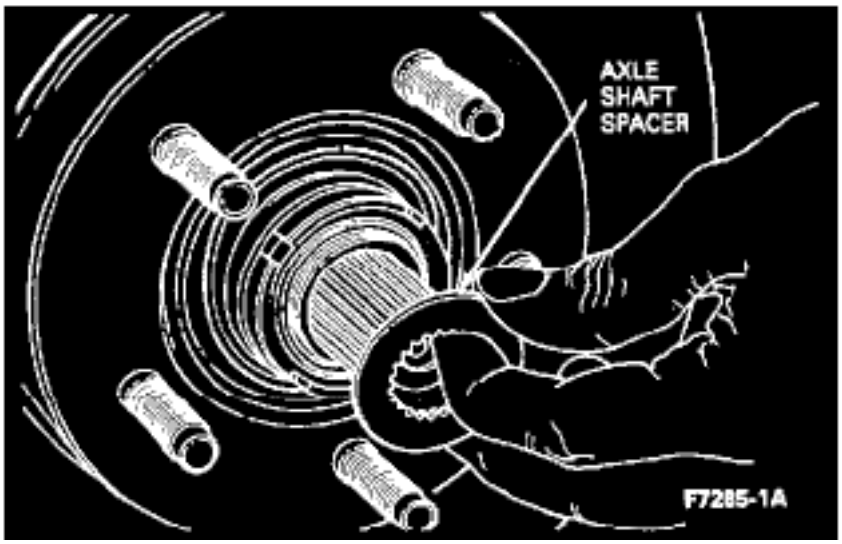
6. Remove the axle shaft spacer. 7. Pull cam assembly off the wheel bearing adjusting nut and remove the two plastic thrust spacers from the adjusting nut.

CAUTION: Do not pry on the plastic cam or thrust spacers during removal. Prying may damage the cam or spacers.

Cam Assembly And Locking Key

8. Using a magnet, remove the locking key.





NOTICE: If required, rotate the adjusting nut slightly to relieve pressure against the locking key, before the key can be removed.

CAUTION: To prevent damage to the spindle threads, look into the spindle keyway under the adjusting nut and remove the separate locking key before removing the adjusting nut.

9. Remove the wheel bearing adjusting nut from the spindle using a 2-3/8 inch Hex Locknut Wrench.

10. Remove the inner locknut and slide hub/rotor off spindle being careful to catch the outer wheel bearing.

With Manual Locking Hubs

Fig. 5 Manual Locking Hub

1. Raise the vehicle until the tire clears the floor and remove the wheel and tire assembly. 2. Remove the brake caliper and secure to the underbody to prevent damage to the brake hose. It is not necessary to disconnect the hose from the

caliper.

CAUTION: Do not let the caliper hang with its weight on the brake hose or the hose may become stretched, twisted or ruptured.

3. Remove the retainer washers from the lugnut studs and the manual locking hub assembly from the spindle. 4. Remove the snap ring from the end of the spindle shaft.

Wheel Hub: Service and Repair Installation

With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

CAUTION: Wheel bearing lubricant is a lithium-base grease. Sodium-base grease is not compatible with lithium-base grease and should not be intermixed. Therefore, do not lubricate front wheel bearings without first identifying the type of original wheel bearing lubricant. Usage of incompatible bearing lubricants may result in premature lubricant breakdown.

Installing Bearing Cups (Typical)

1. If inner or outer bearing cups were removed, install replacement inner and outer bearing cups in the hub with the appropriate bearing cup replacer

tool. Be sure to seat the cups properly in the hub. The cups will be properly seated when they are fully bottomed. Replace grease retainers. Polish grease retainer journal on spindle with 400 grit sandpaper. Clean with clean cloth.

2. Pack the inside of the hub with lithium-base grease or equivalent. Fill the hub until the grease is flush with the inside diameters of both bearing

cups. Pack the bearing cones and rollers with wheel bearing grease. Use a bearing packer for this operation. If a packer is not available, work as much lubricant as possible between the rollers and cages. Lubricate the cone surfaces with grease.

HUB

Installing Grease Seal (Typical)

3. Place the inner bearing in the inner cup and install the new grease seal. Be sure that the seal is fully seated. 4. Install the hub/rotor on the wheel spindle. Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads. 5. Place the outer bearing in the outer cup. 6. Install the wheel bearing adjustment nut. 7. While rotating the hub and rotor assembly, tighten the wheel bearing adjusting nut to 47 Nm (35 ft lb) to seat the bearings. Spin the rotor and back

off the nut one-quarter turn (90 degrees).

8. Retighten the adjusting nut to 1.8 Nm (16 in lb) using a torque wrench. 9. Make sure the final end play of the wheel on the spindle is 0.00-0.08 mm (0.000-0.003 in). the maximum torque to rotate the hub is 2.8 Nm (25 in

lb).

10. Align the closest lug in the wheel bearing adjusting nut with the center of the spindle keyway slot. Advance the nut to the next lug if required.

Install the separate locking key in the spindle keyway under the adjusting nut.

WARNING: Extreme care must be taken when aligning the spindle nut adjustment lug with the center of the spindle keyway slot to prevent damage to the separate locking key. The wheel and tire assembly may come off while the vehicle is in motion if the key is damaged.

11. Install the two thrust spacers and push or press the cam assembly onto the locknut by lining up the key in the fixed cam with the spindle keyway.

CAUTION: Extreme care must be taken when aligning the fixed cam key with the spindle keyway to prevent damage to the fixed cam.

12. Install the axle shaft spacer. 13. Clip the snap ring onto the end of the spindle shaft. 14. Install the automatic locking hub assembly over the spindle. Align three hub assembly legs with three pockets in cam assembly. Install the retainer

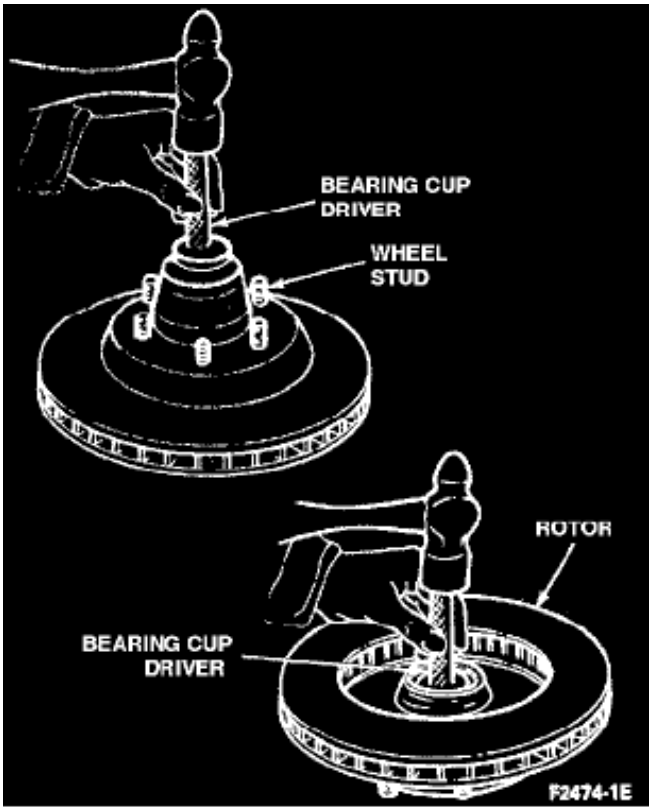
washers.

15. Install the caliper. 16. Install the wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb).

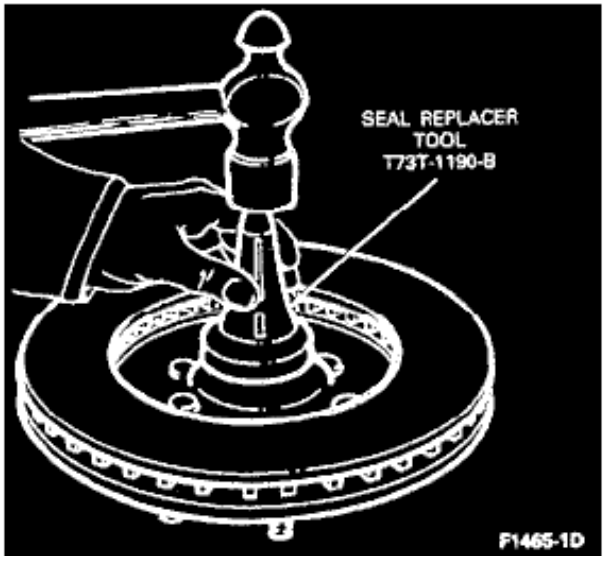
With Manual Locking Hubs

Fig. 5 Manual Locking Hub

CAUTION: Wheel bearing lubricant is a lithium-base grease. Sodium-base grease is not compatible with lithium-base grease and should not be intermixed. Therefore, do not lubricate front wheel bearings without first identifying the type of original wheel bearing lubricant. Usage of incompatible bearing lubricants may result in premature lubricant breakdown.



BEARING CUP
DRIVER
WHEEL
STUD
ROTOR
BEARING CUP
DRIVER
F2474-1E



SEAL REPLACER
TOOL
T73T-1190-B
F1465-1D

Installing Bearing Cups (Typical)

1. If inner or outer bearing cups were removed, install replacement inner and outer bearing cups in the hub with the appropriate bearing cup replacer

tool. Be sure to seat the cups properly in the hub. The cups will be properly seated when they are fully bottomed. Polish grease retainer journal on spindle with 400 grit sandpaper. Clean with clean cloth. Replace grease retainers.

2. Pack the inside of the hub with lithium-base grease or equivalent. Fill the hub until the grease is flush with the inside diameters of both bearing

cups. Pack the bearing cones and rollers with wheel bearing grease. Use a bearing packer for this operation. If a packer is not available, work as much lubricant as possible between the rollers and cages. Lubricate the cone surfaces with grease.

Installing Grease Seal (Typical)

3. Place the inner bearing in the inner cup and install the new grease seal. Be sure that the seal is fully seated. 4. Install the hub/rotor on the wheel spindle. Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads. 5. Place the outer bearing in the outer cup. 6. Install the inner locknut. 7. Tighten the inner locknut to 47 Nm (35 ft lb) while turning the rotor in the opposite direction to seat bearings. 8. Spin the rotor and back off the inner locknut one-quarter turn. Retighten the inner locknut to 1.8 Nm (16 in lb). 9. Install the lockwasher on the spindle.

NOTICE: If necessary, tighten inner locknut slightly to align the locknut pin with lockwasher hole.

10. Install the outer wheel bearing locknut using locknut wrench. Tighten locknut to 203 Nm (150 ft lb). 11. Check the end play of the wheel and tire assembly on the spindle. Final end play should be 0.00-0.08 mm (0.000-0.003 in). The maximum torque

to rotate the hub is 2.8 Nm (25 in lb).

12. Install the axle shaft spacer. 13. Clip the snap ring onto the end of the spindle shaft.

14. Install the manual hub assembly over the spindle. Install the retainer washers. 15. Install caliper. 16. Install wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb). 17. Lower vehicle. 18. Check brakes for proper operation.

WARNING: Before moving vehicle, pump brake pedal several times to be sure it is firm. Do not move vehicle until a firm pedal is obtained.

Wheel Hub (Locking): Customer Interest Front Hub - (4WD) Noise or Failure

Article No. 91-18-12 09/05/91

^ NOISE-"RATCHETING" SOUND FROM HUBLOCKBRONCO II BUILT AFTER 10/1/89, RANGER BUILT BETWEEN 10/1/89 AND 3/31/91, EXPLORER BUILT UNTIL 3/31/91

^ AXLE-FRONT-AUTOMATIC LOCKING HUBS-ENGAGEMENT OF FRONT DRIVELINE DELAYED OR NO COUPLING OF FRONT WHEELS-BRONCO II BUILT AFTER 10/1/89, RANGER BUILT BETWEEN 10/1/89 AND 3/31/91, EXPLORER BUILT UNTIL 3/31/91

LIGHT TRUCK: 1990 BRONCO II 1990-91 RANGER 1991 EXPLORER

This TSB article is being republished in its entirety to note that the wheel bearing retaining nut is included with the front automatic locking hub assembly.

ISSUE: Engagement of the front driveline on 4x4 models of the subject vehicles with Shift-On-The-Fly and Dana 35 axles may exhibit delayed or no coupling of the front wheels. Both of these conditions may result in a hublock ratcheting noise and sometimes may result in structural damage to the hublock. These concerns are caused by the failure of the transfer case to provide synchronization of the drivetrain during cold weather.

ACTION: Test drive the vehicle to determine if the driveline exhibits delayed or no coupling of the front wheels. If so, use the following procedure to service the vehicle.

NOTE: THESE ACTIONS SHOULD PROVIDE SHIFT-ON-FLY CAPABILITY TO 55 MPH (89 KM/H) AT TEMPERATURES ABOVE 32~F (0~C) AND 45 MPH (72 KM/H) WITH TEMPERATURES FROM 32~F (0~C) TO AS LOW AS -20~F (-29~C).

FRONT AUTOMATIC LOCKING HUB

1. Remove the left and right front automatic locking hubs and camming assemblies and replace with new assemblies (FOTZ-3B396-B). Refer to the appropriate Light Truck Shop Manual, Section 04-01D, for service details.

2. Inspect the wheel bearing retaining nut for damage and presence of foreign material which would diminish wheel bearing life.

3. Replace the wheel bearing retaining nut if damaged. This nut is included with the front automatic locking hub assembly.

FRONT AXLE LUBRICANT

1. Determine if the vehicle was built prior to 12/15/90.

2. If the vehicle was built prior to 12/15/90, replace the front axle lubricant with new lubricant (F1TZ-19580-A).

a. Extract the old lubricant using a suction gun.

NOTE: BREAKING THE CARRIER SEAL IS NOT A RECOMMENDED METHOD OF EXTRACTING THE LUBRICANT.

b. Refill the front axle with 56 ounces of lubricant (F1TZ-19580-A) using a suction gun.

TRANSFER CASE

1. Remove the following old transfer case parts and replace them with the following new parts. Refer to the appropriate Light Truck Shop Manual, Section 07-07E, for service details.

^ Clutch Coil Assembly (F1TZ-7G361-B)

^ Clutch Housing (F1TZ-7G362-A)

^ Lock-Up Collar (F1TZ-7106-B)

^ Lock-Up Fork (FOTZ-7289-A) - (Green paint mark by part number)

^ Return Spring (F1TZ-7219-A)

^ Sleeve Spring (E6TZ-7D126-A)

2. Install the sleeve spring (E6TZ-7D126-A) into the bore of the 7106 lock-up collar large end first.

Wheel Hub (Locking): All Technical Service Bulletins Automatic Hublock - Diagnosis/Service Tips

Article No. 95-5-18

03/13/95

^ LOCK HUBS - 4WD - AUTOMATIC HUBLOCK INFORMATION - SERVICE TIPS

^ FOUR-WHEEL DRIVE (4WD) - AUTOMATIC LOCK HUB DIAGNOSIS

LIGHT TRUCK: 1983-90 BRONCO II 1983-95 RANGER 1991-94 EXPLORER

ISSUE: 4X4 system diagnosis can be difficult at times due to system complexities.

ACTION:

For general system operation and diagnosis: Refer to TSB Article No. 92-1-8.

For specific automatic lock hub diagnosis and service: Refer to this article.

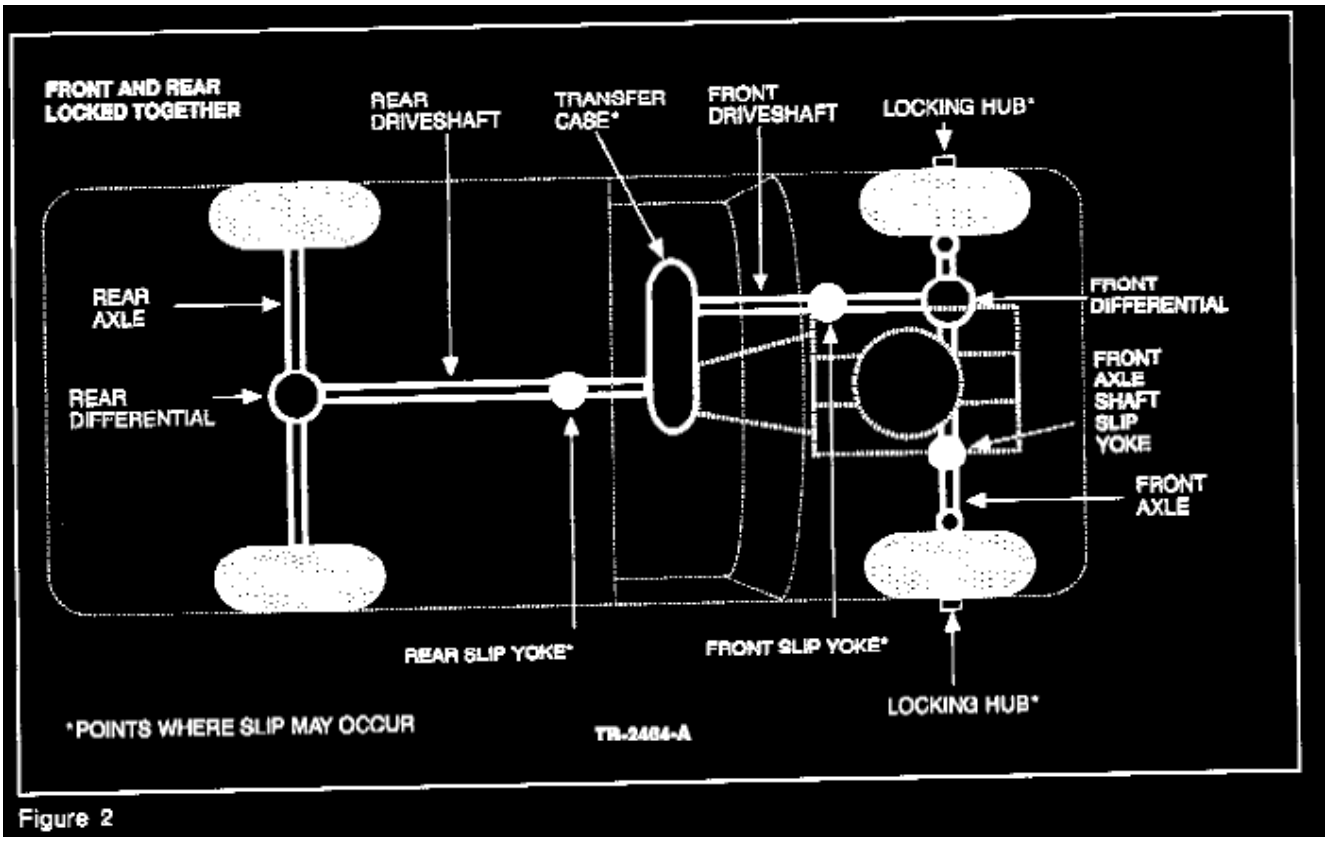

Figure 2

HUBLOCK DIAGNOSTICS

WHEEL END CONTAMINATION:

^ All compact vehicle hublocks have an O-ring seal between the hublock and wheel hub to prevent contamination. Whenever the hublock is removed, the 0-ring seal should be checked for damage.

^ If contamination is found in the wheel end, the path must be determined and corrected. Path possibilities are through the hublock seal, the wheel

bearing seals or the axle spindle seals.

WHEEL END NOISE (BUZZING) IN 4X2, AFTER UNLOCKING HUBS, SHORTLY AFTER FOUR-WHEEL DRIVE USAGE:

^ Noise concerns in two-wheel drive shortly after shifting from four-wheel drive and unlocking hubs, can occur if one of the hublocks fails to disengage. As the vehicle moves forward, the one (1) hublock that has failed to disengage will rotate its axle shaft through the differential and attempt to rotate the other axle shaft in the opposite direction. This is called differential motoring torque. As this torque attempts to turn the other axle shaft through the differential gears, that shaft's hublock will attempt to engage which will result in a ratcheting or buzzing noise.

^ This type of noise concern is usually found on axles that have incorrect front axle differential lubricant or very few 4X4 miles on them.

^ Verify that the front axle differential lubricant is F1TZ-19580-A. If incorrect lubricant is detected, extract the old lubricant using a suction gun.

NOTE:

BREAKING THE CARRIER SEAL IS NOT A RECOMMENDED METHOD OF EXTRACTING THE LUBRICANT.

1. Refill the front axle with 56 oz (1.66 L) of lubricant F1TZ-19580-A using a suction gun.

2. As the front axle accumulates 100-200 miles (161-322 km) of locked hublock operation, the axle will break-in, thus reducing the amount of differential motoring torque significantly.

3. If a front axle requires breaking in, refer to the Front Axle Break-In Procedure in this article.

4. If the front axle has been broken-in and the differential lubricant is F1TZ-19580-A, however, a wheel end noise (buzzing) in 4X2 is still experienced shortly after four-wheel drive usage. It is advised that the hublock which is not ratcheting be replaced as it is not disengaging correctly. When this condition occurs on any 4X4 Ranger, Explorer, or Bronco II, built from 10/89 through model year 1993, it is advised that both hublocks be replaced as the ratcheting hub is likely to become damaged.

FRONT AXLE BREAK-IN PROCEDURE:

^ To break-in the front axle, engage four-wheel drive and then shift out of it without disengaging the hublocks.

^ Thereafter, continue to drive the vehicle with locked hublocks until 100-200 miles (161-322 km) are accumulated. This will break-in the axle. Should the vehicle be backed up during this time

period, the hublocks will disengage and will have to be locked again by repeating the engagement procedure.

WHEEL END NOISE (RATCHETING) IN 4X2 AND HUBS UNLOCKED:

^ This condition could occur during turns or when the suspension is stroked. It is more prevalent in cold weather, with new front axles. It is usually caused by high motoring torque at the axle shafts or by incorrect axle lubrication.

^ Verify that axle lubrication is F1TZ-19580-A. If the front axle is not broken-in, 100-200 4X4 miles (161-322 km), proceed to do so following the outlined front axle break-in procedure in the Hublock Diagnostics section of this TSB article.

WHEEL END NOISE (BUZZING) WHILE ENGAGING 4X4 (TOUCH DRIVE) WHILE MOVING:

^ Refer to TSB Article No. 91-15-10.

POPPING/BANGING SOUND WHILE IN 4X4:

^ If the system slips under load, find what has broken or is slipping. To locate where slip is taking place, put marks at various possible slip points (Figure 1). Test drive the vehicle, then check to see if marks at different points are still in the same relationship to each other. This will help you determine where the slippage is taking place or where to look for broken parts, if any.

^ On vehicles with automatic hubs, find a place where you can do your test, mark the components, then drive without backing up. Stop and check the marks to see if they are in the same relationship to each other. If you back up before checking your marks, the hubs may reindex and not reveal the problem.

^ Reindex component should be serviced.

INSTALLATION PROCEDURE

1. Remove old hublock; remove key from bearing retainer nut and then remove nut.

2. If replacing a manual hublock with an automatic hublock, also remove the three-piece wheel bearing nut assembly.

3. Remove the new wheel bearing retaining nut from the cam assembly and install on the threaded spindle.

4. Using Hex Locknut Wrench (T70T-4252-B), torque the wheel bearing retainer nut to 47 N-m (35 lb.ft.) while rotating the wheel assembly. Back nut off 1/4 turn and retighten to 1.8 N-m (16 lb.in.) of torque.

5. Align scallop of the wheel bearing retaining nut with the center of the spindle keyway by advancing the nut clockwise.

6. Install the retaining key into the spindle keyway. With the garter spring inboard, align the key on the cam assembly with the keyway on the spindle.

7. Firmly press the cam assembly on the wheel bearing retaining nut.

CAUTION:

DO NOT PACK THE HUBLOCK WITH GREASE. TOO MUCH GREASE WILL CAUSE IMPROPER HUBLOCK OPERATION AND MAY DAMAGE THE HUBLOCK.

8. For Ranger and Bronco II, model years 1983-90 (through build date 10/4/89), using the DANA 28 Axle, install the thrust washer set onto the axle:

a. First, the plain steel washer.

b. Second, the needle bearing.

c. Last, the spline washer.

9. For model years 1990-94 (begin build date 10/5/89), DANA 35 Axle, install the one-piece spline washer. Install the "C" clip into the axle groove. It may be necessary to push the axle outboard from the inboard side of the knuckle.

10. For 1995 Ranger, install the thrust washer onto the axle:

a. First, the plain steel thrust washer.

b. Second, the plastic unsplined thrust washer.

AUTOMATIC HUBLOCK IDENTIFICATION CHART				
AUTOMATIC HUBLOCK MODEL TYPE	DATE CODE DESCRIPTION	EXAMPLE	PRODUCTION DATE	HUBLOCK BODY COLOR
M350A	Three (3) alphanumeric characters, or in some cases, no code	AB2 or no code	10/89	Argent
M350B	Six (6) numbers	920621	6/92	Argent
M350C	Backward letter "C" or the letter "C" followed by six (6) numbers	" " 931020 or C931021	8/93	Argent

c. Last, the steel spline thrust washer.

CAUTION:

ENSURE THE RETAINING RING OR "C" CLIP IS SEATED PROPERLY IN THE AXLE GROOVE FOR STEPS 8, 9, OR 10.

11. Check to ensure 0-ring seal on the flange face of the hublock body is not damaged and is properly positioned in its groove.

12. Install the hublock body assembly into the vehicle hub and rotor assembly. The hub may have to be rotated to line up the three (3) prongs of the cam follower (found internally to the hublock) with the cam assembly.

13. Install retainer flat nuts on wheel studs.

NOTE:

DO NOT FORCE THE HUBLOCK ASSEMBLY. IF THE BODY ASSEMBLY WILL NOT FIT, RECHECK THE ALIGNMENT OF ALL COMPONENTS. INSTALL SPEEDNUTS ON WHEEL LUGS TO RETAIN HUBLOCK. THEREAFTER, INSTALL THE WHEEL AND TORQUE THE LUG NUTS TO 136 N-m (100 LB.FT.) (FIGURE 2).

HISTORY AND TIMING

The Warn Automatic Hublock (Model M350) was used on the DANA 28 Axle (Bronco II and Ranger) from model years 1983-90 (through build date 10/4/89). The Warn Automatic Hublocks (Models M350A and M350B) were used on the DANA 35 Axle (Bronco II, Explorer and Ranger) for model years 1990-93 (begin build date 10/5/89). Starting with model year 1994 the Warn Automatic Hublock (Model M350C) used on the DANA 35 Axle (Explorer and Ranger) was introduced.

The Model M350 is black and Model M350A, M350B and M350C are argent (white silver) in color. The Model M350 can only be replaced by Model M350 service parts. The M350C service kits should be used as replacements for the following:

^ M350A hublocks released 10/89 as model year 1990 running change.

^ M350B hublocks released 4/92 as model year 1992 late running change.

^ M350C hublocks released 8/93 as model year 1994 Job 1 change.

When automatic hublock servicing is required for any Ranger, Explorer, or Bronco II built from 10/89 through model year 1993, it is advised that both hublocks be replaced.

NOTE:

IF AN M350A OR M350B HUBLOCK REQUIRES SERVICING, ALL THE HUBLOCK COMPONENTS MUST BE REMOVED AND REPLACED WITH SERVICE KIT F3TZ-3B396-B, WHICH ESSENTIALLY IS THE SERVICE KIT FOR THE M350C AUTOMATIC HUBLOCK. THE CAM ASSEMBLY OF THE M350A OR M35OB SHOULD NOT BE USED WITH AN M350C AUTOMATIC HUBLOCK BODY NOR SHOULD AN M350A OR M350B AUTOMATIC HUBLOCK BODY BE USED WITH AN M350C CAM ASSEMBLY.

For model year 1994 (and beyond) 4X4 Rangers or Explorers, replace automatic hublocks in accordance with the automatic hublock Service Manual procedure and additional diagnostics procedure outlined in this TSB.

IDENTIFYING AUTOMATIC HUBLOCK MODELS

A stamped code found on the rear of the automatic hublock flange face can be used to identify the automatic hublock type, in addition to the model year summary described above. Examples of the three (3) different codes which correlate to the automatic hublock model type are outlined in the chart:

PART NUMBER	PART NAME
E3TZ-1K105-B	Hublock Assembly
E3TZ-3N105-A	Nut And Bearing
E3TZ-1K106-B	Seal Kit
E5TZ-3B459-A	Key
E6TZ-3B477-A	Cam

PART NUMBER	PART NAME
F3TZ-3B396-B	Hublock - Automatic (Hublock Assembly, Wheel Retainer, Cam Assembly Key)
F3TZ-3N105-A	Hublock Nut/Key
F3TZ-1K106-A	Hublock Seal/Decal

THE ABOVE PART APPLICATION CHART IS FOR 1983-90 (THROUGH BUILD DATE 10/4/89) BRONCO II, RANGER, DANA 28 AXLE, HUBLOCK MODEL M350:

THE ABOVE PART APPLICATION CHART IS FOR:

^ 1990-95 Ranger (begin build date 10/5/89)

^ 1990 Bronco (begin build date 10/5/89 through end of production)

^ 1991-94 Explorer (through build date 11/18/94, DANA 35 Axle, Hublock Model M350C)

Article No. 91-18-12 09/05/91

^ NOISE-"RATCHETING" SOUND FROM HUBLOCKBRONCO II BUILT AFTER 10/1/89, RANGER BUILT BETWEEN 10/1/89 AND 3/31/91, EXPLORER BUILT UNTIL 3/31/91

^ AXLE-FRONT-AUTOMATIC LOCKING HUBS-ENGAGEMENT OF FRONT DRIVELINE DELAYED OR NO COUPLING OF FRONT WHEELS-BRONCO II BUILT AFTER 10/1/89, RANGER BUILT BETWEEN 10/1/89 AND 3/31/91, EXPLORER BUILT UNTIL 3/31/91

LIGHT TRUCK: 1990 BRONCO II 1990-91 RANGER 1991 EXPLORER

This TSB article is being republished in its entirety to note that the wheel bearing retaining nut is included with the front automatic locking hub assembly.

ISSUE: Engagement of the front driveline on 4x4 models of the subject vehicles with Shift-On-The-Fly and Dana 35 axles may exhibit delayed or no coupling of the front wheels. Both of these conditions may result in a hublock ratcheting noise and sometimes may result in structural damage to the hublock. These concerns are caused by the failure of the transfer case to provide synchronization of the drivetrain during cold weather.

ACTION: Test drive the vehicle to determine if the driveline exhibits delayed or no coupling of the front wheels. If so, use the following procedure to service the vehicle.

NOTE: THESE ACTIONS SHOULD PROVIDE SHIFT-ON-FLY CAPABILITY TO 55 MPH (89 KM/H) AT TEMPERATURES ABOVE 32~F (0~C) AND 45 MPH (72 KM/H) WITH TEMPERATURES FROM 32~F (0~C) TO AS LOW AS -20~F (-29~C).

FRONT AUTOMATIC LOCKING HUB

1. Remove the left and right front automatic locking hubs and camming assemblies and replace with new assemblies (FOTZ-3B396-B). Refer to the appropriate Light Truck Shop Manual, Section 04-01D, for service details.

2. Inspect the wheel bearing retaining nut for damage and presence of foreign material which would diminish wheel bearing life.

3. Replace the wheel bearing retaining nut if damaged. This nut is included with the front automatic locking hub assembly.

FRONT AXLE LUBRICANT

1. Determine if the vehicle was built prior to 12/15/90.

2. If the vehicle was built prior to 12/15/90, replace the front axle lubricant with new lubricant (F1TZ-19580-A).

a. Extract the old lubricant using a suction gun.

NOTE: BREAKING THE CARRIER SEAL IS NOT A RECOMMENDED METHOD OF EXTRACTING THE LUBRICANT.

b. Refill the front axle with 56 ounces of lubricant (F1TZ-19580-A) using a suction gun.

TRANSFER CASE

1. Remove the following old transfer case parts and replace them with the following new parts. Refer to the appropriate Light Truck Shop Manual, Section 07-07E, for service details.

^ Clutch Coil Assembly (F1TZ-7G361-B)

^ Clutch Housing (F1TZ-7G362-A)

^ Lock-Up Collar (F1TZ-7106-B)

^ Lock-Up Fork (FOTZ-7289-A) - (Green paint mark by part number)

^ Return Spring (F1TZ-7219-A)

^ Sleeve Spring (E6TZ-7D126-A)

2. Install the sleeve spring (E6TZ-7D126-A) into the bore of the 7106 lock-up collar large end first.

^ FOUR-WHEEL DRIVE (4WD) - AUTOMATIC LOCK HUB DIAGNOSIS

LIGHT TRUCK: 1983-90 BRONCO II 1983-95 RANGER 1991-94 EXPLORER

ISSUE: 4X4 system diagnosis can be difficult at times due to system complexities.

ACTION:

For general system operation and diagnosis: Refer to TSB Article No. 92-1-8.

For specific automatic lock hub diagnosis and service: Refer to this article.

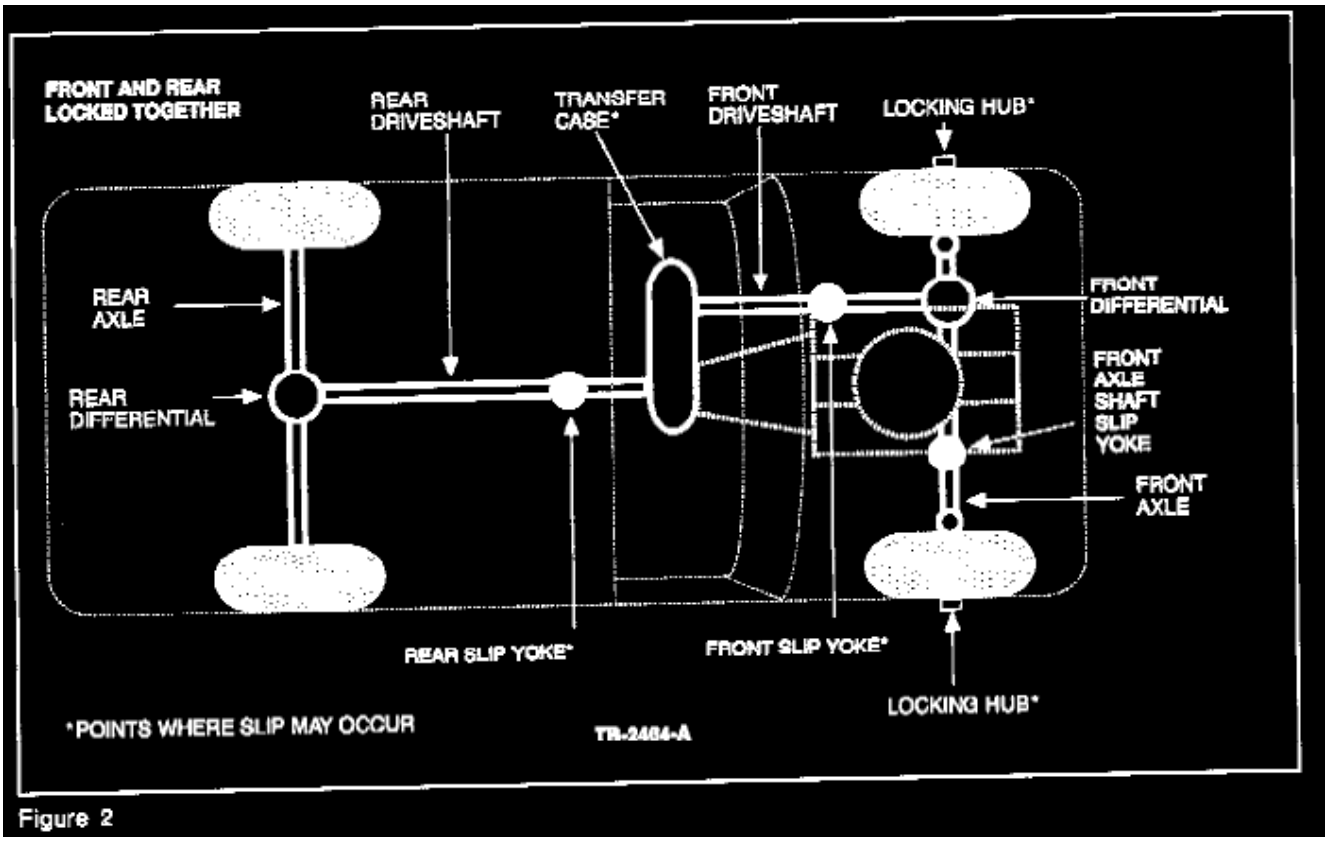

Figure 2

HUBLOCK DIAGNOSTICS

WHEEL END CONTAMINATION:

^ All compact vehicle hublocks have an O-ring seal between the hublock and wheel hub to prevent contamination. Whenever the hublock is removed, the 0-ring seal should be checked for damage.

^ If contamination is found in the wheel end, the path must be determined and corrected. Path possibilities are through the hublock seal, the wheel

bearing seals or the axle spindle seals.

WHEEL END NOISE (BUZZING) IN 4X2, AFTER UNLOCKING HUBS, SHORTLY AFTER FOUR-WHEEL DRIVE USAGE:

^ Noise concerns in two-wheel drive shortly after shifting from four-wheel drive and unlocking hubs, can occur if one of the hublocks fails to disengage. As the vehicle moves forward, the one (1) hublock that has failed to disengage will rotate its axle shaft through the differential and attempt to rotate the other axle shaft in the opposite direction. This is called differential motoring torque. As this torque attempts to turn the other axle shaft through the differential gears, that shaft's hublock will attempt to engage which will result in a ratcheting or buzzing noise.

^ This type of noise concern is usually found on axles that have incorrect front axle differential lubricant or very few 4X4 miles on them.

^ Verify that the front axle differential lubricant is F1TZ-19580-A. If incorrect lubricant is detected, extract the old lubricant using a suction gun.

NOTE:

BREAKING THE CARRIER SEAL IS NOT A RECOMMENDED METHOD OF EXTRACTING THE LUBRICANT.

1. Refill the front axle with 56 oz (1.66 L) of lubricant F1TZ-19580-A using a suction gun.

2. As the front axle accumulates 100-200 miles (161-322 km) of locked hublock operation, the axle will break-in, thus reducing the amount of differential motoring torque significantly.

3. If a front axle requires breaking in, refer to the Front Axle Break-In Procedure in this article.

4. If the front axle has been broken-in and the differential lubricant is F1TZ-19580-A, however, a wheel end noise (buzzing) in 4X2 is still experienced shortly after four-wheel drive usage. It is advised that the hublock which is not ratcheting be replaced as it is not disengaging correctly. When this condition occurs on any 4X4 Ranger, Explorer, or Bronco II, built from 10/89 through model year 1993, it is advised that both hublocks be replaced as the ratcheting hub is likely to become damaged.

FRONT AXLE BREAK-IN PROCEDURE:

^ To break-in the front axle, engage four-wheel drive and then shift out of it without disengaging the hublocks.

^ Thereafter, continue to drive the vehicle with locked hublocks until 100-200 miles (161-322 km) are accumulated. This will break-in the axle. Should the vehicle be backed up during this time

period, the hublocks will disengage and will have to be locked again by repeating the engagement procedure.

WHEEL END NOISE (RATCHETING) IN 4X2 AND HUBS UNLOCKED:

^ This condition could occur during turns or when the suspension is stroked. It is more prevalent in cold weather, with new front axles. It is usually caused by high motoring torque at the axle shafts or by incorrect axle lubrication.

^ Verify that axle lubrication is F1TZ-19580-A. If the front axle is not broken-in, 100-200 4X4 miles (161-322 km), proceed to do so following the outlined front axle break-in procedure in the Hublock Diagnostics section of this TSB article.

WHEEL END NOISE (BUZZING) WHILE ENGAGING 4X4 (TOUCH DRIVE) WHILE MOVING:

^ Refer to TSB Article No. 91-15-10.

POPPING/BANGING SOUND WHILE IN 4X4:

^ If the system slips under load, find what has broken or is slipping. To locate where slip is taking place, put marks at various possible slip points (Figure 1). Test drive the vehicle, then check to see if marks at different points are still in the same relationship to each other. This will help you determine where the slippage is taking place or where to look for broken parts, if any.

^ On vehicles with automatic hubs, find a place where you can do your test, mark the components, then drive without backing up. Stop and check the marks to see if they are in the same relationship to each other. If you back up before checking your marks, the hubs may reindex and not reveal the problem.

^ Reindex component should be serviced.

INSTALLATION PROCEDURE

1. Remove old hublock; remove key from bearing retainer nut and then remove nut.

2. If replacing a manual hublock with an automatic hublock, also remove the three-piece wheel bearing nut assembly.

3. Remove the new wheel bearing retaining nut from the cam assembly and install on the threaded spindle.

4. Using Hex Locknut Wrench (T70T-4252-B), torque the wheel bearing retainer nut to 47 N-m (35 lb.ft.) while rotating the wheel assembly. Back nut off 1/4 turn and retighten to 1.8 N-m (16 lb.in.) of torque.

5. Align scallop of the wheel bearing retaining nut with the center of the spindle keyway by advancing the nut clockwise.

6. Install the retaining key into the spindle keyway. With the garter spring inboard, align the key on the cam assembly with the keyway on the spindle.

7. Firmly press the cam assembly on the wheel bearing retaining nut.

CAUTION:

DO NOT PACK THE HUBLOCK WITH GREASE. TOO MUCH GREASE WILL CAUSE IMPROPER HUBLOCK OPERATION AND MAY DAMAGE THE HUBLOCK.

8. For Ranger and Bronco II, model years 1983-90 (through build date 10/4/89), using the DANA 28 Axle, install the thrust washer set onto the axle:

a. First, the plain steel washer.

b. Second, the needle bearing.

c. Last, the spline washer.

9. For model years 1990-94 (begin build date 10/5/89), DANA 35 Axle, install the one-piece spline washer. Install the "C" clip into the axle groove. It may be necessary to push the axle outboard from the inboard side of the knuckle.

10. For 1995 Ranger, install the thrust washer onto the axle:

a. First, the plain steel thrust washer.

b. Second, the plastic unsplined thrust washer.

AUTOMATIC HUBLOCK IDENTIFICATION CHART				
AUTOMATIC HUBLOCK MODEL TYPE	DATE CODE DESCRIPTION	EXAMPLE	PRODUCTION DATE	HUBLOCK BODY COLOR
M350A	Three (3) alphanumeric characters, or in some cases, no code	AB2 or no code	10/89	Argent
M350B	Six (6) numbers	920621	6/92	Argent
M350C	Backward letter "C" or the letter "C" followed by six (6) numbers	" " 931020 or C931021	8/93	Argent

c. Last, the steel spline thrust washer.

CAUTION:

ENSURE THE RETAINING RING OR "C" CLIP IS SEATED PROPERLY IN THE AXLE GROOVE FOR STEPS 8, 9, OR 10.

11. Check to ensure 0-ring seal on the flange face of the hublock body is not damaged and is properly positioned in its groove.

12. Install the hublock body assembly into the vehicle hub and rotor assembly. The hub may have to be rotated to line up the three (3) prongs of the cam follower (found internally to the hublock) with the cam assembly.

13. Install retainer flat nuts on wheel studs.

NOTE:

DO NOT FORCE THE HUBLOCK ASSEMBLY. IF THE BODY ASSEMBLY WILL NOT FIT, RECHECK THE ALIGNMENT OF ALL COMPONENTS. INSTALL SPEEDNUTS ON WHEEL LUGS TO RETAIN HUBLOCK. THEREAFTER, INSTALL THE WHEEL AND TORQUE THE LUG NUTS TO 136 N-m (100 LB.FT.) (FIGURE 2).

HISTORY AND TIMING

The Warn Automatic Hublock (Model M350) was used on the DANA 28 Axle (Bronco II and Ranger) from model years 1983-90 (through build date 10/4/89). The Warn Automatic Hublocks (Models M350A and M350B) were used on the DANA 35 Axle (Bronco II, Explorer and Ranger) for model years 1990-93 (begin build date 10/5/89). Starting with model year 1994 the Warn Automatic Hublock (Model M350C) used on the DANA 35 Axle (Explorer and Ranger) was introduced.

The Model M350 is black and Model M350A, M350B and M350C are argent (white silver) in color. The Model M350 can only be replaced by Model M350 service parts. The M350C service kits should be used as replacements for the following:

^ M350A hublocks released 10/89 as model year 1990 running change.

^ M350B hublocks released 4/92 as model year 1992 late running change.

^ M350C hublocks released 8/93 as model year 1994 Job 1 change.

When automatic hublock servicing is required for any Ranger, Explorer, or Bronco II built from 10/89 through model year 1993, it is advised that both hublocks be replaced.

NOTE:

IF AN M350A OR M350B HUBLOCK REQUIRES SERVICING, ALL THE HUBLOCK COMPONENTS MUST BE REMOVED AND REPLACED WITH SERVICE KIT F3TZ-3B396-B, WHICH ESSENTIALLY IS THE SERVICE KIT FOR THE M350C AUTOMATIC HUBLOCK. THE CAM ASSEMBLY OF THE M350A OR M35OB SHOULD NOT BE USED WITH AN M350C AUTOMATIC HUBLOCK BODY NOR SHOULD AN M350A OR M350B AUTOMATIC HUBLOCK BODY BE USED WITH AN M350C CAM ASSEMBLY.

For model year 1994 (and beyond) 4X4 Rangers or Explorers, replace automatic hublocks in accordance with the automatic hublock Service Manual procedure and additional diagnostics procedure outlined in this TSB.

IDENTIFYING AUTOMATIC HUBLOCK MODELS

A stamped code found on the rear of the automatic hublock flange face can be used to identify the automatic hublock type, in addition to the model year summary described above. Examples of the three (3) different codes which correlate to the automatic hublock model type are outlined in the chart:

PART NUMBER	PART NAME
E3TZ-1K105-B	Hublock Assembly
E3TZ-3N105-A	Nut And Bearing
E3TZ-1K106-B	Seal Kit
E5TZ-3B459-A	Key
E6TZ-3B477-A	Cam

PART NUMBER	PART NAME
F3TZ-3B396-B	Hublock - Automatic (Hublock Assembly, Wheel Retainer, Cam Assembly Key)
F3TZ-3N105-A	Hublock Nut/Key
F3TZ-1K106-A	Hublock Seal/Decal

THE ABOVE PART APPLICATION CHART IS FOR 1983-90 (THROUGH BUILD DATE 10/4/89) BRONCO II, RANGER, DANA 28 AXLE, HUBLOCK MODEL M350:

THE ABOVE PART APPLICATION CHART IS FOR:

^ 1990-95 Ranger (begin build date 10/5/89)

^ 1990 Bronco (begin build date 10/5/89 through end of production)

^ 1991-94 Explorer (through build date 11/18/94, DANA 35 Axle, Hublock Model M350C)

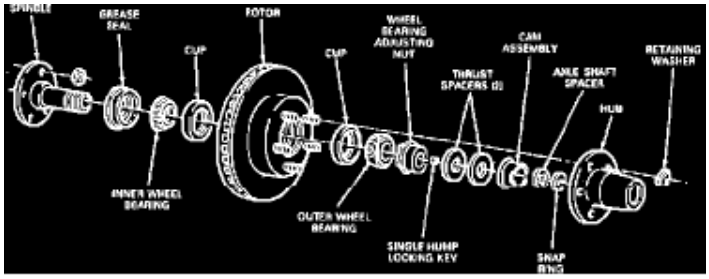
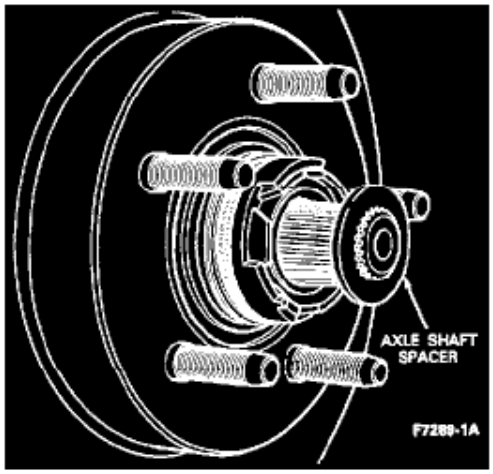
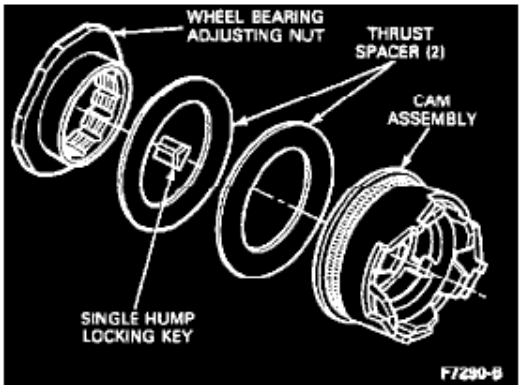
Ford Workshop Manuals > Steering and Suspension > Suspension > Wheel Hub (Locking) > Component Information > Service and Repair > Removal







Wheel Hub (Locking): Service and Repair Removal

With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

1. Raise the vehicle and install safety stands. 2. Remove the wheel lugnuts and the wheel and tire assembly. 3. Remove the brake caliper and secure to the underbody to prevent damage to the brake hose. It is not necessary to disconnect the hose from the

caliper. Do not let the caliper hang with its weight on the brake hose or the hose may become stretched, twisted or ruptured.

4. Remove the retainer washers from the lugnut studs. Remove the automatic locking hub assembly from the spindle. 5. Remove the snap ring from the end of the spindle shaft.

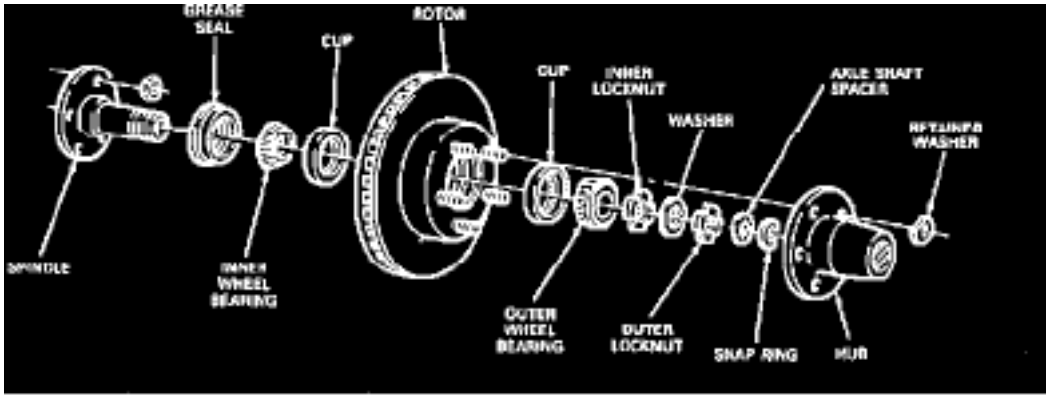
Axle Shaft Spacer

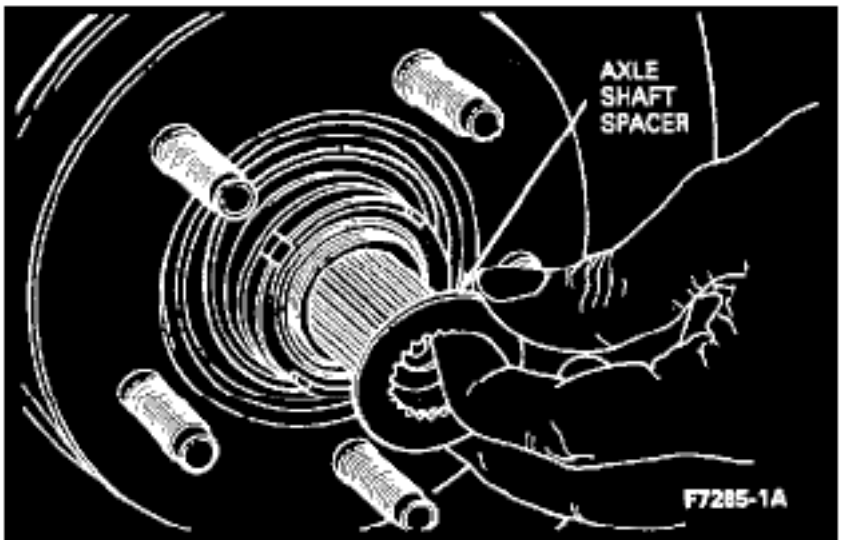
6. Remove the axle shaft spacer. 7. Pull cam assembly off the wheel bearing adjusting nut and remove the two plastic thrust spacers from the adjusting nut.

CAUTION: Do not pry on the plastic cam or thrust spacers during removal. Prying may damage the cam or spacers.

Cam Assembly And Locking Key

8. Using a magnet, remove the locking key.





NOTICE: If required, rotate the adjusting nut slightly to relieve pressure against the locking key, before the key can be removed.

CAUTION: To prevent damage to the spindle threads, look into the spindle keyway under the adjusting nut and remove the separate locking key before removing the adjusting nut.

9. Remove the wheel bearing adjusting nut from the spindle using a 2-3/8 inch Hex Locknut Wrench.

10. Remove the inner locknut and slide hub/rotor off spindle being careful to catch the outer wheel bearing.

With Manual Locking Hubs

Fig. 5 Manual Locking Hub

1. Raise the vehicle until the tire clears the floor and remove the wheel and tire assembly. 2. Remove the brake caliper and secure to the underbody to prevent damage to the brake hose. It is not necessary to disconnect the hose from the

caliper.

CAUTION: Do not let the caliper hang with its weight on the brake hose or the hose may become stretched, twisted or ruptured.

3. Remove the retainer washers from the lugnut studs and the manual locking hub assembly from the spindle. 4. Remove the snap ring from the end of the spindle shaft.

Axle Shaft Spacer

5. Remove the axle shaft spacer.

Wheel Hub (Locking): Service and Repair Installation

With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

CAUTION: Wheel bearing lubricant is a lithium-base grease. Sodium-base grease is not compatible with lithium-base grease and should not be intermixed. Therefore, do not lubricate front wheel bearings without first identifying the type of original wheel bearing lubricant. Usage of incompatible bearing lubricants may result in premature lubricant breakdown.

Installing Bearing Cups (Typical)

1. If inner or outer bearing cups were removed, install replacement inner and outer bearing cups in the hub with the appropriate bearing cup replacer

tool. Be sure to seat the cups properly in the hub. The cups will be properly seated when they are fully bottomed. Replace grease retainers. Polish grease retainer journal on spindle with 400 grit sandpaper. Clean with clean cloth.

2. Pack the inside of the hub with lithium-base grease or equivalent. Fill the hub until the grease is flush with the inside diameters of both bearing

cups. Pack the bearing cones and rollers with wheel bearing grease. Use a bearing packer for this operation. If a packer is not available, work as much lubricant as possible between the rollers and cages. Lubricate the cone surfaces with grease.

Installing Grease Seal (Typical)

3. Place the inner bearing in the inner cup and install the new grease seal. Be sure that the seal is fully seated. 4. Install the hub/rotor on the wheel spindle. Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads. 5. Place the outer bearing in the outer cup. 6. Install the wheel bearing adjustment nut. 7. While rotating the hub and rotor assembly, tighten the wheel bearing adjusting nut to 47 Nm (35 ft lb) to seat the bearings. Spin the rotor and back

off the nut one-quarter turn (90 degrees).

8. Retighten the adjusting nut to 1.8 Nm (16 in lb) using a torque wrench. 9. Make sure the final end play of the wheel on the spindle is 0.00-0.08 mm (0.000-0.003 in). the maximum torque to rotate the hub is 2.8 Nm (25 in

lb).

10. Align the closest lug in the wheel bearing adjusting nut with the center of the spindle keyway slot. Advance the nut to the next lug if required.

Install the separate locking key in the spindle keyway under the adjusting nut.

WARNING: Extreme care must be taken when aligning the spindle nut adjustment lug with the center of the spindle keyway slot to prevent damage to the separate locking key. The wheel and tire assembly may come off while the vehicle is in motion if the key is damaged.

11. Install the two thrust spacers and push or press the cam assembly onto the locknut by lining up the key in the fixed cam with the spindle keyway.

CAUTION: Extreme care must be taken when aligning the fixed cam key with the spindle keyway to prevent damage to the fixed cam.

12. Install the axle shaft spacer. 13. Clip the snap ring onto the end of the spindle shaft. 14. Install the automatic locking hub assembly over the spindle. Align three hub assembly legs with three pockets in cam assembly. Install the retainer

washers.

15. Install the caliper. 16. Install the wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb).

With Manual Locking Hubs

Fig. 5 Manual Locking Hub

CAUTION: Wheel bearing lubricant is a lithium-base grease. Sodium-base grease is not compatible with lithium-base grease and should not be intermixed. Therefore, do not lubricate front wheel bearings without first identifying the type of original wheel bearing lubricant. Usage of incompatible bearing lubricants may result in premature lubricant breakdown.

Installing Grease Seal (Typical)

3. Place the inner bearing in the inner cup and install the new grease seal. Be sure that the seal is fully seated. 4. Install the hub/rotor on the wheel spindle. Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads. 5. Place the outer bearing in the outer cup. 6. Install the inner locknut. 7. Tighten the inner locknut to 47 Nm (35 ft lb) while turning the rotor in the opposite direction to seat bearings. 8. Spin the rotor and back off the inner locknut one-quarter turn. Retighten the inner locknut to 1.8 Nm (16 in lb). 9. Install the lockwasher on the spindle.

NOTICE: If necessary, tighten inner locknut slightly to align the locknut pin with lockwasher hole.

10. Install the outer wheel bearing locknut using locknut wrench. Tighten locknut to 203 Nm (150 ft lb). 11. Check the end play of the wheel and tire assembly on the spindle. Final end play should be 0.00-0.08 mm (0.000-0.003 in). The maximum torque

to rotate the hub is 2.8 Nm (25 in lb).

12. Install the axle shaft spacer. 13. Clip the snap ring onto the end of the spindle shaft.

14. Install the manual hub assembly over the spindle. Install the retainer washers. 15. Install caliper. 16. Install wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb). 17. Lower vehicle. 18. Check brakes for proper operation.

WARNING: Before moving vehicle, pump brake pedal several times to be sure it is firm. Do not move vehicle until a firm pedal is obtained.

Ford Motor Company

October 2001

TO: All Ford and Lincoln Mercury Dealers

SUBJECT: **Owner Notification Program 01B77 Supplement 7:** 10/12/01 Updated Information

REFERENCE: **Owner Notification Program 01B77 – Ford Wilderness AT Program:** Replacement of Wilderness AT tires

PROGRESS TO DATE

- To date we have replaced close to 7 million tires or 55% of the total tires needed
- Ford and Mercury dealers are currently handling over 70% of all Wilderness AT replacements
- All tire sizes are now readily available, though certain brands may not be available

The following information has been updated for ONP 01B77:

CHANGES MADE TO THE ALL DEALER LETTER

- ONP 01B77 – Ford Wilderness AT program will expire on March 31, 2002
- Tires purchased by customers after November 15, 2001 will not be eligible for a refund
- All customers who have not had their tires replaced will receive a follow-up letter by the end of October, 2001 announcing these program changes and encouraging them to visit a Ford Motor Company dealership for tire replacement
- 1995 and 1996 F-150 customers, which were added to the program on August 17, 2001, will receive their first notification letter by the end of October, 2001, which includes the following:
  - The customer must have their tires replaced at a Ford Motor Company dealer
  - They will only be eligible for refunds if they purchased their tires between August 1, 2000 through October 31, 2001

    NOTE: Refunded at actual cost and no DOT sections required, since these customers were never notified of the DOT requirements and maximum dollar limit.
- Effective immediately all tire refund requests are to be processed through the dealer (Online Refund Form should no longer be used)

CHANGES TO ATTACHMENT I

- Tires purchased by customers after November 15, 2001 will not be eligible for a refund
- The Online Refund Form used for refunds before May 22, 2001 is no longer posted on the web

CHANGES TO ATTACHMENT II

- Wait List Survey link added
- A procedure has been added to handle customers who purchase tires after November 15, 2001 and are seeking a refund

All revisions since Supplement 6 are in *red italics* and revised pages have been marked "*Revised10/12/01.*"

Sincerely,

Ann O'Neill
Director
Vehicle Service and Programs

Technical Service Bulletin # 01B77 Date: 011001

Ford Motor Company

May 2001
Revised 10/12/01

TO: All Ford and Lincoln Mercury Dealers

SUBJECT: **Owner Notification Program 01B77-S7 – Ford Firestone Wilderness AT Program:** Replacement of Firestone Wilderness AT tires.

OASIS: Yes
OWNER LIST: Yes
PARTS RETURN: No
PROGRAM TERMS: This program will expire *March 31, 2002* and has no mileage limit.

WHAT WE ARE DOING AND WHY

On August 9, 2000 Firestone initiated a voluntary recall of 6.5 million tires, including 3.8 million P235 75R15 Radial ATX tires manufactured since 1990 at all North American Firestone plants. Also, Firestone recalled about 2.7 million P235 75R15 Wilderness AT tires made at its Decatur, Illinois plant. The recall included both original equipment and replacement tires. As of January 22, 2001 more than 6.1 million tires have been replaced – the recall is more than 94% complete.

Under this new owner notification, Ford will replace 13 million Firestone Wilderness AT tires on Ford and Mercury SUVs and pickup trucks listed below under "affected tires and vehicles." This is a voluntary precautionary measure. Ford made the decision to take this action after extensive examination of field data as well as laboratory and track testing in close collaboration with NHTSA. The field data, along with our testing and statistical analysis, shows a directional trend toward elevated failure rates, that differs based upon where the tires were manufactured. Ford does not have sufficient confidence in the future performance of these tires, so we are acting in the interest of our customers to ensure their continued trust and confidence.

To date we have replaced close to 7 million tires or 55% of the total tires needed for this program. Ford and Mercury dealers are currently handling over 70% of the Wilderness AT tire replacements. Also, with the increased availability of all 15-, 16-, and 17-inch tires at the dealers, Ford is changing the expiration date of the program to March 31, 2002 to encourage customers to have their tires replaced as soon as possible.

NOTE: Certain brands of tires may have limited availability.

AFFECTED TIRES AND VEHICLES

This program affects 15-, 16-, and 17-inch Firestone Wilderness AT tires and Ford and Mercury vehicles with these tires on them. The vehicles listed below may have been originally equipped with Firestone Wilderness AT tires or may have had Wilderness AT tires installed during the Firestone recall launched in August, 2000.

- Certain 1991 through 2002 Ford Explorer
- Certain 2001 through 2002 Explorer Sport, and Sport Trac
- Certain 1997 through 2002 Mercury Mountaineer
- Certain 1991 through 2001 Ranger
- Certain 1999 through 2001 Expedition
- Certain 1991 through 1997 F-Series
- Certain 1991 through 1994 Bronco

NOTE: Both original equipment (OE) and replacement tires are affected.

IMPORTANT FACTS

- *Ford Wilderness AT tire program will expire on March 31, 2002.*
- *Tires purchased by customers after November 15, 2001 will no longer be eligible for a refund.*
- *A follow-up owner letter announcing program changes will be mailed beginning the week of October 17, 2001.*
- *1995 and 1996 F-150 owners, which were added to the program on August 17, 2001, will be notified by the end of October 2001.*
- All 15-, 16-, and 17-inch Firestone Wilderness AT tires (regardless of series number) that are mounted on Ford or Mercury vehicles are eligible for replacement.
- All other Firestone Wilderness AT tire sizes are not included in this program.
- AtW/Ford Tire Program dealers are to stop the sale of Firestone Wilderness AT tires in their parts inventory effective immediately.
- Ford Motor Company has notified customers of this owner notification program via first class mail.
- Customer refunds will be handled differently based on whether the tires were purchased before or after May 22, 2001.
- *Effective immediately all refunds will be processed through the dealer for customers who purchased their tires from August 1, 2000 through November 15, 2001, (Online Refund Form should no longer be used).*
- *1995 and 1996 F-150 owners will only be eligible for refunds for tires purchased between August 1, 2000 and October 31, 2001, (no DOT sections required).*
- A list of Ford-approved replacement tires is posted on QCDealer. Only these tires may be used as replacement tires for vehicles that were originally equipped with 15-, 16-, and 17-inch Firestone Wilderness AT tires under this program.
- There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.
- **Vehicles with branded titles** - although normally excluded from Owner Notification Programs are included as part of this program.
- Affected vehicles sold in Canada can be serviced by U.S. dealers, and affected vehicles sold in the U.S. can be serviced by Canadian dealers.

STOP SALE OF FIRESTONE WILDERNESS AT TIRES IN DEALER STOCK

Firestone Wilderness AT tires in stock at Ford and Lincoln Mercury dealers enrolled in the Around the Wheel or Ford Tire Program (Certified Tire Dealers) should not be sold. Dealers that purchased these tires through the Ford program and have them in stock should complete the *Unsold Wilderness AT Credit Form* located on QCDealer.com. If you have questions, call the Ford Tire Hotline at 1-888-353-3251 for disposal and credit information.

NON-AtW DEALERS SERVICING IN-STOCK UNITS OR CUSTOMER VEHICLES

Non-Certified Tire (AtW or Ford Tire Program) Dealers who have vehicles in stock, or customer vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires must send the vehicle to a Certified Tire Dealer (AtW or Ford Tire Program) or an approved tire retailer participating in the program to have the tire replacement performed. The non-Certified Tire Dealer (AtW or Ford Tire Program) will submit a 01B77 ONP claim using the miscellaneous expense code of "**SCHP**" (with a dollar value of $15.00 to cover administrative costs). Do not claim the "Admin" labor operation.

SERVICE PROCEDURE

All 15-, 16-, and 17-inch Firestone Wilderness AT (regardless of series number) tires installed on Ford and Mercury vehicles must be replaced under this owner notification program. Original equipment (OE) and replacement tires are included.

Spare Tires

Firestone Wilderness AT (regardless of series number) spare tires are affected and should be replaced. The Firestone P235 75R15 ATX temporary spare tire used on Ranger vehicles is not included in this program.

Note: Spare tires should always be replaced with the exact same size tire; otherwise the spare tire may not store in the proper position on the vehicle.

Note: When processing refunds for customers, inspect the spare tire; if the spare tire is a Firestone Wilderness AT (with the Ranger exception noted previously) replace the spare tire using the information provided on Attachment II.

Does Current Tire Condition Affect Replacement Procedure?

All affected tires should be replaced regardless of the mileage or the remaining tread on the tire. If the customer caused damage to the tires, i.e. hit a curb, accident, under inflation, alignment issues, the tire should still be replaced. If the tire is worn out, it should still be replaced.

What if the Vehicle has a Mix of Affected and Non-Affected Tires?

- If the spare tire is the only Wilderness AT, then only the spare should be replaced (see exception on temporary spares above).
- In most cases an owner's vehicle will have all 15-, 16-, or 17–inch Firestone Wilderness AT tires installed and require replacement of all tires. In cases where a vehicle has a mix of tire brands/sizes installed, replace all Firestone Wilderness AT tires and the remaining tires to match the tire brand and size by axle.

For example, if a vehicle has a Wilderness AT on the left front, a Wilderness AT on the right rear, a Wilderness AT for a spare, and the other two tires are not Wilderness AT; the spare and the left front and right rear should be replaced and the new tires should be installed on the same axle. The customer should also be advised that all tires should be the same size especially on 4 X 4 models.

What replacement tires may be used for vehicles originally equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tires?

Replacement tire(s) must be on the list of tires approved by Ford <link to approved tire list>. Any deviation from this approved list may change the vehicles handling, ride, vibration, and noise characteristics and cannot be claimed through Ford.

If customers are seeking reimbursement for tires purchased outside of a Ford Certified Tire Dealer, refer to Attachment I for reimbursement guidelines and claiming procedures. *Customers who purchase tires after November 15, 2001 are not eligible for a refund.*

Note: There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.

Note: "Blemished" tires may not be used as replacement tires under this program.

FORD AND LINCOLN MERCURY DEALER TIRE DISPOSAL PROCESS

- Tires that are removed from vehicles must immediately be made unusable by either cutting the bead through the DOT code with bolt cutters, or drilling a one-inch diameter hole (directly on the DOT code to make the code unreadable) in the sidewall. Defacing the DOT code will prevent the tire from being used for an additional refund request. Marking the last 6 characters of the VIN on the removed tire(s) is no longer required.
- The tires will be disposed of by using the "National Tire Recovery and Recycle Program".

Regional FCSD and independent personnel will be randomly auditing dealers for proper tire scrapping and claiming procedures. Any infractions will result in prior approval for tire owner notification claims.

Note: Make removed tires unusable during tire replacement. Do not stack tires and disable them at a later time.

DEALERSHIPS ELIGIBLE TO REPLACE TIRES UNDER THIS PROGRAM

All Ford and Lincoln Mercury dealers enrolled on the Around the Wheel or Ford Tire Program (Certified Tire Dealers) are eligible to complete tire replacements under this program.

Ford dealers interested in joining the Ford Tire Program may call the Ford Tire Hotline 1-888-353-3251 for enrollment and program details.

APPROVED RETAILERS PARTICIPATION IN PROGRAM

We have developed a program to authorize Goodyear, Michelin, Continental, and General tire retailers to perform tire replacements at no cost to customers. These eligible retailers will use only tires from the Ford Approved Tire List when performing no cost replacements. This was done to reduce customer inconvenience by:

- Eliminating customer out of pocket expense
- Maximize the number of customers whose replacement tires are those on the Ford Approved tire list
- Expedite the completion of this program
- Reduce administrative burden on our Ford and Lincoln Mercury dealers
- Reduce dealer tire disposal responsibility
- Allow dealers to continue with their normal day to day service business

Attachment I - Administrative Information

OASIS

OASIS must be used to determine vehicle eligibility.

IMPORTANT:

When an eligible vehicle is at the dealership for service, OASIS must be contacted to determine if Owner Notification Program 01B77 is open. If 01B77 is listed in OASIS as open, it is important that the vehicle is inspected for eligible tires. If the eligible vehicle is not equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tires a claim must be submitted using labor operation 01B77A to close the program. If an affected vehicle does not have 01B77 open, this may indicate that a refund

or tire replacement has already been processed on this vehicle.

Some Ford and Lincoln Mercury vehicles not listed in the AFFECTED TIRES AND VEHICLES list may have 15-, 16-, or 17-inch Firestone Wilderness AT tires installed. These vehicles are covered under this program, but will not be active in OASIS. Contact the Special Service Support Center at 1-800-325-5621 to obtain prior approval before performing the repair or issuing a refund. This will insure that a previous repair/refund has not been performed on the vehicle.

CLAIMS PREPARATION AND SUBMISSION

^ Enter claims using DWE.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Enter information on a Recall/ONP claim type. DO NOT use a Warranty Claim type.

^ Program code 01B77.

^ Enter the full part number of the replacement tire with the quantity of tires replaced. Tires will be reimbursed at AtW Dealer cost + 25% (wheel weights and valve stems incl.).

^ Use the appropriate labor operation(s) from Attachment II.

^ Freight is reimbursable at actual cost in the miscellaneous expense area of the claim.

NOTE:

Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier. Dealers are encouraged to arrange for shipment of 4 or more tires at a time.

^ Dealers can no longer claim tire disposal for ONP 01B77. See the "National Tire Recovery and Recycle Program". You may still claim any applicable local waste tax - enter OTHER in the expense area of the claim with the actual cost.

^ Enter each unique (complete 10 or 11 digit) DOT codes of the replaced tires on the diagnostic code entry screen in the field marked "other". If the DOT codes cannot be completely entered in the space provided in the diagnostic code area, use the technician comment area to complete the data entry.

RELATED DAMAGE

Vehicle damage caused by a tire related failure is not covered by this program. Refer to the Warranty and Policy Manual for proper claiming procedure for vehicles covered by the Ford Bumper-to-Bumper Tire Warranty (model years 2001 and 2002). All other pre-2001 model year vehicles with alleged tire related vehicle damage should be handled through the Firestone claims process, or by referring the customers to their insurance company.

Damage related to replacement of tires should be handled as described in the Warranty and Policy Manual.

OWNER REFUND

With the increased availability of replacement tires, it will no longer be necessary for customers to pay out-of-pocket expenses for tires. Therefore, refund requests for tires purchased after November 15, 2001 will no longer be granted. Owners will be notified of the refund expiration date and will be directed to a Ford or Mercury dealer They are directed to an authorized retailer only if the Ford or Mercury dealer cannot meet their scheduling needs or tires are not in stock. All Ford and Mercury dealers (AtW and non-AtW dealers) are required to process refunds for customers who purchase tires prior to November 15, 2001.

The following rules apply to refunds for tires purchased from August 1, 2001 through November 15, 2001:

Refunds will be processed for vehicles listed under "AFFECTED TIRES AND VEHICLES", and for other Ford and Lincoln Mercury vehicles that have 15-. 16-, or 17-inch Wilderness AT tires installed.

^ The customer must provide the original paid receipt (a copy of their paid receipt is acceptable on an exception basis in instances where the owner requires the original for another purpose (e.g. extended tire warranty or purchase rebate). The dealer will attach the receipt to the dealer file copy of the refund claim (see claim instructions below).

^ Dealers will be reimbursed to immediately disable tires returned for a refund (see claiming instructions for refunds and Attachment II for labor operations).

^ The tires must be purchased August 1, 2000 through November 15, 2001 to be eligible for a refund (through October 31, 2001 for 1995 and 1996 F-150 owners).

^ Customers requesting refunds for tire replacement May 22, 2001 through November 15, 2001 must provide either:

NOTE:

This does not apply to 1995 and 1996 F-150 customers.

^ The Firestone Wilderness AT tires that were replaced. Returned tire(s) are to be disabled by the dealership. Ford will reimburse the dealer to disable (see claim instructions below and use labor operation 01B77G). If tires are brought in for refund with the DOT codes missing dealers should not process the refund.

^ A section of the old tire(s) containing the DOT codes from each of the Firestone Wilderness AT tires that were replaced (To be cut from the Wilderness AT tires that were replaced by the outside repair facility) (use labor operation 01B77L). Dealers should deface (cut in pieces or make code unreadable) the DOT sections of the tire so they cannot be used to obtain another refund. If sections are brought in for refund with the DOT code defaced dealers should not process the refund.

NOTE:

The DOT Code Identification Guide has been developed to help dealers determine if the DOT sections returned to the dealership are from 15-, 16-,

Purchase Date Range	Refund Guidelines
August 1, 2000 through May 22, 2001	• The actual cost as stated on the paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes • *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
1995 and 1996 F-150 vehicles only *August 1, 2000 through October 31, 2001*	• *The actual cost as stated on the paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes (no DOT required)* • *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
May 23, 2001 through November 15, 2001	• 15 inch tires - $110 (includes mounting, balancing, stems, disposal, and taxes) • 16 and 17 inch tires - $130 (includes mounting, balancing, stems, disposal, and taxes) • Dealers process refunds
After November 15, 2001	• *No refunds accepted for tires purchased after November 15, 2001*

Refund Questions	What is the owner qualified to receive?
Example: On December 21, 2000 the customer paid to have (4) Firestone Wilderness AT tires replaced on an affected vehicle.	o August 1, 2000 through May 22, 2001 (October 31, 2001 for 1995 and 1996 F-150) full refund with paid receipt o Customer does not need old tire(s) o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
Example: On January 15, 2001 the customer paid to have (2) Wilderness AT tires replaced on a 1988 F-Series truck. The other tires are non-Firestone Wilderness AT.	o August 1, 2000 through May 22, 2001 – full refund with paid receipt o Dealer contacts Special Service Support Center at 1-800-325-5621 for approval code o Customer does not need old tire(s) o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*

or 17-inch Firestone Wilderness AT tires. Use the DOT Code Identification Guide in conjunction with the bulletin section "What if the Vehicle has a Mix of Affected and Non-Affected Tires" to determine how many tires are eligible for refund.

NOTE:

Ford will allow customers to file for a refund (with or without tires) for tires purchased after May 22 through June 30, 2001 because customers may not have tires to turn in. Customers must provide a paid receipt indicating tire replacement before July 1, 2001 in order to process a refund without tires or DOT sections. Customers who purchase tires after June 30, 2001 must provide tires or DOT sections.

Ford will reimburse customers the following amounts:

^ Tires purchased from August 1, 2000 through May 22, 2001, the actual cost as stated on their paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes.

^ (1995 and 1996 F-150 vehicle only) Tires purchased from August 1, 2000 through October 31, 2001, the actual cost as stated on their paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes. No DOT section required.

^ Tires purchased May 23, 2001 through November 15, 2001, the actual cost as stated on the receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes up to a maximum of $110 per tire for 15 inch, and $130 per tire for 16 and 17 inch tires.

^ Refunds will not be granted for tires purchased after November 15, 2001.

Note:

If an owner pays for the replacement of their tires after November 15, 2001, the dealer may handle on a case by case basis following the procedure in Attachment II.

Refund Questions	What is the owner qualified to receive?
Example: On May 27, 2001 the customer took their 1998 Explorer to an outside tire retailer and had (5) Firestone Wilderness AT 16 inch tires replaced.	o After May 22, 2001 refund tire replacement with paid receipt up to: o 15 inch = $110 (maximum per tire) o 16 and 17 inch = $130 (maximum per tire) o With a paid receipt this customer would be entitled to (5) tires x $130 (16 inch maximum per tire) = $650 refund (includes mounting, balancing, stems, disposal, and taxes) o Dealer will be eligible to claim for refund allowance using labor operation 01B77L o If the customer returns the old tires to the dealer o The dealer will disable the old tires and dispose of them using the *"National Tire Recovery and Recycle Program"* using labor operation 01B77G (disable) in conjunction with 01B77L (refund allowance) o Customer does not need old tire(s) *since tires purchased prior to July 1, 2001* (After June 30, 2001 customer will need old tires or removed DOT codes from replaced tires to qualify)
Example: On December 2, 2000 the owner replaced their (5) Firestone Wilderness AT tires with another set of Wilderness AT tires.	o The owner is not eligible for refund o The owner is eligible for tire replacement only o Use only tires from the "Ford Approved Tire List"
Example: *On November 16, 2001 the owner purchases tires from a tire retailer.*	o *No refund will be granted after November 15, 2001* o *Dealers may handle on a case-by-case (See Attachment II)*
Example: *On October 10, 2001 a 1995 F-150 owner purchases tires from a tire retailer.*	o *August 1, 2000 through October 31, 2001 – full refund with paid receipt* o *Customer does not need old tire(s) or DOT section(s)* o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*

CLAIMS PREPARATION FOR REFUNDS (USE THIS PROCEDURE FOR ALL REFUND REQUESTS)

NOTE:

Tires must be purchased prior to November 15, 2001

^ Enter claims using DWE.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Enter information on a Recall/ONP claim type. DO NOT use a Warranty Claim type.

^ Program code 01B77.

^ When a customer brings in their old tires and is seeking a refund, use labor operation 01B77G (disable) and 01B77L (refund administration allowance) from Attachment II.

^ If a customer brings in the old DOT codes removed from the old tires - use labor operation 01B77L only.

^ The Miscellaneous Expense Code "ADMIN" will not be accepted under this program. A labor operation 01B77L has been provided to cover administrative costs.

^ Enter REFUND in the miscellaneous area of the claim.

^ Dealers will no longer be able to claim tire disposal for ONP 01B77. See the "National Tire Recovery and Recycle Program" You may still claim any applicable local waste tax - enter OTHER

in the expense area of the claim with the actual cost.

^ Enter each unique (complete 10 or 11 digit) DOT codes of the replaced tires in the diagnostic code entry screen in the field marked "other". If the DOT codes cannot be completely entered in the space provided in the diagnostic code area, use the technician comment area to complete the data entry. If the tires were replaced prior to May 23, 2001 (or November 1, 2001 for 1995 and 1996 F150 customers) the DOT may not be available, in this case record the brand, make and size of the tires in the technician comments area of the claim.

RENTAL CARS

TAP allowances have been increased specifically for this owner notification program. Refer to Don Brunner letter.

DOT REGISTRATION OF NEW TIRES

Dealers are required to register the DOT number of every tire sold to meet federal tire registration requirements. Ford has established a partnership with CIMS to assist dealers in registering these DOT codes. Information is available on QCDealer.com under CIMS Tire Registration or by contacting CIMS

Description	Labor Operation	Labor Time
Inspect for non-Wilderness AT tires (used to close 01B77 not for use when processing a refund)	01B77A	0.2 Hours
Replace & balance 1 tire (to be used for spare tire only)	01B77B	0.4 Hours
Replace & balance 2 tires (one axle)	01B77C	0.6 Hours
Replace & balance 3 tires (one axle plus spare)	01B77D	0.8 Hours
Replace & balance 4 tires (both axles)	01B77E	1.0 Hours
Replace & balance 5 tires	01B77F	1.2 Hours
Disable up to five tires (used only for refund claims)	01B77G	0.2 Hours
*Refund administration allowance (to be used when processing a customer refund without tire disposal, if tires are returned to dealership for disposal use in conjunction with operation 01B77G)	01B77L	0.2 Hours
Administrative Allowance for Non-Certified Tire Dealers (AtW or Ford Tire Program) to be used when sending a dealer stock unit, or customer vehicle (for tire replacement) to a Certified Tire Dealer, or tire retailer authorized to perform tire replacement under this program	Misc. Expense use code "SCHP"	$15.00

NOTE: Front-end alignment is not included in this program.

***NOTE:** When processing a refund for four (4) road tires, the non-temporary spare tire should be replaced as part of this program – file a related damage claim to cover the spare tire replacement.

at 330-794-9190.

NON-FORD OR LINCOLN MERCURY VEHICLES WITH FIRESTONE WILDERNESS AT

Non-Ford or Lincoln Mercury vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires installed by a Certified Tire Dealer (AtW or Ford Tire Program) are eligible for replacement. The repair should be submitted using a Warranty/ESP claim type form. The dealer must enter Program Code "P19", this will allow the repair to be submitted without a VIN. The causal part must be TIRE, with the actual part numbers for reimbursement at dealer cost plus 25%, and use actual time for labor reimbursement. These types of claims cannot be submitted as an Owner Notification Repair type.

Attachment II - Parts and Labor Information

LABOR ALLOWANCES

NON-AtW DEALERS SERVICING IN-STOCK UNITS OR CUSTOMER VEHICLES

NOTE:

Non-Certified Tire Dealers (AtW or Ford Tire Program) who have vehicles in stock, or customer vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires must send the vehicle to a Certified Tire Dealer (AtW or Ford Tire Program), or an approved tire retailer participating in the program to have the tire replacement performed. The non-Certified Tire Dealer (AtW or Ford Tire Program) will submit a 01B77 ONP claim using the miscellaneous expense code of "SCHP" (with a dollar value of $15.00 to cover administrative costs). Do not claim the "Admin" labor operation.

PARTS REQUIREMENTS

Tire Ordering Information

^ Dealers are required to install only tires from the Approved Tire List for vehicles originally equipped with 15-, 16-, and 17-inch Firestone Wilderness AT tires. Dealers should immediately order replacement tires for inventory.

^ Certified Tire Dealers will order replacement tires through normal channels.

^ Dealers not authorized for the Around the Wheel Program will not participate in this recall. Dealers may call the Ford Tire Hotline 1-888-353-3251 for enrollment and program details.

TIRE AVAILABILITY:

All dealers should check QCDealer.com daily for updates to the approved tires list. Distributors and tire retailers will allocate tires as best they can on a daily basis. Your dealership should do the following to ensure that you are able to secure your fair allotment of these limited volumes:

^ Contact your Ford authorized facing distributor(s) for each tire manufacturer.

^ Contact your Ford authorized facing tire retailers for each tire manufacturer.

^ Review with these supply points the volume of tires you need to ensure you have tires ready to fill orders with every supply point.

Questions not addressed by above sources should be directed to your market area team.

CUSTOMER WAIT LISTS:

Dealers should create a customer wait list and record: Customer name

^ Address and phone number

^ Vehicle make

^ Model year

^ Mileage

^ Tire size

NOTE:

Customers should be prioritized to replace oldest tires first.

WAIT LIST SURVEY

Please fill out the Firestone Tire Survey in the Management Report Section of QCDealer weekly. It is critical that you answer the questions as accurately as possible as the survey results will be used to help determine the level of production from the tire manufacturers.

DEALER PRICE

For latest prices on replacement tires, refer to the most recent Ford Motor Company Tire Price List.

PROCEDURE FOR CLAIMING REFUNDS FOR TIRES PURCHASED AFTER NOVEMBER 15, 2001

The following procedure applies to tires purchased after November 15, 2001:

1. Determine if the customer should receive special consideration based on owner loyalty, special circumstance cc, etc.

2. If the customer is eligible for special consideration the dealer will call the Special Service Support Center at 1800-325-5621 to request an authorization code.

3. The Special Service Support Center representative will ask for the following:

^ Customer Name

^ VIN

^ Date of repair

^ Original copy of invoice (be prepared to fax)

4. If the customer qualifies for a refund, the Special Service Support Center will provide your dealer with an authorization code.

5. Your dealer will input a claim with the authorization code (authorization code must be included to receive payment).

6. After the dealer receives payment for the claim, the dealer will then send the refund to the customer.

NOTE:

If the Special Service Support Center determines that the customer does not qualify for a refund, no authorization code will be given. Any appeals must be made by the dealer to the appropriate field representative

Attachment III - Technical Information

AFFECTED VEHICLES: REFER TO DEALER LETTER FOR AFFECTED TIRES AND VEHICLES

OVERVIEW

This program details the replacement of 15-, 16-, and 17-inch Firestone Wilderness AT tires regardless of production plant. You will need to perform a DOT code inspection prior to replacing the 15, 16, or 17-inch Wilderness AT tires.

NOTE:

When lowering or raising an under-vehicle spare, DO NOT use power tools. Also make sure that the spare is secure under the vehicle, and not swinging loose. The spare tire winch will ratchet when the tire is completely stowed.

NOTE:

Radial ATX "TEMPORARY USE" spare tires are not included under this program, and should not be replaced as part of this program.

NOTE:

Spare tires should always be replaced with the exact same size tire; otherwise the spare tire may not store in the proper position on the vehicle.

INSPECTION

1. Inspect the vehicle tires (including the spare tire) for the presence of Firestone Wilderness AT tires.

2. If Firestone Wilderness AT tires are present replace them with a suitable replacement from the "Approved Tire List".

Note:

There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.

3. If only one Firestone Wilderness AT road tire is present on the vehicle, you will need to replace the opposing tire on the same axle. However, if one (1) front and one (1) rear tire are Wilderness AT you would not automatically replace all four (4) tires instead, you would replace the two (2) Wilderness AT tires and place them on the same axle.

4. Record the DOT code from each removed tire(s) on the repair order.

5. Tires that are removed from vehicles must immediately be made unusable by either cutting through the bead and DOT code with bolt cutters, or drilling a one-inch diameter hole (directly on the DOT code to make the code unreadable) in the sidewall.

6. Adjust all tires to the proper inflation pressure, and release the vehicle. For specifications, refer to the vehicle Owner's Manual or the vehicle certification label located on the driver's door opening.

NOTE:

Tires that are removed from vehicles under this program, and those in dealer inventory must immediately be made unusable by either cutting the bead with bolt cutters or drilling a 1" diameter hole (directly on the DOT code to make the code unreadable) in the sidewall. Defacing the DOT

code will prevent the tire from being used for an additional refund request.

NOTE:

If the vehicle is a 4X4, and is equipped with non-Firestone Wilderness AT tires on one axle, and the replacement tires for the Firestone equipped axle causes a mismatch with the existing non-Firestone axle, the customer is responsible for the tire mismatch. If the customer refuses to purchase matching tires to correct the mismatch - the dealer should annotate the repair order to reflect the customer's decision.

Ford Motor Company

FIRESTONE TIRE RECALL

September 2000

TO: All Ford and Lincoln Mercury Dealers
SUBJECT: Firestone Tire Recall Supplement #4 9/1/00 - Updated Information
REFERENCE: Firestone Recall - Firestone P235/75 R15 Radial ATX and Certain Wilderness AT tires

Changes for this Supplement:

- The following has been added to Attachment I to clarify the claiming of freight: Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier.
- Additional information is now required in the comments of each claim filed for tire replacement under both Program Codes P17 and P18. The comments must include the entire DOT code from the tire being replaced and under P17 only the part number of the replacement tire. Firestone requires this information for government reporting.

Claims under the Firestone recall for tire replacement filed by Ford and Lincoln Mercury dealers not enrolled in the AtW/Ford Tire Program will not be accepted for payment. Non-AtW/Ford Tire Program dealers will continue to be able to file claims for tire inspection. This is not new information; we have just added the edits to the ACES II system.

The revised letter and attachments have been marked "Revised 9/1/00", and a ( ) symbol appears at the beginning of any text that changed since the last Supplement and the text appears in green when viewed on line. To avoid confusion please discard all previous versions.

Sincerely,

A. R. O'Neill
Director
Vehicle Service and Programs

Firestone Recall - Firestone P235/75 R15 Radial ATX and Certain Wilderness AT tires.

AFFECTED TIRES AND VEHICLES

Bridgestone Firestone Tire Company recently announced a Safety Recall on the following:

- All Firestone P235/75 R15 Radial ATX tires produced excluding tires marked "TEMPORARY" on the sidewall - and -

- P235/75 R15 wilderness AT tires produced only at the Decatur plant.

NOTE:

Decatur built tires have a DOT code of VDHL - see Attachment III for details. All other Wilderness AT tires are not affected.

Both original equipment (OE) and replacement tires are affected.

The following vehicles produced with Firestone P235/75 R15 Radial ATX original equipment tires are affected by this recall:

^ Certain 1991 through 1996 Ford Explorer (see chart)

^ Certain 1997 Mercury Mountaineer vehicles

^ Certain 1991 through 2000 Ranger vehicles

^ Certain 1991 through 1994 Bronco vehicles

^ Certain 1991 through 1994 F-Series vehicles

The following vehicles produced with P235/75 R15 Wilderness AT tires as original equipment are affected by this recall:

Certain 1997 through August 7, 2000 Mountaineer vehicles

^ Certain 1997 through August 7, 2000 Explorer vehicles (see chart)

^ Certain 1997 through June 1, 2000 Ranger vehicles

^ Certain 2001 Explorer Sport Trac and Sport vehicles produced through August 7, 2000

These Explorer vehicles produced with either P235/75 R15 Radial ATX or P235/75 R15 Wilderness AT tires as original equipment are affected as shown.

These Explorer vehicles are NOT affected:

IMPORTANT FACTS

^ This is a FIRESTONE recall.

^ FIRESTONE will notify customers of the recall via first class mail.

^ FIRESTONE will communicate recall information to authorized repair sites including Ford and Lincoln-Mercury Around the wheel/Ford Tire Program dealers.

FORD AND LINCOLN MERCURY DEALER INVOLVEMENT

As this field action will severely impact the availability of Firestone replacement tires, Ford and Lincoln Mercury Around the Wheel (AtW)/Ford Tire Program dealers will be afforded the opportunity to address this recall utilizing Firestone and non-Firestone tires. This is being done to address immediate needs of our customers.

FORD AND LINCOLN MERCURY DEALERS ENROLLED IN AROUND THE WHEEL (AtW)

Dealerships enrolled in the AtW/Ford Tire Program are authorized Firestone outlets. If a customer with affected tires contacts an ATW Ford Tire Program dealer, as an authorized Firestone dealer regarding this safety recall, you will be able to replace that customer's tires with Firestone or "approved" non-Firestone tires. Tires that are approved for use as replacement tires under this recall will be posted in a matrix in the Firestone Tire Center in QCDealer.com. This matrix will be amended to add new tire manufactures and models of tires as they are approved. Claiming for reimbursement of tires is outlined on Attachment I.

If the customer requests a replacement Firestone tire, secure the tire through your normal distribution chain and process reimbursement as outlined in Attachment I.

FORD AND LINCOLN MERCURY DEALERS NOT ENROLLED IN AROUND THE WHEEL (AtW)

Dealers not enrolled in the ATW/Ford Tire Program can inspect customer vehicles (see Attachments I & II for claiming instructions & labor operations). These dealers should make individual arrangements with local Firestone outlets for tire replacement, or refer customers to their local Firestone outlet.

SERVICE PROCEDURE

All Firestone P235/75 R15 tires with Radial ATX on the sidewall (excludes Temporary spare tires identified by "Temporary" on the sidewall) must be replaced under this recall.

Firestone P235/75 R15 tires with Wilderness AT on the sidewall will need to be inspected for a DOT code of VDHL to determine if replacement is required. Refer to Attachment III for details.

This service action applies to original equipment and replacement tires that are installed on Ford and Mercury vehicles.

DEMONSTRATION / DELIVERY HOLD FOR VEHICLES AND TIRES IN DEALER INVENTORY

Do not demonstrate or deliver any of the affected vehicles prior to completing the Firestone recall. In addition, Ford and Lincoln Mercury Around the Wheel (AtW)/Ford Tire Program dealers may have affected tires in inventory; these tires should not be sold.

Tires Removed from Vehicles

Tires that are removed from vehicles must immediately be made unusable by either cutting the bead with bolt cutters, drilling a one-inch diameter hole in the sidewall, or cutting the tire completely in half The DOT code should not be defaced or removed. The tire should then be disposed of according to local laws refer to the Tire Administration Guide for further information.

NOTE:

AtW/Ford Tire Program dealers will be independently audited for compliance with the above procedure.

New Inventory Tires

All new Radial ATX or Wilderness AT tires with DOT code VDHL tires (never mounted) in AtW/Ford Tire Program dealer inventory must be returned to Firestone. Dealers must call 1-800-668-0345 to obtain a "Returned Goods Authorization (RGA) number. The RGA is a 6-digit number required to return the tires. Only tires affected by the Firestone recall will be accepted. Firestone will pay all freight for the return of these tires.

For Around the Wheel/Ford Tire Program 1-888-353-3251

Questions:

Attachment I

OASIS Since this is a Firestone recall, OASIS will not be activated.

PLEASE NOTE

Correct all vehicles in stock before delivery. Federal law requires dealers to complete any outstanding safety recall service before a vehicle is delivered to the buyer or lessee. Violation of this requirement by a dealer could result in a civil penalty of up to $1,100 per vehicle.

CLAIMS PREPARATION AND SUBMISSION

NOTE:

Claims for Firestone tires (P18) may be entered for payment beginning with repairs dated August 28, 2000 and later.

Claims for non-Firestone tires

Enter claims in ACES II for non-Firestone tires using DWE with the following information:

^ Enter information on a warranty claim. DO NOT use a recall claim.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Program Code - P17. Enter P17TIRE as the causal part with condition code 82.

^ On the same line as PI7TIRE enter the total value of the tires from the "Suggested List Price" column of the latest Ford Motor Company Tire Selling Guide.

^ Use the appropriate labor operation(s) from Attachment II.

^ Freight is reimbursable at actual cost in the miscellaneous expense area of the claim.

NOTE:

Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier.

^ Tire disposal and applicable local waste tax will be reimbursed - enter OTHER in the miscellaneous expense area of the claim with the actual cost.

^ Enter the entire DOT code and the part number of the replacement tire being used in the comments area of the claim.

Claims for Firestone tires

Enter claims in ACES II for Firestone tires using the following information:

^ Enter information on a warranty claim. DO NOT use a recall claim type.

^ Program Code - P18.

^ Enter "P18TIRE" as the causal part, no material cost should be entered on this line.

Description	Labor Operation	Labor Time
Inspect 5 tires applies only to P235/75 R15 Wilderness AT tires) - VEHICLE NOT AFFECTED (Non VDHL DOT Code)	00V01G	0.2 Hours

Replace & balance 5 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01F	1.2 Hour

^ Condition code "82".

^ Use Customer Concern Code "A99".

^ Enter the full published tire part number with the quantity of tires replaced, the payment system will price the tire at Dealer Net multiplied by the quantity for the total value of the replaced tires.

^ Use Miscellaneous Expense Code "TIREMU" to claim the $20.00 difference per tire7 a maximum of $100.00.

^ The Firestone warranty claim form must be filled out and attached to the hard copy of the claim and retained in the service file. The entire DOT code from the replacement tire(s) must be recorded on this form.

^ The DOT code must also be entered in the comments area of the claim.

^ No labor operations will be allowed when claiming P18.

OWNER REFUND

Ford and Lincoln Mercury dealers, including AtW/Ford tire dealers; will not be involved in processing refunds for customers included in the Firestone recall. Customers inquiring about a refund should be provided copies of the Firestone refund request form. Refer to the Firestone website for the refund forms and for further details.

RENTAL CARS

TAP allowances have been increased specifically for the Firestone recall refer to M.J. Lombardi's Letter.

Attachment II

LABOR ALLOWANCES

NOTE:

Front-end alignment is not included in this recall.

NOTE:

These labor operations and revised times will begin paying with claims submitted on August 18, 2000; Claims in process at dealerships will need to use these new operations.

PARTS REQUIREMENTS

Tire Ordering Information

FIRESTONE TIRE INSPECTION

AFFECTED VEHICLES: **REFER TO DEALER LETTER FOR AFFECTED TIRES AND VEHICLES**

OVERVIEW

This procedure outlines how to check the DOT code on the tires and determine if they must be replaced.

NOTE: All Firestone P235/75R15 tires that say "RADIAL ATX" on the sidewall are being recalled and no further inspection is necessary.

NOTE: All tires including the spare must be inspected if they are "WILDERNESS AT" P235/75R15.

NOTE: When lowering or raising an under-vehicle spare, **DO NOT** use power tools. Also make sure that the spare is secure under the vehicle, and not swinging loose. The spare tire winch will ratchet when the tire is completely stowed.

INSPECTION

1. Raise vehicle on a hoist.
2. Locate the DOT code on the inboard sidewall of all tires including the spare. On F-Series and Bronco models, the spare tire must be lowered to view the DOT code. Clean the area if necessary in order to accurately read the code.
3. If the DOT code is **VDHL**, the tire must be replaced. See the matrix (part of the dealer bulletin) to determine the correct replacement tires. See Figure 1.

NOTE: Recall tires that are removed from vehicles and in dealer inventory must immediately be made unusable by either cutting the bead with bolt cutters or drilling a 1" diameter hole in the sidewall.

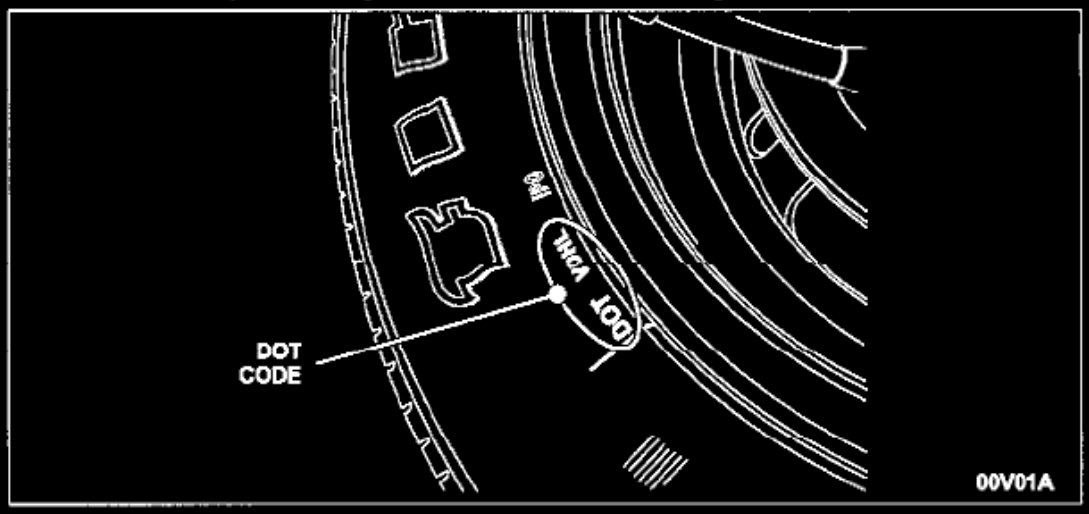

FIGURE 1

4. If the code is anything other than **VDHL**, release the vehicle to the owner.

CPR© 2000 FORD MOTOR COMPANY
DEARBORN, MICHIGAN 48121
08/00

Authorized Around the Wheel (ATW)/Ford Tire Program dealers will order replacement tires through normal channels. Dealers not authorized for the Around the Wheel Program will not participate in the Firestone recall. Dealers may call the Ford Tire Hotline 1-888-353-3251 for enrollment and program details.

DEALER PRICE

For latest prices on replacement tires refer to the most recent Ford Motor Company Tire Selling Guide.

Tires: Customer Interest Transfer Case - Unable to Disengage 4WD Into 2WD

Article No. 91-20-17

10/02/91

TRANSFER CASE - 4X4 - UNABLE TO DISENGAGE

LIGHT TRUCK: 1990-91 RANGER 1991 EXPLORER

ISSUE: The vehicle may remain in 4 Wheel Drive after the transfer case has been shifted back into 2WD. This may occur because of uneven tire wear, the front axle hubs not disengaging, or the return spring force not being sufficient to move the lock-up fork back to the 2WD position.

ACTION: Inspect the vehicle tires for wear and, if necessary, replace the return spring, sleeve spring and lock-up fork in the transfer case.

INITIAL CHECKS

1. Rotate the tires and check for evidence of an uneven wear band or spots.

2. Set the tire pressure as specified on the safety compliance certification label.

3. Confirm that the tires are matched in design, size and manufacture.

4. Confirm by hand rotation that the front axle automatic and manual locking hubs are disengaging correctly.

NOTE: IF THE VEHICLE WAS PREVIOUSLY REPAIRED PER TSB 91-15-10, THE TRANSFER CASE WAS UPDATED WITH THE PARTS

INCLUDED IN THIS TSB. IF THE UPDATED TRANSFER CASE STILL WILL NOT DISENGAGE AFTER FOLLOWING THE INITIAL CHECKS, THEN THE CAUSE COULD BE THAT THE DRIVER IS NOT ALLOWING SUFFICIENT TIME FOR THE 4WD SYSTEM TO DISENGAGE.

VERIFICATION

Drive the vehicle. If the transfer case still will not disengage after performing the initial checks, proceed as follows:

1. Shift the vehicle with lever operated or electric shift transfer case to 4WD high.

2. Hand rotate the front axle manual locking hubs to the lock position, if so equipped.

3. Drive the vehicle slowly in a tight turn on dry hard pavement until you feel the front wheel power hop/skip which indicates that the 4WD system is engaged.

4. Drive the vehicle on a frame hoist...

a. Shift the automatic or manual transmission to neutral.

b. Shift the transfer case to 2WD.

c. Turn the ignition key to the OFF position.

5. Raise the vehicle on the frame hoist, making sure all tires are free to rotate.

6. Using gloves, hand rotate the rear driveshaft while viewing the front driveshaft for rotation.

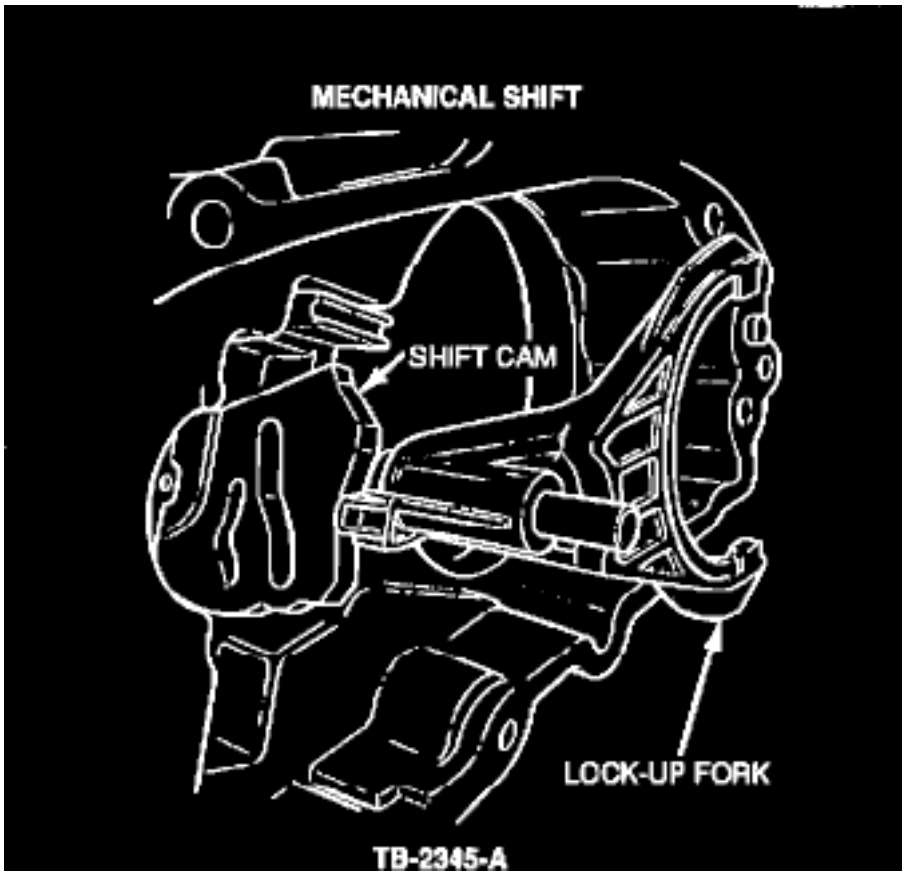
^ If the front driveshaft does not rotate, this indicates that the transfer case has disengaged and is functioning correctly.

^ If the front driveshaft rotates while turning the rear driveshaft, this indicates that the transfer case has not disengaged and must be repaired.

7. Before starting the repair, repeat the above procedure a second time to confirm that the transfer case will not disengage.

ELECTRIC SHIFT TRANSFER CASE

If the above procedure is not conclusive, for an electric shift transfer case system, proceed as follows:



1. Remove the 7K470 speed sensor/wiring harness bracket and 7F293 speed sensor assembly from the transfer case.

2. With the use of a light and looking into the speed sensor opening...

a. Locate the white or black 7289 lock-up fork.

b. Using a straight tool, push it forward toward the front of the vehicle.

^ If the lock-up fork does not move, this indicates that the lock-up assembly has moved back to the 2WD position and the transfer case is functioning correctly.

^ If the lock-up fork moves about 3/8" (9.525 mm), this indicates that the lock-up assembly remained in the 4WD position or did not disengage and must be repaired.

TRANSFER CASE REPAIR

Refer to the 1991 Ranger and Explorer Service Manual, Sections 07-07E and 07-07D, for procedures to remove and dissemble the transfer case. Install and reassemble the following components:

^ One (1) Return Spring (F1TZ-7219-A)

^ One (1) Sleeve Spring (E6TZ-7D126-A), with large end installed first into bore of 7106 lock-up collar.

^ One (1) Lock-Up Fork (F1TZ-7289-D, bone white color).

Figure 1

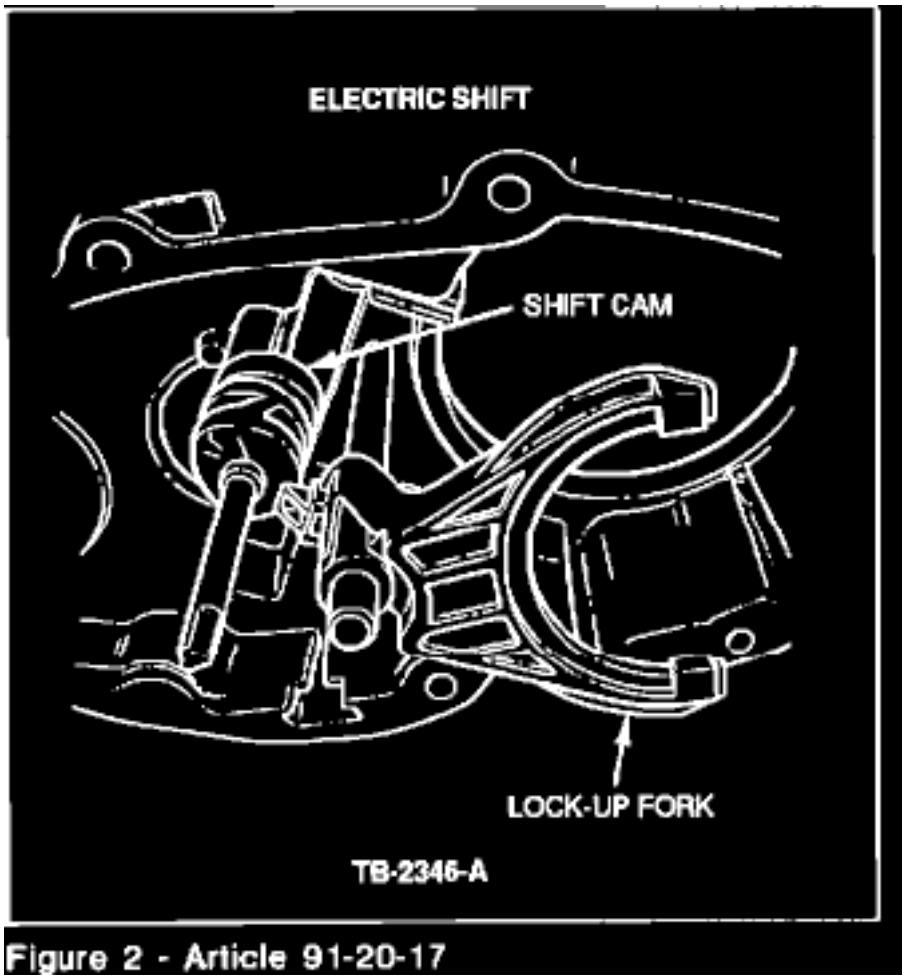


Figure 2 - Article 91-20-17

Figure 2

NOTE: WHEN INSTALLING THE 7289 LOCK-UP FORK, MAKE SURE THAT THE 7235 LOCK-UP FORK ROLLER BUSHING IS

POSITIONED ON THE TOP OR END SURFACE OF THE 7F063 SHIFT CAM AND NOT INTO AN INSIDE CAM TRACK, FIGURES 1 AND 2.

Reinstall the transfer case in the vehicle and check for shift function including engagement and disengagement.

Ford Motor Company

October 2001

TO: All Ford and Lincoln Mercury Dealers

SUBJECT: **Owner Notification Program 01B77 Supplement 7:** 10/12/01 Updated Information

REFERENCE: **Owner Notification Program 01B77 – Ford Wilderness AT Program:** Replacement of Wilderness AT tires

PROGRESS TO DATE

- To date we have replaced close to 7 million tires or 55% of the total tires needed
- Ford and Mercury dealers are currently handling over 70% of all Wilderness AT replacements
- All tire sizes are now readily available, though certain brands may not be available

The following information has been updated for ONP 01B77:

CHANGES MADE TO THE ALL DEALER LETTER

- ONP 01B77 – Ford Wilderness AT program will expire on March 31, 2002
- Tires purchased by customers after November 15, 2001 will not be eligible for a refund
- All customers who have not had their tires replaced will receive a follow-up letter by the end of October, 2001 announcing these program changes and encouraging them to visit a Ford Motor Company dealership for tire replacement
- 1995 and 1996 F-150 customers, which were added to the program on August 17, 2001, will receive their first notification letter by the end of October, 2001, which includes the following:
  - The customer must have their tires replaced at a Ford Motor Company dealer
  - They will only be eligible for refunds if they purchased their tires between August 1, 2000 through October 31, 2001

    NOTE: Refunded at actual cost and no DOT sections required, since these customers were never notified of the DOT requirements and maximum dollar limit.
- Effective immediately all tire refund requests are to be processed through the dealer (Online Refund Form should no longer be used)

CHANGES TO ATTACHMENT I

- Tires purchased by customers after November 15, 2001 will not be eligible for a refund
- The Online Refund Form used for refunds before May 22, 2001 is no longer posted on the web

CHANGES TO ATTACHMENT II

- Wait List Survey link added
- A procedure has been added to handle customers who purchase tires after November 15, 2001 and are seeking a refund

All revisions since Supplement 6 are in *red italics* and revised pages have been marked "*Revised10/12/01.*"

Sincerely,

Ann O'Neill
Director
Vehicle Service and Programs

Technical Service Bulletin # 01B77 Date: 011001

Ford Motor Company

May 2001
Revised 10/12/01

TO: All Ford and Lincoln Mercury Dealers

SUBJECT: **Owner Notification Program 01B77-S7 – Ford Firestone Wilderness AT Program:** Replacement of Firestone Wilderness AT tires.

OASIS: Yes
OWNER LIST: Yes
PARTS RETURN: No
PROGRAM TERMS: This program will expire *March 31, 2002* and has no mileage limit.

WHAT WE ARE DOING AND WHY

On August 9, 2000 Firestone initiated a voluntary recall of 6.5 million tires, including 3.8 million P235 75R15 Radial ATX tires manufactured since 1990 at all North American Firestone plants. Also, Firestone recalled about 2.7 million P235 75R15 Wilderness AT tires made at its Decatur, Illinois plant. The recall included both original equipment and replacement tires. As of January 22, 2001 more than 6.1 million tires have been replaced – the recall is more than 94% complete.

Under this new owner notification, Ford will replace 13 million Firestone Wilderness AT tires on Ford and Mercury SUVs and pickup trucks listed below under "affected tires and vehicles." This is a voluntary precautionary measure. Ford made the decision to take this action after extensive examination of field data as well as laboratory and track testing in close collaboration with NHTSA. The field data, along with our testing and statistical analysis, shows a directional trend toward elevated failure rates, that differs based upon where the tires were manufactured. Ford does not have sufficient confidence in the future performance of these tires, so we are acting in the interest of our customers to ensure their continued trust and confidence.

To date we have replaced close to 7 million tires or 55% of the total tires needed for this program. Ford and Mercury dealers are currently handling over 70% of the Wilderness AT tire replacements. Also, with the increased availability of all 15-, 16-, and 17-inch tires at the dealers, Ford is changing the expiration date of the program to March 31, 2002 to encourage customers to have their tires replaced as soon as possible.

NOTE: Certain brands of tires may have limited availability.

AFFECTED TIRES AND VEHICLES

This program affects 15-, 16-, and 17-inch Firestone Wilderness AT tires and Ford and Mercury vehicles with these tires on them. The vehicles listed below may have been originally equipped with Firestone Wilderness AT tires or may have had Wilderness AT tires installed during the Firestone recall launched in August, 2000.

- Certain 1991 through 2002 Ford Explorer
- Certain 2001 through 2002 Explorer Sport, and Sport Trac
- Certain 1997 through 2002 Mercury Mountaineer
- Certain 1991 through 2001 Ranger
- Certain 1999 through 2001 Expedition
- Certain 1991 through 1997 F-Series
- Certain 1991 through 1994 Bronco

NOTE: Both original equipment (OE) and replacement tires are affected.

IMPORTANT FACTS

- *Ford Wilderness AT tire program will expire on March 31, 2002.*
- *Tires purchased by customers after November 15, 2001 will no longer be eligible for a refund.*
- *A follow-up owner letter announcing program changes will be mailed beginning the week of October 17, 2001.*
- *1995 and 1996 F-150 owners, which were added to the program on August 17, 2001, will be notified by the end of October 2001.*
- All 15-, 16-, and 17-inch Firestone Wilderness AT tires (regardless of series number) that are mounted on Ford or Mercury vehicles are eligible for replacement
- All other Firestone Wilderness AT tire sizes are not included in this program.
- AtW/Ford Tire Program dealers are to stop the sale of Firestone Wilderness AT tires in their parts inventory effective immediately.
- Ford Motor Company has notified customers of this owner notification program via first class mail.
- Customer refunds will be handled differently based on whether the tires were purchased before or after May 22, 2001.
- *Effective immediately all refunds will be processed through the dealer for customers who purchased their tires from August 1, 2000 through November 15, 2001, (Online Refund Form should no longer be used).*
- *1995 and 1996 F-150 owners will only be eligible for refunds for tires purchased between August 1, 2000 and October 31, 2001, (no DOT sections required).*
- A list of Ford-approved replacement tires is posted on QCDealer. Only these tires may be used as replacement tires for vehicles that were originally equipped with 15-, 16-, and 17-inch Firestone Wilderness AT tires under this program.
- There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.
- **Vehicles with branded titles** - although normally excluded from Owner Notification Programs are included as part of this program.
- Affected vehicles sold in Canada can be serviced by U.S. dealers, and affected vehicles sold in the U.S. can be serviced by Canadian dealers.

STOP SALE OF FIRESTONE WILDERNESS AT TIRES IN DEALER STOCK

Firestone Wilderness AT tires in stock at Ford and Lincoln Mercury dealers enrolled in the Around the Wheel or Ford Tire Program (Certified Tire Dealers) should not be sold. Dealers that purchased these tires through the Ford program and have them in stock should complete the *Unsold Wilderness AT Credit Form* located on QCDealer.com. If you have questions, call the Ford Tire Hotline at 1-888-353-3251 for disposal and credit information.

NON-AtW DEALERS SERVICING IN-STOCK UNITS OR CUSTOMER VEHICLES

Non-Certified Tire (AtW or Ford Tire Program) Dealers who have vehicles in stock, or customer vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires must send the vehicle to a Certified Tire Dealer (AtW or Ford Tire Program) or an approved tire retailer participating in the program to have the tire replacement performed. The non-Certified Tire Dealer (AtW or Ford Tire Program) will submit a 01B77 ONP claim using the miscellaneous expense code of "**SCHP**" (with a dollar value of $15.00 to cover administrative costs). Do not claim the "Admin" labor operation.

SERVICE PROCEDURE

All 15-, 16-, and 17-inch Firestone Wilderness AT (regardless of series number) tires installed on Ford and Mercury vehicles must be replaced under this owner notification program. Original equipment (OE) and replacement tires are included.

Spare Tires

Firestone Wilderness AT (regardless of series number) spare tires are affected and should be replaced. The Firestone P235 75R15 ATX temporary spare tire used on Ranger vehicles is not included in this program.

Note: Spare tires should always be replaced with the exact same size tire; otherwise the spare tire may not store in the proper position on the vehicle.

Note: When processing refunds for customers, inspect the spare tire; if the spare tire is a Firestone Wilderness AT (with the Ranger exception noted previously) replace the spare tire using the information provided on Attachment II.

Does Current Tire Condition Affect Replacement Procedure?

All affected tires should be replaced regardless of the mileage or the remaining tread on the tire. If the customer caused damage to the tires, i.e. hit a curb, accident, under inflation, alignment issues, the tire should still be replaced. If the tire is worn out, it should still be replaced.

What if the Vehicle has a Mix of Affected and Non-Affected Tires?

- If the spare tire is the only Wilderness AT, then only the spare should be replaced (see exception on temporary spares above).
- In most cases an owner's vehicle will have all 15-, 16-, or 17–inch Firestone Wilderness AT tires installed and require replacement of all tires. In cases where a vehicle has a mix of tire brands/sizes installed, replace all Firestone Wilderness AT tires and the remaining tires to match the tire brand and size by axle.

For example, if a vehicle has a Wilderness AT on the left front, a Wilderness AT on the right rear, a Wilderness AT for a spare, and the other two tires are not Wilderness AT; the spare and the left front and right rear should be replaced and the new tires should be installed on the same axle. The customer should also be advised that all tires should be the same size especially on 4 X 4 models.

What replacement tires may be used for vehicles originally equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tires?

Replacement tire(s) must be on the list of tires approved by Ford <link to approved tire list>. Any deviation from this approved list may change the vehicles handling, ride, vibration, and noise characteristics and cannot be claimed through Ford.

If customers are seeking reimbursement for tires purchased outside of a Ford Certified Tire Dealer, refer to Attachment I for reimbursement guidelines and claiming procedures. *Customers who purchase tires after November 15, 2001 are not eligible for a refund.*

Note: There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.

Note: "Blemished" tires may not be used as replacement tires under this program.

FORD AND LINCOLN MERCURY DEALER TIRE DISPOSAL PROCESS

- Tires that are removed from vehicles must immediately be made unusable by either cutting the bead through the DOT code with bolt cutters, or drilling a one-inch diameter hole (directly on the DOT code to make the code unreadable) in the sidewall. Defacing the DOT code will prevent the tire from being used for an additional refund request. Marking the last 6 characters of the VIN on the removed tire(s) is no longer required.
- The tires will be disposed of by using the "National Tire Recovery and Recycle Program".

Regional FCSD and independent personnel will be randomly auditing dealers for proper tire scrapping and claiming procedures. Any infractions will result in prior approval for tire owner notification claims.

Note: Make removed tires unusable during tire replacement. Do not stack tires and disable them at a later time.

DEALERSHIPS ELIGIBLE TO REPLACE TIRES UNDER THIS PROGRAM

All Ford and Lincoln Mercury dealers enrolled on the Around the Wheel or Ford Tire Program (Certified Tire Dealers) are eligible to complete tire replacements under this program.

Ford dealers interested in joining the Ford Tire Program may call the Ford Tire Hotline 1-888-353-3251 for enrollment and program details.

APPROVED RETAILERS PARTICIPATION IN PROGRAM

We have developed a program to authorize Goodyear, Michelin, Continental, and General tire retailers to perform tire replacements at no cost to customers. These eligible retailers will use only tires from the Ford Approved Tire List when performing no cost replacements. This was done to reduce customer inconvenience by:

- Eliminating customer out of pocket expense
- Maximize the number of customers whose replacement tires are those on the Ford Approved tire list
- Expedite the completion of this program
- Reduce administrative burden on our Ford and Lincoln Mercury dealers
- Reduce dealer tire disposal responsibility
- Allow dealers to continue with their normal day to day service business

Vehicle Service and Programs

Attachment I - Administrative Information

OASIS

OASIS must be used to determine vehicle eligibility.

IMPORTANT:

When an eligible vehicle is at the dealership for service, OASIS must be contacted to determine if Owner Notification Program 01B77 is open. If 01B77 is listed in OASIS as open, it is important that the vehicle is inspected for eligible tires. If the eligible vehicle is not equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tires a claim must be submitted using labor operation 01B77A to close the program. If an affected vehicle does not have 01B77 open, this may indicate that a refund

or tire replacement has already been processed on this vehicle.

Some Ford and Lincoln Mercury vehicles not listed in the AFFECTED TIRES AND VEHICLES list may have 15-, 16-, or 17-inch Firestone Wilderness AT tires installed. These vehicles are covered under this program, but will not be active in OASIS. Contact the Special Service Support Center at 1-800-325-5621 to obtain prior approval before performing the repair or issuing a refund. This will insure that a previous repair/refund has not been performed on the vehicle.

CLAIMS PREPARATION AND SUBMISSION

^ Enter claims using DWE.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Enter information on a Recall/ONP claim type. DO NOT use a Warranty Claim type.

^ Program code 01B77.

^ Enter the full part number of the replacement tire with the quantity of tires replaced. Tires will be reimbursed at AtW Dealer cost + 25% (wheel weights and valve stems incl.).

^ Use the appropriate labor operation(s) from Attachment II.

^ Freight is reimbursable at actual cost in the miscellaneous expense area of the claim.

NOTE:

Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier. Dealers are encouraged to arrange for shipment of 4 or more tires at a time.

^ Dealers can no longer claim tire disposal for ONP 01B77. See the "National Tire Recovery and Recycle Program". You may still claim any applicable local waste tax - enter OTHER in the expense area of the claim with the actual cost.

^ Enter each unique (complete 10 or 11 digit) DOT codes of the replaced tires on the diagnostic code entry screen in the field marked "other". If the DOT codes cannot be completely entered in the space provided in the diagnostic code area, use the technician comment area to complete the data entry.

RELATED DAMAGE

Vehicle damage caused by a tire related failure is not covered by this program. Refer to the Warranty and Policy Manual for proper claiming procedure for vehicles covered by the Ford Bumper-to-Bumper Tire Warranty (model years 2001 and 2002). All other pre-2001 model year vehicles with alleged tire related vehicle damage should be handled through the Firestone claims process, or by referring the customers to their insurance company.

Damage related to replacement of tires should be handled as described in the Warranty and Policy Manual.

OWNER REFUND

With the increased availability of replacement tires, it will no longer be necessary for customers to pay out-of-pocket expenses for tires. Therefore, refund requests for tires purchased after November 15, 2001 will no longer be granted. Owners will be notified of the refund expiration date and will be directed to a Ford or Mercury dealer They are directed to an authorized retailer only if the Ford or Mercury dealer cannot meet their scheduling needs or tires are not in stock. All Ford and Mercury dealers (AtW and non-AtW dealers) are required to process refunds for customers who purchase tires prior to November 15, 2001.

The following rules apply to refunds for tires purchased from August 1, 2001 through November 15, 2001:

Refunds will be processed for vehicles listed under "AFFECTED TIRES AND VEHICLES", and for other Ford and Lincoln Mercury vehicles that have 15-. 16-, or 17-inch Wilderness AT tires installed.

^ The customer must provide the original paid receipt (a copy of their paid receipt is acceptable on an exception basis in instances where the owner requires the original for another purpose (e.g. extended tire warranty or purchase rebate). The dealer will attach the receipt to the dealer file copy of the refund claim (see claim instructions below).

^ Dealers will be reimbursed to immediately disable tires returned for a refund (see claiming instructions for refunds and Attachment II for labor operations).

^ The tires must be purchased August 1, 2000 through November 15, 2001 to be eligible for a refund (through October 31, 2001 for 1995 and 1996 F-150 owners).

^ Customers requesting refunds for tire replacement May 22, 2001 through November 15, 2001 must provide either:

NOTE:

This does not apply to 1995 and 1996 F-150 customers.

^ The Firestone Wilderness AT tires that were replaced. Returned tire(s) are to be disabled by the dealership. Ford will reimburse the dealer to disable (see claim instructions below and use labor operation 01B77G). If tires are brought in for refund with the DOT codes missing dealers should not process the refund.

^ A section of the old tire(s) containing the DOT codes from each of the Firestone Wilderness AT tires that were replaced (To be cut from the Wilderness AT tires that were replaced by the outside repair facility) (use labor operation 01B77L). Dealers should deface (cut in pieces or make code unreadable) the DOT sections of the tire so they cannot be used to obtain another refund. If sections are brought in for refund with the DOT code defaced dealers should not process the refund.

NOTE:

The DOT Code Identification Guide has been developed to help dealers determine if the DOT sections returned to the dealership are from 15-, 16-,

Purchase Date Range	Refund Guidelines
August 1, 2000 through May 22, 2001	• The actual cost as stated on the paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes • *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
1995 and 1996 F-150 vehicles only *August 1, 2000 through October 31, 2001*	• *The actual cost as stated on the paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes (no DOT required)* • *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
May 23, 2001 through November 15, 2001	• 15 inch tires - $110 (includes mounting, balancing, stems, disposal, and taxes) • 16 and 17 inch tires - $130 (includes mounting, balancing, stems, disposal, and taxes) • Dealers process refunds
After November 15, 2001	• *No refunds accepted for tires purchased after November 15, 2001*

Refund Questions	What is the owner qualified to receive?
Example: On December 21, 2000 the customer paid to have (4) Firestone Wilderness AT tires replaced on an affected vehicle.	o August 1, 2000 through May 22, 2001 (October 31, 2001 for 1995 and 1996 F 150) full refund with paid receipt o Customer does not need old tire(s) o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
Example: On January 15, 2001 the customer paid to have (2) Wilderness AT tires replaced on a 1988 F-Series truck. The other tires are non-Firestone Wilderness AT.	o August 1, 2000 through May 22, 2001 – full refund with paid receipt o Dealer contacts Special Service Support Center at 1-800-325-5621 for approval code o Customer does not need old tire(s) o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*

or 17-inch Firestone Wilderness AT tires. Use the DOT Code Identification Guide in conjunction with the bulletin section "What if the Vehicle has a Mix of Affected and Non-Affected Tires" to determine how many tires are eligible for refund.

NOTE:

Ford will allow customers to file for a refund (with or without tires) for tires purchased after May 22 through June 30, 2001 because customers may not have tires to turn in. Customers must provide a paid receipt indicating tire replacement before July 1, 2001 in order to process a refund without tires or DOT sections. Customers who purchase tires after June 30, 2001 must provide tires or DOT sections.

Ford will reimburse customers the following amounts:

^ Tires purchased from August 1, 2000 through May 22, 2001, the actual cost as stated on their paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes.

^ (1995 and 1996 F-150 vehicle only) Tires purchased from August 1, 2000 through October 31, 2001, the actual cost as stated on their paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes. No DOT section required.

^ Tires purchased May 23, 2001 through November 15, 2001, the actual cost as stated on the receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes up to a maximum of $110 per tire for 15 inch, and $130 per tire for 16 and 17 inch tires.

^ Refunds will not be granted for tires purchased after November 15, 2001.

Note:

If an owner pays for the replacement of their tires after November 15, 2001, the dealer may handle on a case by case basis following the procedure in Attachment II.

Refund Questions	What is the owner qualified to receive?
Example: On May 27, 2001 the customer took their 1998 Explorer to an outside tire retailer and had (5) Firestone Wilderness AT 16 inch tires replaced.	o After May 22, 2001 refund tire replacement with paid receipt up to: o 15 inch = $110 (maximum per tire) o 16 and 17 inch = $130 (maximum per tire) o With a paid receipt this customer would be entitled to (5) tires x $130 (16 inch maximum per tire) = $650 refund (includes mounting, balancing, stems, disposal, and taxes) o Dealer will be eligible to claim for refund allowance using labor operation 01B77L o If the customer returns the old tires to the dealer o The dealer will disable the old tires and dispose of them using the *"National Tire Recovery and Recycle Program"* using labor operation 01B77G (disable) in conjunction with 01B77L (refund allowance) o Customer does not need old tire(s) *since tires purchased prior to July 1, 2001* (After June 30, 2001 customer will need old tires or removed DOT codes from replaced tires to qualify)
Example: On December 2, 2000 the owner replaced their (5) Firestone Wilderness AT tires with another set of Wilderness AT tires.	o The owner is not eligible for refund o The owner is eligible for tire replacement only o Use only tires from the "Ford Approved Tire List"
Example: *On November 16, 2001 the owner purchases tires from a tire retailer.*	o *No refund will be granted after November 15, 2001* o *Dealers may handle on a case-by-case (See Attachment II)*
Example: *On October 10, 2001 a 1995 F-150 owner purchases tires from a tire retailer.*	o *August 1, 2000 through October 31, 2001 – full refund with paid receipt* o *Customer does not need old tire(s) or DOT section(s)* o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*

CLAIMS PREPARATION FOR REFUNDS (USE THIS PROCEDURE FOR ALL REFUND REQUESTS)

NOTE:

Tires must be purchased prior to November 15, 2001

^ Enter claims using DWE.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Enter information on a Recall/ONP claim type. DO NOT use a Warranty Claim type.

^ Program code 01B77.

^ When a customer brings in their old tires and is seeking a refund, use labor operation 01B77G (disable) and 01B77L (refund administration allowance) from Attachment II.

^ If a customer brings in the old DOT codes removed from the old tires - use labor operation 01B77L only.

^ The Miscellaneous Expense Code "ADMIN" will not be accepted under this program. A labor operation 01B77L has been provided to cover administrative costs.

^ Enter REFUND in the miscellaneous area of the claim.

^ Dealers will no longer be able to claim tire disposal for ONP 01B77. See the "National Tire Recovery and Recycle Program" You may still claim any applicable local waste tax - enter OTHER in the expense area of the claim with the actual cost.

^ Enter each unique (complete 10 or 11 digit) DOT codes of the replaced tires in the diagnostic code entry screen in the field marked "other". If the DOT codes cannot be completely entered in the space provided in the diagnostic code area, use the technician comment area to complete the data entry. If the tires were replaced prior to May 23, 2001 (or November 1, 2001 for 1995 and 1996 F150 customers) the DOT may not be available, in this case record the brand, make and size of the tires in the technician comments area of the claim.

RENTAL CARS

TAP allowances have been increased specifically for this owner notification program. Refer to Don Brunner letter.

DOT REGISTRATION OF NEW TIRES

Dealers are required to register the DOT number of every tire sold to meet federal tire registration requirements. Ford has established a partnership with CIMS to assist dealers in registering these DOT codes. Information is available on QCDealer.com under CIMS Tire Registration or by contacting CIMS

Description	Labor Operation	Labor Time
Inspect for non-Wilderness AT tires (used to close 01B77 not for use when processing a refund)	01B77A	0.2 Hours
Replace & balance 1 tire (to be used for spare tire only)	01B77B	0.4 Hours
Replace & balance 2 tires (one axle)	01B77C	0.6 Hours
Replace & balance 3 tires (one axle plus spare)	01B77D	0.8 Hours
Replace & balance 4 tires (both axles)	01B77E	1.0 Hours
Replace & balance 5 tires	01B77F	1.2 Hours
Disable up to five tires (used only for refund claims)	01B77G	0.2 Hours
*Refund administration allowance (to be used when processing a customer refund without tire disposal, if tires are returned to dealership for disposal use in conjunction with operation 01B77G)	01B77L	0.2 Hours
Administrative Allowance for Non-Certified Tire Dealers (AtW or Ford Tire Program) to be used when sending a dealer stock unit, or customer vehicle (for tire replacement) to a Certified Tire Dealer, or tire retailer authorized to perform tire replacement under this program	Misc. Expense use code "SCHP"	$15.00

NOTE: Front-end alignment is not included in this program.

***NOTE:** When processing a refund for four (4) road tires, the non-temporary spare tire should be replaced as part of this program – file a related damage claim to cover the spare tire replacement.

at 330-794-9190.

NON-FORD OR LINCOLN MERCURY VEHICLES WITH FIRESTONE WILDERNESS AT

Non-Ford or Lincoln Mercury vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires installed by a Certified Tire Dealer (AtW or Ford Tire Program) are eligible for replacement. The repair should be submitted using a Warranty/ESP claim type form. The dealer must enter Program Code "P19", this will allow the repair to be submitted without a VIN. The causal part must be TIRE, with the actual part numbers for reimbursement at dealer cost plus 25%, and use actual time for labor reimbursement. These types of claims cannot be submitted as an Owner Notification Repair type.

Attachment II - Parts and Labor Information

LABOR ALLOWANCES

NON-AtW DEALERS SERVICING IN-STOCK UNITS OR CUSTOMER VEHICLES

NOTE:

Non-Certified Tire Dealers (AtW or Ford Tire Program) who have vehicles in stock, or customer vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires must send the vehicle to a Certified Tire Dealer (AtW or Ford Tire Program), or an approved tire retailer participating in the program to have the tire replacement performed. The non-Certified Tire Dealer (AtW or Ford Tire Program) will submit a 01B77 ONP claim using the miscellaneous expense code of "SCHP" (with a dollar value of $15.00 to cover administrative costs). Do not claim the "Admin" labor operation.

PARTS REQUIREMENTS

Tire Ordering Information

^ Dealers are required to install only tires from the Approved Tire List for vehicles originally equipped with 15-, 16-, and 17-inch Firestone Wilderness AT tires. Dealers should immediately order replacement tires for inventory.

^ Certified Tire Dealers will order replacement tires through normal channels.

^ Dealers not authorized for the Around the Wheel Program will not participate in this recall. Dealers may call the Ford Tire Hotline 1-888-353-3251 for enrollment and program details.

TIRE AVAILABILITY:

All dealers should check QCDealer.com daily for updates to the approved tires list. Distributors and tire retailers will allocate tires as best they can on a daily basis. Your dealership should do the following to ensure that you are able to secure your fair allotment of these limited volumes:

^ Contact your Ford authorized facing distributor(s) for each tire manufacturer.

^ Contact your Ford authorized facing tire retailers for each tire manufacturer.

^ Review with these supply points the volume of tires you need to ensure you have tires ready to fill orders with every supply point.

Questions not addressed by above sources should be directed to your market area team.

CUSTOMER WAIT LISTS:

Dealers should create a customer wait list and record: Customer name

^ Address and phone number

^ Vehicle make

^ Model year

^ Mileage

^ Tire size

NOTE:

Customers should be prioritized to replace oldest tires first.

WAIT LIST SURVEY

Please fill out the Firestone Tire Survey in the Management Report Section of QCDealer weekly. It is critical that you answer the questions as accurately as possible as the survey results will be used to help determine the level of production from the tire manufacturers.

DEALER PRICE

For latest prices on replacement tires, refer to the most recent Ford Motor Company Tire Price List.

PROCEDURE FOR CLAIMING REFUNDS FOR TIRES PURCHASED AFTER NOVEMBER 15, 2001

The following procedure applies to tires purchased after November 15, 2001:

1. Determine if the customer should receive special consideration based on owner loyalty, special circumstance cc, etc.

2. If the customer is eligible for special consideration the dealer will call the Special Service Support Center at 1800-325-5621 to request an authorization code.

3. The Special Service Support Center representative will ask for the following:

^ Customer Name

^ VIN

^ Date of repair

^ Original copy of invoice (be prepared to fax)

4. If the customer qualifies for a refund, the Special Service Support Center will provide your dealer with an authorization code.

5. Your dealer will input a claim with the authorization code (authorization code must be included to receive payment).

6. After the dealer receives payment for the claim, the dealer will then send the refund to the customer.

NOTE:

If the Special Service Support Center determines that the customer does not qualify for a refund, no authorization code will be given. Any appeals must be made by the dealer to the appropriate field representative

Attachment III - Technical Information

AFFECTED VEHICLES: REFER TO DEALER LETTER FOR AFFECTED TIRES AND VEHICLES

OVERVIEW

This program details the replacement of 15-, 16-, and 17-inch Firestone Wilderness AT tires regardless of production plant. You will need to perform a DOT code inspection prior to replacing the 15, 16, or 17-inch Wilderness AT tires.

NOTE:

When lowering or raising an under-vehicle spare, DO NOT use power tools. Also make sure that the spare is secure under the vehicle, and not swinging loose. The spare tire winch will ratchet when the tire is completely stowed.

NOTE:

Radial ATX "TEMPORARY USE" spare tires are not included under this program, and should not be replaced as part of this program.

NOTE:

Spare tires should always be replaced with the exact same size tire; otherwise the spare tire may not store in the proper position on the vehicle.

INSPECTION

1. Inspect the vehicle tires (including the spare tire) for the presence of Firestone Wilderness AT tires.

2. If Firestone Wilderness AT tires are present replace them with a suitable replacement from the "Approved Tire List".

Note:

There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.

3. If only one Firestone Wilderness AT road tire is present on the vehicle, you will need to replace the opposing tire on the same axle. However, if one (1) front and one (1) rear tire are Wilderness AT you would not automatically replace all four (4) tires instead, you would replace the two (2) Wilderness AT tires and place them on the same axle.

4. Record the DOT code from each removed tire(s) on the repair order.

5. Tires that are removed from vehicles must immediately be made unusable by either cutting through the bead and DOT code with bolt cutters, or drilling a one-inch diameter hole (directly on the DOT code to make the code unreadable) in the sidewall.

6. Adjust all tires to the proper inflation pressure, and release the vehicle. For specifications, refer to the vehicle Owner's Manual or the vehicle certification label located on the driver's door opening.

NOTE:

Tires that are removed from vehicles under this program, and those in dealer inventory must immediately be made unusable by either cutting the bead with bolt cutters or drilling a 1" diameter hole (directly on the DOT code to make the code unreadable) in the sidewall. Defacing the DOT code will prevent the tire from being used for an additional refund request.

NOTE:

If the vehicle is a 4X4, and is equipped with non-Firestone Wilderness AT tires on one axle, and the replacement tires for the Firestone equipped axle causes a mismatch with the existing non-Firestone axle, the customer is responsible for the tire mismatch. If the customer refuses to purchase matching tires to correct the mismatch - the dealer should annotate the repair order to reflect the customer's decision.

Ford Motor Company

FIRESTONE TIRE RECALL

September 2000

TO: All Ford and Lincoln Mercury Dealers
SUBJECT: Firestone Tire Recall Supplement #4 9/1/00 - Updated Information
REFERENCE: Firestone Recall - Firestone P235/75 R15 Radial ATX and Certain Wilderness AT tires

Changes for this Supplement:

- The following has been added to Attachment I to clarify the claiming of freight: Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier.
- Additional information is now required in the comments of each claim filed for tire replacement under both Program Codes P17 and P18. The comments must include the entire DOT code from the tire being replaced and under P17 only the part number of the replacement tire. Firestone requires this information for government reporting.

Claims under the Firestone recall for tire replacement filed by Ford and Lincoln Mercury dealers not enrolled in the AtW/Ford Tire Program will not be accepted for payment. Non-AtW/Ford Tire Program dealers will continue to be able to file claims for tire inspection. This is not new information; we have just added the edits to the ACES II system.

The revised letter and attachments have been marked "Revised 9/1/00", and a ( ) symbol appears at the beginning of any text that changed since the last Supplement and the text appears in green when viewed on line. To avoid confusion please discard all previous versions.

Sincerely,

A. R. O'Neill
Director
Vehicle Service and Programs

Firestone Recall - Firestone P235/75 R15 Radial ATX and Certain Wilderness AT tires.

AFFECTED TIRES AND VEHICLES

Bridgestone Firestone Tire Company recently announced a Safety Recall on the following:

- All Firestone P235/75 R15 Radial ATX tires produced excluding tires marked "TEMPORARY" on the sidewall - and -

- P235/75 R15 wilderness AT tires produced only at the Decatur plant.

NOTE:

Decatur built tires have a DOT code of VDHL - see Attachment III for details. All other Wilderness AT tires are not affected.

Both original equipment (OE) and replacement tires are affected.

The following vehicles produced with Firestone P235/75 R15 Radial ATX original equipment tires are affected by this recall:

^ Certain 1991 through 1996 Ford Explorer (see chart)

^ Certain 1997 Mercury Mountaineer vehicles

^ Certain 1991 through 2000 Ranger vehicles

^ Certain 1991 through 1994 Bronco vehicles

^ Certain 1991 through 1994 F-Series vehicles

The following vehicles produced with P235/75 R15 Wilderness AT tires as original equipment are affected by this recall:

Certain 1997 through August 7, 2000 Mountaineer vehicles

^ Certain 1997 through August 7, 2000 Explorer vehicles (see chart)

^ Certain 1997 through June 1, 2000 Ranger vehicles

^ Certain 2001 Explorer Sport Trac and Sport vehicles produced through August 7, 2000

These Explorer vehicles produced with either P235/75 R15 Radial ATX or P235/75 R15 Wilderness AT tires as original equipment are affected as shown.

These Explorer vehicles are NOT affected:

IMPORTANT FACTS

^ This is a FIRESTONE recall.

^ FIRESTONE will notify customers of the recall via first class mail.

^ FIRESTONE will communicate recall information to authorized repair sites including Ford and Lincoln-Mercury Around the wheel/Ford Tire Program dealers.

FORD AND LINCOLN MERCURY DEALER INVOLVEMENT

As this field action will severely impact the availability of Firestone replacement tires, Ford and Lincoln Mercury Around the Wheel (AtW)/Ford Tire Program dealers will be afforded the opportunity to address this recall utilizing Firestone and non-Firestone tires. This is being done to address immediate needs of our customers.

FORD AND LINCOLN MERCURY DEALERS ENROLLED IN AROUND THE WHEEL (AtW)

Dealerships enrolled in the AtW/Ford Tire Program are authorized Firestone outlets. If a customer with affected tires contacts an ATW Ford Tire Program dealer, as an authorized Firestone dealer regarding this safety recall, you will be able to replace that customer's tires with Firestone or "approved" non-Firestone tires. Tires that are approved for use as replacement tires under this recall will be posted in a matrix in the Firestone Tire Center in QCDealer.com. This matrix will be amended to add new tire manufactures and models of tires as they are approved. Claiming for reimbursement of tires is outlined on Attachment I.

If the customer requests a replacement Firestone tire, secure the tire through your normal distribution chain and process reimbursement as outlined in Attachment I.

FORD AND LINCOLN MERCURY DEALERS NOT ENROLLED IN AROUND THE WHEEL (AtW)

Dealers not enrolled in the ATW/Ford Tire Program can inspect customer vehicles (see Attachments I & II for claiming instructions & labor operations). These dealers should make individual arrangements with local Firestone outlets for tire replacement, or refer customers to their local Firestone outlet.

SERVICE PROCEDURE

All Firestone P235/75 R15 tires with Radial ATX on the sidewall (excludes Temporary spare tires identified by "Temporary" on the sidewall) must be replaced under this recall.

Firestone P235/75 R15 tires with Wilderness AT on the sidewall will need to be inspected for a DOT code of VDHL to determine if replacement is required. Refer to Attachment III for details.

This service action applies to original equipment and replacement tires that are installed on Ford and Mercury vehicles.

DEMONSTRATION / DELIVERY HOLD FOR VEHICLES AND TIRES IN DEALER INVENTORY

Do not demonstrate or deliver any of the affected vehicles prior to completing the Firestone recall. In addition, Ford and Lincoln Mercury Around the Wheel (AtW)/Ford Tire Program dealers may have affected tires in inventory; these tires should not be sold.

Tires Removed from Vehicles

Tires that are removed from vehicles must immediately be made unusable by either cutting the bead with bolt cutters, drilling a one-inch diameter hole in the sidewall, or cutting the tire completely in half The DOT code should not be defaced or removed. The tire should then be disposed of according to local laws refer to the Tire Administration Guide for further information.

NOTE:

AtW/Ford Tire Program dealers will be independently audited for compliance with the above procedure.

New Inventory Tires

All new Radial ATX or Wilderness AT tires with DOT code VDHL tires (never mounted) in AtW/Ford Tire Program dealer inventory must be returned to Firestone. Dealers must call 1-800-668-0345 to obtain a "Returned Goods Authorization (RGA) number. The RGA is a 6-digit number required to return the tires. Only tires affected by the Firestone recall will be accepted. Firestone will pay all freight for the return of these tires.

For Around the Wheel/Ford Tire Program 1-888-353-3251

Questions:

Attachment I

OASIS Since this is a Firestone recall, OASIS will not be activated.

PLEASE NOTE

Correct all vehicles in stock before delivery. Federal law requires dealers to complete any outstanding safety recall service before a vehicle is delivered to the buyer or lessee. Violation of this requirement by a dealer could result in a civil penalty of up to $1,100 per vehicle.

CLAIMS PREPARATION AND SUBMISSION

NOTE:

Claims for Firestone tires (P18) may be entered for payment beginning with repairs dated August 28, 2000 and later.

Claims for non-Firestone tires

Enter claims in ACES II for non-Firestone tires using DWE with the following information:

^ Enter information on a warranty claim. DO NOT use a recall claim.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Program Code - P17. Enter P17TIRE as the causal part with condition code 82.

^ On the same line as PI7TIRE enter the total value of the tires from the "Suggested List Price" column of the latest Ford Motor Company Tire Selling Guide.

^ Use the appropriate labor operation(s) from Attachment II.

^ Freight is reimbursable at actual cost in the miscellaneous expense area of the claim.

NOTE:

Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier.

^ Tire disposal and applicable local waste tax will be reimbursed - enter OTHER in the miscellaneous expense area of the claim with the actual cost.

^ Enter the entire DOT code and the part number of the replacement tire being used in the comments area of the claim.

Claims for Firestone tires

Enter claims in ACES II for Firestone tires using the following information:

^ Enter information on a warranty claim. DO NOT use a recall claim type.

^ Program Code - P18.

^ Enter "P18TIRE" as the causal part, no material cost should be entered on this line.

Description	Labor Operation	Labor Time
Inspect 5 tires applies only to P235/75 R15 Wilderness AT tires) - VEHICLE NOT AFFECTED (Non VDHL DOT Code)	00V01G	0.2 Hours
Inspect 5 tires (applies only to P235/75 R15 Wilderness AT tires) - VEHICLE AFFECTED - Customer must return at a later date due to unavailability of replacement tires. This may be claimed only one time per vehicle per dealer.	00V01A	0.2 Hours
Replace & balance 1 tire (No longer includes inspect) May be used with labor op 00V01A only	00V01B	0.4 Hours
Replace & balance 2 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01C	0.6 Hours
Replace & balance 3 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01D	0.8 Hours
Replace & balance 4 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01E	1.0 Hours
Replace & balance 5 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01F	1.2 Hour

^ Condition code "82".

^ Use Customer Concern Code "A99".

^ Enter the full published tire part number with the quantity of tires replaced, the payment system will price the tire at Dealer Net multiplied by the quantity for the total value of the replaced tires.

^ Use Miscellaneous Expense Code "TIREMU" to claim the $20.00 difference per tire7 a maximum of $100.00.

^ The Firestone warranty claim form must be filled out and attached to the hard copy of the claim and retained in the service file. The entire DOT code from the replacement tire(s) must be recorded on this form.

^ The DOT code must also be entered in the comments area of the claim.

^ No labor operations will be allowed when claiming P18.

OWNER REFUND

Ford and Lincoln Mercury dealers, including AtW/Ford tire dealers; will not be involved in processing refunds for customers included in the Firestone recall. Customers inquiring about a refund should be provided copies of the Firestone refund request form. Refer to the Firestone website for the refund forms and for further details.

RENTAL CARS

TAP allowances have been increased specifically for the Firestone recall refer to M.J. Lombardi's Letter.

Attachment II

LABOR ALLOWANCES

NOTE:

Front-end alignment is not included in this recall.

NOTE:

These labor operations and revised times will begin paying with claims submitted on August 18, 2000; Claims in process at dealerships will need to use these new operations.

PARTS REQUIREMENTS

Tire Ordering Information

FIRESTONE TIRE INSPECTION

AFFECTED VEHICLES: **REFER TO DEALER LETTER FOR AFFECTED TIRES AND VEHICLES**

OVERVIEW

This procedure outlines how to check the DOT code on the tires and determine if they must be replaced.

NOTE: All Firestone P235/75R15 tires that say "RADIAL ATX" on the sidewall are being recalled and no further inspection is necessary.

NOTE: All tires including the spare must be inspected if they are "WILDERNESS AT" P235/75R15.

NOTE: When lowering or raising an under-vehicle spare, **DO NOT** use power tools. Also make sure that the spare is secure under the vehicle, and not swinging loose. The spare tire winch will ratchet when the tire is completely stowed.

INSPECTION

1. Raise vehicle on a hoist.
2. Locate the DOT code on the inboard sidewall of all tires including the spare. On F-Series and Bronco models, the spare tire must be lowered to view the DOT code. Clean the area if necessary in order to accurately read the code.
3. If the DOT code is **VDHL**, the tire must be replaced. See the matrix (part of the dealer bulletin) to determine the correct replacement tires. See Figure 1.

NOTE: Recall tires that are removed from vehicles and in dealer inventory must immediately be made unusable by either cutting the bead with bolt cutters or drilling a 1" diameter hole in the sidewall.

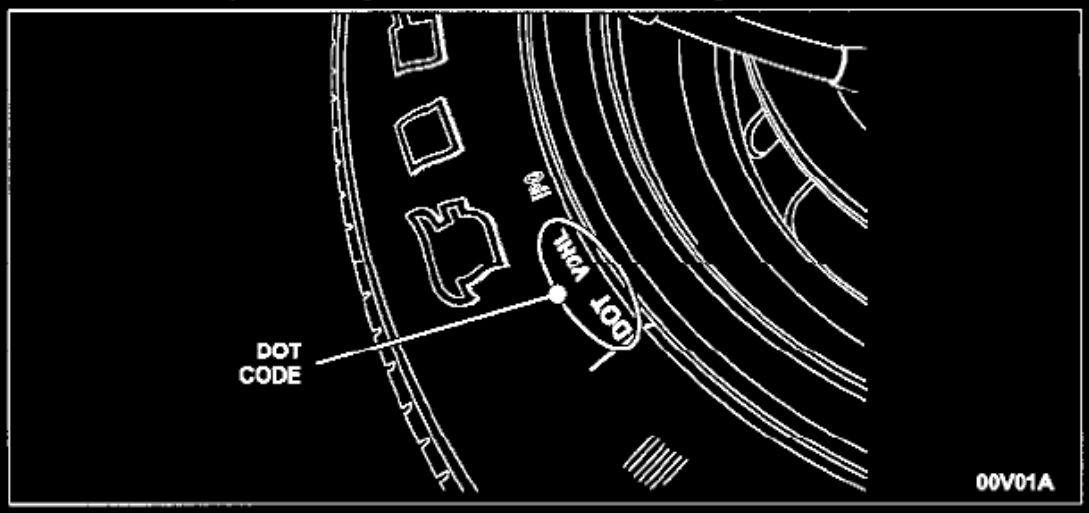

FIGURE 1

4. If the code is anything other than **VDHL**, release the vehicle to the owner.

Tires: All Technical Service Bulletins Transfer Case - Unable to Disengage 4WD Into 2WD

Article No. 91-20-17

10/02/91

TRANSFER CASE - 4X4 - UNABLE TO DISENGAGE

LIGHT TRUCK: 1990-91 RANGER 1991 EXPLORER

ISSUE: The vehicle may remain in 4 Wheel Drive after the transfer case has been shifted back into 2WD. This may occur because of uneven tire wear, the front axle hubs not disengaging, or the return spring force not being sufficient to move the lock-up fork back to the 2WD position.

ACTION: Inspect the vehicle tires for wear and, if necessary, replace the return spring, sleeve spring and lock-up fork in the transfer case.

INITIAL CHECKS

1. Rotate the tires and check for evidence of an uneven wear band or spots.

2. Set the tire pressure as specified on the safety compliance certification label.

3. Confirm that the tires are matched in design, size and manufacture.

4. Confirm by hand rotation that the front axle automatic and manual locking hubs are disengaging correctly.

NOTE: IF THE VEHICLE WAS PREVIOUSLY REPAIRED PER TSB 91-15-10, THE TRANSFER CASE WAS UPDATED WITH THE PARTS

INCLUDED IN THIS TSB. IF THE UPDATED TRANSFER CASE STILL WILL NOT DISENGAGE AFTER FOLLOWING THE INITIAL CHECKS, THEN THE CAUSE COULD BE THAT THE DRIVER IS NOT ALLOWING SUFFICIENT TIME FOR THE 4WD SYSTEM TO DISENGAGE.

VERIFICATION

Drive the vehicle. If the transfer case still will not disengage after performing the initial checks, proceed as follows:

1. Shift the vehicle with lever operated or electric shift transfer case to 4WD high.

2. Hand rotate the front axle manual locking hubs to the lock position, if so equipped.

3. Drive the vehicle slowly in a tight turn on dry hard pavement until you feel the front wheel power hop/skip which indicates that the 4WD system is engaged.

4. Drive the vehicle on a frame hoist...

a. Shift the automatic or manual transmission to neutral.

b. Shift the transfer case to 2WD.

c. Turn the ignition key to the OFF position.

5. Raise the vehicle on the frame hoist, making sure all tires are free to rotate.

6. Using gloves, hand rotate the rear driveshaft while viewing the front driveshaft for rotation.

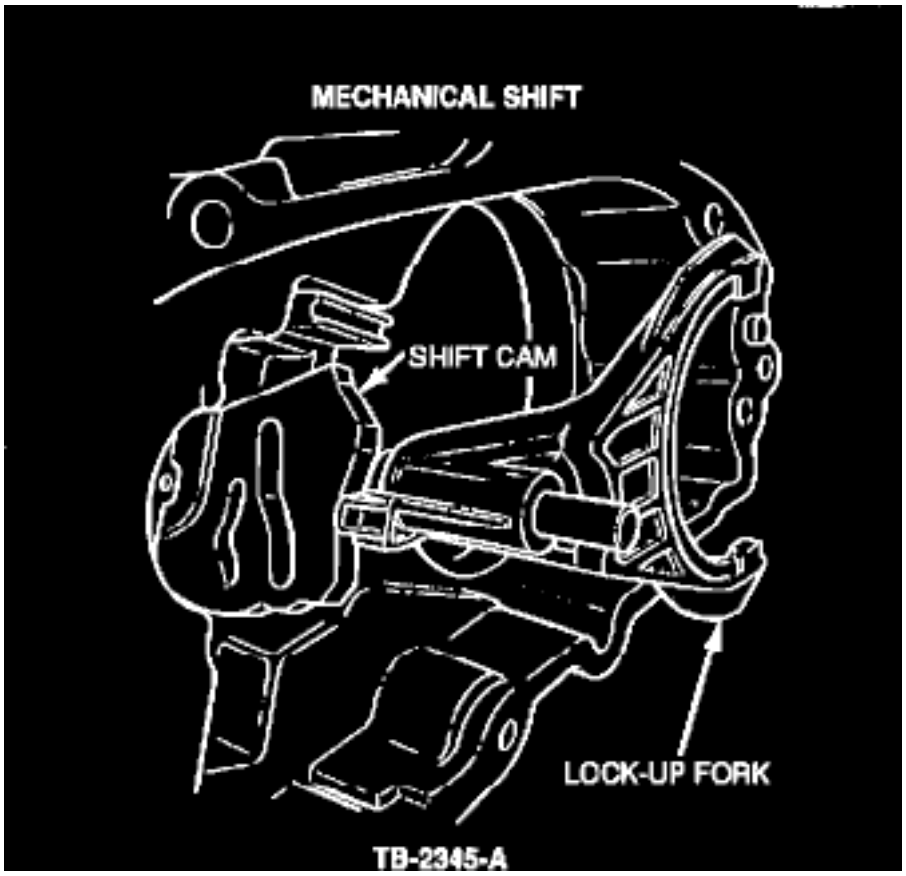
^ If the front driveshaft does not rotate, this indicates that the transfer case has disengaged and is functioning correctly.

^ If the front driveshaft rotates while turning the rear driveshaft, this indicates that the transfer case has not disengaged and must be repaired.

7. Before starting the repair, repeat the above procedure a second time to confirm that the transfer case will not disengage.

ELECTRIC SHIFT TRANSFER CASE

If the above procedure is not conclusive, for an electric shift transfer case system, proceed as follows:



1. Remove the 7K470 speed sensor/wiring harness bracket and 7F293 speed sensor assembly from the transfer case.

2. With the use of a light and looking into the speed sensor opening...

a. Locate the white or black 7289 lock-up fork.

b. Using a straight tool, push it forward toward the front of the vehicle.

^ If the lock-up fork does not move, this indicates that the lock-up assembly has moved back to the 2WD position and the transfer case is functioning correctly.

^ If the lock-up fork moves about 3/8" (9.525 mm), this indicates that the lock-up assembly remained in the 4WD position or did not disengage and must be repaired.

TRANSFER CASE REPAIR

Refer to the 1991 Ranger and Explorer Service Manual, Sections 07-07E and 07-07D, for procedures to remove and dissemble the transfer case. Install and reassemble the following components:

^ One (1) Return Spring (F1TZ-7219-A)

^ One (1) Sleeve Spring (E6TZ-7D126-A), with large end installed first into bore of 7106 lock-up collar.

^ One (1) Lock-Up Fork (F1TZ-7289-D, bone white color).

OASIS CODES: 508000

Ford Motor Company

October 2001

TO: All Ford and Lincoln Mercury Dealers

SUBJECT: **Owner Notification Program 01B77 Supplement 7:** 10/12/01 Updated Information

REFERENCE: **Owner Notification Program 01B77 – Ford Wilderness AT Program:** Replacement of Wilderness AT tires

PROGRESS TO DATE

- To date we have replaced close to 7 million tires or 55% of the total tires needed
- Ford and Mercury dealers are currently handling over 70% of all Wilderness AT replacements
- All tire sizes are now readily available, though certain brands may not be available

The following information has been updated for ONP 01B77:

CHANGES MADE TO THE ALL DEALER LETTER

- ONP 01B77 – Ford Wilderness AT program will expire on March 31, 2002
- Tires purchased by customers after November 15, 2001 will not be eligible for a refund
- All customers who have not had their tires replaced will receive a follow-up letter by the end of October, 2001 announcing these program changes and encouraging them to visit a Ford Motor Company dealership for tire replacement
- 1995 and 1996 F-150 customers, which were added to the program on August 17, 2001, will receive their first notification letter by the end of October, 2001, which includes the following:
  - The customer must have their tires replaced at a Ford Motor Company dealer
  - They will only be eligible for refunds if they purchased their tires between August 1, 2000 through October 31, 2001

    NOTE: Refunded at actual cost and no DOT sections required, since these customers were never notified of the DOT requirements and maximum dollar limit.
- Effective immediately all tire refund requests are to be processed through the dealer (Online Refund Form should no longer be used)

CHANGES TO ATTACHMENT I

- Tires purchased by customers after November 15, 2001 will not be eligible for a refund
- The Online Refund Form used for refunds before May 22, 2001 is no longer posted on the web

CHANGES TO ATTACHMENT II

- Wait List Survey link added
- A procedure has been added to handle customers who purchase tires after November 15, 2001 and are seeking a refund

All revisions since Supplement 6 are in *red italics* and revised pages have been marked "*Revised10/12/01.*"

Sincerely,

Ann O'Neill
Director
Vehicle Service and Programs

Technical Service Bulletin # 01B77 Date: 011001

Ford Motor Company

May 2001
Revised 10/12/01

TO: All Ford and Lincoln Mercury Dealers

SUBJECT: **Owner Notification Program 01B77-S7 – Ford Firestone Wilderness AT Program:** Replacement of Firestone Wilderness AT tires.

OASIS: Yes
OWNER LIST: Yes
PARTS RETURN: No
PROGRAM TERMS: This program will expire *March 31, 2002* and has no mileage limit.

WHAT WE ARE DOING AND WHY

On August 9, 2000 Firestone initiated a voluntary recall of 6.5 million tires, including 3.8 million P235 75R15 Radial ATX tires manufactured since 1990 at all North American Firestone plants. Also, Firestone recalled about 2.7 million P235 75R15 Wilderness AT tires made at its Decatur, Illinois plant. The recall included both original equipment and replacement tires. As of January 22, 2001 more than 6.1 million tires have been replaced – the recall is more than 94% complete.

Under this new owner notification, Ford will replace 13 million Firestone Wilderness AT tires on Ford and Mercury SUVs and pickup trucks listed below under "affected tires and vehicles." This is a voluntary precautionary measure. Ford made the decision to take this action after extensive examination of field data as well as laboratory and track testing in close collaboration with NHTSA. The field data, along with our testing and statistical analysis, shows a directional trend toward elevated failure rates, that differs based upon where the tires were manufactured. Ford does not have sufficient confidence in the future performance of these tires, so we are acting in the interest of our customers to ensure their continued trust and confidence.

To date we have replaced close to 7 million tires or 55% of the total tires needed for this program. Ford and Mercury dealers are currently handling over 70% of the Wilderness AT tire replacements. Also, with the increased availability of all 15-, 16-, and 17-inch tires at the dealers, Ford is changing the expiration date of the program to March 31, 2002 to encourage customers to have their tires replaced as soon as possible.

NOTE: Certain brands of tires may have limited availability.

AFFECTED TIRES AND VEHICLES

This program affects 15-, 16-, and 17-inch Firestone Wilderness AT tires and Ford and Mercury vehicles with these tires on them. The vehicles listed below may have been originally equipped with Firestone Wilderness AT tires or may have had Wilderness AT tires installed during the Firestone recall launched in August, 2000.

- Certain 1991 through 2002 Ford Explorer
- Certain 2001 through 2002 Explorer Sport, and Sport Trac
- Certain 1997 through 2002 Mercury Mountaineer
- Certain 1991 through 2001 Ranger
- Certain 1999 through 2001 Expedition
- Certain 1991 through 1997 F-Series
- Certain 1991 through 1994 Bronco

NOTE: Both original equipment (OE) and replacement tires are affected.

IMPORTANT FACTS

- *Ford Wilderness AT tire program will expire on March 31, 2002.*
- *Tires purchased by customers after November 15, 2001 will no longer be eligible for a refund.*
- *A follow-up owner letter announcing program changes will be mailed beginning the week of October 17, 2001.*
- *1995 and 1996 F-150 owners, which were added to the program on August 17, 2001, will be notified by the end of October 2001.*
- All 15-, 16-, and 17-inch Firestone Wilderness AT tires (regardless of series number) that are mounted on Ford or Mercury vehicles are eligible for replacement
- All other Firestone Wilderness AT tire sizes are not included in this program.
- AtW/Ford Tire Program dealers are to stop the sale of Firestone Wilderness AT tires in their parts inventory effective immediately.
- Ford Motor Company has notified customers of this owner notification program via first class mail.
- Customer refunds will be handled differently based on whether the tires were purchased before or after May 22, 2001.
- *Effective immediately all refunds will be processed through the dealer for customers who purchased their tires from August 1, 2000 through November 15, 2001, (Online Refund Form should no longer be used).*
- *1995 and 1996 F-150 owners will only be eligible for refunds for tires purchased between August 1, 2000 and October 31, 2001, (no DOT sections required).*
- A list of Ford-approved replacement tires is posted on QCDealer. Only these tires may be used as replacement tires for vehicles that were originally equipped with 15-, 16-, and 17-inch Firestone Wilderness AT tires under this program.
- There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.
- **Vehicles with branded titles** - although normally excluded from Owner Notification Programs are included as part of this program.
- Affected vehicles sold in Canada can be serviced by U.S. dealers, and affected vehicles sold in the U.S. can be serviced by Canadian dealers.

STOP SALE OF FIRESTONE WILDERNESS AT TIRES IN DEALER STOCK

Firestone Wilderness AT tires in stock at Ford and Lincoln Mercury dealers enrolled in the Around the Wheel or Ford Tire Program (Certified Tire Dealers) should not be sold. Dealers that purchased these tires through the Ford program and have them in stock should complete the *Unsold Wilderness AT Credit Form* located on QCDealer.com. If you have questions, call the Ford Tire Hotline at 1-888-353-3251 for disposal and credit information.

NON-AtW DEALERS SERVICING IN-STOCK UNITS OR CUSTOMER VEHICLES

Non-Certified Tire (AtW or Ford Tire Program) Dealers who have vehicles in stock, or customer vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires must send the vehicle to a Certified Tire Dealer (AtW or Ford Tire Program) or an approved tire retailer participating in the program to have the tire replacement performed. The non-Certified Tire Dealer (AtW or Ford Tire Program) will submit a 01B77 ONP claim using the miscellaneous expense code of "**SCHP**" (with a dollar value of $15.00 to cover administrative costs). Do not claim the "Admin" labor operation.

SERVICE PROCEDURE

All 15-, 16-, and 17-inch Firestone Wilderness AT (regardless of series number) tires installed on Ford and Mercury vehicles must be replaced under this owner notification program. Original equipment (OE) and replacement tires are included.

Spare Tires

Firestone Wilderness AT (regardless of series number) spare tires are affected and should be replaced. The Firestone P235 75R15 ATX temporary spare tire used on Ranger vehicles is not included in this program.

Note: Spare tires should always be replaced with the exact same size tire; otherwise the spare tire may not store in the proper position on the vehicle.

Note: When processing refunds for customers, inspect the spare tire; if the spare tire is a Firestone Wilderness AT (with the Ranger exception noted previously) replace the spare tire using the information provided on Attachment II.

Does Current Tire Condition Affect Replacement Procedure?

All affected tires should be replaced regardless of the mileage or the remaining tread on the tire. If the customer caused damage to the tires, i.e. hit a curb, accident, under inflation, alignment issues, the tire should still be replaced. If the tire is worn out, it should still be replaced.

What if the Vehicle has a Mix of Affected and Non-Affected Tires?

- If the spare tire is the only Wilderness AT, then only the spare should be replaced (see exception on temporary spares above).
- In most cases an owner's vehicle will have all 15-, 16-, or 17–inch Firestone Wilderness AT tires installed and require replacement of all tires. In cases where a vehicle has a mix of tire brands/sizes installed, replace all Firestone Wilderness AT tires and the remaining tires to match the tire brand and size by axle.

For example, if a vehicle has a Wilderness AT on the left front, a Wilderness AT on the right rear, a Wilderness AT for a spare, and the other two tires are not Wilderness AT; the spare and the left front and right rear should be replaced and the new tires should be installed on the same axle. The customer should also be advised that all tires should be the same size especially on 4 X 4 models.

What replacement tires may be used for vehicles originally equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tires?

Replacement tire(s) must be on the list of tires approved by Ford <link to approved tire list>. Any deviation from this approved list may change the vehicles handling, ride, vibration, and noise characteristics and cannot be claimed through Ford.

If customers are seeking reimbursement for tires purchased outside of a Ford Certified Tire Dealer, refer to Attachment I for reimbursement guidelines and claiming procedures. *Customers who purchase tires after November 15, 2001 are not eligible for a refund.*

Note: There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.

Note: "Blemished" tires may not be used as replacement tires under this program.

FORD AND LINCOLN MERCURY DEALER TIRE DISPOSAL PROCESS

- Tires that are removed from vehicles must immediately be made unusable by either cutting the bead through the DOT code with bolt cutters, or drilling a one-inch diameter hole (directly on the DOT code to make the code unreadable) in the sidewall. Defacing the DOT code will prevent the tire from being used for an additional refund request. Marking the last 6 characters of the VIN on the removed tire(s) is no longer required.
- The tires will be disposed of by using the "National Tire Recovery and Recycle Program".

Regional FCSD and independent personnel will be randomly auditing dealers for proper tire scrapping and claiming procedures. Any infractions will result in prior approval for tire owner notification claims.

Note: Make removed tires unusable during tire replacement. Do not stack tires and disable them at a later time.

DEALERSHIPS ELIGIBLE TO REPLACE TIRES UNDER THIS PROGRAM

All Ford and Lincoln Mercury dealers enrolled on the Around the Wheel or Ford Tire Program (Certified Tire Dealers) are eligible to complete tire replacements under this program.

Ford dealers interested in joining the Ford Tire Program may call the Ford Tire Hotline 1-888-353-3251 for enrollment and program details.

APPROVED RETAILERS PARTICIPATION IN PROGRAM

We have developed a program to authorize Goodyear, Michelin, Continental, and General tire retailers to perform tire replacements at no cost to customers. These eligible retailers will use only tires from the Ford Approved Tire List when performing no cost replacements. This was done to reduce customer inconvenience by:

- Eliminating customer out of pocket expense
- Maximize the number of customers whose replacement tires are those on the Ford Approved tire list
- Expedite the completion of this program
- Reduce administrative burden on our Ford and Lincoln Mercury dealers
- Reduce dealer tire disposal responsibility
- Allow dealers to continue with their normal day to day service business

Attachment I - Administrative Information

OASIS

OASIS must be used to determine vehicle eligibility.

IMPORTANT:

When an eligible vehicle is at the dealership for service, OASIS must be contacted to determine if Owner Notification Program 01B77 is open. If 01B77 is listed in OASIS as open, it is important that the vehicle is inspected for eligible tires. If the eligible vehicle is not equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tires a claim must be submitted using labor operation 01B77A to close the program. If an affected vehicle does not have 01B77 open, this may indicate that a refund

or tire replacement has already been processed on this vehicle.

Some Ford and Lincoln Mercury vehicles not listed in the AFFECTED TIRES AND VEHICLES list may have 15-, 16-, or 17-inch Firestone Wilderness AT tires installed. These vehicles are covered under this program, but will not be active in OASIS. Contact the Special Service Support Center at 1-800-325-5621 to obtain prior approval before performing the repair or issuing a refund. This will insure that a previous repair/refund has not been performed on the vehicle.

CLAIMS PREPARATION AND SUBMISSION

^ Enter claims using DWE.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Enter information on a Recall/ONP claim type. DO NOT use a Warranty Claim type.

^ Program code 01B77.

^ Enter the full part number of the replacement tire with the quantity of tires replaced. Tires will be reimbursed at AtW Dealer cost + 25% (wheel weights and valve stems incl.).

^ Use the appropriate labor operation(s) from Attachment II.

^ Freight is reimbursable at actual cost in the miscellaneous expense area of the claim.

NOTE:

Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier. Dealers are encouraged to arrange for shipment of 4 or more tires at a time.

^ Dealers can no longer claim tire disposal for ONP 01B77. See the "National Tire Recovery and Recycle Program". You may still claim any applicable local waste tax - enter OTHER in the expense area of the claim with the actual cost.

^ Enter each unique (complete 10 or 11 digit) DOT codes of the replaced tires on the diagnostic code entry screen in the field marked "other". If the DOT codes cannot be completely entered in the space provided in the diagnostic code area, use the technician comment area to complete the data entry.

RELATED DAMAGE

Vehicle damage caused by a tire related failure is not covered by this program. Refer to the Warranty and Policy Manual for proper claiming procedure for vehicles covered by the Ford Bumper-to-Bumper Tire Warranty (model years 2001 and 2002). All other pre-2001 model year vehicles with alleged tire related vehicle damage should be handled through the Firestone claims process, or by referring the customers to their insurance company.

Damage related to replacement of tires should be handled as described in the Warranty and Policy Manual.

OWNER REFUND

With the increased availability of replacement tires, it will no longer be necessary for customers to pay out-of-pocket expenses for tires. Therefore, refund requests for tires purchased after November 15, 2001 will no longer be granted. Owners will be notified of the refund expiration date and will be directed to a Ford or Mercury dealer They are directed to an authorized retailer only if the Ford or Mercury dealer cannot meet their scheduling needs or tires are not in stock. All Ford and Mercury dealers (AtW and non-AtW dealers) are required to process refunds for customers who purchase tires prior to November 15, 2001.

The following rules apply to refunds for tires purchased from August 1, 2001 through November 15, 2001:

Refunds will be processed for vehicles listed under "AFFECTED TIRES AND VEHICLES", and for other Ford and Lincoln Mercury vehicles that have 15-. 16-, or 17-inch Wilderness AT tires installed.

^ The customer must provide the original paid receipt (a copy of their paid receipt is acceptable on an exception basis in instances where the owner requires the original for another purpose (e.g. extended tire warranty or purchase rebate). The dealer will attach the receipt to the dealer file copy of the refund claim (see claim instructions below).

^ Dealers will be reimbursed to immediately disable tires returned for a refund (see claiming instructions for refunds and Attachment II for labor operations).

^ The tires must be purchased August 1, 2000 through November 15, 2001 to be eligible for a refund (through October 31, 2001 for 1995 and 1996 F-150 owners).

^ Customers requesting refunds for tire replacement May 22, 2001 through November 15, 2001 must provide either:

NOTE:

This does not apply to 1995 and 1996 F-150 customers.

^ The Firestone Wilderness AT tires that were replaced. Returned tire(s) are to be disabled by the dealership. Ford will reimburse the dealer to disable (see claim instructions below and use labor operation 01B77G). If tires are brought in for refund with the DOT codes missing dealers should not process the refund.

^ A section of the old tire(s) containing the DOT codes from each of the Firestone Wilderness AT tires that were replaced (To be cut from the Wilderness AT tires that were replaced by the outside repair facility) (use labor operation 01B77L). Dealers should deface (cut in pieces or make code unreadable) the DOT sections of the tire so they cannot be used to obtain another refund. If sections are brought in for refund with the DOT code defaced dealers should not process the refund.

NOTE:

The DOT Code Identification Guide has been developed to help dealers determine if the DOT sections returned to the dealership are from 15-, 16-,

Purchase Date Range	Refund Guidelines
August 1, 2000 through May 22, 2001	• The actual cost as stated on the paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes • *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
1995 and 1996 F-150 vehicles only *August 1, 2000 through October 31, 2001*	• *The actual cost as stated on the paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes (no DOT required)* • *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
May 23, 2001 through November 15, 2001	• 15 inch tires - $110 (includes mounting, balancing, stems, disposal, and taxes) • 16 and 17 inch tires - $130 (includes mounting, balancing, stems, disposal, and taxes) • Dealers process refunds
After November 15, 2001	• *No refunds accepted for tires purchased after November 15, 2001*

Refund Questions	What is the owner qualified to receive?
Example: On December 21, 2000 the customer paid to have (4) Firestone Wilderness AT tires replaced on an affected vehicle.	o August 1, 2000 through May 22, 2001 (October 31, 2001 for 1995 and 1996 F 150) full refund with paid receipt o Customer does not need old tire(s) o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*
Example: On January 15, 2001 the customer paid to have (2) Wilderness AT tires replaced on a 1988 F-Series truck. The other tires are non-Firestone Wilderness AT.	o August 1, 2000 through May 22, 2001 – full refund with paid receipt o Dealer contacts Special Service Support Center at 1-800-325-5621 for approval code o Customer does not need old tire(s) o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*

or 17-inch Firestone Wilderness AT tires. Use the DOT Code Identification Guide in conjunction with the bulletin section "What if the Vehicle has a Mix of Affected and Non-Affected Tires" to determine how many tires are eligible for refund.

NOTE:

Ford will allow customers to file for a refund (with or without tires) for tires purchased after May 22 through June 30, 2001 because customers may not have tires to turn in. Customers must provide a paid receipt indicating tire replacement before July 1, 2001 in order to process a refund without tires or DOT sections. Customers who purchase tires after June 30, 2001 must provide tires or DOT sections.

Ford will reimburse customers the following amounts:

^ Tires purchased from August 1, 2000 through May 22, 2001, the actual cost as stated on their paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes.

^ (1995 and 1996 F-150 vehicle only) Tires purchased from August 1, 2000 through October 31, 2001, the actual cost as stated on their paid receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes. No DOT section required.

^ Tires purchased May 23, 2001 through November 15, 2001, the actual cost as stated on the receipt for replacing tires, mounting, balancing, valve stems, disposal, and taxes up to a maximum of $110 per tire for 15 inch, and $130 per tire for 16 and 17 inch tires.

^ Refunds will not be granted for tires purchased after November 15, 2001.

Note:

If an owner pays for the replacement of their tires after November 15, 2001, the dealer may handle on a case by case basis following the procedure in Attachment II.

Refund Questions	What is the owner qualified to receive?
Example: On May 27, 2001 the customer took their 1998 Explorer to an outside tire retailer and had (5) Firestone Wilderness AT 16 inch tires replaced.	o After May 22, 2001 refund tire replacement with paid receipt up to: o 15 inch = $110 (maximum per tire) o 16 and 17 inch = $130 (maximum per tire) o With a paid receipt this customer would be entitled to (5) tires x $130 (16 inch maximum per tire) = $650 refund (includes mounting, balancing, stems, disposal, and taxes) o Dealer will be eligible to claim for refund allowance using labor operation 01B77L o If the customer returns the old tires to the dealer o The dealer will disable the old tires and dispose of them using the *"National Tire Recovery and Recycle Program"* using labor operation 01B77G (disable) in conjunction with 01B77L (refund allowance) o Customer does not need old tire(s) *since tires purchased prior to July 1, 2001* (After June 30, 2001 customer will need old tires or removed DOT codes from replaced tires to qualify)
Example: On December 2, 2000 the owner replaced their (5) Firestone Wilderness AT tires with another set of Wilderness AT tires.	o The owner is not eligible for refund o The owner is eligible for tire replacement only o Use only tires from the "Ford Approved Tire List"
Example: *On November 16, 2001 the owner purchases tires from a tire retailer.*	o *No refund will be granted after November 15, 2001* o *Dealers may handle on a case-by-case (See Attachment II)*
Example: *On October 10, 2001 a 1995 F-150 owner purchases tires from a tire retailer.*	o *August 1, 2000 through October 31, 2001 – full refund with paid receipt* o *Customer does not need old tire(s) or DOT section(s)* o *Effective immediately dealers process refunds (Online Refund Form should no longer be used)*

CLAIMS PREPARATION FOR REFUNDS (USE THIS PROCEDURE FOR ALL REFUND REQUESTS)

NOTE:

Tires must be purchased prior to November 15, 2001

^ Enter claims using DWE.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Enter information on a Recall/ONP claim type. DO NOT use a Warranty Claim type.

^ Program code 01B77.

^ When a customer brings in their old tires and is seeking a refund, use labor operation 01B77G (disable) and 01B77L (refund administration allowance) from Attachment II.

^ If a customer brings in the old DOT codes removed from the old tires - use labor operation 01B77L only.

^ The Miscellaneous Expense Code "ADMIN" will not be accepted under this program. A labor operation 01B77L has been provided to cover administrative costs.

^ Enter REFUND in the miscellaneous area of the claim.

^ Dealers will no longer be able to claim tire disposal for ONP 01B77. See the "National Tire Recovery and Recycle Program" You may still claim any applicable local waste tax - enter OTHER in the expense area of the claim with the actual cost.

^ Enter each unique (complete 10 or 11 digit) DOT codes of the replaced tires in the diagnostic code entry screen in the field marked "other". If the DOT codes cannot be completely entered in the space provided in the diagnostic code area, use the technician comment area to complete the data entry. If the tires were replaced prior to May 23, 2001 (or November 1, 2001 for 1995 and 1996 F150 customers) the DOT may not be available, in this case record the brand, make and size of the tires in the technician comments area of the claim.

RENTAL CARS

TAP allowances have been increased specifically for this owner notification program. Refer to Don Brunner letter.

DOT REGISTRATION OF NEW TIRES

Dealers are required to register the DOT number of every tire sold to meet federal tire registration requirements. Ford has established a partnership with CIMS to assist dealers in registering these DOT codes. Information is available on QCDealer.com under CIMS Tire Registration or by contacting CIMS

Description	Labor Operation	Labor Time
Inspect for non-Wilderness AT tires (used to close 01B77 not for use when processing a refund)	01B77A	0.2 Hours
Replace & balance 1 tire (to be used for spare tire only)	01B77B	0.4 Hours
Replace & balance 2 tires (one axle)	01B77C	0.6 Hours
Replace & balance 3 tires (one axle plus spare)	01B77D	0.8 Hours
Replace & balance 4 tires (both axles)	01B77E	1.0 Hours
Replace & balance 5 tires	01B77F	1.2 Hours
Disable up to five tires (used only for refund claims)	01B77G	0.2 Hours
*Refund administration allowance (to be used when processing a customer refund without tire disposal, if tires are returned to dealership for disposal use in conjunction with operation 01B77G)	01B77L	0.2 Hours
Administrative Allowance for Non-Certified Tire Dealers (AtW or Ford Tire Program) to be used when sending a dealer stock unit, or customer vehicle (for tire replacement) to a Certified Tire Dealer, or tire retailer authorized to perform tire replacement under this program	Misc. Expense use code "SCHP"	$15.00

NOTE: Front-end alignment is not included in this program.

***NOTE:** When processing a refund for four (4) road tires, the non-temporary spare tire should be replaced as part of this program – file a related damage claim to cover the spare tire replacement.

at 330-794-9190.

NON-FORD OR LINCOLN MERCURY VEHICLES WITH FIRESTONE WILDERNESS AT

Non-Ford or Lincoln Mercury vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires installed by a Certified Tire Dealer (AtW or Ford Tire Program) are eligible for replacement. The repair should be submitted using a Warranty/ESP claim type form. The dealer must enter Program Code "P19", this will allow the repair to be submitted without a VIN. The causal part must be TIRE, with the actual part numbers for reimbursement at dealer cost plus 25%, and use actual time for labor reimbursement. These types of claims cannot be submitted as an Owner Notification Repair type.

Attachment II - Parts and Labor Information

LABOR ALLOWANCES

NON-AtW DEALERS SERVICING IN-STOCK UNITS OR CUSTOMER VEHICLES

NOTE:

Non-Certified Tire Dealers (AtW or Ford Tire Program) who have vehicles in stock, or customer vehicles with 15-, 16-, or 17-inch Firestone Wilderness AT tires must send the vehicle to a Certified Tire Dealer (AtW or Ford Tire Program), or an approved tire retailer participating in the program to have the tire replacement performed. The non-Certified Tire Dealer (AtW or Ford Tire Program) will submit a 01B77 ONP claim using the miscellaneous expense code of "SCHP" (with a dollar value of $15.00 to cover administrative costs). Do not claim the "Admin" labor operation.

PARTS REQUIREMENTS

Tire Ordering Information

^ Dealers are required to install only tires from the Approved Tire List for vehicles originally equipped with 15-, 16-, and 17-inch Firestone Wilderness AT tires. Dealers should immediately order replacement tires for inventory.

^ Certified Tire Dealers will order replacement tires through normal channels.

^ Dealers not authorized for the Around the Wheel Program will not participate in this recall. Dealers may call the Ford Tire Hotline 1-888-353-3251 for enrollment and program details.

TIRE AVAILABILITY:

All dealers should check QCDealer.com daily for updates to the approved tires list. Distributors and tire retailers will allocate tires as best they can on a daily basis. Your dealership should do the following to ensure that you are able to secure your fair allotment of these limited volumes:

^ Contact your Ford authorized facing distributor(s) for each tire manufacturer.

^ Contact your Ford authorized facing tire retailers for each tire manufacturer.

^ Review with these supply points the volume of tires you need to ensure you have tires ready to fill orders with every supply point.

Questions not addressed by above sources should be directed to your market area team.

CUSTOMER WAIT LISTS:

Dealers should create a customer wait list and record: Customer name

^ Address and phone number

^ Vehicle make

^ Model year

^ Mileage

^ Tire size

NOTE:

Customers should be prioritized to replace oldest tires first.

WAIT LIST SURVEY

Please fill out the Firestone Tire Survey in the Management Report Section of QCDealer weekly. It is critical that you answer the questions as accurately as possible as the survey results will be used to help determine the level of production from the tire manufacturers.

DEALER PRICE

For latest prices on replacement tires, refer to the most recent Ford Motor Company Tire Price List.

PROCEDURE FOR CLAIMING REFUNDS FOR TIRES PURCHASED AFTER NOVEMBER 15, 2001

The following procedure applies to tires purchased after November 15, 2001:

1. Determine if the customer should receive special consideration based on owner loyalty, special circumstance cc, etc.

2. If the customer is eligible for special consideration the dealer will call the Special Service Support Center at 1800-325-5621 to request an authorization code.

3. The Special Service Support Center representative will ask for the following:

^ Customer Name

^ VIN

^ Date of repair

^ Original copy of invoice (be prepared to fax)

4. If the customer qualifies for a refund, the Special Service Support Center will provide your dealer with an authorization code.

5. Your dealer will input a claim with the authorization code (authorization code must be included to receive payment).

6. After the dealer receives payment for the claim, the dealer will then send the refund to the customer.

NOTE:

If the Special Service Support Center determines that the customer does not qualify for a refund, no authorization code will be given. Any appeals must be made by the dealer to the appropriate field representative

Attachment III - Technical Information

AFFECTED VEHICLES: REFER TO DEALER LETTER FOR AFFECTED TIRES AND VEHICLES

OVERVIEW

This program details the replacement of 15-, 16-, and 17-inch Firestone Wilderness AT tires regardless of production plant. You will need to perform a DOT code inspection prior to replacing the 15, 16, or 17-inch Wilderness AT tires.

NOTE:

When lowering or raising an under-vehicle spare, DO NOT use power tools. Also make sure that the spare is secure under the vehicle, and not swinging loose. The spare tire winch will ratchet when the tire is completely stowed.

NOTE:

Radial ATX "TEMPORARY USE" spare tires are not included under this program, and should not be replaced as part of this program.

NOTE:

Spare tires should always be replaced with the exact same size tire; otherwise the spare tire may not store in the proper position on the vehicle.

INSPECTION

1. Inspect the vehicle tires (including the spare tire) for the presence of Firestone Wilderness AT tires.

2. If Firestone Wilderness AT tires are present replace them with a suitable replacement from the "Approved Tire List".

Note:

There may be cases where a vehicle is equipped with 15-, 16-, or 17-inch Firestone Wilderness AT tire sizes that are not included on the Ford-approved replacement list. These tires are not original equipment (OE) and, therefore, will not have an approved tire listed. In such cases, it is recommended that the customer install the proper OE tire, or have a tire of suitable quality installed. Reference the vehicle's "Safety Certification Label" and current "Ford Motor Company Tire Price Guide" for OE or suitable replacement recommendations.

3. If only one Firestone Wilderness AT road tire is present on the vehicle, you will need to replace the opposing tire on the same axle. However, if one (1) front and one (1) rear tire are Wilderness AT you would not automatically replace all four (4) tires instead, you would replace the two (2) Wilderness AT tires and place them on the same axle.

4. Record the DOT code from each removed tire(s) on the repair order.

5. Tires that are removed from vehicles must immediately be made unusable by either cutting through the bead and DOT code with bolt cutters, or drilling a one-inch diameter hole (directly on the DOT code to make the code unreadable) in the sidewall.

6. Adjust all tires to the proper inflation pressure, and release the vehicle. For specifications, refer to the vehicle Owner's Manual or the vehicle certification label located on the driver's door opening.

NOTE:

Tires that are removed from vehicles under this program, and those in dealer inventory must immediately be made unusable by either cutting the bead with bolt cutters or drilling a 1" diameter hole (directly on the DOT code to make the code unreadable) in the sidewall. Defacing the DOT code will prevent the tire from being used for an additional refund request.

NOTE:

If the vehicle is a 4X4, and is equipped with non-Firestone Wilderness AT tires on one axle, and the replacement tires for the Firestone equipped axle causes a mismatch with the existing non-Firestone axle, the customer is responsible for the tire mismatch. If the customer refuses to purchase matching tires to correct the mismatch - the dealer should annotate the repair order to reflect the customer's decision.

Ford Motor Company

FIRESTONE TIRE RECALL

September 2000

TO: All Ford and Lincoln Mercury Dealers
SUBJECT: Firestone Tire Recall Supplement #4 9/1/00 - Updated Information
REFERENCE: Firestone Recall - Firestone P235/75 R15 Radial ATX and Certain Wilderness AT tires

Changes for this Supplement:

- The following has been added to Attachment I to clarify the claiming of freight: Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier.
- Additional information is now required in the comments of each claim filed for tire replacement under both Program Codes P17 and P18. The comments must include the entire DOT code from the tire being replaced and under P17 only the part number of the replacement tire. Firestone requires this information for government reporting.

Claims under the Firestone recall for tire replacement filed by Ford and Lincoln Mercury dealers not enrolled in the AtW/Ford Tire Program will not be accepted for payment. Non-AtW/Ford Tire Program dealers will continue to be able to file claims for tire inspection. This is not new information; we have just added the edits to the ACES II system.

The revised letter and attachments have been marked "Revised 9/1/00", and a ( ) symbol appears at the beginning of any text that changed since the last Supplement and the text appears in green when viewed on line. To avoid confusion please discard all previous versions.

Sincerely,

A. R. O'Neill
Director
Vehicle Service and Programs

Firestone Recall - Firestone P235/75 R15 Radial ATX and Certain Wilderness AT tires.

AFFECTED TIRES AND VEHICLES

Bridgestone Firestone Tire Company recently announced a Safety Recall on the following:

- All Firestone P235/75 R15 Radial ATX tires produced excluding tires marked "TEMPORARY" on the sidewall - and -

- P235/75 R15 wilderness AT tires produced only at the Decatur plant.

NOTE:

Decatur built tires have a DOT code of VDHL - see Attachment III for details. All other Wilderness AT tires are not affected.

Both original equipment (OE) and replacement tires are affected.

The following vehicles produced with Firestone P235/75 R15 Radial ATX original equipment tires are affected by this recall:

^ Certain 1991 through 1996 Ford Explorer (see chart)

^ Certain 1997 Mercury Mountaineer vehicles

^ Certain 1991 through 2000 Ranger vehicles

^ Certain 1991 through 1994 Bronco vehicles

^ Certain 1991 through 1994 F-Series vehicles

The following vehicles produced with P235/75 R15 Wilderness AT tires as original equipment are affected by this recall:

Certain 1997 through August 7, 2000 Mountaineer vehicles

^ Certain 1997 through August 7, 2000 Explorer vehicles (see chart)

^ Certain 1997 through June 1, 2000 Ranger vehicles

^ Certain 2001 Explorer Sport Trac and Sport vehicles produced through August 7, 2000

These Explorer vehicles produced with either P235/75 R15 Radial ATX or P235/75 R15 Wilderness AT tires as original equipment are affected as shown.

These Explorer vehicles are NOT affected:

IMPORTANT FACTS

^ This is a FIRESTONE recall.

^ FIRESTONE will notify customers of the recall via first class mail.

^ FIRESTONE will communicate recall information to authorized repair sites including Ford and Lincoln-Mercury Around the wheel/Ford Tire Program dealers.

FORD AND LINCOLN MERCURY DEALER INVOLVEMENT

As this field action will severely impact the availability of Firestone replacement tires, Ford and Lincoln Mercury Around the Wheel (AtW)/Ford Tire Program dealers will be afforded the opportunity to address this recall utilizing Firestone and non-Firestone tires. This is being done to address immediate needs of our customers.

FORD AND LINCOLN MERCURY DEALERS ENROLLED IN AROUND THE WHEEL (AtW)

Dealerships enrolled in the AtW/Ford Tire Program are authorized Firestone outlets. If a customer with affected tires contacts an ATW Ford Tire Program dealer, as an authorized Firestone dealer regarding this safety recall, you will be able to replace that customer's tires with Firestone or "approved" non-Firestone tires. Tires that are approved for use as replacement tires under this recall will be posted in a matrix in the Firestone Tire Center in QCDealer.com. This matrix will be amended to add new tire manufactures and models of tires as they are approved. Claiming for reimbursement of tires is outlined on Attachment I.

If the customer requests a replacement Firestone tire, secure the tire through your normal distribution chain and process reimbursement as outlined in Attachment I.

FORD AND LINCOLN MERCURY DEALERS NOT ENROLLED IN AROUND THE WHEEL (AtW)

Dealers not enrolled in the ATW/Ford Tire Program can inspect customer vehicles (see Attachments I & II for claiming instructions & labor operations). These dealers should make individual arrangements with local Firestone outlets for tire replacement, or refer customers to their local Firestone outlet.

SERVICE PROCEDURE

All Firestone P235/75 R15 tires with Radial ATX on the sidewall (excludes Temporary spare tires identified by "Temporary" on the sidewall) must be replaced under this recall.

Firestone P235/75 R15 tires with Wilderness AT on the sidewall will need to be inspected for a DOT code of VDHL to determine if replacement is required. Refer to Attachment III for details.

This service action applies to original equipment and replacement tires that are installed on Ford and Mercury vehicles.

DEMONSTRATION / DELIVERY HOLD FOR VEHICLES AND TIRES IN DEALER INVENTORY

Do not demonstrate or deliver any of the affected vehicles prior to completing the Firestone recall. In addition, Ford and Lincoln Mercury Around the Wheel (AtW)/Ford Tire Program dealers may have affected tires in inventory; these tires should not be sold.

Tires Removed from Vehicles

Tires that are removed from vehicles must immediately be made unusable by either cutting the bead with bolt cutters, drilling a one-inch diameter hole in the sidewall, or cutting the tire completely in half The DOT code should not be defaced or removed. The tire should then be disposed of according to local laws refer to the Tire Administration Guide for further information.

NOTE:

AtW/Ford Tire Program dealers will be independently audited for compliance with the above procedure.

New Inventory Tires

All new Radial ATX or Wilderness AT tires with DOT code VDHL tires (never mounted) in AtW/Ford Tire Program dealer inventory must be returned to Firestone. Dealers must call 1-800-668-0345 to obtain a "Returned Goods Authorization (RGA) number. The RGA is a 6-digit number required to return the tires. Only tires affected by the Firestone recall will be accepted. Firestone will pay all freight for the return of these tires.

For Around the Wheel/Ford Tire Program 1-888-353-3251

Questions:

Attachment I

OASIS Since this is a Firestone recall, OASIS will not be activated.

PLEASE NOTE

Correct all vehicles in stock before delivery. Federal law requires dealers to complete any outstanding safety recall service before a vehicle is delivered to the buyer or lessee. Violation of this requirement by a dealer could result in a civil penalty of up to $1,100 per vehicle.

CLAIMS PREPARATION AND SUBMISSION

NOTE:

Claims for Firestone tires (P18) may be entered for payment beginning with repairs dated August 28, 2000 and later.

Claims for non-Firestone tires

Enter claims in ACES II for non-Firestone tires using DWE with the following information:

^ Enter information on a warranty claim. DO NOT use a recall claim.

^ Refer to ACESII User Manual for claims preparation and submission information.

^ Program Code - P17. Enter P17TIRE as the causal part with condition code 82.

^ On the same line as PI7TIRE enter the total value of the tires from the "Suggested List Price" column of the latest Ford Motor Company Tire Selling Guide.

^ Use the appropriate labor operation(s) from Attachment II.

^ Freight is reimbursable at actual cost in the miscellaneous expense area of the claim.

NOTE:

Freight is only reimbursable for rural dealers whose only means of acquiring tires is by having them shipped in via common carrier.

^ Tire disposal and applicable local waste tax will be reimbursed - enter OTHER in the miscellaneous expense area of the claim with the actual cost.

^ Enter the entire DOT code and the part number of the replacement tire being used in the comments area of the claim.

Claims for Firestone tires

Enter claims in ACES II for Firestone tires using the following information:

^ Enter information on a warranty claim. DO NOT use a recall claim type.

^ Program Code - P18.

^ Enter "P18TIRE" as the causal part, no material cost should be entered on this line.

Description	Labor Operation	Labor Time
Inspect 5 tires applies only to P235/75 R15 Wilderness AT tires) - VEHICLE NOT AFFECTED (Non VDHL DOT Code)	00V01G	0.2 Hours
Inspect 5 tires (applies only to P235/75 R15 Wilderness AT tires) - VEHICLE AFFECTED - Customer must return at a later date due to unavailability of replacement tires. This may be claimed only one time per vehicle per dealer.	00V01A	0.2 Hours
Replace & balance 1 tire (No longer includes inspect) May be used with labor op 00V01A only	00V01B	0.4 Hours
Replace & balance 2 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01C	0.6 Hours
Replace & balance 3 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01D	0.8 Hours
Replace & balance 4 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01E	1.0 Hours
Replace & balance 5 tires (No longer includes inspect) May be used with labor op 00V01A only	00V01F	1.2 Hour

^ Condition code "82".

^ Use Customer Concern Code "A99".

^ Enter the full published tire part number with the quantity of tires replaced, the payment system will price the tire at Dealer Net multiplied by the quantity for the total value of the replaced tires.

^ Use Miscellaneous Expense Code "TIREMU" to claim the $20.00 difference per tire7 a maximum of $100.00.

^ The Firestone warranty claim form must be filled out and attached to the hard copy of the claim and retained in the service file. The entire DOT code from the replacement tire(s) must be recorded on this form.

^ The DOT code must also be entered in the comments area of the claim.

^ No labor operations will be allowed when claiming P18.

OWNER REFUND

Ford and Lincoln Mercury dealers, including AtW/Ford tire dealers; will not be involved in processing refunds for customers included in the Firestone recall. Customers inquiring about a refund should be provided copies of the Firestone refund request form. Refer to the Firestone website for the refund forms and for further details.

RENTAL CARS

TAP allowances have been increased specifically for the Firestone recall refer to M.J. Lombardi's Letter.

Attachment II

LABOR ALLOWANCES

NOTE:

Front-end alignment is not included in this recall.

NOTE:

These labor operations and revised times will begin paying with claims submitted on August 18, 2000; Claims in process at dealerships will need to use these new operations.

PARTS REQUIREMENTS

Tire Ordering Information

FIRESTONE TIRE INSPECTION

AFFECTED VEHICLES: **REFER TO DEALER LETTER FOR AFFECTED TIRES AND VEHICLES**

OVERVIEW

This procedure outlines how to check the DOT code on the tires and determine if they must be replaced.

NOTE: All Firestone P235/75R15 tires that say "RADIAL ATX" on the sidewall are being recalled and no further inspection is necessary.

NOTE: All tires including the spare must be inspected if they are "WILDERNESS AT" P235/75R15.

NOTE: When lowering or raising an under-vehicle spare, **DO NOT** use power tools. Also make sure that the spare is secure under the vehicle, and not swinging loose. The spare tire winch will ratchet when the tire is completely stowed.

INSPECTION

1. Raise vehicle on a hoist.
2. Locate the DOT code on the inboard sidewall of all tires including the spare. On F-Series and Bronco models, the spare tire must be lowered to view the DOT code. Clean the area if necessary in order to accurately read the code.
3. If the DOT code is **VDHL**, the tire must be replaced. See the matrix (part of the dealer bulletin) to determine the correct replacement tires. See Figure 1.

NOTE: Recall tires that are removed from vehicles and in dealer inventory must immediately be made unusable by either cutting the bead with bolt cutters or drilling a 1" diameter hole in the sidewall.

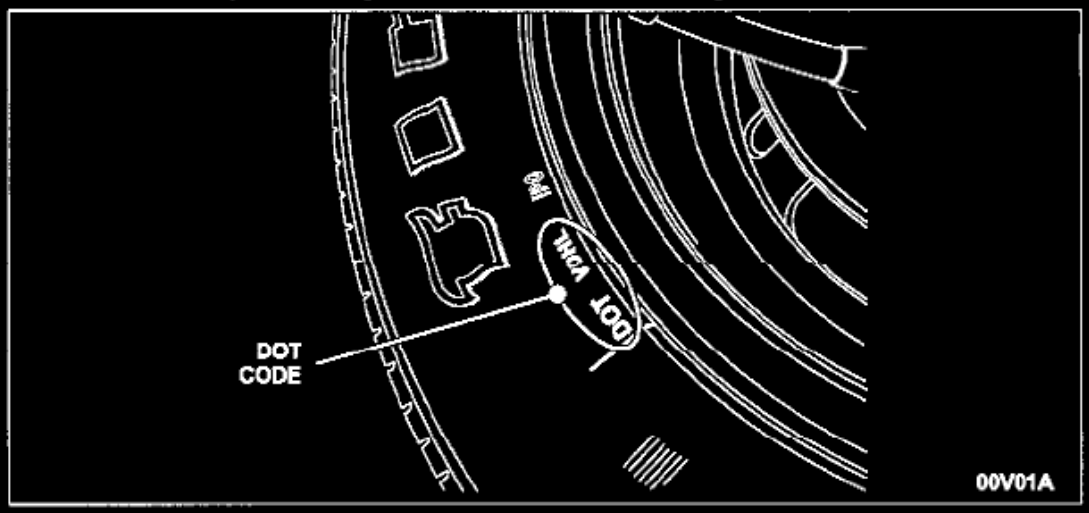

FIGURE 1

4. If the code is anything other than **VDHL**, release the vehicle to the owner.

CPR© 2000 FORD MOTOR COMPANY
DEARBORN, MICHIGAN 48121
08/00

Authorized Around the Wheel (ATW)/Ford Tire Program dealers will order replacement tires through normal channels. Dealers not authorized for the Around the Wheel Program will not participate in the Firestone recall. Dealers may call the Ford Tire Hotline 1-888-353-3251 for enrollment and program details.

DEALER PRICE

For latest prices on replacement tires refer to the most recent Ford Motor Company Tire Selling Guide.

ISSUE: The use of a power impact wrench to install wheel nuts provides minimal torque control. Undertightening may allow the lug nuts to loosen, and can result in the wheel separating from the vehicle. Overtightening of wheel nuts may cause brake rotor distortion that could result in a brake shudder. Overtightening may cause distortion of the wheel. This can result in a change in the diameter of the center (axle) hole and make it difficult to remove from the axle it is mounted on or difficult or impossible to install on another axle with a smaller center hole diameter.

ACTION: Use a manual torque wrench to tighten wheel nuts. Refer to the approriate Shop Manual for specific torque values.

OTHER APPLICABLE ARTICLES: None WARRANTY STATUS: INFORMATION ONLY OASIS CODES:

306000, 301000

Wheels: Specifications

Lugnut torque ..... 135 Nm (100 ft lb)

NOTE: Torque specifications are for clean, dirt and paint free dry bolt and nut threads. Never use oil or grease on studs and nuts.

Wheel Bearing: Specifications

TORQUE SPECIFICATIONS

Bearing Inner Locknut - Manual Locking Hub* Torque Limits - ..... 47 Nm (35 ft lb)

Bearing Outer Locknut - Manual Locking Hub Torque Limits - ..... 203 Nm (150 ft lb)

Bearing Nut - Automatic Locknut Hub* Torque Limits - ..... 47 Nm (35 ft lb)

Wheel Lug Nuts** Torque Limits - ..... 135 Nm (100 ft lb)

NOTES:

* After tightening to specified torque, back off the nut 1/4 turn (90°). After backing off the nut, retighten to 1.8 Nm (16 in lb)

** Torque specifications are for clean, dry bolt and nut threads. Never use oil or grease on studs or nuts.

Wheel Bearing: Adjustments With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

1. Raise the vehicle and install safety stands. 2. Remove the wheel lugnuts and the wheel and tire assembly. 3. Remove the retainer washers from the lugnut studs. Remove the automatic locking hub assembly from the spindle. 4. Remove the snap ring from the end of the spindle shaft.

Axle Shaft Spacer

5. Remove the axle shaft spacer. 6. Pull cam assembly off the wheel bearing adjusting nut and remove the two plastic thrust spacers from the adjusting nut.

CAUTION: Do not pry on the plastic cam or thrust spacers during removal. Prying may damage the cam or spacers.

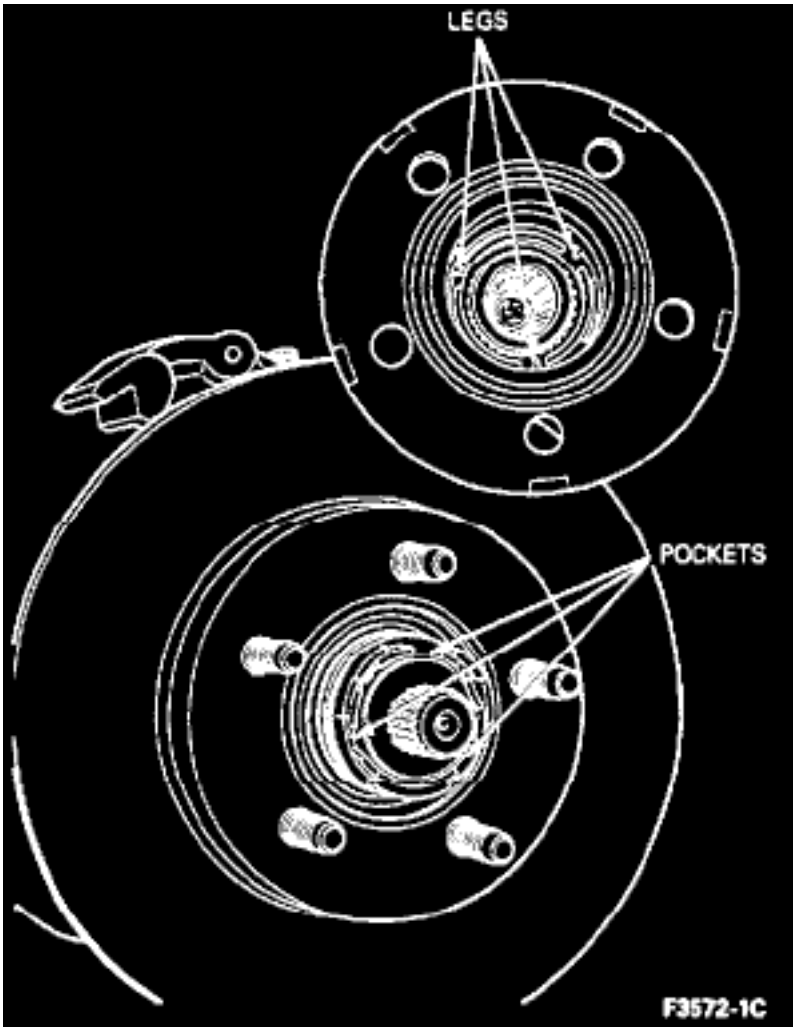
Cam Assembly And Locking Key

7. Using a magnet, remove the locking key.

NOTICE: If required, rotate the adjusting nut slightly to relieve pressure against the locking key, before the key can be removed.

CAUTION: To prevent damage to the spindle threads, look into the spindle keyway under the adjusting nut and remove the separate locking key before removing the adjusting nut.

8. Loosen the wheel bearing adjusting nut from the spindle using a 2-3/8 inch hex locknut wrench.



9. While rotating the hub and rotor assembly, tighten the wheel bearing adjusting nut to 47 Nm (35 ft lb) to seat the bearings. Spin the rotor and back

off the nut one-quarter turn (90 degrees).

10. Retighten the adjusting nut to 1.8 Nm (16 in lb) using a torque wrench. 11. Make sure the final end play of the wheel on the spindle is 0.00-0.08mm (0.000-0.003 inch). 12. Align the closest lug in the wheel bearing adjusting nut with the center of the spindle keyway slot. Advance the nut to the next lug if required.

Install the separate locking key in the spindle keyway under the adjusting nut.

WARNING: Extreme care must be taken when aligning the spindle nut adjustment lug with the center of the spindle keyway slot to prevent damage to the separate locking key. the wheel and tire assembly may come off while the vehicle is in motion if the key is damaged.

13. Install the two thrust spacers and push or press the cam assembly onto the locknut by lining up the key in the fixed cam with the spindle keyway.

CAUTION: Extreme care must be taken when aligning the fixed cam key with the spindle keyway to prevent damage to the fixed cam.

14. Install the axle shaft spacer. 15. Clip the snap ring onto the end of the spindle shaft.

Automatic Locking Hub Installation

16. Install the automatic locking hub assembly over the spindle. Align three hub assembly legs with three pockets in cam assembly. Install the retainer

washers.

17. Install the wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb).

Wheel Hub: Service and Repair Removal

With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

1. Raise the vehicle and install safety stands. 2. Remove the wheel lugnuts and the wheel and tire assembly. 3. Remove the brake caliper and secure to the underbody to prevent damage to the brake hose. It is not necessary to disconnect the hose from the

caliper. Do not let the caliper hang with its weight on the brake hose or the hose may become stretched, twisted or ruptured.

4. Remove the retainer washers from the lugnut studs. Remove the automatic locking hub assembly from the spindle. 5. Remove the snap ring from the end of the spindle shaft.

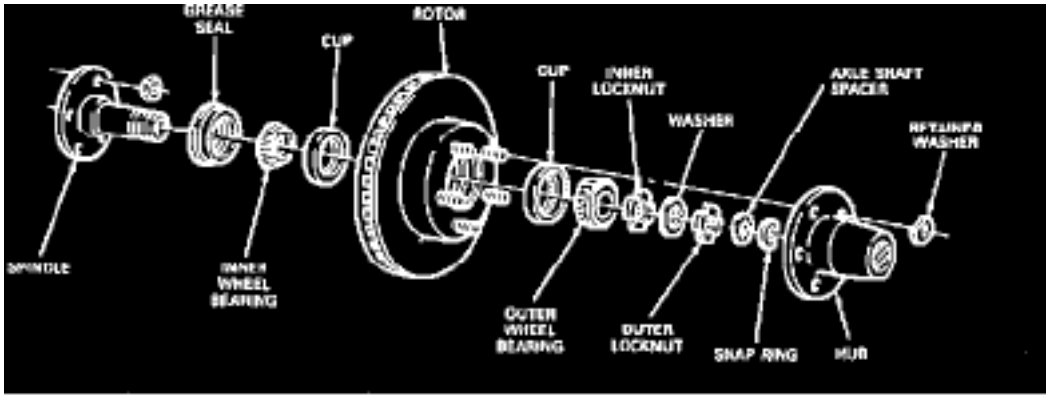
Axle Shaft Spacer

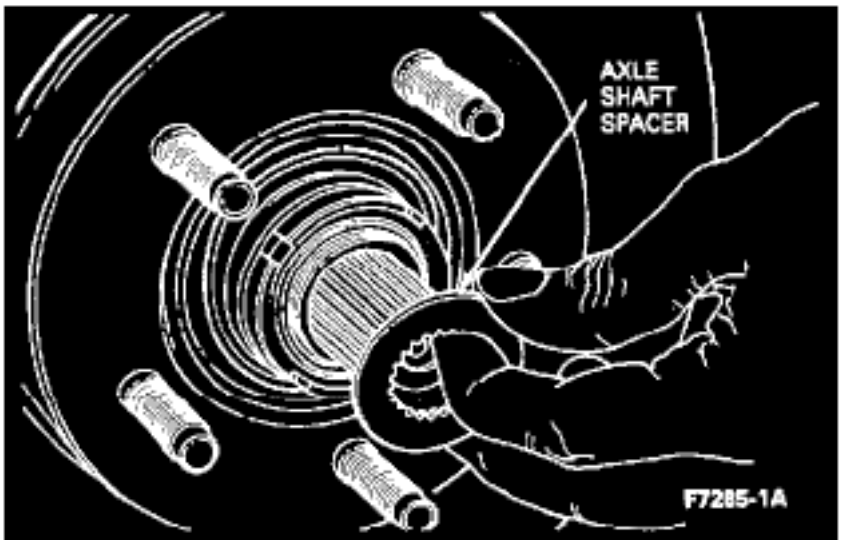
6. Remove the axle shaft spacer. 7. Pull cam assembly off the wheel bearing adjusting nut and remove the two plastic thrust spacers from the adjusting nut.

CAUTION: Do not pry on the plastic cam or thrust spacers during removal. Prying may damage the cam or spacers.

Cam Assembly And Locking Key

8. Using a magnet, remove the locking key.





NOTICE: If required, rotate the adjusting nut slightly to relieve pressure against the locking key, before the key can be removed.

CAUTION: To prevent damage to the spindle threads, look into the spindle keyway under the adjusting nut and remove the separate locking key before removing the adjusting nut.

9. Remove the wheel bearing adjusting nut from the spindle using a 2-3/8 inch Hex Locknut Wrench.

10. Remove the inner locknut and slide hub/rotor off spindle being careful to catch the outer wheel bearing.

With Manual Locking Hubs

Fig. 5 Manual Locking Hub

1. Raise the vehicle until the tire clears the floor and remove the wheel and tire assembly. 2. Remove the brake caliper and secure to the underbody to prevent damage to the brake hose. It is not necessary to disconnect the hose from the

caliper.

CAUTION: Do not let the caliper hang with its weight on the brake hose or the hose may become stretched, twisted or ruptured.

3. Remove the retainer washers from the lugnut studs and the manual locking hub assembly from the spindle. 4. Remove the snap ring from the end of the spindle shaft.

Axle Shaft Spacer

Wheel Hub: Service and Repair Installation

With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

CAUTION: Wheel bearing lubricant is a lithium-base grease. Sodium-base grease is not compatible with lithium-base grease and should not be intermixed. Therefore, do not lubricate front wheel bearings without first identifying the type of original wheel bearing lubricant. Usage of incompatible bearing lubricants may result in premature lubricant breakdown.

Installing Bearing Cups (Typical)

1. If inner or outer bearing cups were removed, install replacement inner and outer bearing cups in the hub with the appropriate bearing cup replacer

tool. Be sure to seat the cups properly in the hub. The cups will be properly seated when they are fully bottomed. Replace grease retainers. Polish grease retainer journal on spindle with 400 grit sandpaper. Clean with clean cloth.

2. Pack the inside of the hub with lithium-base grease or equivalent. Fill the hub until the grease is flush with the inside diameters of both bearing

cups. Pack the bearing cones and rollers with wheel bearing grease. Use a bearing packer for this operation. If a packer is not available, work as much lubricant as possible between the rollers and cages. Lubricate the cone surfaces with grease.

Installing Grease Seal (Typical)

3. Place the inner bearing in the inner cup and install the new grease seal. Be sure that the seal is fully seated. 4. Install the hub/rotor on the wheel spindle. Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads. 5. Place the outer bearing in the outer cup. 6. Install the wheel bearing adjustment nut. 7. While rotating the hub and rotor assembly, tighten the wheel bearing adjusting nut to 47 Nm (35 ft lb) to seat the bearings. Spin the rotor and back

off the nut one-quarter turn (90 degrees).

8. Retighten the adjusting nut to 1.8 Nm (16 in lb) using a torque wrench. 9. Make sure the final end play of the wheel on the spindle is 0.00-0.08 mm (0.000-0.003 in). the maximum torque to rotate the hub is 2.8 Nm (25 in

lb).

10. Align the closest lug in the wheel bearing adjusting nut with the center of the spindle keyway slot. Advance the nut to the next lug if required.

Install the separate locking key in the spindle keyway under the adjusting nut.

WARNING: Extreme care must be taken when aligning the spindle nut adjustment lug with the center of the spindle keyway slot to prevent damage to the separate locking key. The wheel and tire assembly may come off while the vehicle is in motion if the key is damaged.

11. Install the two thrust spacers and push or press the cam assembly onto the locknut by lining up the key in the fixed cam with the spindle keyway.

CAUTION: Extreme care must be taken when aligning the fixed cam key with the spindle keyway to prevent damage to the fixed cam.

12. Install the axle shaft spacer. 13. Clip the snap ring onto the end of the spindle shaft. 14. Install the automatic locking hub assembly over the spindle. Align three hub assembly legs with three pockets in cam assembly. Install the retainer

washers.

15. Install the caliper. 16. Install the wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb).

With Manual Locking Hubs

Fig. 5 Manual Locking Hub

CAUTION: Wheel bearing lubricant is a lithium-base grease. Sodium-base grease is not compatible with lithium-base grease and should not be intermixed. Therefore, do not lubricate front wheel bearings without first identifying the type of original wheel bearing lubricant. Installing Bearing Cups (Typical)

1. If inner or outer bearing cups were removed, install replacement inner and outer bearing cups in the hub with the appropriate bearing cup replacer

tool. Be sure to seat the cups properly in the hub. The cups will be properly seated when they are fully bottomed. Polish grease retainer journal on spindle with 400 grit sandpaper. Clean with clean cloth. Replace grease retainers.

2. Pack the inside of the hub with lithium-base grease or equivalent. Fill the hub until the grease is flush with the inside diameters of both bearing

cups. Pack the bearing cones and rollers with wheel bearing grease. Use a bearing packer for this operation. If a packer is not available, work as much lubricant as possible between the rollers and cages. Lubricate the cone surfaces with grease.

Installing Grease Seal (Typical)

3. Place the inner bearing in the inner cup and install the new grease seal. Be sure that the seal is fully seated. 4. Install the hub/rotor on the wheel spindle. Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads. 5. Place the outer bearing in the outer cup. 6. Install the inner locknut. 7. Tighten the inner locknut to 47 Nm (35 ft lb) while turning the rotor in the opposite direction to seat bearings. 8. Spin the rotor and back off the inner locknut one-quarter turn. Retighten the inner locknut to 1.8 Nm (16 in lb). 9. Install the lockwasher on the spindle.

NOTICE: If necessary, tighten inner locknut slightly to align the locknut pin with lockwasher hole.

10. Install the outer wheel bearing locknut using locknut wrench. Tighten locknut to 203 Nm (150 ft lb). 11. Check the end play of the wheel and tire assembly on the spindle. Final end play should be 0.00-0.08 mm (0.000-0.003 in). The maximum torque

to rotate the hub is 2.8 Nm (25 in lb).

12. Install the axle shaft spacer. 13. Clip the snap ring onto the end of the spindle shaft.

14. Install the manual hub assembly over the spindle. Install the retainer washers. 15. Install caliper. 16. Install wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb). 17. Lower vehicle. 18. Check brakes for proper operation.

WARNING: Before moving vehicle, pump brake pedal several times to be sure it is firm. Do not move vehicle until a firm pedal is obtained.

Wheel Hub (Locking): Customer Interest Front Hub - (4WD) Noise or Failure

Article No. 91-18-12 09/05/91

^ NOISE-"RATCHETING" SOUND FROM HUBLOCKBRONCO II BUILT AFTER 10/1/89, RANGER BUILT BETWEEN 10/1/89 AND 3/31/91, EXPLORER BUILT UNTIL 3/31/91

^ AXLE-FRONT-AUTOMATIC LOCKING HUBS-ENGAGEMENT OF FRONT DRIVELINE DELAYED OR NO COUPLING OF FRONT WHEELS-BRONCO II BUILT AFTER 10/1/89, RANGER BUILT BETWEEN 10/1/89 AND 3/31/91, EXPLORER BUILT UNTIL 3/31/91

LIGHT TRUCK: 1990 BRONCO II 1990-91 RANGER 1991 EXPLORER

This TSB article is being republished in its entirety to note that the wheel bearing retaining nut is included with the front automatic locking hub assembly.

ISSUE: Engagement of the front driveline on 4x4 models of the subject vehicles with Shift-On-The-Fly and Dana 35 axles may exhibit delayed or no coupling of the front wheels. Both of these conditions may result in a hublock ratcheting noise and sometimes may result in structural damage to the hublock. These concerns are caused by the failure of the transfer case to provide synchronization of the drivetrain during cold weather.

ACTION: Test drive the vehicle to determine if the driveline exhibits delayed or no coupling of the front wheels. If so, use the following procedure to service the vehicle.

NOTE: THESE ACTIONS SHOULD PROVIDE SHIFT-ON-FLY CAPABILITY TO 55 MPH (89 KM/H) AT TEMPERATURES ABOVE 32~F (0~C) AND 45 MPH (72 KM/H) WITH TEMPERATURES FROM 32~F (0~C) TO AS LOW AS -20~F (-29~C).

FRONT AUTOMATIC LOCKING HUB

1. Remove the left and right front automatic locking hubs and camming assemblies and replace with new assemblies (FOTZ-3B396-B). Refer to the appropriate Light Truck Shop Manual, Section 04-01D, for service details.

2. Inspect the wheel bearing retaining nut for damage and presence of foreign material which would diminish wheel bearing life.

3. Replace the wheel bearing retaining nut if damaged. This nut is included with the front automatic locking hub assembly.

FRONT AXLE LUBRICANT

1. Determine if the vehicle was built prior to 12/15/90.

2. If the vehicle was built prior to 12/15/90, replace the front axle lubricant with new lubricant (F1TZ-19580-A).

a. Extract the old lubricant using a suction gun.

NOTE: BREAKING THE CARRIER SEAL IS NOT A RECOMMENDED METHOD OF EXTRACTING THE LUBRICANT.

b. Refill the front axle with 56 ounces of lubricant (F1TZ-19580-A) using a suction gun.

TRANSFER CASE

1. Remove the following old transfer case parts and replace them with the following new parts. Refer to the appropriate Light Truck Shop Manual, Section 07-07E, for service details.

^ Clutch Coil Assembly (F1TZ-7G361-B)

^ Clutch Housing (F1TZ-7G362-A)

^ Lock-Up Collar (F1TZ-7106-B)

^ Lock-Up Fork (FOTZ-7289-A) - (Green paint mark by part number)

^ Return Spring (F1TZ-7219-A)

^ Sleeve Spring (E6TZ-7D126-A)

2. Install the sleeve spring (E6TZ-7D126-A) into the bore of the 7106 lock-up collar large end first.

Wheel Hub (Locking): All Technical Service Bulletins Automatic Hublock - Diagnosis/Service Tips

Article No. 95-5-18

03/13/95

^ LOCK HUBS - 4WD - AUTOMATIC HUBLOCK INFORMATION - SERVICE TIPS

^ FOUR-WHEEL DRIVE (4WD) - AUTOMATIC LOCK HUB DIAGNOSIS

LIGHT TRUCK: 1983-90 BRONCO II 1983-95 RANGER 1991-94 EXPLORER

ISSUE: 4X4 system diagnosis can be difficult at times due to system complexities.

ACTION:

For general system operation and diagnosis: Refer to TSB Article No. 92-1-8.

For specific automatic lock hub diagnosis and service: Refer to this article.

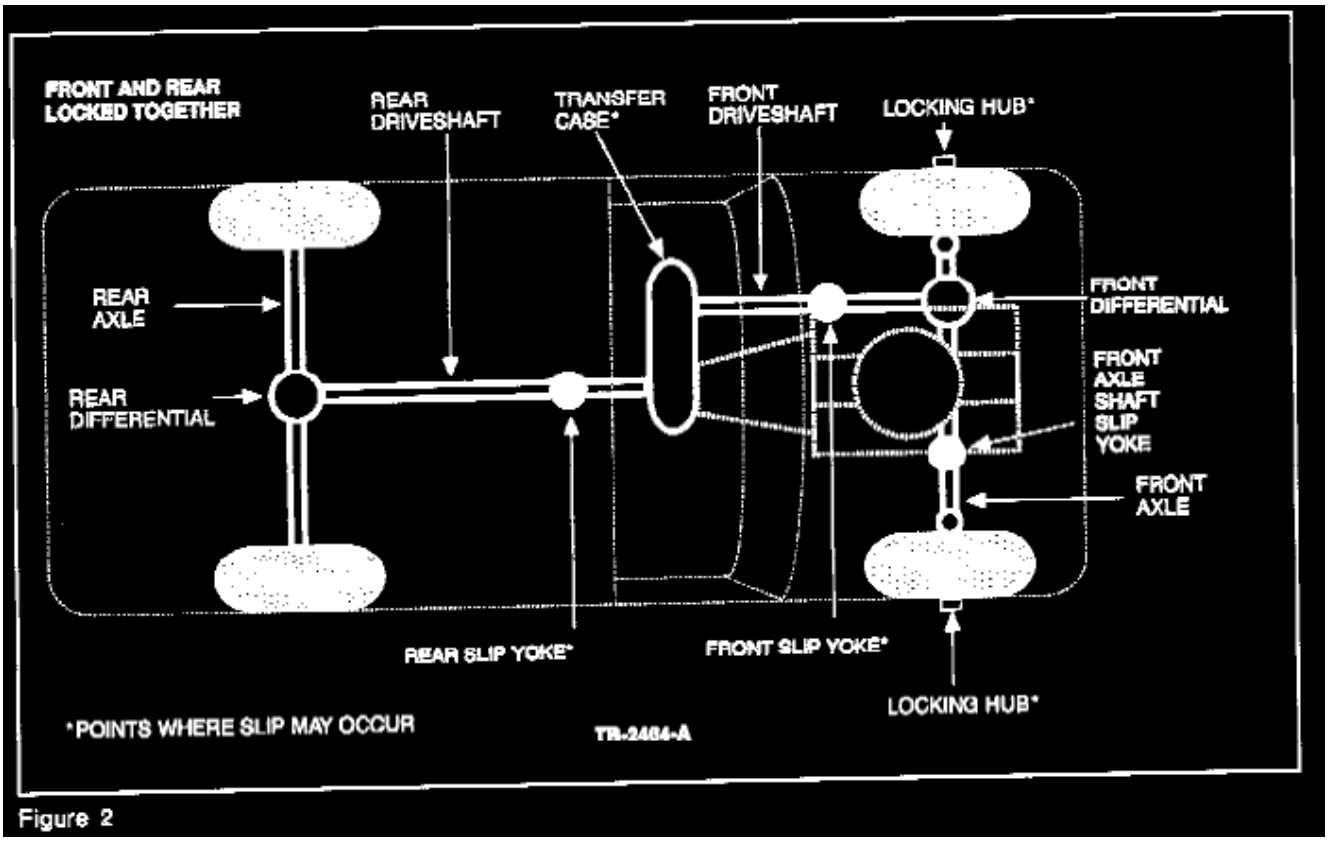

Figure 2

HUBLOCK DIAGNOSTICS

WHEEL END CONTAMINATION:

^ All compact vehicle hublocks have an O-ring seal between the hublock and wheel hub to prevent contamination. Whenever the hublock is removed, the 0-ring seal should be checked for damage.

^ If contamination is found in the wheel end, the path must be determined and corrected. Path possibilities are through the hublock seal, the wheel

bearing seals or the axle spindle seals.

WHEEL END NOISE (BUZZING) IN 4X2, AFTER UNLOCKING HUBS, SHORTLY AFTER FOUR-WHEEL DRIVE USAGE:

^ Noise concerns in two-wheel drive shortly after shifting from four-wheel drive and unlocking hubs, can occur if one of the hublocks fails to disengage. As the vehicle moves forward, the one (1) hublock that has failed to disengage will rotate its axle shaft through the differential and attempt to rotate the other axle shaft in the opposite direction. This is called differential motoring torque. As this torque attempts to turn the other axle shaft through the differential gears, that shaft's hublock will attempt to engage which will result in a ratcheting or buzzing noise.

^ This type of noise concern is usually found on axles that have incorrect front axle differential lubricant or very few 4X4 miles on them.

^ Verify that the front axle differential lubricant is F1TZ-19580-A. If incorrect lubricant is detected, extract the old lubricant using a suction gun.

NOTE:

BREAKING THE CARRIER SEAL IS NOT A RECOMMENDED METHOD OF EXTRACTING THE LUBRICANT.

1. Refill the front axle with 56 oz (1.66 L) of lubricant F1TZ-19580-A using a suction gun.

2. As the front axle accumulates 100-200 miles (161-322 km) of locked hublock operation, the axle will break-in, thus reducing the amount of differential motoring torque significantly.

3. If a front axle requires breaking in, refer to the Front Axle Break-In Procedure in this article.

4. If the front axle has been broken-in and the differential lubricant is F1TZ-19580-A, however, a wheel end noise (buzzing) in 4X2 is still experienced shortly after four-wheel drive usage. It is advised that the hublock which is not ratcheting be replaced as it is not disengaging correctly. When this condition occurs on any 4X4 Ranger, Explorer, or Bronco II, built from 10/89 through model year 1993, it is advised that both hublocks be replaced as the ratcheting hub is likely to become damaged.

FRONT AXLE BREAK-IN PROCEDURE:

^ To break-in the front axle, engage four-wheel drive and then shift out of it without disengaging the hublocks.

^ Thereafter, continue to drive the vehicle with locked hublocks until 100-200 miles (161-322 km) are accumulated. This will break-in the axle. Should the vehicle be backed up during this time

period, the hublocks will disengage and will have to be locked again by repeating the engagement procedure.

WHEEL END NOISE (RATCHETING) IN 4X2 AND HUBS UNLOCKED:

^ This condition could occur during turns or when the suspension is stroked. It is more prevalent in cold weather, with new front axles. It is usually caused by high motoring torque at the axle shafts or by incorrect axle lubrication.

^ Verify that axle lubrication is F1TZ-19580-A. If the front axle is not broken-in, 100-200 4X4 miles (161-322 km), proceed to do so following the outlined front axle break-in procedure in the Hublock Diagnostics section of this TSB article.

WHEEL END NOISE (BUZZING) WHILE ENGAGING 4X4 (TOUCH DRIVE) WHILE MOVING:

^ Refer to TSB Article No. 91-15-10.

POPPING/BANGING SOUND WHILE IN 4X4:

^ If the system slips under load, find what has broken or is slipping. To locate where slip is taking place, put marks at various possible slip points (Figure 1). Test drive the vehicle, then check to see if marks at different points are still in the same relationship to each other. This will help you determine where the slippage is taking place or where to look for broken parts, if any.

^ On vehicles with automatic hubs, find a place where you can do your test, mark the components, then drive without backing up. Stop and check the marks to see if they are in the same relationship to each other. If you back up before checking your marks, the hubs may reindex and not reveal the problem.

^ Reindex component should be serviced.

INSTALLATION PROCEDURE

1. Remove old hublock; remove key from bearing retainer nut and then remove nut.

2. If replacing a manual hublock with an automatic hublock, also remove the three-piece wheel bearing nut assembly.

3. Remove the new wheel bearing retaining nut from the cam assembly and install on the threaded spindle.

4. Using Hex Locknut Wrench (T70T-4252-B), torque the wheel bearing retainer nut to 47 N-m (35 lb.ft.) while rotating the wheel assembly. Back nut off 1/4 turn and retighten to 1.8 N-m (16 lb.in.) of torque.

5. Align scallop of the wheel bearing retaining nut with the center of the spindle keyway by advancing the nut clockwise.

6. Install the retaining key into the spindle keyway. With the garter spring inboard, align the key on the cam assembly with the keyway on the spindle.

7. Firmly press the cam assembly on the wheel bearing retaining nut.

CAUTION:

DO NOT PACK THE HUBLOCK WITH GREASE. TOO MUCH GREASE WILL CAUSE IMPROPER HUBLOCK OPERATION AND MAY DAMAGE THE HUBLOCK.

8. For Ranger and Bronco II, model years 1983-90 (through build date 10/4/89), using the DANA 28 Axle, install the thrust washer set onto the axle:

a. First, the plain steel washer.

b. Second, the needle bearing.

c. Last, the spline washer.

9. For model years 1990-94 (begin build date 10/5/89), DANA 35 Axle, install the one-piece spline washer. Install the "C" clip into the axle groove. It may be necessary to push the axle outboard from the inboard side of the knuckle.

10. For 1995 Ranger, install the thrust washer onto the axle:

a. First, the plain steel thrust washer.

b. Second, the plastic unsplined thrust washer.

AUTOMATIC HUBLOCK IDENTIFICATION CHART				
AUTOMATIC HUBLOCK MODEL TYPE	DATE CODE DESCRIPTION	EXAMPLE	PRODUCTION DATE	HUBLOCK BODY COLOR
M350A	Three (3) alphanumeric characters, or in some cases, no code	AB2 or no code	10/89	Argent
M350B	Six (6) numbers	920621	6/92	Argent
M350C	Backward letter "C" or the letter "C" followed by six (6) numbers	" " 931020 or C931021	8/93	Argent

c. Last, the steel spline thrust washer.

CAUTION:

ENSURE THE RETAINING RING OR "C" CLIP IS SEATED PROPERLY IN THE AXLE GROOVE FOR STEPS 8, 9, OR 10.

11. Check to ensure 0-ring seal on the flange face of the hublock body is not damaged and is properly positioned in its groove.

12. Install the hublock body assembly into the vehicle hub and rotor assembly. The hub may have to be rotated to line up the three (3) prongs of the cam follower (found internally to the hublock) with the cam assembly.

13. Install retainer flat nuts on wheel studs.

NOTE:

DO NOT FORCE THE HUBLOCK ASSEMBLY. IF THE BODY ASSEMBLY WILL NOT FIT, RECHECK THE ALIGNMENT OF ALL COMPONENTS. INSTALL SPEEDNUTS ON WHEEL LUGS TO RETAIN HUBLOCK. THEREAFTER, INSTALL THE WHEEL AND TORQUE THE LUG NUTS TO 136 N-m (100 LB.FT.) (FIGURE 2).

HISTORY AND TIMING

The Warn Automatic Hublock (Model M350) was used on the DANA 28 Axle (Bronco II and Ranger) from model years 1983-90 (through build date 10/4/89). The Warn Automatic Hublocks (Models M350A and M350B) were used on the DANA 35 Axle (Bronco II, Explorer and Ranger) for model years 1990-93 (begin build date 10/5/89). Starting with model year 1994 the Warn Automatic Hublock (Model M350C) used on the DANA 35 Axle (Explorer and Ranger) was introduced.

The Model M350 is black and Model M350A, M350B and M350C are argent (white silver) in color. The Model M350 can only be replaced by Model M350 service parts. The M350C service kits should be used as replacements for the following:

^ M350A hublocks released 10/89 as model year 1990 running change.

^ M350B hublocks released 4/92 as model year 1992 late running change.

^ M350C hublocks released 8/93 as model year 1994 Job 1 change.

When automatic hublock servicing is required for any Ranger, Explorer, or Bronco II built from 10/89 through model year 1993, it is advised that both hublocks be replaced.

NOTE:

IF AN M350A OR M350B HUBLOCK REQUIRES SERVICING, ALL THE HUBLOCK COMPONENTS MUST BE REMOVED AND REPLACED WITH SERVICE KIT F3TZ-3B396-B, WHICH ESSENTIALLY IS THE SERVICE KIT FOR THE M350C AUTOMATIC HUBLOCK. THE CAM ASSEMBLY OF THE M350A OR M35OB SHOULD NOT BE USED WITH AN M350C AUTOMATIC HUBLOCK BODY NOR SHOULD AN M350A OR M350B AUTOMATIC HUBLOCK BODY BE USED WITH AN M350C CAM ASSEMBLY.

For model year 1994 (and beyond) 4X4 Rangers or Explorers, replace automatic hublocks in accordance with the automatic hublock Service Manual procedure and additional diagnostics procedure outlined in this TSB.

IDENTIFYING AUTOMATIC HUBLOCK MODELS

A stamped code found on the rear of the automatic hublock flange face can be used to identify the automatic hublock type, in addition to the model year summary described above. Examples of the three (3) different codes which correlate to the automatic hublock model type are outlined in the chart:

PART NUMBER	PART NAME
E3TZ-1K105-B	Hublock Assembly
E3TZ-3N105-A	Nut And Bearing
E3TZ-1K106-B	Seal Kit
E5TZ-3B459-A	Key
E6TZ-3B477-A	Cam

PART NUMBER	PART NAME
F3TZ-3B396-B	Hublock - Automatic (Hublock Assembly, Wheel Retainer, Cam Assembly Key)
F3TZ-3N105-A	Hublock Nut/Key
F3TZ-1K106-A	Hublock Seal/Decal

THE ABOVE PART APPLICATION CHART IS FOR 1983-90 (THROUGH BUILD DATE 10/4/89) BRONCO II, RANGER, DANA 28 AXLE, HUBLOCK MODEL M350:

THE ABOVE PART APPLICATION CHART IS FOR:

^ 1990-95 Ranger (begin build date 10/5/89)

^ 1990 Bronco (begin build date 10/5/89 through end of production)

^ 1991-94 Explorer (through build date 11/18/94, DANA 35 Axle, Hublock Model M350C)

Wheel Hub (Locking): All Technical Service Bulletins Front Hub - (4WD) Noise or Failure

Article No. 91-18-12 09/05/91

^ NOISE-"RATCHETING" SOUND FROM HUBLOCKBRONCO II BUILT AFTER 10/1/89, RANGER BUILT BETWEEN 10/1/89 AND 3/31/91, EXPLORER BUILT UNTIL 3/31/91

^ AXLE-FRONT-AUTOMATIC LOCKING HUBS-ENGAGEMENT OF FRONT DRIVELINE DELAYED OR NO COUPLING OF FRONT WHEELS-BRONCO II BUILT AFTER 10/1/89, RANGER BUILT BETWEEN 10/1/89 AND 3/31/91, EXPLORER BUILT UNTIL 3/31/91

LIGHT TRUCK: 1990 BRONCO II 1990-91 RANGER 1991 EXPLORER

This TSB article is being republished in its entirety to note that the wheel bearing retaining nut is included with the front automatic locking hub assembly.

ISSUE: Engagement of the front driveline on 4x4 models of the subject vehicles with Shift-On-The-Fly and Dana 35 axles may exhibit delayed or no coupling of the front wheels. Both of these conditions may result in a hublock ratcheting noise and sometimes may result in structural damage to the hublock. These concerns are caused by the failure of the transfer case to provide synchronization of the drivetrain during cold weather.

ACTION: Test drive the vehicle to determine if the driveline exhibits delayed or no coupling of the front wheels. If so, use the following procedure to service the vehicle.

NOTE: THESE ACTIONS SHOULD PROVIDE SHIFT-ON-FLY CAPABILITY TO 55 MPH (89 KM/H) AT TEMPERATURES ABOVE 32~F (0~C) AND 45 MPH (72 KM/H) WITH TEMPERATURES FROM 32~F (0~C) TO AS LOW AS -20~F (-29~C).

FRONT AUTOMATIC LOCKING HUB

1. Remove the left and right front automatic locking hubs and camming assemblies and replace with new assemblies (FOTZ-3B396-B). Refer to the appropriate Light Truck Shop Manual, Section 04-01D, for service details.

2. Inspect the wheel bearing retaining nut for damage and presence of foreign material which would diminish wheel bearing life.

3. Replace the wheel bearing retaining nut if damaged. This nut is included with the front automatic locking hub assembly.

FRONT AXLE LUBRICANT

1. Determine if the vehicle was built prior to 12/15/90.

2. If the vehicle was built prior to 12/15/90, replace the front axle lubricant with new lubricant (F1TZ-19580-A).

a. Extract the old lubricant using a suction gun.

NOTE: BREAKING THE CARRIER SEAL IS NOT A RECOMMENDED METHOD OF EXTRACTING THE LUBRICANT.

b. Refill the front axle with 56 ounces of lubricant (F1TZ-19580-A) using a suction gun.

TRANSFER CASE

1. Remove the following old transfer case parts and replace them with the following new parts. Refer to the appropriate Light Truck Shop Manual, Section 07-07E, for service details.

^ Clutch Coil Assembly (F1TZ-7G361-B)

^ Clutch Housing (F1TZ-7G362-A)

^ Lock-Up Collar (F1TZ-7106-B)

^ Lock-Up Fork (FOTZ-7289-A) - (Green paint mark by part number)

^ Return Spring (F1TZ-7219-A)

^ Sleeve Spring (E6TZ-7D126-A)

2. Install the sleeve spring (E6TZ-7D126-A) into the bore of the 7106 lock-up collar large end first.

Wheel Hub (Locking): All Technical Service Bulletins Automatic Hublock - Diagnosis/Service Tips

Article No. 95-5-18

03/13/95

^ LOCK HUBS - 4WD - AUTOMATIC HUBLOCK INFORMATION - SERVICE TIPS

^ FOUR-WHEEL DRIVE (4WD) - AUTOMATIC LOCK HUB DIAGNOSIS

LIGHT TRUCK: 1983-90 BRONCO II 1983-95 RANGER 1991-94 EXPLORER

ISSUE: 4X4 system diagnosis can be difficult at times due to system complexities.

ACTION:

For general system operation and diagnosis: Refer to TSB Article No. 92-1-8.

For specific automatic lock hub diagnosis and service: Refer to this article.

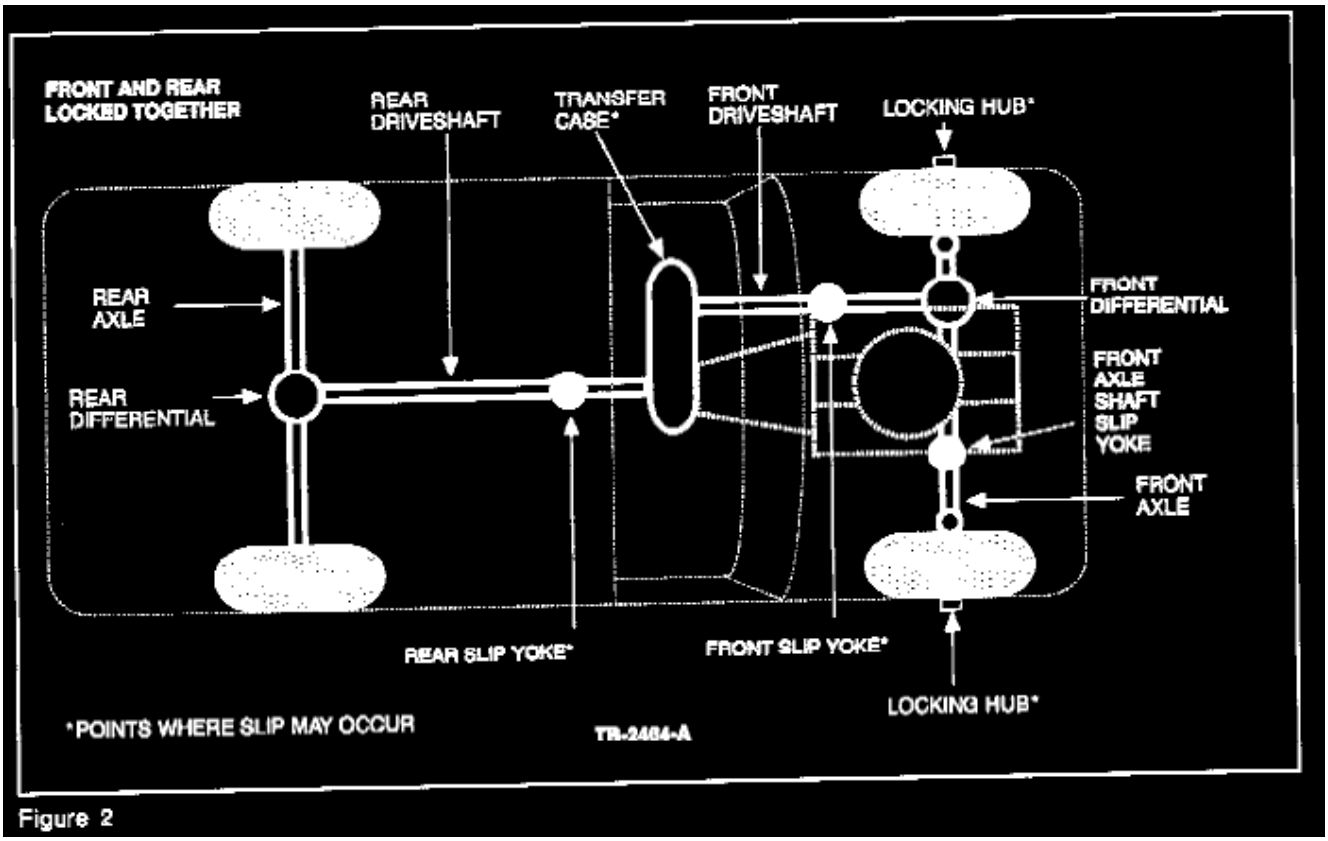

Figure 2

HUBLOCK DIAGNOSTICS

WHEEL END CONTAMINATION:

^ All compact vehicle hublocks have an O-ring seal between the hublock and wheel hub to prevent contamination. Whenever the hublock is removed, the 0-ring seal should be checked for damage.

^ If contamination is found in the wheel end, the path must be determined and corrected. Path possibilities are through the hublock seal, the wheel

bearing seals or the axle spindle seals.

WHEEL END NOISE (BUZZING) IN 4X2, AFTER UNLOCKING HUBS, SHORTLY AFTER FOUR-WHEEL DRIVE USAGE:

^ Noise concerns in two-wheel drive shortly after shifting from four-wheel drive and unlocking hubs, can occur if one of the hublocks fails to disengage. As the vehicle moves forward, the one (1) hublock that has failed to disengage will rotate its axle shaft through the differential and attempt to rotate the other axle shaft in the opposite direction. This is called differential motoring torque. As this torque attempts to turn the other axle shaft through the differential gears, that shaft's hublock will attempt to engage which will result in a ratcheting or buzzing noise.

^ This type of noise concern is usually found on axles that have incorrect front axle differential lubricant or very few 4X4 miles on them.

^ Verify that the front axle differential lubricant is F1TZ-19580-A. If incorrect lubricant is detected, extract the old lubricant using a suction gun.

NOTE:

BREAKING THE CARRIER SEAL IS NOT A RECOMMENDED METHOD OF EXTRACTING THE LUBRICANT.

1. Refill the front axle with 56 oz (1.66 L) of lubricant F1TZ-19580-A using a suction gun.

2. As the front axle accumulates 100-200 miles (161-322 km) of locked hublock operation, the axle will break-in, thus reducing the amount of differential motoring torque significantly.

3. If a front axle requires breaking in, refer to the Front Axle Break-In Procedure in this article.

4. If the front axle has been broken-in and the differential lubricant is F1TZ-19580-A, however, a wheel end noise (buzzing) in 4X2 is still experienced shortly after four-wheel drive usage. It is advised that the hublock which is not ratcheting be replaced as it is not disengaging correctly. When this condition occurs on any 4X4 Ranger, Explorer, or Bronco II, built from 10/89 through model year 1993, it is advised that both hublocks be replaced as the ratcheting hub is likely to become damaged.

FRONT AXLE BREAK-IN PROCEDURE:

^ To break-in the front axle, engage four-wheel drive and then shift out of it without disengaging the hublocks.

^ Thereafter, continue to drive the vehicle with locked hublocks until 100-200 miles (161-322 km) are accumulated. This will break-in the axle. Should the vehicle be backed up during this time

period, the hublocks will disengage and will have to be locked again by repeating the engagement procedure.

WHEEL END NOISE (RATCHETING) IN 4X2 AND HUBS UNLOCKED:

^ This condition could occur during turns or when the suspension is stroked. It is more prevalent in cold weather, with new front axles. It is usually caused by high motoring torque at the axle shafts or by incorrect axle lubrication.

^ Verify that axle lubrication is F1TZ-19580-A. If the front axle is not broken-in, 100-200 4X4 miles (161-322 km), proceed to do so following the outlined front axle break-in procedure in the Hublock Diagnostics section of this TSB article.

WHEEL END NOISE (BUZZING) WHILE ENGAGING 4X4 (TOUCH DRIVE) WHILE MOVING:

^ Refer to TSB Article No. 91-15-10.

POPPING/BANGING SOUND WHILE IN 4X4:

^ If the system slips under load, find what has broken or is slipping. To locate where slip is taking place, put marks at various possible slip points (Figure 1). Test drive the vehicle, then check to see if marks at different points are still in the same relationship to each other. This will help you determine where the slippage is taking place or where to look for broken parts, if any.

^ On vehicles with automatic hubs, find a place where you can do your test, mark the components, then drive without backing up. Stop and check the marks to see if they are in the same relationship to each other. If you back up before checking your marks, the hubs may reindex and not reveal the problem.

^ Reindex component should be serviced.

INSTALLATION PROCEDURE

1. Remove old hublock; remove key from bearing retainer nut and then remove nut.

2. If replacing a manual hublock with an automatic hublock, also remove the three-piece wheel bearing nut assembly.

3. Remove the new wheel bearing retaining nut from the cam assembly and install on the threaded spindle.

4. Using Hex Locknut Wrench (T70T-4252-B), torque the wheel bearing retainer nut to 47 N-m (35 lb.ft.) while rotating the wheel assembly. Back nut off 1/4 turn and retighten to 1.8 N-m (16 lb.in.) of torque.

5. Align scallop of the wheel bearing retaining nut with the center of the spindle keyway by advancing the nut clockwise.

6. Install the retaining key into the spindle keyway. With the garter spring inboard, align the key on the cam assembly with the keyway on the spindle.

7. Firmly press the cam assembly on the wheel bearing retaining nut.

CAUTION:

DO NOT PACK THE HUBLOCK WITH GREASE. TOO MUCH GREASE WILL CAUSE IMPROPER HUBLOCK OPERATION AND MAY DAMAGE THE HUBLOCK.

8. For Ranger and Bronco II, model years 1983-90 (through build date 10/4/89), using the DANA 28 Axle, install the thrust washer set onto the axle:

a. First, the plain steel washer.

b. Second, the needle bearing.

c. Last, the spline washer.

9. For model years 1990-94 (begin build date 10/5/89), DANA 35 Axle, install the one-piece spline washer. Install the "C" clip into the axle groove. It may be necessary to push the axle outboard from the inboard side of the knuckle.

10. For 1995 Ranger, install the thrust washer onto the axle:

a. First, the plain steel thrust washer.

b. Second, the plastic unsplined thrust washer.

AUTOMATIC HUBLOCK IDENTIFICATION CHART				
AUTOMATIC HUBLOCK MODEL TYPE	DATE CODE DESCRIPTION	EXAMPLE	PRODUCTION DATE	HUBLOCK BODY COLOR
M350A	Three (3) alphanumeric characters, or in some cases, no code	AB2 or no code	10/89	Argent
M350B	Six (6) numbers	920621	6/92	Argent
M350C	Backward letter "C" or the letter "C" followed by six (6) numbers	" " 931020 or C931021	8/93	Argent

c. Last, the steel spline thrust washer.

CAUTION:

ENSURE THE RETAINING RING OR "C" CLIP IS SEATED PROPERLY IN THE AXLE GROOVE FOR STEPS 8, 9, OR 10.

11. Check to ensure 0-ring seal on the flange face of the hublock body is not damaged and is properly positioned in its groove.

12. Install the hublock body assembly into the vehicle hub and rotor assembly. The hub may have to be rotated to line up the three (3) prongs of the cam follower (found internally to the hublock) with the cam assembly.

13. Install retainer flat nuts on wheel studs.

NOTE:

DO NOT FORCE THE HUBLOCK ASSEMBLY. IF THE BODY ASSEMBLY WILL NOT FIT, RECHECK THE ALIGNMENT OF ALL COMPONENTS. INSTALL SPEEDNUTS ON WHEEL LUGS TO RETAIN HUBLOCK. THEREAFTER, INSTALL THE WHEEL AND TORQUE THE LUG NUTS TO 136 N-m (100 LB.FT.) (FIGURE 2).

HISTORY AND TIMING

The Warn Automatic Hublock (Model M350) was used on the DANA 28 Axle (Bronco II and Ranger) from model years 1983-90 (through build date 10/4/89). The Warn Automatic Hublocks (Models M350A and M350B) were used on the DANA 35 Axle (Bronco II, Explorer and Ranger) for model years 1990-93 (begin build date 10/5/89). Starting with model year 1994 the Warn Automatic Hublock (Model M350C) used on the DANA 35 Axle (Explorer and Ranger) was introduced.

The Model M350 is black and Model M350A, M350B and M350C are argent (white silver) in color. The Model M350 can only be replaced by Model M350 service parts. The M350C service kits should be used as replacements for the following:

^ M350A hublocks released 10/89 as model year 1990 running change.

^ M350B hublocks released 4/92 as model year 1992 late running change.

^ M350C hublocks released 8/93 as model year 1994 Job 1 change.

When automatic hublock servicing is required for any Ranger, Explorer, or Bronco II built from 10/89 through model year 1993, it is advised that both hublocks be replaced.

NOTE:

IF AN M350A OR M350B HUBLOCK REQUIRES SERVICING, ALL THE HUBLOCK COMPONENTS MUST BE REMOVED AND REPLACED WITH SERVICE KIT F3TZ-3B396-B, WHICH ESSENTIALLY IS THE SERVICE KIT FOR THE M350C AUTOMATIC HUBLOCK. THE CAM ASSEMBLY OF THE M350A OR M35OB SHOULD NOT BE USED WITH AN M350C AUTOMATIC HUBLOCK BODY NOR SHOULD AN M350A OR M350B AUTOMATIC HUBLOCK BODY BE USED WITH AN M350C CAM ASSEMBLY.

For model year 1994 (and beyond) 4X4 Rangers or Explorers, replace automatic hublocks in accordance with the automatic hublock Service Manual procedure and additional diagnostics procedure outlined in this TSB.

IDENTIFYING AUTOMATIC HUBLOCK MODELS

A stamped code found on the rear of the automatic hublock flange face can be used to identify the automatic hublock type, in addition to the model year summary described above. Examples of the three (3) different codes which correlate to the automatic hublock model type are outlined in the chart:

PART NUMBER	PART NAME
E3TZ-1K105-B	Hublock Assembly
E3TZ-3N105-A	Nut And Bearing
E3TZ-1K106-B	Seal Kit
E5TZ-3B459-A	Key
E6TZ-3B477-A	Cam

PART NUMBER	PART NAME
F3TZ-3B396-B	Hublock - Automatic (Hublock Assembly, Wheel Retainer, Cam Assembly Key)
F3TZ-3N105-A	Hublock Nut/Key
F3TZ-1K106-A	Hublock Seal/Decal

THE ABOVE PART APPLICATION CHART IS FOR 1983-90 (THROUGH BUILD DATE 10/4/89) BRONCO II, RANGER, DANA 28 AXLE, HUBLOCK MODEL M350:

THE ABOVE PART APPLICATION CHART IS FOR:

^ 1990-95 Ranger (begin build date 10/5/89)

^ 1990 Bronco (begin build date 10/5/89 through end of production)

^ 1991-94 Explorer (through build date 11/18/94, DANA 35 Axle, Hublock Model M350C)

Wheel Hub (Locking): Service and Repair Removal

With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

1. Raise the vehicle and install safety stands. 2. Remove the wheel lugnuts and the wheel and tire assembly. 3. Remove the brake caliper and secure to the underbody to prevent damage to the brake hose. It is not necessary to disconnect the hose from the

caliper. Do not let the caliper hang with its weight on the brake hose or the hose may become stretched, twisted or ruptured.

4. Remove the retainer washers from the lugnut studs. Remove the automatic locking hub assembly from the spindle. 5. Remove the snap ring from the end of the spindle shaft.

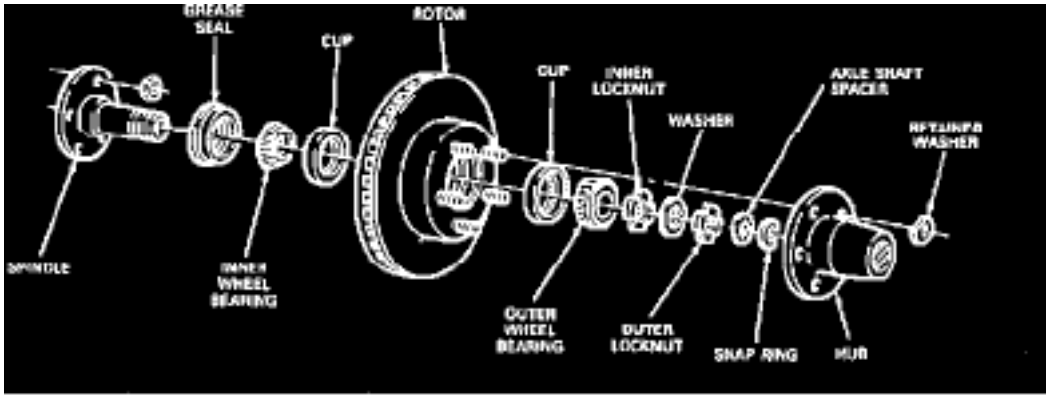
Axle Shaft Spacer

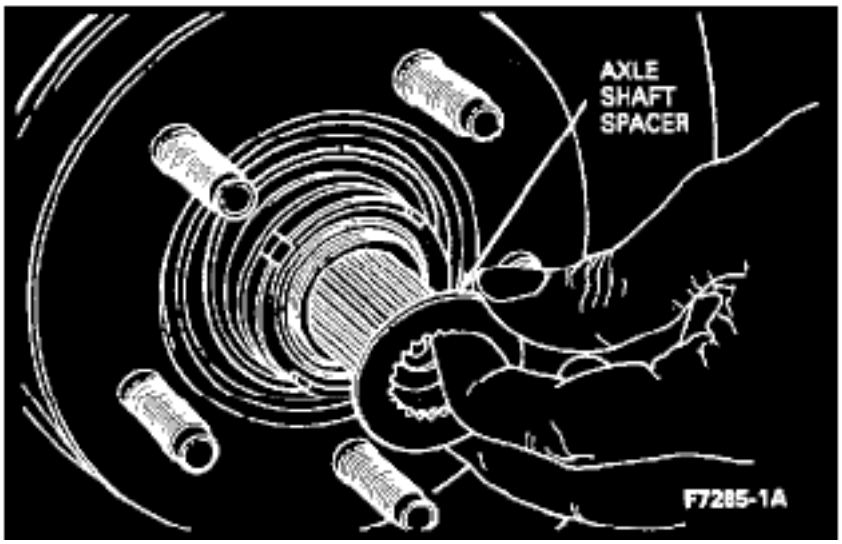
6. Remove the axle shaft spacer. 7. Pull cam assembly off the wheel bearing adjusting nut and remove the two plastic thrust spacers from the adjusting nut.

CAUTION: Do not pry on the plastic cam or thrust spacers during removal. Prying may damage the cam or spacers.

Cam Assembly And Locking Key

8. Using a magnet, remove the locking key.





NOTICE: If required, rotate the adjusting nut slightly to relieve pressure against the locking key, before the key can be removed.

CAUTION: To prevent damage to the spindle threads, look into the spindle keyway under the adjusting nut and remove the separate locking key before removing the adjusting nut.

9. Remove the wheel bearing adjusting nut from the spindle using a 2-3/8 inch Hex Locknut Wrench.

10. Remove the inner locknut and slide hub/rotor off spindle being careful to catch the outer wheel bearing.

With Manual Locking Hubs

Fig. 5 Manual Locking Hub

1. Raise the vehicle until the tire clears the floor and remove the wheel and tire assembly. 2. Remove the brake caliper and secure to the underbody to prevent damage to the brake hose. It is not necessary to disconnect the hose from the

caliper.

CAUTION: Do not let the caliper hang with its weight on the brake hose or the hose may become stretched, twisted or ruptured.

3. Remove the retainer washers from the lugnut studs and the manual locking hub assembly from the spindle. 4. Remove the snap ring from the end of the spindle shaft.

Axle Shaft Spacer

5. Remove the axle shaft spacer.

Wheel Hub (Locking): Service and Repair Installation

With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

CAUTION: Wheel bearing lubricant is a lithium-base grease. Sodium-base grease is not compatible with lithium-base grease and should not be intermixed. Therefore, do not lubricate front wheel bearings without first identifying the type of original wheel bearing lubricant. Usage of incompatible bearing lubricants may result in premature lubricant breakdown.

Installing Bearing Cups (Typical)

1. If inner or outer bearing cups were removed, install replacement inner and outer bearing cups in the hub with the appropriate bearing cup replacer

tool. Be sure to seat the cups properly in the hub. The cups will be properly seated when they are fully bottomed. Replace grease retainers. Polish grease retainer journal on spindle with 400 grit sandpaper. Clean with clean cloth.

2. Pack the inside of the hub with lithium-base grease or equivalent. Fill the hub until the grease is flush with the inside diameters of both bearing

cups. Pack the bearing cones and rollers with wheel bearing grease. Use a bearing packer for this operation. If a packer is not available, work as much lubricant as possible between the rollers and cages. Lubricate the cone surfaces with grease.

HUB

Installing Grease Seal (Typical)

3. Place the inner bearing in the inner cup and install the new grease seal. Be sure that the seal is fully seated. 4. Install the hub/rotor on the wheel spindle. Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads. 5. Place the outer bearing in the outer cup. 6. Install the wheel bearing adjustment nut. 7. While rotating the hub and rotor assembly, tighten the wheel bearing adjusting nut to 47 Nm (35 ft lb) to seat the bearings. Spin the rotor and back

off the nut one-quarter turn (90 degrees).

8. Retighten the adjusting nut to 1.8 Nm (16 in lb) using a torque wrench. 9. Make sure the final end play of the wheel on the spindle is 0.00-0.08 mm (0.000-0.003 in). the maximum torque to rotate the hub is 2.8 Nm (25 in

lb).

10. Align the closest lug in the wheel bearing adjusting nut with the center of the spindle keyway slot. Advance the nut to the next lug if required.

Install the separate locking key in the spindle keyway under the adjusting nut.

WARNING: Extreme care must be taken when aligning the spindle nut adjustment lug with the center of the spindle keyway slot to prevent damage to the separate locking key. The wheel and tire assembly may come off while the vehicle is in motion if the key is damaged.

11. Install the two thrust spacers and push or press the cam assembly onto the locknut by lining up the key in the fixed cam with the spindle keyway.

CAUTION: Extreme care must be taken when aligning the fixed cam key with the spindle keyway to prevent damage to the fixed cam.

12. Install the axle shaft spacer. 13. Clip the snap ring onto the end of the spindle shaft. 14. Install the automatic locking hub assembly over the spindle. Align three hub assembly legs with three pockets in cam assembly. Install the retainer

washers.

15. Install the caliper. 16. Install the wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb).

With Manual Locking Hubs

Fig. 5 Manual Locking Hub

CAUTION: Wheel bearing lubricant is a lithium-base grease. Sodium-base grease is not compatible with lithium-base grease and should not be intermixed. Therefore, do not lubricate front wheel bearings without first identifying the type of original wheel bearing lubricant. Usage of incompatible bearing lubricants may result in premature lubricant breakdown.

SEAL REPLACER TOOL T73T-1190-B
F1465-1D

Installing Bearing Cups (Typical)

1. If inner or outer bearing cups were removed, install replacement inner and outer bearing cups in the hub with the appropriate bearing cup replacer

tool. Be sure to seat the cups properly in the hub. The cups will be properly seated when they are fully bottomed. Polish grease retainer journal on spindle with 400 grit sandpaper. Clean with clean cloth. Replace grease retainers.

2. Pack the inside of the hub with lithium-base grease or equivalent. Fill the hub until the grease is flush with the inside diameters of both bearing

cups. Pack the bearing cones and rollers with wheel bearing grease. Use a bearing packer for this operation. If a packer is not available, work as much lubricant as possible between the rollers and cages. Lubricate the cone surfaces with grease.

Installing Grease Seal (Typical)

3. Place the inner bearing in the inner cup and install the new grease seal. Be sure that the seal is fully seated. 4. Install the hub/rotor on the wheel spindle. Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads. 5. Place the outer bearing in the outer cup. 6. Install the inner locknut. 7. Tighten the inner locknut to 47 Nm (35 ft lb) while turning the rotor in the opposite direction to seat bearings. 8. Spin the rotor and back off the inner locknut one-quarter turn. Retighten the inner locknut to 1.8 Nm (16 in lb). 9. Install the lockwasher on the spindle.

NOTICE: If necessary, tighten inner locknut slightly to align the locknut pin with lockwasher hole.

10. Install the outer wheel bearing locknut using locknut wrench. Tighten locknut to 203 Nm (150 ft lb). 11. Check the end play of the wheel and tire assembly on the spindle. Final end play should be 0.00-0.08 mm (0.000-0.003 in). The maximum torque

to rotate the hub is 2.8 Nm (25 in lb).

12. Install the axle shaft spacer. 13. Clip the snap ring onto the end of the spindle shaft.

14. Install the manual hub assembly over the spindle. Install the retainer washers. 15. Install caliper. 16. Install wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb). 17. Lower vehicle. 18. Check brakes for proper operation.

WARNING: Before moving vehicle, pump brake pedal several times to be sure it is firm. Do not move vehicle until a firm pedal is obtained.

ISSUE: The use of air impact tools to tighten wheel lug nuts can lead to overtightened and/or unevenly tightened wheel lug nuts. Air impact tools typically used for wheel lug nut removal and installation can generate up to 475 N.m (350 lb-ft) of torque. Overtightened and/or unevenly torqued wheel lug nuts may cause:

^ Brake vibration

^ Distortion of the wheel hub

^ Distortion of the brake rotor

TD-4106-B

Figure 1

^ Brake rotor runout

^ Damage to the wheel

^ Damage to the wheel nuts and studs

ACTION: All wheel lug nuts should only be tightened to specification using a torque wrench or by using the Rotunda ACCUTORO 164-R0314 or equivalent on a 1/2" drive air impact tool. The "ACCUTORO" lug nut sockets limit the torque of the air impact tool, preventing overtightening or uneven tightening of the wheel lug nuts. The torque limiting devices (regulators) on air impact tools will not reduce the output torque enough to prevent overtightening of the wheel lug nuts.

NOTE:

REFER TO THE APPROPRIATE SERVICE MANUAL OR THE CHART IN FIGURE 1 FOR THE CORRECT WHEEL LUG NUT TORQUE SPECIFICATION. THE CHART IN FIGURE 1 ALSO PROVIDES THE CORRECT "ACCUTORO" LUG NUT SOCKET TO USE.

The "ACCUTORO" socket is intended for lug nut installation, not removal. When using the "ACCUTORO" socket, the output torque of the air impact tool must be set to 217-339 N.m (160-250 lb-ft), usually this will be the lowest setting on the air impact tool.

The "ACCUTORO" lug nut sockets are available through Rotunda Equipment. The four-piece set (164-R0314) fits most Ford Motor Company cars and light trucks. The tool set consists of four (4) lug nut sockets and a storage case. The set can be ordered by calling Rotunda Equipment at 1-800-ROT-UNDA (768-8632).

CAUTION:

AIR IMPACT TOOLS SHOULD NOT BE USED TO TIGHTEN WHEEL LUG NUTS UNLESS THE "ACCUTORO" LUG NUT SOCKET OF THE CORRECT SPECIFICATION IS USED.

NOTE:

DO NOT USE AIR IMPACT TOOLS ON LOCKING WHEEL LUG NUTS. THEY ARE TO BE HAND-TORQUED ONLY.

Lug Nut Torque Patterns

IMPORTANT

Check all parts, including rims, lug studs, lug nuts, and mating surfaces of hubs and tire rims for rust, damage, or dirt. Clean mating surfaces with a wire brush to remove any foreign material. Replace any damaged parts as needed. Careless installation of tire/rim assemblies in a vehicle is a major cause of tire installation problems. Proper installation, including fastener torque, is essential to economical, safe and trouble free service. Use only the proper sizes and types of fasteners for safe and proper service.

Tighten the fasteners a quarter turn at a time using the tightening sequence diagram as a guide. This is very important to prevent misalignment of the wheel. Continue tightening the fasteners in sequence until the fasteners are tightened to the proper torque. See Specifications See: Wheels/Specifications

CAUTION: Improper torque or tightening sequence can cause distortion, fatigue cracks, or alignment problems. After driving the vehicle for a short distance, recheck the wheel fastener torque. Parts will usually seat naturally, reducing the torque on the fasteners. Retorque all fasteners to the proper torque.

Accumulator HVAC: Service and Repair

The accumulator/dryer must be replaced any time the system has been left open for more than 24 hours with the system completely discharged, there is evidence of moisture in the system, the system is badly contaminated, there is more than five ounces of compressor oil in it, or the accumulator/dryer is restricted, plugged or perforated. Replacement of a refrigerant line or a major component (condenser, evaporator or seized compressor) requires replacement of the accumulator/drier. The receiver/dryer does not necessarily need to be replaced every time there is a loss of refrigerant charge, a component is replaced or the outer shell of the unit is dented.

Fig. 2 Spring lock coupling disconnect & connect

1. Disconnect battery ground cable.

2. Discharge refrigerant from system.

3. Disconnect electrical connector from pressure switch and remove switch from accumulator.

4. Disconnect and cap suction line from accumulator/dryer, Fig. 2.

5. Loosen fitting connecting accumulator to evaporator core.

6. Remove lower forward screw holding flanges of case and bracket together, and remove screw holding evaporator inlet tube to the accumulator bracket. Disconnect accumulator from evaporator core, then remove bracket from accumulator/dryer.

7. Reverse procedure to install. Use new O-rings lubricated with refrigerant oil.

8. Leak test, evacuate and charge system. Check system for proper operation.

Air Door Actuator / Motor: Customer Interest Climate Control - Vibration Type Sound

Article No. 94-8-15

Air Duct: Customer Interest Heater - Poor Heat Distribution On the Driver's Side

Article No. 92-15-11

07/15/92

HEATER - FLOOR DUCTS - POOR HEAT DISTRIBUTION ON DRIVER'S SIDE - VEHICLES BUILT BEFORE 2/1/92

LIGHT TRUCK: 1991-92 EXPLORER, RANGER

ISSUE: Poor heat distribution on the driver's side may result in cold feet or legs. This condition is caused by the floor duct outlets directing air away from the driver's feet.

ACTION: Install a new floor duct that provides better directional air flow to the feet and leg area. Refer to the following procedure for service details.

SERVICE PROCEDURE - RANGER

REMOVAL:

1. Remove the one screw which attaches the rear of the front floor duct to the plenum.

2. Disengage the front floor duct from the tab on the left side of the plenum and remove the front floor duct.

INSTALLATION:

1. Position the new front floor duct (F2TZ-18C433-A) so the tab on the left side of the plenum protrudes through the oval hole in the duct.

2. Install the front floor duct attaching screw.

SERVICE PROCEDURE - EXPLORER

REMOVAL:

1. Remove the console and bracket (if applicable).

Wire Color Code Identification

NOTE: Whenever a wire is labeled with two colors; the first color listed is the basic color of the wire, and the second color is the tracer marking of the wire. If the second color is followed by by a D, the tracer is dots. If the second color is followed by an H, the tracer is hash marks.

For example: BR/O is a brown wire with an orange stripe, R/Y D is a red wire with yellow dots and BK/W H is a black wire with white hash marks.

BL: Blue BK: Black

BR: Brown DB: Dark Blue DG: Dark Green GR: Green GY: Gray LB: Light Blue LG: Light Green N: Natural

O: Orange

PK: Pink R: Red

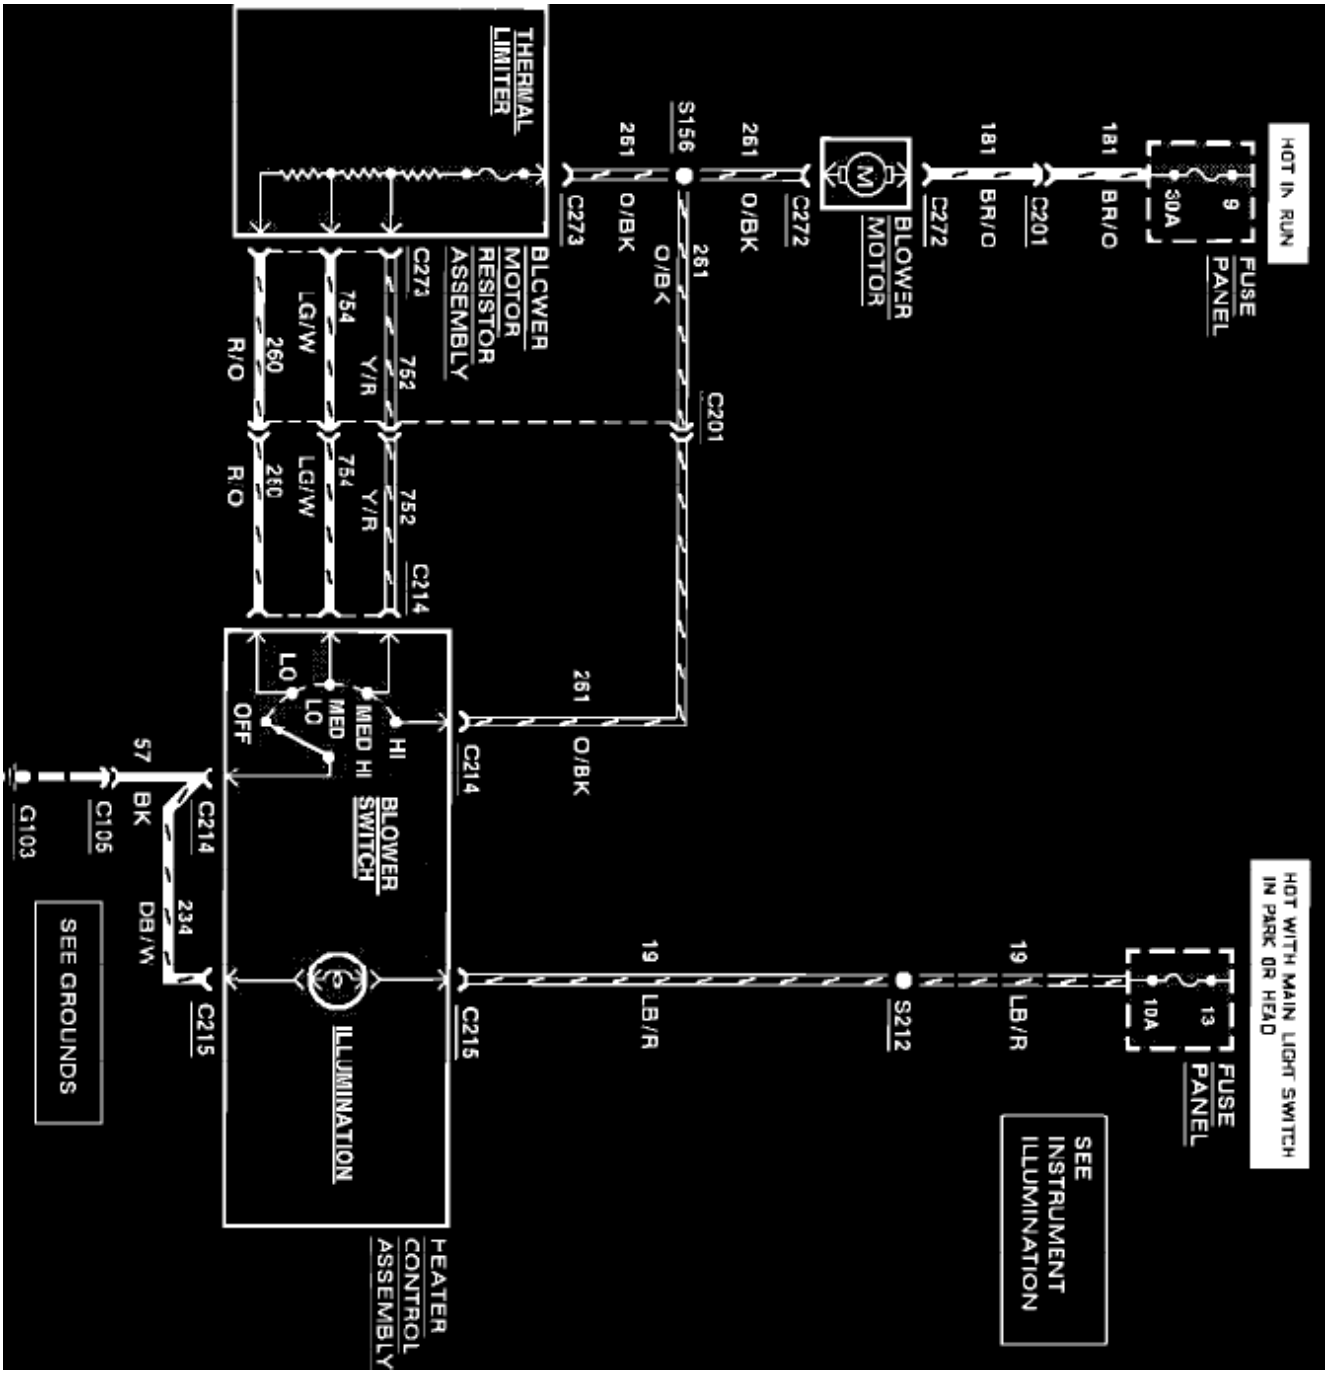
P: Purple

T: Tan

V: Violet

W: White

Y: Yellow



Heater Wiring Circuit

Blower Motor Current Draw		
Switch Setting	Amps	Volts
Off	0	0
Low	3.5-5.5	5
Med. Low	5-7.5	8
Med. High	7-9.5	10
High	9.5-11.5	12

Blower Motor: Testing and Inspection Blower Motor Current Draw, HEATER

Fig. 40 Blower motor current draw & voltage test chart.

1. Disconnect blower motor electrical connector.

2. Connect ammeter between positive terminal on motor and corresponding terminal of wire harness electrical connector.

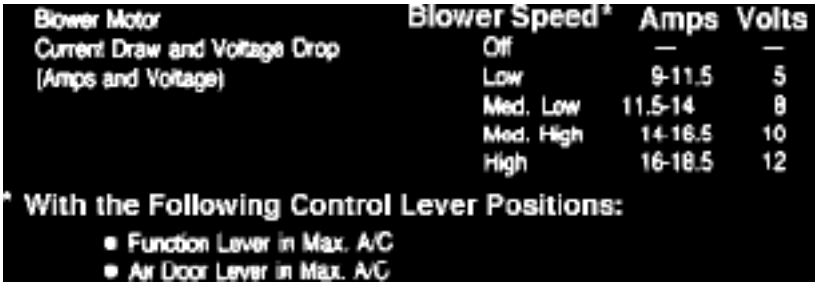
3. Connect jumper wire between two negative terminals.

4. Place system temperature control lever in mid-range position (halfway between COOL and WARM). Place function selector lever in HEAT or VENT position on models less A/C. A/C on models with A/C. Ensure blower is on.

5. With engine running, operate blower in all speeds. Note current draw for each blower speed. Ensure battery voltage is approximately 14.2 volts when performing this test.

6. Current draw for each blower speed should be as shown in Fig. 40.

7. Disconnect ammeter and jumper wire, then connect electrical connector to blower motor.



Blower Motor Current Draw and Voltage Drop (Amps and Voltage)	Blower Speed*	Amps	Volts
	Off	—	—
	Low	9-11.5	5
	Med. Low	11.5-14	8
	Med. High	14-16.5	10
	High	16-18.5	12

* With the Following Control Lever Positions:
- Function Lever in Max. A/C
- Air Door Lever in Max. A/C

Blower Motor: Testing and Inspection W/ MTC

Fig. 41 Blower motor current draw & voltage test chart.

1. Disconnect blower motor electrical connector.

2. Connect ammeter between positive terminal on motor and corresponding terminal of wire harness electrical connector.

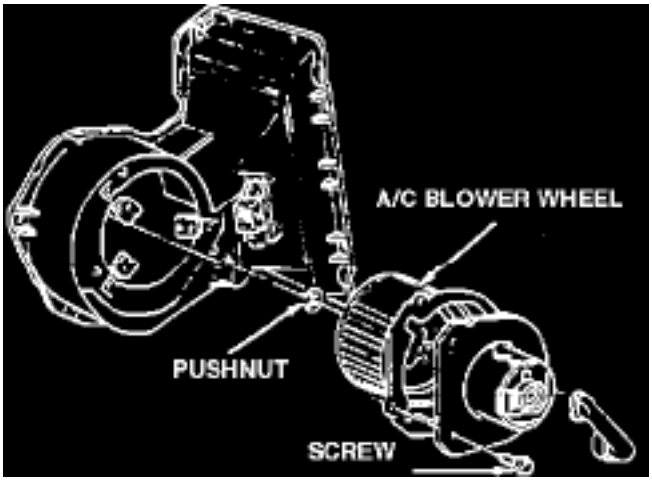
3. Connect jumper wire between two negative terminals.

4. Place system temperature control lever in mid-range position (halfway between COOL and WARM). Place function selector lever in HEAT or VENT position on models less A/C. A/C on models with A/C. Ensure blower is on.

5. With engine running, operate blower in all speeds. Note current draw for each blower speed. Ensure battery voltage is approximately 14.2 volts when performing this test.

6. Current draw for each blower speed should be as shown in Fig. 41

7. Disconnect ammeter and jumper wire, then connect electrical connector to blower motor.



Blower Motor: Service and Repair

Fig. 26 Disconnecting blower motor wire connectors

1. Disconnect battery ground cable.

2. Disconnect wire connector from blower motor.

3. Remove air cleaner.

4. Remove three solenoid box cover bolts, Fig. 26.

5. Disconnect blower motor cooling tube at blower motor.

6. Remove three blower motor to housing attaching screws and remove motor and wheel assembly.

7. Reverse procedure to install.

Compressor Clutch: Technical Service Bulletins A/C Clutch - Slips At High Ambient Temperature

Article No. 92-20-5

09/23/92

AIR CONDITIONING - FX-15 - COMPRESSOR AIR GAP SPECIFICATION - REVISION

FORD: 1988-93 TAURUS 1989-93 THUNDERBIRD 1991-93 CROWN VICTORIA 1992-93 ESCORT, TEMPO

LINCOLN-MERCURY: 1988-93 SABLE 1989-93 COUGAR 1991-93 CONTINENTAL, GRAND MARQUIS, TOWN CAR 1992-93 TOPAZ, TRACER

LIGHT TRUCK: 1989 ECONOLINE 1989-90 BRONCO II 1989-93 BRONCO, F-150-350 SERIES, F-47, RANGER 1990-93 AEROSTAR, EXPLORER

ISSUE: The air conditioner clutch may "slip" during high ambient temperature conditions. This is normally caused by improper air gap adjustment between the clutch plate and hub assembly.

ACTION: The air gap specifications between the clutch plate, hub assembly and the clutch pulley has been revised. When service is required the air gap must be set between 0.35 and 0.85 mm instead of the current Service Manual specification of 0.45 and 0.85 mm.

NOTE: WHEN ADJUSTMENT IS REQUIRED, USE THE SPACERS INCLUDED IN THE SPACER KIT LISTED IN THE PARTS BLOCK. OPTIMUM ADJUSTMENT IS TOWARD THE LOWER LIMIT OF THE SPECIFICATION RANGE IN THE INTEREST OF DURABILITY.

①—Models less rear A/C unit.
②—Models with rear A/C unit.
③—Compressor Oil Level Inches cannot be checked. Refer to "Maintenance Procedures" section for oil check & charging procedure.
④—R-4 compressor, 11 oz.; V-5 compressor, 8 oz.
⑤—Less auxiliary air, 7 oz.; w/auxiliary air, 10 oz.

Air Conditioning Specifications

• Compressor Clutch doesn't operate.	• No voltage at Clutch Cycling Pressure Switch.	• Fuse 7 blown. • Remove Connector from Cluich Cycling Pressure Switch. With the A/C-Heater Control Assembly Switch in the ON position, check for battery voltage at the 348 (P) wire.
	• Inoperative Clutch Cycling Pressure Switch.	• Check the Clutch Cycling Pressure Switch for continuity. No continuity indicates low refrigerant, or an inoperative Clutch Cycling Pressure Switch. Check refrigerant system.
	• No voltage at A/C Clutch Field Coil.	• Remove connector from the A/C Clutch Field Coil. Check the wire connector for battery voltage. Check the EEC Module (including Throttle Position Sensor and Coolant Temperature Sensor) and the WOT Cutout Relay for correct operation.
	• Inoperative A/C Clutch Field Coil.	• Repair A/C Clutch Field Coil or terminals as required.
• Compressor Clutch won't shut off.	• A/C Switch or Defrost Switch in A/C-Heater Control Assembly is stuck closed.	• Remove connector from the A/C Clutch Field Coil. Ensure correct voltage for each switch position.
• No cooling or not enough cooling (compressor operates).	• Clutch plates have no air gap. • Loose A/C Compressor drive belt. • Temperature Blend door out of adjustment. • Too much or too little Refrigerant in system.	• If compressor continues to run with connector disconnected, repair clutch air gap • Check drive belt tension. • Check operation of temperature control cable • Perform refrigerant system diagnosis and problem evaluation

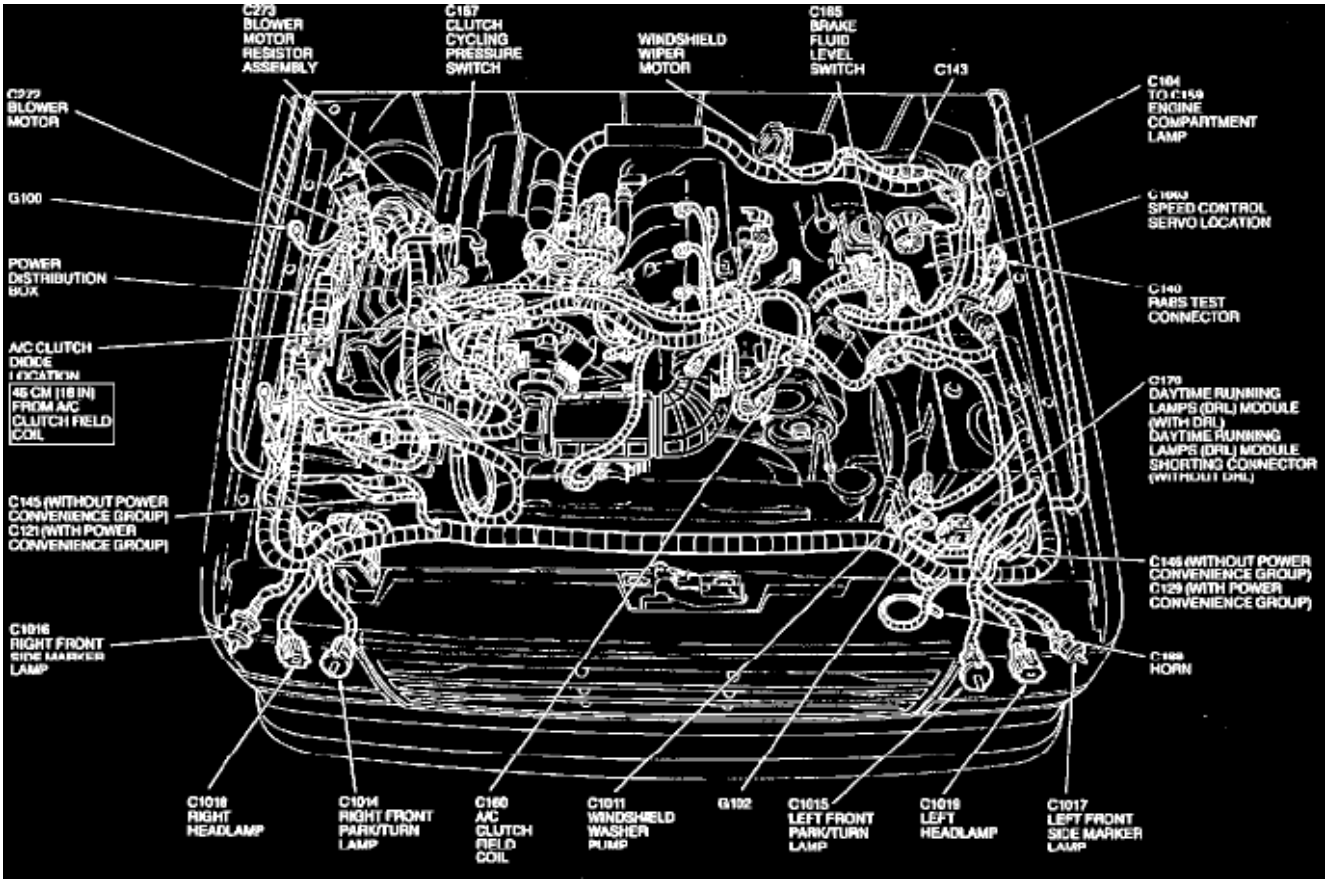
WARRANTY STATUS: INFORMATION ONLY

OASIS CODES: 208999, 290000



Compressor Clutch Coil: Locations

Engine Compartment Components.

Top LH Front Of Engine, Part Of A/C Compressor Assembly

Applicable to: 4.0L/V6-244

Compressor Clutch Coil: Testing and Inspection

1. Disconnect wire connector at clutch.

2. Connect negative terminal of an ammeter to one of the field coil terminals, then connect a jumper wire from a suitable ground to other terminal.

3. Connect a jumper wire to positive terminal of ammeter and connect other end of jumper wire to battery positive terminal.

4. With engine running and at operating temperature, current draw should be approximately 3.44 amperes. An audible click should be heard, indicating clutch engagement. If intermittent coil operation is suspected, maintain current draw test for 5 minutes or longer if necessary.

5. If current draw is not within specifications, replace magnetic clutch field coil.

Compressor Clutch Coil: Service and Repair Except FX-15 Compressor

Removal

1. Remove clutch hub and pulley.

2. Disconnect ground wire if equipped.

3. Remove snap ring retaining clutch field coil on front of compressor.

4. Remove field coil.

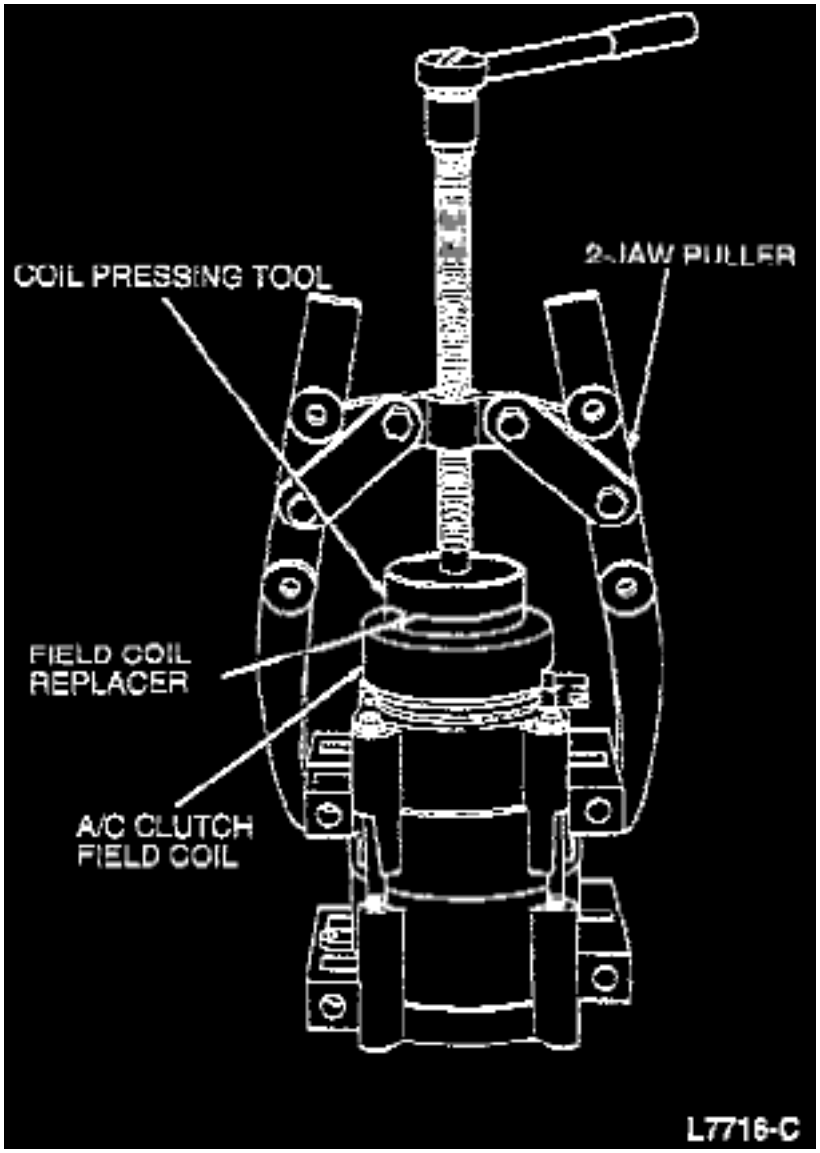
Installation

1. Position clutch field coil to compressor, engaging locator pin on compressor head with hole in clutch field coil.

2. Connect ground wire if equipped.

3. Install snap ring to retain clutch field coil on compressor with bevel side out.

4. Install pulley and hub on compressor.



Compressor Clutch Coil: Service and Repair With FX-15 Compressor

A/C Coil Pressing Tool - Installation

Removal

1. Remove clutch hub and pulley.

2. Install shaft protector tool T89P-19623-RH or equivalent on nose of compressor, and 2-jaw puller on coil Fig. 7.

3. Tighten puller, forcing screw to pull coil from compressor head.

Installation

1. Place coil on compressor head and ensure electrical connector is in correct position.

2. Install using tool T89P-19623-EH or equivalent and 2-jaw puller.

3. Install clutch hub and pulley on compressor.

Compressor Clutch Hub: Technical Service Bulletins A/C - FX 15 Compressor Clutch Shaft and Hub Assembly

Article No. 92-5-8

February 26, 1992

AIR CONDITIONING - FX-15 COMPRESSOR - CLUTCH SHAFT AND HUB ASSEMBLY - DESIGN CHANGE INFORMATION

FORD: 1988-92 TAURUS 1989-92 THUNDERBIRD 1991-92 CROWN VICTORIA 1992 ESCORT, TEMPO

LINCOLN-MERCURY: 1988-92 SABLE

1989-92 COUGAR 1991-92 CONTINENTAL, GRAND MARQUIS, TOWN CAR 1992 TOPAZ

LIGHT TRUCK: 1989 ECONOLINE 1989-92 BRONCO, F-150-350 SERIES, F-47, RANGER 1990-92 AEROSTAR 1991-92 EXPLORER

ISSUE: Effective with Job # 1, 1992, the FX-15 compressor shaft and hub assemblies have 21 splines instead of 16, as in prior years. This design change was made to increase shaft strength. The 16 tooth spline compressor is no longer in production.

Figure 1

ACTION: If it becomes necessary to replace an FX-15 Compressor, use the following guidelines for replacement. Refer to Figure 1.

16 TOOTH SPLINE COMPRESSOR AND CLUTCH ASSEMBLY

If a 16 tooth spline compressor and clutch assembly are not available, replace both assemblies with 21 tooth spline compressor and clutch hub assembly.

16 TOOTH SPLINE CLUTCH HUB ASSEMBLY

Use a 16 tooth spline clutch hub assembly.

16 TOOTH SPLINE COMPRESSOR

If a 16 tooth spline compressor is not available, replace it with a 21 tooth spline compressor. It will also be necessary to replace the clutch hub assembly with a 21 tooth spline clutch hub. If the clutch pulley has grooves worn into the friction surface, it should be replaced.

21 TOOTH SPLINE COMPRESSOR AND/OR CLUTCH HUB ASSEMBLY

Job # 1, 1992 and beyond ... Replace with 21 tooth spline components. Clutch hub assembly and compressor are ordered separately.

Compressor Clutch Hub: Technical Service Bulletins A/C Clutch - Slips At High Ambient Temperature

Article No. 92-20-5

09/23/92

AIR CONDITIONING - FX-15 - COMPRESSOR AIR GAP SPECIFICATION - REVISION

FORD: 1988-93 TAURUS 1989-93 THUNDERBIRD 1991-93 CROWN VICTORIA 1992-93 ESCORT, TEMPO

LINCOLN-MERCURY: 1988-93 SABLE 1989-93 COUGAR 1991-93 CONTINENTAL, GRAND MARQUIS, TOWN CAR 1992-93 TOPAZ, TRACER

LIGHT TRUCK: 1989 ECONOLINE 1989-90 BRONCO II 1989-93 BRONCO, F-150-350 SERIES, F-47, RANGER 1990-93 AEROSTAR, EXPLORER

ISSUE: The air conditioner clutch may "slip" during high ambient temperature conditions. This is normally caused by improper air gap adjustment between the clutch plate and hub assembly.

ACTION: The air gap specifications between the clutch plate, hub assembly and the clutch pulley has been revised. When service is required the air gap must be set between 0.35 and 0.85 mm instead of the current Service Manual specification of 0.45 and 0.85 mm.

NOTE: WHEN ADJUSTMENT IS REQUIRED, USE THE SPACERS INCLUDED IN THE SPACER KIT LISTED IN THE PARTS BLOCK. OPTIMUM ADJUSTMENT IS TOWARD THE LOWER LIMIT OF THE SPECIFICATION RANGE IN THE INTEREST OF DURABILITY.

Compressor Clutch Hub: Service and Repair Removal

1. Remove clutch hub retaining nut using spanner wrench T81P-19623-MH or equivalent. On 10P15A compressors, use strap wrench D85L-6000-A or equivalent. It is necessary to connect field coil to a 12V source to energize the coil engaging the clutch.

Fig. 2 Clutch hub removal

Fig. 1a Hub Driven Plate Remover Tool. FX-15

2. Remove clutch hub and shims from compressor shaft with tool T80L-19703-B or equivalent, Fig. 2. Holding tool with 1 inch wrench, tighten bolt with 1/2 inch wrench. Use tool T88C-19703-BH or equivalent, Fig. 1a, to remove hub plate of 10P15A compressors.

3. Remove clutch pulley retaining snap ring.

4. Remove pulley and bearing assembly from compressor. If pulley and bearing assembly cannot be removed by hand, use a suitable puller.

6. Check clutch air gap between hub and pulley mating surface in three locations equally spaced, Fig. 6. Rotate pulley one-half turn and check again. The smallest air gap must be within specification, refer to ``Air Conditioning Specifications'' section. Add or remove shims until desired limit is attained.

Compressor Shaft Seal: Service and Repair

Except for manifold hose O-rings and front shaft seal this compressor is not serviceable and must be replaced as an assembly.

Removal

1. Drain oil from compressor through manifold openings.

2. Clamp compressor in suitable vise, then remove clutch hub.

3. Remove shaft seal felt from nose of compressor.

4. Remove retaining snap ring as follows:

Fig. 25 Snap ring tool placement. FX-15

a. Insert tip of snap ring remover T89P-19623-DH or equivalent into one of snap ring eyes. Fig. 25.

b. Rotate tool to position tip and snap ring eye closest to compressor shaft. Fig. 26.

SEAL

Fig. 27 Snap ring removal. FX-15

c. Pull tool up quickly while keeping tool shaft against side of nose opening and remove snap ring. Fig. 27.

5. Place shaft seal remover tool T89P-19623-BH or equivalent over compressor shaft and push tool into nose of compressor and down against shaft seal. Engage end of tool with internal diameter of shaft seal and turn handle clockwise to expand tool tip inside seal inner radius, then remove seal.

Installation

1. Ensure new shaft protector is free of burrs, then lubricate tool with clean refrigerant oil.

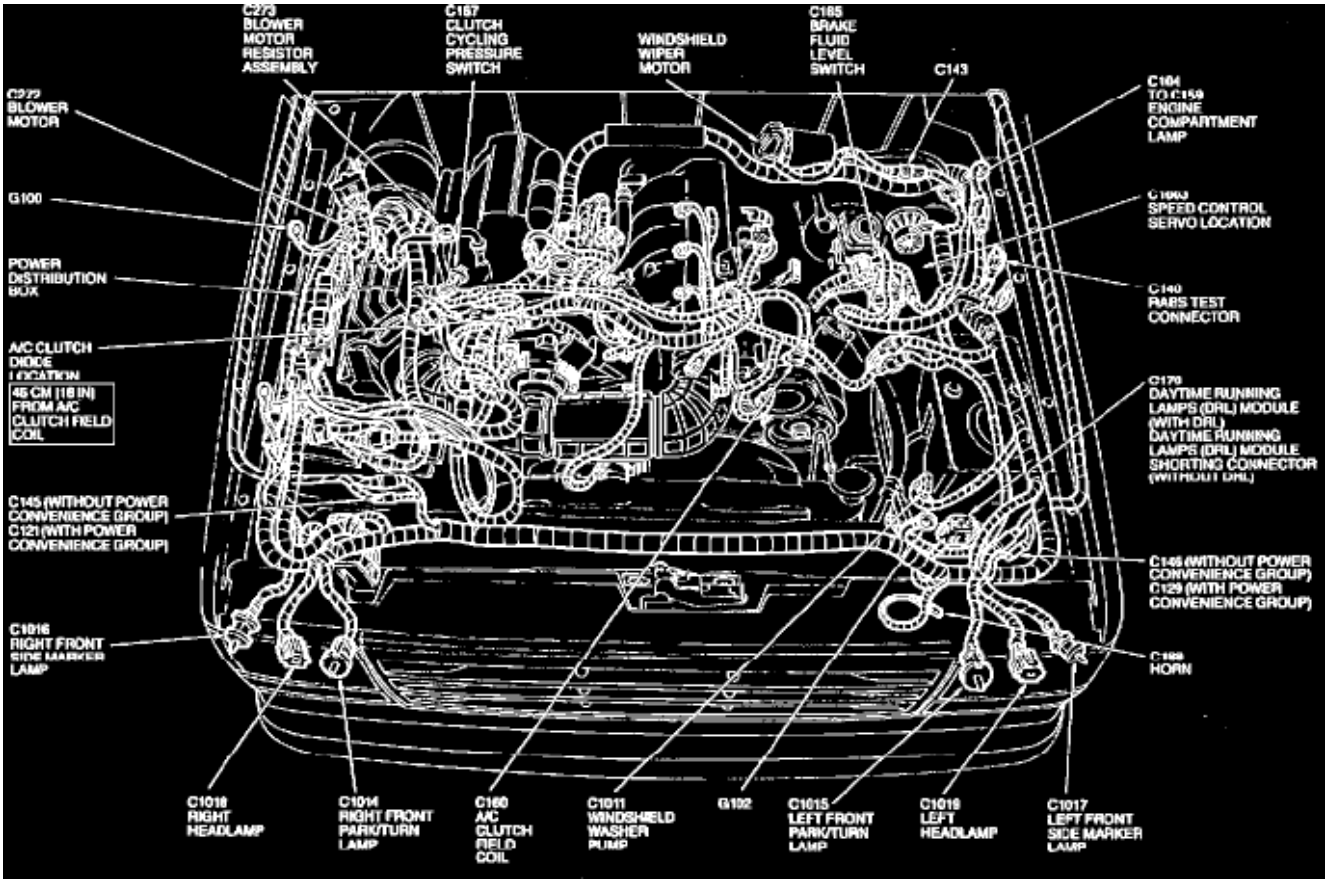
2. Lubricate shaft seal in clean refrigerant oil and place seal over shaft protector. Ensure lip portion of seal is pointed toward large end of protector.

Fig. 24 Shaft seal removal. FX-15

3. Place protector and seal over end of compressor shaft. Fig. 28.

4. Using shaft seal installer tool T89P-19623-AH or equivalent, slowly push seal down shaft protector until seated.

5. Remove replacer tool and shaft protector tool, then install snap ring. After ensuring no external leaks are present, install felt in nose and replace hub on compressor.

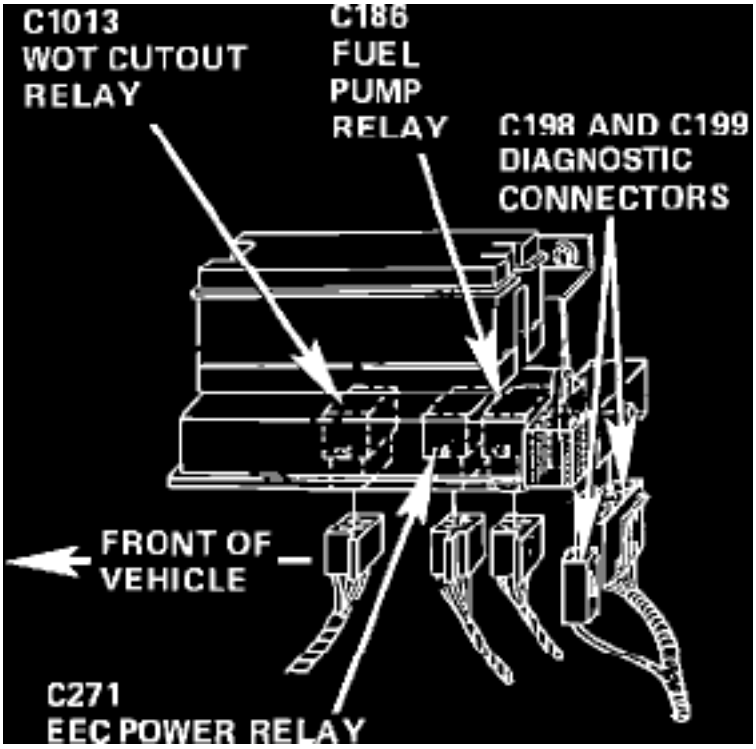


Compressor Clutch Diode HVAC: Locations

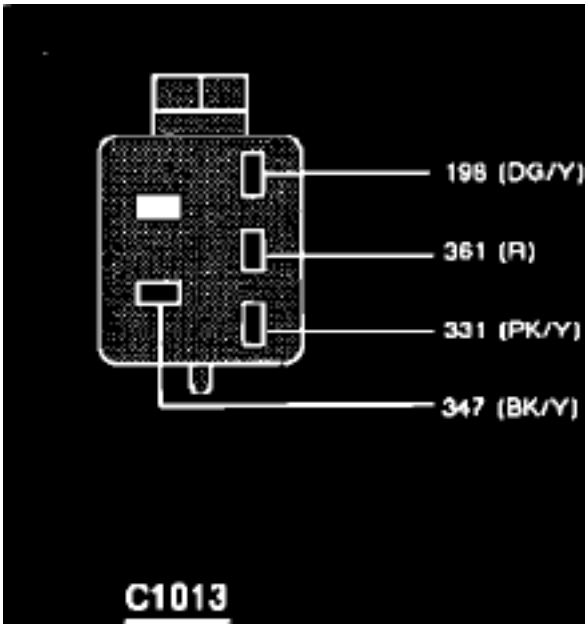
Engine Compartment Components.

Top Front Of Engine, Taped In Harness

Applicable to: 4.0L/V6-244



Relay And Diagnostic Connectors



Wide Open Throttle (WOT) Cutout Relay Connector

Compressor Clutch Relay: Description and Operation

When the vehicle operator goes to Wide Open Throttle (WOT), the Wide open throttle A/C (WAC) relay opens, suspending A/C operation until normal vehicle operation resumes. This is done to allow maximum power to the drive wheels under heavy acceleration or load.

• Compressor Clutch doesn't operate.	• No voltage at Clutch Cycling Pressure Switch. • Inoperative Clutch Cycling Pressure Switch. • No voltage at A/C Clutch Field Coil. • Inoperative A/C Clutch Field Coil.	• Fuse 7 blown. • Remove Connector from Clutch Cycling Pressure Switch. With the A/C-Heater Control Assembly Switch in the ON position, check for battery voltage at the 348 (P) wire. • Check the Clutch Cycling Pressure Switch for continuity. No continuity indicates low refrigerant, or an inoperative Clutch Cycling Pressure Switch. Check refrigerant system. • Remove connector from the A/C Clutch Field Coil. Check the wire connector for battery voltage. Check the EEC Module (including Throttle Position Sensor and Coolant Temperature Sensor) and the WOT Cutout Relay for correct operation. • Repair A/C Clutch Field Coil or terminals as required.
• Compressor Clutch won't shut off. • No cooling or not enough cooling (compressor operates).	• A/C Switch or Defrost Switch in A/C-Heater Control Assembly is stuck closed. • Clutch plates have no air gap. • Loose A/C Compressor drive belt. • Temperature Blend door out of adjustment. • Too much or too little Refrigerant in system.	• Remove connector from the A/C Clutch Field Coil. Ensure correct voltage for each switch position. • If compressor continues to run with connector disconnected, repair clutch air gap • Check drive belt tension. • Check operation of temperature control cable • Perform refrigerant system diagnosis and problem evaluation

This TSB is being republished in its entirety to include Labor Operations for system flushing.

ISSUE: Ford Motor Company has approved a procedure to provide technicians with a non-CFC method of flushing contaminated A/C system heat exchangers (evaporators and condensers). This procedure allows the A/C components to be cleaned and flushed while installed in the vehicle. The types of contamination flushed include particle matter which results from compressor or desiccant failure and the gummy residue which may form when refrigerant oil is overheated. Some Ford authorized HFC-134a retrofit kit procedures will also require A/C system flushing to remove mineral oil for capacity reasons.

ACTION: Refer to the following text for proper flushing procedures.

The flushing procedure is a two-step process which involves the use of an A/C Flusher. The Flusher is used to do the following:

1. Circulate the flushing solvent through the A/C system heat exchangers in the reverse direction of normal refrigerant flow (back flushing). Particle matter is filtered from the returning solvent and the solvent is returned to the reservoir for continued circulation.

2. Remove the flushing solvent from the A/C system. In this step, pressurized air (90-125 psi/620-862 kPa) is used to push and evaporate any remaining flush solvent from the heat exchangers.

Only Rotunda Item No. 014-00990 A/C Flushing kit which includes 014-00991 A/C Flusher, 014-00992 A/C Flusher Filling Kit. and F4AZ-19579-A A/C Flushing Solvent (case of 4 gallons/15 L), is approved for use on Ford vehicles. No other flushing device or solvent is approved by Ford Motor Company for flushing A/C systems. The use of other equipment or solvent may cause damage to the A/C system and the flushing unit.

Minimum time for flushing is 15 minutes and minimum time for air flushing is 30 minutes. Failure to continue air purge for the entire 30 minutes as specified may result in residual amounts of flush solvent contaminating the A/C system. Residual flush solvent in a functioning A/C system may lead to A/C system failure.

Do not flush through orifice tubes. TXVs, accumulator/driers, receiver/driers, mufflers or hoses. Internal plumbing and material make-up of these components make it impossible to properly remove the debris and/or residual flushing solvent.

One (1) gallon (3.8 L) of Ford A/C System Flushing Solvent is used in this device and is intended for one (1) vehicle only. It may be used to flush both heat exchangers on an individual vehicle, but under no circumstances should it be used on more than one (1) vehicle. The filter used when flushing is also intended for use on one (1) vehicle only.

NOTE:

DURING THE FLUSHING PROCESS, THIS MATERIAL MAY COLLECT RESIDUE FROM THE A/C SYSTEM, WHICH MAY INCLUDE CFC-12. DISPOSE OF THE SOLVENT AND FILTER IN ACCORDANCE WITH FEDERAL, STATE AND LOCAL REGULATIONS.

Use of A/C system filter kits as prescribed in TSB 94-15-5 is optional if the A/C system is flushed. Filter kit use is recommended after flushing if the system is highly contaminated. If the hoses are clogged with debris, hose replacement is required.

Always remember to match oil properly, replace the accumulator/drier and orifice tube, or TXV and receiver/drier when servicing an A/C system with a compressor or desiccant failure.

The following vehicles require A/C system flushing with retrofit kits to remove mineral oil for capacity reasons.

^ 1993 Probe 2.0L and 2.5L

Condenser HVAC: Service and Repair

Fig. 2 Spring lock coupling disconnect & connect

1. Discharge refrigerant from system.

2. Disconnect and cap compressor discharge line and liquid line from condenser, Fig. 2.

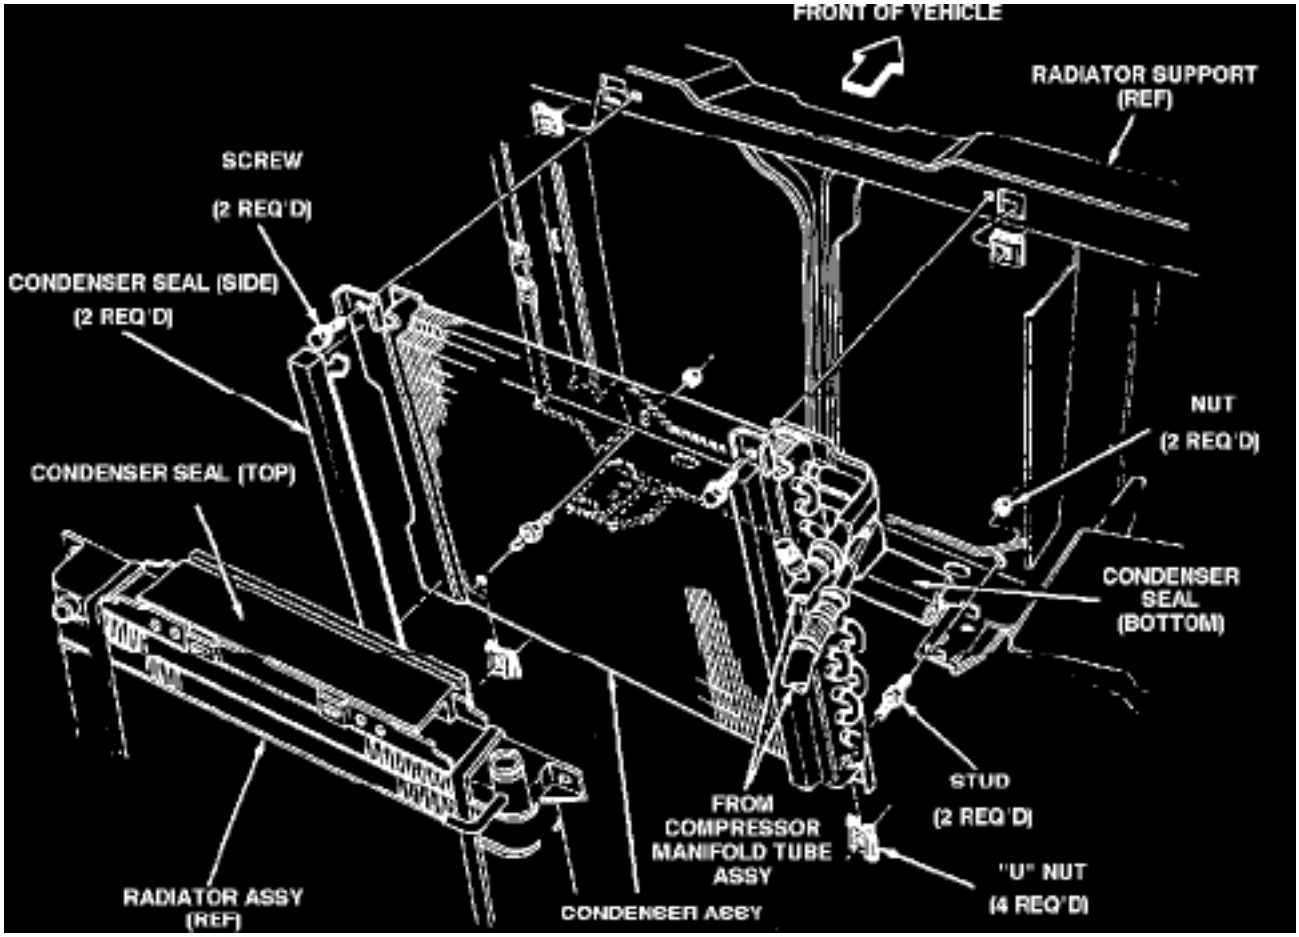

Fig. 4 Condenser removal

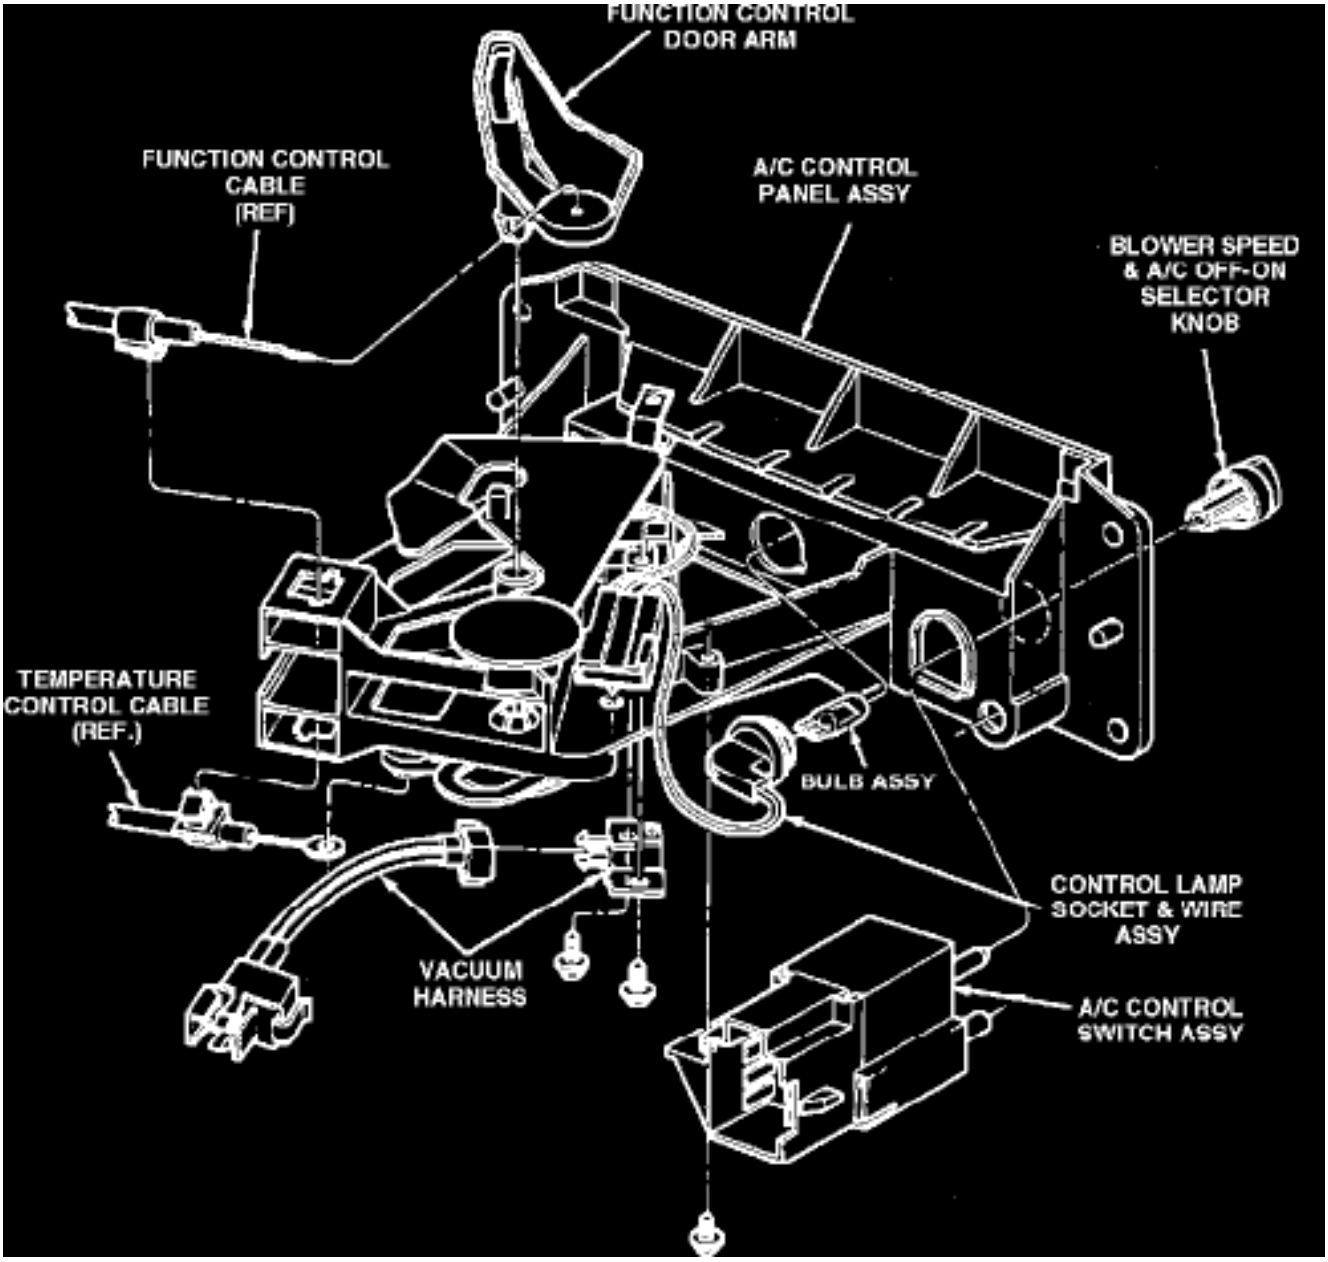
3. Working under vehicle, remove two nuts attaching two lower mounting studs, Fig. 4.

4. Remove upper radiator brackets and tilt top of radiator rearward. Then remove two bolts attaching two condenser upper mounting brackets to rear side of radiator support.

5. Remove condenser from vehicle.

6. Reverse procedure to install. Use new O-ring lubricated with suitable oil.

7. Leak test, evacuate and charge system.



Control Assembly: Service and Repair Control Assembly, HVAC

1. Disconnect battery ground cable.

2. Remove ashtray and disconnect cigar lighter electrical connector, then remove ashtray retaining screws and the ashtray retainer from instrument panel.

Fig. 9 Control assembly & electrical connectors

3. Pull center finish panel away from instrument panel to expose heater control attaching screws, Fig. 9. On 4WD Vehicles equipped with electronic shift-on-the-fly module, disconnect wire from the rear of the 4x4/transfer switch before trying to remove finish panel.

4. Remove four screws attaching control assembly to the instrument panel.

5. Pull control assembly through opening far enough to allow removal of electrical connectors from blower switch and control lamp.

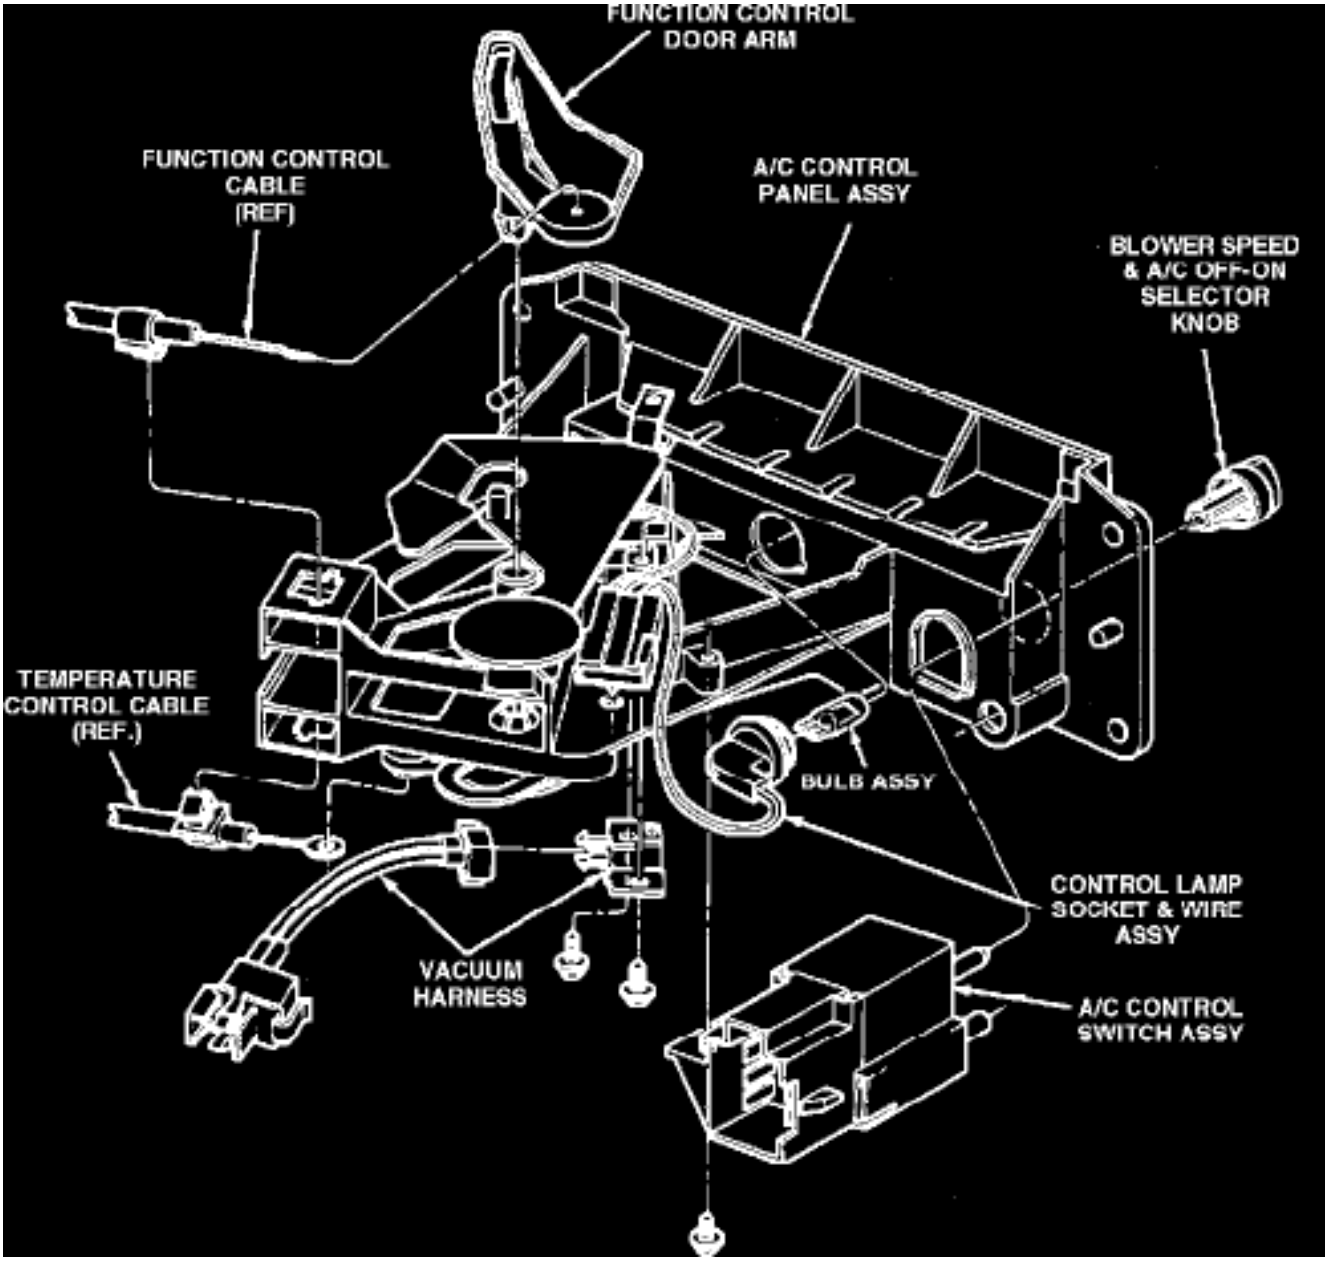
6. Disconnect vacuum harness from outside air control.

7. Using a screwdriver or needle nose pliers, release temperature and function cable snap-on flags from control bracket.

8. Spin temperature cable until it is released from T-pin.

9. Pull enough white cable through instrument panel opening until function cable can be held vertical to control. Remove control cable from function lever.

10. Reverse procedure to install.



Control Assembly: Service and Repair Control Panel Assembly Replace

1. Disconnect battery ground cable.

2. Remove ashtray and disconnect cigar lighter electrical connector, then remove ashtray retaining screws and the ashtray retainer from instrument panel.

Fig. 9 Control assembly & electrical connectors

3. Pull center finish panel away from instrument panel to expose heater control attaching screws, Fig. 9. On 4WD Vehicles equipped with electronic shift-on-the-fly module, disconnect wire from the rear of the 4x4/transfer switch before trying to remove finish panel.

4. Remove four screws attaching control assembly to the instrument panel.

5. Pull control assembly through opening far enough to allow removal of electrical connectors from blower switch and control lamp.

6. Disconnect vacuum harness from outside air control.

7. Using a screwdriver or needle nose pliers, release temperature and function cable snap-on flags from control bracket.

ISSUE: New refrigerant 0-rings (GREEN COLOR) are available for use in the Ford Spring Lock Coupling (SLC) and threaded (Tube-0) connections. The new GREEN COLORED 0-ring material provides improved sealing and longer seal life. Use of any other 0-ring for Ford refrigerant fittings is not recommended and may result in premature leakage at the fitting.

ACTION: If a refrigerant system repair is made which requires an A/C fitting to be disconnected, replace the existing 0-rings with the new GREEN COLORED type. Refer to the following 0-ring Usage Chart for identifying the correct 0-ring.

This TSB is being republished in its entirety to include the latest level tools and procedures available.

ISSUE: Some technicians may use small screwdrivers to remove 0-rings from spring lock coupling fittings. This practice can and has resulted in scratches across the 0-ring grooves in the fittings. Loss of refrigerant charge in the system may result.

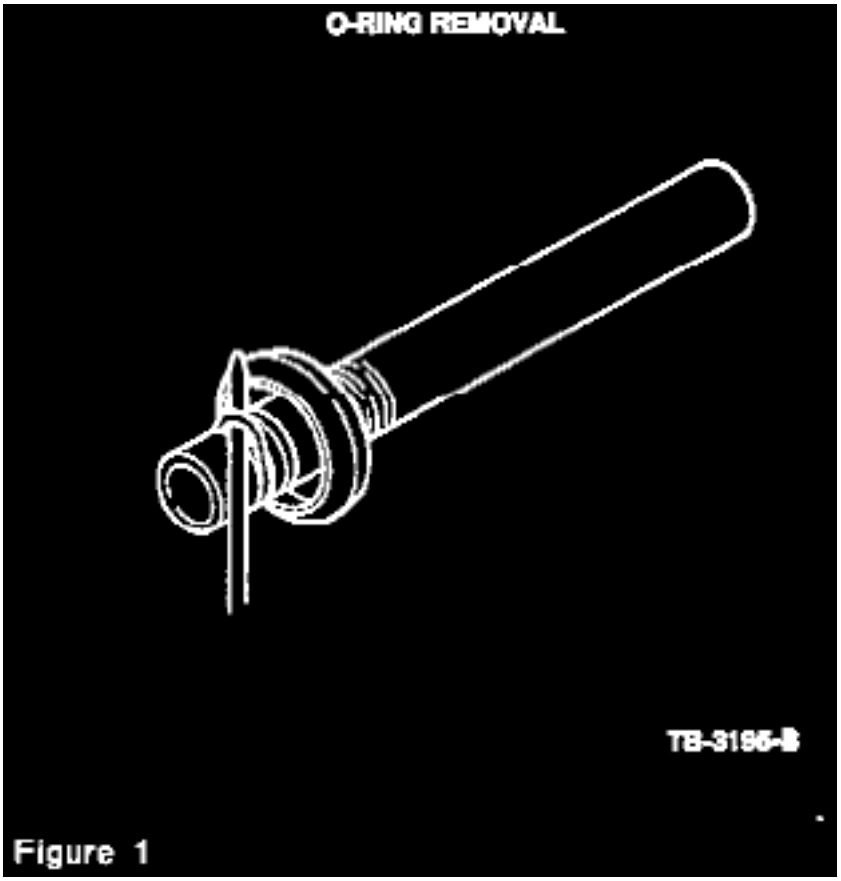

Figure 1

ACTION: It is recommended that a plastic toothpick, or equivalent tool, be used to remove 0-rings. Refer to Figure 1. Do not use the metal O-Ring Tool (T71P-19703-C). Only plastic O-Ring Tool (F5VH-17B017-AA) is approved for O-ring removal.

ISSUE: A procedure has been developed for cleaning Spring Lock Coupling (SLC) refrigerant fittings during air conditioning system repairs. This procedure and replacement of black O-rings with the improved green O-rings will reduce the potential of refrigerant leaks.

ACTION:

When servicing the air conditioning system on the subject vehicles, or if a refrigerant leak is suspected at any of the SLC connections, disconnect all SLC connections and replace all black O-rings with new green O-rings which are made of an improved material. Use the following service procedure to clean the coupling before installing new green O-rings. Refer to the Parts Block in this article for correct parts usage.

CLEANING PROCEDURE

1. Remove all refrigerant from the vehicle A/C system using an U.L. approved Refrigerant/Recovery device prior to disconnecting the refrigerant couplings. Refer to the appropriate model year Service Manual for a detailed A/C discharging procedure.

2. Disconnect the SLC coupling.

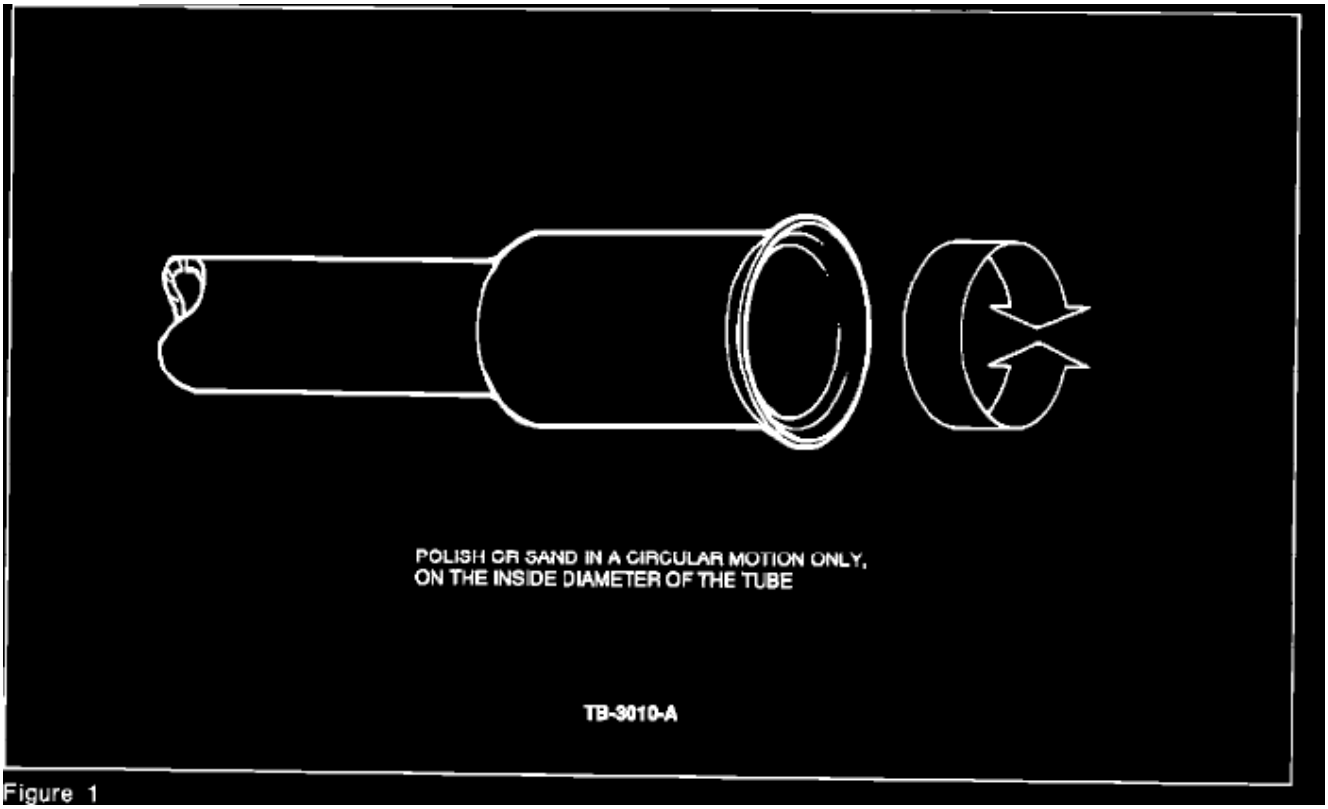

Figure 1

3. Remove the black O-rings. Be careful not to scratch the O-ring grooves.

CAUTION: A SCRATCH CAN CAUSE FUTURE REFRIGERANT LEAKS.

4. Remove any surface residue from the inside of the female SLC and the grooves of the male SLC by polishing with 400 grit emery cloth or equivalent. Polish the female surface by using a twisting motion, Figure 1, so that any scratches made will not cross the O-ring sealing surface.

5. Perform additional polishing of the surface using 600 grit emery cloth or equivalent.

6. Remove all residue from polishing operations from both fittings by wiping with a lint-free rag.

7. Install new green O-rings. If the O-rings are not prelubricated, lube with YN-9 A/C compressor oil (F73Z-19577-A) before installing them.

8. Lubricate the inside of the female portion of the SLC with YN-9 compressor oil (F73Z-19577-A) and apply additional oil to the O-rings.

9. Reconnect the fitting.

10. Recharge the A/C system. Refer to the appropriate model year Service Manual for specific detailed instructions.

This TSB is being republished in its entirety to include Labor Operations for system flushing.

ISSUE: Ford Motor Company has approved a procedure to provide technicians with a non-CFC method of flushing contaminated A/C system heat exchangers (evaporators and condensers). This procedure allows the A/C components to be cleaned and flushed while installed in the vehicle. The types of contamination flushed include particle matter which results from compressor or desiccant failure and the gummy residue which may form when refrigerant oil is overheated. Some Ford authorized HFC-134a retrofit kit procedures will also require A/C system flushing to remove mineral oil for capacity reasons.

ACTION: Refer to the following text for proper flushing procedures.

The flushing procedure is a two-step process which involves the use of an A/C Flusher. The Flusher is used to do the following:

1. Circulate the flushing solvent through the A/C system heat exchangers in the reverse direction of normal refrigerant flow (back flushing). Particle matter is filtered from the returning solvent and the solvent is returned to the reservoir for continued circulation.

2. Remove the flushing solvent from the A/C system. In this step, pressurized air (90-125 psi/620-862 kPa) is used to push and evaporate any remaining flush solvent from the heat exchangers.

Only Rotunda Item No. 014-00990 A/C Flushing kit which includes 014-00991 A/C Flusher, 014-00992 A/C Flusher Filling Kit. and F4AZ-19579-A A/C Flushing Solvent (case of 4 gallons/15 L), is approved for use on Ford vehicles. No other flushing device or solvent is approved by Ford Motor Company for flushing A/C systems. The use of other equipment or solvent may cause damage to the A/C system and the flushing unit.

Minimum time for flushing is 15 minutes and minimum time for air flushing is 30 minutes. Failure to continue air purge for the entire 30 minutes as specified may result in residual amounts of flush solvent contaminating the A/C system. Residual flush solvent in a functioning A/C system may lead to A/C system failure.

Do not flush through orifice tubes. TXVs, accumulator/driers, receiver/driers, mufflers or hoses. Internal plumbing and material make-up of these components make it impossible to properly remove the debris and/or residual flushing solvent.

One (1) gallon (3.8 L) of Ford A/C System Flushing Solvent is used in this device and is intended for one (1) vehicle only. It may be used to flush both heat exchangers on an individual vehicle, but under no circumstances should it be used on more than one (1) vehicle. The filter used when flushing is also intended for use on one (1) vehicle only.

NOTE:

DURING THE FLUSHING PROCESS, THIS MATERIAL MAY COLLECT RESIDUE FROM THE A/C SYSTEM, WHICH MAY INCLUDE CFC-12. DISPOSE OF THE SOLVENT AND FILTER IN ACCORDANCE WITH FEDERAL, STATE AND LOCAL REGULATIONS.

Use of A/C system filter kits as prescribed in TSB 94-15-5 is optional if the A/C system is flushed. Filter kit use is recommended after flushing if the system is highly contaminated. If the hoses are clogged with debris, hose replacement is required.

Always remember to match oil properly, replace the accumulator/drier and orifice tube, or TXV and receiver/drier when servicing an A/C system with a compressor or desiccant failure.

The following vehicles require A/C system flushing with retrofit kits to remove mineral oil for capacity reasons.

^ 1993 Probe 2.0L and 2.5L

^ 1988-90 Escort 1.9L EFI

^ 1989-93 Thunderbird Super Coupe

Fig. 2 Spring lock coupling disconnect & connect

Removal

1. Discharge refrigerant from system. 2. Disconnect and cap liquid line from evaporator core inlet tube. 3. Pour a small amount of refrigerant oil into inlet tube to lubricate orifice tube O-rings and inlet tube. 4. Using tool D80L-19990-A or equivalent, engage with the two tangs on the orifice tube.

CAUTION: Do not twist or rotate the fixed orifice tube in the evaporator core inlet tube, as it may break off.

5. Hold T-handle of removal tool to prevent it from turning, and run nut down against evaporator core tube until orifice tube is pulled from inlet tube. 6. If the A/C Evaporator Core Orifice breaks in tube, it must be removed from the tube with Broken Orifice Tube Extractor D80L-19990-B. 7. To remove a broken Orifice Tube, insert the screw end of the Extractor Tool into the tube and thread the screw end of the tool into the brass tube

in the center of the orifice body. Then pull the orifice from the tube.

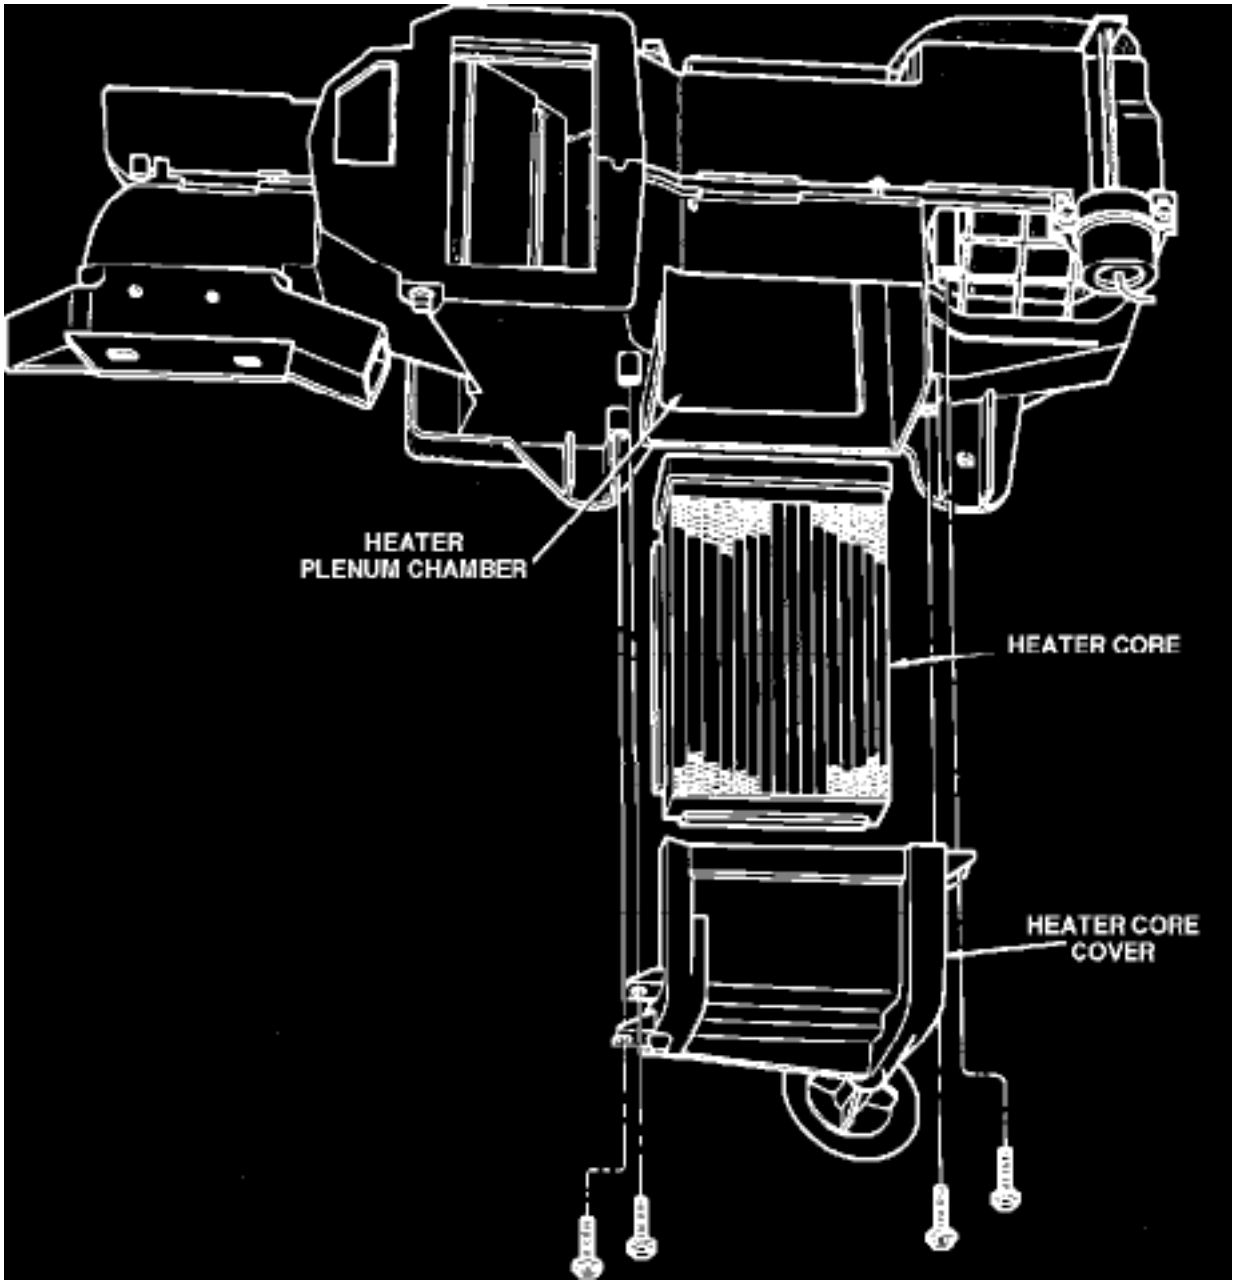
8. If only the brass tube is removed in step 7, insert the screw end of the extractor tool into the orifice body. Then pull the body from the tube.

Installation

1. Lubricate the O-rings on the A/C Evaporator cor orifice liberally with clean refrigerant oil. 2. Place the orifice in the remover/replacer tool and insert into the evaporator tube until the orifice is seated at the stop. 3. Remove the tool from the orifice. 4. After checking the condenser to evaporator tube coupling end for a missing or damaged spring, install two new O-rings lubricated with clean

refrigerant oil onto the male fitting. Insert the male fitting into the inlet tube until the spring lock coupling is fully engaged.

5. Leak test, evacuate and charge system. 6. Check system for proper operation.



Heater Core: Service and Repair

Heater Core

REMOVAL

1. Drain cooling system. See: Engine, Cooling and Exhaust/Cooling System/Service and Repair 2. Disconnect hoses from heater core. Plug hoses and core openings to prevent leakage of residual coolant. 3. Working inside the passenger compartment, remove screws attaching heater core access cover and remove the cover. 4. Pull the heater core rearward and down to remove from the plenum.

INSTALLATION

1. Position heater core and seal in the plenum opening. 2. Install heater core access cover. 3. Attach heater hoses to core tubes. Do not overtighten clamps. 4. Refill cooling system. 5. Check system for proper operation.

Housing Assembly HVAC: Customer Interest Heater - Lack of Heat to the Floor Area

Article No. 91-8-20

04/17/91

HEATER - EXCESSIVE AIR BLEED TO DEFROST

LIGHT TRUCK: 1990-91 EXPLORER, RANGER

ISSUE: Lack of heat to the floor area while in the floor heat mode may be caused by excessive air bleed to the defroster. This may be caused by the floor/defroster door. This is most noticeable after the vehicle has reached normal operating temperatures.

ACTION: Install a new foam covered floor/defrost door. Refer to the following procedure for service details.

SERVICE PROCEDURE:

1. Remove the plenum assembly from the vehicle. Refer to the Shop Manual Section 12-02B for service details.

2. Disconnect the floor/defrost door linkage from the black arm of the function cam located on the top of the plenum assembly.

3. Using a flat blade screwdriver, disengage the door pivot pins from the side of the plenum air duct and lift the door out of the plenum.

4. Position the new foam covered floor/defrost door in the plenum air duct.

5. Snap the pivot pins into the slots provided.

6. Be sure the notched section of the foamed door is above the lower case opening to the floor duct. This will assure that the door will open and close

properly.

7. Connect the floor/defrost door linkage to the function cam.

8. Use Ford Silicone Spray or equivalent, to lubricate both door pivots, both ends of the door linkage, plenum air duct walls and the foam edges of the

door.

9. Install the plenum assembly in the vehicle. Refer to the Shop Manual Section 12-02B for service details.

HEATER - EXCESSIVE AIR BLEED TO DEFROST

LIGHT TRUCK: 1990-91 EXPLORER, RANGER

ISSUE: Lack of heat to the floor area while in the floor heat mode may be caused by excessive air bleed to the defroster. This may be caused by the floor/defroster door. This is most noticeable after the vehicle has reached normal operating temperatures.

ACTION: Install a new foam covered floor/defrost door. Refer to the following procedure for service details.

SERVICE PROCEDURE:

1. Remove the plenum assembly from the vehicle. Refer to the Shop Manual Section 12-02B for service details.

2. Disconnect the floor/defrost door linkage from the black arm of the function cam located on the top of the plenum assembly.

3. Using a flat blade screwdriver, disengage the door pivot pins from the side of the plenum air duct and lift the door out of the plenum.

4. Position the new foam covered floor/defrost door in the plenum air duct.

5. Snap the pivot pins into the slots provided.

6. Be sure the notched section of the foamed door is above the lower case opening to the floor duct. This will assure that the door will open and close

properly.

7. Connect the floor/defrost door linkage to the function cam.

8. Use Ford Silicone Spray or equivalent, to lubricate both door pivots, both ends of the door linkage, plenum air duct walls and the foam edges of the

door.

9. Install the plenum assembly in the vehicle. Refer to the Shop Manual Section 12-02B for service details.

3 PULL THE COUPLING MALE AND FEMALE FITTINGS APART.
GARTER SPRING
3 TO ENSURE COUPLING ENGAGEMENT, VISUALLY CHECK TO BE SURE GARTER SPRING IS OVER FLARED END OF FEMALE FITTING.
4 REMOVE THE TOOL FROM THE DISCONNECTED SPRING LOCK COUPLING.

Receiver Dryer: Service and Repair

The accumulator/dryer must be replaced any time the system has been left open for more than 24 hours with the system completely discharged, there is evidence of moisture in the system, the system is badly contaminated, there is more than five ounces of compressor oil in it, or the accumulator/dryer is restricted, plugged or perforated. Replacement of a refrigerant line or a major component (condenser, evaporator or seized compressor) requires replacement of the accumulator/drier. The receiver/dryer does not necessarily need to be replaced every time there is a loss of refrigerant charge, a component is replaced or the outer shell of the unit is dented.

Fig. 2 Spring lock coupling disconnect & connect

1. Disconnect battery ground cable.

2. Discharge refrigerant from system.

3. Disconnect electrical connector from pressure switch and remove switch from accumulator.

4. Disconnect and cap suction line from accumulator/dryer, Fig. 2.

5. Loosen fitting connecting accumulator to evaporator core.

6. Remove lower forward screw holding flanges of case and bracket together, and remove screw holding evaporator inlet tube to the accumulator bracket. Disconnect accumulator from evaporator core, then remove bracket from accumulator/dryer.

7. Reverse procedure to install. Use new O-rings lubricated with refrigerant oil.

8. Leak test, evacuate and charge system. Check system for proper operation.

This TSB article is being republished in its entirety to add model year vehicles

ISSUE A number of non-approved/alternate refrigerants have entered the marketplace and are being advertised as "drop-in replacements" for R-12 and R-134a. The use of non-approved refrigerants such as R-22, hydrocarbons, and other refrigerant blends could cause safety, durability, and performance concerns if they are installed in Ford A/C systems. Identification of the type of refrigerant contained in vehicle A/C systems, before servicing, is necessary to prevent dealer service equipment and refrigerant supplies from being contaminated with non-approved refrigerants.

ACTION Refrigerant identification must be performed prior to recovering the refrigerant into a recovery machine to prevent cross-contamination of the recovery machine and other A/C systems being serviced with that recovery machine. Refer to the following text.

A/C Refrigerant Analyzer Function

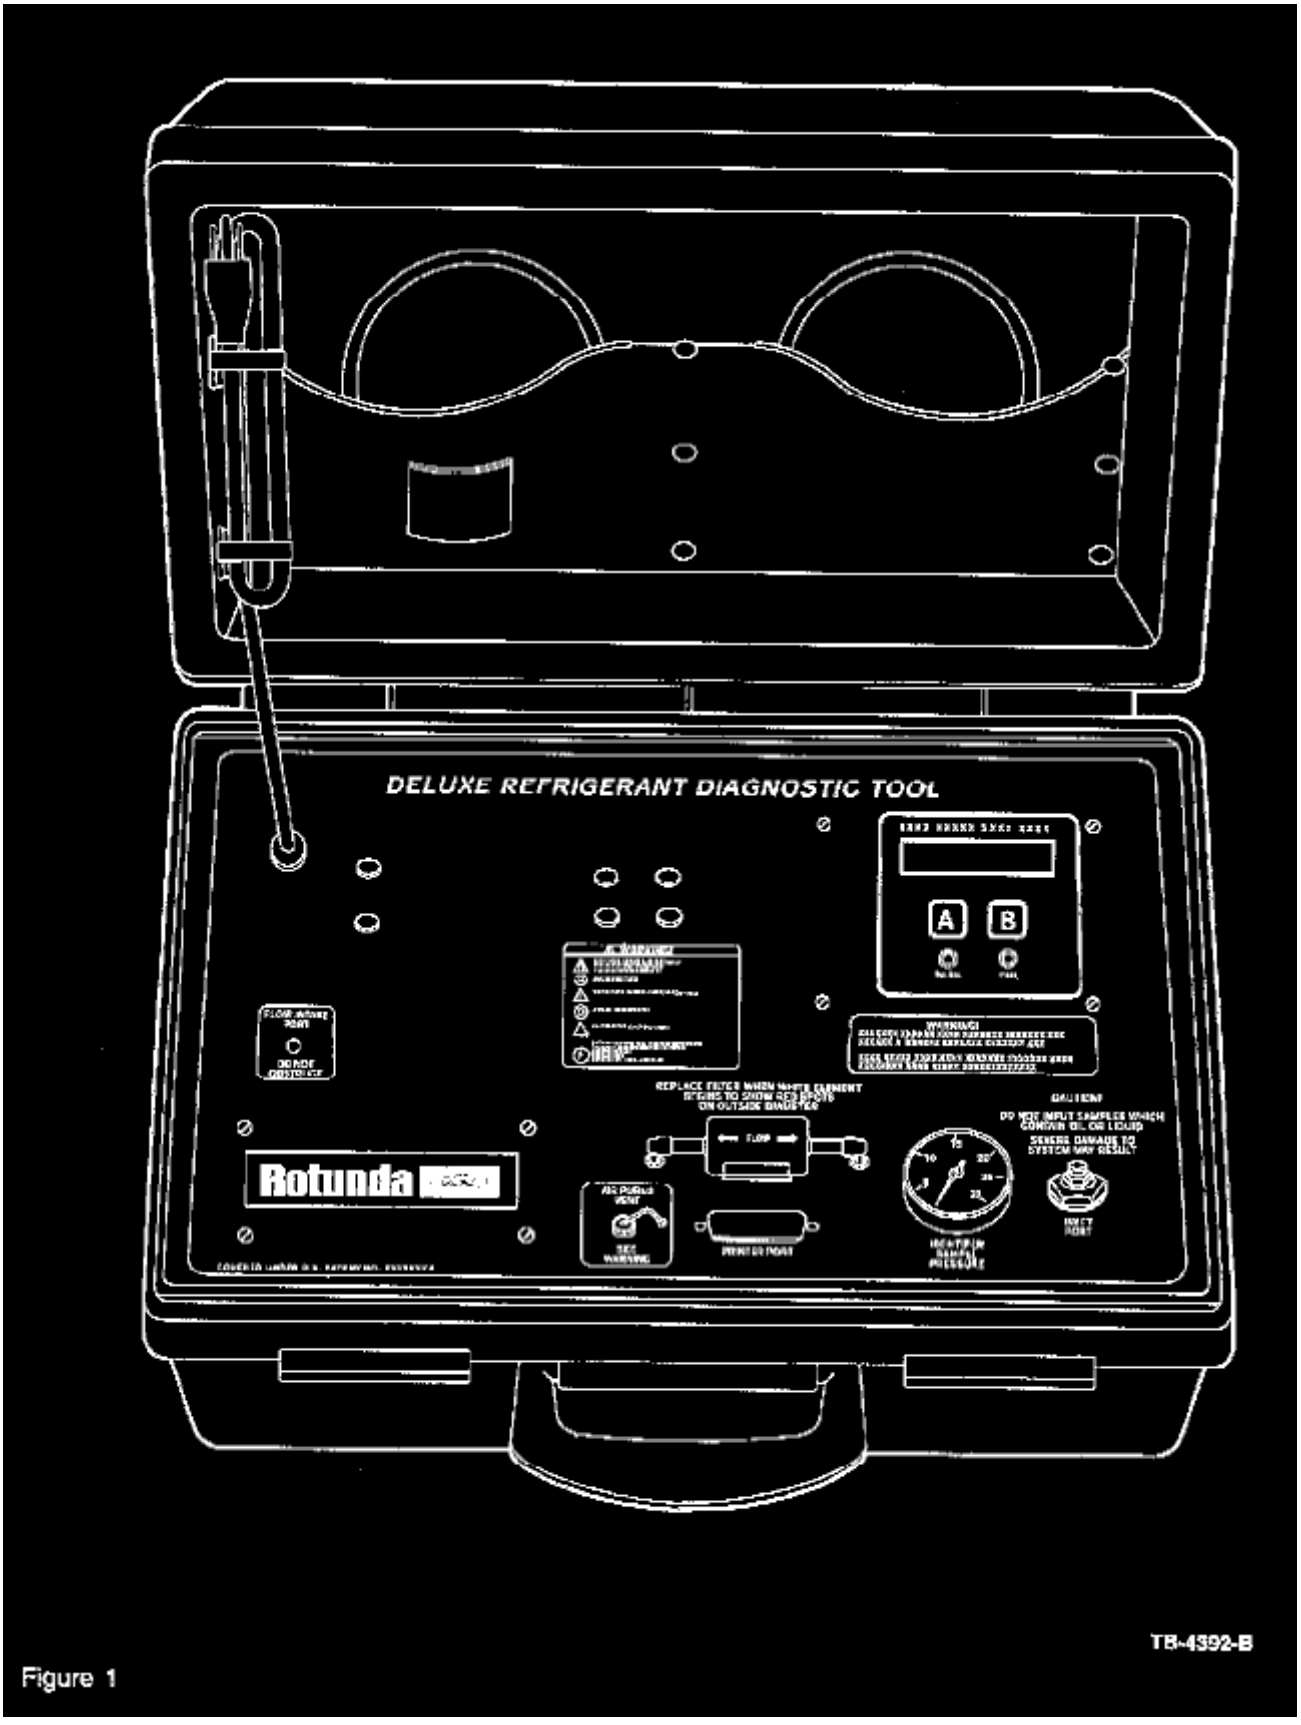

Figure 1

Ford Motor Company has approved the Rotunda Deluxe A/C Refrigerant Analyzer (198-00003) for use on Ford and Lincoln-Mercury vehicles (Figure 1). The analyzer provides the technician with a quick and easy way to identify the type and percentage of refrigerant (R-134a, R-12, R-22, or flammable hydrocarbon). The analyzer can also provide the percentage of air in the A/C system and automatically purge air from the system.

The A/C Refrigerant Analyzer is designed to identify vapor gas samples taken directly from automotive air conditioning systems or refrigerant storage cylinders. Refrigerant vapor passes through the multiple sensor Non-Dispersive Infra-Red (NDIR) sensing unit. The microprocessor calculates each refrigerant type and purity percentage which is displayed on the analyzer's Liquid Crystal Display (LCD).

The analyzer identifies the purity percentage of R-134a, R-12, R-22, hydrocarbon; and air in the sample. If the purity percentage of the R-134a or R-12 is 98% or greater by weight, a green "PASS" Light Emitting Diode (LED) will light. If refrigerants R-134a or R-12 do not meet 98% purity levels, the red "FAIL" LED will light. Levels of R-22 and flammable hydrocarbons above 2% will light the red "FAIL" light. If a hydrocarbon is detected above 5%, both the "FAIL" light and "HYDROCARBON" light will illuminate and a horn will sound alerting the user of potential hazards.

The percent of air contained in the sample will be displayed if the R-134a or R-12 content is 98% or above. The analyzer eliminates the effect of air

when determining the refrigerant sample content because air is not considered a contaminant although air can affect A/C system performance. Air will automatically be purged until a pure refrigerant with a less than 2% by weight air measurement is reached.

Recovery of Contaminated Refrigerant

If contaminated refrigerant is detected, DO NOT recover the refrigerant into your R-134a or R-12 recovery/recycling equipment. Take the following actions:

1. Repeat the test to verify contaminated refrigerant is present.

2. Advise the customer of the contaminated A/C system and any additional cost to repair the system. The customer may wish to return to the service facility which performed the last A/C service.

3. Recover the contaminated refrigerant using suitable recovery-only equipment designed for capturing and storing contaminated refrigerant. This equipment must only be used to recover contaminated refrigerant to prevent the spread to other vehicles. As an alternative, contact an A/C service facility in your area which has the proper equipment for refrigerant recovery.

Repairing A Contaminated A/C System

Once the contaminated refrigerant is removed from the system it will be necessary to repair the system. Ford recommends that you do the following to be sure a quality repair is made:

1. Determine the cause of the failure.

2. Determine which parts will need to be replaced.

3. Flush the heat exchangers to remove any oil that may be degraded due to the contaminated refrigerant.

4. Install a new suction/accumulator.

5. Properly oil match the system to verify that the correct amount of clean refrigerant oil is present in the system.

6. Evacuate the system for 45 minutes.

7. Recharge the system, verify proper operation, and leak test.

Disposal of Contaminated Refrigerant

Disposal of contaminated refrigerant is a new process to the automotive industry Listed below are companies that will assist with disposal of contaminated refrigerant. Ford Motor Company has not evaluated the processes of the listed refrigerant disposal companies and is not endorsing or promoting their companies Business transactions are between the dealership and disposal companies. Disposal costs will vary between $3.00 and $5.00 per pound, plus the cost of round trip cylinder shipping.

ISSUE Vehicles that have and inoperative A/C compressor, due to internal causes, MUST have the refrigerant system cleaned to remove any debris or contaminants that may be present to prevent damage to the replacement compressor.

ACTION

Install a Service Filter Kit in the refrigerant system prior to installing the replacement compressor. Refer to the following Service Procedure for details.

Service Procedure

THIS PROCEDURE IS OPTIONAL IF THE SYSTEM IS FLUSHED USING THE ROTUNDA A/C FLUSHER.

CAUTION

THIS FILTERING PROCEDURE MAY BE USED FOR EITHER R-12 OR R-134a REFRIGERANT SYSTEMS. BECAUSE THE TWO (2) SYSTEMS USE DIFFERENT REFRIGERANT OILS AND BECAUSE THE COMPRESSOR COULD BE DAMAGED IF THE WRONG OIL IS USED, SYSTEM IDENTIFICATION IS VERY IMPORTANT. BE SURE SYSTEM IS CORRECTLY IDENTIFIED BEFORE STARTING THE FILTERING PROCEDURE.

Each Service Filter Kit includes the following items:

^ One (1) Pancake Filter (to be installed in the liquid line between the condenser and the orifice tube)

^ One (1) Instruction Sheet

NOTE

ON 1993-94 RANGER/EXPLORER VEHICLES, TECHNICIANS MAY EXPERIENCE DIFFICULTY WHEN CONNECTING THE PANCAKE FILTER HOSE FITTINGS TO THE EVAPORATOR INLET WITH THE ORIFICE TUBE INSTALLED. REMOVE THE OFFICE TUBE AND RUN THE SYSTEM FOR 1 HOUR AS DESCRIBED IN THE FILTERING PROCEDURE. REINSTALL THE ORIFICE TUBE AFTER FILTERING IS COMPLETE.

CAUTION

FOLLOW ALL REFRIGERANT SYSTEM SAFETY AND SERVICE PRECAUTIONS OUTLINED IN THE APPROPRIATE SERVICE OR WORKSHOP MANUAL.

1. Before removing any refrigerant system components, recover the refrigerant from the system following the recycling methods outlined In the appropriate Service/Workshop Manual.

2. Remove the suction accumulator/drier assembly and drain the oil into a calibrated container.

3. Install a new suction accumulator/drier and add new refrigerant oil to replace the old oil. The quantity of the new oil to be added is the amount to match that drained from the old accumulator plus 60 mL (2 oz). Refer to the Dealer Master Parts Catalog for the correct suction accumulator/drier part number.

CAUTION

REMEMBER TO USE MOTORCRAFT YN-9-A REFRIGERANT COMPRESSOR OIL WITH R-12 SYSTEMS AND MOTORCRAFT YN-12-C REFRIGERANT COMPRESSOR OIL WITH R-134a SYSTEMS. FAILURE TO USE THE CORRECT REFRIGERANT OIL MAY RESULT IN DAMAGE TO SYSTEM COMPONENTS.

4. Install a new orifice tube. Refer to the Dealer Master Parts Catalog for the correct orifice tube part number. If the orifice tube in the vehicle is located in the liquid line between the condenser and the evaporator, replace the liquid line assembly.

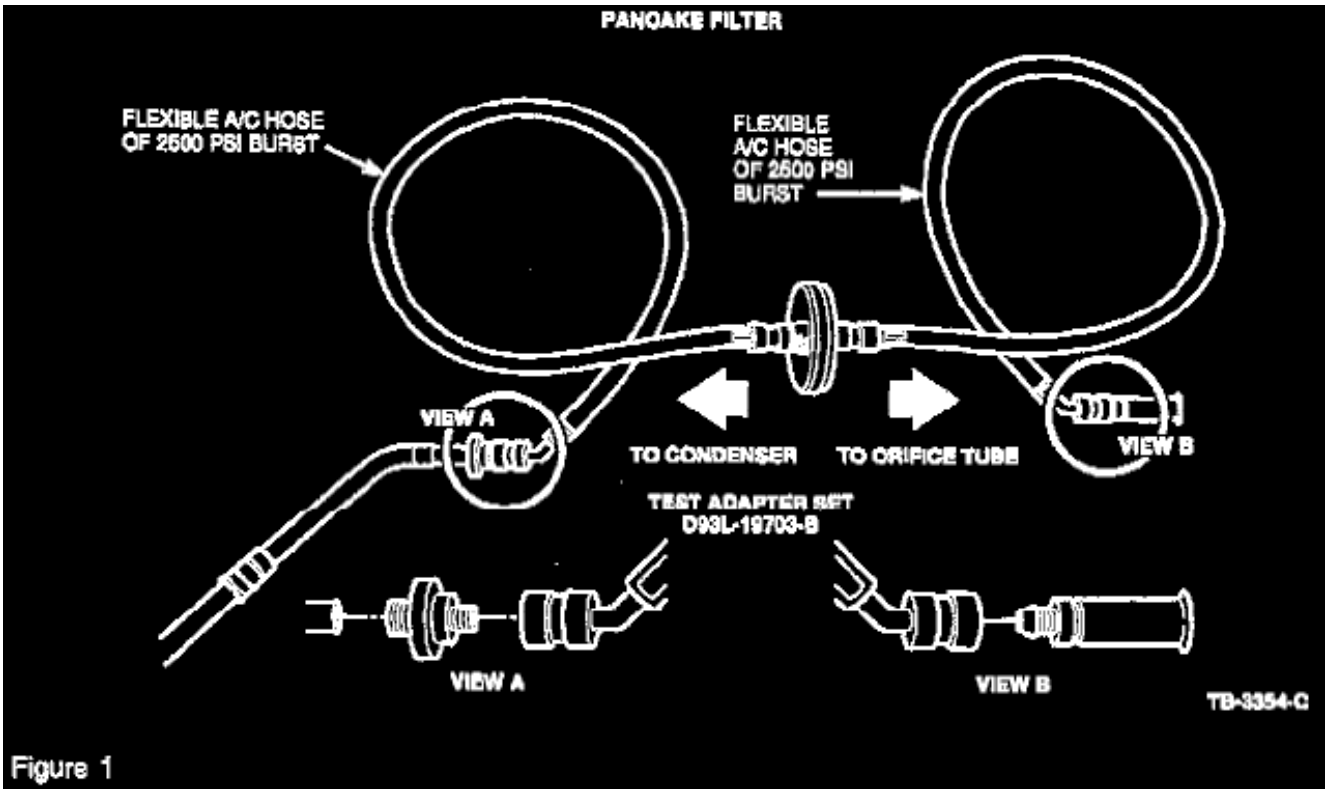

Figure 1

5. Install pancake filter in the liquid line between the condenser and the orifice tube, Figure 1.

a. Be sure orifice inlet is toward the condenser.

b. Connections can be made using Test Adapter Set D93L-19703-B, or equivalent, and flexible refrigerant hose of 2500 psi burst rating. Individual fittings are also available.

6. Remove the old compressor following Service/Workshop Manual procedures. Drain the oil into a calibrated container.

7. Drain the oil from the replacement compressor into a clean calibrated container.

NOTE:

IT WILL BE NECESSARY TO TRANSFER THE MAGNET CLUTCH FROM THE OLD COMPRESSOR TO THE REPLACEMENT COMPRESSOR. FOLLOW SERVICE/WORKSHOP MANUAL PROCEDURES.

8. A new FX-15 service compressor contains 207 mL (7 oz.) of R-12 refrigerant oil. A new FS-10 service compressor does not contain any oil and can be used with an R-12 or an R-134a system.

CAUTION

REMEMBER TO USE YN-9-A (MINERAL) OIL WITH R-12 SYSTEMS AND YN-12-C (PAG) OIL WITH R-134a SYSTEMS. FAILURE TO USE THE CORRECT REFRIGERANT OIL MAY RESULT IN DAMAGE TO SYSTEM COMPONENTS.

^ If the amount of oil drained from the removed compressor is between 90 and 148 mL (3-5 oz), pour the same amount of clean refrigerant oil into the new compressor.

^ If the amount of oil drained from the old compressor is greater than 90 mL (3 oz), pour 90 mL (3 oz) of clean refrigerant oil into the new compressor.

9. Install the new compressor following Service/Workshop Manual procedures. Make sure all mounting bolts are tightened properly. Check the tension of the compressor drive belt. Adjust if necessary.

10. Evacuate, charge and leak test the system, following Service/Workshop Manual procedures.

11. Check all refrigerant system hoses, lines and the position of the newly-installed filters to make sure they do not interfere with other engine compartment components. If necessary, use tie straps to make adjustments.

12. Set the A/C control on Max A/C, high blower and temperature control at full cold.

a. Start engine and let idle briefly.

b. Be sure A/C system is operating properly.

13. Gradually bring the engine up to 1200 rpm by running it at lower rpms for short periods (first at 800 rpm, then at 1000 rpm). Set the engine at 1200 rpm and run it for an hour with the A/C system

operating.

14. Stop the engine.

NOTE:

IT WILL BE NECESSARY TO RECOVER THE SYSTEM REFRIGERANT CHARGE BEFORE PROCEEDING.

15. Allow the engine to cool sufficiently to remove the fittings, flexible hoses and pancake filter from the liquid line.

16. Discard the filter. It can be used one (1) tie only.

17. Reconnect the liquid line back into the system.

18. Evacuate, charge and leak test the system. Make any necessary adjustments.

19. Check the operation of the system in all models.

This TSB article is being republished in its entirety to list Environmental Protection Agency (EPA) reviewed NC substitutes for R-12 refrigerant.

ISSUE: A number of manufacturers are producing refrigerant products which are described as being direct replacements for refrigerant R-12.

ACTION: If service is required, use only new or of known quality recycled refrigerant R-12. Ford Motor Company has approved R-134a as the only refrigerant substitute for R-12.

CAUTION:

USING ANY UNAUTHORIZED SUBSTITUTE REFRIGERANT FOR R-12 MAY RESULT IN SEVERE DAMAGE TO THE A/C SYSTEM COMPONENTS.

INFORMATION FROM THE EPA

				Components Percentage							
Brand Name (1)	Ford Approved	Status (2)	Date	HCFC 22	HCFC 124	HCFC 142b	HFC 134a	HFC 152a	Propane (R-290)	Butane (R-600)	Iso-butane (R-600a)

(1) R-401A (made by DuPont), R-401B (DuPont), R-409A (Elf Atochem), Care 30 (Calor Gas), Adak-29/Adak-12 (TACIP International) and ES-12R (Interveet) have not been submitted for review in motor vehicle air conditioning, and it is therefore illegal to use them in such systems.

(2) See article for details on legality of use according to Status:
- ASU = acceptable subject to fittings, labeling, and no drop-in use conditions
- P = proposed acceptable subject to use conditions; open to public comment so decision is not final
- UNA = unacceptable; illegal for use as CFC-12 substitutes in motor vehicle air conditioners

(3) Freezone contains 2% of a lubricant

(4) Additional use condition: MUST BE USED WITH BARRIER HOSES

This information has been taken from EPA documents to address Ford specific applications and recommendations. Further EPA information on ozone-depleting substances and regulations regarding its handling can be found on the Internet at World Wide Web site: http://www.epa.gov/ozone/

In 1994, EPA established the Significant New Alternatives Policy (SNAP) program to review alternatives to ozone-depleting substances like R-12. EPA examines new substitutes for their ozone depleting, global warming, flammability, and toxicity characteristics. The SNAP process does not test these substitutes for A/C system compatibility, reliability, durability, or performance.

Under the SNAP rule, each new refrigerant must be used in accordance with the following conditions:

1. Unique Fittings - Each new refrigerant must be used with a unique set of fittings to prevent the accidental mixing of different refrigerants.

2. Unique Equipment - Each refrigerant must have dedicated recovery/recycling equipment for that refrigerant.

3. Labels - Whether a vehicle is originally designed to use a new refrigerant or is retrofitted, the technician must apply a detailed label giving specific information about the alternative. This label covers up information about the old refrigerant and provides valuable details on the alternative and how it was used. The technician is required to fill in their name, company performing the retrofit, address and the date retrofitted.

4. Remove Original Refrigerant - The original R-12 must be removed from the system prior to charging with the new refrigerant. This will guarantee that the largest amount of clean R-12 is available for use in vehicles that still need it.

				Reason Unacceptable
Brand Name (1)	Ford Approved	Status (2)	Date	HCFC 22, HCFC 124, HCFC 142b, HFC 134a, HFC 152a, Propane (R-290), Butane (R-600), Iso-butane (R-600a)
Ikon-12	No	ASU	5/22/96	Composition claimed as confidential business information
OZ-12	No	UNA	3/18/94	Flammable blend of hydrocarbons; insufficient data to demonstrate safety
R-176	No	UNA	3/18/94	Contains CFC-12, which is inappropriate in a CFC-12 substitute
HC-12a	No	UNA	6/13/95	Flammable blend of hydrocarbons; insufficient data to demonstrate safety
R-405A	No	UNA	6/13/95	Contains a perfluorocarbon, which has extremely high global warming potential and lifetime

(1) R-401A (made by DuPont), R-401B (DuPont), R-409A (Elf Atochem), Care 30 (Calor Gas), Adak-29/Adak-12 (TACIP International) and ES-12H (Intervest) have not been submitted for review in motor vehicle air conditioning, and it is therefore illegal to use them in such systems.

(2) See article for details on legality of use according to Status:

- ASU = acceptable subject to fittings, labeling, and no drop-in use conditions
- P = proposed acceptable subject to use conditions; open to public comment so decision is not final
- UNA = unacceptable; illegal for use as CFC-12 substitutes in motor vehicle air conditioners

(3) Freezone contains 2% of a lubricant

(4) Additional use condition; MUST BE USED WITH BARRIER HOSES

A summary of the refrigerants reviewed under EPA's SNAP program for use in motor vehicle air conditioning systems is in the table.

This TSB is being republished in its entirety to include Heavy Truck models.

ISSUE:

A number of manufacturers are producing refrigerant products which are described as being direct replacements for refrigerant R-12. The use of any unauthorized substitute refrigerant may severely damage the A/C system components.

ACTION:

If service is required, use only NEW or RECYCLED refrigerant R-12.

Ford Motor Company has not tested or approved any R-12 refrigerant substitute at this time. R-134a is approved only for systems which specify R-134a,

and is not compatible with R-12 systems.

R-22 likewise, is not compatible with R-12 systems.

CAUTION:

USING ANY UNAUTHORIZED SUBSTITUTE REFRIGERANT FOR R-12 MAY RESULT IN SEVERE DAMAGE TO THE A/C SYSTEM COMPONENTS.

This TSB article is being republished in its entirety to revise the Service Procedure and to update the model years.

ISSUE Vehicles that have and inoperative A/C compressor, due to internal causes, MUST have the refrigerant system cleaned to remove any debris or contaminants that may be present to prevent damage to the replacement compressor.

ACTION

Install a Service Filter Kit in the refrigerant system prior to installing the replacement compressor. Refer to the following Service Procedure for details.

OASIS CODES: 208000, 208999

Service Procedure

THIS PROCEDURE IS OPTIONAL IF THE SYSTEM IS FLUSHED USING THE ROTUNDA A/C FLUSHER.

CAUTION

THIS FILTERING PROCEDURE MAY BE USED FOR EITHER R-12 OR R-134a REFRIGERANT SYSTEMS. BECAUSE THE TWO (2) SYSTEMS USE DIFFERENT REFRIGERANT OILS AND BECAUSE THE COMPRESSOR COULD BE DAMAGED IF THE WRONG OIL IS USED, SYSTEM IDENTIFICATION IS VERY IMPORTANT. BE SURE SYSTEM IS CORRECTLY IDENTIFIED BEFORE STARTING THE FILTERING PROCEDURE.

Each Service Filter Kit includes the following items:

^ One (1) Pancake Filter (to be installed in the liquid line between the condenser and the orifice tube)

^ One (1) Instruction Sheet

NOTE

ON 1993-94 RANGER/EXPLORER VEHICLES, TECHNICIANS MAY EXPERIENCE DIFFICULTY WHEN CONNECTING THE PANCAKE FILTER HOSE FITTINGS TO THE EVAPORATOR INLET WITH THE ORIFICE TUBE INSTALLED. REMOVE THE OFFICE TUBE AND RUN THE SYSTEM FOR 1 HOUR AS DESCRIBED IN THE FILTERING PROCEDURE. REINSTALL THE ORIFICE TUBE AFTER FILTERING IS COMPLETE.

CAUTION

FOLLOW ALL REFRIGERANT SYSTEM SAFETY AND SERVICE PRECAUTIONS OUTLINED IN THE APPROPRIATE SERVICE OR WORKSHOP MANUAL.

1. Before removing any refrigerant system components, recover the refrigerant from the system following the recycling methods outlined In the appropriate Service/Workshop Manual.

2. Remove the suction accumulator/drier assembly and drain the oil into a calibrated container.

3. Install a new suction accumulator/drier and add new refrigerant oil to replace the old oil. The quantity of the new oil to be added is the amount to match that drained from the old accumulator plus 60 mL (2 oz). Refer to the Dealer Master Parts Catalog for the correct suction accumulator/drier part number.

CAUTION

REMEMBER TO USE MOTORCRAFT YN-9-A REFRIGERANT COMPRESSOR OIL WITH R-12 SYSTEMS AND MOTORCRAFT YN-12-C REFRIGERANT COMPRESSOR OIL WITH R-134a SYSTEMS. FAILURE TO USE THE CORRECT REFRIGERANT OIL MAY RESULT IN DAMAGE TO SYSTEM COMPONENTS.

4. Install a new orifice tube. Refer to the Dealer Master Parts Catalog for the correct orifice tube part number. If the orifice tube in the vehicle is located in the liquid line between the condenser and the evaporator, replace the liquid line assembly.

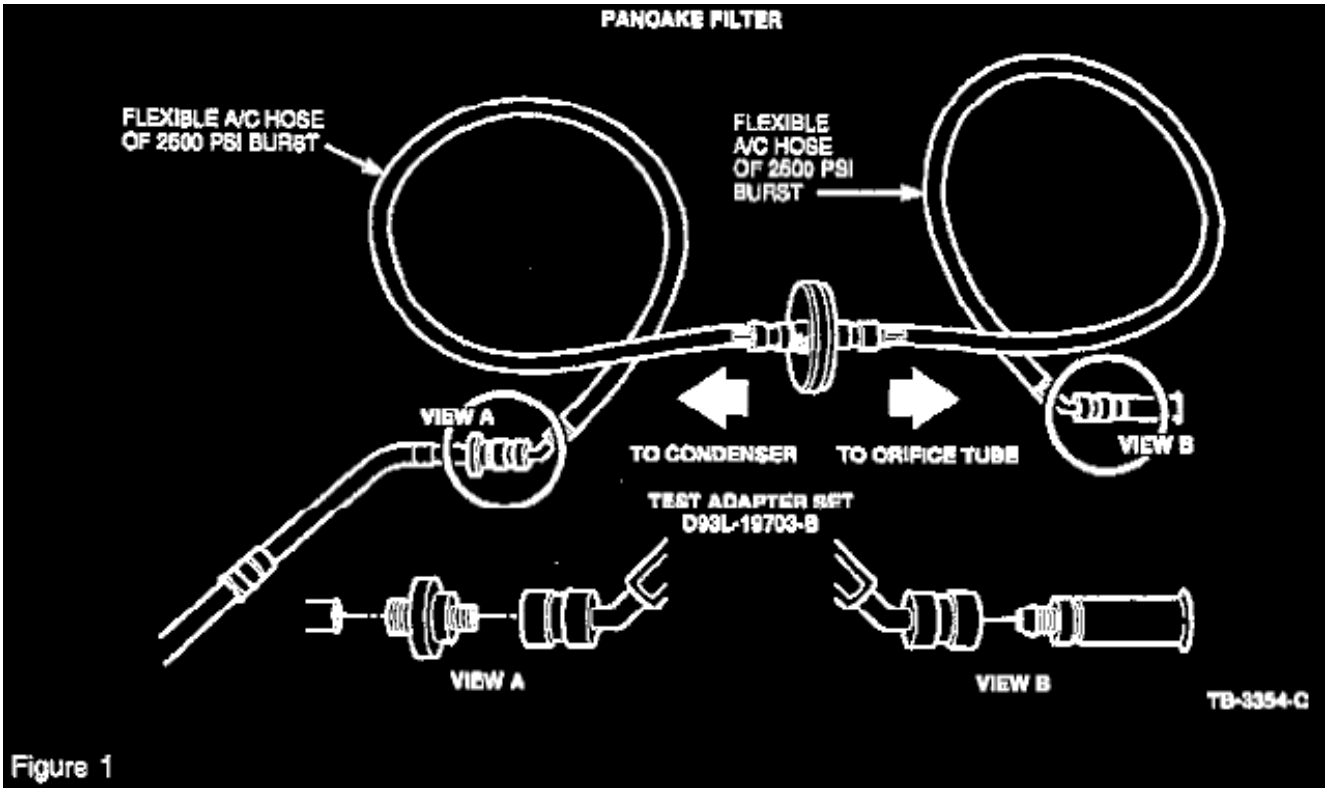

Figure 1

5. Install pancake filter in the liquid line between the condenser and the orifice tube, Figure 1.

a. Be sure orifice inlet is toward the condenser.

b. Connections can be made using Test Adapter Set D93L-19703-B, or equivalent, and flexible refrigerant hose of 2500 psi burst rating. Individual fittings are also available.

6. Remove the old compressor following Service/Workshop Manual procedures. Drain the oil into a calibrated container.

7. Drain the oil from the replacement compressor into a clean calibrated container.

NOTE:

IT WILL BE NECESSARY TO TRANSFER THE MAGNET CLUTCH FROM THE OLD COMPRESSOR TO THE REPLACEMENT COMPRESSOR. FOLLOW SERVICE/WORKSHOP MANUAL PROCEDURES.

8. A new FX-15 service compressor contains 207 mL (7 oz.) of R-12 refrigerant oil. A new FS-10 service compressor does not contain any oil and can be used with an R-12 or an R-134a system.

CAUTION

REMEMBER TO USE YN-9-A (MINERAL) OIL WITH R-12 SYSTEMS AND YN-12-C (PAG) OIL WITH R-134a SYSTEMS. FAILURE TO USE THE CORRECT REFRIGERANT OIL MAY RESULT IN DAMAGE TO SYSTEM COMPONENTS.

^ If the amount of oil drained from the removed compressor is between 90 and 148 mL (3-5 oz), pour the same amount of clean refrigerant oil into the new compressor.

^ If the amount of oil drained from the old compressor is greater than 90 mL (3 oz), pour 90 mL (3 oz) of clean refrigerant oil into the new compressor.

9. Install the new compressor following Service/Workshop Manual procedures. Make sure all mounting bolts are tightened properly. Check the tension of the compressor drive belt. Adjust if necessary.

10. Evacuate, charge and leak test the system, following Service/Workshop Manual procedures.

11. Check all refrigerant system hoses, lines and the position of the newly-installed filters to make sure they do not interfere with other engine compartment components. If necessary, use tie straps to make adjustments.

12. Set the A/C control on Max A/C, high blower and temperature control at full cold.

a. Start engine and let idle briefly.

b. Be sure A/C system is operating properly.

13. Gradually bring the engine up to 1200 rpm by running it at lower rpms for short periods (first at 800 rpm, then at 1000 rpm). Set the engine at 1200 rpm and run it for an hour with the A/C system operating.

14. Stop the engine.

NOTE:

IT WILL BE NECESSARY TO RECOVER THE SYSTEM REFRIGERANT CHARGE BEFORE PROCEEDING.

15. Allow the engine to cool sufficiently to remove the fittings, flexible hoses and pancake filter from the liquid line.

16. Discard the filter. It can be used one (1) tie only.

17. Reconnect the liquid line back into the system.

18. Evacuate, charge and leak test the system. Make any necessary adjustments.

19. Check the operation of the system in all models.

This TSB is being republished in its entirety to include Heavy Truck models.

ISSUE:

A number of manufacturers are producing refrigerant products which are described as being direct replacements for refrigerant R-12. The use of any unauthorized substitute refrigerant may severely damage the A/C system components.

ACTION:

If service is required, use only NEW or RECYCLED refrigerant R-12.

Ford Motor Company has not tested or approved any R-12 refrigerant substitute at this time. R-134a is approved only for systems which specify R-134a,

and is not compatible with R-12 systems.

R-22 likewise, is not compatible with R-12 systems.

CAUTION:

USING ANY UNAUTHORIZED SUBSTITUTE REFRIGERANT FOR R-12 MAY RESULT IN SEVERE DAMAGE TO THE A/C SYSTEM COMPONENTS.

This TSB article is being republished in its entirety to revise the Service Procedure and to update the model years.

ISSUE Vehicles that have and inoperative A/C compressor, due to internal causes, MUST have the refrigerant system cleaned to remove any debris or contaminants that may be present to prevent damage to the replacement compressor.

ACTION

Install a Service Filter Kit in the refrigerant system prior to installing the replacement compressor. Refer to the following Service Procedure for details.

Service Procedure

THIS PROCEDURE IS OPTIONAL IF THE SYSTEM IS FLUSHED USING THE ROTUNDA A/C FLUSHER.

CAUTION

THIS FILTERING PROCEDURE MAY BE USED FOR EITHER R-12 OR R-134a REFRIGERANT SYSTEMS. BECAUSE THE TWO (2) SYSTEMS USE DIFFERENT REFRIGERANT OILS AND BECAUSE THE COMPRESSOR COULD BE DAMAGED IF THE WRONG OIL IS USED, SYSTEM IDENTIFICATION IS VERY IMPORTANT. BE SURE SYSTEM IS CORRECTLY IDENTIFIED BEFORE STARTING THE FILTERING PROCEDURE.

Each Service Filter Kit includes the following items:

^ One (1) Pancake Filter (to be installed in the liquid line between the condenser and the orifice tube)

^ One (1) Instruction Sheet

NOTE

ON 1993-94 RANGER/EXPLORER VEHICLES, TECHNICIANS MAY EXPERIENCE DIFFICULTY WHEN CONNECTING THE PANCAKE FILTER HOSE FITTINGS TO THE EVAPORATOR INLET WITH THE ORIFICE TUBE INSTALLED. REMOVE THE OFFICE TUBE AND RUN THE SYSTEM FOR 1 HOUR AS DESCRIBED IN THE FILTERING PROCEDURE. REINSTALL THE ORIFICE TUBE AFTER FILTERING IS COMPLETE.

CAUTION

FOLLOW ALL REFRIGERANT SYSTEM SAFETY AND SERVICE PRECAUTIONS OUTLINED IN THE APPROPRIATE SERVICE OR WORKSHOP MANUAL.

1. Before removing any refrigerant system components, recover the refrigerant from the system following the recycling methods outlined In the appropriate Service/Workshop Manual.

2. Remove the suction accumulator/drier assembly and drain the oil into a calibrated container.

3. Install a new suction accumulator/drier and add new refrigerant oil to replace the old oil. The quantity of the new oil to be added is the amount to match that drained from the old accumulator plus 60 mL (2 oz). Refer to the Dealer Master Parts Catalog for the correct suction accumulator/drier part number.

CAUTION

REMEMBER TO USE MOTORCRAFT YN-9-A REFRIGERANT COMPRESSOR OIL WITH R-12 SYSTEMS AND MOTORCRAFT YN-12-C REFRIGERANT COMPRESSOR OIL WITH R-134a SYSTEMS. FAILURE TO USE THE CORRECT REFRIGERANT OIL MAY RESULT IN DAMAGE TO SYSTEM COMPONENTS.

4. Install a new orifice tube. Refer to the Dealer Master Parts Catalog for the correct orifice tube part number. If the orifice tube in the vehicle is located in the liquid line between the condenser and the evaporator, replace the liquid line assembly.

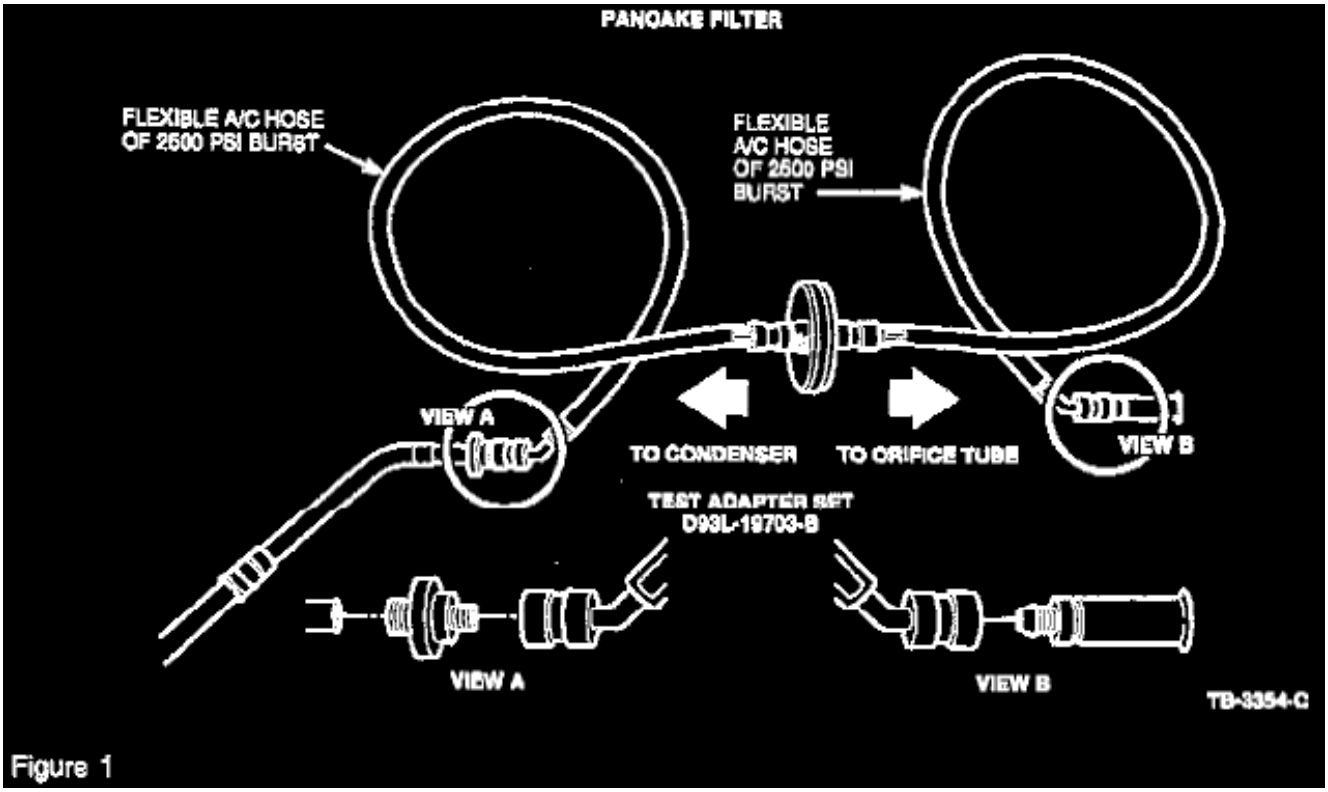

Figure 1

5. Install pancake filter in the liquid line between the condenser and the orifice tube, Figure 1.

a. Be sure orifice inlet is toward the condenser.

b. Connections can be made using Test Adapter Set D93L-19703-B, or equivalent, and flexible refrigerant hose of 2500 psi burst rating. Individual fittings are also available.

6. Remove the old compressor following Service/Workshop Manual procedures. Drain the oil into a calibrated container.

7. Drain the oil from the replacement compressor into a clean calibrated container.

NOTE:

IT WILL BE NECESSARY TO TRANSFER THE MAGNET CLUTCH FROM THE OLD COMPRESSOR TO THE REPLACEMENT COMPRESSOR. FOLLOW SERVICE/WORKSHOP MANUAL PROCEDURES.

8. A new FX-15 service compressor contains 207 mL (7 oz.) of R-12 refrigerant oil. A new FS-10 service compressor does not contain any oil and can be used with an R-12 or an R-134a system.

CAUTION

REMEMBER TO USE YN-9-A (MINERAL) OIL WITH R-12 SYSTEMS AND YN-12-C (PAG) OIL WITH R-134a SYSTEMS. FAILURE TO USE THE CORRECT REFRIGERANT OIL MAY RESULT IN DAMAGE TO SYSTEM COMPONENTS.

^ If the amount of oil drained from the removed compressor is between 90 and 148 mL (3-5 oz), pour the same amount of clean refrigerant oil into the new compressor.

^ If the amount of oil drained from the old compressor is greater than 90 mL (3 oz), pour 90 mL (3 oz) of clean refrigerant oil into the new compressor.

9. Install the new compressor following Service/Workshop Manual procedures. Make sure all mounting bolts are tightened properly. Check the tension of the compressor drive belt. Adjust if necessary.

10. Evacuate, charge and leak test the system, following Service/Workshop Manual procedures.

11. Check all refrigerant system hoses, lines and the position of the newly-installed filters to make sure they do not interfere with other engine compartment components. If necessary, use tie straps to make adjustments.

12. Set the A/C control on Max A/C, high blower and temperature control at full cold.

a. Start engine and let idle briefly.

b. Be sure A/C system is operating properly.

13. Gradually bring the engine up to 1200 rpm by running it at lower rpms for short periods (first at 800 rpm, then at 1000 rpm). Set the engine at 1200 rpm and run it for an hour with the A/C system operating.

14. Stop the engine.

NOTE:

IT WILL BE NECESSARY TO RECOVER THE SYSTEM REFRIGERANT CHARGE BEFORE PROCEEDING.

15. Allow the engine to cool sufficiently to remove the fittings, flexible hoses and pancake filter from the liquid line.

16. Discard the filter. It can be used one (1) tie only.

17. Reconnect the liquid line back into the system.

18. Evacuate, charge and leak test the system. Make any necessary adjustments.

19. Check the operation of the system in all models.

Refrigerant Oil: Technical Service Bulletins A/C Compressor - Service Tips

Article No. 94-15-6

07/27/94

AIR CONDITIONING - FS-10 AND FX-15 COMPRESSORS - SERVICE TIPS

FORD: 1988-94 CROWN VICTORIA, ESCORT, TAURUS, TEMPO, THUNDERBIRD

LINCOLN-MERCURY: 1988-92 MARK VII 1988-94 CONTINENTAL, COUGAR, GRAND MARQUIS, SABLE, TOPAZ, TOWN CAR 1991-94 TRACER 1993-94 MARK VIII

LIGHT TRUCK: 1988-90 BRONCO II 1988-94 AEROSTAR, BRONCO, ECONOLINE, F-150-350 SERIES, RANGER 1991-94 EXPLORER 1993-94 VILLAGER

ISSUE: FS-10 service compressors built between 1/1/93 and 9/30/93 were built with 7 oz. of oil. These compressors have a white label and are labeled to be compatible with either R-12 or R-134a. These compressors contain either PAG oil or Mineral oil and should be used only in the proper systems.

ACTION: Refer to the chart to determine the type of oil that is in each service compressor.

NOTE:

BE SURE TO CHOOSE THE COMPRESSOR THAT HAS THE CORRECT OIL FOR THE SYSTEM BEING SERVICED.

NOTE:

FS-10 COMPRESSORS BUILT AFTER 9/30/93 ARE NOT FILLED WITH OIL AND HAVE A YELLOW LABEL. THESE COMPRESSORS REQUIRE THE CORRECT AMOUNT OF EITHER MINERAL OIL OR PAG OIL DEPENDING ON THE SYSTEM BEING SERVICED.

NOTE:

FX-15 SERVICE COMPRESSORS BUILT BEFORE 1/1/93 ARE FILLED WITH MINERAL OIL AND ARE ONLY COMPATIBLE WITH R-12 SYSTEMS.

AIR CONDITIONING - FX-15 AIR COMPRESSOR - OIL RECOVERY AND MEASURING PROCEDURE

FORD: 1988-93 TAURUS 1989-93 CROWN VICTORIA, THUNDERBIRD 1992-93 ESCORT, TEMPO

LINCOLN-MERCURY: 1988-93 SABLE 1989-93 COUGAR 1991-93 CONTINENTAL, GRAND MARQUIS, TOWN CAR 1992-93 TOPAZ, TRACER

LIGHT TRUCK: 1989-90 BRONCO II 1989-93 AEROSTAR, BRONCO, ECONOLINE, F SUPER DUTY, F-150-350 SERIES, RANGER 1991-93 EXPLORER

This article is being republished in its entirety to clarify the information about removing oil from both the "old" and "new" compressors.

ISSUE: When replacing the FX-15 Compressor it is very important to accurately match the amount of oil being replaced. Some dealerships have indicated that they are unable to properly match the amounts of oil being replaced.

ACTION: Replace the amount of oil being drained from the FX-15 compressor with an equal amount of new oil to assure proper compressor operation. Refer to the following service procedure for service details.

SERVICE - PROCEDURE

1. With both "OLD" and "NEW" compressors, remove as much oil as possible. On both compressors, the shaft should be rotated about six to eight revolutions while pouring the oil from the ports. This effectively empties the compressor of oil.

a. Obtain a clean container that can also be used as a measuring device.

b. Place the disc and hub assembly on the compressor shaft so the shaft can be rotated.

c. Rotate the shaft by hand (6) six to (8) eight revolutions, collecting the oil in a clean measuring device.

NOTE: SERVICE COMPRESSORS COME PRE-CHARGED WITH 7 OUNCES OF OIL

2. If the amount of oil drained from the old compressor is between (3) three and (5) five fluid ounces (85 and 142 cc), pour the same amount of clean Motorcraft YN-9 refrigerant oil into the new compressor.

3. If the amount of oil that was removed from the old compressor is greater than (5) fluid ounces (142 cc), pour five ounces of clean Motorcraft YN-9 refrigerant oil into the new compressor.

4. If the amount of refrigerant oil that was removed from the old compressor is less than (3) three fluid ounces (85 cc), pour three fluid ounces of clean Motorcraft YN-9 refrigerant oil into the new compressor.

NOTE: THE SUCTION/ACCUMULATOR-DRYER AND ORIFICE TUBE MUST BE REPLACED WHENEVER THE COMPRESSOR IS REPLACED.

MEDIUM/HEAVY TRUCK: 1990-91 C SERIES, CL-CLT-9000 SERIES 1990-95 CARGO SERIES, F & B SERIES, L SERIES

ISSUE: Current repair procedures do not advise on the addition of refrigerant oil to the A/C system when a minor repair is made.

ACTION: Add 0.06 L (2 oz) of the proper type new refrigerant oil to the system,. before recharging, when servicing concerns that do not require major component replacement. Repairs considered minor are: O-ring leaks, charge port leaks, Pressure Relief Valve (PRV) leaks, compressor shaft seal leaks, hose leaks, etc. Remember to use polyalkylene glycol (PAG) oil with R-134a systems and mineral oil with R-12 systems.

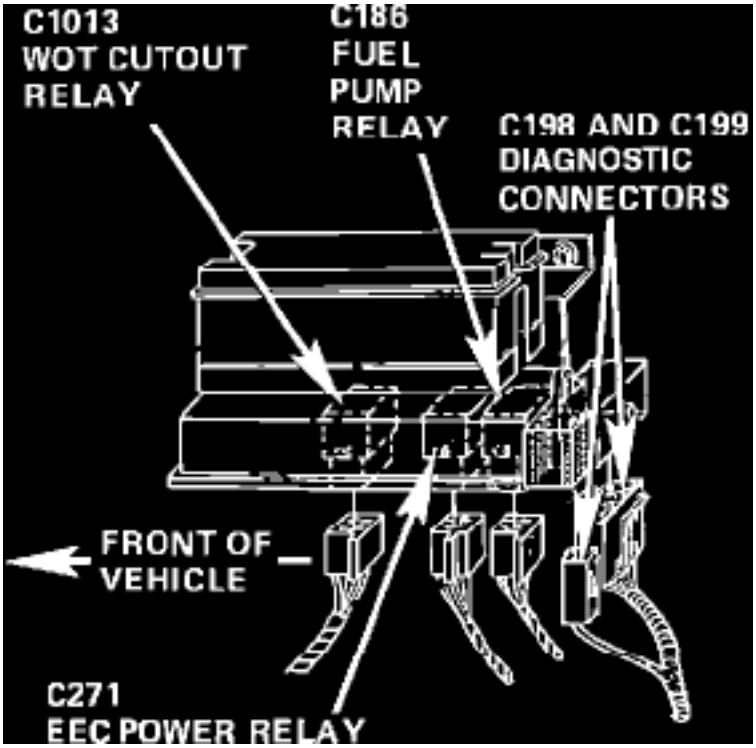
• Compressor Clutch doesn't operate.	• No voltage at Clutch Cycling Pressure Switch. • Inoperative Clutch Cycling Pressure Switch. • No voltage at A/C Clutch Field Coil. • Inoperative A/C Clutch Field Coil.	• Fuse 7 blown. • Remove Connector from Cluich Cycling Pressure Switch. With the A/C-Heater Control Assembly Switch in the ON position, check for battery voltage at the 348 (P) wire. • Check the Clutch Cycling Pressure Switch for continuity. No continuity indicates low refrigerant, or an inoperative Clutch Cycling Pressure Switch. Check refrigerant system. • Remove connector from the A/C Clutch Field Coil. Check the wire connector for battery voltage. Check the EEC Module (including Throttle Position Sensor and Coolant Temperature Sensor) and the WOT Cutout Relay for correct operation. • Repair A/C Clutch Field Coil or terminals as required.
• Compressor Clutch won't shut off. • No cooling or not enough cooling (compressor operates).	• A/C Switch or Defrost Switch in A/C-Heater Control Assembly is stuck closed. • Clutch plates have no air gap. • Loose A/C Compressor drive belt. • Temperature Blend door out of adjustment. • Too much or too little Refrigerant in system.	• Remove connector from the A/C Clutch Field Coil. Ensure correct voltage for each switch position. • If compressor continues to run with connector disconnected, repair clutch air gap • Check drive belt tension. • Check operation of temperature control cable • Perform refrigerant system diagnosis and problem evaluation

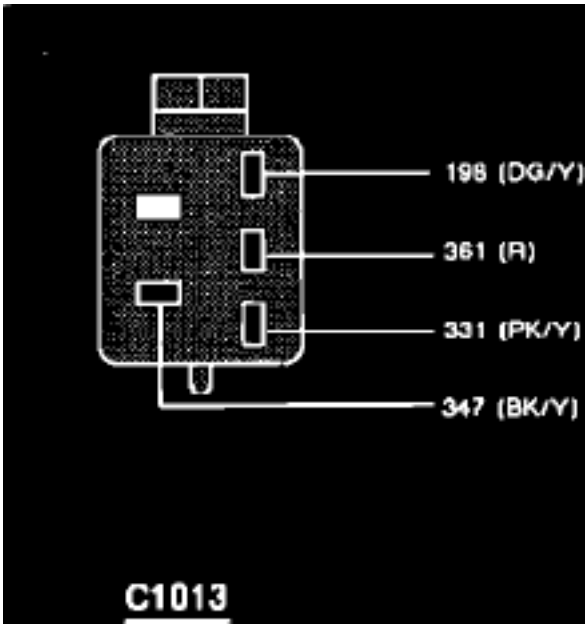
Troubleshooting Hints - Compressor

Refrigerant Pressure Sensor / Switch: Service and Repair

The clutch cycling pressure switch is mounted on a schrader type fitting on the accumulator. Replacement of switch does not require discharge of refrigerant from system.



Relay And Diagnostic Connectors



Wide Open Throttle (WOT) Cutout Relay Connector

Compressor Clutch Relay: Description and Operation

When the vehicle operator goes to Wide Open Throttle (WOT), the Wide open throttle A/C (WAC) relay opens, suspending A/C operation until normal vehicle operation resumes. This is done to allow maximum power to the drive wheels under heavy acceleration or load.

• Compressor Clutch doesn't operate.	• No voltage at Clutch Cycling Pressure Switch.	• Fuse 7 blown. • Remove Connector from Cluich Cycling Pressure Switch. With the A/C-Heater Control Assembly Switch in the ON position, check for battery voltage at the 348 (P) wire.
	• Inoperative Clutch Cycling Pressure Switch.	• Check the Clutch Cycling Pressure Switch for continuity. No continuity indicates low refrigerant, or an inoperative Clutch Cycling Pressure Switch. Check refrigerant system.
	• No voltage at A/C Clutch Field Coil.	• Remove connector from the A/C Clutch Field Coil. Check the wire connector for battery voltage. Check the EEC Module (including Throttle Position Sensor and Coolant Temperature Sensor) and the WOT Cutout Relay for correct operation.
	• Inoperative A/C Clutch Field Coil.	• Repair A/C Clutch Field Coil or terminals as required.
• Compressor Clutch won't shut off.	• A/C Switch or Defrost Switch in A/C-Heater Control Assembly is stuck closed.	• Remove connector from the A/C Clutch Field Coil. Ensure correct voltage for each switch position.
• No cooling or not enough cooling (compressor operates).	• Clutch plates have no air gap. • Loose A/C Compressor drive belt. • Temperature Blend door out of adjustment. • Too much or too little Refrigerant in system.	• If compressor continues to run with connector disconnected, repair clutch air gap • Check drive belt tension. • Check operation of temperature control cable • Perform refrigerant system diagnosis and problem evaluation

Engine Compartment Components.

RH Side Of Engine Compartment, On A/C Accumulator

Applicable to: 4.0L/V6-244

• Compressor Clutch doesn't operate.	• No voltage at Clutch Cycling Pressure Switch. • Inoperative Clutch Cycling Pressure Switch. • No voltage at A/C Clutch Field Coil. • Inoperative A/C Clutch Field Coil.	• Fuse 7 blown. • Remove Connector from Clutch Cycling Pressure Switch. With the A/C-Heater Control Assembly Switch in the ON position, check for battery voltage at the 348 (P) wire. • Check the Clutch Cycling Pressure Switch for continuity. No continuity indicates low refrigerant, or an inoperative Clutch Cycling Pressure Switch. Check refrigerant system. • Remove connector from the A/C Clutch Field Coil. Check the wire connector for battery voltage. Check the EEC Module (including Throttle Position Sensor and Coolant Temperature Sensor) and the WOT Cutout Relay for correct operation. • Repair A/C Clutch Field Coil or terminals as required.
• Compressor Clutch won't shut off. • No cooling or not enough cooling (compressor operates).	• A/C Switch or Defrost Switch in A/C-Heater Control Assembly is stuck closed. • Clutch plates have no air gap. • Loose A/C Compressor drive belt. • Temperature Blend door out of adjustment. • Too much or too little Refrigerant in system.	• Remove connector from the A/C Clutch Field Coil. Ensure correct voltage for each switch position. • If compressor continues to run with connector disconnected, repair clutch air gap • Check drive belt tension. • Check operation of temperature control cable • Perform refrigerant system diagnosis and problem evaluation

Troubleshooting Hints - Compressor

Refrigerant Pressure Sensor / Switch: Service and Repair

The clutch cycling pressure switch is mounted on a schrader type fitting on the accumulator. Replacement of switch does not require discharge of refrigerant from system.

Vacuum Check Valve HVAC: Customer Interest Heater - Air Flow From Panel During Heavy Acceleration

Article No. 94-4-11

02/23/94

HEATER - OBJECTIONABLE AIRFLOW FROM PANEL REGISTERS DURING HEAVY ACCELERATION - NON A/C VEHICLES

LIGHT TRUCK: 1990-92 RANGER 1991-92 EXPLORER

This TSB article is being republished in its entirety to include 1992 Model vehicles.

ISSUE: Objectionable airflow from the heater system panel registers may occur when the system is in the OFF mode and the vehicle is under heavy acceleration. This condition is caused by movement of the fresh air door when the vacuum to the door actuator is lost during heavy acceleration.

ACTION: Installation of a vacuum hose/reservoir/check valve assembly will provide sufficient vacuum level to maintain proper operation of the heater system in the OFF mode. Refer to the following procedure for service details.

SERVICE PROCEDURE

1. Remove the blower assembly from the vehicle.

2. Drill two holes in the blower assembly, in a vertical position, to allow for installation of the vacuum reservoir. Refer to Figure 1.

3. Using two screws, mount the vacuum reservoir as shown in Figure 1.

4. Disconnect the existing vacuum check valve.

5. Remove the vacuum line which sourced the heater system check valve and attached to an engine vacuum port. Refer to Figure 1.

6. Discard the check valve and vacuum line.

7. Reinstall the blower assembly in the vehicle.

8. Route the new vacuum line and check valve (attached to the reservoir) as the original vacuum line was routed and attach to the original vacuum port.

9. Attach the vacuum line from the heater plenum chamber to the open port on the vacuum check valve.

10. Start the engine and verify proper operation of the Fresh Air/Off door.

ISSUE This TSB article is a diagnostic procedure to address vehicles that exhibit lean driveability symptoms and may or may not have any Diagnostic Trouble Codes (DTCs) stored in memory.

ACTION Follow the diagnostic procedures described in the following Service Tip. The revised diagnostic procedure is a more accurate means of diagnosing the symptoms.

SERVICE TIP

MASS AIR FLOW (MAF) DISCUSSION

MAF sensors can get contaminated from a variety of sources: dirt, oil, silicon, spider webs, potting compound from the sensor itself, etc. When a MAF sensor gets contaminated, it skews the transfer function such that the sensor over-estimates air flow at idle (causes the fuel system to go rich) and under-estimates air flow at high air flows (causes fuel system to go lean). This means Long Term Fuel Trims will learn lean (negative) corrections at idle and learn rich (positive) corrections at higher air flows.

If vehicle is driven at Wide Open Throttle (WOT) or high loads, the fuel system normally goes open loop rich to provide maximum power. If the MAF sensor is contaminated, the fuel system will actually be lean because of under-estimated air flow. During open loop fuel operation, the vehicle applies Long Term Fuel Trim corrections that have been learned during closed loop operation. These corrections are often lean corrections learned at lower air flows. This combination of under-estimated air flow and lean fuel trim corrections can result in spark knock/detonation and lack of power concerns at WOT and high loads.

One of the indicators for diagnosing this condition is barometric pressure. Barometric pressure (BARO) is inferred by the Powertrain Control Module (PCM) software at part throttle and WOT (there is no actual BARO sensor on MAF-equipped vehicles, except for the 3.8L Supercharged engine). At high air flows, a contaminated MAF sensor will under-estimate air flow coming into the engine, hence the PCM infers that the vehicle is operating at a higher altitude. The BARO reading is stored in Keep Alive Memory (KAM) after it is updated. Other indicators are Long Term Fuel Trim and MAF

voltage at idle.

NOTE

THE FOLLOWING PROCEDURE MAY ALSO BE USED TO DIAGNOSE VEHICLES THAT DO NOT HAVE FUEL SYSTEM/HO2S SENSOR DTCS.

Symptoms

^ Lack of Power

^ Spark Knock/Detonation

^ Buck/Jerk

^ Hesitation/Surge on Acceleration

^ Malfunction Indicator Lamp (MIL) Illuminated -

DTCs P0171, P0172, P0174, P0175 may be stored in memory

OBDII DTCs

^ P0171, P0174 (Fuel system lean, Bank 1 or 2)

^ P0172, P0175, (Fuel system rich, Bank 1 or 2)

^ P1130, P1131, P1132, (HO2S11 lack of switching, Bank 1)

^ P1150, P1151, P1152, (HO2S21 lack of switching, Bank 2)

OBDI DTCs

^ 181, 189 (Fuel system lean, Bank 1 or 2)

^ 179, 188 (Fuel system rich, Bank 1 or 2)

^ 171, 172, 173 (HO2S11 lack of switching, Bank 1)

^ 175, 176, 177 (HO2S21 lack of switching, Bank 2)

^ 184, 185 (MAF higher/lower than expected)

^ 186, 187 (Injector pulse width higher/lower than expected)

NOTE:

DO NOT DISCONNECT THE BATTERY. IT WILL ERASE KEEP ALIVE MEMORY AND RESET LONG TERM FUEL TRIM AND BARO TO THEIR STARTING/BASE VALUES. THE BARO PARAMETER IDENTIFICATION DISPLAY (PID) IS USED FOR THIS DIAGNOSTIC PROCEDURE. ALL OBDII APPLICATIONS HAVE THIS PID AVAILABLE. THERE ARE SOME OBDI VEHICLES THAT DO NOT HAVE THE BARO PID, FOR THESE VEHICLES OMIT THE BARO CHECK AND REFER ONLY TO STEPS 2, 3, AND 4 IN THE DIAGNOSTIC PROCEDURE.

BAROMETRIC PRESSURE REFERENCE			
Barometric Pressure (in. Hg.)	Barometric Pressure (kPa)	BARO/MAP PID (Hz)	Altitude above sea level (ft)
3.5	11.8	89.3	
5	16.9	92.8	
10	33.8	104.6	
15	50.7	117.0	14,000
20	67.5	129.6	10,000
21	70.9	132.5	9,000
22	74.3	135.4	8,000
23	77.7	138.3	7,000
24	81.1	141.1	6,000
25	84.4	144.0	5,000
26	87.8	146.9	4,000
27	91.2	149.8	3,000
28	94.6	152.8	2,000
29	97.9	155.8	1,000
30	101.3	158.9	0 (sea level)
31	104.7	162.0	
31.875	107.7	164.7	

1. Look at the BARO PID. Refer to the Barometric Pressure Reference Chart in this article. At sea level, BARO should read about 159 Hz (29.91 in. Hg). As a reference, Denver, Colorado at 1524 meters (5000 ft.) altitude should be about 144 Hz (24.88 in.Hg). Normal learned BARO variability is up to +/- 6 Hz (+/- 2 in. Hg.). If BARO indicates a higher altitude than you are not at (7 or more Hz lower than expected), you may have MAF contamination. If available, Service Bay Diagnostic System (SBDS) has a Manifold Absolute Pressure (MAP) sensor that can be used as a barometric pressure reference. Use "MAP/BARO" test under "Powertrain," "Testers and Meters." Ignore the hookup screen. Connect GP2 to the reference MAP on the following screen.

NOTE

REMEMBER THAT MOST WEATHER SERVICES REPORT A LOCAL BAROMETRIC PRESSURE THAT HAS BEEN CORRECTED TO SEA LEVEL. THE BARO PID, ON THE OTHER HAND, REPORTS THE ACTUAL BAROMETRIC PRESSURE FOR THE ALTITUDE THE VEHICLE IS BEING OPERATED IN. LOCAL WEATHER CONDITIONS (HIGH AND LOW PRESSURE AREAS) WILL CHANGE THE LOCAL BAROMETRIC PRESSURE BY SEVERAL INCHES OF MERCURY (+/- 3 Hz, +/- 1 in. Hg.).

NOTE

BARO IS UPDATED ONLY WHEN THE VEHICLE IS AT HIGH THROTTLE OPENINGS. THEREFORE, A VEHICLE WHICH IS DRIVEN DOWN FROM A HIGHER ALTITUDE MAY NOT HAVE HAD AN OPPORTUNITY TO UPDATE THE BARO VALUE IN KAM. IF YOU ARE NOT CONFIDENT THAT BARO HAS BEEN UPDATED, PERFORM THREE OR FOUR HEAVY, SUSTAINED ACCELERATIONS AT GREATER THAN HALF-THROTTLE TO ALLOW BARO TO UPDATE.

2. On a fully warmed up engine, look at Long Term Fuel Trim at idle, in Neutral, A/C off, (LONGFT1 and/or LONGFT2 PIDs). If it is more negative than -12%, the fuel system has learned lean corrections which may be due to the MAF sensor over-estimating air flow at idle. Note that both Banks 1 and 2 will exhibit negative corrections for 2-bank system. If only one bank of a 2-bank system has negative corrections, the MAF sensor is probably not contaminated.

3. On a fully warmed up engine, look at MAF voltage at idle, in Neutral, A/C off (MAF V PID). If it's 30% greater than the nominal MAF V voltage listed in the Powertrain Control/Emissions Diagnosis (PC/ED) Diagnostic Value Reference Charts for your vehicle, or greater than 1.1 volts as a rough guide, the MAF sensor is over-estimating air flow at idle.

4. If at least tow of the previous three steps are true, proceed to disconnect the MAF sensor connector. This puts the vehicle into Failure Mode and Effects Management (FMEM). In FMEM mode, air flow is inferred by using rpm and throttle position instead of reading the MAF sensor. (In addition, the BARO value is reset to a base/unlearned value.) If the lean driveability symptoms go away, the MAF sensor is probably contaminated and should be replaced. If the lean driveability symptoms do not go away, go to the PC/ED Service Manual for the appropriate diagnostics.

NOTE

DUE TO INCREASINGLY STRINGENT EMISSION/OBDII REQUIREMENTS, IT IS POSSIBLE FOR SOME VEHICLES WITH MAF SENSOR CONTAMINATION TO SET FUEL SYSTEM DTCs AND ILLUMINATE THE MIL WITH NO DRIVEABILITY CONCERNS. DISCONNECTING THE MAF ON THESE VEHICLES WILL, THEREFORE, PRODUCE NO IMPROVEMENTS IN DRIVEABILITY. IN THESE CASES, IF THE BARO, LONGFT1, LONGFT2, AND MAF V PIDs INDICATE THAT THE MAF IS CONTAMINATED, PROCEED TO REPLACE THE MAF SENSOR.

After replacing the MAF sensor, disconnect the vehicle battery (5 minutes, minimum to reset KAM, or on newer vehicles, use the "KAM Reset" feature on the New Generation Star (NGS) Tester and verify that the lean driveability symptoms are gone.

MAN CARB

Vacuum Controller: Description and Operation

VACUUM REGULATOR VALVES

LOCATION

The Vacuum Regulator Valve (VRV) is located within the vacuum hose routing or harness assembly.

PURPOSE

The VRV is designed to provide a constant vacuum output.

TYPES

2-Port Vacuum Regulator

The 2-Port Vacuum Regulator Valve - maintains a constant vacuum output signal, while source vacuum is greater than the pre-set calibration of the valve.

If the input source vacuum falls below the pre-set calibration, the 2-port VRV output vacuum signal will be equal to the input source vacuum.

3-Port Vacuum Regulator

Vacuum Regulator (3 & 4 Port)

The 3-Port and 4-Port Regulators - are used to control the vacuum signal to the vacuum advance unit of the distributor. During engine idle, the manifold vacuum input signal is limited to a constant output signal.

Once the engine is off-idle, the output signal will equal the spark port.

02/23/94

HEATER - OBJECTIONABLE AIRFLOW FROM PANEL REGISTERS DURING HEAVY ACCELERATION - NON A/C VEHICLES

LIGHT TRUCK: 1990-92 RANGER 1991-92 EXPLORER

This TSB article is being republished in its entirety to include 1992 Model vehicles.

ISSUE: Objectionable airflow from the heater system panel registers may occur when the system is in the OFF mode and the vehicle is under heavy acceleration. This condition is caused by movement of the fresh air door when the vacuum to the door actuator is lost during heavy acceleration.

ACTION: Installation of a vacuum hose/reservoir/check valve assembly will provide sufficient vacuum level to maintain proper operation of the heater system in the OFF mode. Refer to the following procedure for service details.

SERVICE PROCEDURE

1. Remove the blower assembly from the vehicle.

2. Drill two holes in the blower assembly, in a vertical position, to allow for installation of the vacuum reservoir. Refer to Figure 1.

3. Using two screws, mount the vacuum reservoir as shown in Figure 1.

4. Disconnect the existing vacuum check valve.

5. Remove the vacuum line which sourced the heater system check valve and attached to an engine vacuum port. Refer to Figure 1.

6. Discard the check valve and vacuum line.

7. Reinstall the blower assembly in the vehicle.

8. Route the new vacuum line and check valve (attached to the reservoir) as the original vacuum line was routed and attach to the original vacuum port.

9. Attach the vacuum line from the heater plenum chamber to the open port on the vacuum check valve.

10. Start the engine and verify proper operation of the Fresh Air/Off door.

OASIS CODES: 208000, 208300

Vacuum Tank: Description and Operation

Vacuum Reservoirs

PURPOSE

The Vacuum Reservoir temporarily stores vacuum until it is needed. This temporary vacuum storage helps to prevent rapid fluctuations and/or sudden drops in a vacuum signal line, as when an engine is under load or during acceleration.

Vacuum Tank: Testing and Inspection

1. Disconnect vacuum hose at servo, then connect hose to suitable vacuum gauge.

2. Start engine and observe vacuum gauge. Vacuum should be approximately 23 inches Hg. If vacuum is not as specified, check for leaking vacuum hose or defective vacuum pump.

3. Turn engine off after vacuum has stabilized above 20 inches Hg. Vacuum should remain steady. After 24 hours, vacuum should still be a minimum of 15 inches Hg.

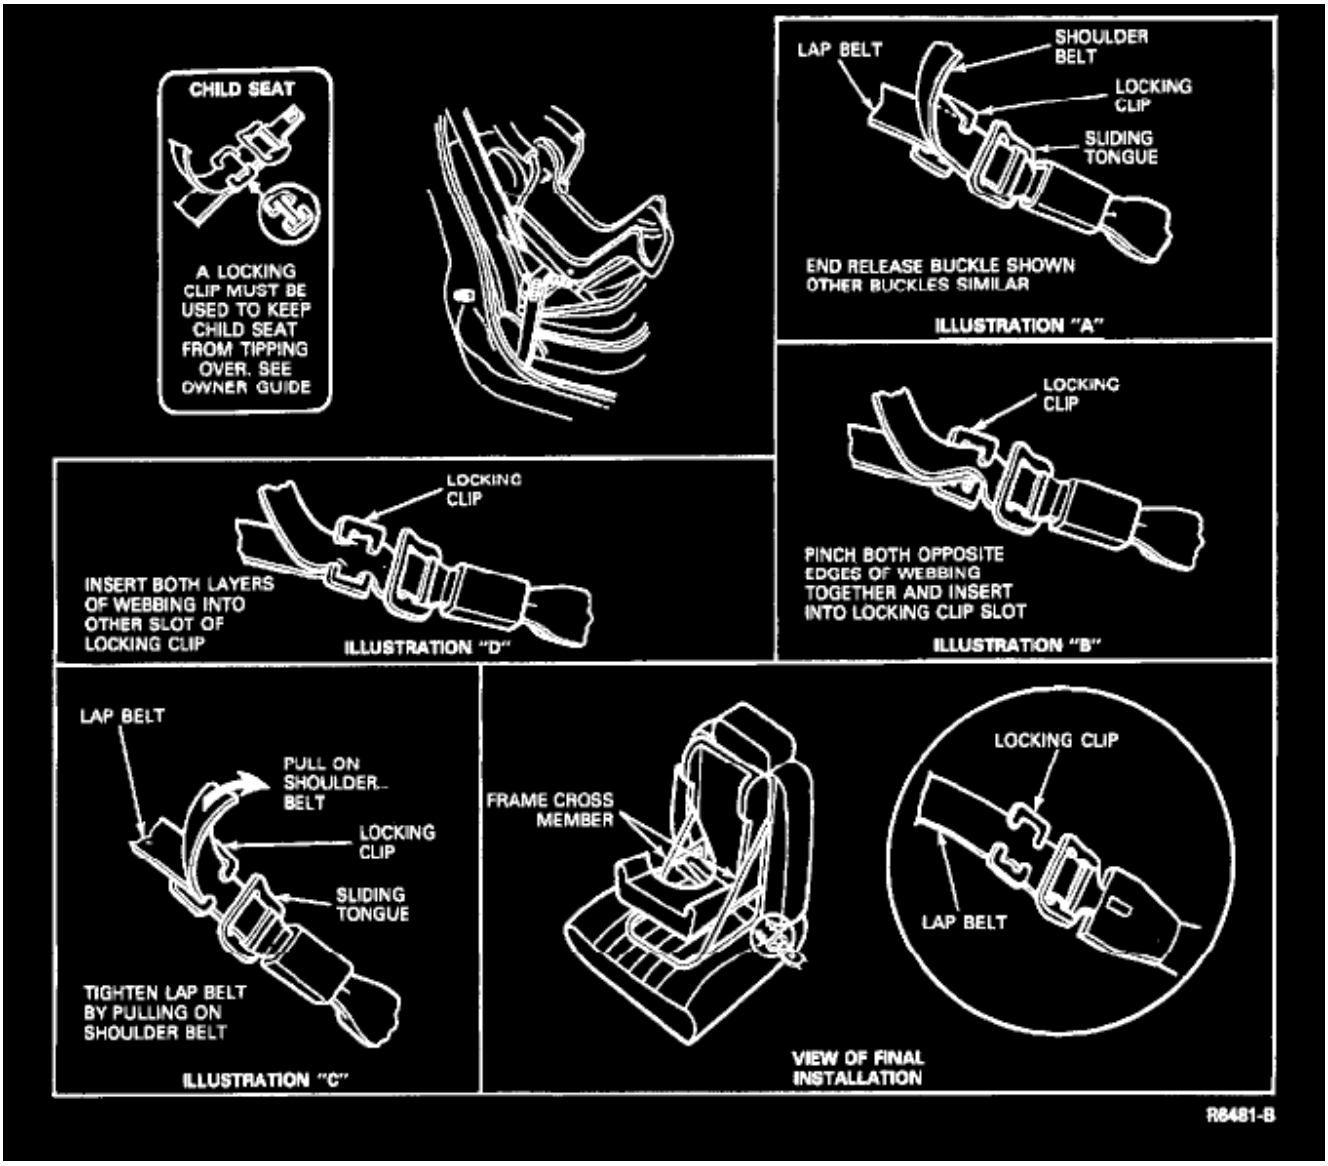
4. If vacuum does not hold, check for leak in vacuum harness and repair or replace as required. If vacuum still does not hold after checking vacuum harness for leaks, replace vacuum reservoir.

Vacuum Tank: Service and Repair

1. Disconnect the two vacuum lines connected to the reservoir ports.

2. Remove reservoir retaining nuts from the underside of the lefthand apron, then the reservoir.

3. Reverse procedure to install.



Child Restraint: Service and Repair

Child Seat Locking Clip

The locking clip must be used to secure a child seat when your vehicle has a shoulder and lap belt with a sliding tongue. The locking clip is not needed it the seat belt has only a lap belt. It you do not use a locking clip, injuries could result from the child seat tipping over during normal braking or turning. 1. Thread the belt webbing through the child seat according to the child seat manufacturers instructions. 2. Buckle seat belt. Pull on shoulder portion of the belt to make the lap portion fit snugly. 3. Slide either corner of locking clip slot closest to the tongue, over both layers of webbing as shown in Illustration "A" 4. Pinch both opposite edges of webbing together and insert them into locking clip slot as shown in Illustration "B". 5. Tighten the lap belt by pulling on the shoulder belt as shown in Illustration "C". 6. Insert both layers of webbing into the other slot of the locking clip in the same manner as step 4. See Illustration "D". 7. Forcibly tilt the child seat from side to side and also tug it forward to see if it is held securely in place. If excessive movement occurs, repeat steps

3 through 7 or properly install the child seat in a different seating position in the vehicle.

Seat Belt: Customer Interest Safety Belts - Front/Rear Twisted at `D' Ring

Article No. 92-5-1

February 26, 1992

SAFETY BELTS - FRONT/REAR - SHOULDER BELTS TWISTED AT "D" RING OR SAFETY BELT TONGUE

ROTATED ON WEBBING

FORD: 1990-92 CROWN VICTORIA, ESCORT, MUSTANG, TAURUS, TEMPO, THUNDERBIRD

LINCOLN-MERCURY: 1990-92 CONTINENTAL, COUGAR, GRAND MARQUIS, MARK VII, SABLE, TOPAZ, TOWN CAR

1991-92 TRACER

LIGHT TRUCK: 1990 BRONCO II 1990-92 AEROSTAR, BRONCO, ECONOLINE, F SUPER DUTY, F-150-350 SERIES, F-47, RANGER 1991-92 EXPLORER

ISSUE: The front and/or rear seat shoulder safety belts may become twisted at the "D" ring or the safety belt tongue may be rotated on the belt webbing. A procedure has been developed for correcting these concerns.

ACTION: If the safety belt becomes twisted at the "D" ring or the safety belt tongue is rotated on the belt webbing, use the following procedure to

remove the twists.

NOTE: THESE PROCEDURES AFFECT BOTH WIRE FORMED AND STAMPED "D" RING DESIGNS.

SAFETY BELT TWISTED AT THE "D" RING

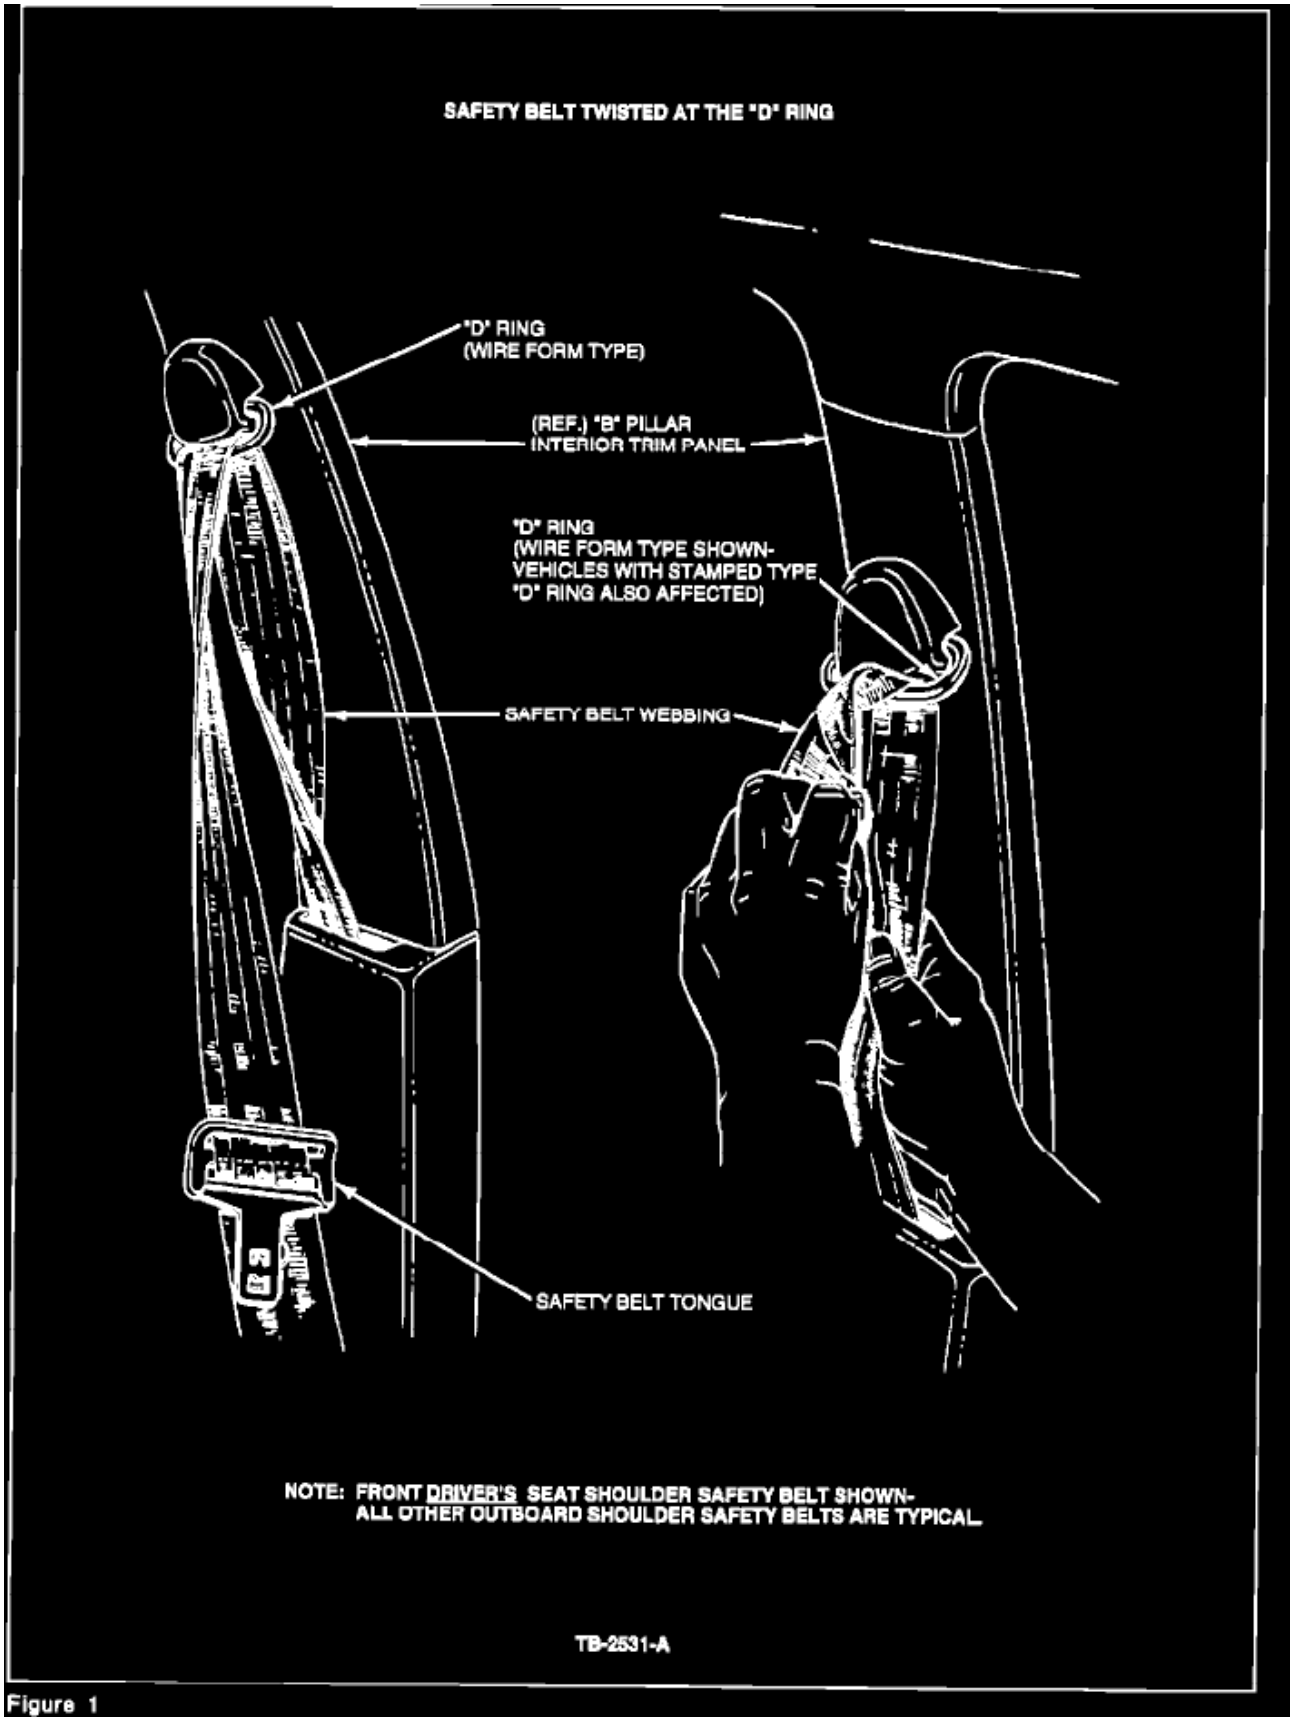


Figure 1

1. Grasp the belt webbing at the "D" ring as shown on the right side of Figure 1.

2. Rotate and fold the belt webbing over itself as required to remove the twist.

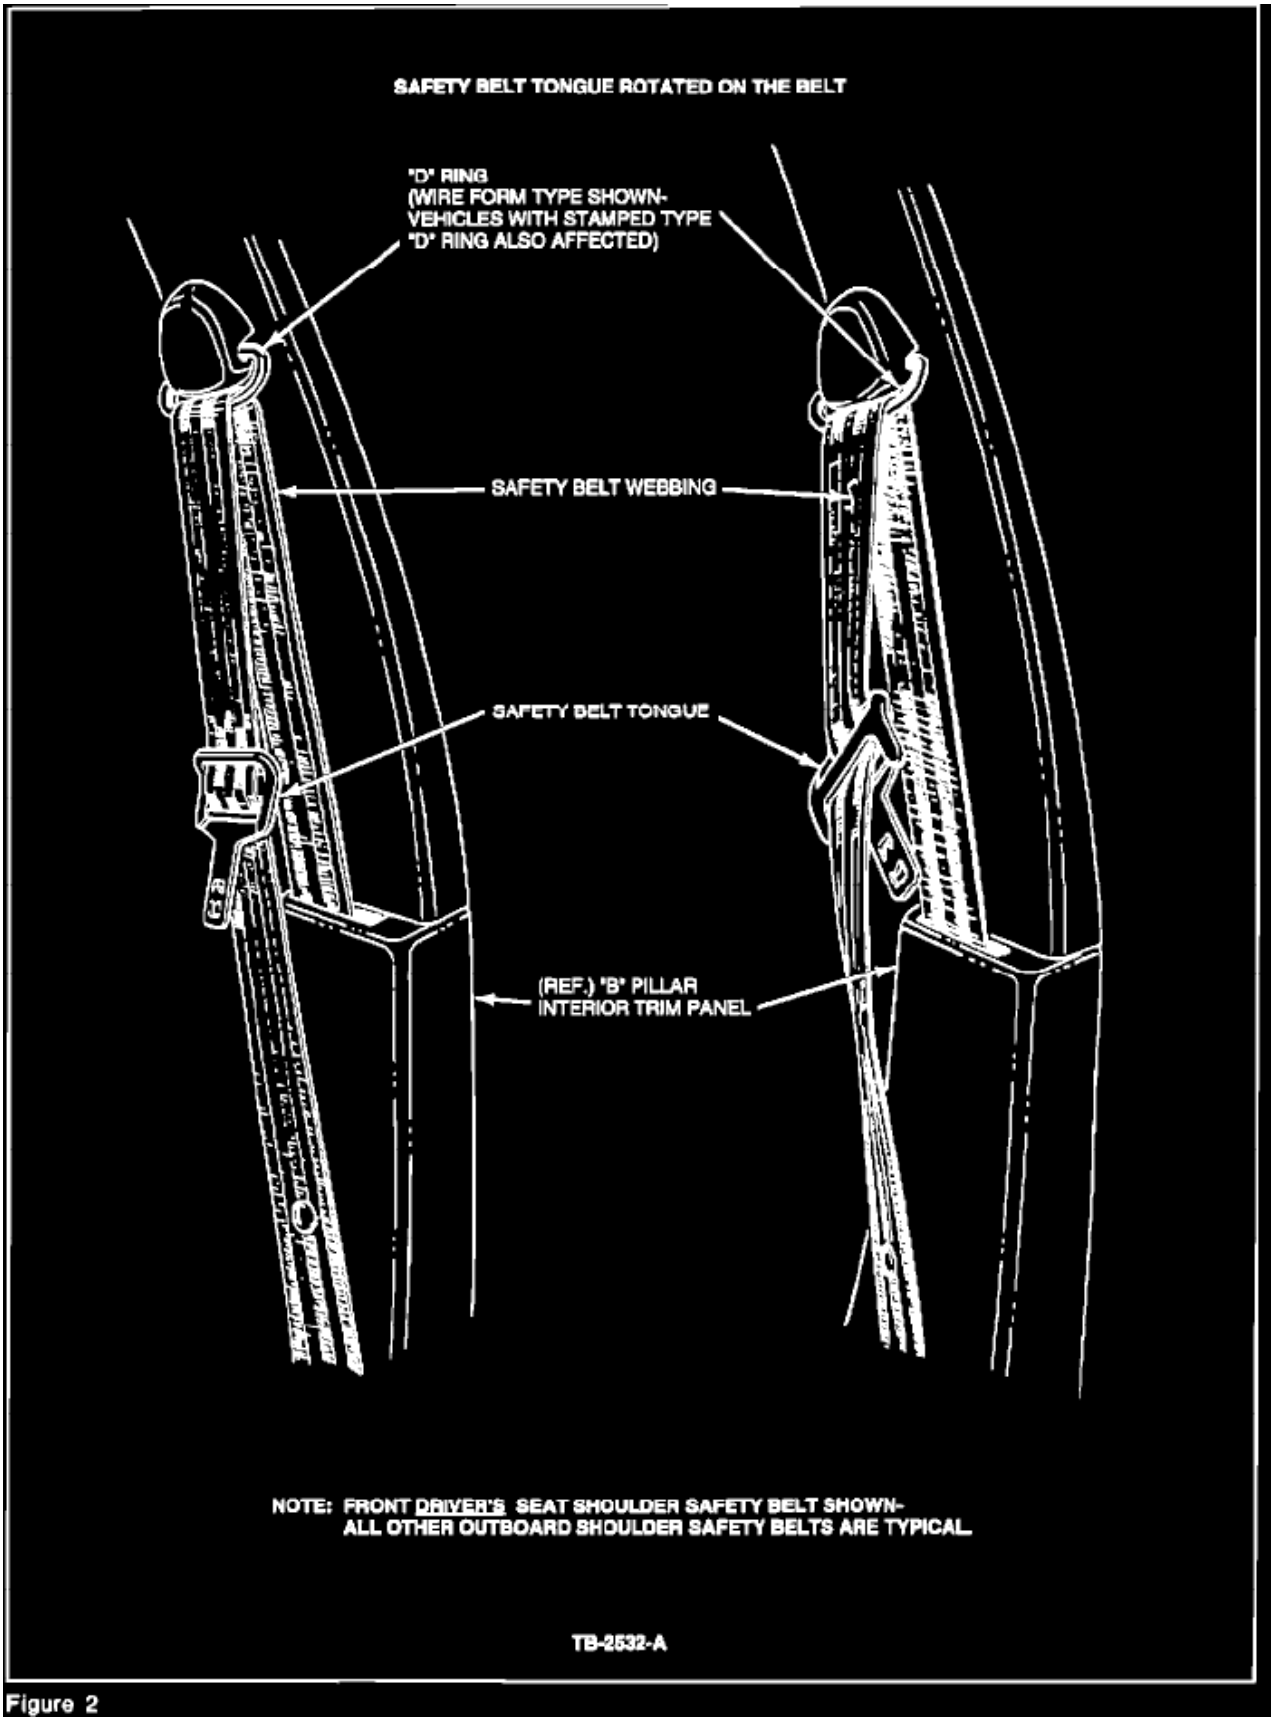

Figure 2

3. When completed, the safety belt should look like the belt shown on the left side of Figure 2.

SAFETY BELT TONGUE ROTATED ON BELT

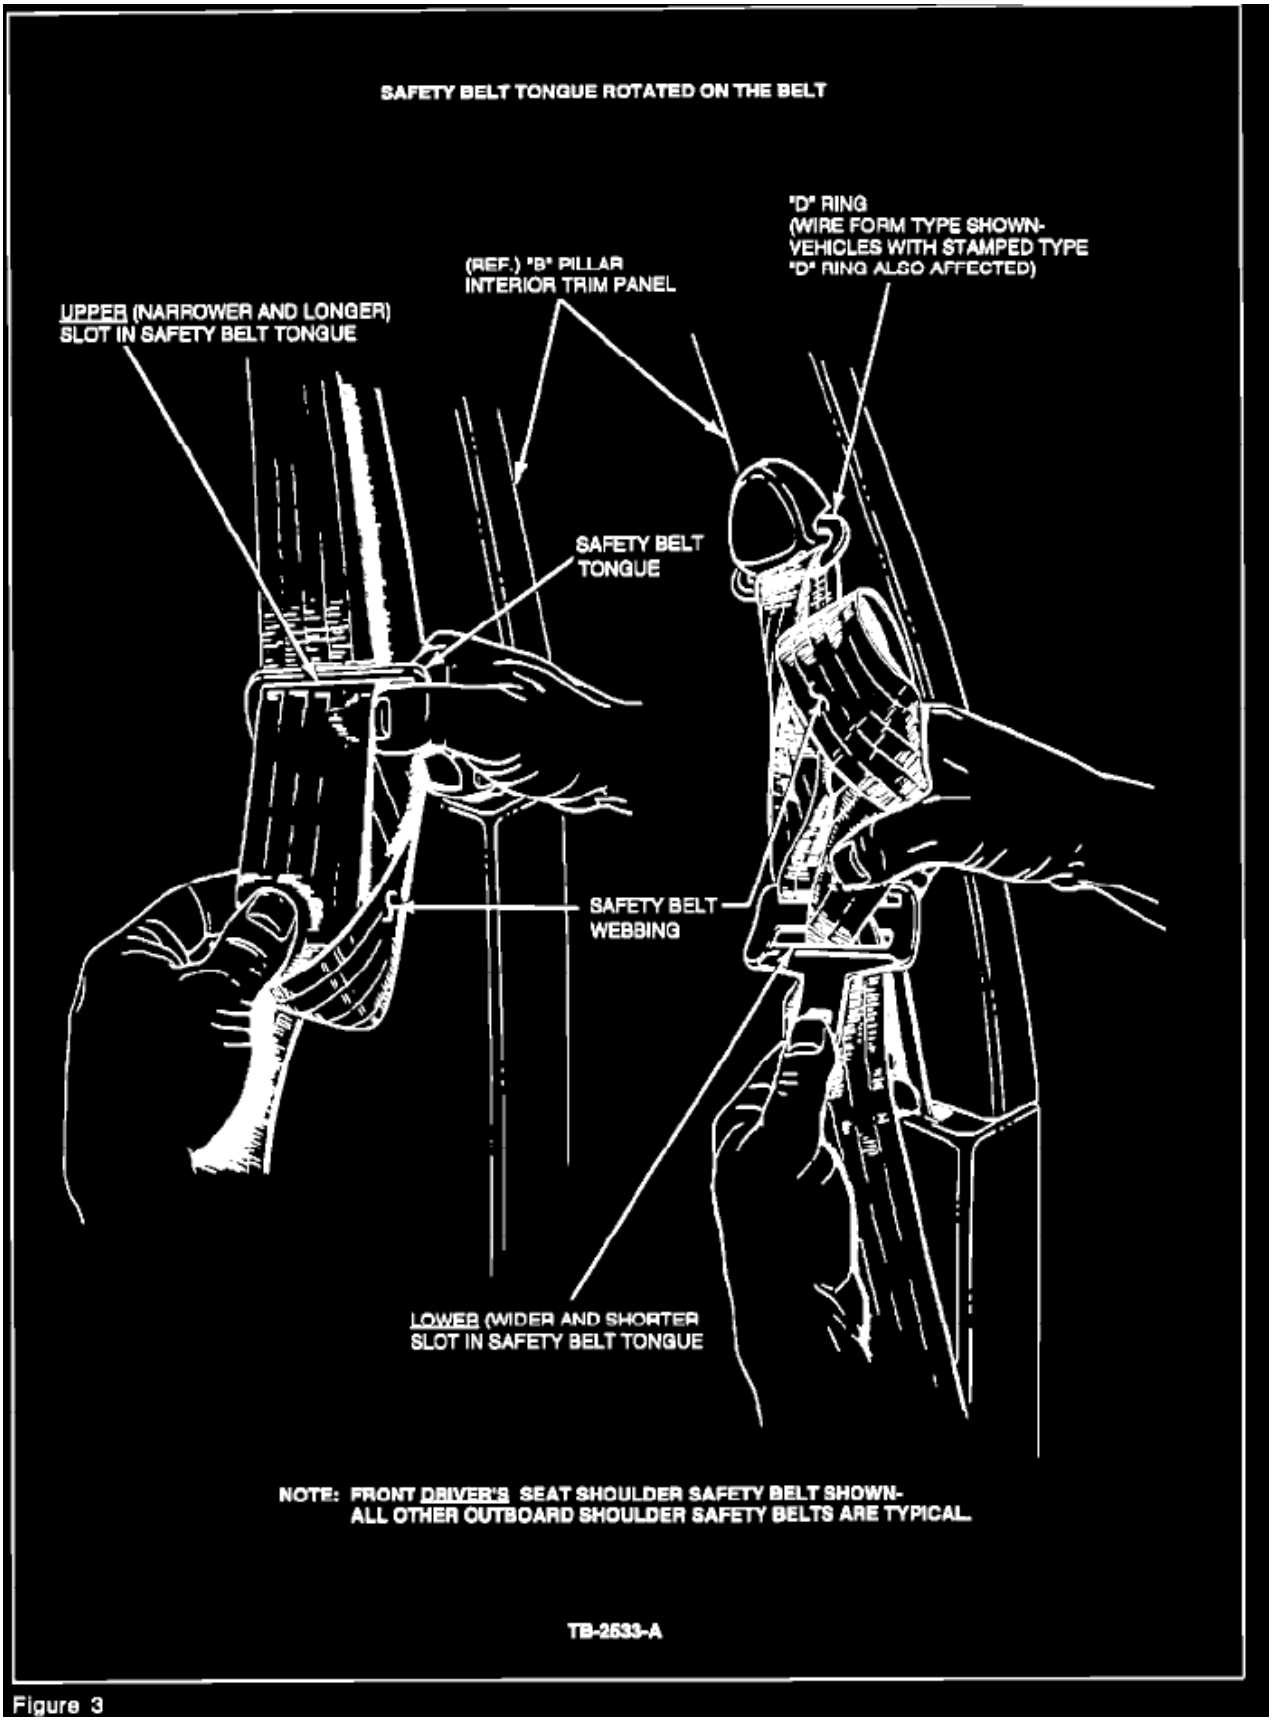

Figure 3

1. Grasp the belt tongue and pull down on the belt webbing closest to you to form a loop through the upper (narrow and longer) slot in the tongue. See the left side of Figure 3.

2. Working within the upper slot, rotate and fold the belt webbing over itself as required to remove the twist.

3. Pull the excess belt webbing back through the upper slot in the tongue.

4. Repeat the above steps to complete the removal of the twist at the lower (wider and larger) slot in the tongue. See the right side of Figure 3.

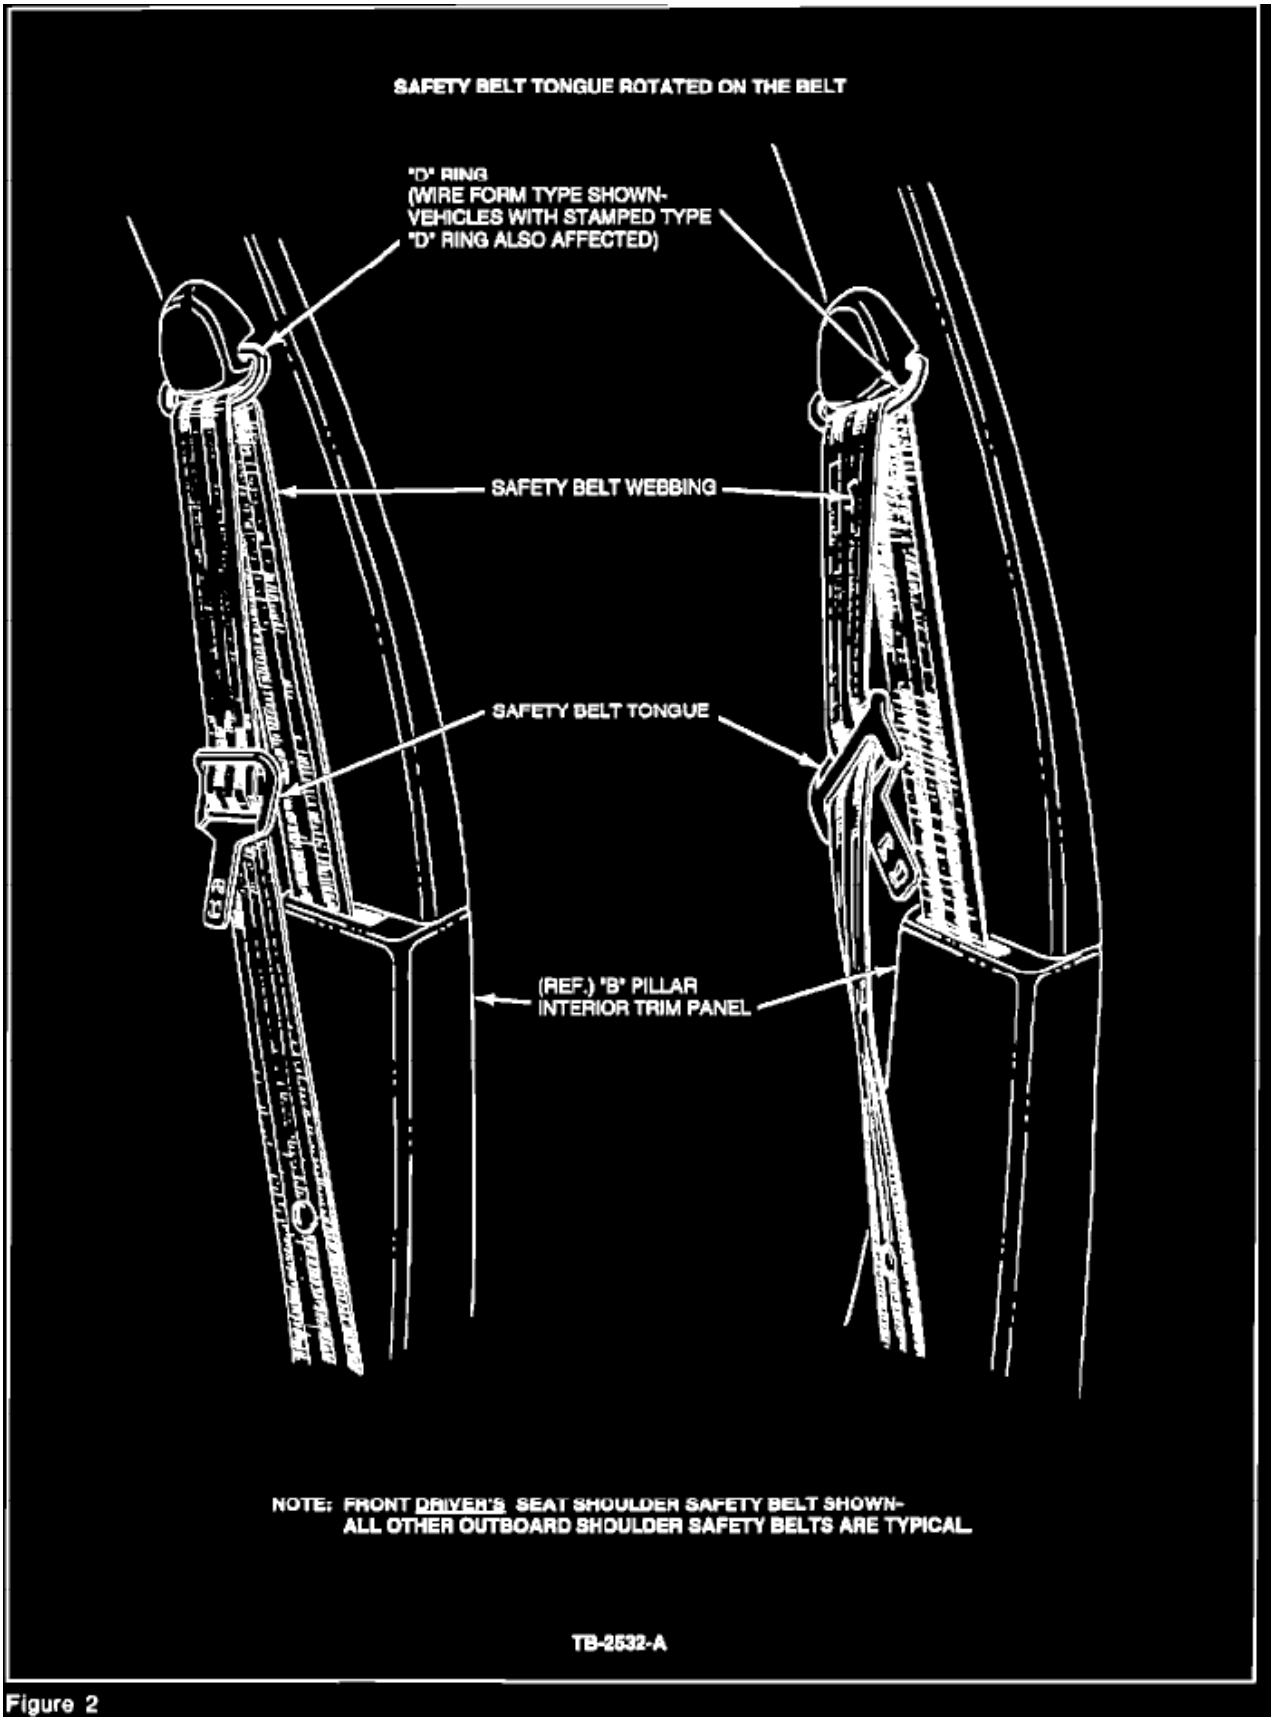

Figure 2

5. When completed, the safety belt should look like the belt shown on the left side of Figure 2.

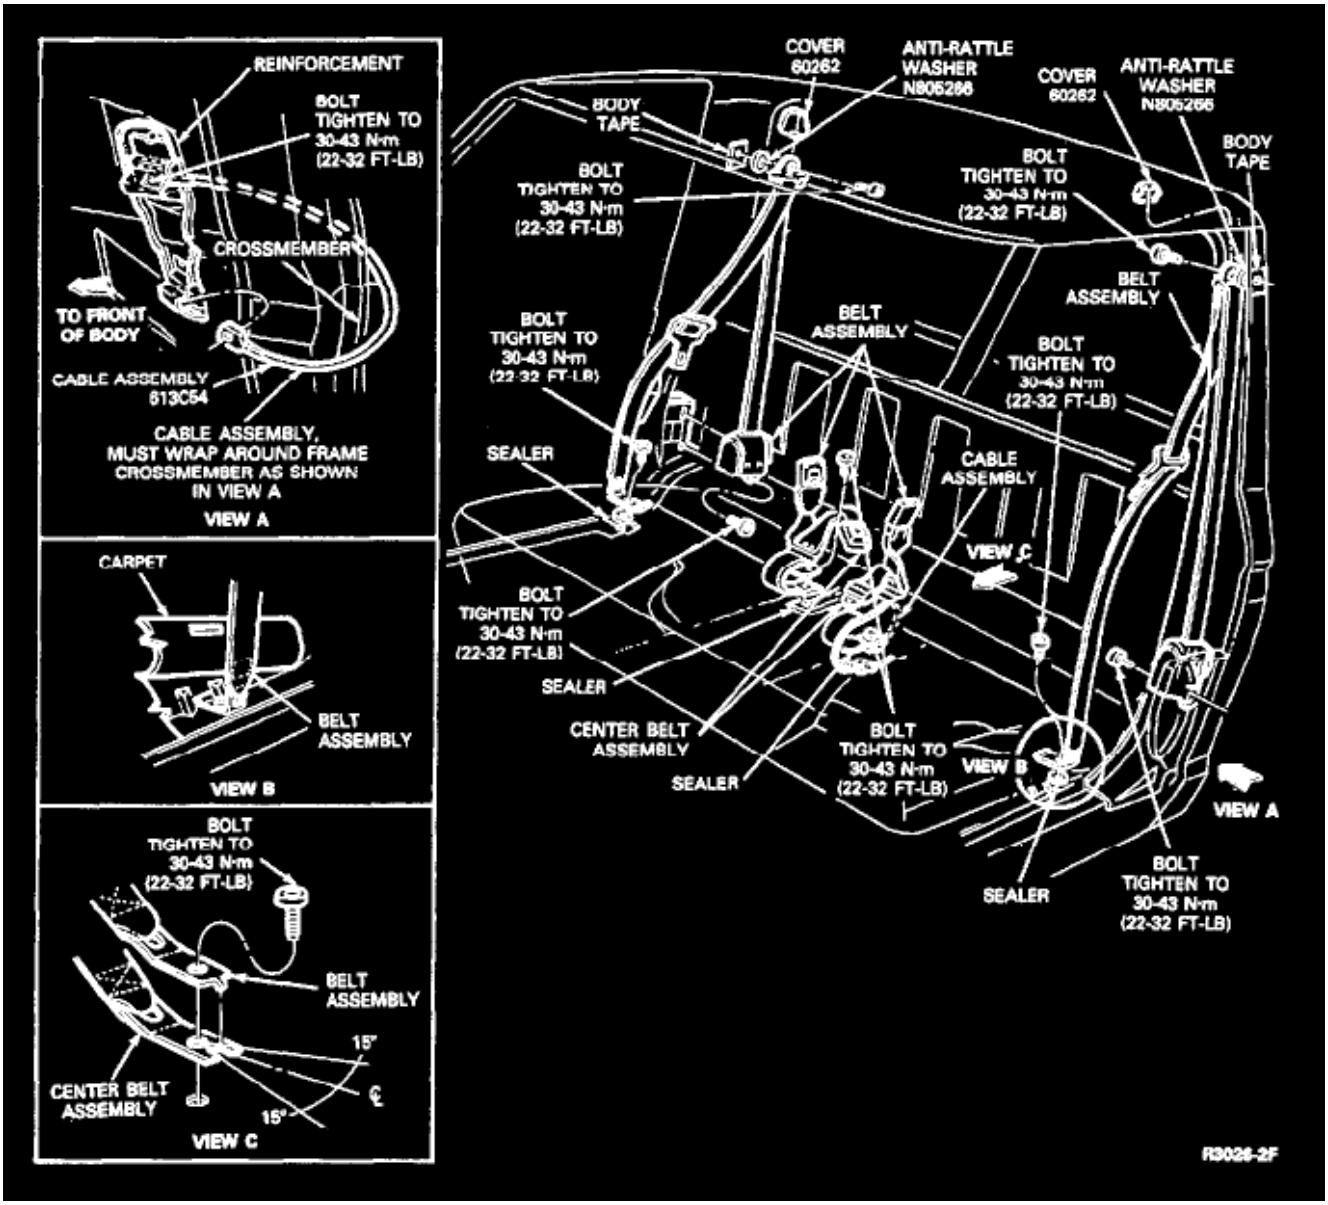
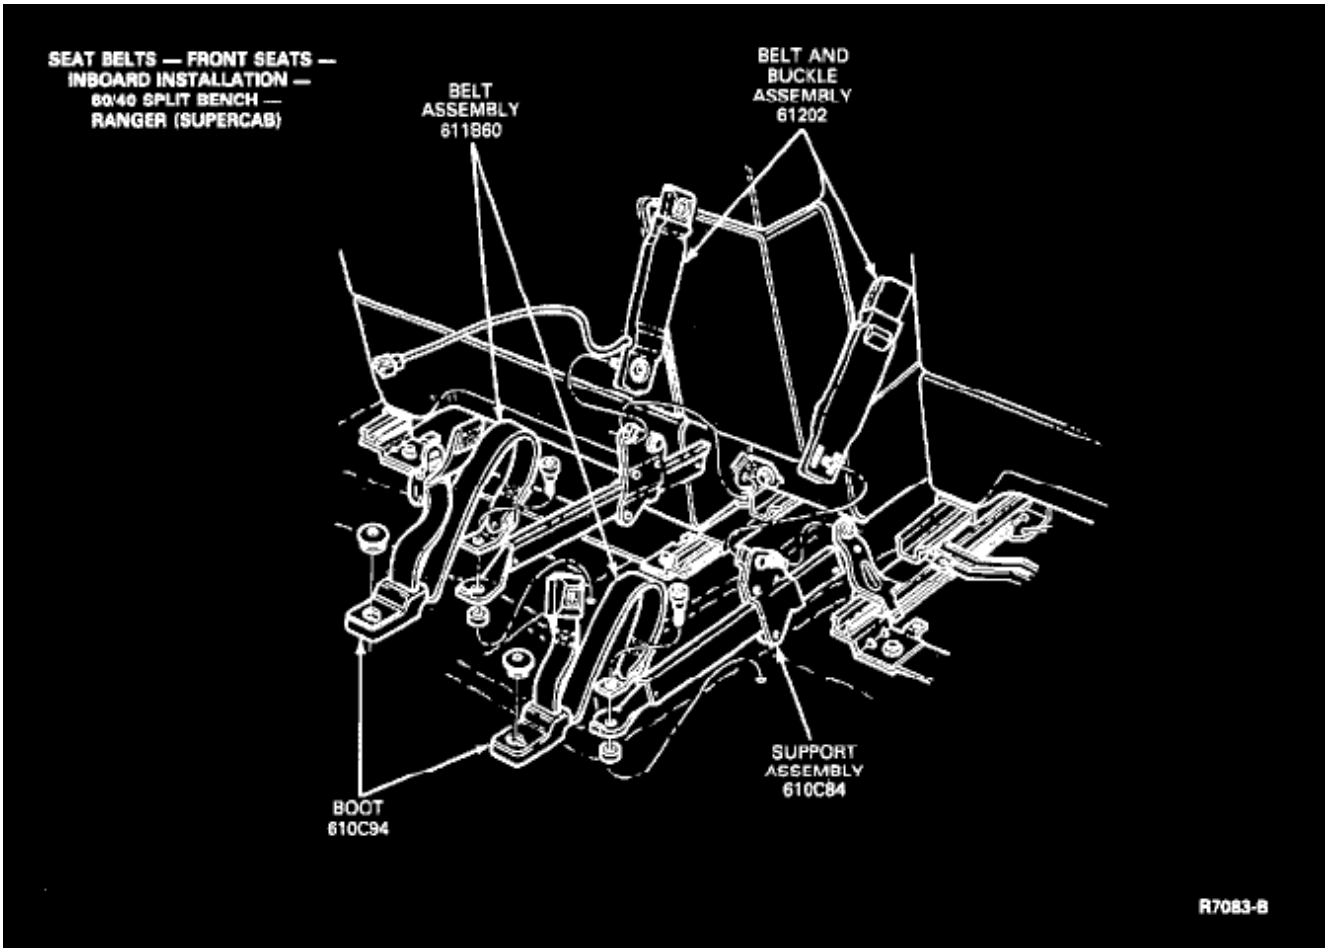
Seat Belt: Service and Repair Cleaning and Inspection

Clean the belt webbing with any mild soap solution recommended for cleaning upholstery or carpets; follow instructions provided with soap. Avoid bleaching or redyeing the webbing as this could hinder belt strength and performance.



Seat Belt: Service and Repair Removal and Installation

Center Belt/Buckle - Bench Seat

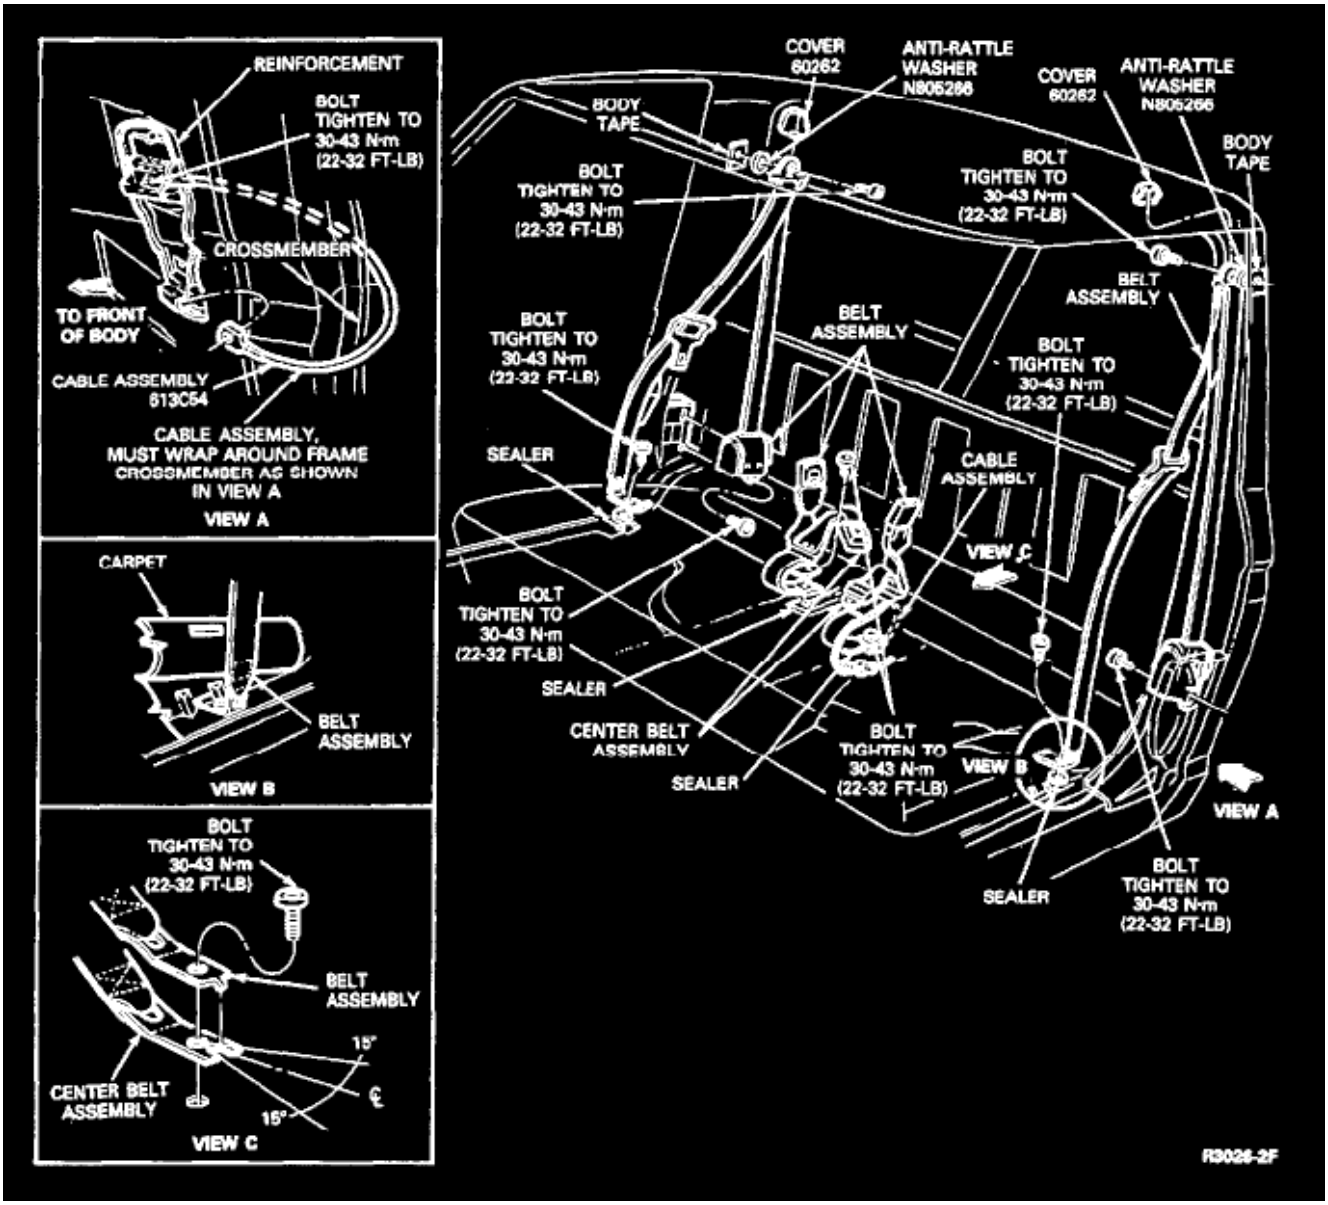


Removal

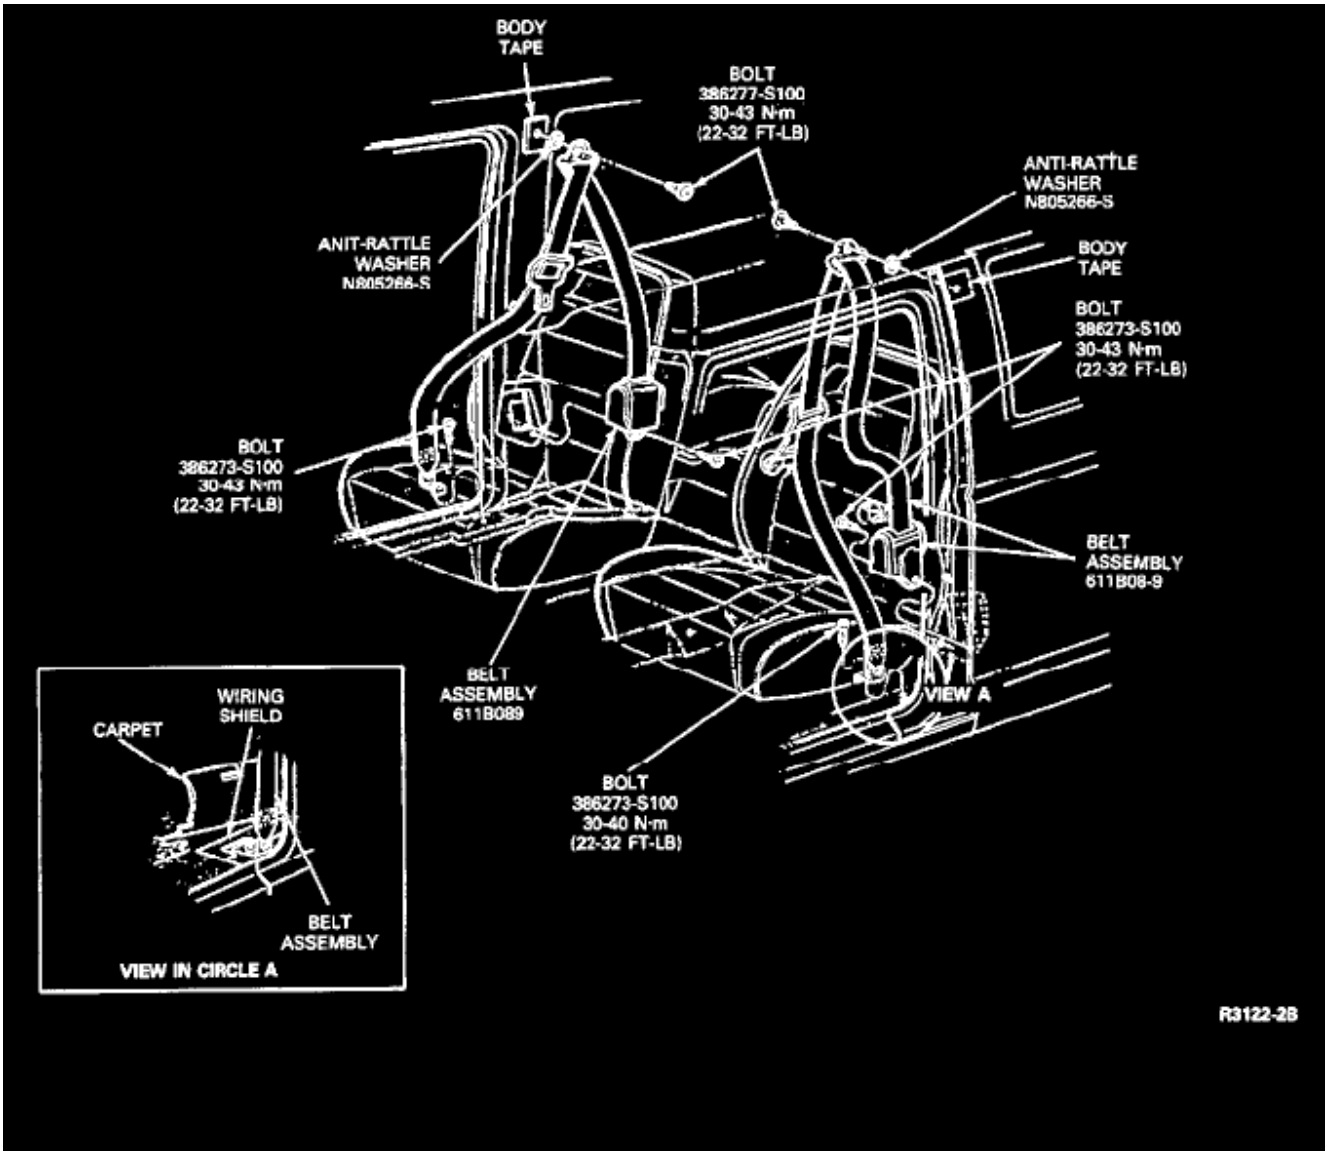
1. Remove the bolts securing the belt and buckle assemblies to floorpan (one each side). Remove belt and buckle assemblies from vehicle.

Installation

1. Position belt and buckle assemblies to floorpan and secure with bolt. Tighten to 30-43 N.m (22-32 ft-lb).



Front Outboard



Removal

1. Remove the D-ring cover. 2. Remove bolt from the retractor assembly. 3. Remove bolt from floor anchorage by lifting up on carpet. 4. Remove bolt from strap guide and remove belt from vehicle.

Installation

1. Position belt to vehicle and install bolt into guide strap. Tighten to 30-43 N.m (22-32 ft-lb). 2. Install bolt into retractor assembly. Tighten to 30-43 N.m (22-32 ft-lb). 3. Install bolt into floor anchorage. Tighten to 30-43 N.m (22-32 ft-lb). 4. Install D-ring cover.

Seat Belt: Service and Repair Service Procedures

Post Collision Inspection

All safety belt assemblies must be replaced after a collision, provided:

1. The safety belt was in use at the time of the accident or, 2. The safety belt was damaged by the accident (bent retractor, torn webbing, etc.) or, 3. The safety belt attaching area(s) was damaged by the accident.

Before installing the new safety belt assembly, the safety belt attaching areas must be inspected for damage and distortion. If the attaching points are damaged and distorted, the sheet metal must be reworked back to its original shape and structural integrity.

Install the new safety belt(s) using the appropriate instructions, then functionally test.

Repair Notes

The seat and shoulder safety belts are factory installed in their proper locations. If the belts are removed for any reason, they should be re-installed Ford Caulking Cord D6AZ-19560-A or equivalent sealer should be placed around all seat belt anchor bolt holes in the floorpan. Tighten the anchor bolts to 30-43 N.m (22-32 ft-lb).

Seat Belt With Anchor Plate Thread Damage

Parts Replacement Chart

1. Remove the broken or stripped bolt and discard. 2. Drill out the internal threads in the safety belt anchor plate with a 27/64-inch drill. 3. Re-thread the anchor plate with a 1/2-13 tap (seat belt). 4. Blow out the chips. 5. Install the attachment parts in the order shown, whichever is applicable. Tighten the replacement bolt to 30-43 N.m (22-32 ft-lb). Original parts

are to be replaced with the repair parts indicated in the Parts Replacement Chart. Unless specified in the chart, use original parts.

6. When repairing a multiple belt and attachment, install nut to the bolt in the tunnel area from the underside of the floorpan. Tighten to specification

30-43 N.m (22-32 ft-lb).

Seat Belt Extension: Description and Operation

Safety Belt Extension Assembly

A safety belt assembly that is too short when fully extended over the lap of a stocky vehicle occupant can be lengthened approximately 203 mm (8 inches) with a safety belt extension assembly, which can be procured through local Ford dealers. The safety belt extension assembly is only available with black webbing and standard buckle and must be of the same manufacture as the belt system to which it is attached.

Seat Belt Guide Track: Customer Interest Split Bench - Difficult or No Fore/Aft Adjustment

Article No. 94-17-7

08/24/94

FRONT SEAT - DRIVER'S 60/40 SPLIT BENCH - POOR OR NO FORE/AFT ADJUSTMENT - SUPERCAB MODELS BUILT THROUGH 7/93

LIGHT TRUCK: 1991-93 RANGER

ISSUE: Some vehicles may exhibit the front seat being difficult to adjust and may eventually lead to no seat adjustment at all. This could be caused by the sliding collar of the front seat belt buckle support assembly (slide bar) rotating and not allowing the seat to glide freely on the seat tracks.

ACTION: Replace the front seat belt support bracket or the slide bar. Refer to the following, for proper service procedures.

SERVICE PROCEDURE

1. Remove the front seat from the vehicle as follows:

a. Remove the plastic seat track covers from the seat tracks.

b. Remove the four (4) seat track-to-floor retaining bolts.

c. Remove the Torx bolt behind the cover retaining the rear part of the slide bar assembly to the floor.

d. Disconnect the electrical connector for the seat belt buckle switch.

e. Lift the complete seat assembly from the vehicle and place upside down on a clean and protected surface.

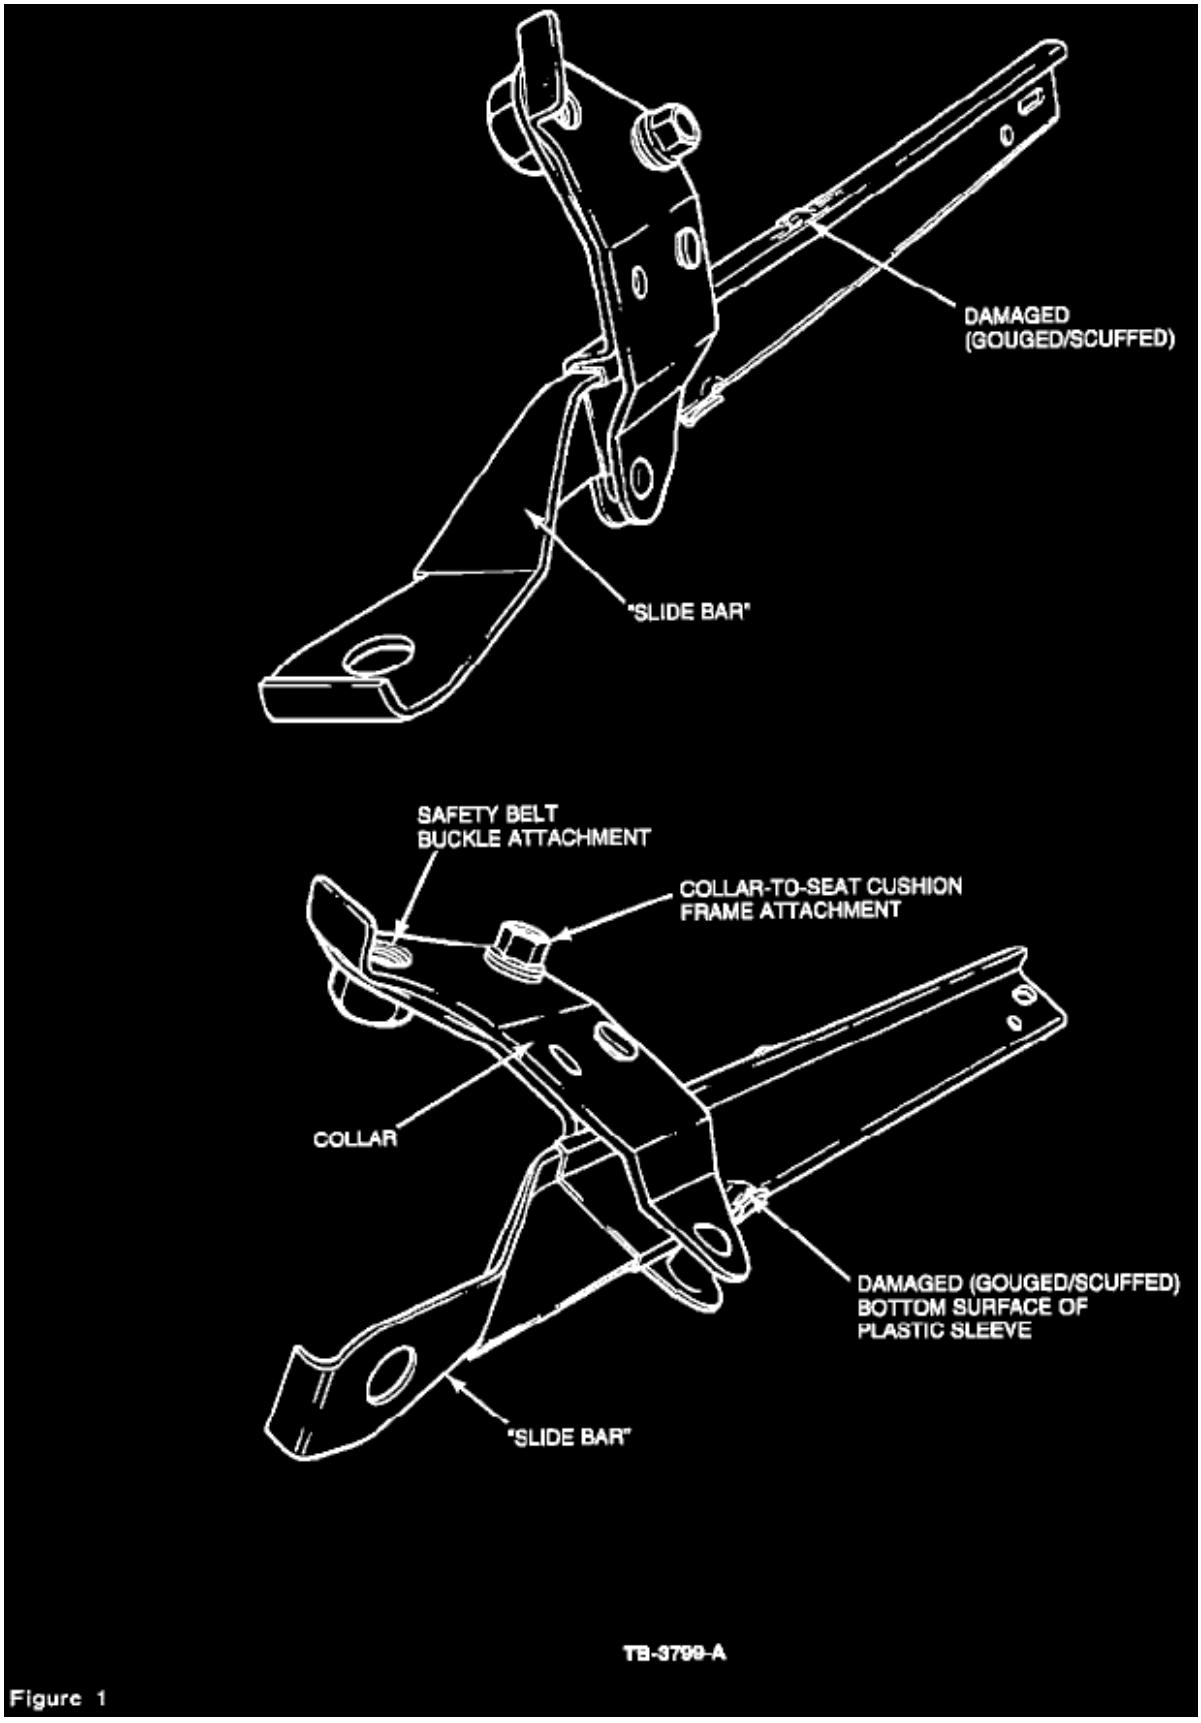

Figure 1

2. Inspect the top and/or bottom plastic surfaces of the front seat belt buckle support assembly slide bar for damaged, scuffed or gouged top and/or bottom surfaces. Refer to Figure 1.

NOTE:

IF THE SLIDE BAR SLEEVE DOES NOT SHOW ANY DAMAGE AS DESCRIBED ABOVE, DO NOT REPLACE THE SLIDE BAR. REPLACE THE FRONT SEAT BELT SUPPORT BRACKET ASSEMBLY (F37Z-13610D11-A). PROCEED TO STEP 3 FOR DETAILS.

NOTE:

IF THE SLIDE BAR DOES SHOW DAMAGE AS DESCRIBED ABOVE, OBTAIN A NEW SLIDE BAR ASSEMBLY (F3TZ-13610C85-A) AND FRONT SEAT BELT BUCKLE BRACKET ASSEMBLY (F37Z-13610D11-A) AND PROCEED TO STEP 3.

3. Remove the seat belt buckle assembly from the slide bar assembly.

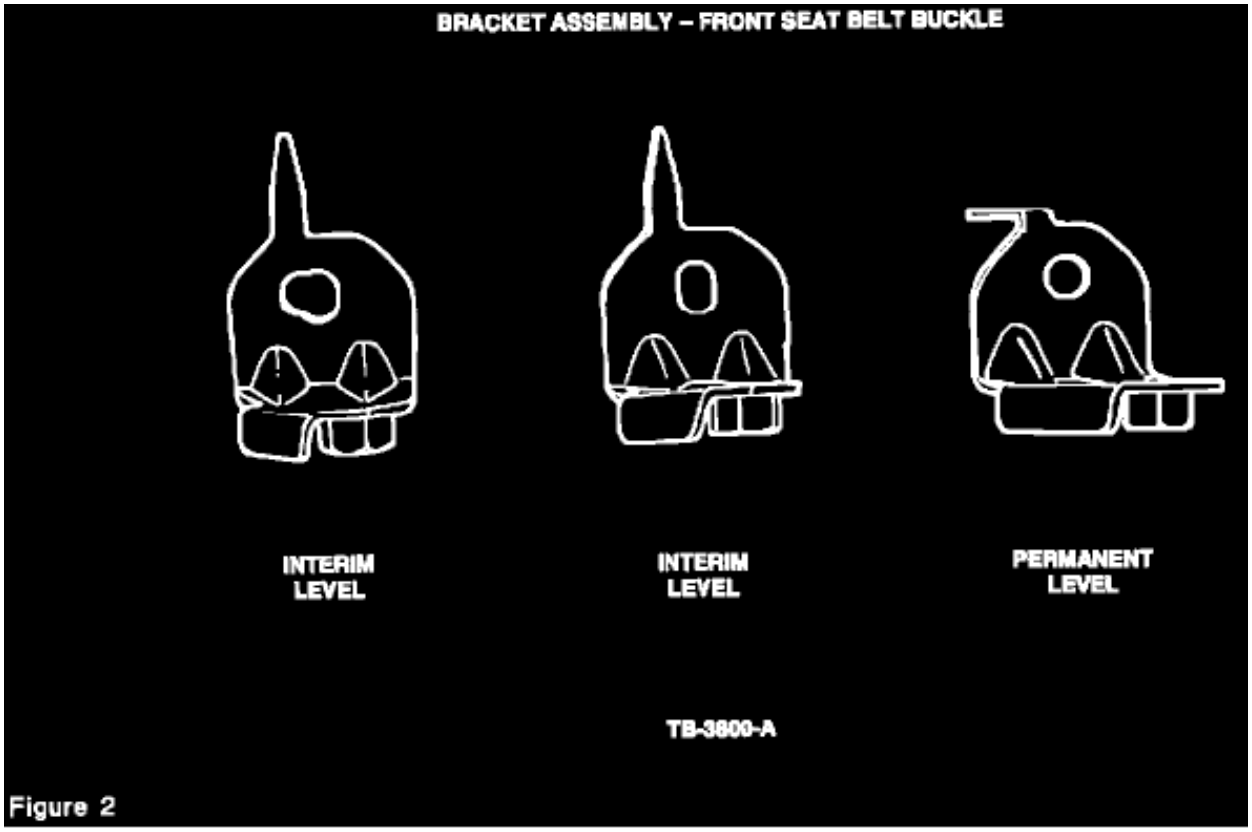

Figure 2

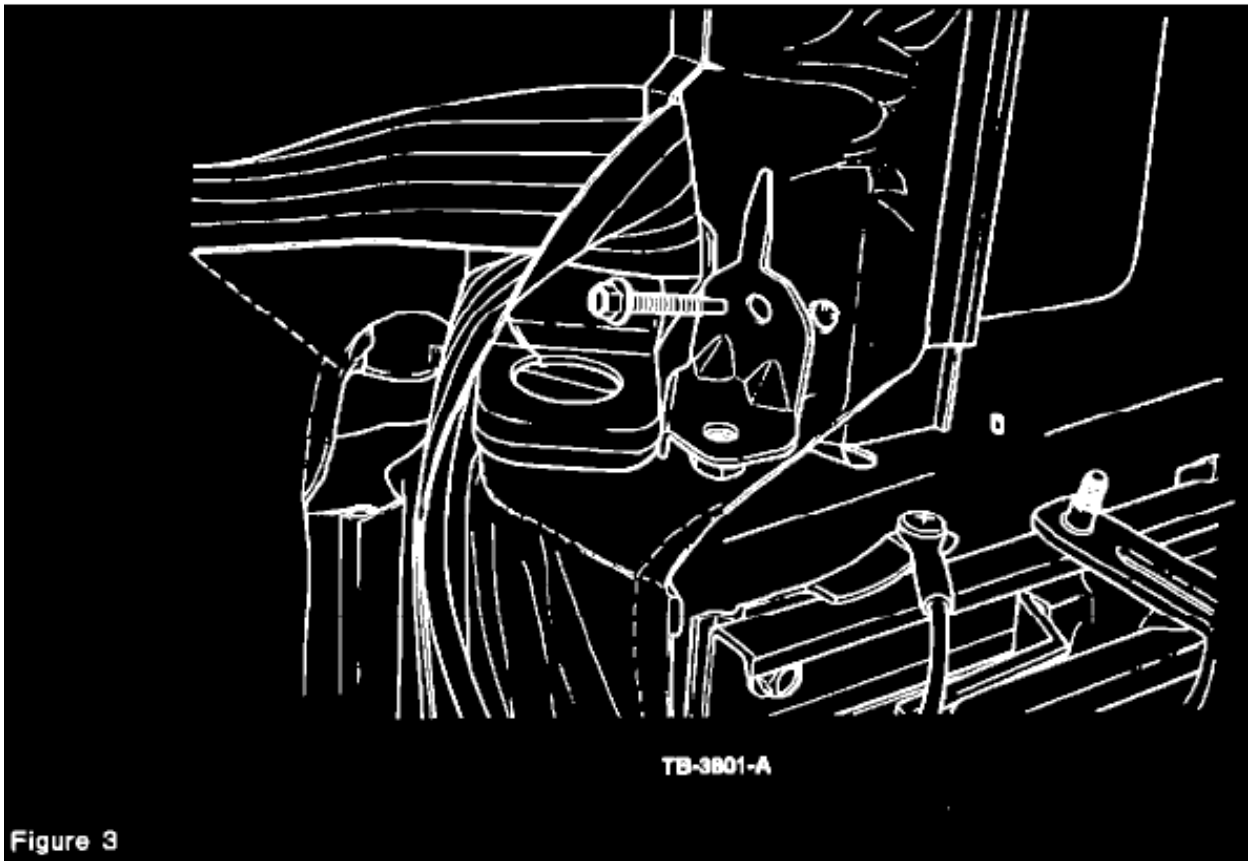

Figure 3

4. Remove the slide bar assembly from the seat as follows:

a. Remove the bolt retaining the collar of the slide bar assembly to the seat belt buckle support bracket on the inboard side of the seat cushion.

b. Remove the nut retaining the slide bar assembly to the mounting bracket attached to the front of the seat track assembly.

c. Remove the slide bar assembly from the seat assembly.

5. Locate and remove the M6 Torx head bolt retaining the seat belt buckle support bracket to the seat cushion frame. Discard the bracket and save the bolt for installation.

INSTALLATION PROCEDURE

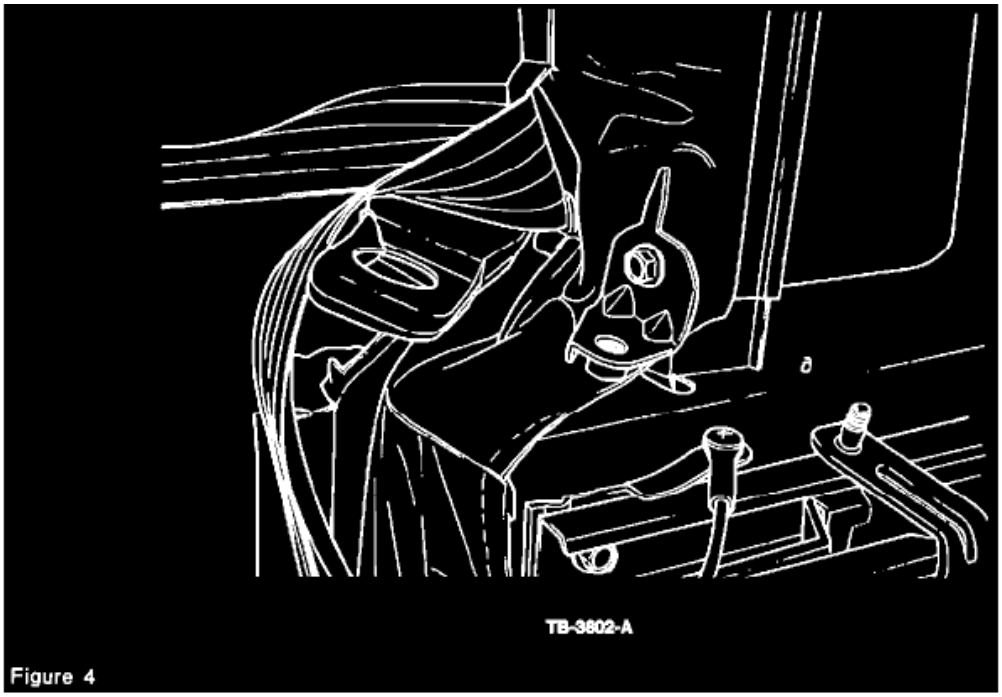

Figure 4

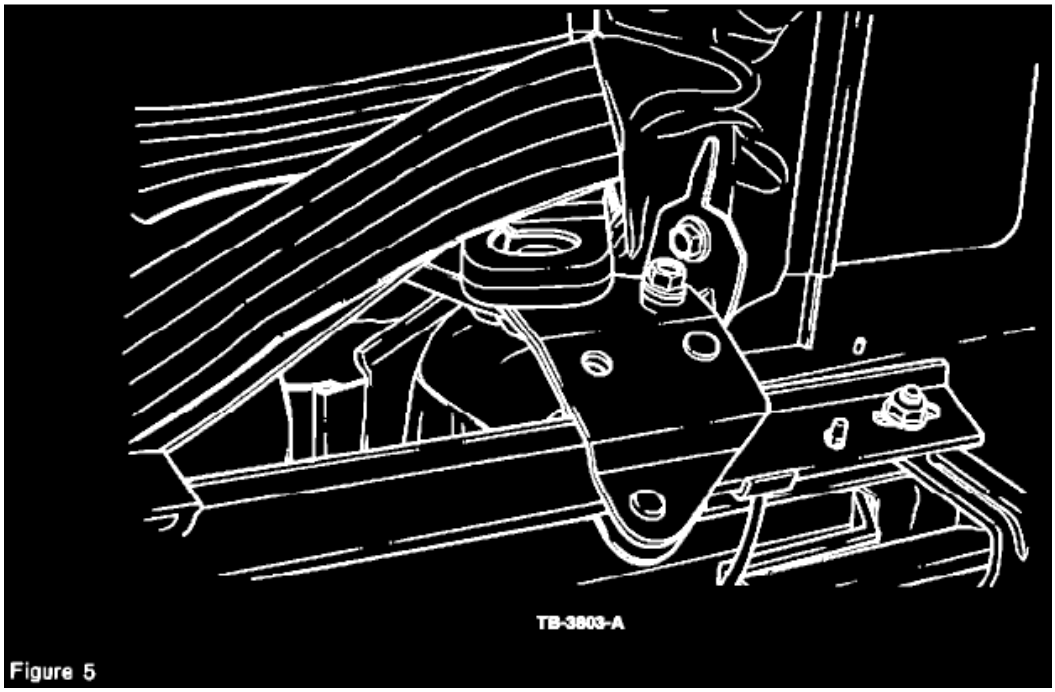

Figure 5

1. Install the new seat belt buckle support bracket (F37Z-13610D11-A) Figure 2, to the seat cushion frame using the M6 Torx head bolt and torque to 8-11 N-m (6-8 lb.ft.). Refer to Figures 3

and 4.

2. Lubricate the seat track assembly assembly with Multi-Purpose Grease Spray (D7AZ-19584-AA, or equivalent).

3. Position the slide bar assembly onto the seat track assembly. Refer to Figure 3.

NOTE:

THE SLIDE BAR MUST BE POSITIONED OVER THE STUD OF THE MOUNTING BRACKET ATTACHED TO THE SEAT TRACK ASSEMBLY.

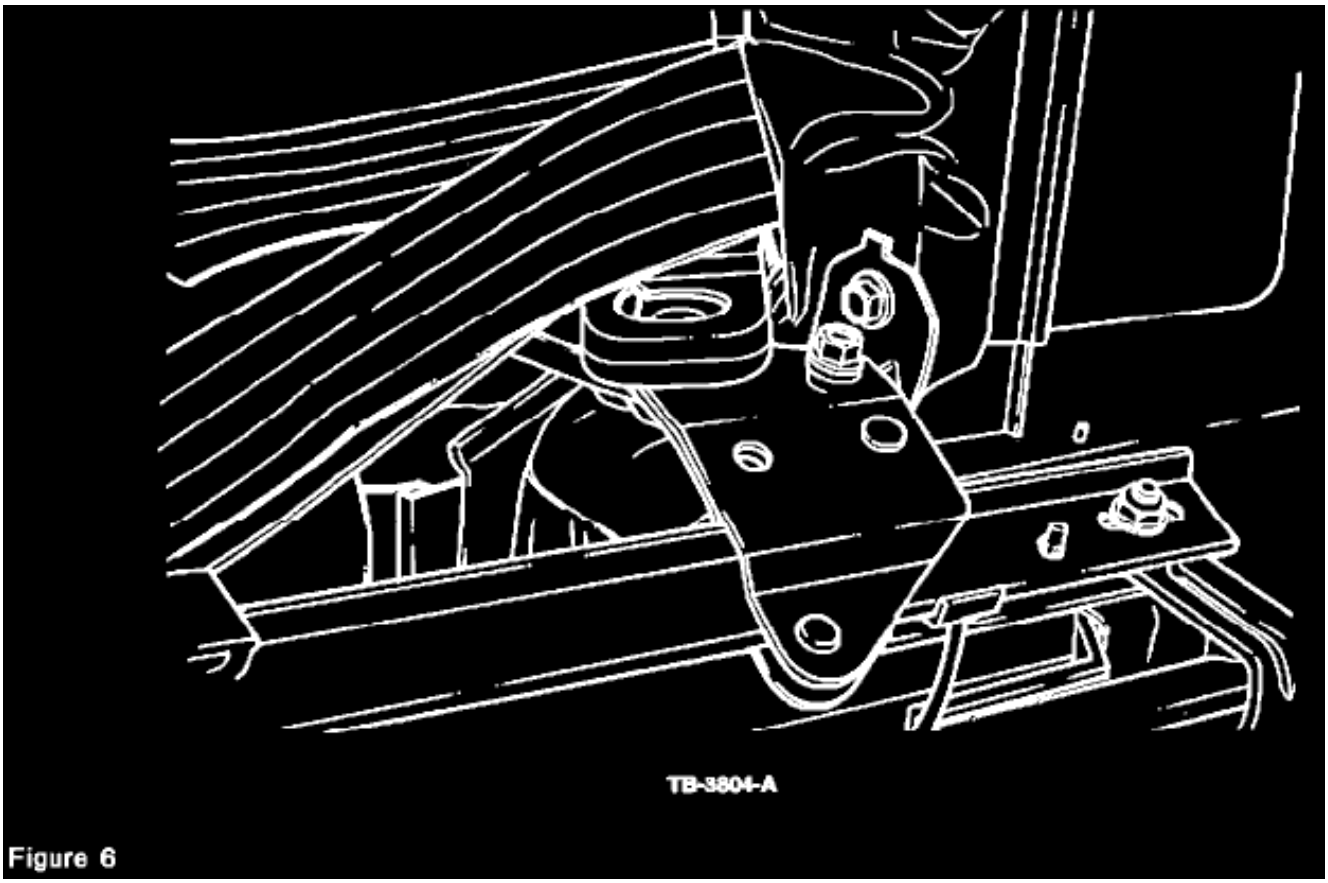

Figure 6

4. Secure the bolt required to retain the collar of the slide bar to the seat cushion seat belt buckle bracket as shown in Figures 5 and 6; torque to 8-11 N-m (6-8 lb.ft.).

5. Loosely install the nut required to retain the front end of the slide bar to the seat belt buckle support bracket located on the front of the seat track assembly.

NOTE:

THE SLIDE BAR MUST ABLE TO MOVE EASILY FORWARD AND REARWARD PRIOR TO INSTALLATION OF THE SEAT INTO THE VEHICLE.

6. Position the seat assembly into the vehicle.

7. Install the bolts needed to retain the seat track to the floor and torque the front retaining bolts to 12-23 N-m (9-17 lb.ft.).

a. Torque the rear seat track attaching bolts to 19-26 N-m (14-19 lb.ft.).

8. Position the anchor of the center seat belt assembly on the end of the slide bar.

9. Position the slide bar boot over both the anchor of the seat belt and the end of the slide bar.

10. Align the rear attaching hole in slide bar assembly with the attaching hole in the floor.

NOTE:

BE SURE THE RUBBER SPACER IS IN PLACE BETWEEN THE SLIDE BAR AND THE FLOOR ATTACHMENT.

11. Position the Torx head bolt through the boot, seat belt anchor, end of slide bar, rubber spacer and into the weld nut in the floor.

12. Pull the slide bar against the head of the shoulder bolt.

NOTE:

IF THE SLIDE BAR IS NOT HELD AGAINST THE BOLT HEAD, IT MAY BE POSSIBLE FOR THE SHOULDER OF THE BOLT TO BOTTOM OUT ON THE SLIDE BAR RESULTING THE SLIDE BAR NOT BEING IN REQUIRED ALIGNMENT.

13. Torque the bolt to 30-40 N-m (22-29 lb.ft.).

14. Install the boot plug.

15. Install the electrical connector for the lumbar support, if so equipped.

16. Connect the connector for the seat belt buckle switch.

17. Install the seat track covers on the seat tracks.

18. Move the seat rearward and forward at least ten (10) times to verify concern has been resolved.

OASIS CODES: 101000

Antenna Cable: Customer Interest Radio - Poor AM Reception

Article No. 93-2-5

01/18/93

RADIO - POOR AM RECEPTION CAUSED BY POOR ANTENNA CONNECTIONS

FORD: 1990 CROWN VICTORIA

LINCOLN-MERCURY: 1990 GRAND MARQUIS

LIGHT TRUCK: 1989-90 BRONCO II 1989-92 RANGER 1991-92 EXPLORER

ISSUE: Poor AM radio reception, such as fading or static, may be caused by poor antenna connections.

ACTION: Perform the following diagnostic and repair procedures. If necessary, replace the antenna and antenna cable as required.

VERIFICATION

In some cases, a customer's concern may be caused by normal radio operating conditions. This is especially true if the customer complains of static in certain locations or while tuned to certain stations.

Obtain as much information from the customer as possible regarding the audio system's performance. The following descriptions will then help the technician and the customer decide whether the radio system concerns are caused by a defective audio system or are the results of normal operating conditions.

FADING

AM fade will occur under viaducts and in urban areas with tall buildings. Certain AM stations may lower their power in the evening which will cause poor reception at night.

STATIC

AM static may be caused by power lines, electric fences, neon signs, and thunderstorms. Static may become very noticeable if the AM station is weak or distant.

AM Signal Issue - Diagnostic Tips

First, it is important that you compare the reception performance of the complaint vehicle with the reception performance of other vehicles with known good reception. Use the same set of test stations in the same locations when you test the vehicle, in order to become accustomed to how the stations should sound and what external interference is to be expected. This should be done with the engine running and with the engine not running in the same location.

It is important to note that even with a perfect AM radio receiver and a perfect antenna, reception conditions are constantly varying. Interference from noise sources, both internal and external to the vehicle, are often erratic and unpredictable.

The most important tool used in diagnosing AM radio concern is a reliable weak AM signal source. A high-power AM Broadcast station one or two hundred miles away is ideal. The station should be clear so that you can understand what is being said with little or no difficulty.

It is important to note that there are other sources of noise, external to the vehicle, that can interfere with the signal you are trying to receive. These external noises should be either taken into account or avoided. For example, power lines, transformers or fluorescent lights can radiate noise in the AM broadcast band. It is best to test the concern vehicle in an area well clear of such noise sources.

Summary:

Select a set of test stations, especially the stations that may be the reason for the customer concern, and some which are over 100 miles away.

^ Note the reception performance of a known good vehicle in the desired locations. Note the presence of any local external noise sources (eg. power lines, etc.).

^ Compare the performance of the concern vehicle when receiving the test stations in the same locations.

DIAGNOSIS

If a vehicle's audio system has been verified to have an AM fading or static concern that is not found in a comparably equipped vehicle under similar conditions, perform the following diagnosis.

VISUAL INSPECTION

Poor AM radio reception may be caused by poor antenna cable connections at the various antenna cable connectors, and/or at the antenna base. Visually inspect all the connectors of the antenna system. This includes...

^ The antenna connector at the rear of the radio

^ The in-line antenna connector (if equipped)

^ The connector at the base of the antenna

^ The base of the antenna for signs of poor grounding (Some antenna bases "bite" into the underside of the fender for grounding. To ensure proper installation, refer to the appropriate Service Manual, Sections 35-10 or 15-02, depending on model year.)

^ The antenna for any loose screws or station nuts

^ Improper connections (repair if found and verify the effectiveness of repair).

CORROSION INSPECTION

Inspect all of the connectors of the antenna system. These include...

^ Connector at the rear of the radio

^ The in-line antenna connector (if equipped)

^ The connector at the base of the antenna

^ If there are signs of corrosion (severe discoloration, rust or white powder from the zinc die-cast bases) on any antenna components, repair the concern by replacing any antenna component where evidence of corrosion is found. Verify effectiveness of repair.

ELECTRICAL TESTS

Perform the following antenna conductivity/resistance diagnosis and testing procedures.

ANTENNA TEST # 1 - ALL ANTENNA TYPES

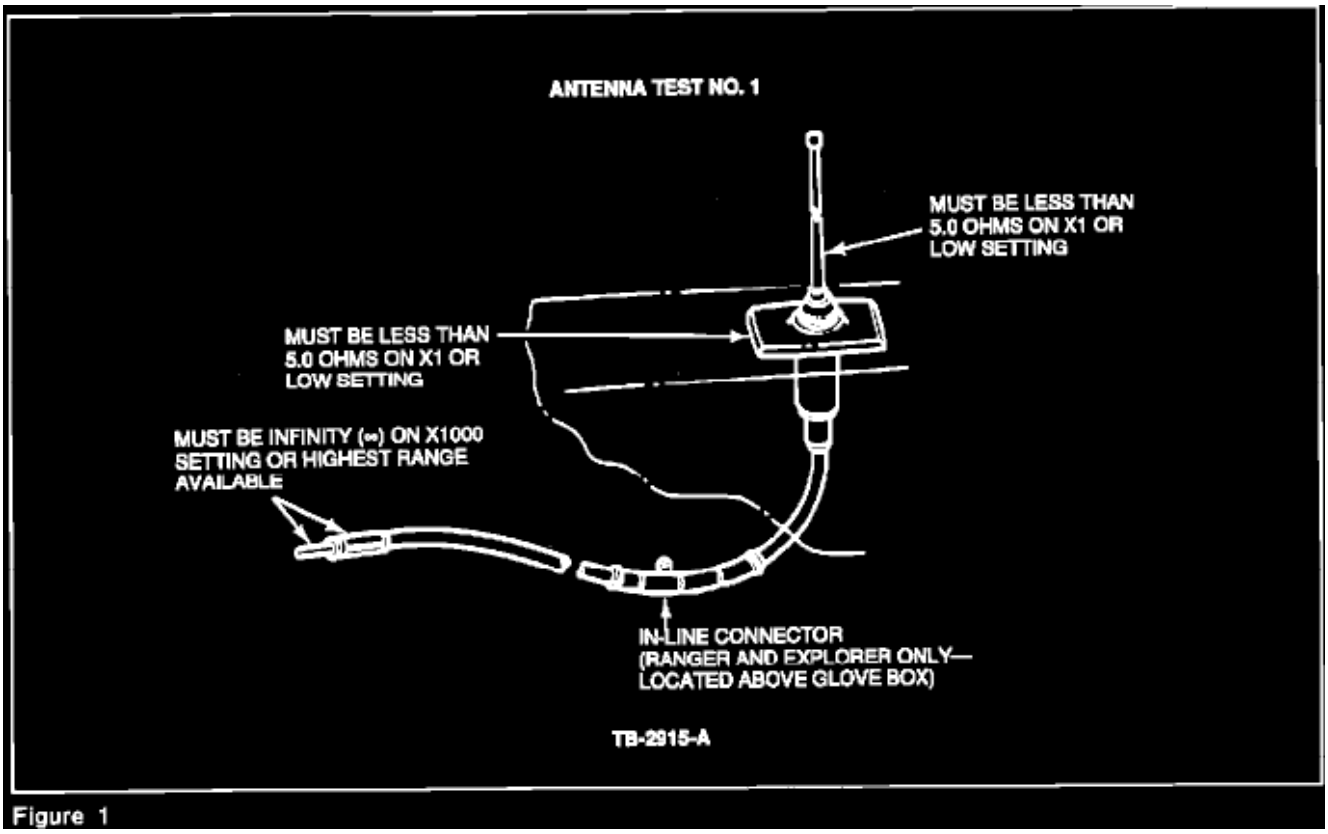

Figure 1

1. With the antenna installed on the vehicle and the cable unplugged from the radio, perform the following resistance tests with an ohmmeter. Probes must contact antenna at points specified by arrowheads in Figure 1.

2. If ohmmeter tests are satisfactory, the antenna is good.

3. If any ohmmeter is unsatisfactory, take the following action:

a. If it is a one-piece assembly, replace the complete antenna and cable assembly.

b. If it is a detachable cable and mast, perform Antenna Tests # 2 and # 3.

c. If it is a manual antenna with an extension cable, perform Antenna Test # 4.

ANTENNA TEST # 2 - ANTENNA EQUIPPED WITH DETACHABLE CABLE AND MAST

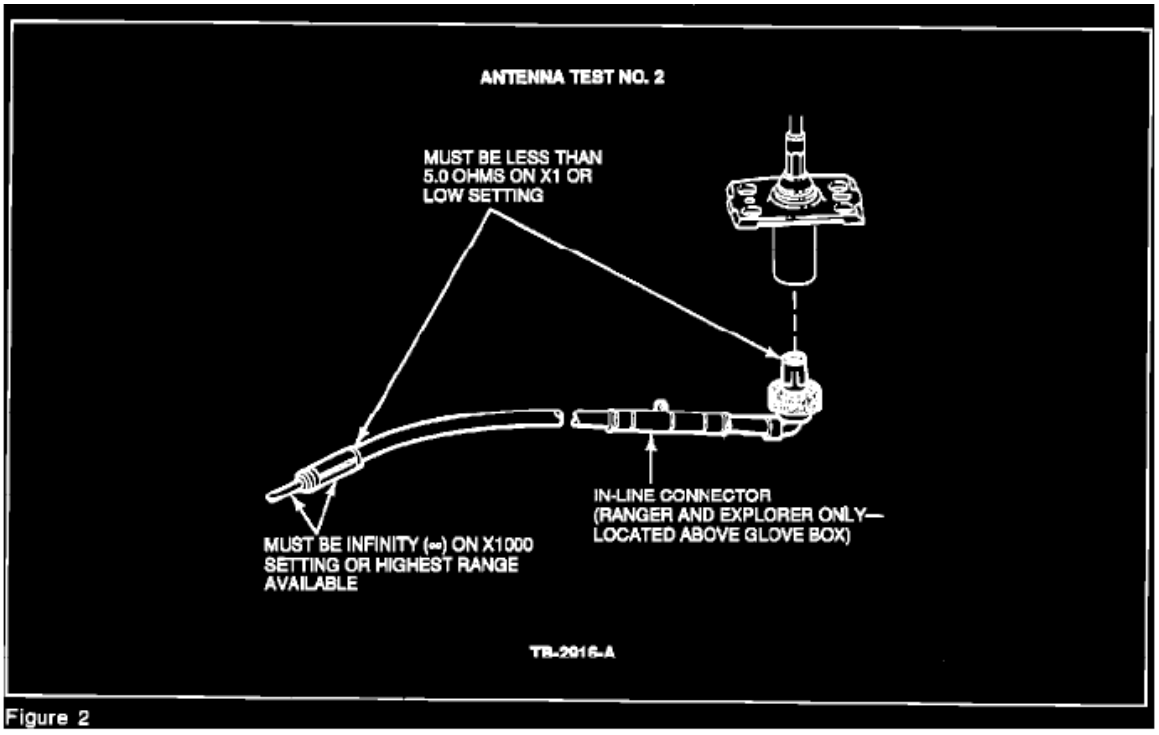

Figure 2

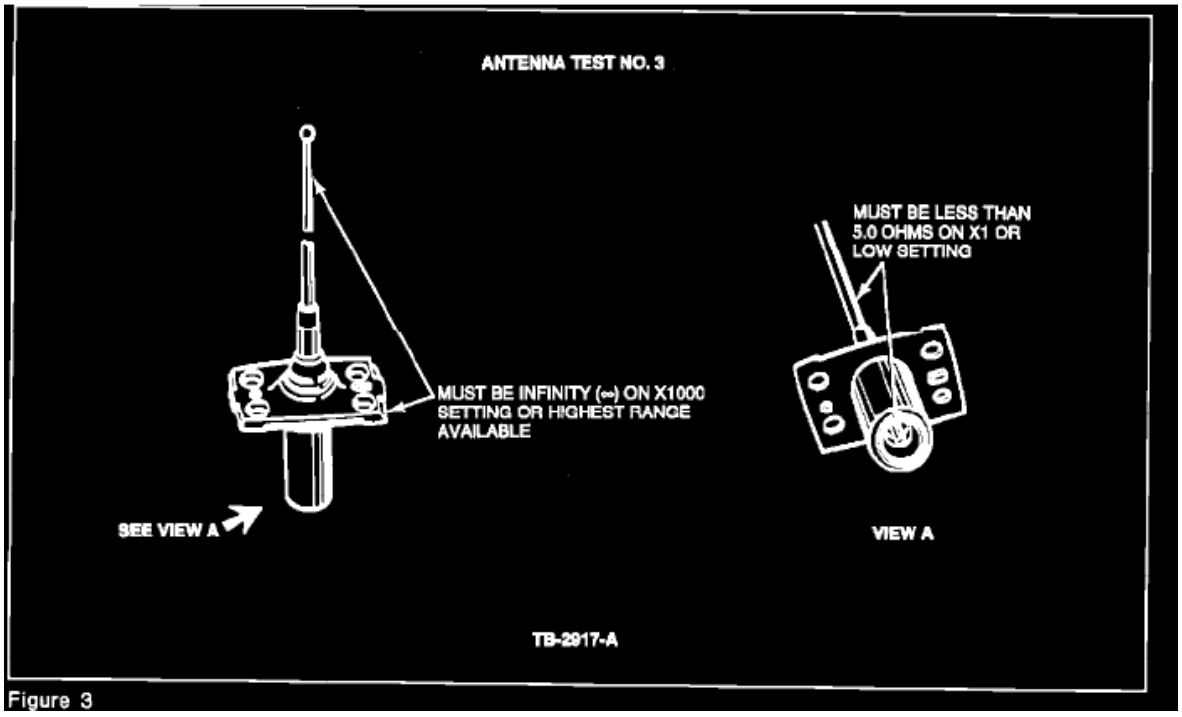

Figure 3

1. When the results in Antenna Test # 1 have been unsatisfactory, disconnect the antenna mast and base from the cable and perform the tests shown in Figure 2.

2. If ohmmeter readings are satisfactory, the antenna is good. Perform Antenna Test # 3.

3. If either of the readings are unsatisfactory, replace the cable.

ANTENNA TEST # 3 - ANTENNA MAST AND BASE

1. Perform the tests shown in Figure 3.

2. If ohmmeter readings are satisfactory, the antenna mast and base are good. Replace the cable.

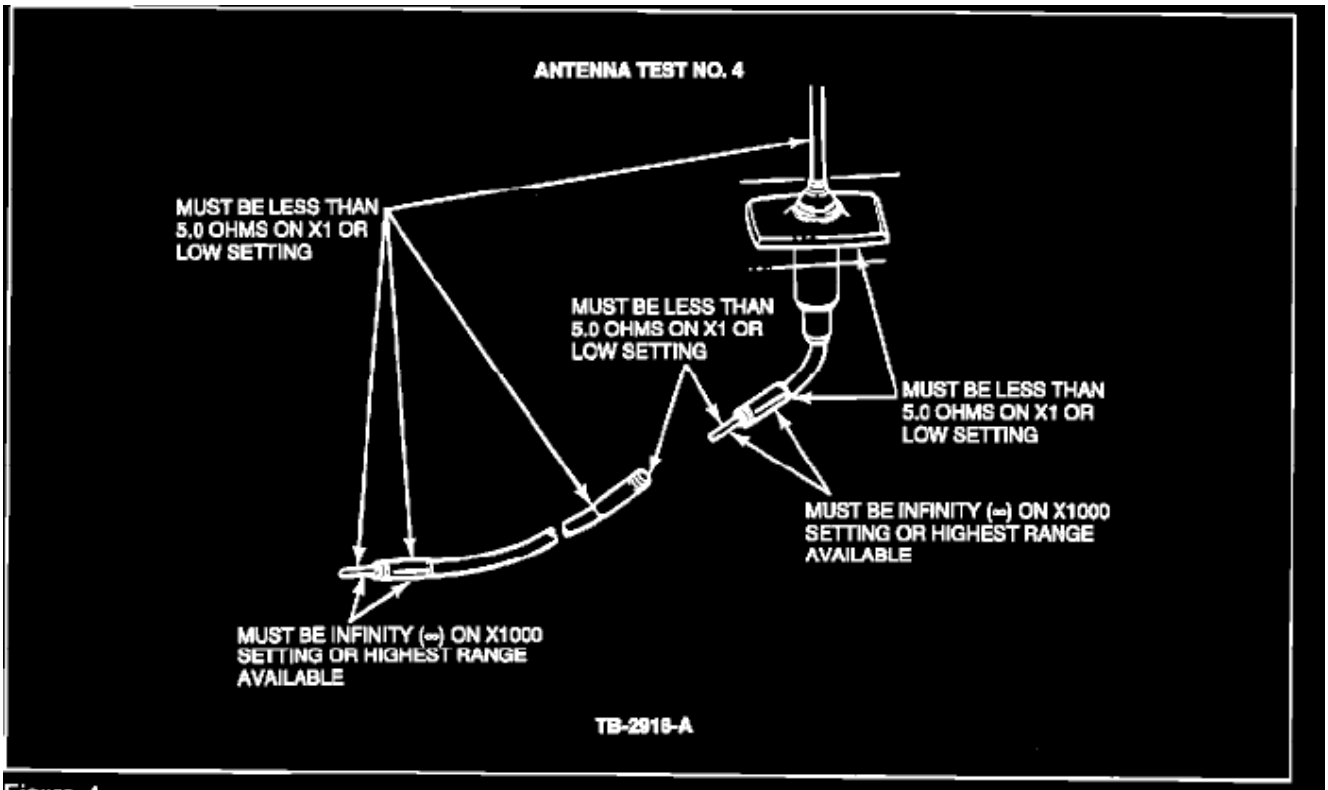

Figure 4

3. If either reading is unsatisfactory, replace only the base assembly. The mast should be good.

ANTENNA TEST # 4 - ANTENNA WITH EXTENSION CABLE

1. When the results in Antenna Test # 2 have been unsatisfactory, disconnect the extension cable from the main cable and perform the tests shown in Figure 4.

2. If ohmmeter readings are satisfactory, the extension cable and main antenna cable are good. Perform Antenna Test # 3.

3. If either reading on the extension cable is unsatisfactory, replace the extension cable.

4. If either reading on the main antenna cable is unsatisfactory, take the following action:

a. If it is a one-piece assembly, replace the complete antenna and main cable assembly.

b. If the main cable is detachable, perform Antenna Test # 2 and # 3.

Service as needed per the appropriate Service Manual, section 35-10 or 15-02. Verify the effectiveness of the repair.

IN-LINE CONNECTOR

If diagnosis and repair procedures above have not been effective, the in-line connector of the subject vehicles may be intermittent. Service it as outlined in the following repair procedure.

STATIC CONCERNS - ALL RANGER, BRONCO II AND EXPLORER VEHICLES

1. Remove the radio. Refer to the appropriate Service Manual, Sections 35-01 or 15-02, for removal procedure.

2. Disconnect the antenna cable at the in-line connector located above the glove box.

3. Unbolt the in-line connector from its mounting location above the glove box. A 7 mm straight/open ended wrench can be used.

4. Remove the instrument panel portion of the antenna cable. Detach the antenna cable from the two locators, one to the right of the radio opening and the other behind the center heat duct.

5. Remove the antenna base and lead-in cable. Refer to the appropriate Service Manual for the removal procedure.

6. Remove the instrument panel using the appropriate Service Manual procedure.

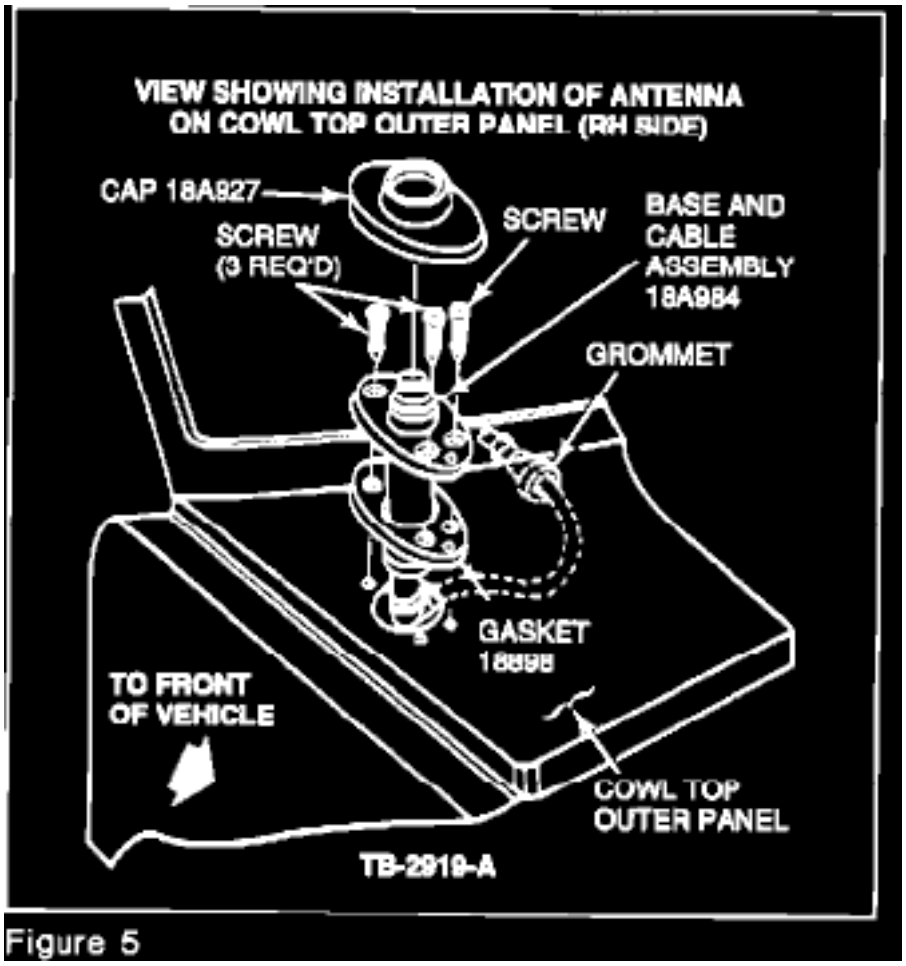

Figure 5

NOTE: THE HOLE WHERE THE ANTENNA PASSES THROUGH THE COWL IS JUST BELOW THE WINDSHIELD, ABOUT 4" (101.6 MM) FROM THE RIGHT SIDE. IT IS ONLY NECESSARY TO GAIN ACCESS TO THE HOLE, SO THE INSTRUMENT PANEL DOES NOT HAVE TO BE TOTALLY REMOVED FROM THE VEHICLE.

7. Replace the antenna cable with a one-piece cable provided in Service Kit (E3TZ-18813-B).

a. Route the new antenna cable through the fender and cowl hole.

b. Seat the grommet. See Figure 5 for details.

8. Route the new cable in the instrument panel along the same path as the original to the radio opening.

CAUTION: DO NOT POSITION THE CABLE USING THE RETAINERS INCLUDED WITH THE ANTENNA KIT AS SHOWN IN THE ACCOMPANYING INSTRUCTION SHEET IS-5082-B.

9. Reinstall the instrument panel.

10. Reinstall the radio.

11. Install the antenna base on the cowl top outer panel per service Manual.

NOTE: THE KIT INCLUDES A NEW MAST AND BASE COVER. USING THE NEW WHIP MAY CAUSE INCREASED WIND NOISE. THEREFORE, ITS USE IS NOT RECOMMENDED. THE BASE COVERS DIFFER ONLY IN COLOR, AND MAY BE INTERCHANGED IF THE CUSTOMER WISHES TO DO SO.

1990 CROWN VICTORIA/GRAND MARQUIS

1. Replace the existing antenna system with instrument panel cable (F1VY-18812-D).

2. Replace the antenna using the following components.

^ Power Antenna: F0AZ-18850-A

^ Fixed Antenna: F0AZ-18A984-A

3. Use the replace procedure outlined in the 1990 Crown Victoria/Grand Marquis Service Manual, Sections 35-10 or 15-02.

RADIO - POOR AM RECEPTION CAUSED BY POOR ANTENNA CONNECTIONS

FORD: 1990 CROWN VICTORIA

LINCOLN-MERCURY: 1990 GRAND MARQUIS

LIGHT TRUCK: 1989-90 BRONCO II 1989-92 RANGER 1991-92 EXPLORER

ISSUE: Poor AM radio reception, such as fading or static, may be caused by poor antenna connections.

ACTION: Perform the following diagnostic and repair procedures. If necessary, replace the antenna and antenna cable as required.

VERIFICATION

In some cases, a customer's concern may be caused by normal radio operating conditions. This is especially true if the customer complains of static in certain locations or while tuned to certain stations.

Obtain as much information from the customer as possible regarding the audio system's performance. The following descriptions will then help the technician and the customer decide whether the radio system concerns are caused by a defective audio system or are the results of normal operating conditions.

FADING

AM fade will occur under viaducts and in urban areas with tall buildings. Certain AM stations may lower their power in the evening which will cause poor reception at night.

STATIC

AM static may be caused by power lines, electric fences, neon signs, and thunderstorms. Static may become very noticeable if the AM station is weak or distant.

AM Signal Issue - Diagnostic Tips

First, it is important that you compare the reception performance of the complaint vehicle with the reception performance of other vehicles with known good reception. Use the same set of test stations in the same locations when you test the vehicle, in order to become accustomed to how the stations should sound and what external interference is to be expected. This should be done with the engine running and with the engine not running in the same location.

It is important to note that even with a perfect AM radio receiver and a perfect antenna, reception conditions are constantly varying. Interference from noise sources, both internal and external to the vehicle, are often erratic and unpredictable.

The most important tool used in diagnosing AM radio concern is a reliable weak AM signal source. A high-power AM Broadcast station one or two hundred miles away is ideal. The station should be clear so that you can understand what is being said with little or no difficulty.

It is important to note that there are other sources of noise, external to the vehicle, that can interfere with the signal you are trying to receive. These external noises should be either taken into account or avoided. For example, power lines, transformers or fluorescent lights can radiate noise in the AM broadcast band. It is best to test the concern vehicle in an area well clear of such noise sources.

Summary:

Select a set of test stations, especially the stations that may be the reason for the customer concern, and some which are over 100 miles away.

^ Note the reception performance of a known good vehicle in the desired locations. Note the presence of any local external noise sources (eg. power lines, etc.).

^ Compare the performance of the concern vehicle when receiving the test stations in the same locations.

DIAGNOSIS

If a vehicle's audio system has been verified to have an AM fading or static concern that is not found in a comparably equipped vehicle under similar conditions, perform the following diagnosis.

VISUAL INSPECTION

Poor AM radio reception may be caused by poor antenna cable connections at the various antenna cable connectors, and/or at the antenna base. Visually inspect all the connectors of the antenna system. This includes...

^ The antenna connector at the rear of the radio

^ The in-line antenna connector (if equipped)

^ The connector at the base of the antenna

^ The base of the antenna for signs of poor grounding (Some antenna bases "bite" into the underside of the fender for grounding. To ensure proper installation, refer to the appropriate Service Manual, Sections 35-10 or 15-02, depending on model year.)

^ The antenna for any loose screws or station nuts

^ Improper connections (repair if found and verify the effectiveness of repair).

CORROSION INSPECTION

Inspect all of the connectors of the antenna system. These include...

^ Connector at the rear of the radio

^ The in-line antenna connector (if equipped)

^ The connector at the base of the antenna

^ If there are signs of corrosion (severe discoloration, rust or white powder from the zinc die-cast bases) on any antenna components, repair the concern by replacing any antenna component where evidence of corrosion is found. Verify effectiveness of repair.

ELECTRICAL TESTS

Perform the following antenna conductivity/resistance diagnosis and testing procedures.

ANTENNA TEST # 1 - ALL ANTENNA TYPES

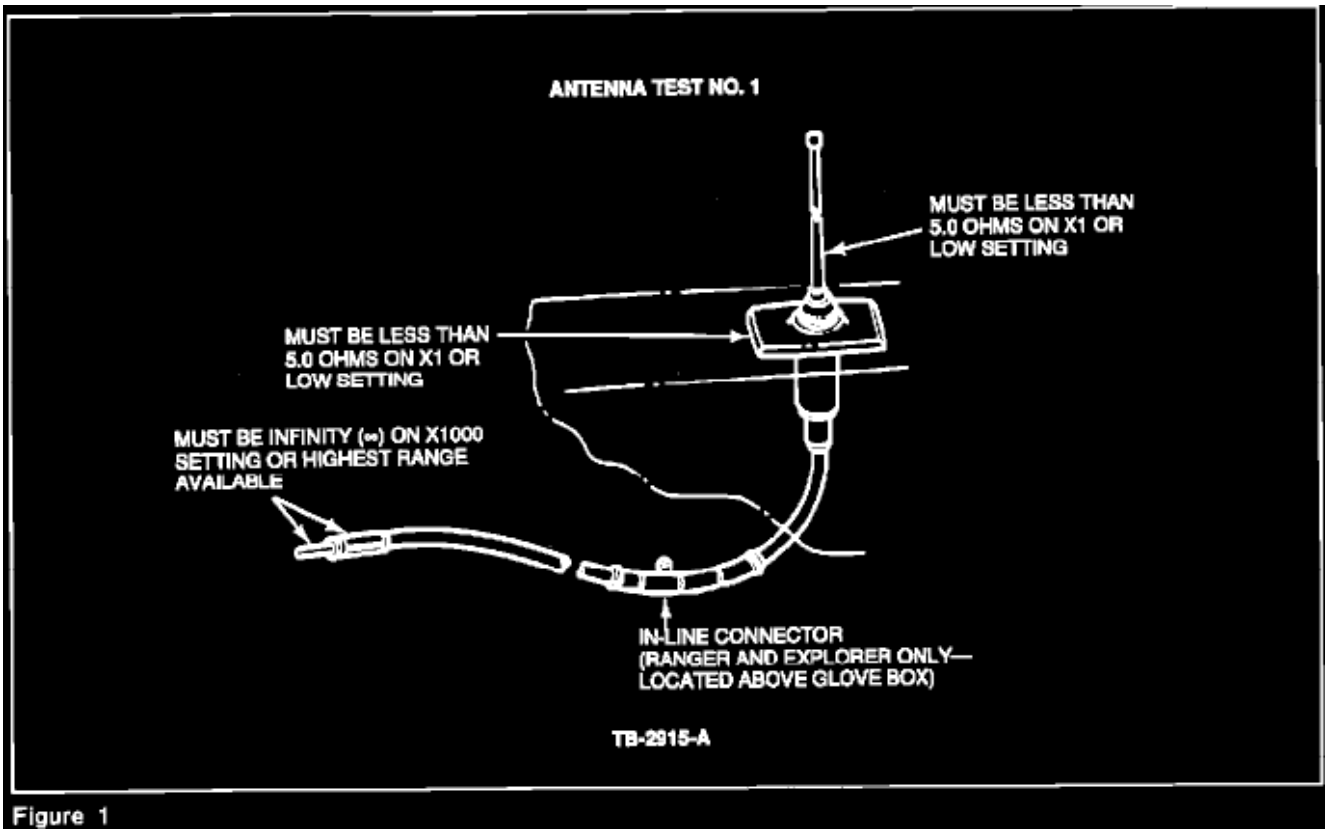

Figure 1

1. With the antenna installed on the vehicle and the cable unplugged from the radio, perform the following resistance tests with an ohmmeter. Probes must contact antenna at points specified by arrowheads in Figure 1.

2. If ohmmeter tests are satisfactory, the antenna is good.

3. If any ohmmeter is unsatisfactory, take the following action:

a. If it is a one-piece assembly, replace the complete antenna and cable assembly.

b. If it is a detachable cable and mast, perform Antenna Tests # 2 and # 3.

c. If it is a manual antenna with an extension cable, perform Antenna Test # 4.

ANTENNA TEST # 2 - ANTENNA EQUIPPED WITH DETACHABLE CABLE AND MAST

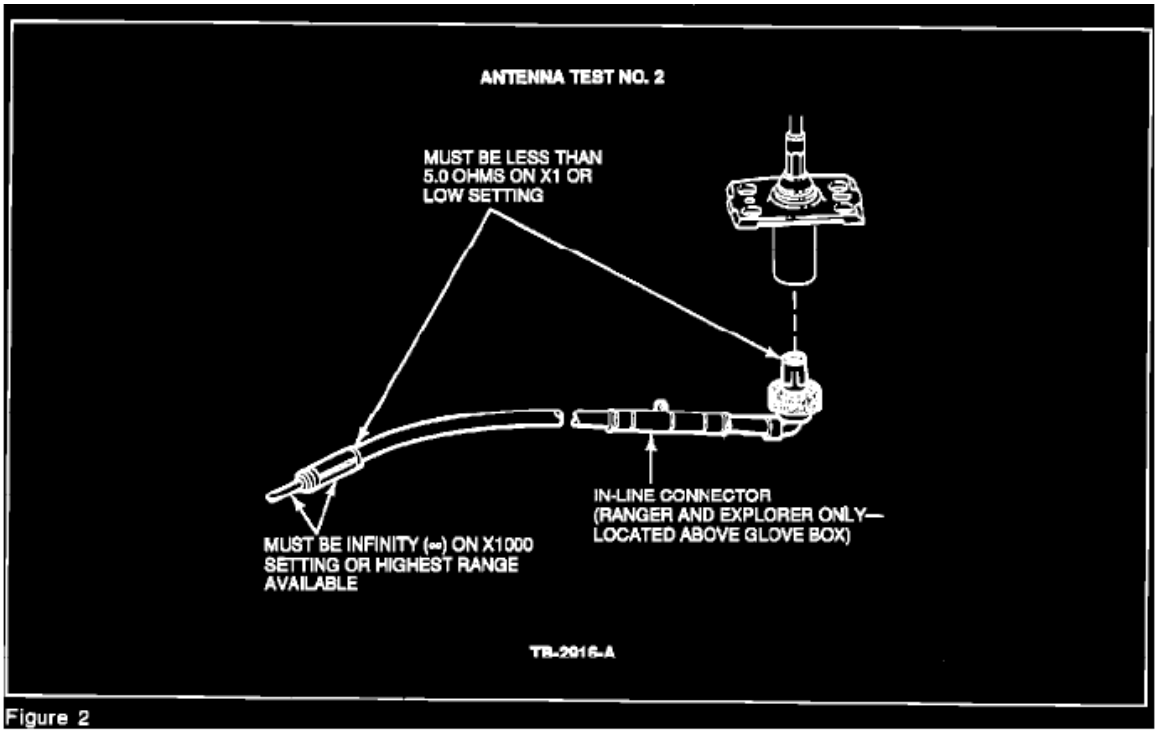

Figure 2

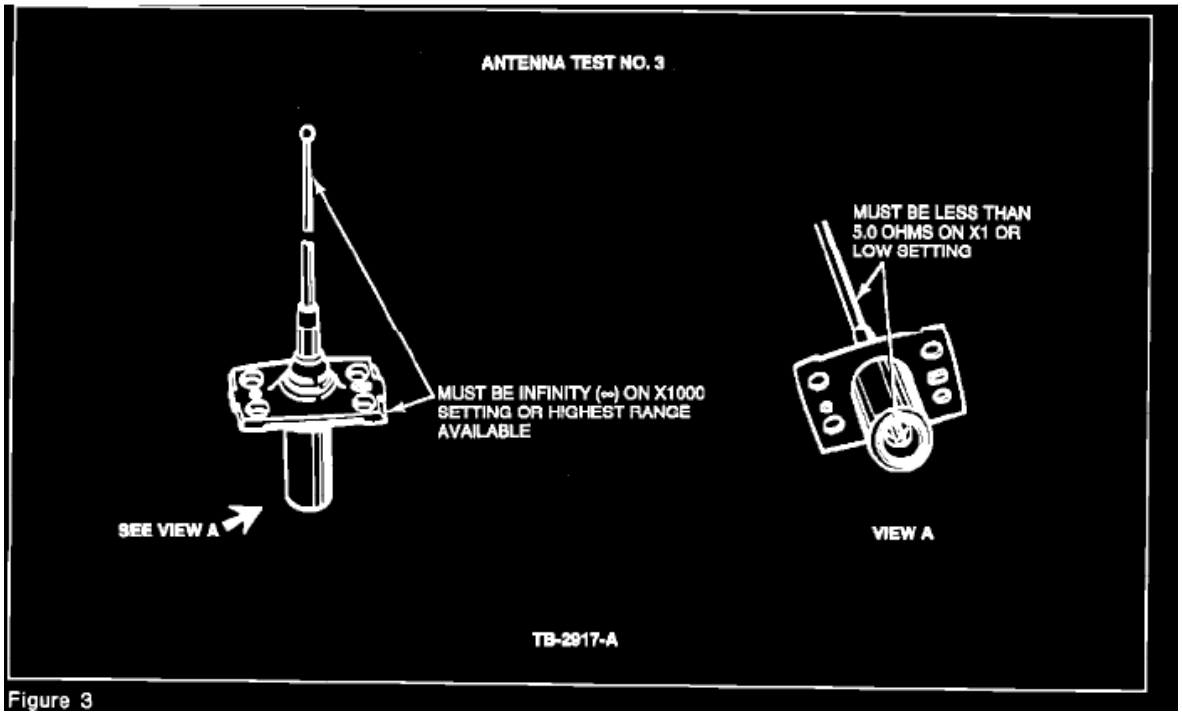

Figure 3

1. When the results in Antenna Test # 1 have been unsatisfactory, disconnect the antenna mast and base from the cable and perform the tests shown in Figure 2.

2. If ohmmeter readings are satisfactory, the antenna is good. Perform Antenna Test # 3.

3. If either of the readings are unsatisfactory, replace the cable.

ANTENNA TEST # 3 - ANTENNA MAST AND BASE

1. Perform the tests shown in Figure 3.

2. If ohmmeter readings are satisfactory, the antenna mast and base are good. Replace the cable.

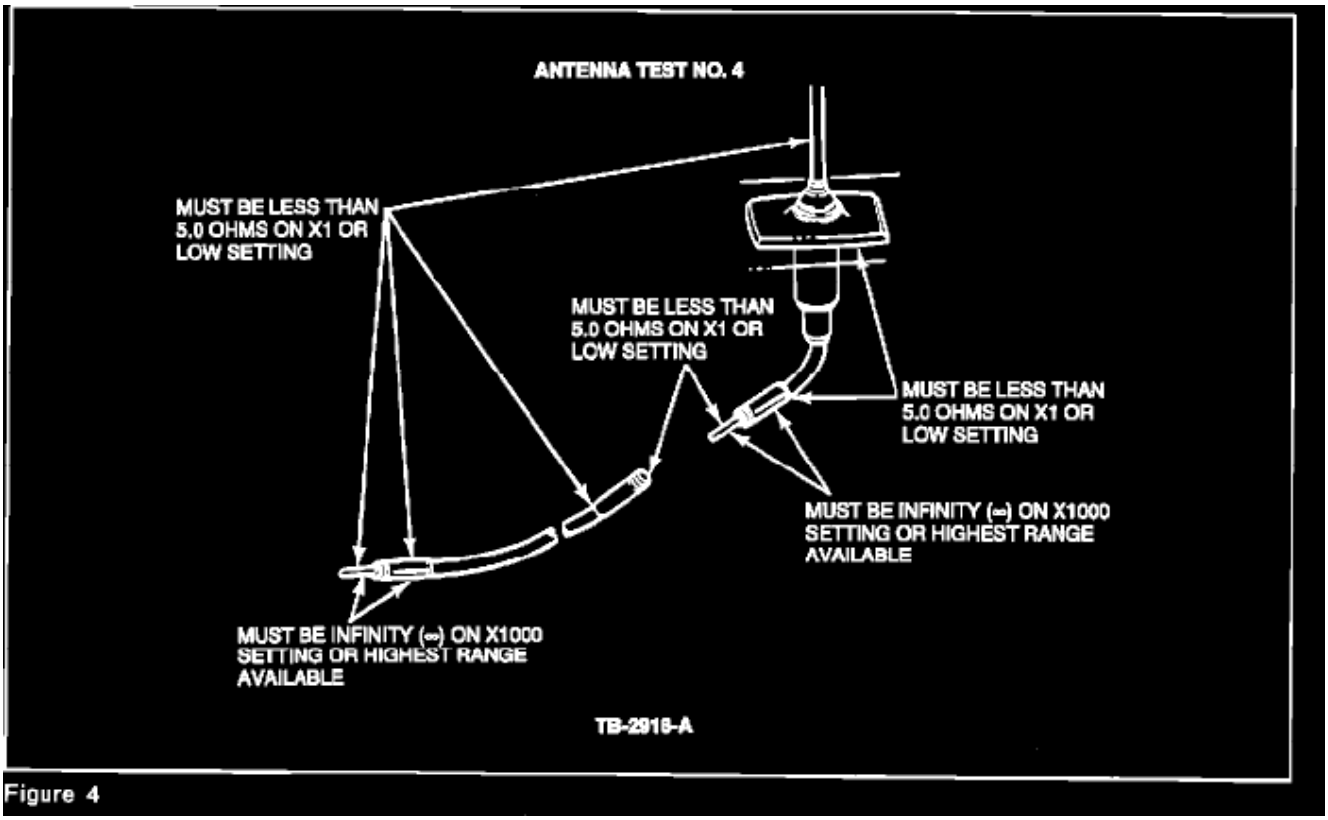

Figure 4

3. If either reading is unsatisfactory, replace only the base assembly. The mast should be good.

ANTENNA TEST # 4 - ANTENNA WITH EXTENSION CABLE

1. When the results in Antenna Test # 2 have been unsatisfactory, disconnect the extension cable from the main cable and perform the tests shown in Figure 4.

2. If ohmmeter readings are satisfactory, the extension cable and main antenna cable are good. Perform Antenna Test # 3.

3. If either reading on the extension cable is unsatisfactory, replace the extension cable.

4. If either reading on the main antenna cable is unsatisfactory, take the following action:

a. If it is a one-piece assembly, replace the complete antenna and main cable assembly.

b. If the main cable is detachable, perform Antenna Test # 2 and # 3.

Service as needed per the appropriate Service Manual, section 35-10 or 15-02. Verify the effectiveness of the repair.

IN-LINE CONNECTOR

If diagnosis and repair procedures above have not been effective, the in-line connector of the subject vehicles may be intermittent. Service it as outlined in the following repair procedure.

STATIC CONCERNS - ALL RANGER, BRONCO II AND EXPLORER VEHICLES

1. Remove the radio. Refer to the appropriate Service Manual, Sections 35-01 or 15-02, for removal procedure.

2. Disconnect the antenna cable at the in-line connector located above the glove box.

3. Unbolt the in-line connector from its mounting location above the glove box. A 7 mm straight/open ended wrench can be used.

4. Remove the instrument panel portion of the antenna cable. Detach the antenna cable from the two locators, one to the right of the radio opening and the other behind the center heat duct.

5. Remove the antenna base and lead-in cable. Refer to the appropriate Service Manual for the removal procedure.

6. Remove the instrument panel using the appropriate Service Manual procedure.

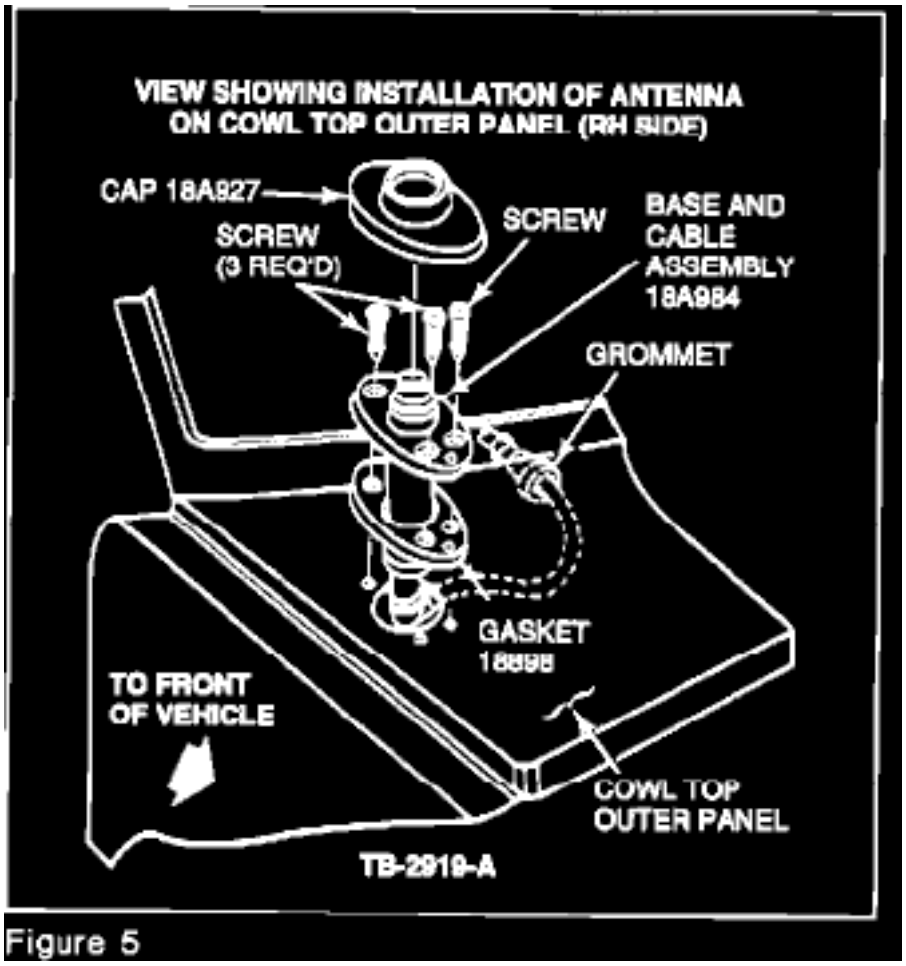

Figure 5

NOTE: THE HOLE WHERE THE ANTENNA PASSES THROUGH THE COWL IS JUST BELOW THE WINDSHIELD, ABOUT 4" (101.6 MM) FROM THE RIGHT SIDE. IT IS ONLY NECESSARY TO GAIN ACCESS TO THE HOLE, SO THE INSTRUMENT PANEL DOES NOT HAVE TO BE TOTALLY REMOVED FROM THE VEHICLE.

7. Replace the antenna cable with a one-piece cable provided in Service Kit (E3TZ-18813-B).

a. Route the new antenna cable through the fender and cowl hole.

b. Seat the grommet. See Figure 5 for details.

8. Route the new cable in the instrument panel along the same path as the original to the radio opening.

CAUTION: DO NOT POSITION THE CABLE USING THE RETAINERS INCLUDED WITH THE ANTENNA KIT AS SHOWN IN THE ACCOMPANYING INSTRUCTION SHEET IS-5082-B.

9. Reinstall the instrument panel.

10. Reinstall the radio.

11. Install the antenna base on the cowl top outer panel per service Manual.

NOTE: THE KIT INCLUDES A NEW MAST AND BASE COVER. USING THE NEW WHIP MAY CAUSE INCREASED WIND NOISE. THEREFORE, ITS USE IS NOT RECOMMENDED. THE BASE COVERS DIFFER ONLY IN COLOR, AND MAY BE INTERCHANGED IF THE CUSTOMER WISHES TO DO SO.

1990 CROWN VICTORIA/GRAND MARQUIS

1. Replace the existing antenna system with instrument panel cable (F1VY-18812-D).

2. Replace the antenna using the following components.

^ Power Antenna: F0AZ-18850-A

^ Fixed Antenna: F0AZ-18A984-A

3. Use the replace procedure outlined in the 1990 Crown Victoria/Grand Marquis Service Manual, Sections 35-10 or 15-02.

Wire Color Code Identification

NOTE: Whenever a wire is labeled with two colors; the first color listed is the basic color of the wire, and the second color is the tracer marking of the wire. If the second color is followed by by a D, the tracer is dots. If the second color is followed by an H, the tracer is hash marks.

For example: BR/O is a brown wire with an orange stripe, R/Y D is a red wire with yellow dots and BK/W H is a black wire with white hash marks.

This TSB article is being republished in its entirety to update the model year vehicles.

ISSUE

A "whining"/"buzzing" noise in the speakers of the entertainment radio or two-way radio on vehicles with an in-tank electric fuel pump may be caused by electrical noise from the fuel pump.

ACTION

Install an electronic noise Radio Frequency Interference (RFI) Filter (F1PZ-18B925-A) on the fuel pump inside the fuel tank. Refer to the following Test Procedure to confirm that the concern exists,

then refer to the Service Procedure for repair details.

NOTE

SOME LIGHT TRUCKS REQUIRE ONE (1) RFI FILTER FOR EACH IN-TANK ELECTRIC FUEL PUMP ON MULTI-TANK VEHICLES.

NOTE

THIS TSB DOES NOT INCLUDE TAURUS FLEXIBLE FUEL VEHICLES (FFVS) OR 1999 RANGER 3.0L FFVS.

TEST PROCEDURE

Fuel pump radio noise is relatively constant and changes only slightly with vehicle speed. If the frequency of the noise varies or the noise comes and goes with the vehicle speed, then it is not the fuel pump and this fix will not be effective. The following procedure will help determine if the fuel pump is the cause of the radio noise:

1. Turn on the radio before the key is turned on (assuming the radio will operate without the ignition key - you may need to put the ignition key in the Accessory position).

2. Turn the ignition key to the Run position (do not start the engine).

3. The fuel pump should run for about 1 second with the key in the Run position with the engine not running. Listen for noise in the radio. If noise is present while the pump is running and stops when the pump stops, then the noise is being generated by the pump and this procedure should help.

SERVICE PROCEDURE

1. Remove the fuel pump sender assembly from the fuel tank. Refer to the appropriate model year Workshop Manual for removal procedure.

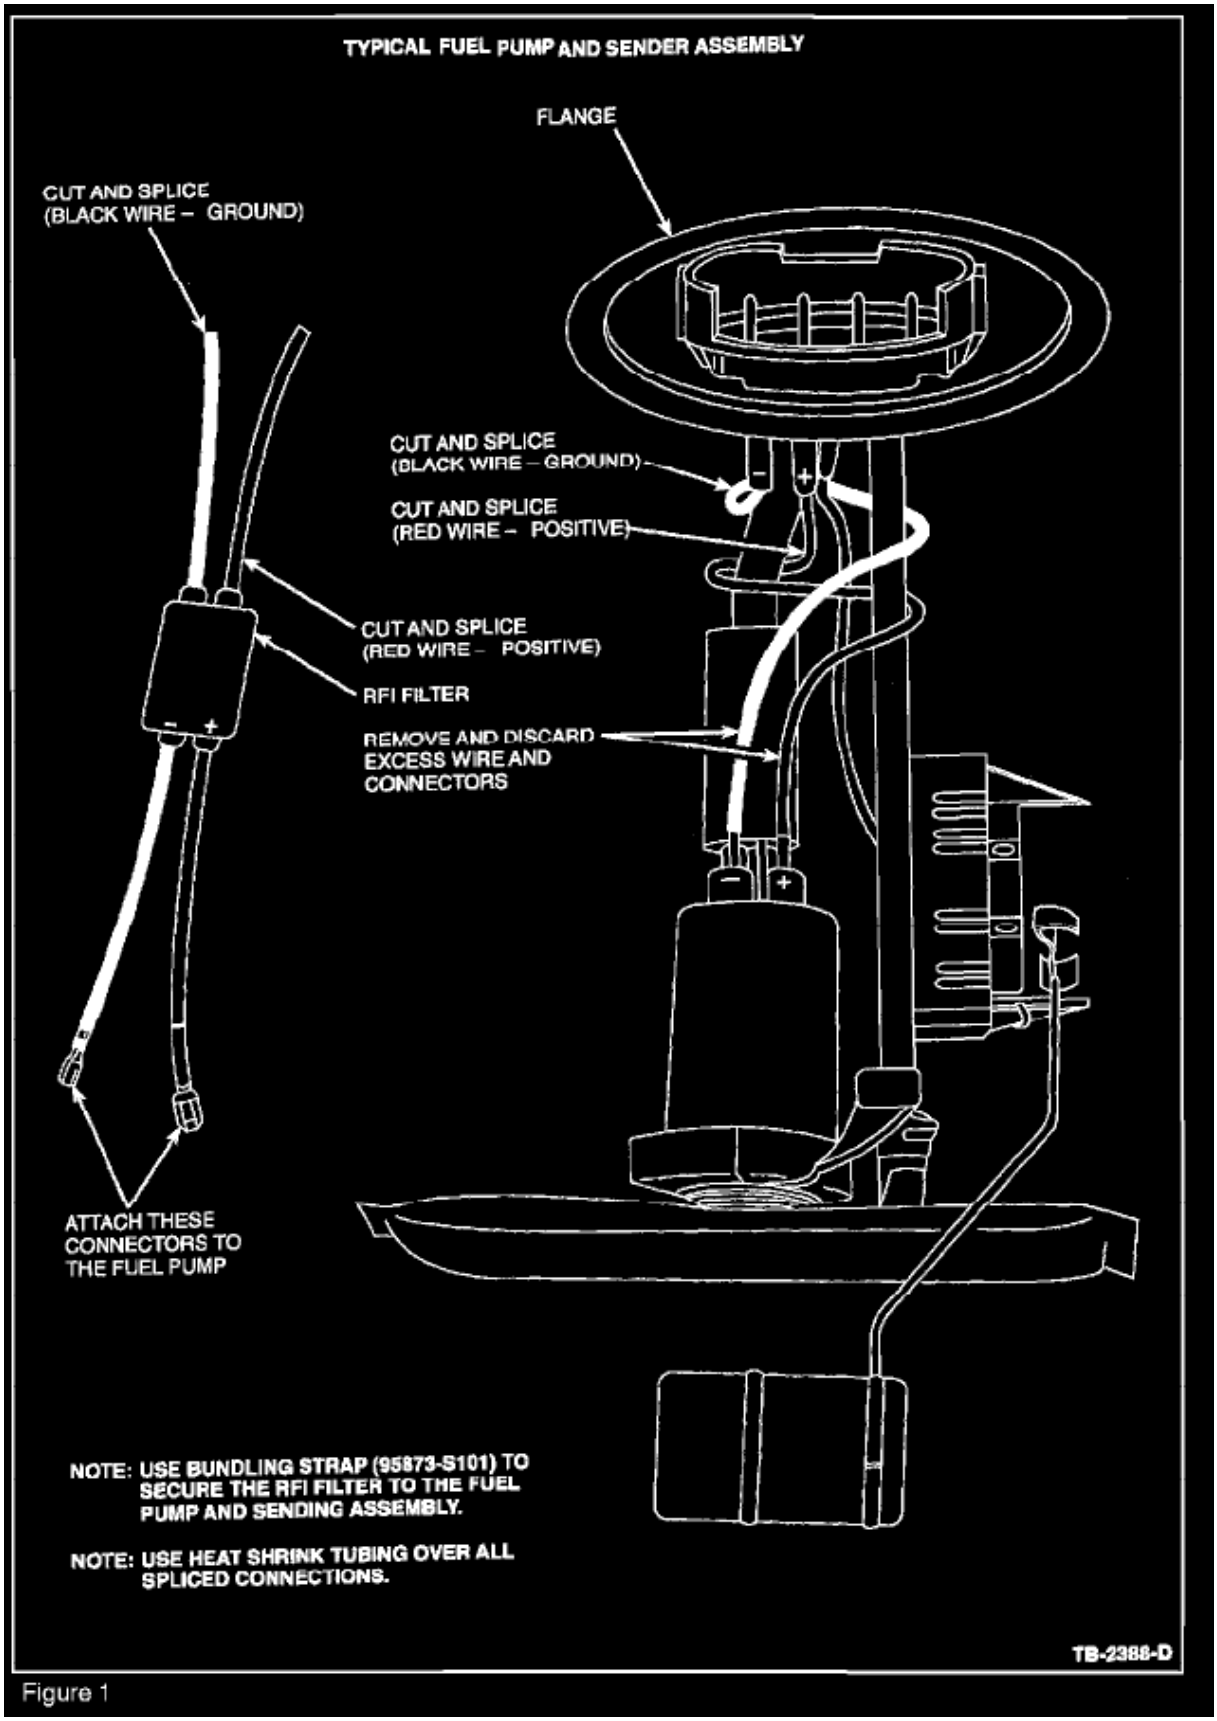

Figure 1

2. On vehicles without a fuel delivery module, remove the negative and positive connectors from the fuel pump, Figure 1.

a. Cut the wires to the fuel pump 76 mm (3") from the flange of the fuel pump and discard the wires.

b. Connect the RFI filter connectors to the spade terminal on the fuel pump.

c. Cut and solder both the red and black wires of the RFI filter to the red and black wires of the flange. Use Heat Shrink Tubing (F5AZ-14A099-M) over the solder connections.

NOTE

HEAT SHRINK TUBING MUST BE USED OVER ALL SOLDERED CONNECTIONS MADE PRIOR TO THIS TSB. USE SUFFICIENT

TUBING (ABOUT 50 mm (2",)) OF THE SPECIFIED TYPE TO ENTIRELY COVER EACH SOLDERED CONNECTION AND SHRINK APPROPRIATELY TO PREVENT EXPOSURE OF

THE CONNECTIONS.

NOTE

FOR SOME VEHICLES WITH EXTREMELY LONG FUEL PUMP GROUND WIRE CIRCUITS, IT MAY BE NECESSARY TO SHORTEN THE GROUND WIRE TO A POINT CLOSE TO THE FUEL TANK. IF THE GROUND IS MOVED, BE SURE IT IS SECURE AND PROTECTED FROM CORROSION SINCE IT IS THE OPERATING GROUND FOR THE PUMP. CHECK SERVICE LITERATURE (EVTM, ETC.) FOR GROUND LOCATIONS.

WARNING

ALL SOLDERING AND HEAT SHRINKING MUST BE COMPLETED AWAY FROM THE FUEL TANK AREA. USE A SOLDERING IRON ONLY FOR SOLDERING AND HEAT GUN ONLY FOR APPLYING SHRINK TUBING.

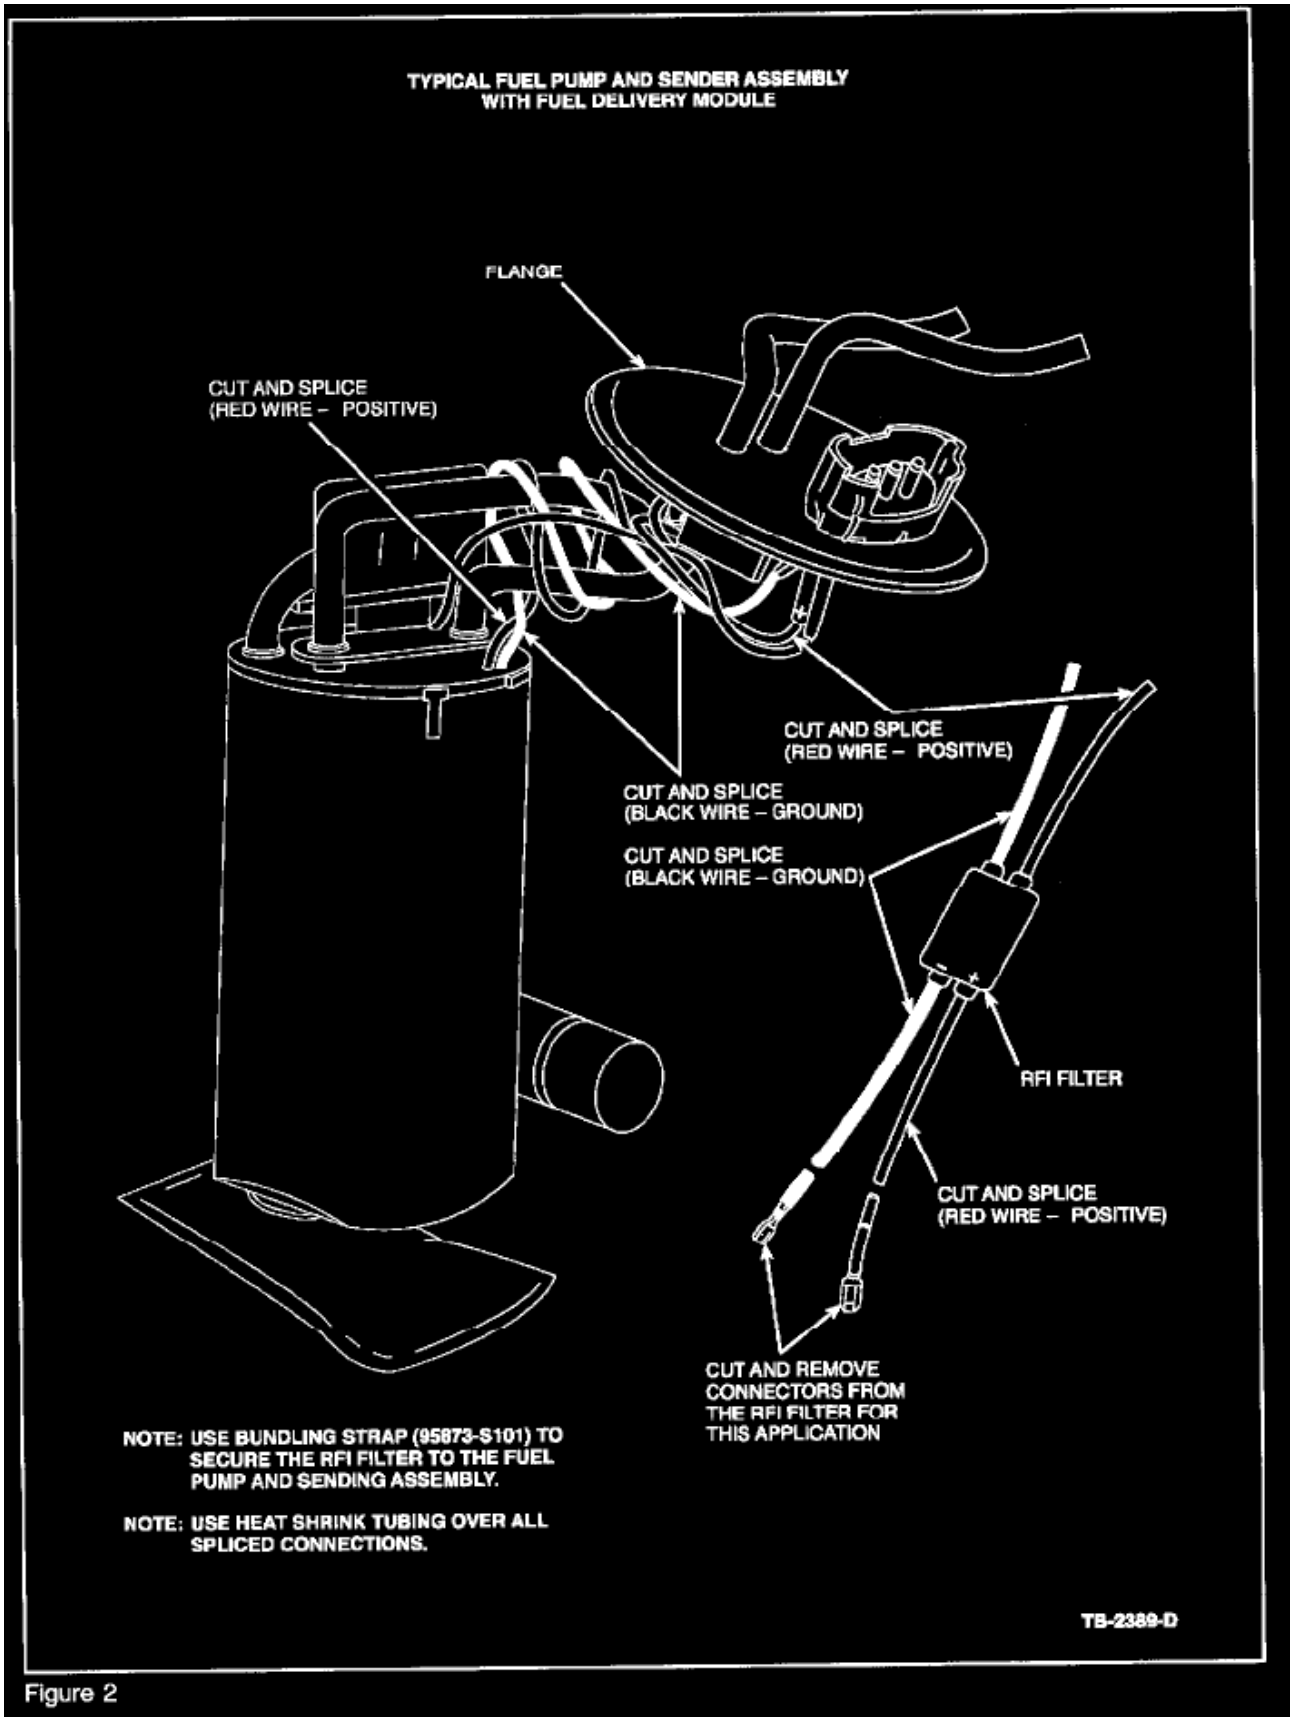

Figure 2

3. On light trucks and compact trucks with a fuel delivery module, cut the fuel pump wires to the fuel delivery module 50 mm (2") from the flange and discard the wires, Figure 2.

a. Cut the connectors from the RFI filter and solder wires to the fuel delivery module (red to red and black to black). Use heat shrink tubing over soldering connections.

b. Solder wires from the RFI filter to the flange wires (red to red and black to black). Use heat shrink tubing over soldered connections.

NOTE:

PART NUMBER	PART NAME
F1PZ-18B925-A	Radio Frequency Interference (RFI) Filter
95873-S101	Bundling Strap
F5AZ-14A099-AA	Heat Shrink Tubing

010703AA	Diagnose And Install RFI Filter (1990-1995 Thunderbird Super Coupe)	2.1 Hrs.
010703AB	Diagnose And Install RFI Filter (1991-1993 Thunderbird/Cougar 5.0L HO)	2.1 Hrs.
010703AC	Diagnose And Install RFI Filter (1994-1997 Thunderbird/Cougar 4.6L MFI)	2.1 Hrs.
010703AD	Diagnose And Install RFI Filter (1990-1997 Thunderbird/Cougar 3.8L)	1.9 Hrs.
010703BA	Diagnose And Install RFI Filter (1990-1995 Taurus/Sable)	1.4 Hrs.
010703BB	Diagnose And Install RFI Filter (1996-1999 Taurus/Sable)	1.4 Hrs.
010703BC	Diagnose And Install RFI Filter (2001 Taurus/Sable)	1.4 Hrs.
010703CA	Diagnose And Install RFI Filter (1992-1997 Crown Victoria/Grand Marquis, Town Car)	1.2 Hrs.

HEAT SHRINK TUBING MUST BE USED OVER ALL SOLDERED CONNECTIONS MADE PRIOR TO THIS TSB. USE SUFFICIENT TUBING (ABOUT 50 mm (2")) OF THE SPECIFIED TYPE TO ENTIRELY COVER EACH SOLDERED CONNECTION AND SHRINK APPROPRIATELY TO PREVENT EXPOSURE OF THE CONNECTIONS.

NOTE:

FOR SOME VEHICLES WITH EXTREMELY LONG FUEL PUMP GROUND WIRE CIRCUITS, IT MAY BE NECESSARY TO SHORTEN THE WIRE TO A POINT CLOSE TO THE FUEL TANK IF THE GROUND IS MOVED, BE SURE IT IS SECURE AND PROTECTED FROM CORROSION. SINCE IT IS THE OPERATING GROUND FOR THE PUMP. CHECK SERVICE LITERATURE (EVTM, ETC.) FOR GROUND LOCATIONS.

WARNING

ALL SOLDERING AND HEAT SHRINKING MUST BE COMPLETED AWAY FROM THE FUEL TANK AREA. USE A SOLDERING IRON ONLY FOR SOLDERING AND HEAT GUN ONLY FOR APPLYING SHRINK TUBING.

4. Secure the RFI filter to the fuel pump and sender assembly with a Bundling Strap (95873-S101) to prevent rattling in the tank, Figures 1 and 2.

5. Reinstall the fuel pump sender assembly into the fuel tank.

CAUTION

INSTALL NEW GASKETS WHEN REINSTALLING SENDER TO PREVENT LEAKS. REFER TO THE PARTS CATALOG FOR PROPER APPLICATIONS.

6. Check the appropriate Electrical and vacuum troubleshooting manual (EVTM) (or other Service Literature) for the location of the fuel pump pump ground. If ground is more than 0.9m (3') from the tank, cut wire and ground fuel pump end within 0.9m (3') of the tank to prevent ground wire from acting as an antenna. Be sure ground is secure and protected from corrosion since it is the operating ground for the fuel pump.

7. Install the fuel tank in the vehicle as outlined in the appropriate Service or Workshop manual.

This TSB article is being republished in its entirety to update the model year vehicles.

ISSUE

A "whining"/"buzzing" noise in the speakers of the entertainment radio or two-way radio on vehicles with an in-tank electric fuel pump may be caused by electrical noise from the fuel pump.

ACTION

Install an electronic noise Radio Frequency Interference (RFI) Filter (F1PZ-18B925-A) on the fuel pump inside the fuel tank. Refer to the following Test Procedure to confirm that the concern exists,

then refer to the Service Procedure for repair details.

NOTE

SOME LIGHT TRUCKS REQUIRE ONE (1) RFI FILTER FOR EACH IN-TANK ELECTRIC FUEL PUMP ON MULTI-TANK VEHICLES.

NOTE

THIS TSB DOES NOT INCLUDE TAURUS FLEXIBLE FUEL VEHICLES (FFVS) OR 1999 RANGER 3.0L FFVS.

TEST PROCEDURE

Fuel pump radio noise is relatively constant and changes only slightly with vehicle speed. If the frequency of the noise varies or the noise comes and goes with the vehicle speed, then it is not the fuel pump and this fix will not be effective. The following procedure will help determine if the fuel pump is the cause of the radio noise:

1. Turn on the radio before the key is turned on (assuming the radio will operate without the ignition key - you may need to put the ignition key in the Accessory position).

2. Turn the ignition key to the Run position (do not start the engine).

3. The fuel pump should run for about 1 second with the key in the Run position with the engine not running. Listen for noise in the radio. If noise is present while the pump is running and stops when the pump stops, then the noise is being generated by the pump and this procedure should help.

SERVICE PROCEDURE

1. Remove the fuel pump sender assembly from the fuel tank. Refer to the appropriate model year Workshop Manual for removal procedure.

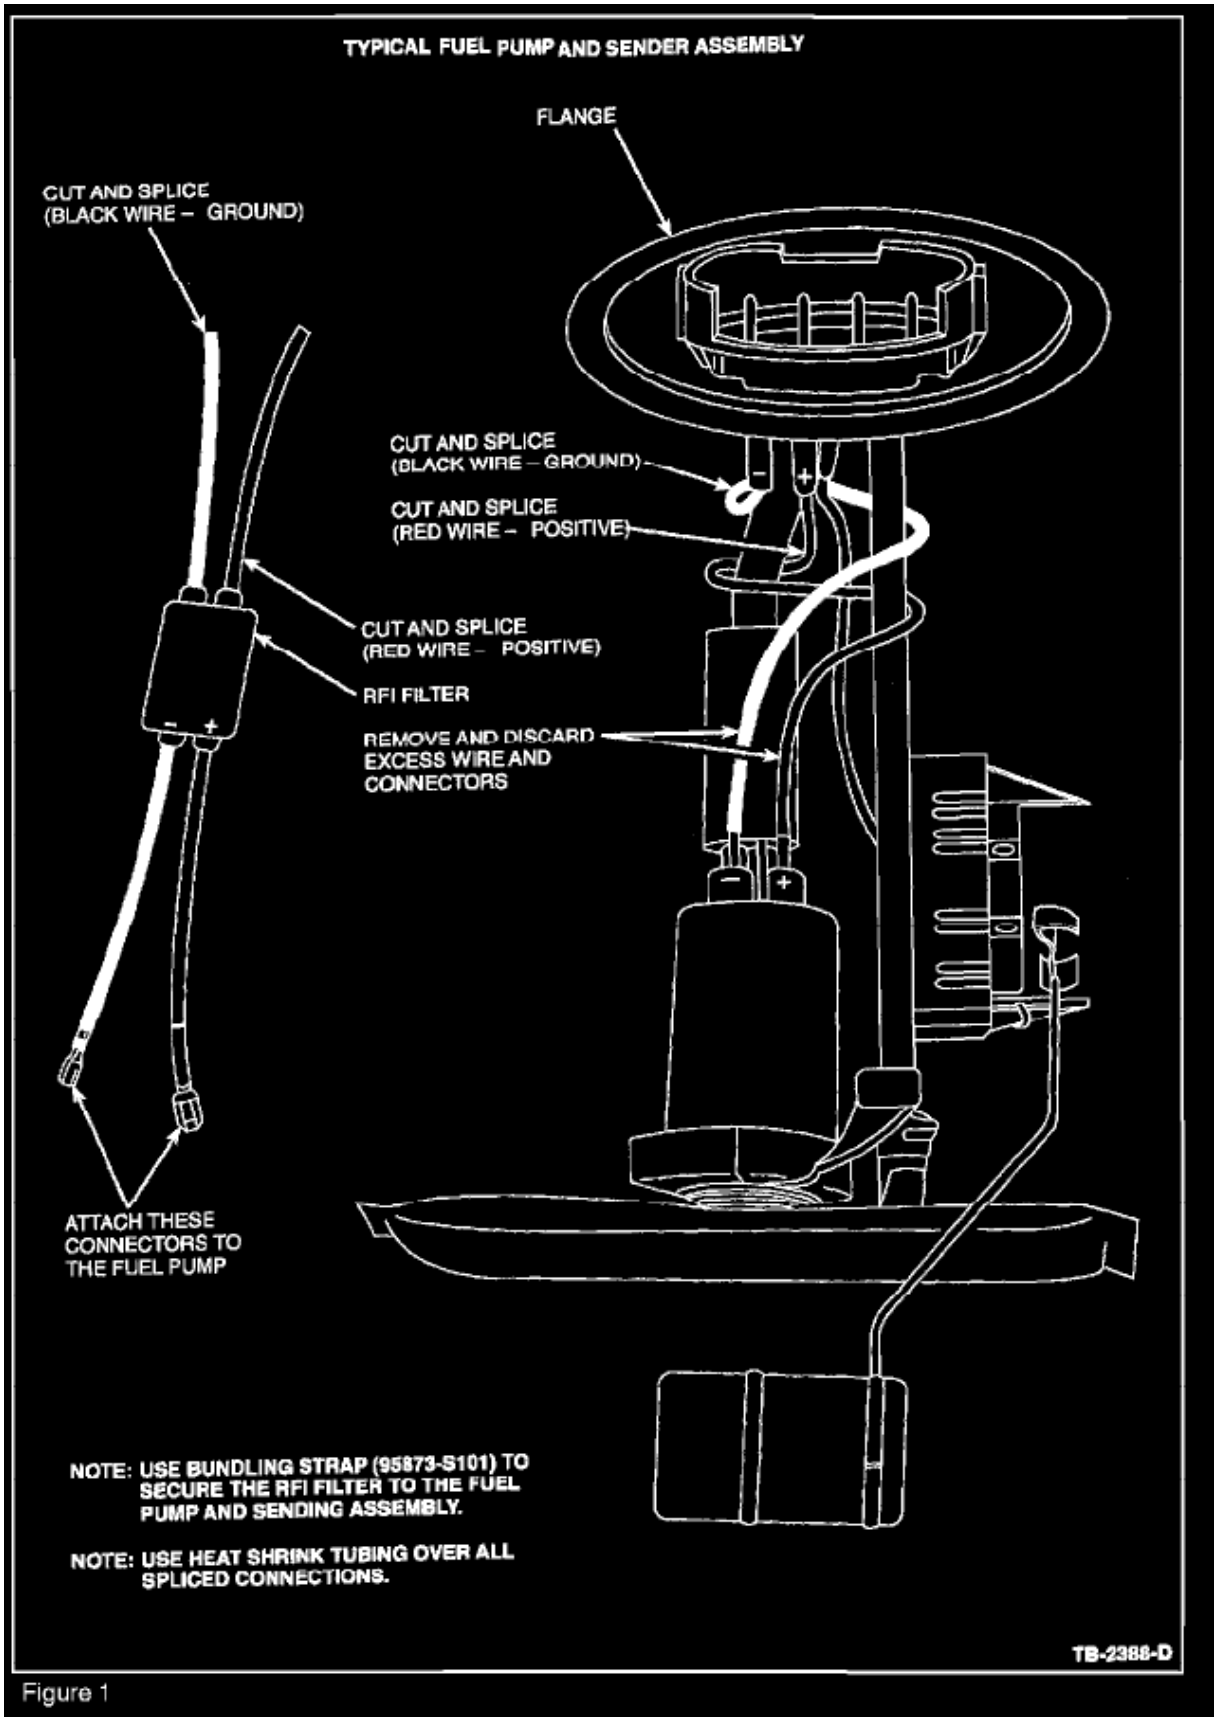

Figure 1

2. On vehicles without a fuel delivery module, remove the negative and positive connectors from the fuel pump, Figure 1.

a. Cut the wires to the fuel pump 76 mm (3") from the flange of the fuel pump and discard the wires.

b. Connect the RFI filter connectors to the spade terminal on the fuel pump.

c. Cut and solder both the red and black wires of the RFI filter to the red and black wires of the flange. Use Heat Shrink Tubing (F5AZ-14A099-M) over the solder connections.

NOTE

HEAT SHRINK TUBING MUST BE USED OVER ALL SOLDERED CONNECTIONS MADE PRIOR TO THIS TSB. USE SUFFICIENT

TUBING (ABOUT 50 mm (2",)) OF THE SPECIFIED TYPE TO ENTIRELY COVER EACH SOLDERED CONNECTION AND SHRINK APPROPRIATELY TO PREVENT EXPOSURE OF

THE CONNECTIONS.

NOTE

FOR SOME VEHICLES WITH EXTREMELY LONG FUEL PUMP GROUND WIRE CIRCUITS, IT MAY BE NECESSARY TO SHORTEN THE GROUND WIRE TO A POINT CLOSE TO THE FUEL TANK. IF THE GROUND IS MOVED, BE SURE IT IS SECURE AND PROTECTED FROM CORROSION SINCE IT IS THE OPERATING GROUND FOR THE PUMP. CHECK SERVICE LITERATURE (EVTM, ETC.) FOR GROUND LOCATIONS.

WARNING

ALL SOLDERING AND HEAT SHRINKING MUST BE COMPLETED AWAY FROM THE FUEL TANK AREA. USE A SOLDERING IRON ONLY FOR SOLDERING AND HEAT GUN ONLY FOR APPLYING SHRINK TUBING.

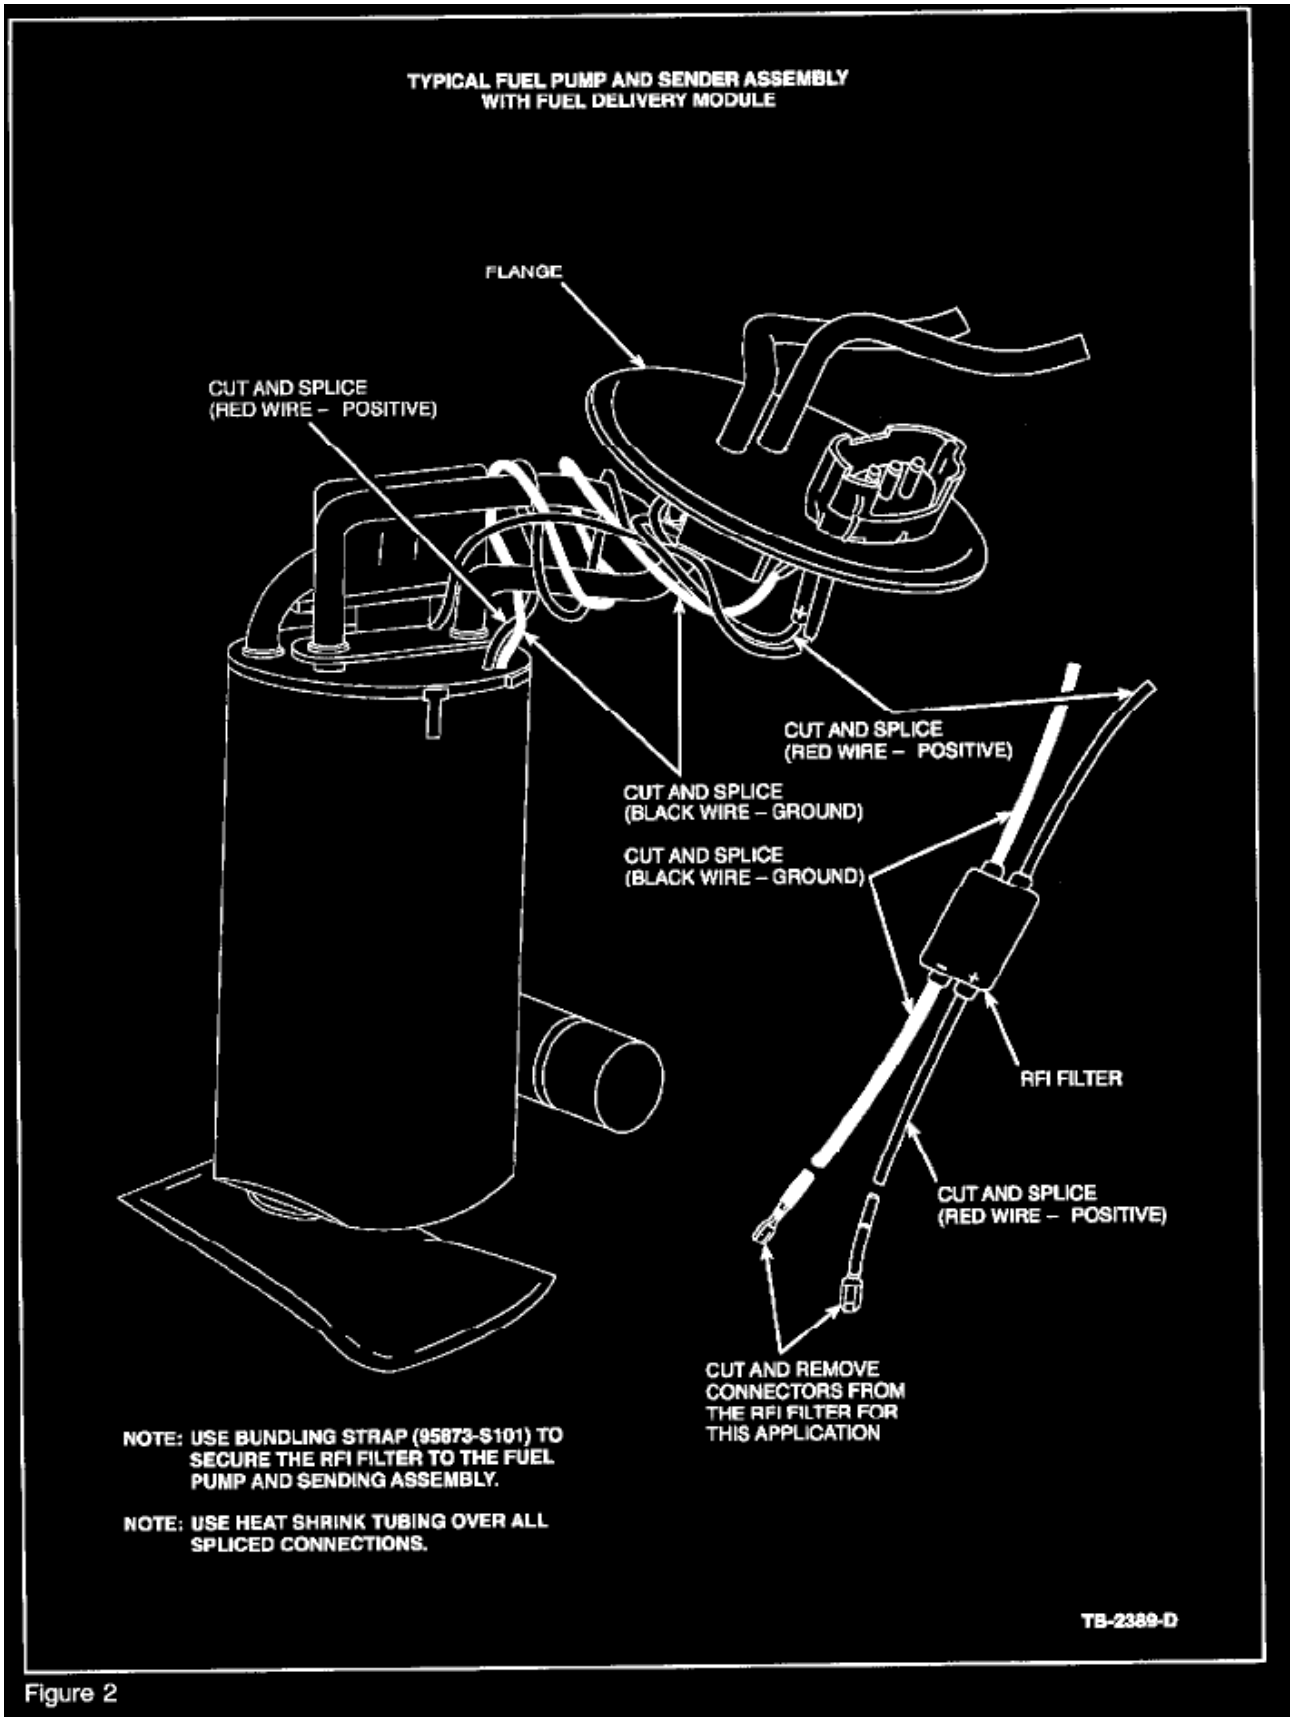

Figure 2

3. On light trucks and compact trucks with a fuel delivery module, cut the fuel pump wires to the fuel delivery module 50 mm (2") from the flange and discard the wires, Figure 2.

a. Cut the connectors from the RFI filter and solder wires to the fuel delivery module (red to red and black to black). Use heat shrink tubing over soldering connections.

b. Solder wires from the RFI filter to the flange wires (red to red and black to black). Use heat shrink tubing over soldered connections.

NOTE:

PART NUMBER	PART NAME

010703BB	Diagnose And Install RFI Filter (1996-1999 Taurus/Sable)	1.4 Hrs.
010703BC	Diagnose And Install RFI Filter (2001 Taurus/Sable)	1.4 Hrs.
010703CA	Diagnose And Install RFI Filter (1992-1997 Crown Victoria/Grand Marquis, Town Car)	1.2 Hrs.

HEAT SHRINK TUBING MUST BE USED OVER ALL SOLDERED CONNECTIONS MADE PRIOR TO THIS TSB. USE SUFFICIENT TUBING (ABOUT 50 mm (2")) OF THE SPECIFIED TYPE TO ENTIRELY COVER EACH SOLDERED CONNECTION AND SHRINK APPROPRIATELY TO PREVENT EXPOSURE OF THE CONNECTIONS.

NOTE:

FOR SOME VEHICLES WITH EXTREMELY LONG FUEL PUMP GROUND WIRE CIRCUITS, IT MAY BE NECESSARY TO SHORTEN THE WIRE TO A POINT CLOSE TO THE FUEL TANK IF THE GROUND IS MOVED, BE SURE IT IS SECURE AND PROTECTED FROM CORROSION. SINCE IT IS THE OPERATING GROUND FOR THE PUMP. CHECK SERVICE LITERATURE (EVTM, ETC.) FOR GROUND LOCATIONS.

WARNING

ALL SOLDERING AND HEAT SHRINKING MUST BE COMPLETED AWAY FROM THE FUEL TANK AREA. USE A SOLDERING IRON ONLY FOR SOLDERING AND HEAT GUN ONLY FOR APPLYING SHRINK TUBING.

4. Secure the RFI filter to the fuel pump and sender assembly with a Bundling Strap (95873-S101) to prevent rattling in the tank, Figures 1 and 2.

5. Reinstall the fuel pump sender assembly into the fuel tank.

CAUTION

INSTALL NEW GASKETS WHEN REINSTALLING SENDER TO PREVENT LEAKS. REFER TO THE PARTS CATALOG FOR PROPER APPLICATIONS.

6. Check the appropriate Electrical and vacuum troubleshooting manual (EVTM) (or other Service Literature) for the location of the fuel pump pump ground. If ground is more than 0.9m (3') from the tank, cut wire and ground fuel pump end within 0.9m (3') of the tank to prevent ground wire from acting as an antenna. Be sure ground is secure and protected from corrosion since it is the operating ground for the fuel pump.

7. Install the fuel tank in the vehicle as outlined in the appropriate Service or Workshop manual.

This TSB article is being republished in its entirety to update the model year vehicles.

ISSUE

A "whining"/"buzzing" noise in the speakers of the entertainment radio or two-way radio on vehicles with an in-tank electric fuel pump may be caused by electrical noise from the fuel pump.

ACTION

Install an electronic noise Radio Frequency Interference (RFI) Filter (F1PZ-18B925-A) on the fuel pump inside the fuel tank. Refer to the following Test Procedure to confirm that the concern exists,

then refer to the Service Procedure for repair details.

NOTE

SOME LIGHT TRUCKS REQUIRE ONE (1) RFI FILTER FOR EACH IN-TANK ELECTRIC FUEL PUMP ON MULTI-TANK VEHICLES.

NOTE

THIS TSB DOES NOT INCLUDE TAURUS FLEXIBLE FUEL VEHICLES (FFVS) OR 1999 RANGER 3.0L FFVS.

TEST PROCEDURE

Fuel pump radio noise is relatively constant and changes only slightly with vehicle speed. If the frequency of the noise varies or the noise comes and goes with the vehicle speed, then it is not the fuel pump and this fix will not be effective. The following procedure will help determine if the fuel pump is the cause of the radio noise:

1. Turn on the radio before the key is turned on (assuming the radio will operate without the ignition key - you may need to put the ignition key in the Accessory position).

2. Turn the ignition key to the Run position (do not start the engine).

3. The fuel pump should run for about 1 second with the key in the Run position with the engine not running. Listen for noise in the radio. If noise is present while the pump is running and stops when the pump stops, then the noise is being generated by the pump and this procedure should help.

SERVICE PROCEDURE

1. Remove the fuel pump sender assembly from the fuel tank. Refer to the appropriate model year Workshop Manual for removal procedure.

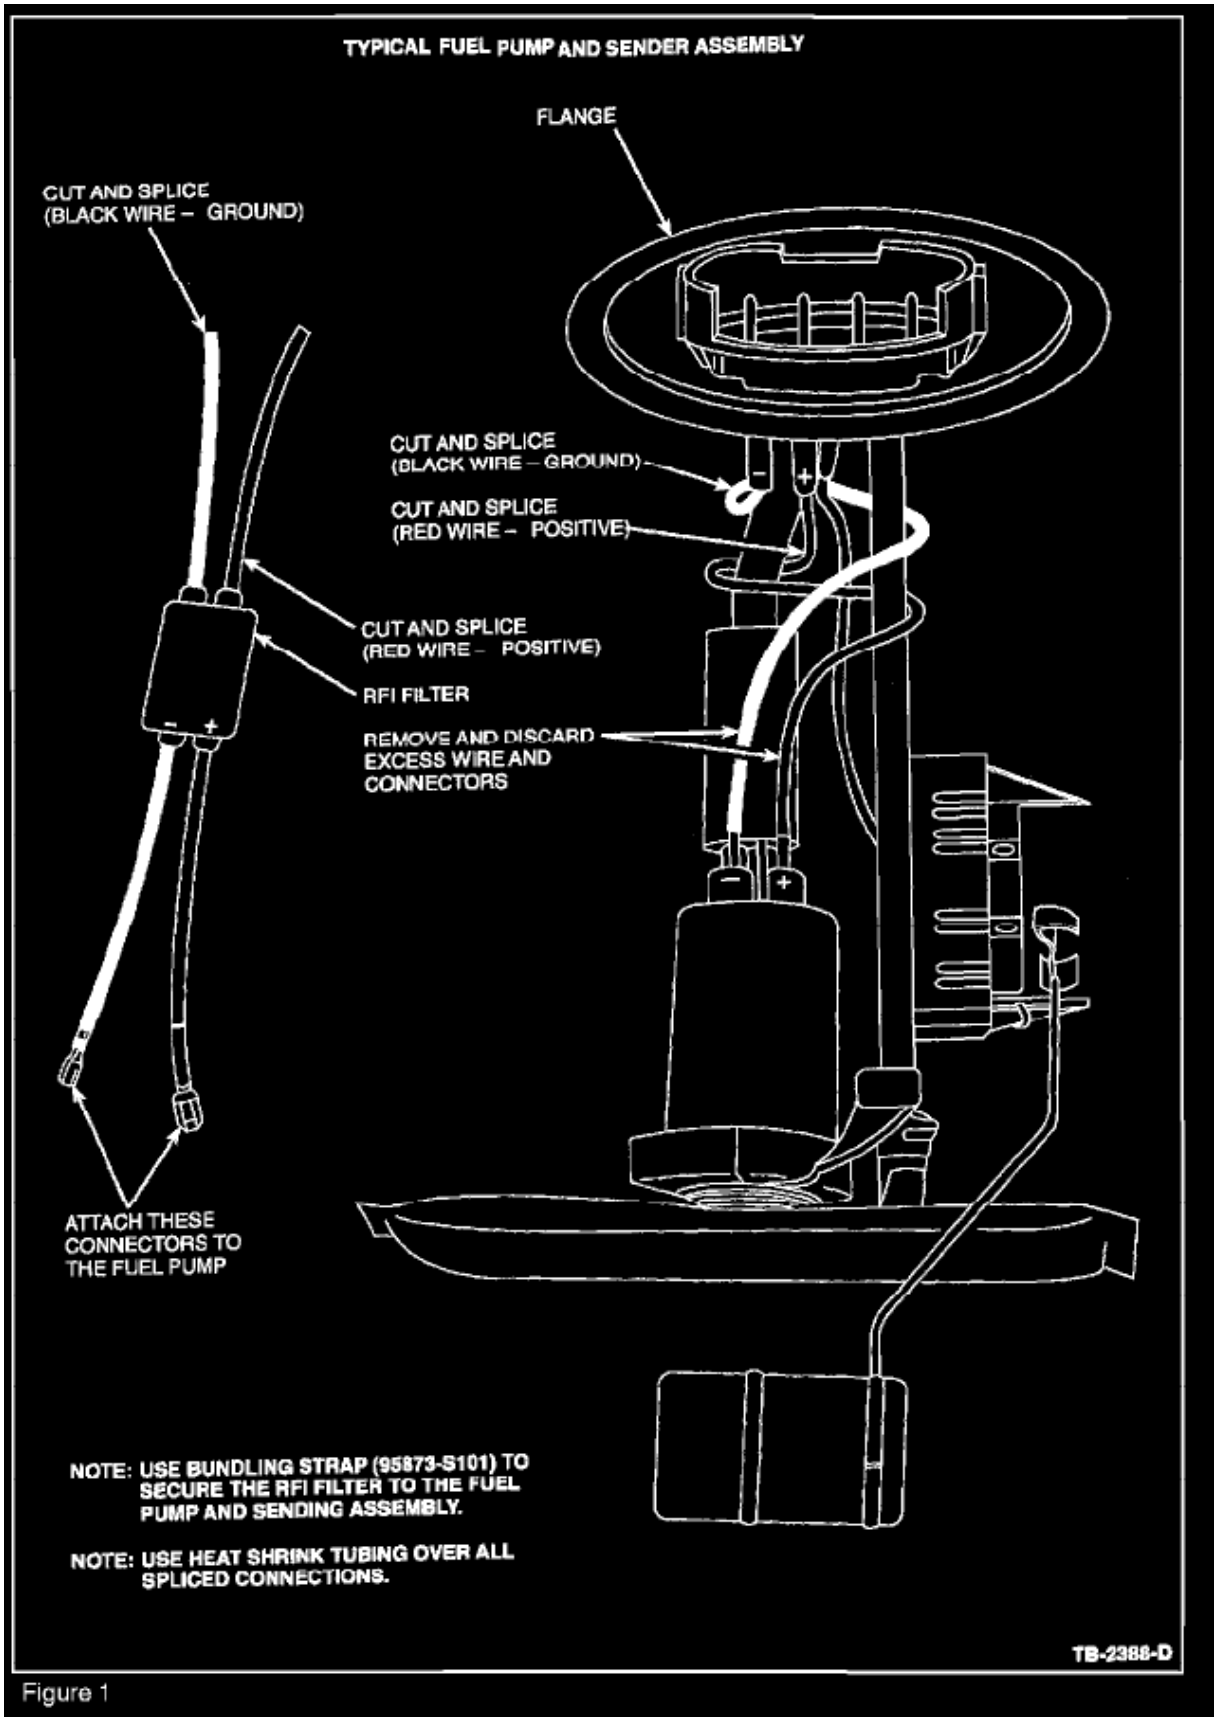

Figure 1

2. On vehicles without a fuel delivery module, remove the negative and positive connectors from the fuel pump, Figure 1.

a. Cut the wires to the fuel pump 76 mm (3") from the flange of the fuel pump and discard the wires.

b. Connect the RFI filter connectors to the spade terminal on the fuel pump.

c. Cut and solder both the red and black wires of the RFI filter to the red and black wires of the flange. Use Heat Shrink Tubing (F5AZ-14A099-M) over the solder connections.

NOTE

HEAT SHRINK TUBING MUST BE USED OVER ALL SOLDERED CONNECTIONS MADE PRIOR TO THIS TSB. USE SUFFICIENT

TUBING (ABOUT 50 mm (2",)) OF THE SPECIFIED TYPE TO ENTIRELY COVER EACH SOLDERED CONNECTION AND SHRINK APPROPRIATELY TO PREVENT EXPOSURE OF

THE CONNECTIONS.

NOTE

FOR SOME VEHICLES WITH EXTREMELY LONG FUEL PUMP GROUND WIRE CIRCUITS, IT MAY BE NECESSARY TO SHORTEN THE GROUND WIRE TO A POINT CLOSE TO THE FUEL TANK. IF THE GROUND IS MOVED, BE SURE IT IS SECURE AND PROTECTED FROM CORROSION SINCE IT IS THE OPERATING GROUND FOR THE PUMP. CHECK SERVICE LITERATURE (EVTM, ETC.) FOR GROUND LOCATIONS.

WARNING

ALL SOLDERING AND HEAT SHRINKING MUST BE COMPLETED AWAY FROM THE FUEL TANK AREA. USE A SOLDERING IRON ONLY FOR SOLDERING AND HEAT GUN ONLY FOR APPLYING SHRINK TUBING.

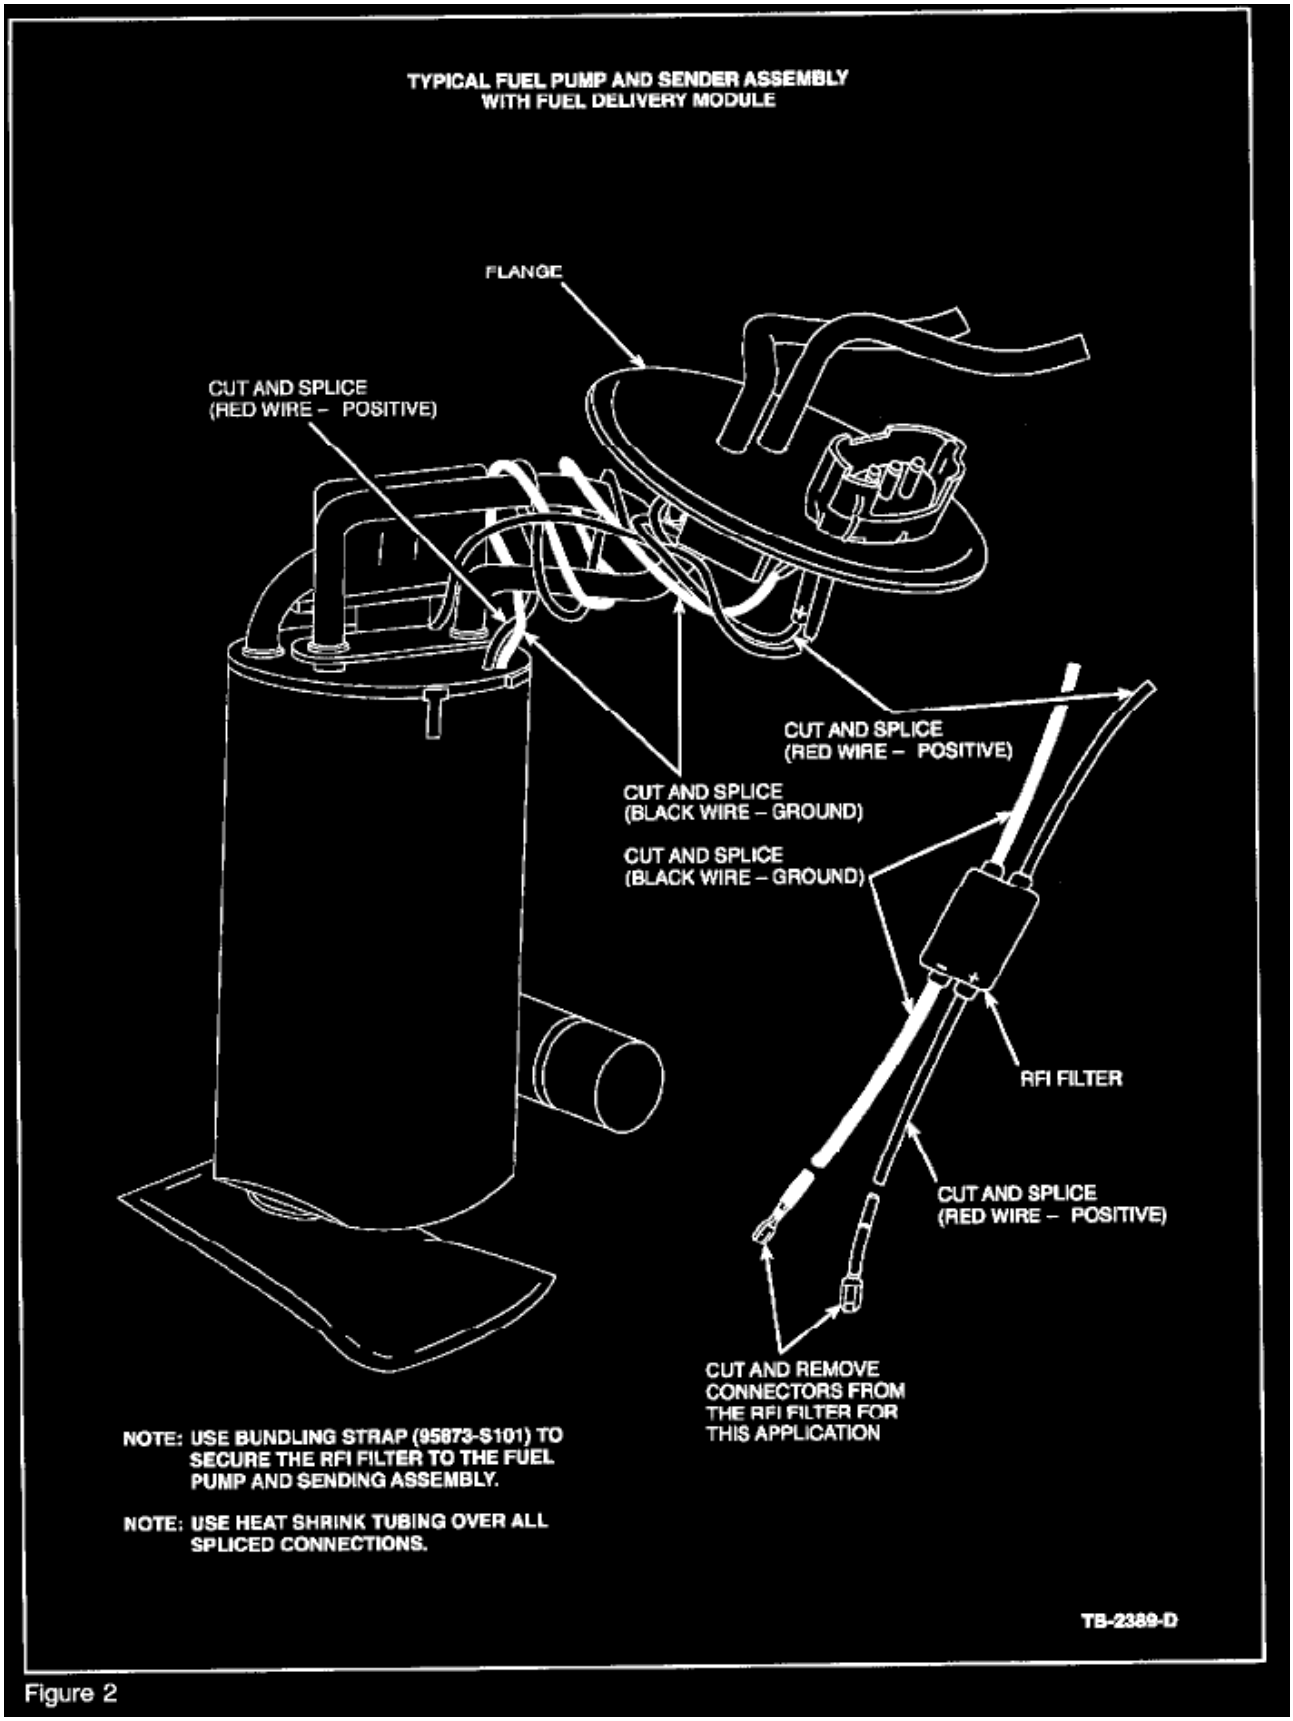

Figure 2

3. On light trucks and compact trucks with a fuel delivery module, cut the fuel pump wires to the fuel delivery module 50 mm (2") from the flange and discard the wires, Figure 2.

a. Cut the connectors from the RFI filter and solder wires to the fuel delivery module (red to red and black to black). Use heat shrink tubing over soldering connections.

b. Solder wires from the RFI filter to the flange wires (red to red and black to black). Use heat shrink tubing over soldered connections.

This TSB article is being republished in its entirety to update the model year vehicles.

ISSUE

A "whining"/"buzzing" noise in the speakers of the entertainment radio or two-way radio on vehicles with an in-tank electric fuel pump may be caused by electrical noise from the fuel pump.

ACTION

Install an electronic noise Radio Frequency Interference (RFI) Filter (F1PZ-18B925-A) on the fuel pump inside the fuel tank. Refer to the following Test Procedure to confirm that the concern exists,

then refer to the Service Procedure for repair details.

NOTE

SOME LIGHT TRUCKS REQUIRE ONE (1) RFI FILTER FOR EACH IN-TANK ELECTRIC FUEL PUMP ON MULTI-TANK VEHICLES.

NOTE

THIS TSB DOES NOT INCLUDE TAURUS FLEXIBLE FUEL VEHICLES (FFVS) OR 1999 RANGER 3.0L FFVS.

TEST PROCEDURE

Fuel pump radio noise is relatively constant and changes only slightly with vehicle speed. If the frequency of the noise varies or the noise comes and goes with the vehicle speed, then it is not the fuel pump and this fix will not be effective. The following procedure will help determine if the fuel pump is the cause of the radio noise:

1. Turn on the radio before the key is turned on (assuming the radio will operate without the ignition key - you may need to put the ignition key in the Accessory position).

2. Turn the ignition key to the Run position (do not start the engine).

3. The fuel pump should run for about 1 second with the key in the Run position with the engine not running. Listen for noise in the radio. If noise is present while the pump is running and stops when the pump stops, then the noise is being generated by the pump and this procedure should help.

SERVICE PROCEDURE

1. Remove the fuel pump sender assembly from the fuel tank. Refer to the appropriate model year Workshop Manual for removal procedure.

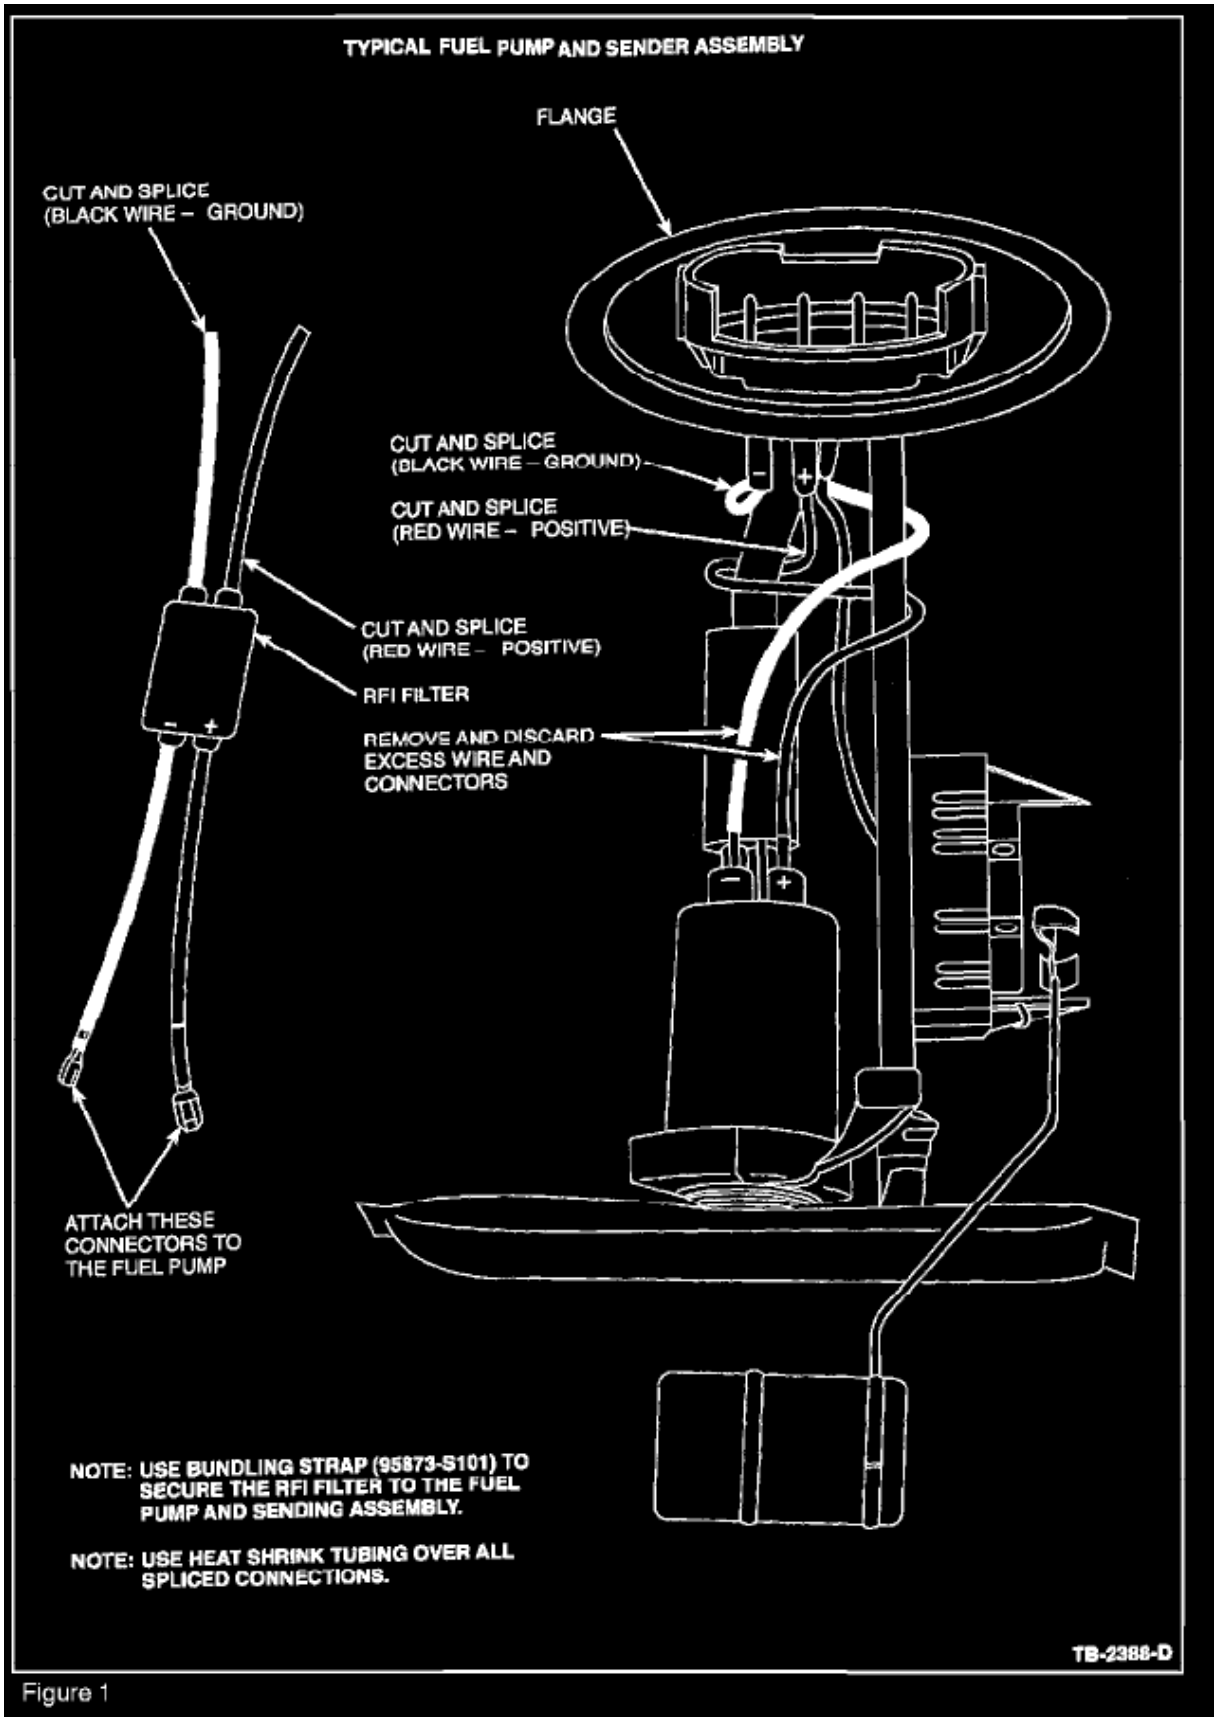

Figure 1

2. On vehicles without a fuel delivery module, remove the negative and positive connectors from the fuel pump, Figure 1.

a. Cut the wires to the fuel pump 76 mm (3") from the flange of the fuel pump and discard the wires.

b. Connect the RFI filter connectors to the spade terminal on the fuel pump.

c. Cut and solder both the red and black wires of the RFI filter to the red and black wires of the flange. Use Heat Shrink Tubing (F5AZ-14A099-M) over the solder connections.

NOTE

HEAT SHRINK TUBING MUST BE USED OVER ALL SOLDERED CONNECTIONS MADE PRIOR TO THIS TSB. USE SUFFICIENT

TUBING (ABOUT 50 mm (2",)) OF THE SPECIFIED TYPE TO ENTIRELY COVER EACH SOLDERED CONNECTION AND SHRINK APPROPRIATELY TO PREVENT EXPOSURE OF

THE CONNECTIONS.

NOTE

FOR SOME VEHICLES WITH EXTREMELY LONG FUEL PUMP GROUND WIRE CIRCUITS, IT MAY BE NECESSARY TO SHORTEN THE GROUND WIRE TO A POINT CLOSE TO THE FUEL TANK. IF THE GROUND IS MOVED, BE SURE IT IS SECURE AND PROTECTED FROM CORROSION SINCE IT IS THE OPERATING GROUND FOR THE PUMP. CHECK SERVICE LITERATURE (EVTM, ETC.) FOR GROUND LOCATIONS.

WARNING

ALL SOLDERING AND HEAT SHRINKING MUST BE COMPLETED AWAY FROM THE FUEL TANK AREA. USE A SOLDERING IRON ONLY FOR SOLDERING AND HEAT GUN ONLY FOR APPLYING SHRINK TUBING.

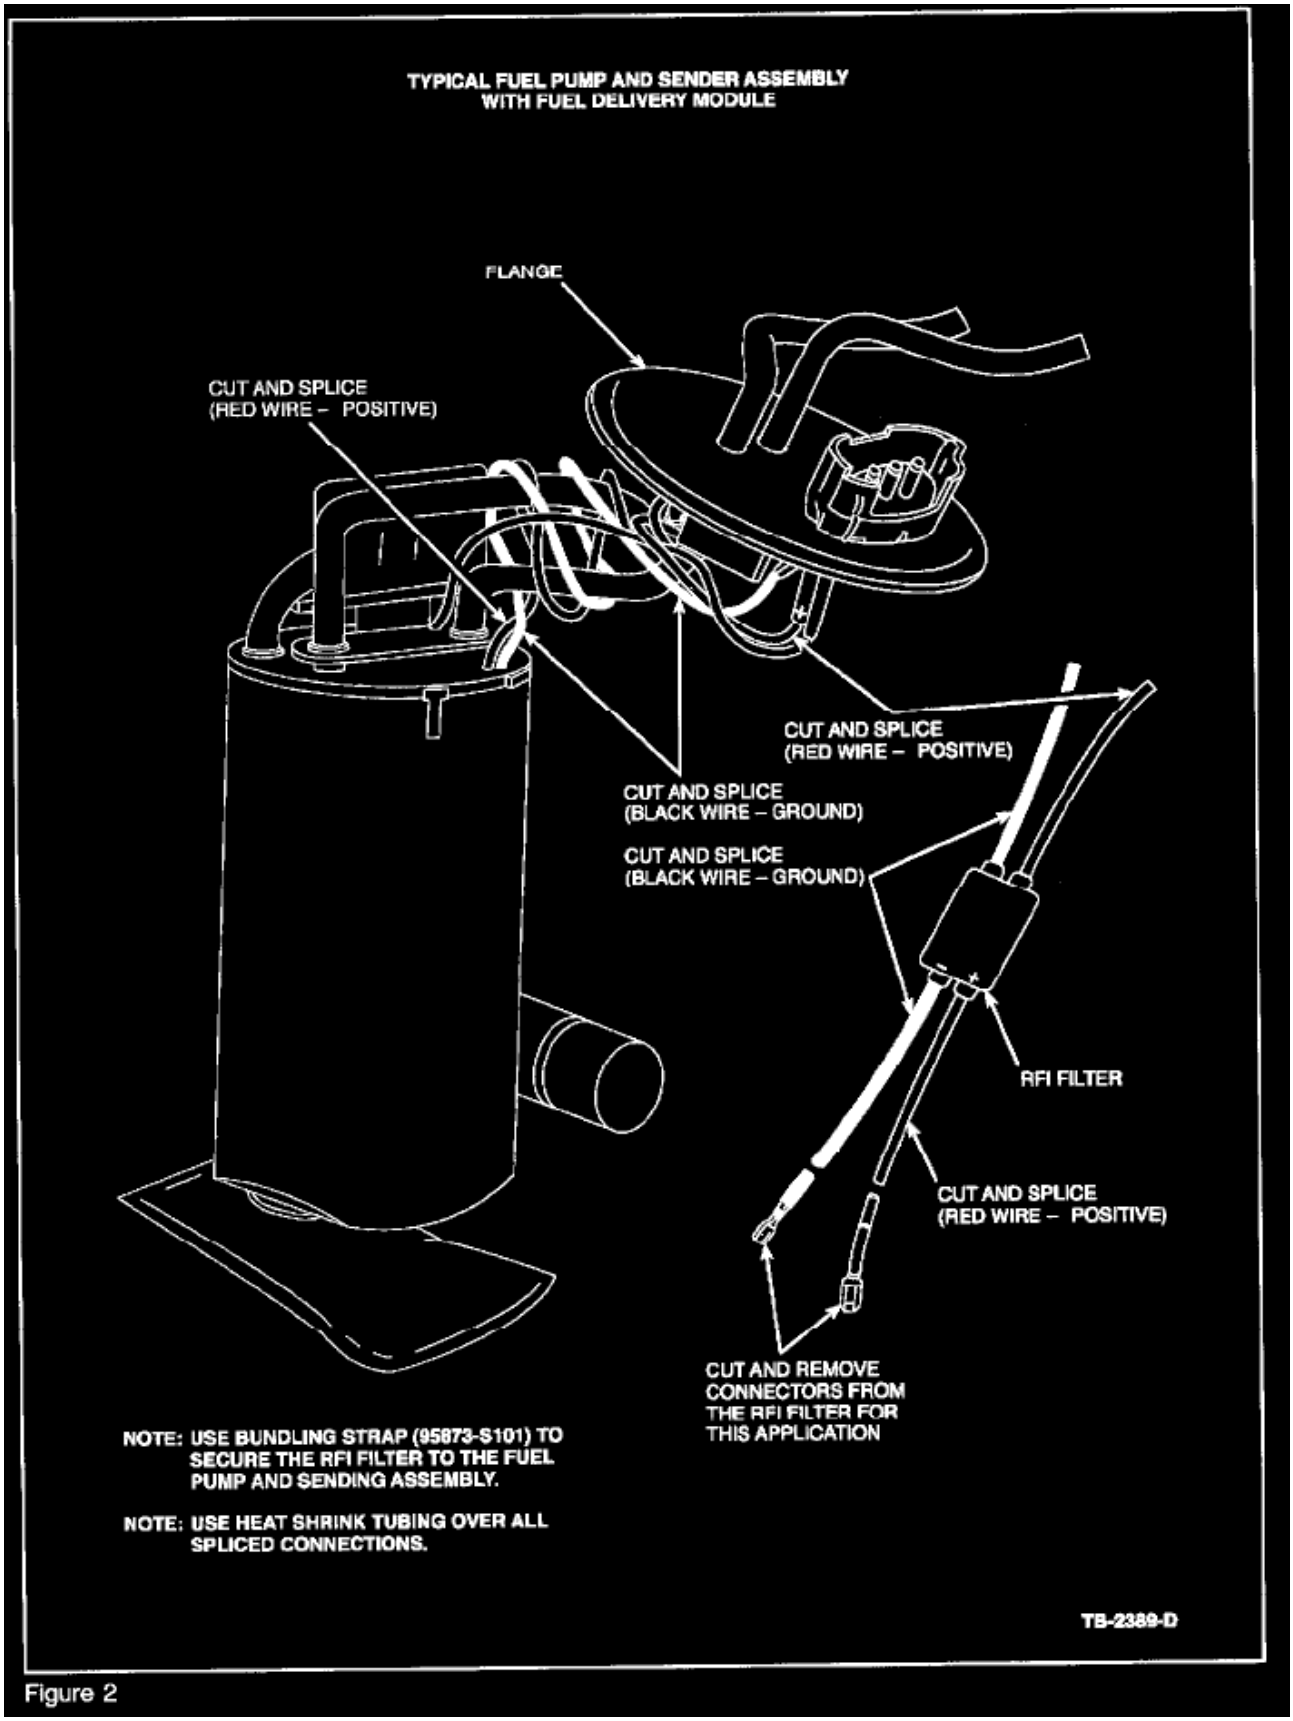

Figure 2

3. On light trucks and compact trucks with a fuel delivery module, cut the fuel pump wires to the fuel delivery module 50 mm (2") from the flange and discard the wires, Figure 2.

a. Cut the connectors from the RFI filter and solder wires to the fuel delivery module (red to red and black to black). Use heat shrink tubing over soldering connections.

b. Solder wires from the RFI filter to the flange wires (red to red and black to black). Use heat shrink tubing over soldered connections.

NOTE:

PART NUMBER	PART NAME
F1PZ-18B925-A	Radio Frequency Interference (RFI) Filter
95B73-S101	Bundling Strap
F5AZ-14A099-AA	Heat Shrink Tubing

010703AA	Diagnose And Install RFI Filter (1990-1995 Thunderbird Super Coupe)	2.1 Hrs.

010703AD	Diagnose And Install RFI Filter (1990-1997 Thunderbird/Cougar 3.8L)	1.9 Hrs.
010703BA	Diagnose And Install RFI Filter (1990-1995 Taurus/Sable)	1.4 Hrs.
010703BB	Diagnose And Install RFI Filter (1996-1999 Taurus/Sable)	1.4 Hrs.
010703BC	Diagnose And Install RFI Filter (2001 Taurus/Sable)	1.4 Hrs.
010703CA	Diagnose And Install RFI Filter (1992-1997 Crown Victoria/Grand Marquis, Town Car)	1.2 Hrs.

HEAT SHRINK TUBING MUST BE USED OVER ALL SOLDERED CONNECTIONS MADE PRIOR TO THIS TSB. USE SUFFICIENT TUBING (ABOUT 50 mm (2")) OF THE SPECIFIED TYPE TO ENTIRELY COVER EACH SOLDERED CONNECTION AND SHRINK APPROPRIATELY TO PREVENT EXPOSURE OF THE CONNECTIONS.

NOTE:

FOR SOME VEHICLES WITH EXTREMELY LONG FUEL PUMP GROUND WIRE CIRCUITS, IT MAY BE NECESSARY TO SHORTEN THE WIRE TO A POINT CLOSE TO THE FUEL TANK IF THE GROUND IS MOVED, BE SURE IT IS SECURE AND PROTECTED FROM CORROSION. SINCE IT IS THE OPERATING GROUND FOR THE PUMP. CHECK SERVICE LITERATURE (EVTM, ETC.) FOR GROUND LOCATIONS.

WARNING

ALL SOLDERING AND HEAT SHRINKING MUST BE COMPLETED AWAY FROM THE FUEL TANK AREA. USE A SOLDERING IRON ONLY FOR SOLDERING AND HEAT GUN ONLY FOR APPLYING SHRINK TUBING.

4. Secure the RFI filter to the fuel pump and sender assembly with a Bundling Strap (95873-S101) to prevent rattling in the tank, Figures 1 and 2.

5. Reinstall the fuel pump sender assembly into the fuel tank.

CAUTION

INSTALL NEW GASKETS WHEN REINSTALLING SENDER TO PREVENT LEAKS. REFER TO THE PARTS CATALOG FOR PROPER APPLICATIONS.

6. Check the appropriate Electrical and vacuum troubleshooting manual (EVTM) (or other Service Literature) for the location of the fuel pump pump ground. If ground is more than 0.9m (3') from the tank, cut wire and ground fuel pump end within 0.9m (3') of the tank to prevent ground wire from acting as an antenna. Be sure ground is secure and protected from corrosion since it is the operating ground for the fuel pump.

7. Install the fuel tank in the vehicle as outlined in the appropriate Service or Workshop manual.

ELECTRICAL/VACUUM TROUBLESHOOTING MANUAL - 1991 - CIRCUIT COLOR CODE CHANGES Article No. 90-25B LIGHT TRUCK:

1991 EXPLORER, RANGER

ISSUE: The wiring color codes on several circuits (power windows and speakers) have been changed during the model year. This affects service information in the 1991 Ranger EVTM and the 1991 Explorer EVTM.

ACTION: Refer to the pages following this TSB article for the updated wiring color codes.

ELECTRICAL/VACUUM TROUBLESHOOTING MANUAL - 1991 - CIRCUIT COLOR CODE CHANGES Article No. 90-25B LIGHT TRUCK:

1991 EXPLORER, RANGER

ISSUE: The wiring color codes on several circuits (power windows and speakers) have been changed during the model year. This affects service information in the 1991 Ranger EVTM and the 1991 Explorer EVTM.

ACTION: Refer to the pages following this TSB article for the updated wiring color codes.

TROUBLESHOOTING HINTS

CONDITION	POSSIBLE CAUSE	ACTION
• Power Windows do not work	• Tripped circuit breaker	• Check 30A Circuit Breaker 14 in the Interior Fuse Panel.
	• Open circuit	• Check for 12V on 400 (LB/BK) wire at Master Window Control Switch
• One Power Window does not work	• Open circuit	• Check for continuity from Master Window Control Switch to Control Switch of inoperative window. -Right front 313 (W/Y) and 314 (T/LB) wires. -Left rear 316 (Y/LB) and 317 (GY/OR) wires. -Right rear 319 (Y/BK) and 320 (R/BK) wires. REVISED • Check for continuity in 226 (W/BK) and 227 (Y) wires from Window Control Switch to Window Motor.
	• Faulty ground	• Check for continuity to ground in 57 (BK) wires at Master Window Control Switch.
	• Faulty Master Window Control Switch	• Check Master Window Control Switch
• Passenger's Window Control Switches do not work	• Faulty Window Lock Switch	• Check Window Lock Switch
	• Open circuit	• Check for 12V on 170 (R/LB) wire at Window Control Switches
	• Faulty Master Window Control Switch	• Check Master Window Control Switch
• One Window Control Switch does not work	• Faulty Window Control Switch	• Check Window Control Switch

For further diagnostic information refer to section 01-11 of shop manual.

Towing Information: Technical Service Bulletins Vehicle - Towing Behind RVs Guidelines

Article No. 98-5A-12

03/18/98

^ BRAKES - WEIGHT LIMITATIONS FOR TOWING

^ RECREATIONAL VEHICLES - WEIGHT RATINGS FOR UNBRAKED TOWING LESS THAN GROSS COMBINATION WEIGHT RATING (GCWR)

^ TOWING BEHIND RECREATIONAL VEHICLES - RECOMMENDED GUIDELINES

^ TRANSAXLE/TRANSMISSION/TRANSFER CASE - VEHICLES TOWED BEHIND RECREATIONAL VEHICLES - RECOMMENDED TOWING GUIDELINES

FORD: 1988-93 FESTIVA 1988-94 TEMPO 1989-96 PROBE, TAURUS SHO 1991-97 ESCORT 1994-96 ASPIRE

LINCOLN-MERCURY: 1988-94 TOPAZ 1991-94 CAPRI 1991-97 TRACER

LIGHT TRUCK: 1988-96 AEROSTAR, BRONCO, E-350, F SUPER DUTY, F-250, F-350, F-53 MOTORHOME, RANGER 1988-97 F-150 1991-96 EXPLORER 1997 MOUNTAINEER

ISSUE: Many motorhome owners tow a vehicle when traveling. Improper techniques can "overload" the brake system of the tow vehicle or damage the drivetrain of the vehicle being towed.

ACTION: Use the information and charts shown in this TSB article to properly match tow vehicle, towed vehicle and towing method.

TOWING METHODS

1. TRAILER - The vehicle is loaded onto and secured to a trailer and simply acts as "secured" cargo.

2. DOLLY - The vehicle is "partially" loaded and partially towed. Either front or rear wheels are loaded and secured to a "towing dolly" and the other wheels roll on the road.

3. TOW BAR - All of the vehicle wheels roll on the pavement. The towed vehicle's steering column must be unlocked so that it can track correctly behind the tow vehicle.

WEIGHT RATINGS AND BRAKES

^ GVWR (Gross Vehicle Weight Rating) - is the MAXIMUM allowable weight of the towing vehicle, passengers and cargo

^ GCWR (Gross Combined Weight Rating) - is the MAXIMUM allowable weight of the towing vehicle and the weight of the trailer or vehicle being towed, including all passengers and cargo

^ BRAKES - The motorhome brakes are designed and rated for the GVWR of that vehicle and will provide adequate braking for trailers and towing vehicles up to 680 kg (1500 lb)

E-350	YES	NO
MOUNTAINEER 4X2	YES	NO
MOUNTAINEER 4X4	YES	YES**

**Manual transfer case only (not Touch Drive Electric Shift).

CAUTION:

SEPARATE AUXILIARY BRAKES ARE REQUIRED ON TRAILERS OR TOWED VEHICLES OVER 680 KG (1500 LBS). DO NOT CONNECT A TRAILER'S, DOLLY'S OR OTHER TOWED VEHICLE'S BRAKE SYSTEM TO THE TOWING VEHICLE'S BRAKE SYSTEM.

TOWED VEHICLES

1. Trailer-towed - The vehicle should be loaded on the trailer in a manner to:

a. achieve a trailer tongue load of 10-15% of total trailer weight,

b. not exceed the trailer or hitch ratings and

c. be securely tied down.

2. Dolly-towed - For front wheel drive vehicles, towing an automatic transaxle (ATX)-equipped vehicle behind another vehicle, such as a Recreational Vehicle (RV), requires that a front wheel dolly or trailer be used.

NOTE:

TEMPO ALL-WHEEL DRIVE MODELS MUST BE TRAILER-TOWED. DO NOT TOW THESE VEHICLES USING A TWO-WHEEL TOWING DOLLY.

CAUTION:

DO NOT TOW A VEHICLE WITH AN AUTOMATIC (ATX) TRANSAXLE WITH THE DRIVE WHEELS ON THE GROUND. DAMAGE TO THE TRANSAXLE MAY RESULT.

3. Tow Bar-towed - Vehicles which can be successfully towed with a tow bar are listed in the following chart. Additional vehicle-specific information follows the chart.

ALL VEHICLES

NOTE:

DO NOT TOW ANY VEHICLE AT A SPEED FASTER THAN 88 KM/H (55 MPH). THE MAXIMUM TOWING DISTANCE (WHEN TOWED CORRECTLY) IS UNLIMITED.

WARNING:

NEVER USE A TOW BAR THAT ATTACHES ONLY TO THE BUMPER.

MTX-EQUIPPED VEHICLES

Towing a manual transaxle (MTX)-equipped vehicle with the drive wheels on the ground is acceptable only if the vehicle is towed in a forward direction. The parking brake must be released and the gear shift lever must be in Neutral.

^ For Aspire, Festiva, Escort and Tracer, the ignition key must be in the ACO position, the battery must be disconnected to eliminate battery drain, and the steering wheel must be unlocked

^ For Capri, the ignition key must be in the OFF position and the steering wheel unlocked

^ Refer to the specific vehicle Owner Guide for complete details

CAUTION:

TOWING MTX-EQUIPPED VEHICLES INCORRECTLY MAY RESULT IN TRANSAXLE DAMAGE.

TRUCKS

^ The steering wheel must be unlocked by placing the ignition key in the OFF position

^ Manual transmission shift lever must be in Neutral

^ On 4X4 manual shift transfer cases, the shift lever must be in Neutral

^ 4X4 locking hubs (both manual and automatic) must be unlocked

^ Refer to the specific vehicle Owner Guide for complete details

This TSB is being republished in its entirety to include vehicles through the 1995 model year.

ISSUE: Running boards which are incorrectly installed may result in noise/vibration complaints.

ACTION: Install running boards to either the body or frame; NEVER to both unless the mounting system uses isolated mounts. A manufacturer's instruction to attach running boards to both body and frame should be immediately questioned because such action provides a direct path from chassis to body for road vibration and noise.

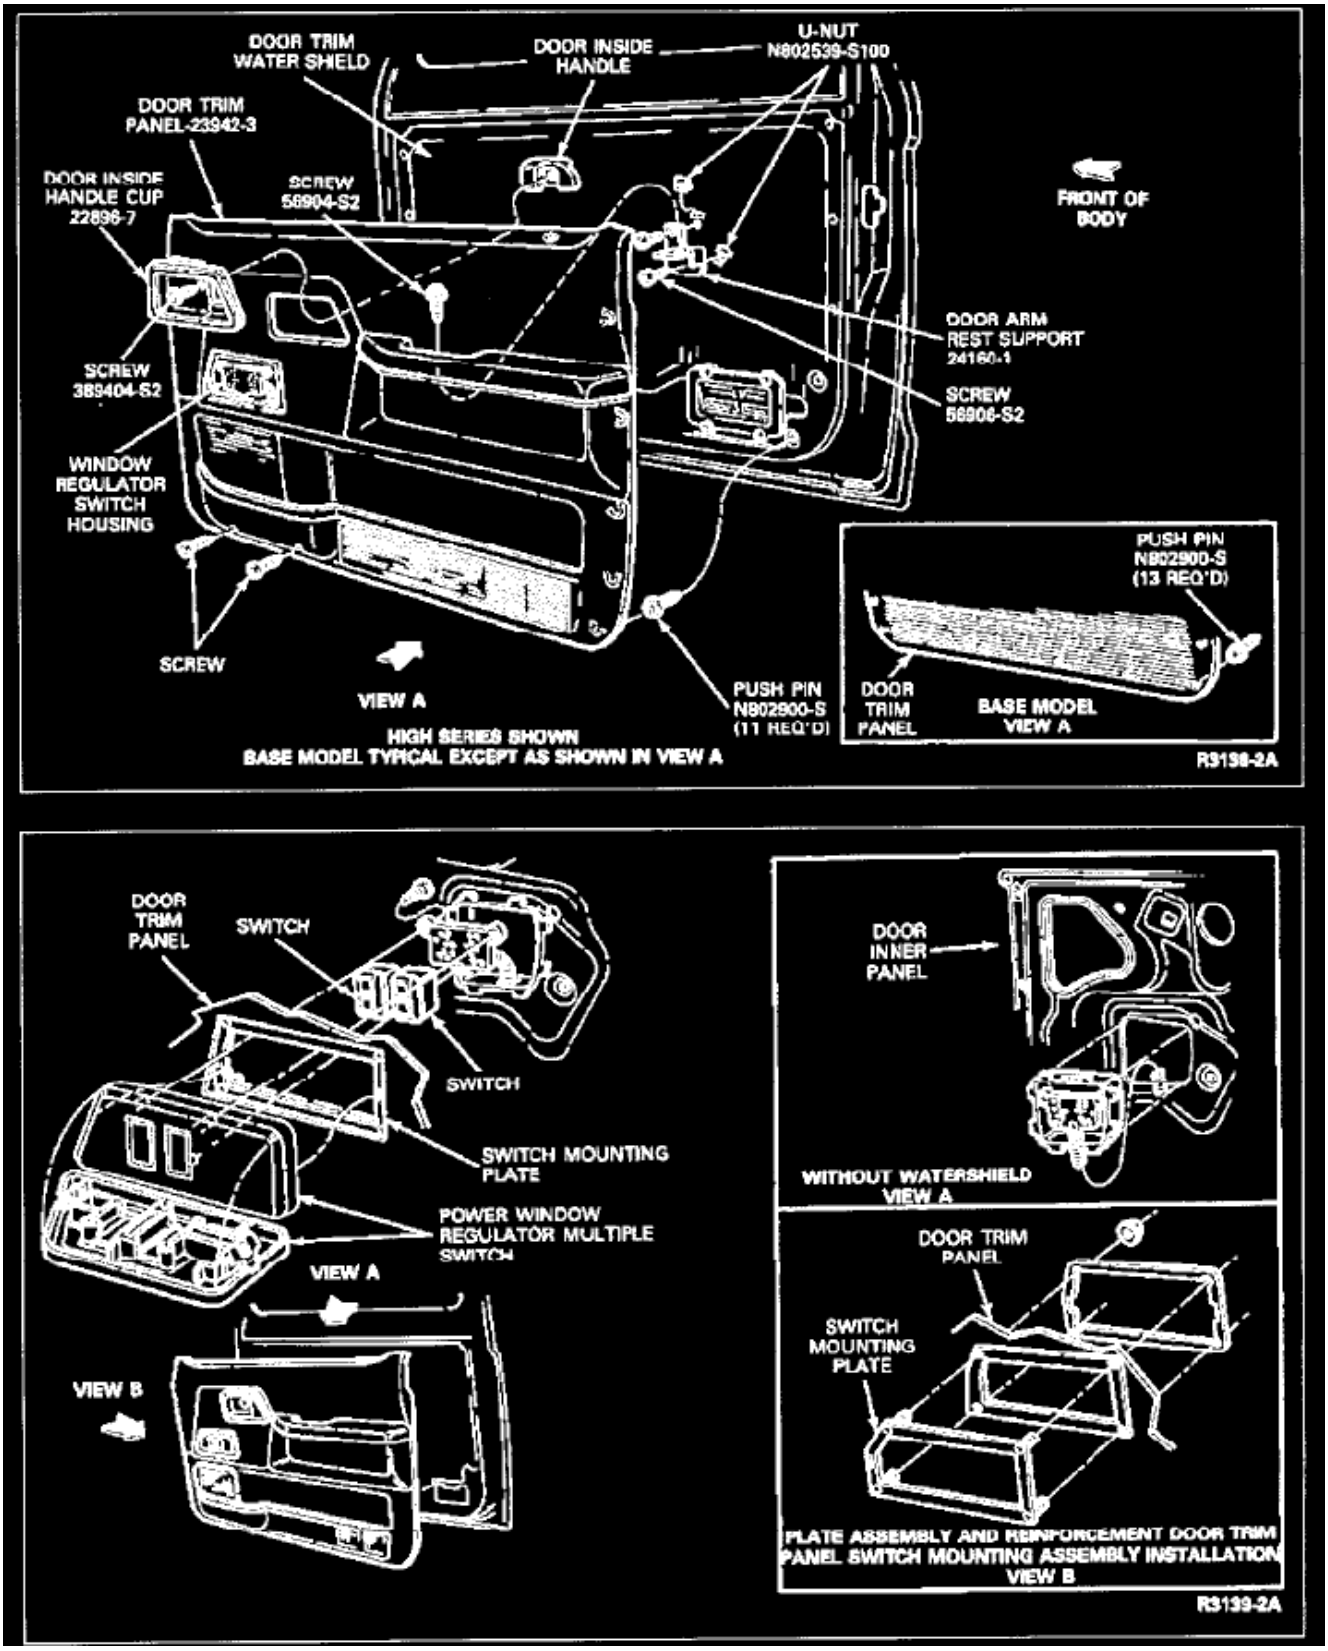
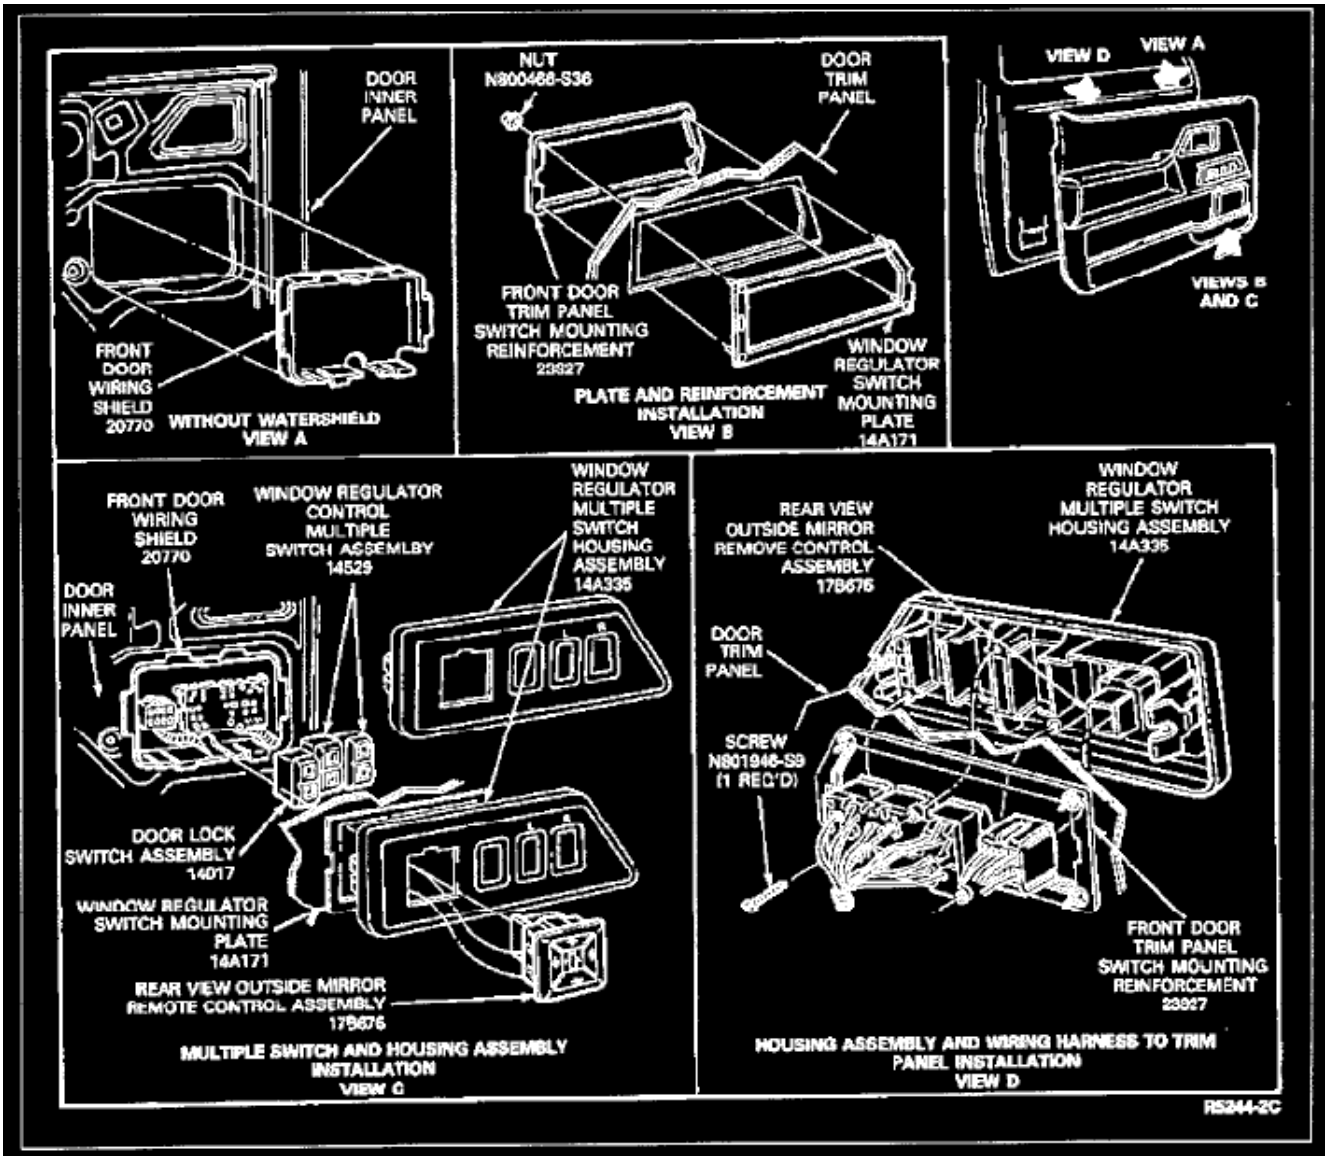
Ford Ranger 4wd Workshop Manual (V6-245 4.0L (1991))
Ford Workshop Manuals > Body and Frame > Doors, Hood and Trunk > Doors > Front Door > Front Door Panel > System Information > Service and Repair



Front Door Panel: Service and Repair

Door Trim Panel



Removal

1. Remove the screws retaining the armrest area of the trim panel to the door inner panel.

2. Remove the screw retaining the door inside handle cup.

3. Remove the screw retaining the door window regulator handle. Remove the handle and washer.

4. Remove the power door lock control and/or power window control, if so equipped.

5. At each plastic clip location, carefully pry the trim panel away from the door inner panel using the Trim Pad Removing Tool from Rotunda

Moulding/Trim Kit 107-00401 or equivalent. Remove the trim panel.

NOTE: At no time should the trim panel be used to pull the clips from the inner panel holes.

Installation

1. Replace any bent, damaged, or missing push pins on the door trim panel. Position the trim panel to the door inner panel, locating the push pins in

the countersunk holes. Firmly push the trim panel at the push pin locations to seat each push pin into the holes in the door inner panel.

2. To complete installation, reverse Steps 1 through 4 as outlined under Removal.

Driveshaft - Boom/Vibration At 20-65 MPH

Article No. 97-21-16

10/13/97

^ NOISE - "BOOM" WHEN DRIVING 32-105 KM/H (20-65 MPH) - SUPERCAB MODELS ONLY

^ VIBRATION WHEN DRIVING 32-105 KM/H (20-65 MPH) - SUPERCAB MODELS ONLY

^ DRIVESHAFT - "BOOM" VIBRATION WHEN DRIVING 32-105 KM/H (20-65 MPH)-SUPERCAB MODELS ONLY

LIGHT TRUCK: 1989-97 RANGER

This TSB article is being republished in its entirety to remove mention of build dates in title.

ISSUE: A driveline "boom" or vibration may be experienced when driving 32-105 km/h (20-65 mph) in some vehicles. This may occur because of driveline sensitivity of the vehicle.

Service Procedure

NOTE:

BEFORE DIAGNOSING A 4-WHEEL-DRIVE VEHICLE, MAKE SURE IT IS IN 2WD AND THE FRONT HUBS ARE UNLOCKED.

1. On smooth pavement, drive the vehicle at a constant speed and feel for the "float" condition:

a. This is the narrow, neutral range where the driveline can be said to "float" because neither accel nor decel forces are being applied to the driveline.

b. It is important to accurately identify vehicle behavior in "float" mode because the diagnostic routine to be used will depend on Noise/Vibration/Harshness (NVH) characteristics during float.

c. It may be necessary to drive the vehicle several minutes before the sensation can be clearly identified.

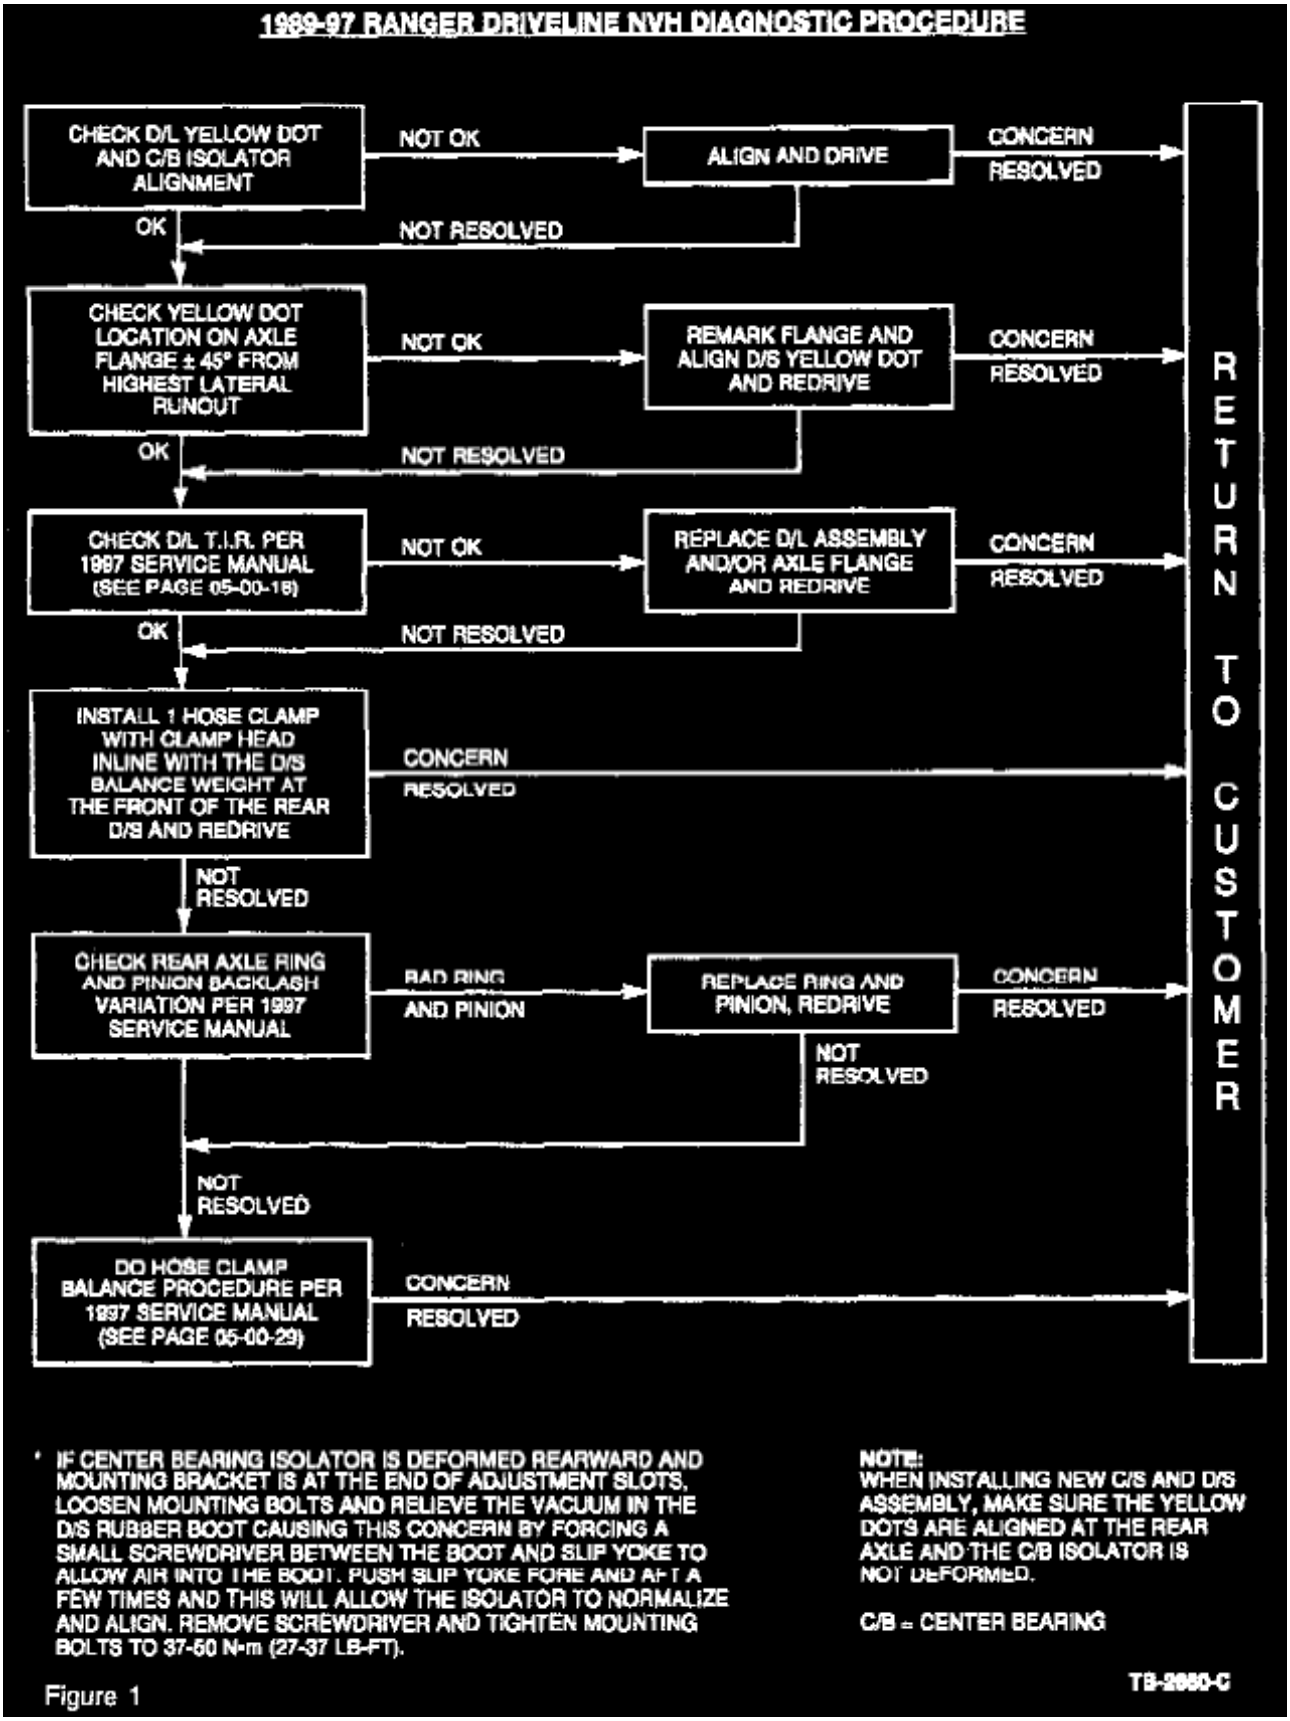

Figure 1

2. Perform the Driveline NVH Diagnostic Procedure shown in Figure 1 BEFORE replacing any components.

Vibration

Vibration, technically, is a high-frequency trembling, shaking or grounding condition, felt or heard, that is constant or variable in level and occurs during a portion of the total operating speed range. The types of vibrations that can be felt in the vehicle can be divided into three groups:

^ Vibrations of various unbalanced rotating parts of the vehicle

^ Body and frame vibrations excited by the powertrain, wind or road inputs

^ Tip-in moans or resonance vibrations from stressed engine or exhaust system mounts

If vibration is gone, check the front driveshaft, transfer case, front axle, or halfshafts for loose components. Refer to the 1997 Ranger Service Manual, Section 05-03B, for details.

NOTE:

DRIVING A 4-WHEEL-DRIVE VEHICLE WITH THE REAR DRIVESHAFT REMOVED FURTHER CONFIRMS ANY VIBRATION CONCERNS WITH THE FRONT DRIVE SYSTEM.

These vehicle vibrations can also be subdivided into those that occur at low speeds and those that are most noticeable at higher speeds. Since the dividing line between low and higher speed vibrations is not clear, there will be vibrations that overlap the two ranges.

Typical Low Speed Vibrations (less than 72 km/h (45 mph))

^ Exhaust vibration

^ Engine harshness

^ Driveline vibration due to improper driveline angles

^ Power steering pump disturbances

^ Air conditioner compressor or drive belt vibrations

^ Takeoff shudder (clutch or driveline problems)

^ Brake roughness or harshness

^ Driveline roughness

^ Clutch torsion vibration

^ Driveline slip-yoke or U-joints

Typical High Speed Vibrations (above than 72 km/h (45 mph))

^ Axle and companion flange runout or imbalance

^ Driveshaft imbalance

^ Excessive tire-wheel and drum assembly imbalance

^ Tire roughness due to high non-uniformity (force variation) or out-of-balance condition

^ Rear axle pinion gear pitch line runout

^ Excessive tire and wheel run out

^ Worn suspension components

^ Front end accessory vibrations

^ Exhaust vibration - Exhaust vibration is greatly reduced in Ranger exhaust systems de-coupled by a flexible coupling and mounted with blade and block hangers

Driveshaft Vibrates

1. Road test vehicle to determine critical vibration points. Note road speed, engine rpm and shift lever positions at which vibration occurs.

2. Stop vehicle and run engine with clutch depressed (automatic transmission in Neutral) through critical speed ranges determined in Step 1 of Driveshaft Vibrates.

3. If vibration is gone, the driveshaft must be balanced as described in the 1997 Ranger Service Manual, Page 05-00-29.

Component Test

Driveline Vibration

^ Driveline vibration exhibits a higher frequency and lower amplitude than does high-speed shake

^ Driveline vibration is directly related to the speed of the vehicle and is usually noticed at speeds of 72 km/h (45 mph) or higher

^ Driveline vibration can be perceived as a tremor in the floor pan or is heard as a rumble, hum or boom

^ Driveline vibration can exist in all drive modes, but may exhibit different symptoms depending upon whether the vehicle is accelerating, decelerating, floating or coasting. If the vibration is

particularly noticeable during acceleration or deceleration, especially at lower speeds, then driveline angle should be checked

^ Driveline vibration can be duplicated by supporting the axle upon a hoist or upon jackstands, though the brakes may need to be applied lightly in order to simulate road resistance. Refer to the 1997 Ranger Service Manual, Page 05-00-15, Steps 1-10

Driveshaft Runout and Balance

Vibration or shudder which is noticeable either on fast acceleration, when coasting, or when using the engine for braking, may be caused by the rear axle housing being loose on the rear suspension, improper tire balance, improper driveline installation, or driveline balance.

If driveshaft components are replaced and shaft vibration is encountered after installation, disconnect and remove the driveshaft. Rotate the rear axle companion flange 180 degrees; then, reconnect the driveshaft to the driveshaft slip-yoke and reinstall in vehicle. If the vibration persists, disconnect the driveshaft at the rear axle companion flange. Rotate the rear axle companion flange 180 degrees and reconnect the driveshaft to the rear axle companion flange.

If rotating the driveshaft 180 degrees does not eliminate vibration, the driveshaft may be balanced by referring to the 1997 Ranger Service Manual, Page 05-00-29, Steps 1-9, for details.

Slip-Yoke Spline

Vehicle noise and vibration can be caused by a seized driveshaft slip-yoke spline. The service resolution to minimize driveshaft slip-yoke spline contamination and ultimate seizure can be found in the 1997 Ranger Service Manual, Page 05-00-32, Steps 1-11.

Driveline Angularity

Driveline angularity is the angular relationship between the engine crankshaft, the driveshaft and the rear axle pinion. Factors determining driveline angularity include ride height (rear spring) and engine mounts.

Low speed vibration, less than 72 km/h (45 mph), especially when the vehicle is subjected to heavy acceleration or deceleration, is an indication of improper driveline angles. When these conditions exist, check the universal joints for proper seating, mounting and operation.

Center Bearing, Supercab 4X2 and 4X4

1. Unbolt the center bearing mount and spin the bearing. If bearing does not rotate freely it must be replaced.

2. Inspect the rubber insulator for evidence of hardening, cracking or deterioration before removing shaft. Replace if damaged. Refer to the 1997 Ranger Workshop Manual, Pages 05-01-14 and -15, for center bearing and rubber insulator service.

NOTE:

IF DRIVESHAFT AND COUPLING SHAFT ARE REMOVED, MAKE SURE THE YOKE IS REINSTALLED ON THE COUPLING SHAFT IN THE SAME ORIENTATION AS IT WAS ORIGINALLY INSTALLED. THE ORIENTATION IS CRITICAL SO THAT PROPER DRIVESHAFT BALANCE AND UNIVERSAL JOINT PHASING IS MAINTAINED. TORQUE THE ATTACHING NUT TO 136-163 N.m (100-120 LB-FT).

NOTE:

THE DRIVESHAFTS CONTAINED IN THIS TSB ARTICLE ARE THE MOST RECENT RELEASED FOR SERVICE. REFER TO OTHER TSB ARTICLES LISTED FOR 1993 AND PRIOR MODELS.

Cross-Member: Customer Interest Frame/Crossmember - Snapping/Popping Noise

Article No. 94-8-13

^ FRAME - # 1 CROSSMEMBER - RIVET REPLACEMENT

^ NOISE - "POPPING/CREAKING" SOUNDS - FRAME # 1 CROSSMEMBER

LIGHT TRUCK: 1980-94 BRONCO, F-150-350 SERIES 1988-94 F SUPER DUTY, F-47

This TSB article is being republished in its entirety to add certain 1992/94 model year vehicles, to revise the nut specified in the article and its torque specification, and to expand the diagnostic and repair procedures contained in the article.

ISSUE:

A "popping/creaking" sound may come from the area of the # 1 crossmember attachment to the left frame rail. This occurs because of a slip/stick motion at a loose rivet in the lower flange of the frame near the steering gear. The rivet could be either a standard cold head rivet in light duty applications or a "huck" rivet, which has the appearance of a large "pop" Civet.

ACTION:

Use the following diagnostic procedure to determine if the noise is originating in this rivet area. If so, replace the rivet with a nut, bolt and washer assembly. The revised parts increase the clamp load at the joint, minimizing the motion that causes the noise. Refer to the following procedure for service details.

SOURCES OF VARIOUS FRONT UNDERBODY NOISES:

Various front underbody noises may originate from several different sources. Several noises have been misdiagnosed as # 1 crossmember rivet "pop/creak" because the noise tends to propagate to the shock tower area and the shock tower area acts as an amplifier such that the noises all appear to be coming from that area. Other underbody areas that produce similar noises include:

^ loose or improperly seated shock tower rivets

^ loose or misaligned transmission crossmembers

^ loose radius arm brackets

^ loose axle pivot brackets

Other service bulletins have been published to address the proper repair of these concerns.

DESCRIPTION OF # 1 CROSSMEMBER NOISES:

"Pop/creak" - A metal-to-metal rubbing motion which slip/sticks when a twist is induced into the frame.

DIAGNOSTIC PROCEDURE:

1. INTERVIEW THE CUSTOMER:

a. Understand the customer's description of the noise and of the conditions under which it is heard.

b. Road test the vehicle with the customer to fully understand where, how and when the noise occurs.

2. DUPLICATE THE NOISE CONCERN:

a. Drive the vehicle around for at least 15 minutes to warm-up and stress the frame joints, so that any frame noise is more likely to be repeatable in the garage.

b. Test the following situations:

^ Can the noise be duplicated while stationary and on dry pavement by repeatedly turning the steering wheel from steering stop to steering stop?

^ Can the noise be repeated while on the hoist without the suspension loaded by repeatedly turning the steering wheel from steering stop to steering stop?

Typically, the twist in the frame can be induced by turning the steering wheel back and forth from steering stop to steering stop to duplicate the noise at the # 1 crossmember attachment. IF THE NOISE IS NOT DUPLICATED UNDER ONE OF THESE SITUATIONS, INVESTIGATE OTHER AREAS FOR THE NOISE BEFORE PROCEEDING TO REPAIR THE # 1 CROSSMEMBER RIVET.

3. INSPECT FRAME BOLTS FOR PROPER INSTALLATION TORQUE:

a. Inspect and tighten all front end components which bolt to the frame to confirm they are at the proper torque. This includes, but is not limited to:

^ Radius arm bracket bolts - 135 +/- 20 N-m (100 +/- 15 lb.ft.)

^ Axle pivot bracket bolts (torques vary by model - refer to the appropriate light truck Service Manual for proper torque specifications)

^ Bumper bracket bolts - (refer to the appropriate light truck Service Manual for proper torque specifications)

b. Inspect the transmission crossmember for proper alignment and bolt torques. If misaligned:

^ Loosen all transmission crossmember fasteners (including to the transmission).

^ Lift the transmission to remove any load on the crossmember.

^ Lift and reposition the transmission crossmember to be centered on the frame attachment holes.

^ Tighten all frame fasteners to the 63 +/- 9 N-m (46 +/- 7 lb.ft.).

^ Lower the transmission and tighten fasteners to 95 +/- 15 N-m (70 +/- 11 lb.ft.).

4. TEST DRIVE THE VEHICLE

Road test the vehicle again to duplicate the concern. If the noise is still present, continue.

5. INSPECT THE FRAME RIVETS

a. Repeat Step 2 to duplicate the noise in the garage.

b. Use a stethoscope or chassis ears to isolate the area of the chassis that the noise appears to be originating from. Areas to check include the shock tower rivets and all # 1 crossmember rivets.

6. SERVICE THE VEHICLE

a. If the noise appears to be from the lower left-front # 1 crossmember fastener, follow the procedure outlined below.

b. If the noise appears to be coming from another rivet (other than the lower left front # 1 crossmember rivet), refer to TSB 93-6-10 for the proper rivet repair procedure.

LOWER LEFT FRONT # 1 CROSSMEMBER RIVET REPLACEMENT:

NOTE:

THIS SERVICE PROCEDURE DOES NOT APPLY TO STEERING GEAR LINER REPLACEMENT. REFER TO TSB 90-11-10 FOR STEERING GEAR LINER REPAIR PROCEDURE.

1. Remove damaged or loose COLD HEAD RIVETS:

a. Drill a 1/8" (3.175 mm) hole through the rivet.

b. Redrill the same hole through the shank of the rivet with a 3/8" (9.525 mm) drill.

c. Remove the rivet head with an air chisel.

d. Drive out the rivet with a punch and hammer.

2. Remove damaged or loose "HUCK" RIVETS:

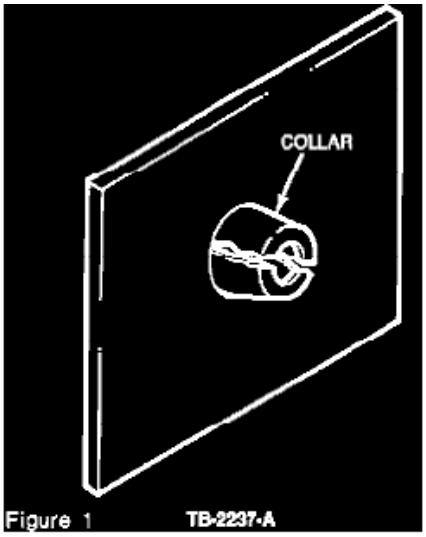

Figure 1 TB-2237-A

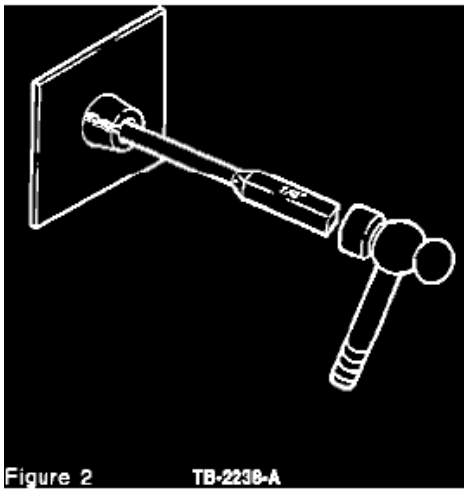

Figure 2 TB-2238-A

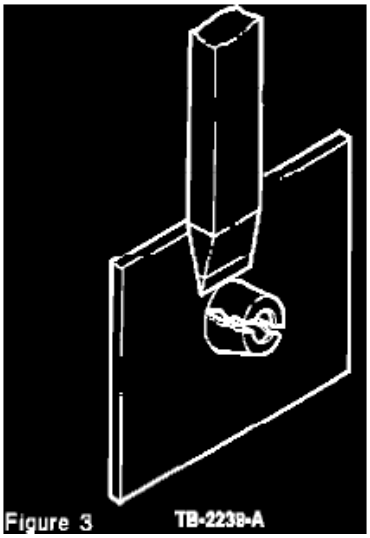

Figure 3 TB-2238-A

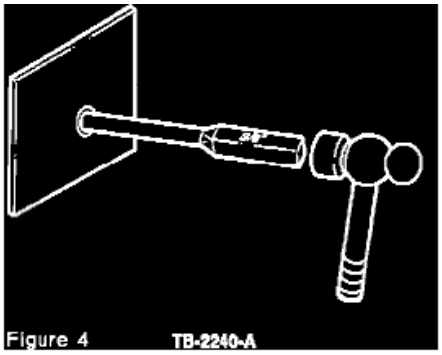
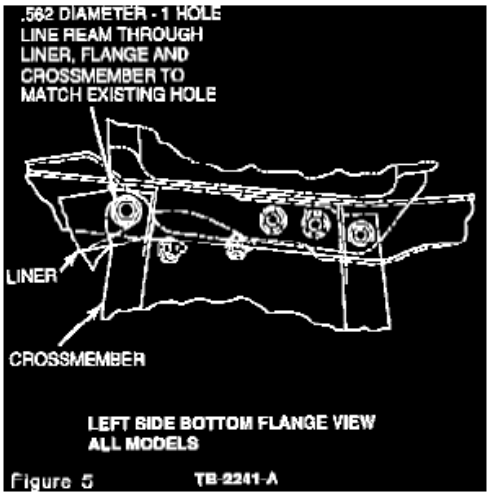
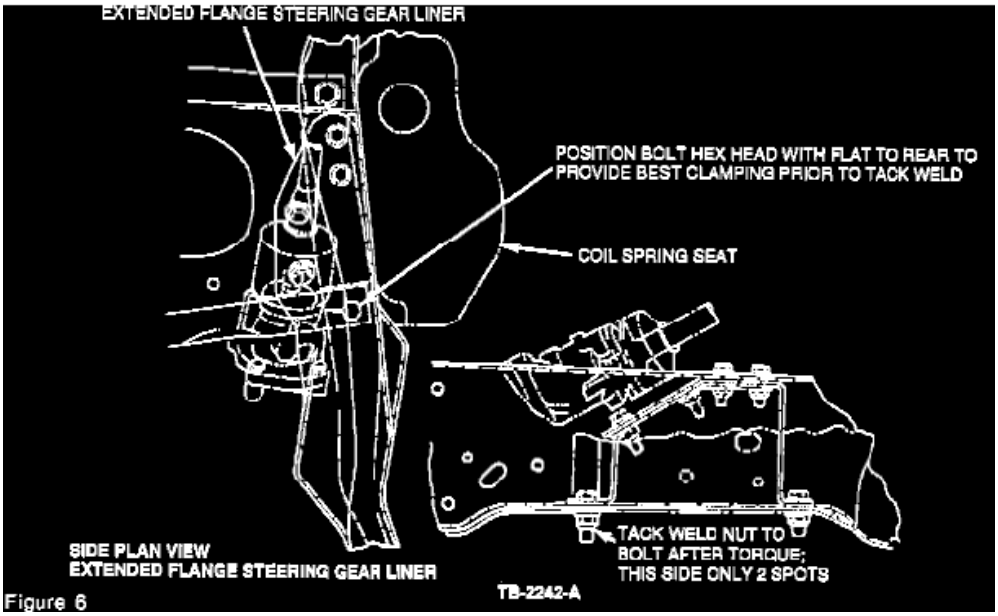
a. Use a flat chisel and hammer (or air chisel) to split the exposed collar of the huck fastener, Figure 1.

b. Knock the rivet pin out of the blind side with a 1/4" (6.35 mm) drift punch and hammer, Figure 2.

c. Cut the rivet's head off with a hammer and flat chisel, Figure 3.







d. Knock the sleeve out of the blind side with a 3/8" (9.525 mm) drift punch and hammer, Figure 4.

CAUTION:

REMOVAL OF THE FASTENER WITH A CUTTING TORCH IS NOT RECOMMENDED BECAUSE OF PROBABLE DAMAGE TO THE FRAME STRUCTURE.

3. Line ream the existing hole through the liner, frame flange and crossmember to 9/16" (14.228 mm), Figure 5.

4. Install a 9/16" Grade 8 nut (34990-S4), bolt (58698-S2) and washer (44880-S2), with nut/washer on the bottom, Figure 6.

a. Push the bolt into place using a brazing rod to hold the bolt.

PART NUMBER	PART NAME	CLASS
34990-S4	Nut 9/16 - 12 Hex (Pkg. 5)	RG
44880-S2	Washer 9/16 (Pkg. 12)	BG
58698-S2	Bolt 9/16-12 x 1.75" (Pkg. 4)	BG

b. Slide the bolt into the opening between the front face of the crossmember and frame liner.

c. Tighten the nut to 140 4-3 lb.ft. (190 4-4 N-m) and tack weld the nut to the bolt after tightening.

CAUTION:

DO NOT WELD THE NUT/WASHER TO THE FRAME.

Service Procedure

NOTE:

BEFORE DIAGNOSING A 4-WHEEL-DRIVE VEHICLE, MAKE SURE IT IS IN 2WD AND THE FRONT HUBS ARE UNLOCKED.

1. On smooth pavement, drive the vehicle at a constant speed and feel for the "float" condition:

a. This is the narrow, neutral range where the driveline can be said to "float" because neither accel nor decel forces are being applied to the driveline.

b. It is important to accurately identify vehicle behavior in "float" mode because the diagnostic routine to be used will depend on Noise/Vibration/Harshness (NVH) characteristics during float.

c. It may be necessary to drive the vehicle several minutes before the sensation can be clearly identified.

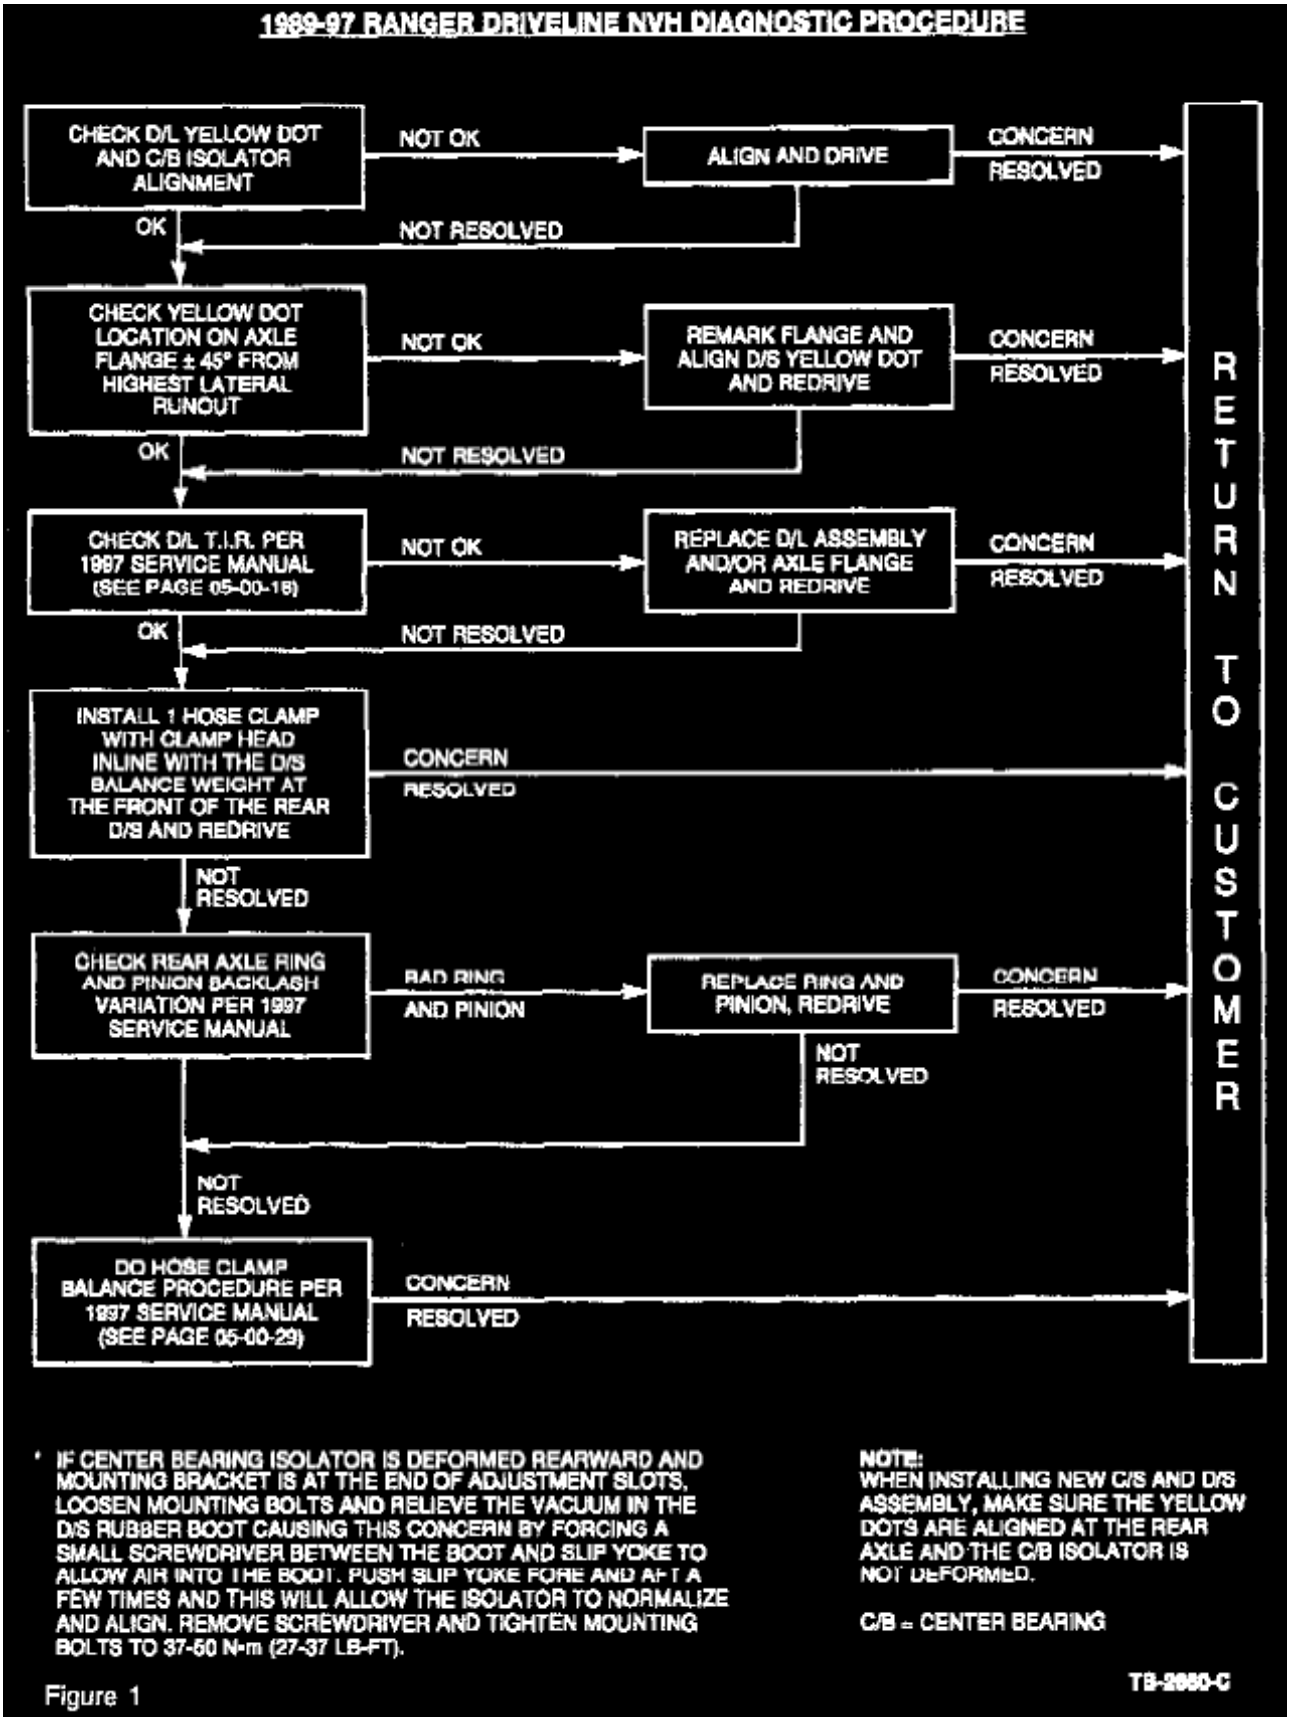

Figure 1

2. Perform the Driveline NVH Diagnostic Procedure shown in Figure 1 BEFORE replacing any components.

Vibration

Vibration, technically, is a high-frequency trembling, shaking or grounding condition, felt or heard, that is constant or variable in level and occurs during a portion of the total operating speed range. The types of vibrations that can be felt in the vehicle can be divided into three groups:

^ Vibrations of various unbalanced rotating parts of the vehicle

^ Body and frame vibrations excited by the powertrain, wind or road inputs

^ Tip-in moans or resonance vibrations from stressed engine or exhaust system mounts

If vibration is gone, check the front driveshaft, transfer case, front axle, or halfshafts for loose components. Refer to the 1997 Ranger Service Manual, Section 05-03B, for details.

NOTE:

DRIVING A 4-WHEEL-DRIVE VEHICLE WITH THE REAR DRIVESHAFT REMOVED FURTHER CONFIRMS ANY VIBRATION CONCERNS WITH THE FRONT DRIVE SYSTEM.

These vehicle vibrations can also be subdivided into those that occur at low speeds and those that are most noticeable at higher speeds. Since the dividing line between low and higher speed vibrations is not clear, there will be vibrations that overlap the two ranges.

Typical Low Speed Vibrations (less than 72 km/h (45 mph))

^ Exhaust vibration

^ Engine harshness

^ Driveline vibration due to improper driveline angles

^ Power steering pump disturbances

^ Air conditioner compressor or drive belt vibrations

^ Takeoff shudder (clutch or driveline problems)

^ Brake roughness or harshness

^ Driveline roughness

^ Clutch torsion vibration

^ Driveline slip-yoke or U-joints

Typical High Speed Vibrations (above than 72 km/h (45 mph))

^ Axle and companion flange runout or imbalance

^ Driveshaft imbalance

^ Excessive tire-wheel and drum assembly imbalance

^ Tire roughness due to high non-uniformity (force variation) or out-of-balance condition

^ Rear axle pinion gear pitch line runout

^ Excessive tire and wheel run out

^ Worn suspension components

^ Front end accessory vibrations

^ Exhaust vibration - Exhaust vibration is greatly reduced in Ranger exhaust systems de-coupled by a flexible coupling and mounted with blade and block hangers

Driveshaft Vibrates

1. Road test vehicle to determine critical vibration points. Note road speed, engine rpm and shift lever positions at which vibration occurs.

2. Stop vehicle and run engine with clutch depressed (automatic transmission in Neutral) through critical speed ranges determined in Step 1 of Driveshaft Vibrates.

3. If vibration is gone, the driveshaft must be balanced as described in the 1997 Ranger Service Manual, Page 05-00-29.

Component Test

Driveline Vibration

^ Driveline vibration exhibits a higher frequency and lower amplitude than does high-speed shake

^ Driveline vibration is directly related to the speed of the vehicle and is usually noticed at speeds of 72 km/h (45 mph) or higher

^ Driveline vibration can be perceived as a tremor in the floor pan or is heard as a rumble, hum or boom

^ Driveline vibration can exist in all drive modes, but may exhibit different symptoms depending upon whether the vehicle is accelerating, decelerating, floating or coasting. If the vibration is

particularly noticeable during acceleration or deceleration, especially at lower speeds, then driveline angle should be checked

^ Driveline vibration can be duplicated by supporting the axle upon a hoist or upon jackstands, though the brakes may need to be applied lightly in order to simulate road resistance. Refer to the 1997 Ranger Service Manual, Page 05-00-15, Steps 1-10

Driveshaft Runout and Balance

Vibration or shudder which is noticeable either on fast acceleration, when coasting, or when using the engine for braking, may be caused by the rear axle housing being loose on the rear suspension, improper tire balance, improper driveline installation, or driveline balance.

If driveshaft components are replaced and shaft vibration is encountered after installation, disconnect and remove the driveshaft. Rotate the rear axle companion flange 180 degrees; then, reconnect the driveshaft to the driveshaft slip-yoke and reinstall in vehicle. If the vibration persists, disconnect the driveshaft at the rear axle companion flange. Rotate the rear axle companion flange 180 degrees and reconnect the driveshaft to the rear axle companion flange.

If rotating the driveshaft 180 degrees does not eliminate vibration, the driveshaft may be balanced by referring to the 1997 Ranger Service Manual, Page 05-00-29, Steps 1-9, for details.

Slip-Yoke Spline

Vehicle noise and vibration can be caused by a seized driveshaft slip-yoke spline. The service resolution to minimize driveshaft slip-yoke spline contamination and ultimate seizure can be found in the 1997 Ranger Service Manual, Page 05-00-32, Steps 1-11.

Driveline Angularity

Driveline angularity is the angular relationship between the engine crankshaft, the driveshaft and the rear axle pinion. Factors determining driveline angularity include ride height (rear spring) and engine mounts.

Low speed vibration, less than 72 km/h (45 mph), especially when the vehicle is subjected to heavy acceleration or deceleration, is an indication of improper driveline angles. When these conditions exist, check the universal joints for proper seating, mounting and operation.

Center Bearing, Supercab 4X2 and 4X4

1. Unbolt the center bearing mount and spin the bearing. If bearing does not rotate freely it must be replaced.

2. Inspect the rubber insulator for evidence of hardening, cracking or deterioration before removing shaft. Replace if damaged. Refer to the 1997 Ranger Workshop Manual, Pages 05-01-14 and -15, for center bearing and rubber insulator service.

NOTE:

IF DRIVESHAFT AND COUPLING SHAFT ARE REMOVED, MAKE SURE THE YOKE IS REINSTALLED ON THE COUPLING SHAFT IN THE SAME ORIENTATION AS IT WAS ORIGINALLY INSTALLED. THE ORIENTATION IS CRITICAL SO THAT PROPER DRIVESHAFT BALANCE AND UNIVERSAL JOINT PHASING IS MAINTAINED. TORQUE THE ATTACHING NUT TO 136-163 N.m (100-120 LB-FT).

NOTE:

THE DRIVESHAFTS CONTAINED IN THIS TSB ARTICLE ARE THE MOST RECENT RELEASED FOR SERVICE. REFER TO OTHER TSB ARTICLES LISTED FOR 1993 AND PRIOR MODELS.

Cross-Member: All Technical Service Bulletins Frame/Crossmember - Snapping/Popping Noise

Article No. 94-8-13

^ FRAME - # 1 CROSSMEMBER - RIVET REPLACEMENT

^ NOISE - "POPPING/CREAKING" SOUNDS - FRAME # 1 CROSSMEMBER

LIGHT TRUCK: 1980-94 BRONCO, F-150-350 SERIES 1988-94 F SUPER DUTY, F-47

This TSB article is being republished in its entirety to add certain 1992/94 model year vehicles, to revise the nut specified in the article and its torque specification, and to expand the diagnostic and repair procedures contained in the article.

ISSUE:

A "popping/creaking" sound may come from the area of the # 1 crossmember attachment to the left frame rail. This occurs because of a slip/stick motion at a loose rivet in the lower flange of the frame near the steering gear. The rivet could be either a standard cold head rivet in light duty applications or a "huck" rivet, which has the appearance of a large "pop" Civet.

ACTION:

Use the following diagnostic procedure to determine if the noise is originating in this rivet area. If so, replace the rivet with a nut, bolt and washer assembly. The revised parts increase the clamp load at the joint, minimizing the motion that causes the noise. Refer to the following procedure for service details.

SOURCES OF VARIOUS FRONT UNDERBODY NOISES:

Various front underbody noises may originate from several different sources. Several noises have been misdiagnosed as # 1 crossmember rivet "pop/creak" because the noise tends to propagate to the shock tower area and the shock tower area acts as an amplifier such that the noises all appear to be coming from that area. Other underbody areas that produce similar noises include:

^ loose or improperly seated shock tower rivets

^ loose or misaligned transmission crossmembers

^ loose radius arm brackets

^ loose axle pivot brackets

Other service bulletins have been published to address the proper repair of these concerns.

DESCRIPTION OF # 1 CROSSMEMBER NOISES:

"Pop/creak" - A metal-to-metal rubbing motion which slip/sticks when a twist is induced into the frame.

DIAGNOSTIC PROCEDURE:

1. INTERVIEW THE CUSTOMER:

a. Understand the customer's description of the noise and of the conditions under which it is heard.

b. Road test the vehicle with the customer to fully understand where, how and when the noise occurs.

2. DUPLICATE THE NOISE CONCERN:

a. Drive the vehicle around for at least 15 minutes to warm-up and stress the frame joints, so that any frame noise is more likely to be repeatable in the garage.

b. Test the following situations:

^ Can the noise be duplicated while stationary and on dry pavement by repeatedly turning the steering wheel from steering stop to steering stop?

^ Can the noise be repeated while on the hoist without the suspension loaded by repeatedly turning the steering wheel from steering stop to steering stop?

Typically, the twist in the frame can be induced by turning the steering wheel back and forth from steering stop to steering stop to duplicate the noise at the # 1 crossmember attachment. IF THE NOISE IS NOT DUPLICATED UNDER ONE OF THESE SITUATIONS, INVESTIGATE OTHER AREAS FOR THE NOISE BEFORE PROCEEDING TO REPAIR THE # 1 CROSSMEMBER RIVET.

3. INSPECT FRAME BOLTS FOR PROPER INSTALLATION TORQUE:

a. Inspect and tighten all front end components which bolt to the frame to confirm they are at the proper torque. This includes, but is not limited to:

^ Radius arm bracket bolts - 135 +/- 20 N-m (100 +/- 15 lb.ft.)

^ Axle pivot bracket bolts (torques vary by model - refer to the appropriate light truck Service Manual for proper torque specifications)

^ Bumper bracket bolts - (refer to the appropriate light truck Service Manual for proper torque specifications)

b. Inspect the transmission crossmember for proper alignment and bolt torques. If misaligned:

^ Loosen all transmission crossmember fasteners (including to the transmission).

^ Lift the transmission to remove any load on the crossmember.

^ Lift and reposition the transmission crossmember to be centered on the frame attachment holes.

^ Tighten all frame fasteners to the 63 +/- 9 N-m (46 +/- 7 lb.ft.).

^ Lower the transmission and tighten fasteners to 95 +/- 15 N-m (70 +/- 11 lb.ft.).

4. TEST DRIVE THE VEHICLE

Road test the vehicle again to duplicate the concern. If the noise is still present, continue.

5. INSPECT THE FRAME RIVETS

a. Repeat Step 2 to duplicate the noise in the garage.

b. Use a stethoscope or chassis ears to isolate the area of the chassis that the noise appears to be originating from. Areas to check include the shock tower rivets and all # 1 crossmember rivets.

6. SERVICE THE VEHICLE

a. If the noise appears to be from the lower left-front # 1 crossmember fastener, follow the procedure outlined below.

b. If the noise appears to be coming from another rivet (other than the lower left front # 1 crossmember rivet), refer to TSB 93-6-10 for the proper rivet repair procedure.

LOWER LEFT FRONT # 1 CROSSMEMBER RIVET REPLACEMENT:

NOTE:

THIS SERVICE PROCEDURE DOES NOT APPLY TO STEERING GEAR LINER REPLACEMENT. REFER TO TSB 90-11-10 FOR STEERING GEAR LINER REPAIR PROCEDURE.

1. Remove damaged or loose COLD HEAD RIVETS:

a. Drill a 1/8" (3.175 mm) hole through the rivet.

b. Redrill the same hole through the shank of the rivet with a 3/8" (9.525 mm) drill.

c. Remove the rivet head with an air chisel.

d. Drive out the rivet with a punch and hammer.

2. Remove damaged or loose "HUCK" RIVETS:

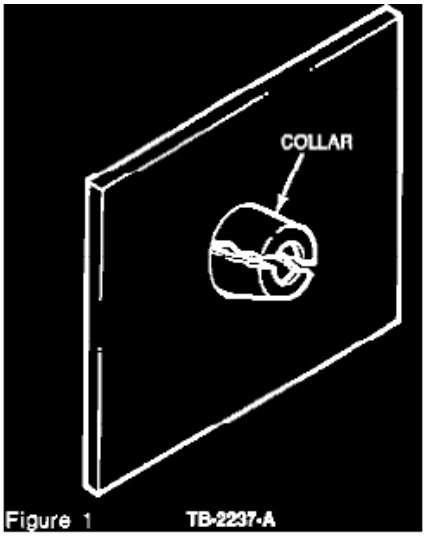

Figure 1 TB-2237-A

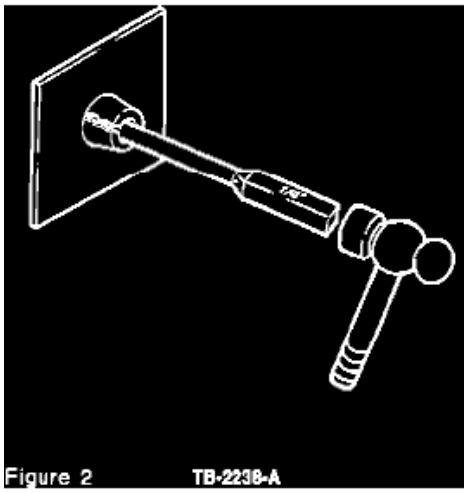

Figure 2 TB-2238-A

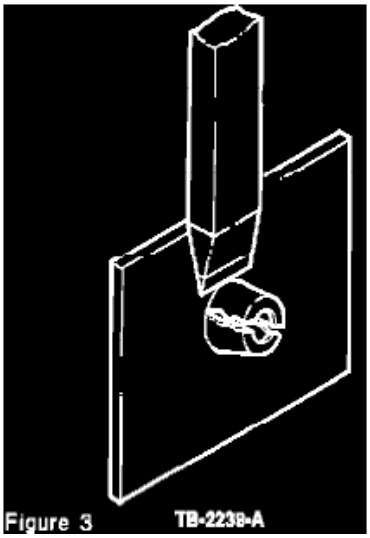

Figure 3 TB-2238-A

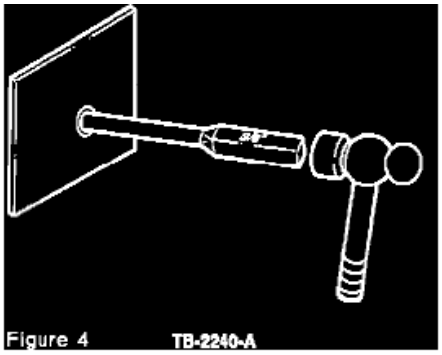
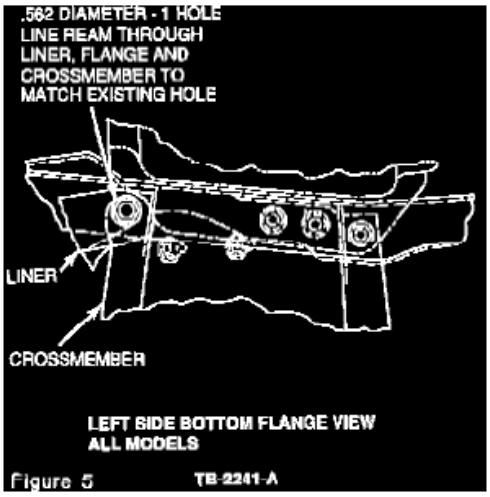
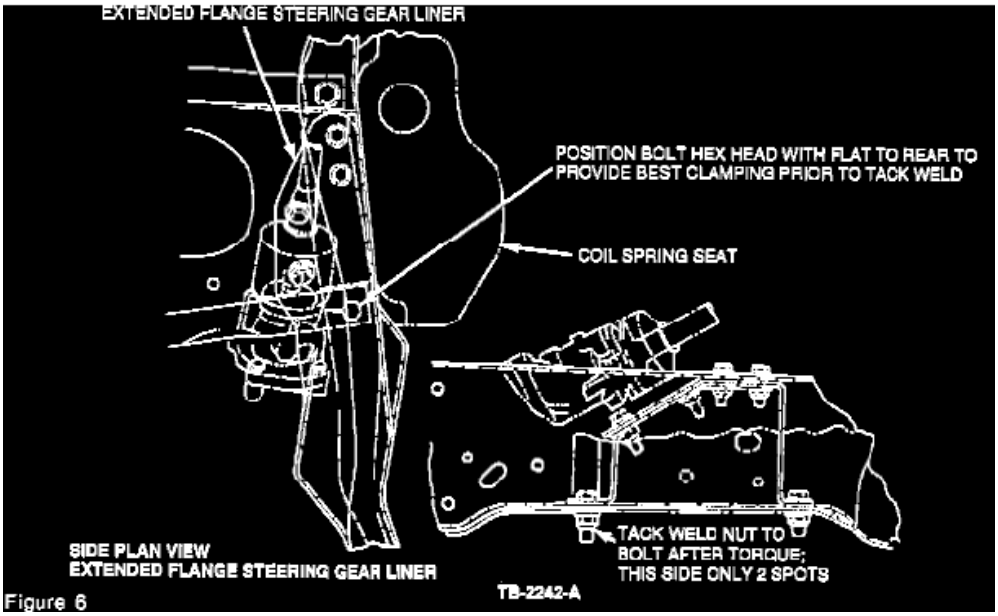
a. Use a flat chisel and hammer (or air chisel) to split the exposed collar of the huck fastener, Figure 1.

b. Knock the rivet pin out of the blind side with a 1/4" (6.35 mm) drift punch and hammer, Figure 2.

c. Cut the rivet's head off with a hammer and flat chisel, Figure 3.







d. Knock the sleeve out of the blind side with a 3/8" (9.525 mm) drift punch and hammer, Figure 4.

CAUTION:

REMOVAL OF THE FASTENER WITH A CUTTING TORCH IS NOT RECOMMENDED BECAUSE OF PROBABLE DAMAGE TO THE FRAME STRUCTURE.

3. Line ream the existing hole through the liner, frame flange and crossmember to 9/16" (14.228 mm), Figure 5.

4. Install a 9/16" Grade 8 nut (34990-S4), bolt (58698-S2) and washer (44880-S2), with nut/washer on the bottom, Figure 6.

a. Push the bolt into place using a brazing rod to hold the bolt.

PART NUMBER	PART NAME	CLASS
34990-S4	Nut 9/16 - 12 Hex (Pkg. 5)	RG
44880-S2	Washer 9/16 (Pkg. 12)	BG
58698-S2	Bolt 9/16-12 x 1.75" (Pkg. 4)	BG

b. Slide the bolt into the opening between the front face of the crossmember and frame liner.

c. Tighten the nut to 140 4-3 lb.ft. (190 4-4 N-m) and tack weld the nut to the bolt after tightening.

CAUTION:

DO NOT WELD THE NUT/WASHER TO THE FRAME.

FRONT SEAT CENTER ARMREST - LOOSE AND WOBBLES - VEHICLES WITH BUCKET SEATS AND FLOOR CONSOLE

LIGHT TRUCK: 1989-90 BRONCO II 1989-94 RANGER 1991-94 EXPLORER

ISSUE: The front seat center console may become loose and wobble from side to side. This may be caused by the console armrest mounting bracket becoming loose and/or weak under extreme load conditions.

ACTION: Replace the center armrest console bracket with a new, more robust center armrest console bracket. Refer to the following for service details.

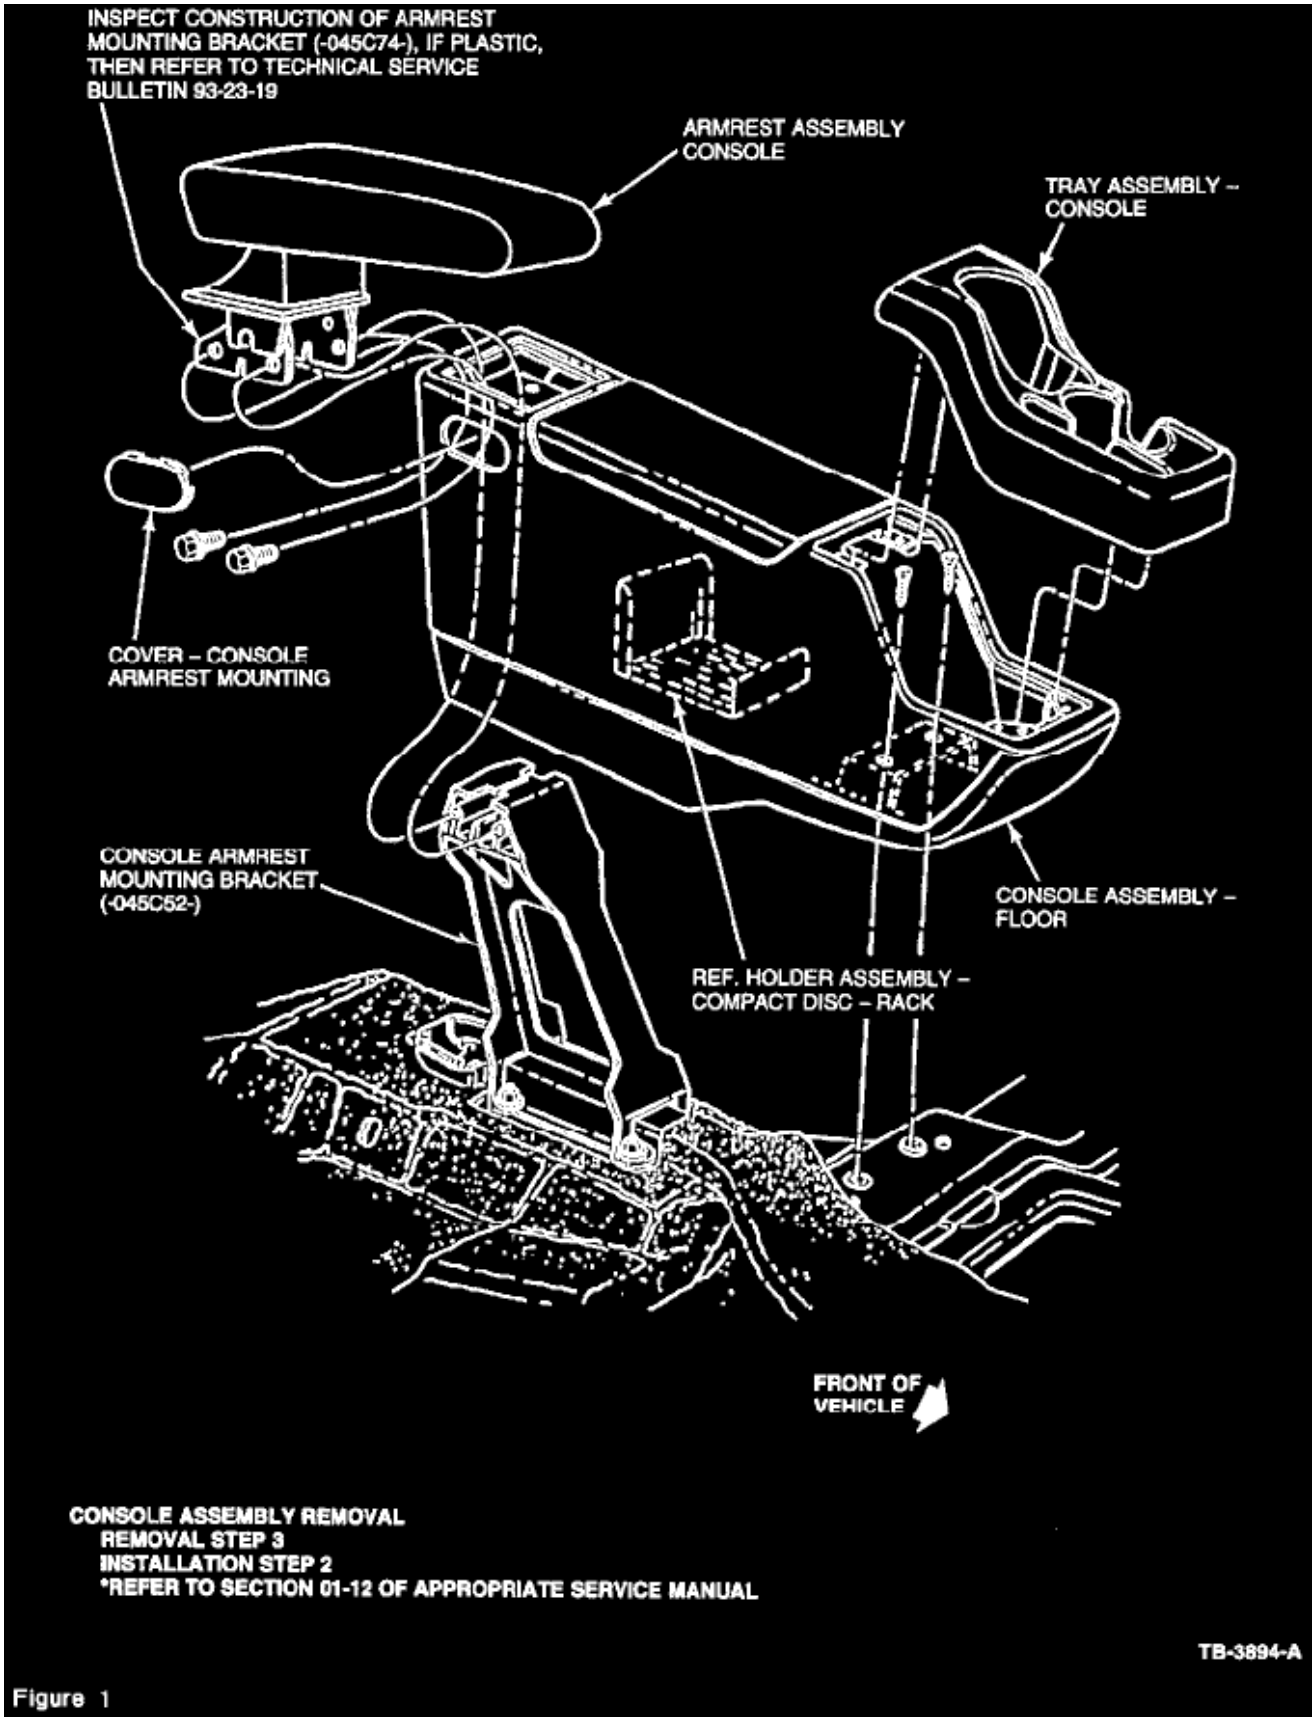
SERVICE PROCEDURE

REMOVAL

1. Verify the concern.

NOTE:

ALSO INSPECT THE ARMREST MOUNTING BRACKET WHICH RETAINS THE ARMREST TO THE CONSOLE. IF THE ARMREST BRACKET IS CONSTRUCTED OF PLASTIC, REFER TO TSB 93-23-19 FOR MORE DETAILS.



INSPECT CONSTRUCTION OF ARMREST MOUNTING BRACKET (-045C74-), IF PLASTIC, THEN REFER TO TECHNICAL SERVICE BULLETIN 93-23-19

Synchronizer Ring: All Technical Service Bulletins M/T - Crunching Shifting From 2nd to 3rd Gear

Article No. 91-18-11 09/05/91

^ NOISE-INTERMITTENT "CRUNCHING" WHEN SHIFTING FROM 2ND TO 3RD-VEHICLES WITH M50D (MAZDA R1 AND R2) TRANSMISSION

^ TRANSMISSION-M50D (MAZDA R1 AND R2)- INTERMITTENT "CRUNCHING" NOISE WHEN SHIFTING FROM 2ND TO 3RD

LIGHT TRUCK: 1988-89 ECONOLINE 1988-90 BRONCO II 1988-91 AEROSTAR, BRONCO, F-150, RANGER 1991 EXPLORER

ISSUE: A slight intermittent "crunch" or grinding noise may be heard when shifting from 2nd to 3rd. This is caused by improper synchronizer engagement.

ACTION: Install a new synchronizer service kit. Refer to the Parts Block for correct parts usage and the following procedure for service details.

INSPECTION

1. Drive the vehicle to warm the transmission oil temperature to about 125~F (52~C). This can usually be done after driving about 10 miles at highway speed when the outside temperature is above freezing.

2. On a smooth road surface, accelerate the vehicle from a stop to 3rd gear at normal shift speeds as defined in the owners guide.

3. If a slight "crunch" is heard or grinding sensation is felt in the shift lever when shifting from 2nd to 3rd, proceed with the following synchronizer kit installation procedure.

SYNCHRONIZER KIT INSTALLATION

1. Remove the transmission from the vehicle. Refer to the appropriate Light Truck Shop Manual, Section 07-03A, for removal procedure.

2. Remove the 1st/2nd and 3rd/4th clutch hub and sleeve assembly along with the corresponding synchronizer ring.

3. Install all parts from the appropriate synchronizer kit. The kits contain new 1, 2, 3, and 4 synchronizer rings, a new 3/4 synchronizer sleeve and an instruction sheet. The original 1/2 clutch hub sleeve assembly and 3/4 clutch hub must be reused.

4. Put a label on the transmission showing it was updated per TSB 91-18-11 and to refer to this TSB before servicing.

NOTE: THE NEW 3RD GEAR SYNCHRONIZER RING AND 3/4 SYNCHRONIZER SLEEVE ARE UNIQUE FROM THE ORIGINAL COMPONENTS. THE NEW COMPONENTS MUST BE INSTALLED AS A SET IN THE PROPER POSITION. FAILURE TO DO SO WILL RESULT IN THE INABILITY TO SHIFT THE TRANSMISSION INTO ONE OF THE GEARS. note>

TRANSMISSION - M50D - HARD SHIFT TO REVERSE OR FIFTH GEAR

LIGHT TRUCK: 1988-89 ECONOLINE 1988-90 BRONCO II 1988-91 AEROSTAR, BRONCO, F-150, F-250, RANGER 1991 EXPLORER

ISSUE: The 5-R synchronizer sliding sleeve clutching teeth may wear on the reverse side. This may cause a hard to engage or partial engagement of fifth or reverse gear and could result in the transmission jumping out of gear. If the wear is allowed to continue, it may become difficult or impossible to engage 1-2-3 or 4th gear.

ACTION: Inspect the 5-R synchronizer sliding sleeve for wear and replace if excessive wear is found. Refer to the following procedure for service details.

INSPECTION PROCEDURE:

1. Remove necessary components so that the transmission extension housing can be removed without removing the entire transmission. Refer to the

Light Truck Shop Manual Section 07-03A for service details.

NOTE: COMPACT VEHICLES MAY REQUIRE REMOVAL OF TRANSMISSION

2. Remove the transmission extension housing.

3. Inspect the 5-R synchronizer sliding sleeve for wear of the reverse clutching teeth.

REPAIR PROCEDURE

1. If wear is observed, remove speedometer drive gear (4 x 2 only).

2. Remove the top cover (if repairing on the bench).

3. Carefully remove the main shaft and counter shaft locking nuts.

4. Remove and replace the following transmission parts. Refer to the Light Truck Shop Manual for service procedures.

^ 5th Counter Shaft Gear

^ 5-R Synchronizer, hub and ring assembly

NOTE: INSTALL WITH THE DOT ON THE SYNCHRONIZER SLEEVE FACING REVERSE GEAR.

^ Reverse counter shaft gear

^ 5-R Counter Lever

^ 5-R Shift fork and rod

NOTE: USE THE SPRING AND BALL FROM THE EXISTING ASSEMBLY.

^ Replace the idler shaft in the reverse idler gear assembly (R1 only).

NOTE: THERE ARE EXTRA ADJUSTING SHIMS PROVIDED IN CASE IT IS NECESSARY TO RESET THE 5-R SYNCHRONIZER HUB AND CONTROL REVERSE GEAR END PLAYS TO

SPECIFICATION. USE THE NEW MAIN SHAFT AND COUNTER SHAFT LOCKING NUTS UPON ASSEMBLY.

CAUTION: USE ALL THE PARTS CONTAINED IN THE SERVICE KIT INCLUDING THE COUNTER REVERSE LEVER. ALTHOUGH THE

NEW LEVER LOOKS THE SAME AS THE ONE CONTAINED IN THE TRANSMISSION, CONTACT ANGLES ARE SLIGHTLY DIFFERENT TO INSURE PROPER TIMING AND

ENGAGEMENT.

FRONT SEAT CENTER ARMREST - LOOSE AND WOBBLES - VEHICLES WITH BUCKET SEATS AND FLOOR CONSOLE

LIGHT TRUCK: 1989-90 BRONCO II 1989-94 RANGER 1991-94 EXPLORER

ISSUE: The front seat center console may become loose and wobble from side to side. This may be caused by the console armrest mounting bracket becoming loose and/or weak under extreme load conditions.

ACTION: Replace the center armrest console bracket with a new, more robust center armrest console bracket. Refer to the following for service details.

SERVICE PROCEDURE

REMOVAL

1. Verify the concern.

NOTE:

ALSO INSPECT THE ARMREST MOUNTING BRACKET WHICH RETAINS THE ARMREST TO THE CONSOLE. IF THE ARMREST BRACKET IS CONSTRUCTED OF PLASTIC, REFER TO TSB 93-23-19 FOR MORE DETAILS.

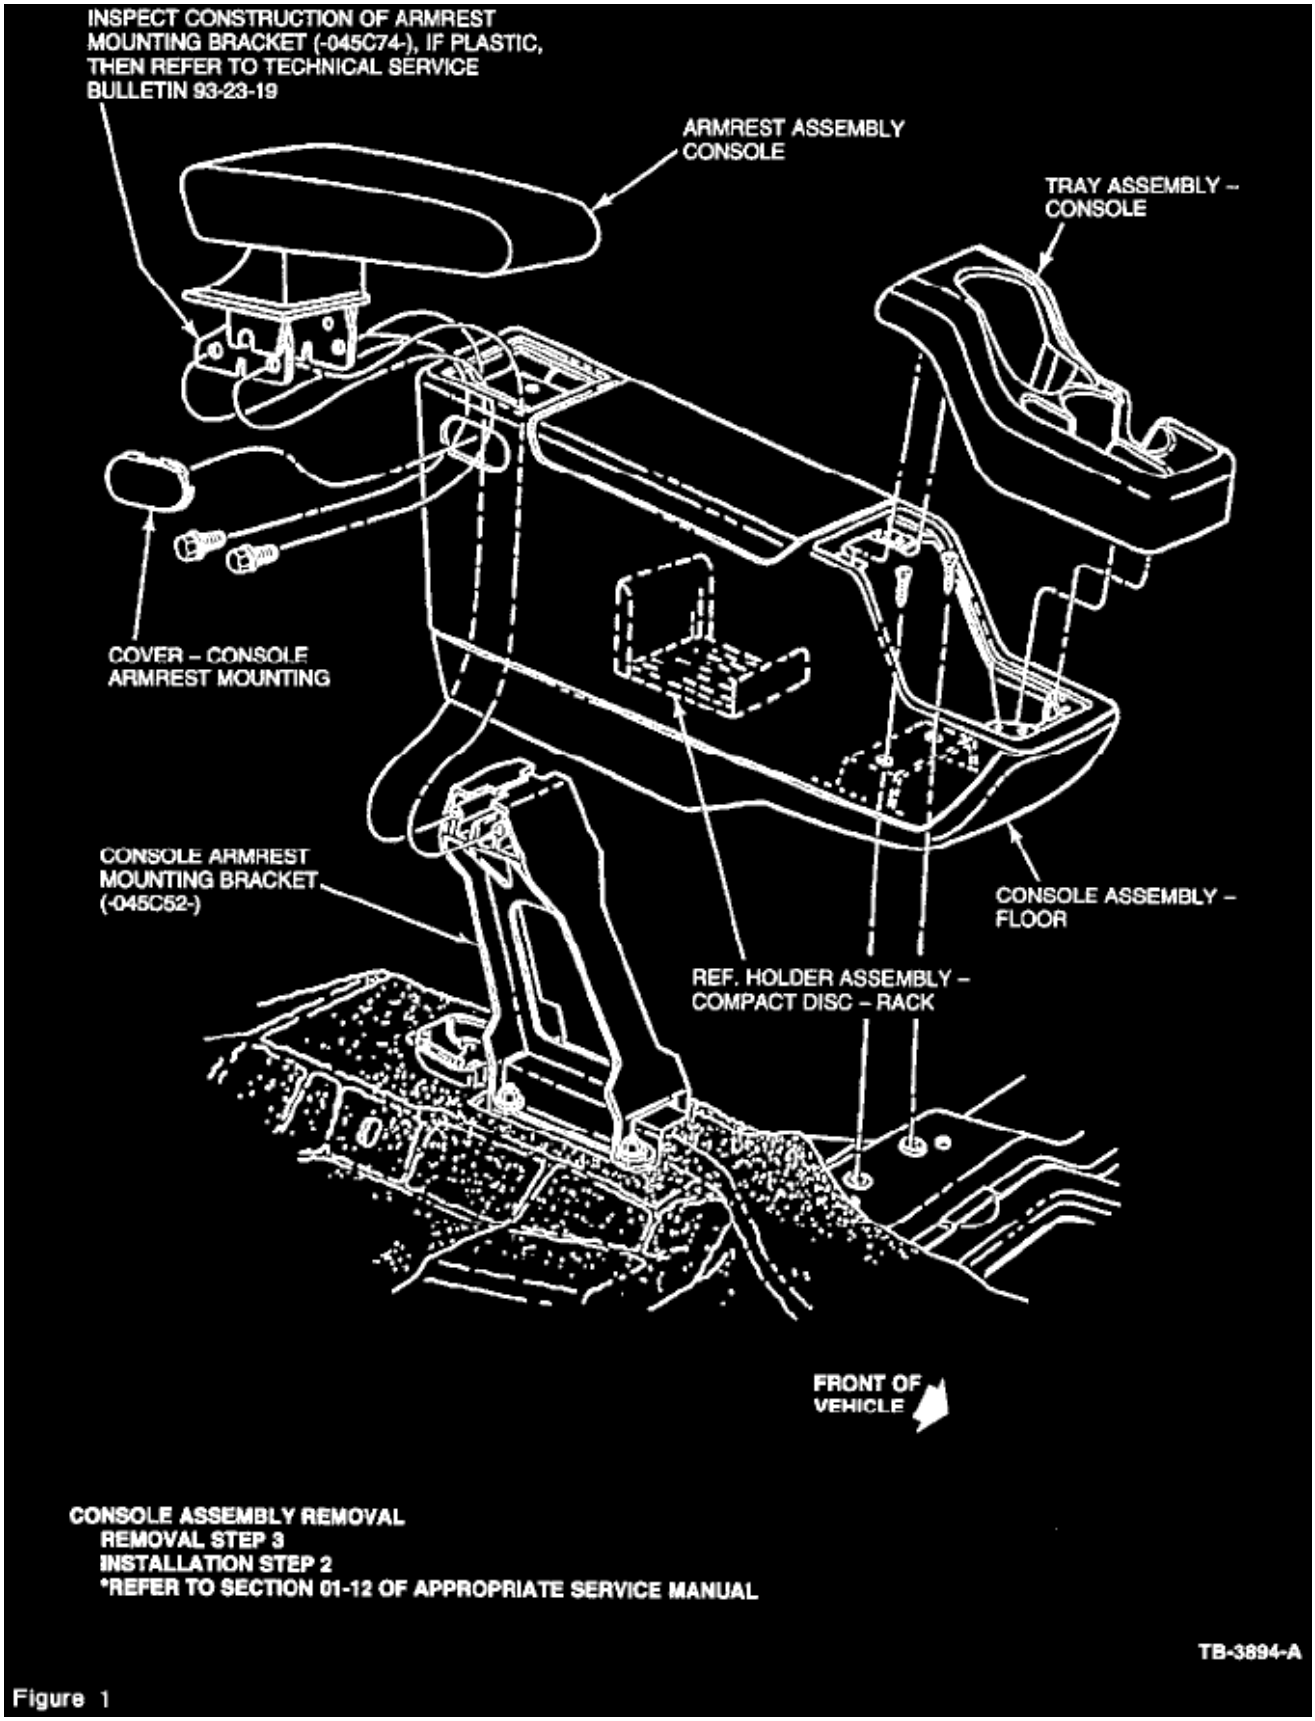

Figure 1

2. Remove the floor console assembly from the vehicle. Refer to Section 01-12 of the appropriate Service Manual and Figure 1 for removal procedures.

INSTALLATION STEPS 1 AND 2
TB-3895-A

Figure 2

3. Remove the four (4) nuts retaining the old console armrest mounting bracket to the floor pan. Save the nuts and discard the bracket. Refer to Figure 2.

INSTALLATION

NOTE:

BEFORE PROCEEDING, THE WELD STUDS MUST BE INSPECTED FOR DAMAGE (BENT, STRIPPED, SHEARED). IF ANY OF THESE CONDITIONS EXIST, THE WELD STUD(S) MUST BE REPLACED. REFER TO THE REPLACEMENT OF WELD STUD(S) SERVICE PROCEDURE LOCATED IN THIS ARTICLE BEFORE INSTALLING THE NEW BRACKET.

1. Position the armrest mounting bracket onto the weld studs and tighten nuts to 7-11 N-m (5-8 lb.ft.). Refer to Figure 2.

2. Install the floor console assembly into the vehicle. Refer to Section 01-12 of the appropriate Service Manual and Figure 1 for installation procedures.

PART NUMBER	PART NAME	CLASS

N606676-S36	Bolt	BR
N621905-S2	Nut	BS
F3AZ-19515-SA	SuperSeal	B

3. Verify proper function of the armrest.

4. Following the instructions and precautions on the can, apply SuperSeal (F3AZ-19515-SA) to the affected area to ensure a proper seal.

REPLACEMENT OF WELD STUD(S)

1. Use a grinding wheel or equivalent tool to remove damaged weld stud(s) from floor pan.

2. Use a punch and hammer to center punch location of damaged weld stud(s).

3. Drill 1/4 inch diameter hole(s) at center punch mark(s).

4. Insert repair bolt(s) (N606676-S36) and washer(s) through hole(s) and new console bracket from underside of vehicle.

5. Install repair nut(s) (N621905-S2) and torque to 9-11 N-m (6-8 lb.ft.).

6. Refer to the Installation Procedure in this TSB to complete the installation procedure.

Article No. 95-24-4

12/04/95

^ DOOR - REPLACEMENT DOOR HAS LOOSE FITTING DOOR LOCK CYLINDER - SERVICE TIP

^ LOCK - LOOSE FITTING DOOR LOCK CYLINDER - SERVICE TIP

LIGHT TRUCK: 1981-96 F-150-350 SERIES 1983-96 BRONCO, RANGER 1986-95 AEROSTAR 1988-96 F SUPER DUTY 1992-96 ECONOLINE 1995-96 WINDSTAR

MEDIUM/HEAVY TRUCK: 1990-96 F & B SERIES

ISSUE: New replacement doors for past model years have a larger lock cylinder hole diameter. A loose fit will occur when installing the door lock cylinder. The lock cylinder mounting hole diameter in new doors has been increased in preparation for a new style lock cylinder. New locks will be phased in for future production.

ACTION: Install a spacer for the larger diameter door lock cylinder mounting hole. Refer to the following Service Procedure for details.

NOTE:

THE DOOR LOCK CYLINDER SPACER HAS BEEN ADDED TO CERTAIN 1996 MODEL YEAR VEHICLES TO ELIMINATE THE LOOSE FIT CONDITION FROM THE SMALLER DOOR LOCK CYLINDER. SOME VEHICLES MAY BE BUILT WITH SPACERS ON ONE SIDE ONLY. THIS IS DUE TO THE BALANCE OF SUPPLIES OF RIGHT AND LEFT DOORS AT THE ASSEMBLY PLANTS AT THE TIME OF MODEL YEAR CHANGEOVER.

SERVICE PROCEDURE

DOOR LOCK CYLINDER

INSTALLATION/REMOVAL

1. Whenever the door lock cylinder is removed, check for presence of lock cylinder spacer in the door in the lock hole. If one is present, check for damage and replace if necessary.

Figure 2

3. Snap a new spacer into the hole from outside the door (Figure 2).

DOOR OR LIFTGATE INSTALLATION/REMOVAL

When replacing the door of liftgate assembly, the new door or liftgate may have the larger lock cylinder hole. Measure the hole diameter (Figure 2). If dimension "X" is more than 24 mm, then a spacer is required. If it is less than 24 mm, then a spacer cannot be used.

NOTE:

EVEN IF THE ORIGINAL DOOR HAS A SPACER, ONE IS NOT NEEDED IF THE "X" DIMENSION IS LESS THAN 24 mm IN THE NEW DOOR.

GENERAL INFORMATION REGARDING SPACER USAGE

The purpose of the spacer is to allow the flexibility of phasing in future lock designs without having to coordinate doors and locks in production or having to maintain two unique service doors. In general, the spacers are to be used with new doors (large hole) and old locks. The new doors are being phased in ahead of the new locks.

Door Locks: All Technical Service Bulletins Door Lock Cylinder - Loose in Replacement Door

Article No. 95-24-4

12/04/95

^ DOOR - REPLACEMENT DOOR HAS LOOSE FITTING DOOR LOCK CYLINDER - SERVICE TIP

^ LOCK - LOOSE FITTING DOOR LOCK CYLINDER - SERVICE TIP

LIGHT TRUCK: 1981-96 F-150-350 SERIES 1983-96 BRONCO, RANGER 1986-95 AEROSTAR 1988-96 F SUPER DUTY 1992-96 ECONOLINE 1995-96 WINDSTAR

MEDIUM/HEAVY TRUCK: 1990-96 F & B SERIES

ISSUE: New replacement doors for past model years have a larger lock cylinder hole diameter. A loose fit will occur when installing the door lock cylinder. The lock cylinder mounting hole diameter in new doors has been increased in preparation for a new style lock cylinder. New locks will be phased in for future production.

ACTION: Install a spacer for the larger diameter door lock cylinder mounting hole. Refer to the following Service Procedure for details.

NOTE:

THE DOOR LOCK CYLINDER SPACER HAS BEEN ADDED TO CERTAIN 1996 MODEL YEAR VEHICLES TO ELIMINATE THE LOOSE FIT CONDITION FROM THE SMALLER DOOR LOCK CYLINDER. SOME VEHICLES MAY BE BUILT WITH SPACERS ON ONE SIDE ONLY. THIS IS DUE TO THE BALANCE OF SUPPLIES OF RIGHT AND LEFT DOORS AT THE ASSEMBLY PLANTS AT THE TIME OF MODEL YEAR CHANGEOVER.

SERVICE PROCEDURE

DOOR LOCK CYLINDER

INSTALLATION/REMOVAL

1. Whenever the door lock cylinder is removed, check for presence of lock cylinder spacer in the door in the lock hole. If one is present, check for damage and replace if necessary.

Clutch Slave Cylinder: All Technical Service Bulletins M/T Clutch Housing - Fluid Inside

Article No. 91-18-14 09/05/91

^ CLUTCH-SLAVE CYLINDER "LEAKS"- VEHICLES USED IN MUDDY OR DUSTY ENVIRONMENTS

^ LEAKS-CLUTCH SLAVE CYLINDER "LEAKS"- VEHICLES USED IN MUDDY OR DUSTY ENVIRONMENTS

LIGHT TRUCK: 1988-89 ECONOLINE 1988-91 AEROSTAR, BRONCO, F-150-350 SERIES, RANGER 1989-90 BRONCO II 1991 EXPLORER

ISSUE: Fluid detected inside the clutch housing may be caused by a leaking clutch slave cylinder. This may occur when vehicles are driven in severely muddy or dusty environments or when operated with extensive idle time. Vehicles include...

^ 1988-1991 Ranger, 1988-1990 Bronco II, 1988-1991 Aerostar and 1991 Explorer with manual transmissions.

^ 1988-1991 Bronco, F-150-350, and 1988-1989 Econoline with 5-Speed Manual Transmissions, except 7.3L Diesel and 7.5L engines.

ACTION: Replace the clutch slave cylinder if inspection confirms the cylinder is leaking. The new clutch slave cylinder contains a guide seal which improves durability and resistance to dirt entry. Refer to the following procedures for service details.

INSPECTION PROCEDURE:

1. If the vehicle is a Bronco or F-150, the repair will only involve 5 speed manual transmissions. Other vehicles described include all manual transmissions.

This slave cylinder is the internal "Concentric" and not the external style. Inspect vehicle to visually verify the style of slave cylinder installed.

2. Determine if the slave cylinder is leaking by checking for a fluid trace inside the bottom of the clutch housing.

REPAIR PROCEDURE

1. Remove the clutch slave cylinder. Refer to the appropriate Light Truck Shop Manual for service details.

2. Replace the clutch slave cylinder with a new slave cylinder (F1TZ-7A564-A). Refer to the appropriate Light Truck Shop Manual for service details.

Power Door Locks

Mirrors: Customer Interest Rear View Mirror - Detaches From Windshield

Article No. 94-17-2

08/24/94

REAR VIEW MIRROR - DETACHES FROM WINDSHIELD - SERVICE TIP

FORD: 1990-94 TEMPO 1990-95 CROWN VICTORIA, ESCORT, MUSTANG, TAURUS, THUNDERBIRD 1992-95 PROBE 1995 CONTOUR

LINCOLN-MERCURY: 1990-92 MARK VII 1990-94 TOPAZ 1990-95 CONTINENTAL, COUGAR, GRAND MARQUIS, SABLE, TOWN CAR 1991-95 TRACER 1993-95 MARK VIII 1995 MYSTIQUE

LIGHT TRUCK: 1990-95 AEROSTAR, BRONCO, ECONOLINE, EXPLORER, F-150-350 SERIES, RANGER 1993-95 VILLAGER 1995 WINDSTAR

ISSUE: The rear view mirror assembly may detach from the windshield. This may be caused by:

^ High humidity conditions, which may cause the production adhesive to fail

^ Improper cleaning of the glass and the mirror button during repair process may cause the Rear View Mirror Adhesive service chemical to fail, resulting in repeat repairs

^ Use of expired or improperly stored service kits

^ Improper use of service kit.

ACTION: Review the service kit expiration date, and use the revised cleaning and application procedures. Refer to the following procedures for service.

WARNING:

USE WITH ADEQUATE VENTILATION. AVOID EYE CONTACT AND CONTACT WITH SKIN.

SERVICE KIT STORAGE AND EXPIRATION PROCEDURES

1. Avoid prolonged storage of Rear View Mirror Adhesive kits. Over time, the adhesive performance will degrade. Excessive storage temperatures and exposure to sunlight will also degrade the unused material. For these reasons, Ford recommends:

^ Rotating stock, using the oldest material first

^ Storing the adhesive kits in a cool, dry, dark place

^ Avoiding placement of display racks in direct sunlight

^ Using only repair kits that are less than one (1) year old.

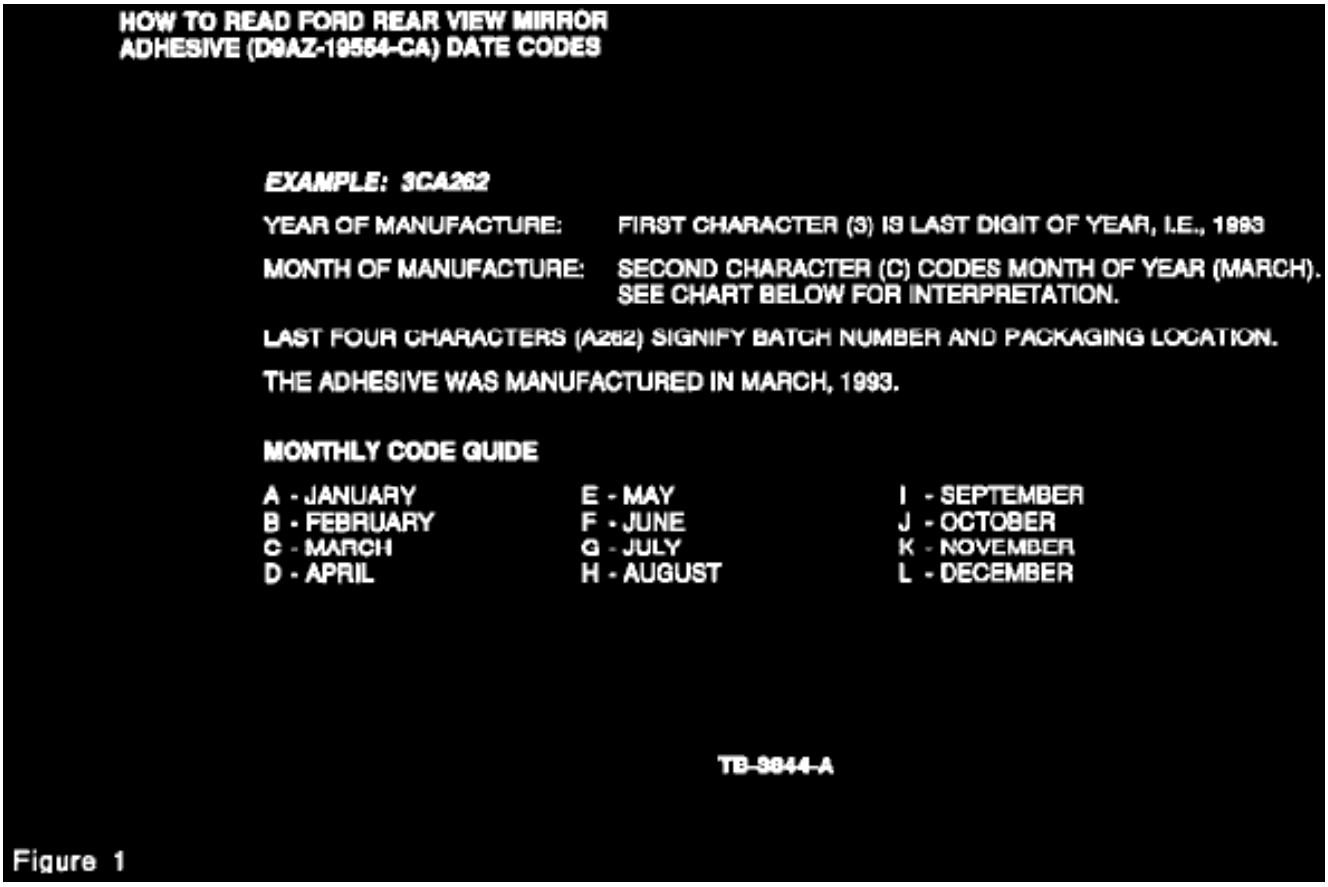

Figure 1

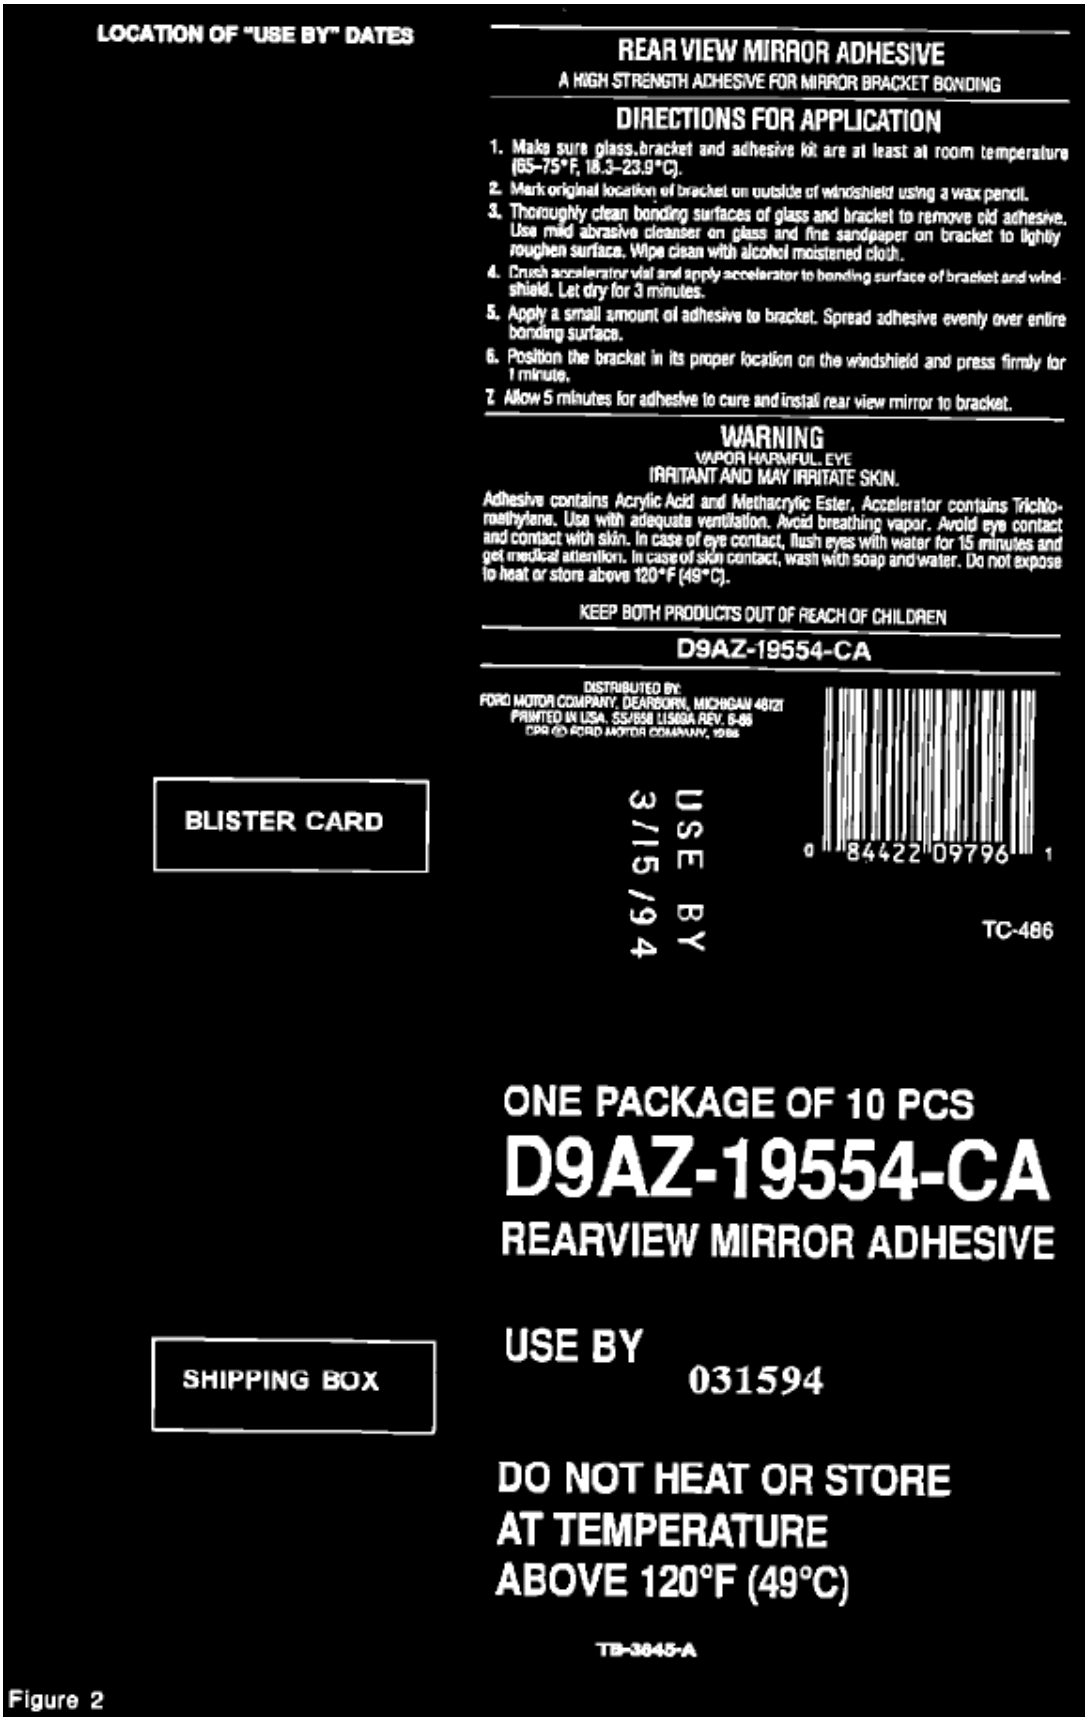
2. You can determine the age of the material in the kit by checking the date code crimped in the plastic seal at the bottom of the adhesive squeeze tube. The date code format is shown in Figure 1.

^ The first character is a digit representing the last digit of the year the material was manufactured.

^ The second character is a letter representing the month of manufacture.

^ The remaining characters indicate the location where the material was produced.



LOCATION OF "USE BY" DATES
REAR VIEW MIRROR ADHESIVE
A HIGH STRENGTH ADHESIVE FOR MIRROR BRACKET BONDING
DIRECTIONS FOR APPLICATION
1. Make sure glass, bracket and adhesive kit are at least at room temperature (65–75°F, 18.3–23.9°C).
2. Mark original location of bracket on outside of windshield using a wax pencil.
3. Thoroughly clean bonding surfaces of glass and bracket to remove old adhesive. Use mild abrasive cleanser on glass and fine sandpaper on bracket to lightly roughen surface. Wipe clean with alcohol moistened cloth.
4. Crush accelerator vial and apply accelerator to bonding surface of bracket and windshield. Let dry for 3 minutes.
5. Apply a small amount of adhesive to bracket. Spread adhesive evenly over entire bonding surface.
6. Position the bracket in its proper location on the windshield and press firmly for 1 minute.
7. Allow 5 minutes for adhesive to cure and install rear view mirror to bracket.
WARNING
VAPOR HARMFUL. EYE
IRRITANT AND MAY IRRITATE SKIN.
Adhesive contains Acrylic Acid and Methacrylic Ester. Accelerator contains Trichloroethylene. Use with adequate ventilation. Avoid breathing vapor. Avoid eye contact and contact with skin. In case of eye contact, flush eyes with water for 15 minutes and get medical attention. In case of skin contact, wash with soap and water. Do not expose to heat or store above 120°F (49°C).
KEEP BOTH PRODUCTS OUT OF REACH OF CHILDREN

TB-3845-A
Figure 2

This date represents the date the material was manufactured. Ford recommends that material older than one year old not be used to install interior rear view mirror assemblies. To enable dealership personnel to more easily determine the suitability of the material, the individual kits and the shipping box will be stamped with a "Use By" date. The new "Use By" label will be on all products made after June, 1994. Figure 2 shows the location of the "Use By" date on the back of each individual blister card and the shipping box.

SERVICE PROCEDURES

NOTE:

THE FOLLOWING PROCEDURES SUPERSEDE THE INSTRUCTIONS ON THE BACK OF THE ORIGINAL REAR VIEW MIRROR ADHESIVE PACKAGE.

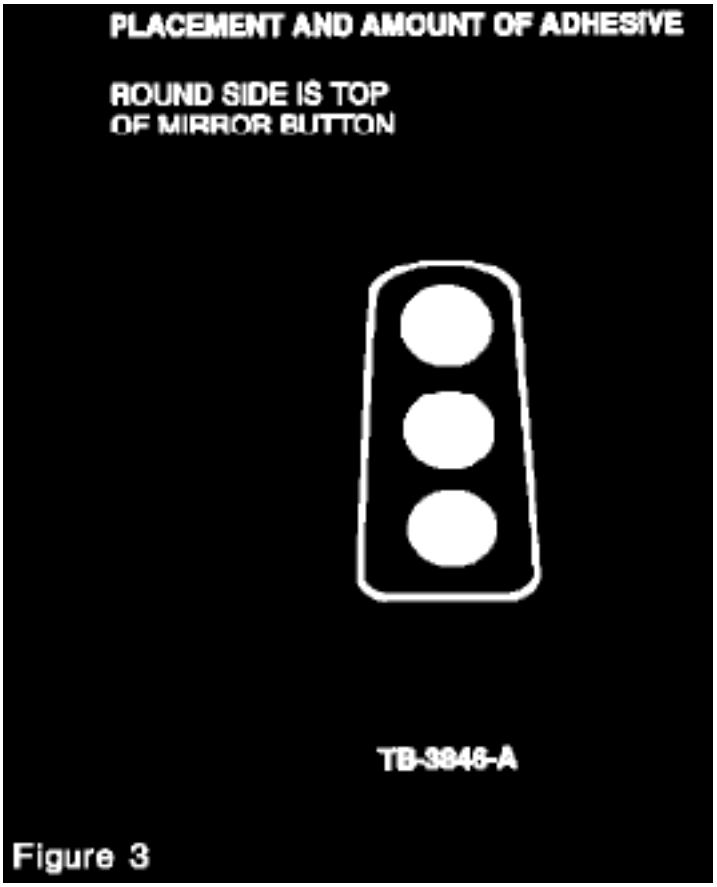

Figure 3

NOTE:

THE MIRROR BUTTON IS OFTEN CALLED A BRACKET, AND THE WINDSHIELD IS SOMETIMES REFERRED TO AS GLASS.

1. Make sure glass, bracket, and rear view mirror adhesive are at room temperature (65-75~F, 18-24~C).

^ If possible, the repair should be performed indoors. Do not perform the repair in direct sunlight.

^ If you must work outside, park the vehicle in a shaded area out of the direct sunlight.

^ The adhesive will not bond at temperatures less than 45~F (7~C), and will bond too quickly in direct sunlight.

2. Mark original location of bracket on outside of windshield with any appropriate marking tool (e.g., crayon, magic marker) before you begin.

NOTE:

SURFACES MUST BE CLEAN FOR PROPER BONDING TO OCCUR.

3. Use the following steps to ensure proper cleaning of glass and button:

a. Carefully remove thick layers of the old adhesive from the glass and the mirror button using a single edge razor blade.

b. Using a clean cloth saturated with isopropyl alcohol (obtain 70% isopropyl rubbing alcohol locally), rub the glass and the mirror button to remove any remaining old adhesive. Soaking the mirror button in isopropyl alcohol may speed the adhesive removal process.

c. Rub the mirror button and the glass with a non-abrasive bathroom cleanser (obtain locally) to ensure all traces of the old adhesive have been removed.

NOTE:

IT IS ESSENTIAL THAT NO TRACES OF CLEANSER OR ADHESIVE REMAIN ON THE GLASS OR THE MIRROR BUTTON.

d. Wipe the glass and the mirror button with a new, clean cloth saturated with isopropyl alcohol (or rubbing alcohol).

4. The accelerator vial contains a priming agent which speeds the adhesive curing process.

a. Grasp the paper wrapper around the vial and squeeze until the vial inside the paper wrapper breaks, releasing the accelerator to the felt tip on the end of the cylinder.

b. Cover the entire bonding area by applying a barely visible, but uniform, film of accelerator to an area larger than the mirror button "footprint" on the glass and to the entire mirror button bonding surface.

c. Let the accelerator dry for 3 minutes.

NOTE:

DO NOT TOUCH THE PRIMED SURFACES.

5. Squeeze only three (3) drops of adhesive in a line from top to bottom on the mirror button (Figure 3). It is not necessary to spread the adhesive.

NOTE:

MAKE SURE THE BUTTON IS POSITIONED PROPERLY FOR STEP 6. REPOSITIONING THE BUTTON, ONCE IN CONTACT WITH GLASS, WILL CAUSE THE ADHESIVE TO FAIL.

6. Position the mirror button in its proper location on the windshield (the rounded edge is pointing up). Press firmly for one full minute to ensure complete bonding. If mirror button is not firmly attached after more than one minute, remove button and repeat Steps 2 through 5.

7. Allow 5 minutes for adhesive to cure (with temperatures above 65~F, 18~C) and install rear view mirror to button. If temperature is between 45-65~F (7-18~C), use masking tape to firmly hold the button to the windshield and allow the adhesive to cure for at least 15 minutes.

ISSUE: This TSB article introduces a new procedure and tool for reattaching the inside rear view mirror assembly in the event the mirror detaches.

ACTION: Utilize the new Rotunda Mirror Button Applicator (164-R3925) to bond the mirror button to the windshield. This preferred method provides improved adhesion performance. Refer to the following Service Procedure for details.

SERVICE PROCEDURE

CAUTION:

DO NOT USE THIS PROCEDURE IF WINDSHIELD IS DAMAGED (e.g., CHIPPED, CRACKED, OR EXHIBITS STAR BREAKS) WITHIN 152 mm (61 OF THE MIRROR BUTTON, AND IF PLASTIC FILMS HAVE BEEN APPLIED TO THE INSIDE SURFACE OF THE WINDSHIELD (SUCH AS ADDITIONAL GRADIENT BANDS) WITHIN 51 mm (2") OF THE MIRROR BUTTON.

1. Mark original location of bracket on outside of windshield with any appropriate marking tool (e.g., white china marker) before you begin.

NOTE:

SURFACES MUST BE CLEAN FOR PROPER BONDING TO OCCUR.

2. Use the following steps to ensure proper cleaning of windshield:

a. Carefully remove any adhesive residue from the windshield using a new single edge razor blade.

b. Spray the inside surface of the windshield with a glass cleaner and wipe with a clean, soft, lint free cloth.

3. Remove the liner from the pre-applied tape and apply the button directly onto the windshield at the marked location.

Button sizes:

^ F7AZ-17698-AA Small Footprint Size (16 mm X 33 mm)

^ F7AZ-17698-BA Large Footprint Size (21 mm X 29 mm)

4. Center the curing head of the Rotunda Mirror Button Applicator (164-R3925) over the button.

5. Hold the curing head in place and press the "ON" button to activate the vacuum pump. Press the "START" button of the time/temperature controller to begin the cure cycle. Immediately clean the mirror button location marks from the outside of the windshield. Do not release the curing head until the cycle is completed. The AUTOMATIC CYCLE (once the start button is pressed) is as follows:

a. Time of curing cycle will be displayed.

b. Time will stay constant until cure temperature 185°C (365°F) is reached.

c. Once the cure temperature is reached, display will reflect time remaining for complete cure.

CAUTION:

THE HEATER BLOCK MAY STILL BE WARM. HANDLE WITH A GLOVE AND AVOID CONTACT WITH ANY SURFACE THAT MAY BE DAMAGED BY HIGH TEMPERATURE.

6. Turn the applicator off. Press the vacuum release button and remove the curing head from the windshield.

7. Once the button has cooled to ambient temperature (about 5 minutes), reattach the mirror assembly.

REAR VIEW MIRROR - DETACHES FROM WINDSHIELD - SERVICE TIP

FORD: 1990-94 TEMPO 1990-95 CROWN VICTORIA, ESCORT, MUSTANG, TAURUS, THUNDERBIRD 1992-95 PROBE 1995 CONTOUR

LINCOLN-MERCURY: 1990-92 MARK VII 1990-94 TOPAZ 1990-95 CONTINENTAL, COUGAR, GRAND MARQUIS, SABLE, TOWN CAR 1991-95 TRACER 1993-95 MARK VIII 1995 MYSTIQUE

LIGHT TRUCK: 1990-95 AEROSTAR, BRONCO, ECONOLINE, EXPLORER, F-150-350 SERIES, RANGER 1993-95 VILLAGER 1995 WINDSTAR

ISSUE: The rear view mirror assembly may detach from the windshield. This may be caused by:

^ High humidity conditions, which may cause the production adhesive to fail

^ Improper cleaning of the glass and the mirror button during repair process may cause the Rear View Mirror Adhesive service chemical to fail, resulting in repeat repairs

^ Use of expired or improperly stored service kits

^ Improper use of service kit.

ACTION: Review the service kit expiration date, and use the revised cleaning and application procedures. Refer to the following procedures for service.

WARNING:

USE WITH ADEQUATE VENTILATION. AVOID EYE CONTACT AND CONTACT WITH SKIN.

SERVICE KIT STORAGE AND EXPIRATION PROCEDURES

1. Avoid prolonged storage of Rear View Mirror Adhesive kits. Over time, the adhesive performance will degrade. Excessive storage temperatures and exposure to sunlight will also degrade the unused material. For these reasons, Ford recommends:

^ Rotating stock, using the oldest material first

^ Storing the adhesive kits in a cool, dry, dark place

^ Avoiding placement of display racks in direct sunlight

^ Using only repair kits that are less than one (1) year old.

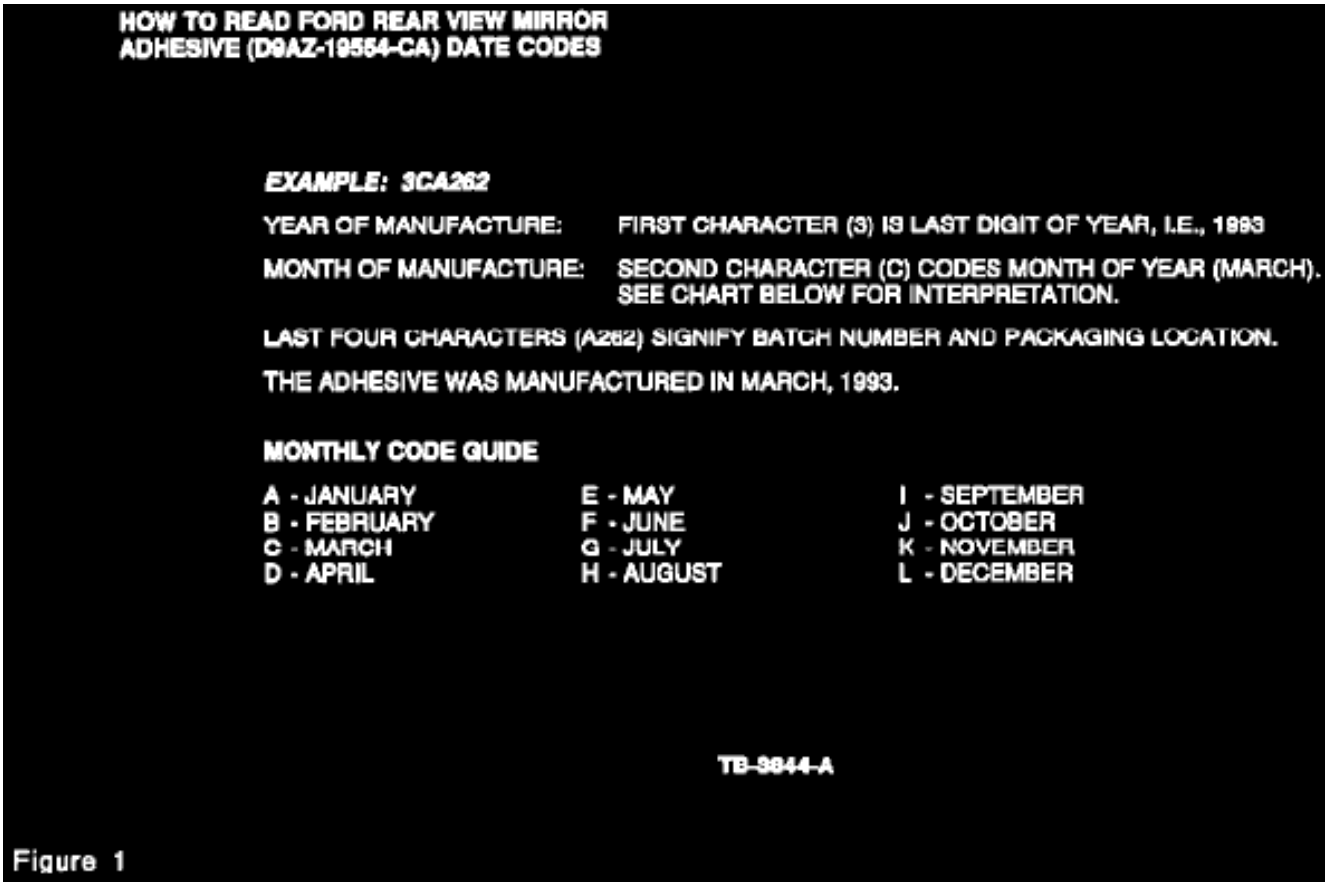

Figure 1

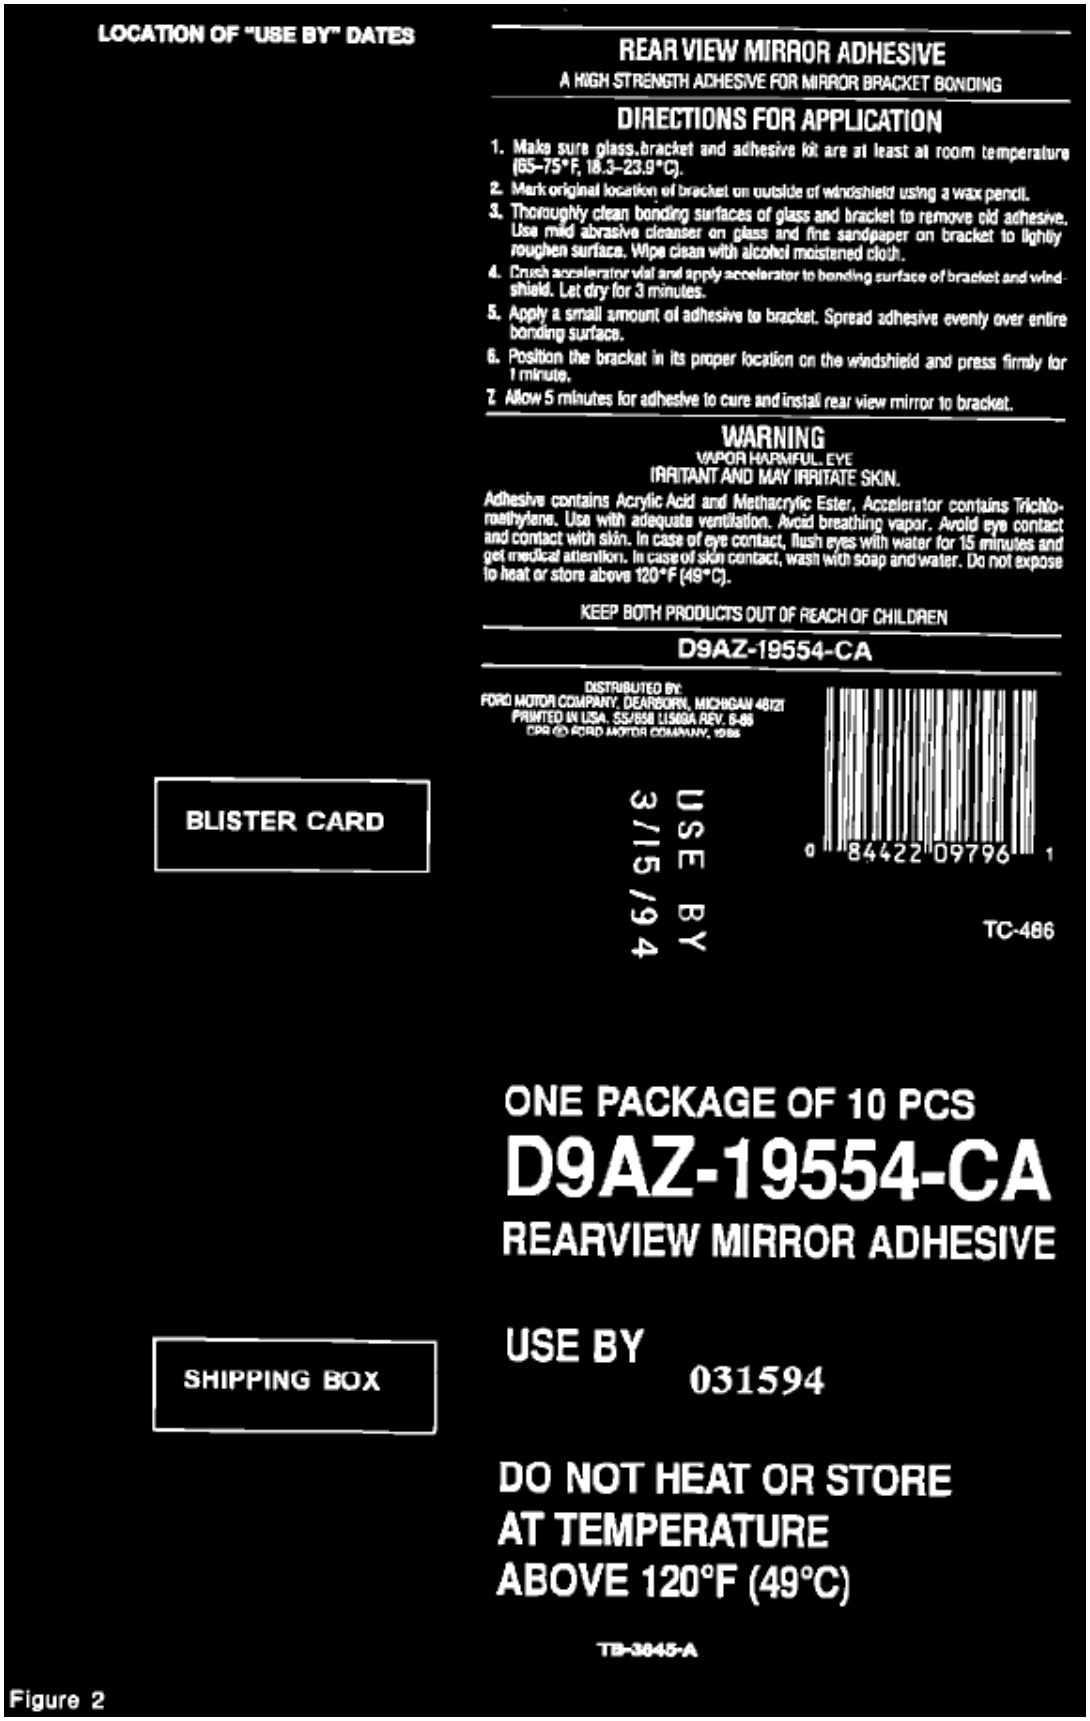
2. You can determine the age of the material in the kit by checking the date code crimped in the plastic seal at the bottom of the adhesive squeeze tube. The date code format is shown in Figure 1.

^ The first character is a digit representing the last digit of the year the material was manufactured.

^ The second character is a letter representing the month of manufacture.

^ The remaining characters indicate the location where the material was produced.



LOCATION OF "USE BY" DATES
REAR VIEW MIRROR ADHESIVE
A HIGH STRENGTH ADHESIVE FOR MIRROR BRACKET BONDING
DIRECTIONS FOR APPLICATION
1. Make sure glass, bracket and adhesive kit are at least at room temperature (65–75°F, 18.3–23.9°C).
2. Mark original location of bracket on outside of windshield using a wax pencil.
3. Thoroughly clean bonding surfaces of glass and bracket to remove old adhesive. Use mild abrasive cleanser on glass and fine sandpaper on bracket to lightly roughen surface. Wipe clean with alcohol moistened cloth.
4. Crush accelerator vial and apply accelerator to bonding surface of bracket and windshield. Let dry for 3 minutes.
5. Apply a small amount of adhesive to bracket. Spread adhesive evenly over entire bonding surface.
6. Position the bracket in its proper location on the windshield and press firmly for 1 minute.
7. Allow 5 minutes for adhesive to cure and install rear view mirror to bracket.
WARNING
VAPOR HARMFUL. EYE IRRITANT AND MAY IRRITATE SKIN.
Adhesive contains Acrylic Acid and Methacrylic Ester. Accelerator contains Trichloroethylene. Use with adequate ventilation. Avoid breathing vapor. Avoid eye contact and contact with skin. In case of eye contact, flush eyes with water for 15 minutes and get medical attention. In case of skin contact, wash with soap and water. Do not expose to heat or store above 120°F (49°C).

DO NOT HEAT OR STORE AT TEMPERATURE ABOVE 120°F (49°C)
TB-3845-A

Figure 2

This date represents the date the material was manufactured. Ford recommends that material older than one year old not be used to install interior rear view mirror assemblies. To enable dealership personnel to more easily determine the suitability of the material, the individual kits and the shipping box will be stamped with a "Use By" date. The new "Use By" label will be on all products made after June, 1994. Figure 2 shows the location of the "Use By" date on the back of each individual blister card and the shipping box.

SERVICE PROCEDURES

NOTE:

THE FOLLOWING PROCEDURES SUPERSEDE THE INSTRUCTIONS ON THE BACK OF THE ORIGINAL REAR VIEW MIRROR ADHESIVE PACKAGE.

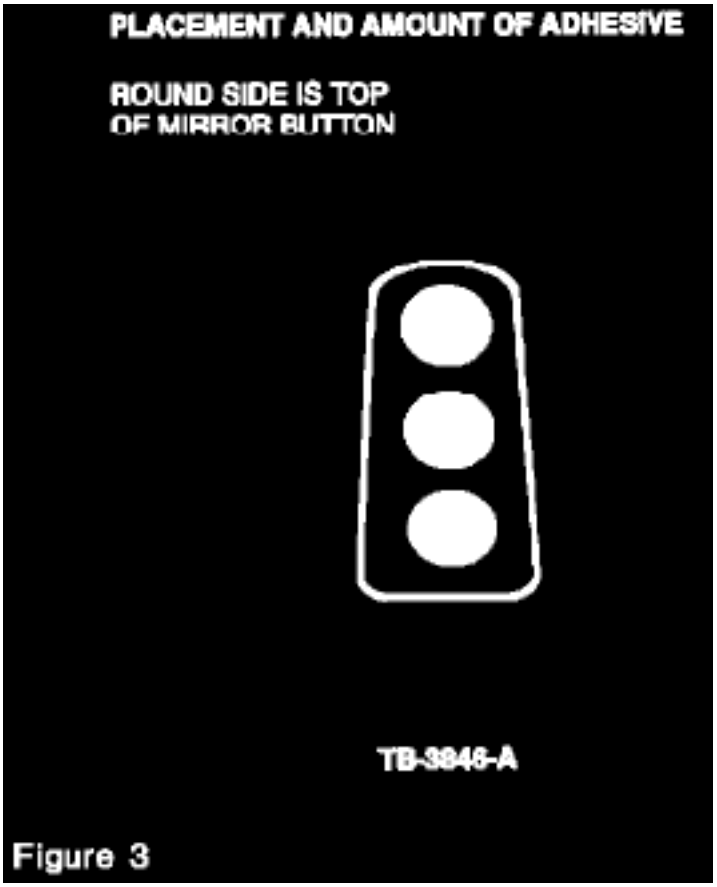

Figure 3

NOTE:

THE MIRROR BUTTON IS OFTEN CALLED A BRACKET, AND THE WINDSHIELD IS SOMETIMES REFERRED TO AS GLASS.

1. Make sure glass, bracket, and rear view mirror adhesive are at room temperature (65-75~F, 18-24~C).

^ If possible, the repair should be performed indoors. Do not perform the repair in direct sunlight.

^ If you must work outside, park the vehicle in a shaded area out of the direct sunlight.

^ The adhesive will not bond at temperatures less than 45~F (7~C), and will bond too quickly in direct sunlight.

2. Mark original location of bracket on outside of windshield with any appropriate marking tool (e.g., crayon, magic marker) before you begin.

NOTE:

SURFACES MUST BE CLEAN FOR PROPER BONDING TO OCCUR.

3. Use the following steps to ensure proper cleaning of glass and button:

a. Carefully remove thick layers of the old adhesive from the glass and the mirror button using a single edge razor blade.

b. Using a clean cloth saturated with isopropyl alcohol (obtain 70% isopropyl rubbing alcohol locally), rub the glass and the mirror button to remove any remaining old adhesive. Soaking the mirror button in isopropyl alcohol may speed the adhesive removal process.

c. Rub the mirror button and the glass with a non-abrasive bathroom cleanser (obtain locally) to ensure all traces of the old adhesive have been removed.

NOTE:

IT IS ESSENTIAL THAT NO TRACES OF CLEANSER OR ADHESIVE REMAIN ON THE GLASS OR THE MIRROR BUTTON.

d. Wipe the glass and the mirror button with a new, clean cloth saturated with isopropyl alcohol (or rubbing alcohol).

4. The accelerator vial contains a priming agent which speeds the adhesive curing process.

a. Grasp the paper wrapper around the vial and squeeze until the vial inside the paper wrapper breaks, releasing the accelerator to the felt tip on the end of the cylinder.

b. Cover the entire bonding area by applying a barely visible, but uniform, film of accelerator to an area larger than the mirror button "footprint" on the glass and to the entire mirror button bonding surface.

c. Let the accelerator dry for 3 minutes.

NOTE:

DO NOT TOUCH THE PRIMED SURFACES.

5. Squeeze only three (3) drops of adhesive in a line from top to bottom on the mirror button (Figure 3). It is not necessary to spread the adhesive.

NOTE:

MAKE SURE THE BUTTON IS POSITIONED PROPERLY FOR STEP 6. REPOSITIONING THE BUTTON, ONCE IN CONTACT WITH GLASS, WILL CAUSE THE ADHESIVE TO FAIL.

6. Position the mirror button in its proper location on the windshield (the rounded edge is pointing up). Press firmly for one full minute to ensure complete bonding. If mirror button is not firmly attached after more than one minute, remove button and repeat Steps 2 through 5.

7. Allow 5 minutes for adhesive to cure (with temperatures above 65~F, 18~C) and install rear view mirror to button. If temperature is between 45-65~F (7-18~C), use masking tape to firmly hold the button to the windshield and allow the adhesive to cure for at least 15 minutes.

REAR VIEW MIRROR - NEW PROCEDURE FOR PREFERRED REATTACHMENT METHOD

FORD: 1990-94 TEMPO 1990-97 CROWN VICTORIA, MUSTANG, TAURUS, THUNDERBIRD 1990-98 ESCORT 1992-97 PROBE 1995-98 CONTOUR

LINCOLN-MERCURY: 1990-92 MARK VII 1990-94 TOPAZ 1990-97 COUGAR, GRAND MARQUIS, SABLE 1990-98 CONTINENTAL, TOWN CAR 1991-98 TRACER 1993-97 MARK VIII 1995-98 MYSTIQUE

LIGHT TRUCK: 1990-96 BRONCO 1990-97 AEROSTAR, ECONOLINE, F-150-350 SERIES, RANGER 1991-97 EXPLORER 1993-97 VILLAGER 1995-98 WINDSTAR 1997 EXPEDITION, MOUNTAINEER 1998 NAVIGATOR

ISSUE: This TSB article introduces a new procedure and tool for reattaching the inside rear view mirror assembly in the event the mirror detaches.

ACTION: Utilize the new Rotunda Mirror Button Applicator (164-R3925) to bond the mirror button to the windshield. This preferred method provides improved adhesion performance. Refer to the following Service Procedure for details.

SERVICE PROCEDURE

CAUTION:

DO NOT USE THIS PROCEDURE IF WINDSHIELD IS DAMAGED (e.g., CHIPPED, CRACKED, OR EXHIBITS STAR BREAKS) WITHIN 152 mm (61 OF THE MIRROR BUTTON, AND IF PLASTIC FILMS HAVE BEEN APPLIED TO THE INSIDE SURFACE OF THE WINDSHIELD (SUCH AS ADDITIONAL GRADIENT BANDS) WITHIN 51 mm (2") OF THE MIRROR BUTTON.

1. Mark original location of bracket on outside of windshield with any appropriate marking tool (e.g., white china marker) before you begin.

NOTE:

SURFACES MUST BE CLEAN FOR PROPER BONDING TO OCCUR.

2. Use the following steps to ensure proper cleaning of windshield:

a. Carefully remove any adhesive residue from the windshield using a new single edge razor blade.

b. Spray the inside surface of the windshield with a glass cleaner and wipe with a clean, soft, lint free cloth.

3. Remove the liner from the pre-applied tape and apply the button directly onto the windshield at the marked location.

Button sizes:

^ F7AZ-17698-AA Small Footprint Size (16 mm X 33 mm)

^ F7AZ-17698-BA Large Footprint Size (21 mm X 29 mm)

4. Center the curing head of the Rotunda Mirror Button Applicator (164-R3925) over the button.

5. Hold the curing head in place and press the "ON" button to activate the vacuum pump. Press the "START" button of the time/temperature controller to begin the cure cycle. Immediately clean the mirror button location marks from the outside of the windshield. Do not release the curing head until the cycle is completed. The AUTOMATIC CYCLE (once the start button is pressed) is as follows:

a. Time of curing cycle will be displayed.

b. Time will stay constant until cure temperature 185°C (365°F) is reached.

c. Once the cure temperature is reached, display will reflect time remaining for complete cure.

CAUTION:

THE HEATER BLOCK MAY STILL BE WARM. HANDLE WITH A GLOVE AND AVOID CONTACT WITH ANY SURFACE THAT MAY BE DAMAGED BY HIGH TEMPERATURE.

6. Turn the applicator off. Press the vacuum release button and remove the curing head from the windshield.

7. Once the button has cooled to ambient temperature (about 5 minutes), reattach the mirror assembly.

Paint: Customer Interest Exterior Clearcoat - Cracking/Eroding/Peeling Off

Article No. 93-8-4

April 14, 1993

PAINT - EXTERIOR CLEARCOAT "MICROCHECKING", HAZING OR PEELING

FORD: 1983-93 THUNDERBIRD 1984-93 TEMPO 1985-93 ESCORT 1986 LTD 1986-93 TAURUS 1989-93 CROWN VICTORIA, MUSTANG, PROBE

LINCOLN-MERCURY: 1983-93 COUGAR 1984-92 MARK VII 1984-93 TOPAZ 1985-89 TRACER 1986 MARQUIS 1986-93 SABLE 1988-93 CONTINENTAL, TOWN CAR 1989-93 GRAND MARQUIS 1991-93 TRACER 1993 MARK VIII

LIGHT TRUCK: 1983-93 RANGER 1986-93 AEROSTAR 1987-90 BRONCO II 1988-93 F SUPER DUTY, F-47 1991-93 ECONOLINE, EXPLORER 1992-93 F-150-350 SERIES 1993 VILLAGER

ISSUE: The clearcoat layer of the basecoat/clearcoat paint system may "microcheck" (crack and erode), turn white, flake or peel off the vehicle. This condition is noticeable on the horizontal surfaces only.

ACTION: Inspect the vehicle and if repair is necessary, refer to the following procedure for service details. This is a wet on wet procedure. Sanding is not required after the seal coat is applied.

NOTE: READ THE ENTIRE SERVICE REPAIR PROCEDURE BEFORE STARTING REPAIRS.

REPAIR PROCEDURE

WARNING: ALWAYS WEAR A NIOSH/OSHA RECOMMENDED VAPOR/PARTICULATE RESPIRATOR AND USE OTHER RECOMMENDED SAFETY EQUIPMENT.

1. Wash the vehicle with soap and water.

2. Verify clearcoat to basecoat or primer adhesion by applying a 2" wide masking tape strip on all horizontal body panels.

a. Pull the tape up quickly

b. Inspect the adhesive side for paint removal.

NOTE: IF PAINT WAS REMOVED DURING TAPE TEST, THE ENTIRE CLEARCOAT AND BASECOAT SHOULD BE REMOVED FROM THE

PANEL.

3. Wipe down the areas to be repainted with wax and grease remover.

^ BASF product # 900 PreKleano or equivalent

4. Sand the affected surface with 150/240 grit sand paper. Remove only clearcoat and colorcoat, featheredge areas with 320 grit paper.

NOTE: DO NOT REMOVE SPRAY PRIMER OR E-COAT.

5. Blow off the area to remove loose dust or debris.

6. Wipe the sanded surface with wax or grease remover.

^ BASF product # 901 Prekleano or equivalent

7. Tack off area.

8. Mix and apply one coat of epoxy primer for adhesion and let dry per manufacturer's label instruction (20 - 30 minutes).

^ BASF product # DE 15, PA16, PR80 or equivalent

NOTE: DO NOT SAND THE NEWLY PRIMED AREAS.

9. Mix and apply two coats of the appropriate colored primer surface sealer.

^ BASF product # DP 21, Solo Color 1:1, then 2 parts of mixture 1 part DH 60, 30% PR80 or equivalent.

10. Mix and apply 2 coats or until hiding of basecoat per manufacturer's label instructions. Apply first coat to repair area only. Apply second coat over entire area. Allow a minimum of 15 minutes flash time before applying the clearcoat.

^ BASF # Diamont Basecoat Color and Diamont Reducer 1:1 or equivalent.

11. Mix and apply 2 coats of urethane clearcoat per manufacturer's label instructions.

^ BASF product # DC90 Diamond Clear, LH50 Diamond Hardener 2:1 or equivalent.

12. Polish if necessary.

13. Clean and detail the vehicle and return it to the customer.

ISSUE: Ferrous metal particles (hot iron dust) are generated by manufacturing facilities, rail shipments, combustion engines, jet engines, body shops, etc. These particles mechanically/magnetically bond to vehicles' painted surfaces. Moisture and temperature combine with the particles to create a chemical reaction. The reaction causes the particles to corrode and enter into the physical paint film.

ACTION: To remove these particles/contaminants, USE ONLY the following procedure. The procedure must be performed before any buffing, polishing, color sanding or refinishing is attempted. The materials in this procedure are alkaline, acidic and neutral. They must be used in the specified order.

CAUTION:

ANY CHANGES TO THIS PROCEDURE WILL CAUSE AN INCOMPLETE OR UNSATISFACTORY REPAIR AND MAY RESULT IN

POSSIBLE DAMAGE TO THE PAINTED SURFACES AND TRIM.

WARNING:

THE TECHNICIAN MUST WEAR PROTECTIVE CLOTHING AND EYE PROTECTION TO PREVENT SKIN IRRITATION.

CAUTION:

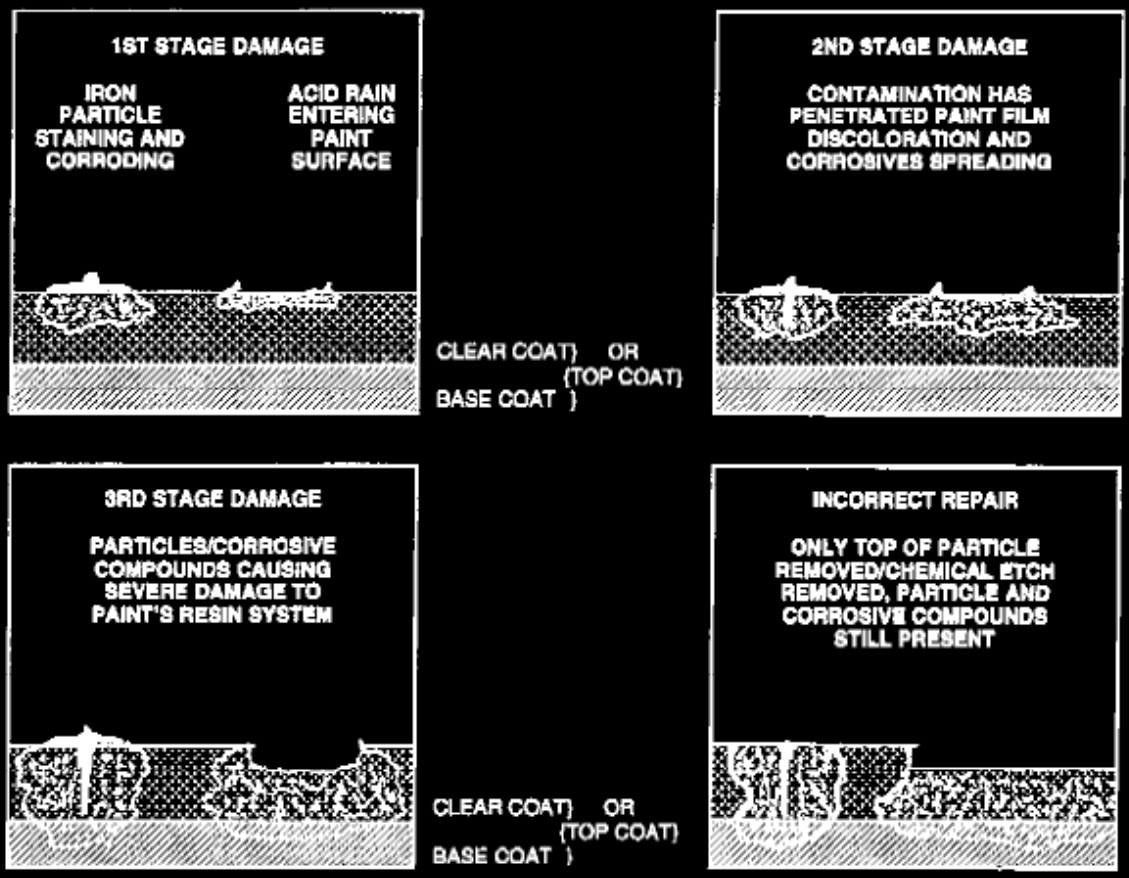
THE USE OF ANY OTHER PRODUCT OR PROCEDURE MAY CAUSE DAMAGE TO ALUMINUM, FLEXIBLE PAINTED SURFACES OR OTHER PAINTED SURFACES. FOLLOW DIRECTIONS EXACTLY AND RINSE THOROUGHLY AFTER EACH STEP.

NOTE:

THIS DECONTAMINATION PROCEDURE IS DESIGNED TO REMOVE SURFACE CONTAMINANTS FROM THE PAINT ON VEHICLES THAT HAVE BEEN CONTAMINATED UP TO 120 DAYS. VEHICLES WHICH HAVE EXPERIENCED THE CONDITION LONGER THAN THIS PERIOD MAY REQUIRE AN ADDITIONAL TREATMENT TO REMOVE FERROUS METAL CONTAMINANTS.

IDENTIFICATION

INDUSTRIAL FALLOUT (IFO) is a general term used to identify Rail Dust, Brake Dust, Ferrous Metal, Alkaline/Crystalline Deposits, Water Spots, Acid Rain, and other types of Environmental Contamination.



Studies conducted have shown the use of Oxalic Acid ferrous metal removers actually contribute to further damage of the paint's resin system, creating long term damage, which may not be evident for months. Additionally, Oxalic Acid products may damage soft exterior trim, aluminum trim and soften the paint.

The use of "clay" type products does not remove the entire ferrous particle or environmental contamination. Clay removes only the top of the particle and stain generated by the contamination, leaving the particle imbedded and the corrosive chemical compounds generated by the contamination in the paint system.

The particles and/or chemical compounds are still present and they continue to generate damage. Color sanding, buffing or compounding the paint film to remove ferrous metal, industrial fallout or acid rain damage may not remove the entire cause of the damage (they treat only the symptom and not the cause). The chemical compounds are still in the paint system and will continue to damage the paint. Color sanding and buffing may result in excessive removal of clear coat film. Removal of OEM clear coat in excess of 0.03 mil may contribute to premature clear coat failure and is not recommended.

THE DECONTAMINATION PROCEDURE DIRECTED IN THIS BULLETIN MUST BE PERFORMED BEFORE ANY BUFFING, POLISHING, COLOR SANDING OR REFINISHING IS ATTEMPTED.

TB-4187-A

Figure 1

For ease of identifying, the Radio Shack Model 63-851, 30X, lighted, magnifier is recommended.

1. Ferrous Metal

^ Light colored vehicles: Small rust orange dots with black in center of stain.

^ Dark colored vehicles: Small white or silver dots with a "rainbow hue" around the particle. The surface will also feel rough to the touch.

2. Industrial Fallout

^ The surface feels rough to the touch and may exhibit crystalline deposits.

^ Usually ferrous metal is present, as well as water spots.

MANUFACTURERS			
PROCEDURE	FINISH KARE (818)-443-8983, CUSTOMER SERVICE	3M (800)-364-3577	MEGUIAR'S (800)-347-5700, CUSTOMER SERVICE

Protectant	#218 Or #2180	Imperial Hand Glaze	#9 Or #7
Color Sanding Lubricant	#780 Sand Lube	None	None

3. Acid Rain

^ Surface will exhibit irregular discolored spotting.

^ Dark colored vehicles will show cloudy or greying spots where the acids have started to etch away the paint.

NOTE:

IN EXTREME CASES ETCHING OF THE SURFACE WILL BE VISIBLE OR FELT.

DECONTAMINATION

Use Finish Kare Inc. products 1119/883/11850 to decontaminate the paint surface. Follow the manufacturer's recommended procedures.

NOTE:

FORD DOES NOT RECOMMEND THE USE OF OXALIC ACIDS OR OTHER "FALLOUT REMOVERS".

1. Rinse off dust and debris with cold water. Be sure to start at the bottom and work up.

2. Prepare product "1119" by mixing one (1) part "1119" with four (4) parts cold water.

3. Use clean wash mitt and apply mixture to entire car, starting at the bottom and working up to the top surface. Keep car wet with the solution for 5 to 10 minutes. Do not allow product to dry on the car, and do not allow it to streak down the sides. Rewipe with mitt if necessary to avoid streaks.

4. Rinse car with cold water.

5. Dry the flat surfaces of the vehicle hood, roof and deck lid.

6. Apply product "883" directly to the contaminated surfaces using a clean dry sponge, wash mitt, or soft truck brush ("883" is ready to use from the bottle, with no mixing involved). Keep the areas wet with the "883" for 5 to 7 minutes. Do not allow to dry on the car. Wipe down to the body line on the sides.

7. Prepare product "118SC" by mixing 1 oz (0.03 L) with 1 gal (3.785 L) of water.

8. Shampoo the vehicle with "118SC" shampoo mixture using a clean wash mitt and then rinse with cold water.

NOTE:

DO NOT USE "1185C" MITT WITH "1119" OR "883" SOLUTIONS. USE SEPARATE MITTS AND ALWAYS KEEP THEM SEPARATE.

9. Inspect paint surface to see if rust particles have been removed. If rust particles have been on the vehicle for a long time, it may be necessary to repeat each of the above steps.

NOTE:

THE NEUTRALIZER CONCENTRATE IS A HEAVY DUTY SHAMPOO AND CAN BE USED IN AN AUTOMATIC CAR WASH SYSTEM.

Obtain From Finish Kare (Refer To Manufacturer Chart In This TSB Article)	#883 Decontaminant
Obtain From Finish Kare (Refer To Manufacturer Chart In This TSB Article)	#1188C Decontaminant
Refer To Manufacturer Chart In This TSB Article For All Other Needed Products	**********

CORRECTION OF SURFACE FOLLOWING DECONTAMINATION:

1. Visually inspect surface for evidence of removal of ferrous metal particles, crystalline deposits and water spots. Acid rain discoloring or etching will require either buffing, color sanding or refinishing if etching is visible.

2. Use the buffing products from only one (1) manufacturer. Do not intermix products.

3. Always follow the manufacturer's product sequence. Use appropriate pads with each product as recommended by the manufacturer.

NOTE:

DO NOT REMOVE MORE THAN 0.3 OF A MIL OF PAINT MATERIAL, OR REPAINTING WILL BE REQUIRED.

4. Use a dual action sander (D/A Sander) with a velcro-mount backing plate and appropriate foam pad for final polishing swirl removal.

5. Use an alcohol and water mixture (1:4 ratio) to clean buffed areas to verify removal of scratches and swirls before application of final protective glaze.

NOTE:

FREQUENT WASHING OF VEHICLES IS IMPORTANT. CONTAMINANTS SETTLE ONTO THE VEHICLE EVERY DAY. USE CLEAN WATER (DEIONIZED, REVERSE OSMOSIS, ETC.) TWICE WEEKLY TO REMOVE HEAVY DUST, AND PARTICULATES. THE USE OF A NEUTRAL pH CAR WASH SOAP EVERY TWO (2) WEEKS IS RECOMMENDED TO NEUTRALIZE VEHICLE CONTAMINATION.

ISSUE: This procedure is being published to advise all body and paint technicians about proper procedures for preparation of sheet metal parts coated with electrodeposition primer (E-Coat).

ACTION: When prepping a replacement body panel for installation, it is mandatory to leave the E-Coat intact. DO NOT SAND OFF THE E-COAT.

Improper preparation with excessive sanding of the E-Coat to bare metal will jeopardize the sheet metal warranty and overall customer satisfaction. In particular, the E-Coat is necessary to protect the parts from rust. Light scuff sanding using a Scotch Brite pad or wet 320 grit sand paper is recommended for minor flaws. If a minor flaw exists, wet sand or scuff out the flaw and prime the repair area. Again, do not remove all of the E-Coat from the panel.

Lead chloride (CAS 7758-95-4)
Lead monoxide (CAS 1317-36-8)
Lead sulfide (CAS 1314-87-0)
and others.

Trade Names: C.I. Pigment Metal 4, C.I. 77575, Lead flake, Whole lead, Litharge, and others.

Uses: Tank linings, piping and other chemical reaction equipment; petroleum refining, manufacture of gasoline additives; pigments for paint; storage batteries, solder and fusible alloys; radiation shielding; and others.

PHYSICAL INFORMATION

Appearance: Bluish white to silvery gray solid (lead metal).

Odor: None.

Minimum Detectable by Odor: Unknown.

Behavior in Water: Insoluble.

Evaporation: Unknown.

HEALTH HAZARD INFORMATION

OSHA Standard: Average 8 hour exposure – 0.05 mg/m³ (lead).

Note: Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to .060 mg lead per 100 ml blood, he must be removed from all exposures to lead and cannot return to an exposed environment until the blood level falls to .040 mg lead per 100 ml blood or less.

NIOSH Recommended Limit: Average 10 hour day/40 hour week exposure – .01 mg/m³ (lead).

ACGIH Recommended Limit: Average 8 hour exposure – 0.15 mg/m³ (lead).

Short Term Exposure:

Note: Lead is a cumulative poison. Increasing amounts build up in the body and eventually a point is reached where symptoms and disability may occur. Lead dust carried home on contaminated clothing can cause symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs.

Inhalation: The effects of exposure to fumes and dusts of inorganic lead may not develop quickly. Symptoms may include decreased physical fitness, fatigue, sleep disturbance, headache, aching bones and muscles, constipation, abdominal pains, and decreased appetite. These effects are reversible and complete recovery is possible. Inhalation of large amounts of lead may lead to seizures, coma, and death.

TB-3995-A

Figure 1

HEALTH HAZARD INFORMATION (CONT'D.)

Skin: May cause irritation.

Eyes: May cause irritation.

Ingestion: See effects listed for inhalation. Ingestion of large amounts of lead may lead to seizures, coma, and death.

Long Term Exposure:

Lead can accumulate in the body over a period of time. Therefore, long term exposures to lower levels can result in a build up of lead in the body and more severe symptoms. These may include anemia, pale skin, a blue line at the gum margin, decreased handgrip strength, abdominal pain, severe constipation, nausea, vomiting, and paralysis of the wrist joint. Prolonged exposure may also result in kidney damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, convulsions, coma, delirium, and death. In non-fatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Continuous exposure can result in decreased fertility. Lead exposure of either parent before pregnancy can increase the chances of miscarriage or birth defects. Exposure of the mother during pregnancy can cause birth defects.

EMERGENCY AND FIRST AID INSTRUCTIONS

Inhalation: Move victim to fresh air. Give artificial respiration, as needed. Get medical attention immediately.

Skin: Wash area with plenty of soap and water. Remove any contaminated clothing immediately.

Eyes: Rinse eyes with plenty of water for 15 minutes. Seek medical attention, if necessary.

Ingestion: If victim is conscious, give water. Seek medical attention.

Note to Physician: Whole blood lead levels, circulating plasma/erythrocyte lead concentration ratio, urine ALA, and erythrocyte protoporphyrin fluorescent microscopy may all be useful in monitoring or assessing lead exposure. Chelating agents such as edetate disodium calcium and penicillamine are generally useful in the therapy of acute lead intoxication.

PROTECTIVE MEASURES

Storage and Handling: Store in an area away from heat and keep separate from potassium.

Engineering Controls: Adequate ventilation, sinks, showers and eyewash stations should be provided.

Protective Clothing: Full body work clothing should be worn including bump caps or hard hats, rubber gloves, and eye protection. Employees should routinely wash their skin thoroughly and change clothing at the end of each work shift.

Figure 2

CAS: 7439-92-1 ★★★★★★ LEAD ★★★★★★ CHEMICAL FACT SHEET

PROTECTIVE MEASURES (CONT'D.)

Protective Equipment:

For levels up to 0.5 mg/m³, use any dust and mist respirator, except single-use.

For up to 1 mg/m³, use any dust and mist respirator, except single-use or quarter mask, or any fume respirator or high efficiency particulate filter respirator.

For up to 5 mg/m³, use a high efficiency particulate filter respirator with a full facepiece.

For up to 100 mg/m³, use a powered air-purifying respirator with a high efficiency particulate filter or a Type C supplied-air respirator operated in pressure-demand or other positive-pressure or continuous-flow mode.

For up to 200 mg/m³, use a Type C supplied-air respirator with full facepiece operated in pressure-demand or other positive-pressure mode, or with a full facepiece, helmet or hood operated in continuous-flow mode.

For levels greater than 200 mg/m³, escape, or entry into unknown concentrations, use a self-contained breathing apparatus with full facepiece operated in pressure-demand or other positive-pressure mode or a combination respirator which includes a Type C supplied-air respirator with a full facepiece operated in pressure-demand or other positive-pressure or continuous-flow mode and an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode.

Other Precautions: No eating, drinking, or smoking in areas where the dusts or fumes of lead or its compounds are present.

FIRE AND EXPLOSION INFORMATION

General: Not combustible. If exposed to fire, may release toxic fumes of sulfur and lead oxides.

Explosive Limits: Unknown.

Extinguisher: Use extinguisher appropriate to burning material. When fighting fire, wear a self-contained breathing apparatus with full facepiece and operated in positive-pressure mode.

REACTIVITY INFORMATION

Conditions to Avoid: Excessive heat.

Materials to Avoid: Reacts violently with potassium.

SOURCE: Chemical Fact Sheet as prepared by the Bureau of Toxic Substance Assessment, New York State Department of Health; modified by the Toxicology Department, Ford Motor Company.

TB-3997-A

Figure 3

WARNING:

LEAD CONTAMINATION POTENTIAL: THE ELECTRODEPOSITION PRIMER USED BY FORD MOTOR COMPANY OVER BASE METAL ON SERVICE REPLACEMENT PARTS OR COMPLETED VEHICLES CONTAINS SMALL AMOUNTS OF LEAD FOR CORROSION PROTECTION OF STEEL. EXCESSIVE DUSTS GENERATED BY UNNECESSARY AND IMPROPER SANDING MAY CONTAIN AIRBORNE LEAD CONTAMINATION IN EXCESS OF OSHA STANDARDS. INFORMATION REGARDING THE HAZARDS OF LEAD CAN BE FOUND IN THE CHEMICAL FACT SHEETS IN THE FIGURES IN THIS ARTICLE.

NOTE:

READ ALL INFORMATION IN THIS TECHNICAL SERVICE BULLETIN CAREFULLY AND FORWARD TO ALL EMPLOYEES PERFORMING PAINT PREPPING OPERATIONS. DEALERS SHOULD CONTACT LEGAL COUNSEL AND/OR LOCAL OSHA

AUTHORITIES FOR DIRECTION REGARDING OSHA LEAD STANDARD REQUIREMENTS.

If a replacement body panel contains more than a minor flaw in the E-coat, it should be returned. Contact your Customer Service representative for instructions.

If more extensive sanding, other than that described above, is necessary, (e.g., refinishing original vehicle sheet metal) follow the procedures outlined below:

ALTERNATIVE SANDING PROCEDURES WHEN EXTENSIVE SANDING IS REQUIRED

The following procedures for sheet metal preparation by sanding or media blasting are based on tests conducted by Ford Motor Company in accordance with requirements set forth in the Federal OSHA Inorganic Lead Standard 29 CFR 1910.1025.

SANDING PROCEDURE

1. Each technician performing the sanding operation MUST wear an approved respirator with high efficiency particulate filter (HEPA).

2. Technicians should use dual action sander with vacuum collection.

3. The vacuum equipment MUST be equipped with a HEPA filter on the air exhaust. Dealers are cautioned not to exhaust vacuum air into the atmosphere. Operators are cautioned to follow the manufacturer's guidelines for maintenance and the replacement of filters.

MEDIA BLASTING PROCEDURE

1. Testing has shown that plastic media blasting meets OSHA lead standard requirements and is efficient when the manufacturer's published procedures are followed.

2. The operator must wear an air supplied hood using compressed air free from carbon monoxide, oil, water, and other contamination when performing this operation. Specifics of the media blasting procedure for whole body paint removal have been previously published.

NOTE:

PLEASE READ THE CHEMICAL FACT SHEETS IN THE FIGURES.

Paint: All Technical Service Bulletins Exterior Clearcoat - Cracking/Eroding/Peeling Off

Article No. 93-8-4

April 14, 1993

PAINT - EXTERIOR CLEARCOAT "MICROCHECKING", HAZING OR PEELING

FORD: 1983-93 THUNDERBIRD 1984-93 TEMPO 1985-93 ESCORT 1986 LTD 1986-93 TAURUS 1989-93 CROWN VICTORIA, MUSTANG, PROBE

LINCOLN-MERCURY: 1983-93 COUGAR 1984-92 MARK VII 1984-93 TOPAZ 1985-89 TRACER 1986 MARQUIS 1986-93 SABLE 1988-93 CONTINENTAL, TOWN CAR 1989-93 GRAND MARQUIS 1991-93 TRACER 1993 MARK VIII

LIGHT TRUCK: 1983-93 RANGER 1986-93 AEROSTAR 1987-90 BRONCO II 1988-93 F SUPER DUTY, F-47 1991-93 ECONOLINE, EXPLORER 1992-93 F-150-350 SERIES 1993 VILLAGER

ISSUE: The clearcoat layer of the basecoat/clearcoat paint system may "microcheck" (crack and erode), turn white, flake or peel off the vehicle. This condition is noticeable on the horizontal surfaces only.

ACTION: Inspect the vehicle and if repair is necessary, refer to the following procedure for service details. This is a wet on wet procedure. Sanding is not required after the seal coat is applied.

NOTE: READ THE ENTIRE SERVICE REPAIR PROCEDURE BEFORE STARTING REPAIRS.

REPAIR PROCEDURE

WARNING: ALWAYS WEAR A NIOSH/OSHA RECOMMENDED VAPOR/PARTICULATE RESPIRATOR AND USE OTHER RECOMMENDED SAFETY EQUIPMENT.

1. Wash the vehicle with soap and water.

2. Verify clearcoat to basecoat or primer adhesion by applying a 2" wide masking tape strip on all horizontal body panels.

a. Pull the tape up quickly

b. Inspect the adhesive side for paint removal.

NOTE: IF PAINT WAS REMOVED DURING TAPE TEST, THE ENTIRE CLEARCOAT AND BASECOAT SHOULD BE REMOVED FROM THE

PANEL.

3. Wipe down the areas to be repainted with wax and grease remover.

^ BASF product # 900 PreKleano or equivalent

4. Sand the affected surface with 150/240 grit sand paper. Remove only clearcoat and colorcoat, featheredge areas with 320 grit paper.

NOTE: DO NOT REMOVE SPRAY PRIMER OR E-COAT.

5. Blow off the area to remove loose dust or debris.

6. Wipe the sanded surface with wax or grease remover.

^ BASF product # 901 Prekleano or equivalent

7. Tack off area.

8. Mix and apply one coat of epoxy primer for adhesion and let dry per manufacturer's label instruction (20 - 30 minutes).

^ BASF product # DE 15, PA16, PR80 or equivalent

NOTE: DO NOT SAND THE NEWLY PRIMED AREAS.

9. Mix and apply two coats of the appropriate colored primer surface sealer.

^ BASF product # DP 21, Solo Color 1:1, then 2 parts of mixture 1 part DH 60, 30% PR80 or equivalent.

10. Mix and apply 2 coats or until hiding of basecoat per manufacturer's label instructions. Apply first coat to repair area only. Apply second coat over entire area. Allow a minimum of 15 minutes flash time before applying the clearcoat.

^ BASF # Diamont Basecoat Color and Diamont Reducer 1:1 or equivalent.

11. Mix and apply 2 coats of urethane clearcoat per manufacturer's label instructions.

^ BASF product # DC90 Diamond Clear, LH50 Diamond Hardener 2:1 or equivalent.

12. Polish if necessary.

13. Clean and detail the vehicle and return it to the customer.

ISSUE: A comprehensive paint repair procedure TSB has been developed for service use. It includes the following paint repair topics:

Section (A) has been superseded by TSB # 9264, dated 3/92.

(B) Exterior Color Peeling From Ultra Violet Light

(C) Lower Body Stone Protection Repair Tips

(D) Procedures For PVC Body Side Moldings

(E) Lower Body-Side Stone Chip Protection Program

(F) Surface Defect Removal Without Repainting

(G) 1991 Color Matched/Compatible Spray Primer Chart

(H) Repair For Tinted Clearcoat

(I) Frequently Used And Paintable Plastics

(J) 1992 Paint Codes

ACTION: If paint repair is required, refer to the following procedures for paint restoration.

Section A Has Been Superseded By TSB # 9264, Dated 3/92.

CAUTION: FAILURE TO THOROUGHLY RINSE THIS SURFACE COULD RESULT IN CORROSION OF ANODIZED ALUMINUM OR

STAINLESS STEEL PARTS

PROCEDURE # 2

FINISH KARE FORMULA # 1119 AND # 883 (Buffered solution not as harsh on aluminum parts)

WARNING: FOR YOUR SAFETY, USE RUBBER GLOVES, GOGGLES AND PROTECTIVE CLOTHING WHEN HANDLING THESE PRODUCTS.

1. Apply hot diluted solution with soft mitt.

2. Agitate to create suds. Suds hold the acid solution in suspension and to the surface creating greater and extended activity.

3. Allow 3 to 5 minutes dwell time.

4. Rinse with COLD WATER.

5. Apply # 883 per label instructions.

LIQUID NEUTRALIZER CONCENTRATE

1. Using a mitt, thoroughly go over the entire surface with the diluted solution (50-1) of water and # 118 Liquid Neutralizer Concentrate. Then wipe dry.

2. If the iron particles are not totally removed after 2 washings, use one or both of the following service actions.

a. Sand with micro fine sandpaper (1500 Grid or greater) in localized areas.

b. Buff with very light compound and polish with wax in localized areas.

WARNING: OUR ENVIRONMENT IS PRECIOUS - PLEASE USE PROPER DISPOSAL TECHNIQUES FOR ANY VOLATILE ORGANIC COMPOUNDS (V.O.C.'S) OR EXCESS MATERIALS.

(B) Paint Exterior Color Peeling From Ultra Violet Light

Paint may be damaged because of ultra violet light absorption through the color coat. This damage will cause the top coat to peel to the E-coat primer.

If service is required, use the following procedure to correct the concerns.

NOTE: READ THE ENTIRE SERVICE PROCEDURE BEFORE STARTING REPAIRS.

WARNING: ALWAYS WEAR A NOISHA/MSHA RECOMMENDED VAPOR/PARTICULATE RESPIRATOR AND USE OTHER RECOMMENDED SAFETY EQUIPMENT.

1. Wash the vehicle with soap and water.

2. Verify topcoat adhesion by applying a 2 inch wide masking tape strip on all body panels above and below the beltline on each panel.

a. Pull the tape up quickly.

b. Inspect the adhesive side of the tape for paint removal.

NOTE: IF PAINT WAS REMOVED DURING THE TAPE TEST, THE ENTIRE PANEL SHOULD BE STRIPPED AND REFINISHED AS NECESSARY.

3. Remove all trim (mouldings, name plates, striping, etc.) from the areas which will be repainted.

NOTE: ALL REQUIRED REPLACEMENT MOULDINGS AND STRIPES SHOULD BE ORDERED AND RECEIVED PRIOR TO REPAIRING THE CUSTOMER'S VEHICLE.

4. Wipe the entire vehicle with wax and grease remover.

^ BASF Product # 900 Prekleano

^ PPG Product # DX300

^ S-W Product # R7-K156

^ DuPont Product # 3919 S

^ Sikkens Product # M 600

5. Mask off all areas on the vehicle which are not going to be painted or will be affected by overspray (engine compartment, wheels, etc.).

6. Remove the paint to bare metal from all the areas of the vehicle which are going to be repainted. Use one of the following methods.

SAND THE AFFECTED AREAS TO BARE METAL USING 40 GRIT 3M GREEN CORPS SANDING DISCS OR EQUIVALENT AND A SOFT PAD ON A 1700 RPM POLISHER. KEEP THE POLISHER MOVING TO AVOID DEVELOPING HOT SPOTS ON THE METAL.

NOTE: CHEMICAL STRIPPING IS NOT RECOMMENDED.

NOTE: IF AVAILABLE, PAINT MAY BE REMOVED USING A PLASTIC MEDIA BLAST SYSTEM. IF THIS PROCESS IS USED, EXTRA

CARE MUST BE TAKEN DURING THE MASKING PROCESS TO PREVENT DAMAGE TO GLASS, MOULDING, ETC.

7. Blow off the entire vehicle to remove loose dust and debris.

NOTE: IF RUST IS PRESENT, USE APPROPRIATE METAL CLEANER AND CONDITIONER (PHOSPHATE COATING) OVER BARE METAL AREAS.

8. Wipe all affected areas with a fast dry enamel reducer solvent, followed by a dry wipe using a clean, lint free cloth to remove all residue.

CAUTION: KEEP WIPING UNTIL SURFACE IS COMPLETELY DRY. ANY RESIDUE WILL RESULT IN POPPING OF THE COATINGS TO

BE APPLIED FOLLOWING THIS STEP.

NOTE: THIS STEP WILL REDUCE THE POSSIBILITY OF FLASH RUST.

^ BASF Product # BR 50

^ PPG Product # DX 300

^ S-W Product # R7 K156

^ DuPont Product # 3812 S

^ Sikkens Product # 123 FAST

9. Apply two medium wet coats (1.0 mil total) of self-etching, anti-corrosion primer using the manufacturer's recommendations and flash times.

^ BASF Product # DE-17

^ PPG Product # DP EPOXY PRIMER

^ S-W Product # E2-6980

^ DuPont Product # VARIPRIME

^ Sikkens Product # WASH FILLER 580

10. Apply three medium wet coats (2.0 mils total) of acrylic urethane primer surfacer following the manufacturer's recommended procedures.

^ BASF Product # DP-20 PRIMER/SUFACER

^ PPG Product # K-36

^ S-W Product # P6-M49 OR P6-A48

^ DuPont Product # URO PRIMERFILLER

^ Sikkens Product # AUTOCRYL 3+1 FILLER

11. Sand the vehicle using one of the following methods:

^ Wet-sand by hand using 400 grit or finer sandpaper.

^ Dry-sand by hand using 320 grit or finer sandpaper.

12. Blow the entire vehicle off to remove loose dust and debris.

13. Demask (remove all paper and tape) as necessary to remove the primer and dirt buildup on the paper and tape.

14. Wipe the entire vehicle with wax and grease remover, followed by a dry wipe using a clean, lint free cloth to remove all residue.

CAUTION: KEEP WIPING UNTIL SURFACE IS COMPLETELY DRY. ANY RESIDUE WILL RESULT IN POPPING OF THE COATINGS TO

BE APPLIED FOLLOWING THIS STEP.

^ BASF Product # 901 PRE-PAINT CLEANER

^ PPG Product # DX 330

^ S-W Product # R7-K156

^ DuPont Product # 3812 S

^ Sikkens Product # M 600

15. Mask all areas on the vehicle which are not to be painted or will be affected by paint overspray (engine compartment, wheels, etc.).

NOTE: APPLY BASECOAT/CLEAR COAT ONLY TO SURFACES WHICH ORIGINALLY HAD BASECOAT/CLEAR COAT

16. Apply three medium wet coats (enough material to hide primer) of acrylic enamel base coat or acrylic urethane monocoat following the manufacturer's recommended procedure.

^ BASF Product # DIAMONT BASECOAT/Solo

^ PPG Product # DELTRON BASECOAT DBC/Deltron

^ S-W Product # ULTRA BASE/Ultra One Stage

^ DuPont Product # CHROMABASE/Cronar

^ Sikkens Product # AUTO BASE/Autocryl

17. Apply two medium wet coats of 2K acrylic urethane enamel clear coat, following manufacturer's recommended procedure.

^ BASF Product # DIAMONT CLEAR 88/89

^ PPG Product # CONCEPT 2001 DCU

^ S-W Product # CC-650 OR CC-640

^ DuPont Product # 1080 S URO CLEAR

^ Sikkens Product # AUTO CLEAR

18. After the paint is dry, demask the entire vehicle and clean up any areas which have overspray.

19. Polish the vehicle as necessary to remove any defects in the paint which may create a customer concern.

CAUTION: USE LOW SPEED (1700 RPM MAXIMUM) POLISHER.

20. Install all trim (mouldings, name plates, striping, etc.) on the vehicle which were removed prior to repainting.

21. Clean the exterior and interior of the vehicle thoroughly, including air ducts and other areas which are prone to accumulating dust. This step is essential to ensure customer satisfaction.

WARNING: OUR ENVIRONMENT IS PRECIOUS - PLEASE USE PROPER DISPOSAL TECHNIQUES FOR ANY VOLATILE ORGANIC COMPOUNDS (V.O.C.'s) OR EXCESS MATERIALS.

STRIP AND REFINISH CLAIMING METHODOLOGY

(See Figures 2 and 3 for Illustration of Claim Preparation)

LABOR

To calculate STRIP AND REFINISH Labor Hours/Labor Operations:

1. Refer to SLTS Manual REFINISH labor allowance for panel or panels being STRIPPED AND REFINISHED.

2. Multiply REFINISH labor hours by 1.6 to arrive at the TOTAL labor allowance for the STRIP AND REFINISH OPERATION.

   EXAMPLE
   Refinish Hood (Metallic) = 1.7 hrs (from SLTS Manual)
   => Strip and Refinish Hood (Metallic) = 1.7 hrs. x 1.6 = 2.7 hrs.

3. LABOR OPERATION - To indicate a STRIP AND REFINISH repair labor operation, take the REFINISH labor operation and replace the suffix with a "C".

   EXAMPLE
   Refinish Hood = P8P => Strip and Refinish Hood = P8C.

MATERIAL

To calculate strip and refinish Material Allowance:

1. Refer to SLTS Manual Refinish "Misc. Mat'l" column.

2. Divide "Misc. Mat'l" Amount by 10. Enter in "Qty" Column.

   EXAMPLE
   Misc. Mat'l for Refinish hood = 21, QTY for Strip and refinish = 21 ÷ 10 = 2.1.

3. Enter the appropriate "Unit Material Cost" from the *Material Cost Matrix* (shown below) in the "Each" column (e.g. 2k Urethane Monocoat = $17.50).

4. Multiply QTY by the appropriate UNIT MATERIAL COST. This number represents the TOTAL MATERIAL ALLOWANCE for the repair and should be entered in the "Amount" column (Qty of 2.1 x $17.50 = $36.75).

*Material Cost Matrix**

Material	*Unit Material Cost*
Enamel Monocoat	*$7.80*
2K Enamel Clearcoat	*$10.20*
2K Urethane Monocoat	*$17.50*
2K Urethane Clearcoat	*$19.20*

*UNIT MATERIAL COST MATRIX APPLIES TO STRIP AND REFINISH REPAIRS COVERED IN THIS TSB ONLY

STRIP AND REFINISH CLAIMING METHODOLOGY

The claiming instructions shown in Figure 1 are applicable to the repair of the EXTERIOR COLOR PEELING FROM ULTRA VIOLET LIGHT concern covered in this TSB only. See the SAMPLE CLAIMS, Figures 2 and 3, for examples.

(C) Lower Body Stone Protection Repair Tips

Ford has introduced a vinyl anti-stone abrasion material for the lower exterior body surfaces of selected passenger vehicles and light trucks. The anti-stone abrasion material is applied to the lower fenders, rocker panels, lower doors, quarter panel dogleg, and lower rear of quarter panel behind the wheel. The anti-stone abrasion material will usually end at a body character line.

While primarily for servicing of factory-applied protective coating, the following provides installation information. If the vehicle has experienced body damage in the factory-applied material protective

area, the sheet metal damage must be serviced prior to the application of the new protective coating.

SMALL AREAS - MINOR DEFECTS (VEHICLES WITH FACTORY SPRAYED-ON VINYL)

A small dent in the sheet metal that did not mar the vinyl surface, can possibly be corrected with proper bumping tools without damage to the vinyl coating. However, noticeable scratches or gouges (not over 1/2 inch in diameter) or dings and dents that when "ironed out" show vinyl damage, can be satisfactorily serviced with the following procedure:

1. Solvent-wipe the damaged area with "Silicone and Wax Remover."

2. Using a heat gun or lamp, soften the vinyl coating of the damaged area until it can be scraped off with a putty knife or a similar tool. If necessary, sand off any hard to remove coating using an orbital disc sander (No. 80 Disc). (The spray-on vinyl protective coatings may not be suitable for "spot" application. See Manufacturer's label for instructions.)

3. Perform necessary servicing to correct the sheet metal damage.

4. Using white bodyfiller, fill the damaged area. Follow the instructions on the label and blend the bodyfiller with the surrounding sheet metal.

5. Allow the bodyfiller to completely cure and then carefully sand the area smooth, removing any high spots.

6. Refer to "Spray Procedure" for restoration of vinyl anti-stone abrasion material.

LARGE DAMAGED AREAS - VEHICLE WITH FACTORY SPRAYED ON VINYL

Peeling or damage over a large area will necessitate removal of the factory sprayed-on vinyl coating. The following procedure is suggested.

NOTE: WHERE SHEET METAL IS DAMAGED TO THE EXTENT THAT A FENDER, DOOR, OR QUARTER PANEL REPLACEMENT IS

REQUIRED (OR IN AN INITIAL INSTALLATION), DISREGARD STEPS NO. 1 AND NO. 2.

1. Using a heat gun or lamp, soften the vinyl coating until it is pliable. Scrape coating off with a putty knife or a similar tool. If necessary, sand off any hard to remove coating using an orbital disc sander (No. 80 Disc). (The vinyl material, abrasion resistant coating may not be suitable for "spot" applications. See manufacturer's label for instructions.)

2. Perform necessary servicing to correct the sheet metal damage.

3. Refer to "Spray Procedure" for restoration of vinyl anti-stone abrasion material.

COATING APPLICATIONS

Approximately two quarts will be required for an initial installation on a passenger car or F-Series. Slightly more will be required for an Econoline. The specified dry film thickness of 15 to 20 mils (.015 to .020 inch) will require at least three, possibly four, applications of coating material, with "flash off" time between coats. Spray coat complete panels only.

The coating must be applied with commercial equipment by an experienced automotive painter. The coating must be thoroughly agitated before application. The material is heavy bodied. A pressure cup spray gun or "Rocker Schutz Gun" is recommended.

COATING PREPARATION - MASKING VEHICLE

Install suitable covers over the wheels.

NOTE: IF THE VEHICLE HAS LOWER BODY SIDE MOULDINGS (12-14 INCHES ABOVE THE "TURN UNDER" OF THE ROCKER PANEL),

THE MOULDING CAN SERVE AS THE UPPER MARGIN OF THE AREA TO BE COATED. IF THE VEHICLE DOES NOT HAVE SUITABLE MOULDINGS, A SCULPTURE OR BREAK LINE IN THE SHEET METAL CAN BE UTILIZED. THIS LINE SHOULD BE SELECTED TO ENSURE ADEQUATE PROTECTION OF THE PAINTED SURFACES.

VEHICLES WITH BODY SIDE MOULDINGS

1. Masking tape should be positioned so that the moulding lower edge is also covered. The adjoining sheet metal should be left uncovered too so anti-stone, abrasion vinyl can be applied.

VEHICLES WITHOUT BODY SIDE MOULDINGS

2. If the contour of the body side has a break line, the upper coating margin must be masked off using 3M "Fine Line" Tape.

a. The normal masking tape and paper protection for the body side should be applied first and positioned about a quarter inch above the margin line.

b. The "Fine Line" tape should then be applied over the regular masking tape with the lower edge at the upper coating margin line. Extend this "Fine Line" tape into the wheel opening, in the absence of wheel opening mouldings, allowing the flange to be coated.

c. The anti-stone abrasion coating does not adhere well to flexible plastic parts. If left exposed, they must be masked off.

d. It is not necessary to mask off the body door openings in the coating area, as they will be uniformly coated where the door margins allow the coating to enter.

NOTE: DOOR OPENING AREAS SHOULD BE CLEANED TO ASSURE COATING ADHERENCE.

COATING PREPARATION - SHEET METAL

REPAIRED SHEETMETAL

1. Scuff sand (No. 180 Grit Paper) the glossy surface of the painted areas to be coated.

2. Using a clean, lint-free cloth, solvent wipe the area to be coated with wax and grease remover.

3. Remove sanding dust using compressed air and lint-free tack cloth.

NEW SHEET METAL

1. Sand off (No. 180 Grit Paper) the prime paint in the area to be coated.

2. Using a lint-free cloth, solvent wipe the area to be coated with wax and grease remover.

3. Remove sanding dust using compressed air and a lint-free tack cloth.

NEW INSTALLATION

1. The glossy surface of the paint in the coating area must be sanded with a D/A sander. A 220/240 Grit Disc does a good, fast job. DO NOT sand through the primer.

2. Using a clean, lint-free cloth, solvent wipe the area to be coated with wax and grease remover.

3. Remove sanding dust using compressed air and a lint-free tack cloth.

SPRAY PROCEDURE

The lower exposed painted fender, rocker, and quarter panel down flanges should be protected. The vehicle must be elevated high enough so that the painter can spray this area effectively. When an initial installation is to be made, a remote two-quart capacity pressure cup makes a much more efficient tool, as the spray gun can be used closer to the floor. The spray gun, fluid hose and/or cup must be cleaned immediately after use. Refer to manufacturer's recommended cleaning procedure. Lacquer thinner can be used when the suggested clean up material is unavailable.

WARNING: WEAR A NOISHA/MSHA RECOMMENDED VAPOR/PARTICULATE RESPIRATOR AND USE ALL OTHER RECOMMENDED SAFETY EOUIPMENT.

1. After preparing the new or damaged area(s), mix either Epoxy primer or Self-etch prime, per manufacturer's label instructions, and spray bare metal areas.

^ BASF DE15 or DE17

^ Sikkens Metalflex CR Primer (1 coat only)

^ DuPont Variprime

^ S-W E2G 980 GBP Etching Filler

^ PPG DP 40 (only)

2. Apply 1-2 light prime coats over the bare metal areas.

LOWER BODY STONE PROTECTION CHART

Softening and Scraping	Coating Application			
	Two Sides	One Side	Total	Material
Door (2-door)	0.3	0.1	0.4 hr.	4/10 qt.
Door (4-door)	0.2	0.1	0.3 hr.	3/10 qt.
Rocker Panel	0.3	0.1	0.4 hr.	4/10 qt.
Fender	0.2	0.1	0.3 hr.	2/10 qt.
Quarter	0.2	0.3	0.3 hr.	2/10 qt.
Complete side (2-door)	1.0	0.3	1.3 hrs.	1 qt.
Complete side (4-door)	1.1	0.4	1.5 hrs.	1 qt.

Operation No.	Labor	Material
SP-19515-A78-Door (2-door)	0.4 hr.	4/10 qt.
SP-19515-B78-Door (4-door)	0.3 hr.	3/10 qt.

SP-19515-F78-Complete side (2-door)	1.3 hrs.	1 qt.
SP-19515-G78-Complete side (4-door)	1.5 hrs.	1 qt.

NOTE: THESE TIMES DO NOT INCLUDE METAL SERVICING OR COLORCOAT APPLICATION.

TB-2207-A

3. Allow the material to dry for 15-20 minutes before applying the anti-stone abrasion material.

4. Mix and apply anti-stone abrasion material per manufacturer's label instructions over the primed area.

NOTE: AN ORANGE PEELED FINISH IS NORMAL WITH THESE PRODUCTS.

^ BASF Glassohyd 1109-1240/6

^ Sikkens 0TO Bodycoat

^ DuPont 123-5 Vinyl

^ S-W G/W 295 Vinyl Gravel Guard

^ PPG DX 54 Roadguard

^ 3M Rocker Schutz

NOTE: SOME ANTI-STONE ABRASION MATERIAL MAY REQUIRE A SLIGHTLY DIFFERENT MIXING PREPARATION, PROCEDURE

AND APPLICATION. SOME ANTI-STONE ABRASION MATERIALS CAN NOT BE USED FOR SPOT REPAIR. CHECK WITH THE PAINT MANUFACTURER FOR RECOMMENDATIONS ABOUT THEIR PRODUCT.

5. Allow the stone abrasion material to dry. Heat can be used to accelerate the drying time. Check the manufacturer's instructions.

COLOR COAT

The complete coated area, as well as the upper raw edge, must be covered with color coat. Mask off the upper margin line using "Fine Line" tape positioned 1/16 inch above the coating edge. Using appropriate service paint and application procedures, the protective coating area can now be finish painted with monocoat or a basecoat/clearcoat urethane system.

NOTE: IF DAMAGED SHEET METAL EXTENDS ABOVE THE PROTECTIVE COATING AREA, NORMAL PRIME/COLOR PAINT PROCEDURES SHOULD BE FOLLOWED.

CAUTION: OUR ENVIRONMENT IS PRECIOUS - PLEASE USE PROPER DISPOSAL TECHNIQUES FOR ANY VOLATILE ORGANIC

COMPOUNDS (V.O.C.'s) OR EXCESS MATERIALS.

Figure 4

Refer to the Lower Body Stone Protection Chart, Figure 4, for the material and labor hours involved.

(D) Procedure For PVC Body Side Moldings

If replacement of the body side molding is necessary, some dealer service kits will be supplied "paint to match."

The painting procedures in the following instructions (also included with the part) address materials from five (5) major aftermarket paint suppliers. Use the paint system materials you are the most

familiar with.

NOTE: CAREFULLY READ ALL LABEL WARNINGS BEFORE APPLYING THESE PRODUCTS.

WARNING: ALWAYS WEAR A NOISHA/MSHA RECOMMENDED VAPOR/PARTICULATE RESPIRATOR AND USE ALL OTHER RECOMMENDED SAFETY EQUIPMENT.

SIKKENS PRODUCTS

PREPARATION

1. Degrease with M600 wax and grease remover.

2. Scuff with # 320 dry paper or Scotchbrite 7447 (red).

3. Repeat degreasing step.

4. Spray two medium coats of Plastoflex primer. Allow 5 to 10 minutes flash between coats.

5. Allow 20 minutes flash-off at 70~ F before topcoating.

TOPCOATING

1. Mix Autocryl color with Elast-O-Actif 50:50 by volume.

2. Mix this material with 1.2.3 hardner and 1.2.3 reducer (use correct reducer for temperature) 100:50:30 by volume.

3. Apply three medium coats, allowing enough flash off to dry to a light touch.

4. Dry one hour at 140~F after 10 minutes flash off or dry 24 hours at 75~F.

PPG PRODUCTS

PPG MONO-COAT SYSTEMS

1. Solvent wipe with DX330 Acryli-clean.

2. Scuff with red Scotchbrite pad.

3. Repeat solvent wipe.

TOPCOATING

1. Mix and apply Deltron topcoat color with DX-369 Flexative per label instructions.

2. Use 40-50 PSI at the gun.

PPG BASECOAT/CLEARCOAT SYSTEMS

PREPARATION

1. Solvent wipe with SX330 Acryli-clean.

2. Scuff with red Scotchbrite pad.

3. Repeat solvent wipe.

TOPCOATING

1. Mix and apply Deltron basecoat color (DBU), with the recommended reducer for the temperature, per label instructions.

2. Mix and apply clearcoat material DBU-88 or DCU-2001, with DX-369 Flexative, per label instructions.

SHERWIN-WILLIAMS PRODUCTS

Ultrabase 7 Basecoat/Clearcoat or Ultra One Stage Acrylic Urethane Enamel

PREPARATION

1. Wash the material with a mild detergent and wipe dry.

2. Solvent wash with R7 K 156 and wipe dry.

3. Clean with a tack cloth.

4. Apply desired system with correct amount of Multi-flex, V6 V 299.

TOPCOATING

Prepare topcoating as follows:

^ S-W Ultra One Stage: (Mono-coat) 4 Parts Color 3 Parts SSR 650 Reducer 1 Part V6 V 440 or SSH 520 2 Parts V6 V 299

^ S-W UB7 Basecoat: 8 Parts Basecoat Color 8 Parts Stabilizer 1 Part V6 V 299

^ S-W UB7 Clearcoat: 4 Parts T1 C 650 Clearcoat 2 Parts T1 C 650 Reducer 1 Part CCH 690 1 Part V6 V 299

^ S-W Ultra One Stage: (Mono-coat) Apply 2-3 medium wet coats at 50 PSI

^ UB7 Basecoat: Apply 2-3 medium coats at 45 PSI

^ UB7 Clearcoat: Apply 2-3 medium coats at 50 PSI

DUPONT PRODUCTS

DUPONT CRONAR POLYOXITHANE MONOCOAT SYSTEM

PREPARATION

1. Wash the surface thoroughly with a mild detergent.

2. Clean with Prep Sol.

TOPCOATING

1. Add 8 parts of Cronar single stage enamel.

2. Add 1 part Cronar initiator 9404S.

3. Add two parts of (9475S, 9485S, or 9495S,) depending on shop temperature.

4. Add 2 parts flex-additive 9250S.

5. Mix thoroughly.

6. Spray at 45-55 PSI at the gun, 2-3 medium wet coats or until hiding.

7. If a clear coat is applied, use 9500S.

DUPONT CENTARI MONO-COAT ENAMEL SYSTEMS

PREPARATION

1. Wash the surface thoroughly with a mild detergent.

2. Clean with Prep Sol.

TOPCOATING (Follow Manufacturer's Recommendation)

1. Add 8 parts of Centari enamel color and 1 part 793S hardener.

2. Add 4 parts of (8022S, 8093S, or 8096S) reducer, depending on shop temperature.

3. Add 355S flex additive per label instructions.

4. Mix thoroughly.

5. Spray 2-3 wet coats, with 5 minutes flash time, at 50-65 PSI.

BASF PRODUCTS

The following procedure is applicable to 4 paint systems in the BASF paint line. Read individual "system" instructions carefully.

PREPARATION

1. Solvent wipe the molding with RM Pre-klean-o 900.

2. Sand with 400 grit sand paper and rinse with 901 pre-paint cleaner.

TOPCOATING BASECOAT

^ "Glasurit" 54-line color 2 vol. parts

^ 54-line reducer 1 vol. part

^ "Diamont" basecoat color 2 vol. parts

^ B R Diamont reducer 2 vol. parts

^ "Miracryl" basecoat color 2 vol. parts

^ BCR reducer 2 vol. parts

^ "Supreme Gold" basecoat color 2 vol. parts

^ LBR reducer 2 vol. parts

Apply basecoat color until hiding is achieved. Allow 3-5 minutes flash time between coats.

NOTE: USE APPROPRIATE REDUCER FOR SHOP CONDITIONS. ALLOW 15 MINUTES FLASH-OFF BEFORE SPRAYING CLEARCOAT.

TOPCOATING

Apply clearcoat per manufacturer's label instructions:

CLEARCOAT REDUCTIONS

^ DC-88 Diamont Clear 4 Vol. Parts

^ DH-44 Diamont Hardener 1 Vol. Part

^ MC-1000 Clear 4 Vol. Parts

^ 894 Hardener 1 Vol. Part

^ LC-1300 Supreme Gold Clear 4 Vol. Parts

^ LH-1301 Hardener 1 Vol. Part

^ 92354 Glasurit Clear 100 Parts

^ 521-111 Elastifier 20 Parts

^ 929-29 Hardener 60 Parts

Apply 2 wet coats with 5 to 10 minutes flash time between coats. Overnight dry or force dry at 140~F for 30 minutes.

CAUTION: OUR ENVIRONMENT IS PRECIOUS - PLEASE USE PROPER DISPOSAL TECHNIQUES FOR ANY VOLATILE ORGANIC COMPOUNDS (V.O.C.'s) OR EXCESS MATERIALS.

(E) Lower Body-Side Stone Chip Protection Program

Ford Motor Company has recently initiated a program to provide improved stone-chip protection on some vehicles and to increase the corrosion protection on cars and trucks.

Some customers are unaware of body side anti-stone chip protection which appears as wavy orange peel texture on the lower body areas.

Ford is increasing the use of PVC (poly vinyl chloride) material which is applied in a thicker coating on the lower body-side. This material has been in use on vehicles destined for the Canadian market for many years.

This PVC material is now applied at the following plants on ALL vehicles.

^ Edison - Ranger

^ Hermosillo - Escort/Tracer

^ Louisville - Ranger and Explorer

^ Ohio Truck - Econoline

^ Wayne - Escort/Tracer

This process is also planned for Kansas City, Oakville, Twin Cities and Wixom.

This material can be identified by the "orange peel" appearance and a visible "break-line" between protected and unprotected areas in the lower body areas.

CAUTION: THIS PROTECTION MUST NOT BE REMOVED IF VEHICLE IS EXPECTED TO MAINTAIN THE CORROSION PROTECTION.

Some customers have expressed concerns due to the appearance of the treated areas. These customers did not know about the extra protection this material provides their vehicle. Once explained, customers were pleased with the added protection and accepted the orange peel finish.

NOTE: DEALERS SHOULD ADVISE THEIR SALES PEOPLE, SERVICE PEOPLE, AND CUSTOMERS, OF THE REASONS AND BENEFITS

OF THIS PROTECTION. CANADIAN DEALERS STRESS THIS AS A SELLING POINT WITH THEIR SALES PEOPLE. IT IS CONSIDERED A COMPETITIVE ADVANTAGE.

(F) Surface Defect Removal Without Repainting

Exterior paint surface damage or imperfections, where the primer coat does not show through, should be restored without repainting. The restoration of gloss and luster, after the condition has been repaired, is possible with new techniques and improved materials.

The following procedure is applicable to surface conditions such as dirt particles, orange peel, runs, sags, industrial fallout stains, swirl marks, light scratches and other minor surface imperfections. For dirt particles or scratches in several localized areas, the entire panel should be refinished to maintain a uniform appearance.

PREPARATION

To repair the affected surface it must be clean and dry. Mask off adjacent panels, mouldings, stripe and character lines as required.

CAUTION: EYE PROTECTION, AND FACE MASK SHOULD BE WORN. RINGS, BRACELETS, WATCHES AND BELT BUCKLES MUST BE

REMOVED TO PREVENT ACCIDENTAL DAMAGE TO PAINT FINISH.

SERVICE PROCEDURE

1. Remove sanding marks with rubbing compound.

2. Swirl marks, evident after buffing, are removed by polishing.

3. Remove light scratches and small dirt particles with a power buffer and medium buffing compound followed with polishing.

4. Remove deeper scratches and heavy dirt particles or orange peel, by wet sanding.

5. Buff with compound to remove the sanding marks and then polish to remove the swirl marks from the buffing operation.

NOTE: PERFORM A TRIAL REPAIR WITH A SMALL AREA. FIRST, TRY POLISHING; IF THIS IS NOT SUCCESSFUL, TRY BUFFING

AND, FINALLY, USE WET SANDING TO REMOVE THE CONDITION. USE MOST EFFECTIVE TECHNIQUE ON REMAINDER OF AREAS. AN OUTLINE OF THE COMPLETE PROCEDURE AND REQUIRED MATERIALS FOLLOWS.

POLISHING - VERY MINOR SCRATCHES OR SWIRL MARKS AND/OR RESTORING A DULL FINISH

1. Apply a small amount of Meguiar's Mirror Glaze, or equivalent, to the affected panel (or pad).

2. Use a suitable electric or air powered polish/buffing wheel (1750 max. RPM) and a Meguiar's Finesse Polishing Pad, or equivalent, to polish the affected area until all swirl marks are gone and desired luster is obtained.

3. When polishing, keep the pad flat against the surface. Do not bear down. The weight of the buffer is sufficient.

CAUTION: DO NOT MIX PRODUCTS! USE A SEPARATE, DEDICATED BUFFING PAD FOR EACH PRODUCT TO ACHIEVE DESIRED

RESULTS.

Variable speed buffers are available in a variety of buffing speeds. The recommended speed range is 1200-1750 RPM.

COMPOUNDING - LIGHT SCRATCHES, SMALL DIRT PARTICLES, MINOR GRIND MARKS, AND SANDING MARKS

1. Apply Meguiar's Rubbing Compound (medium) or equivalent to the panel with a clean compound pad on the wheel.

2. Spread the compound evenly and continue buffing until the condition is removed.

3. Keep the wheel flat to the surface and use light to moderate pressure and long strokes.

4. Periodically check the finish and add compound as required.

5. When buffing is complete, polish the panel as described previously.

Twisted wool cutting pads are the most effective compounding pads to use with Glaze Machine Cleaner for removing paint defects and heavy oxidation. Following the use of a wool compounding pad, it may be necessary to polish the finish with No. 2 Mirror Glaze Hi-Tech Cleaner using a Mirror Glaze Finesse Polishing Pad to remove the deep swirl marks.

GENERAL TECHNIQUES AND HINTS

^ "Foam" buffing pads create added gloss and depth of color on all types of paint finishes without creating buffer swirl marks.

^ When "buffing out" oxidation or other paint defects with a cleaning material, use a liberal amount of material, slower buffing motion and added downward pressure to increase cutting action.

^ Always apply cleaner to buffing pad, not directly on the oxidized paint surface. Dry paint absorbs material into pores upon contact.

^ Always keep the face of the buffing pad completely flat to the surface, reducing the risk of buffer swirl marks. Watch your pad, especially on angled surfaces, to be certain that it stays flat.

^ Avoid short rapid strokes. Move the buffer slowly across the surface using long straight motions and overlap by 50% the buffing pattern left by the previous pass. This insures uniform coverage and allows both material and buffer to perform at maximum efficiency.

^ Avoid buffing directly on raised character lines. The reduced paint film on these surfaces increases the risk of paint burn through. It is best to buff up to them from each side.

^ Always use a "wet buff" technique on a basecoat/clearcoat finish. This is a precaution against buffer swirls. Stop buffing just after the product begins to break down and before an overall dry, glossy finish appears. After "wet buffing", use a towel to wipe off the excess material.

^ Always use a "dry buff" technique on light colored, conventional paint finishes. Continue buffing until the material breaks down and only a slight film remains for final wipe off.

^ If a paint blemish remains after buffing, reapply a small amount of material over the blemish. Confine your buffing strokes to the immediate area of the blemish while applying additional

downward pressure and keeping the pad flat.

NOTE: ALWAYS KEEP THE PAD MOVING AND LIMIT YOUR STROKES OVER THE BLEMISH TO PREVENT EXCESSIVE HEAT

BUILD-UP AND POSSIBLE BURN THROUGH. STOP IMMEDIATELY IF THE SURFACE BECOMES TOO HOT TO LAY THE PALM OF YOUR HAND ON IT.

NOTE: HEAT BUILD-UP: WHEN BUFFING CREATES EXCESSIVE HEAT, HAZING MAY APPEAR ACROSS THE SURFACE BEING

BUFFED AND THE PRODUCT MAY DRY LIKE A FILM AND REFUSE TO BUFF OUT. TO REMEDY, WIPE THE AREA DOWN WITH COOL WATER, DRY THE SURFACE AND RESUME BUFFING ... AT A LOWER RPM IF POSSIBLE.

NOTE: STATIC: STATIC ELECTRICITY MAY BE PRESENT ON PAINTED FIBERGLASS/PLASTIC SURFACE BEING BUFFED, THE

MATERIAL MAY DRY LIKE A FILM OR TURN "GUMMY" AND BEGIN TO BALL UP. TO REMEDY, GROUND THE SURFACE BEING BUFFED TO METAL.

WET SANDING

Paint defects and sanding marks must be completely removed without using compounds and abrasive cleaners that scar the finish.

Mirror Glaze Hi-Tech Finesse Sanding Papers provide uniformity in grit particle size and distribution. Using these precision made sanding papers, water sanding marks can be removed with Meguiar's cleaner and finesse polishing pads.

^ Typical paint defects that are repaired with this system include: dirt-in paint, solvent pop, cratering, orange peel, drips, scratches, water spots, and acid rain.

^ Always use the least abrasive (highest grit) sanding products possible to do this job.

The following wet sanding procedure utilizes light grit sand paper or sanding blocks for removal of surface damage. These materials cut quickly leaving a uniform finish requiring a minimum of buffing to restore gloss.

PROCEDURE

1. Squeeze water to flush the area to be sanded. Continue to flush water to the surface during sanding for maximum lubrication.

2. Use small circular motions to contain the abrasion to the immediate area of the defect. Keep the blocks in water when not in use.

3. If the sanding block is cutting too slow, switch to a lower grade block and resume sanding. When 90% of the defect is removed, switch to a 2000 grade Finesse Sanding Paper or Sanding Block to finish smoothing and prepare the surface for buffing.

4. Finesse Sanding Blocks can be shaped to work on any angle. When the block is wet, rub it against a dry sanding block for shaping.

5. When using Finesse Sanding Papers, wrap the paper tightly around a E-7200 Backing Pad. This pad evenly distributes pressure over the entire surface of the sanding paper. This creates a uniform sanding pattern.

6. Plan your strokes to limit the abrasion to the smallest area possible.

NOTE: ALWAYS SAND IN ONE DIRECTION AND KEEP YOUR STROKES STRAIGHT.

7. Always finish sanding with 2000 Grit Finesse Sanding Paper. This eliminates the need for compounding.

8. Buff out sanding marks by applying Meguiar's Cleaner with a Finesse "Foam" Polishing Pad. Follow with a Mirror Glaze Polish for swirl-free gloss.

WARNING: OUR ENVIRONMENT IS PRECIOUS - PLEASE USE PROPER DISPOSAL TECHNIQUES FOR ANY VOLATILE ORGANIC

COMPOUNDS (V.O.C.'s) OR EXCESS MATERIALS

RUNS AND SAGS REMOVAL

This procedure consists of shaving the run or sag flush with a commercial single edge razor blade, shaving file or sanding with a hard block and then compounding.

NOTE: IF IT IS NECESSARY TO SHAVE RUNS AND SAGS WITH A RAZOR BLADE, FIRST DULL THE CORNERS WITH SANDPAPER TO AVOID SCRATCHING THE ADJACENT PANEL FINISH.

(G) Color Compatible Spray Primer Chart

Ford has released color compatible spray primers for exterior and some interior surfaces.

Colored sprayed primers are being used by our "Best-in-Class" competition and are now being implemented at Ford in order to improve process capability and to help in minimizing unsightly paint chipping from stone abrasion. Color keyed (matched) spray primer for exterior body colors is being used in an effort to help in the elimination of unsightly paint chipping from stone abrasion.

As with "Best-In-Class" competition, the engine compartment will be left with color compatible primer only and not be topcoated as per past practice.

When any paint repair is required, remember that the vehicle may have a colored primer. Refer to the Spray Primer Chart, Figure 5. This information may be of help in correction of exterior paint color match concerns.

(H) Paint Repair For Tinted Clear Coat

Ford introduced (Early Spring, 1991) a new paint color using a tinted clearcoat. The first color to use this new system is Rio Red.

If a paint repair is necessary, refer to the following procedure for repair instructions.

BACKGROUND

The Probe production paint system for Rio Red includes a Medium Green E-Coat primer, a Light Gray spray primer, bright Rio Red (E4) basecoat and a slightly Red tinted clearcoat topcoat.

NOTE: BEFORE ANY REPAIRS ARE BEGUN, IT IS CRITICAL THAT PRIMER, RED BASECOAT AND TINTED CLEARCOAT BE SPRAYED ON A TEST PANEL. THE COLOR MATCH IN EACH STEP IS VERY IMPORTANT FOR A SUCCESSFUL REPAIR.

WARNING: ALWAYS WEAR A NOISHA/MSHA RECOMMENDED VAPOR/PARTICULATE RESPIRATOR AND USE ALL OTHER RECOMMENDED SAFETY EQUIPMENT.

SMALL SPOT REPAIR PROCEDURE

1 Wash the vehicle with detergent soap and

water.

2 Wipe the vehicle down with wax and grease

remover.

3. Sand the spot using 400 grit paper. Do not sand through the E-coat.

4. Wipe the sanded surface again with wax and grease remover/pre-cleaner.

^ BASF Product # 90 Pre-Kleano

^ PPG Product # DX 330

^ S-W Product # R7-K156

^ DuPont Product # 3919 S

^ Sikkens Product # M 600

5. Mix and apply tintable (Light Gray) self-etching or epoxy primer per manufacturer's label instructions.

NOTE: COLOR MATCH OF PRIME COAT IS KEY IN COLOR MATCH OF REPAIRED AREA.

^ BASF Product # DE 17

^ PPG Product # DP 40

^ S-W Product # E2-G973

^ DuPont Product # 615S

^ Sikkens Product # 1016

6. Mix and apply bright Rio Red base coat material per manufacturer's label instructions.

NOTE: COLOR MATCH OF BASE CLEAR COAT IS KEY IN COLOR MATCH OF REPAIRED AREA.

7. Mix and apply red tinted clearcoat material per manufacturer's label instructions.

NOTE: COLOR MATCH OF TINTED CLEAR COAT IS KEY IN COLOR MATCH OF REPAIRED AREA.

FULL PANEL REPAIR PROCEDURE

1. Wash the vehicle with detergent soap and water.

2. Wipe the vehicle down with wax and grease remover.

3. Sand the complete panel and feather edge into the next panel using 400 grit paper. Do not sand through the E-Coat primer.

4. Wipe the sanded surface with wax and grease remover.

5. Mix and apply tintable (light gray) primer per manufacturer's label instructions.

6. Mix and apply Rio Red basecoat per manufacturer's label instructions.

7. Mix and apply Red tinted clearcoat per manufacturer's label instructions.

8. Mix and apply one coat of non-tinted clearcoat per manufacturer's label instructions.

NOTE: COLOR MATCH OF EACH COAT ARE KEY TO COLOR MATCH OF FINISH REPAIR.

WARNING: OUR ENVIRONMENT IS PRECIOUS - PLEASE USE PROPER DISPOSAL TECHNIQUES FOR ANY VOLATILE ORGANIC COMPOUNDS (V.O.C's) OR EXCESS MATERIALS.

Figure 6

The Paintable Plastics Chart, Figure 6, is a summary of widely used plastics in our industry. The standard symbol should be located on the part for ease of material identification.

If painting or repair of these plastics is necessary, the following chart identifies those materials which can be painted. Refer to paint manufacturer for specific paint material recommendations.

NOTE: MATERIALS MAY REQUIRE PRIME COAT SEE "YES", UNDER "CAN BE PAINTED" COLUMN.

Article No. 95-6-1

03/27/95

^ PAINT - IRON PARTICLE REMOVAL - INDUSTRIAL FALLOUT - ACID RAIN NEUTRALIZATION

^ PAINT - ROUGH TEXTURE/FERROUS METAL CONTAMINATION - ACID RAIN DISCOLORATION OR ETCHING

FORD: 1980 and after CROWN VICTORIA, ESCORT, MUSTANG, THUNDERBIRD 1982-88 EXP 1984-94 TEMPO 1986 and after TAURUS 1988-93 FESTIVA 1989 and after PROBE 1994-95 ASPIRE 1995 CONTOUR

LINCOLN-MERCURY: 1980 and after CONTINENTAL, COUGAR, GRAND MARQUIS, TOWN CAR 1981-87 LYNX 1984-92 MARK VII 1984-94 TOPAZ 1986 and after SABLE 1987-89 TRACER 1991-94 CAPRI 1991 and after TRACER 1993 and after MARK VIII 1995 MYSTIQUE

MERKUR: 1985-89 XR4TI 1988-89 SCORPIO

LIGHT TRUCK: 1980 and after F-150-350 SERIES 1981 and after ECONOLINE 1982 and after BRONCO 1983 and after RANGER 1984-90 BRONCO II 1986 and after AEROSTAR 1988 and after F SUPER DUTY 1991 and after EXPLORER 1993 and after VILLAGER 1995 and after WINDSTAR

MEDIUM/HEAVY TRUCK: 1980-91 C SERIES, CL-CLT-9000 SERIES 1980 and after F & B SERIES, L SERIES 1986 and after CARGO SERIES

ISSUE: Ferrous metal particles (hot iron dust) are generated by manufacturing facilities, rail shipments, combustion engines, jet engines, body shops, etc. These particles mechanically/magnetically bond to vehicles' painted surfaces. Moisture and temperature combine with the particles to create a chemical reaction. The reaction causes the particles to corrode and enter into the physical paint film.

ACTION: To remove these particles/contaminants, USE ONLY the following procedure. The procedure must be performed before any buffing, polishing, color sanding or refinishing is attempted. The materials in this procedure are alkaline, acidic and neutral. They must be used in the specified order.

CAUTION:

ANY CHANGES TO THIS PROCEDURE WILL CAUSE AN INCOMPLETE OR UNSATISFACTORY REPAIR AND MAY RESULT IN

POSSIBLE DAMAGE TO THE PAINTED SURFACES AND TRIM.

WARNING:

THE TECHNICIAN MUST WEAR PROTECTIVE CLOTHING AND EYE PROTECTION TO PREVENT SKIN IRRITATION.

CAUTION:

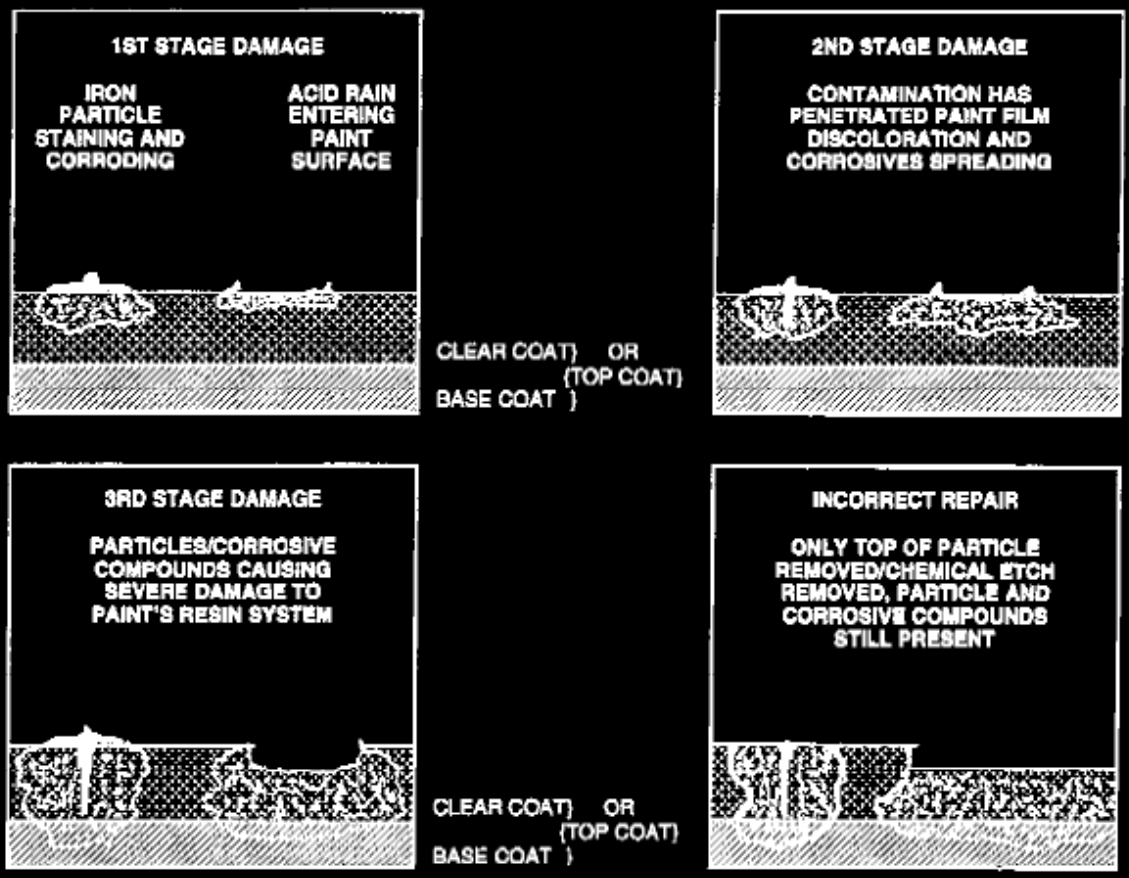
THE USE OF ANY OTHER PRODUCT OR PROCEDURE MAY CAUSE DAMAGE TO ALUMINUM, FLEXIBLE PAINTED SURFACES OR OTHER PAINTED SURFACES. FOLLOW DIRECTIONS EXACTLY AND RINSE THOROUGHLY AFTER EACH STEP.

NOTE:

THIS DECONTAMINATION PROCEDURE IS DESIGNED TO REMOVE SURFACE CONTAMINANTS FROM THE PAINT ON VEHICLES THAT HAVE BEEN CONTAMINATED UP TO 120 DAYS. VEHICLES WHICH HAVE EXPERIENCED THE CONDITION LONGER THAN THIS PERIOD MAY REQUIRE AN ADDITIONAL TREATMENT TO REMOVE FERROUS METAL CONTAMINANTS.

IDENTIFICATION

INDUSTRIAL FALLOUT (IFO) is a general term used to identify Rail Dust, Brake Dust, Ferrous Metal, Alkaline/Crystalline Deposits, Water Spots, Acid Rain, and other types of Environmental Contamination.



Studies conducted have shown the use of Oxalic Acid ferrous metal removers actually contribute to further damage of the paint's resin system, creating long term damage, which may not be evident for months. Additionally, Oxalic Acid products may damage soft exterior trim, aluminum trim and soften the paint.

The use of "clay" type products does not remove the entire ferrous particle or environmental contamination. Clay removes only the top of the particle and stain generated by the contamination, leaving the particle imbedded and the corrosive chemical compounds generated by the contamination in the paint system.

The particles and/or chemical compounds are still present and they continue to generate damage. Color sanding, buffing or compounding the paint film to remove ferrous metal, industrial fallout or acid rain damage may not remove the entire cause of the damage (they treat only the symptom and not the cause). The chemical compounds are still in the paint system and will continue to damage the paint. Color sanding and buffing may result in excessive removal of clear coat film. Removal of OEM clear coat in excess of 0.03 mil may contribute to premature clear coat failure and is not recommended.

THE DECONTAMINATION PROCEDURE DIRECTED IN THIS BULLETIN MUST BE PERFORMED BEFORE ANY BUFFING, POLISHING, COLOR SANDING OR REFINISHING IS ATTEMPTED.

TB-4187-A

Figure 1

For ease of identifying, the Radio Shack Model 63-851, 30X, lighted, magnifier is recommended.

1. Ferrous Metal

^ Light colored vehicles: Small rust orange dots with black in center of stain.

^ Dark colored vehicles: Small white or silver dots with a "rainbow hue" around the particle. The surface will also feel rough to the touch.

2. Industrial Fallout

^ The surface feels rough to the touch and may exhibit crystalline deposits.

^ Usually ferrous metal is present, as well as water spots.

MANUFACTURERS			
PROCEDURE	FINISH KARE (818)-443-8983, CUSTOMER SERVICE	3M (800)-364-3577	MEGUIAR'S (800)-347-5700, CUSTOMER SERVICE
Decontamination	#1119, #883, #11830	None	None
Coarse Compounds	#340 Compound, FK-7503G Pad	Imperial Micro-Finishing Compound	#4 Heavy, #1 Medium, #2 Light
Light	#338 Compound, FK-7503G Pad	Finesse-It II Finishing Compound	#4 Heavy, #1 Medium, #2 Light
Polish	#330, FK-8110G Pad, FK-2500G Pad	Perfect-It Foam Polishing Pad Glaze	#9
Protectant	#218 Or #2180	Imperial Hand Glaze	#9 Or #7
Color Sanding Lubricant	#780 Sand Lube	None	None

3. Acid Rain

^ Surface will exhibit irregular discolored spotting.

^ Dark colored vehicles will show cloudy or greying spots where the acids have started to etch away the paint.

NOTE:

IN EXTREME CASES ETCHING OF THE SURFACE WILL BE VISIBLE OR FELT.

DECONTAMINATION

Use Finish Kare Inc. products 1119/883/11850 to decontaminate the paint surface. Follow the manufacturer's recommended procedures.

NOTE:

FORD DOES NOT RECOMMEND THE USE OF OXALIC ACIDS OR OTHER "FALLOUT REMOVERS".

1. Rinse off dust and debris with cold water. Be sure to start at the bottom and work up.

2. Prepare product "1119" by mixing one (1) part "1119" with four (4) parts cold water.

3. Use clean wash mitt and apply mixture to entire car, starting at the bottom and working up to the top surface. Keep car wet with the solution for 5 to 10 minutes. Do not allow product to dry on the car, and do not allow it to streak down the sides. Rewipe with mitt if necessary to avoid streaks.

4. Rinse car with cold water.

5. Dry the flat surfaces of the vehicle hood, roof and deck lid.

6. Apply product "883" directly to the contaminated surfaces using a clean dry sponge, wash mitt, or soft truck brush ("883" is ready to use from the bottle, with no mixing involved). Keep the areas wet with the "883" for 5 to 7 minutes. Do not allow to dry on the car. Wipe down to the body line on the sides.

7. Prepare product "118SC" by mixing 1 oz (0.03 L) with 1 gal (3.785 L) of water.

8. Shampoo the vehicle with "118SC" shampoo mixture using a clean wash mitt and then rinse with cold water.

NOTE:

DO NOT USE "1185C" MITT WITH "1119" OR "883" SOLUTIONS. USE SEPARATE MITTS AND ALWAYS KEEP THEM SEPARATE.

9. Inspect paint surface to see if rust particles have been removed. If rust particles have been on the vehicle for a long time, it may be necessary to repeat each of the above steps.

NOTE:

THE NEUTRALIZER CONCENTRATE IS A HEAVY DUTY SHAMPOO AND CAN BE USED IN AN AUTOMATIC CAR WASH SYSTEM.

CORRECTION OF SURFACE FOLLOWING DECONTAMINATION:

1. Visually inspect surface for evidence of removal of ferrous metal particles, crystalline deposits and water spots. Acid rain discoloring or etching will require either buffing, color sanding or refinishing if etching is visible.

2. Use the buffing products from only one (1) manufacturer. Do not intermix products.

3. Always follow the manufacturer's product sequence. Use appropriate pads with each product as recommended by the manufacturer.

NOTE:

DO NOT REMOVE MORE THAN 0.3 OF A MIL OF PAINT MATERIAL, OR REPAINTING WILL BE REQUIRED.

4. Use a dual action sander (D/A Sander) with a velcro-mount backing plate and appropriate foam pad for final polishing swirl removal.

5. Use an alcohol and water mixture (1:4 ratio) to clean buffed areas to verify removal of scratches and swirls before application of final protective glaze.

NOTE:

FREQUENT WASHING OF VEHICLES IS IMPORTANT. CONTAMINANTS SETTLE ONTO THE VEHICLE EVERY DAY. USE CLEAN WATER (DEIONIZED, REVERSE OSMOSIS, ETC.) TWICE WEEKLY TO REMOVE HEAVY DUST, AND PARTICULATES. THE USE OF A NEUTRAL pH CAR WASH SOAP EVERY TWO (2) WEEKS IS RECOMMENDED TO NEUTRALIZE VEHICLE CONTAMINATION.

FORD: 1980 and after CROWN VICTORIA, ESCORT, MUSTANG, THUNDERBIRD 1982-88 EXP 1984 and after TEMPO 1986 and after TAURUS 1988-93 FESTIVA 1989 and after PROBE

LINCOLN-MERCURY: 1980 and after CONTINENTAL, COUGAR, GRAND MARQUIS, TOWN CAR 1981-87 LYNX 1984-92 MARK VII 1984 and after TOPAZ 1986 and after SABLE 1987-89 TRACER 1991-94 CAPRI 1993 and after MARK VIII

MERKUR: 1985-89 XR4TI 1988-90 SCORPIO

LIGHT TRUCK: 1980 and after F-150-350 SERIES 1981 and after ECONOLINE 1982 and after BRONCO 1983 and after RANGER 1984-90 BRONCO II 1986 and after AEROSTAR 1988 and after F SUPER DUTY 1991 and after EXPLORER 1993 and after VILLAGER 1995 WINDSTAR

MEDIUM/HEAVY TRUCK: 1980-91 C SERIES, CL-CLT-9000 SERIES 1980 and after F & B SERIES, L SERIES 1986 and after CARGO SERIES

ISSUE: This procedure is being published to advise all body and paint technicians about proper procedures for preparation of sheet metal parts coated with electrodeposition primer (E-Coat).

ACTION: When prepping a replacement body panel for installation, it is mandatory to leave the E-Coat intact. DO NOT SAND OFF THE E-COAT.

Improper preparation with excessive sanding of the E-Coat to bare metal will jeopardize the sheet metal warranty and overall customer satisfaction. In particular, the E-Coat is necessary to protect the parts from rust. Light scuff sanding using a Scotch Brite pad or wet 320 grit sand paper is recommended for minor flaws. If a minor flaw exists, wet sand or scuff out the flaw and prime the repair area. Again, do not remove all of the E-Coat from the panel.

CAS: 7439-92-1 ★★★★★★ **LEAD** ★★★★★★ **CHEMICAL FACT SHEET**

Chemical Names (Synonyms): Lead.

Inorganic Compound Names: Lead carbonate (CAS 598-63-0)
Lead chloride (CAS 7758-95-4)
Lead monoxide (CAS 1317-36-8)
Lead sulfide (CAS 1314-87-0)
and others.

Trade Names: C.I. Pigment Metal 4, C.I. 77575, Lead flake, Whole lead, Litharge, and others.

Uses: Tank linings, piping and other chemical reaction equipment; petroleum refining, manufacture of gasoline additives; pigments for paint; storage batteries, solder and fusible alloys; radiation shielding; and others.

PHYSICAL INFORMATION

Appearance: Bluish white to silvery gray solid (lead metal).

Odor: None.

Minimum Detectable by Odor: Unknown.

Behavior in Water: Insoluble.

Evaporation: Unknown.

HEALTH HAZARD INFORMATION

OSHA Standard: Average 8 hour exposure – 0.05 mg/m³ (lead).

Note: Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to .060 mg lead per 100 ml blood, he must be removed from all exposures to lead and cannot return to an exposed environment until the blood level falls to .040 mg lead per 100 ml blood or less.

NIOSH Recommended Limit: Average 10 hour day/40 hour week exposure – .01 mg/m³ (lead).

ACGIH Recommended Limit: Average 8 hour exposure – 0.15 mg/m³ (lead).

Short Term Exposure:

Note: Lead is a cumulative poison. Increasing amounts build up in the body and eventually a point is reached where symptoms and disability may occur. Lead dust carried home on contaminated clothing can cause symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs.

Inhalation: The effects of exposure to fumes and dusts of inorganic lead may not develop quickly. Symptoms may include decreased physical fitness, fatigue, sleep disturbance, headache, aching bones and muscles, constipation, abdominal pains, and decreased appetite. These effects are reversible and complete recovery is possible. Inhalation of large amounts of lead may lead to seizures, coma, and death.

TB-3995-A

Figure 1

HEALTH HAZARD INFORMATION (CONT'D.)

Skin: May cause irritation.

Eyes: May cause irritation.

Ingestion: See effects listed for inhalation. Ingestion of large amounts of lead may lead to seizures, coma, and death.

Long Term Exposure:

Lead can accumulate in the body over a period of time. Therefore, long term exposures to lower levels can result in a build up of lead in the body and more severe symptoms. These may include anemia, pale skin, a blue line at the gum margin, decreased handgrip strength, abdominal pain, severe constipation, nausea, vomiting, and paralysis of the wrist joint. Prolonged exposure may also result in kidney damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, convulsions, coma, delirium, and death. In non-fatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Continuous exposure can result in decreased fertility. Lead exposure of either parent before pregnancy can increase the chances of miscarriage or birth defects. Exposure of the mother during pregnancy can cause birth defects.

EMERGENCY AND FIRST AID INSTRUCTIONS

Inhalation: Move victim to fresh air. Give artificial respiration, as needed. Get medical attention immediately.

Skin: Wash area with plenty of soap and water. Remove any contaminated clothing immediately.

Eyes: Rinse eyes with plenty of water for 15 minutes. Seek medical attention, if necessary.

Ingestion: If victim is conscious, give water. Seek medical attention.

Note to Physician: Whole blood lead levels, circulating plasma/erythrocyte lead concentration ratio, urine ALA, and erythrocyte protoporphyrin fluorescent microscopy may all be useful in monitoring or assessing lead exposure. Chelating agents such as edetate disodium calcium and penicillamine are generally useful in the therapy of acute lead intoxication.

PROTECTIVE MEASURES

Storage and Handling: Store in an area away from heat and keep separate from potassium.

Engineering Controls: Adequate ventilation, sinks, showers and eyewash stations should be provided.

Protective Clothing: Full body work clothing should be worn including bump caps or hard hats, rubber gloves, and eye protection. Employees should routinely wash their skin thoroughly and change clothing at the end of each work shift.

Figure 2

CAS: 7439-92-1 ★★★★★★ LEAD ★★★★★★ CHEMICAL FACT SHEET

PROTECTIVE MEASURES (CONT'D.)

Protective Equipment:

For levels up to 0.5 mg/m³, use any dust and mist respirator, except single-use.

For up to 1 mg/m³, use any dust and mist respirator, except single-use or quarter mask, or any fume respirator or high efficiency particulate filter respirator.

For up to 5 mg/m³, use a high efficiency particulate filter respirator with a full facepiece.

For up to 100 mg/m³, use a powered air-purifying respirator with a high efficiency particulate filter or a Type C supplied-air respirator operated in pressure-demand or other positive-pressure or continuous-flow mode.

For up to 200 mg/m³, use a Type C supplied-air respirator with full facepiece operated in pressure-demand or other positive-pressure mode, or with a full facepiece, helmet or hood operated in continuous-flow mode.

For levels greater than 200 mg/m³, escape, or entry into unknown concentrations, use a self-contained breathing apparatus with full facepiece operated in pressure-demand or other positive-pressure mode or a combination respirator which includes a Type C supplied-air respirator with a full facepiece operated in pressure-demand or other positive-pressure or continuous-flow mode and an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode.

Other Precautions: No eating, drinking, or smoking in areas where the dusts or fumes of lead or its compounds are present.

FIRE AND EXPLOSION INFORMATION

General: Not combustible. If exposed to fire, may release toxic fumes of sulfur and lead oxides.

Explosive Limits: Unknown.

Extinguisher: Use extinguisher appropriate to burning material. When fighting fire, wear a self-contained breathing apparatus with full facepiece and operated in positive-pressure mode.

REACTIVITY INFORMATION

Conditions to Avoid: Excessive heat.

Materials to Avoid: Reacts violently with potassium.

SOURCE: Chemical Fact Sheet as prepared by the Bureau of Toxic Substance Assessment, New York State Department of Health; modified by the Toxicology Department, Ford Motor Company.

TB-3997-A

Figure 3

WARNING:

LEAD CONTAMINATION POTENTIAL: THE ELECTRODEPOSITION PRIMER USED BY FORD MOTOR COMPANY OVER BASE METAL ON SERVICE REPLACEMENT PARTS OR COMPLETED VEHICLES CONTAINS SMALL AMOUNTS OF LEAD FOR CORROSION PROTECTION OF STEEL. EXCESSIVE DUSTS GENERATED BY UNNECESSARY AND IMPROPER SANDING MAY CONTAIN AIRBORNE LEAD CONTAMINATION IN EXCESS OF OSHA STANDARDS. INFORMATION REGARDING THE HAZARDS OF LEAD CAN BE FOUND IN THE CHEMICAL FACT SHEETS IN THE FIGURES IN THIS ARTICLE.

NOTE:

READ ALL INFORMATION IN THIS TECHNICAL SERVICE BULLETIN CAREFULLY AND FORWARD TO ALL EMPLOYEES PERFORMING PAINT PREPPING OPERATIONS. DEALERS SHOULD CONTACT LEGAL COUNSEL AND/OR LOCAL OSHA

AUTHORITIES FOR DIRECTION REGARDING OSHA LEAD STANDARD REQUIREMENTS.

If a replacement body panel contains more than a minor flaw in the E-coat, it should be returned. Contact your Customer Service representative for instructions.

If more extensive sanding, other than that described above, is necessary, (e.g., refinishing original vehicle sheet metal) follow the procedures outlined below:

ALTERNATIVE SANDING PROCEDURES WHEN EXTENSIVE SANDING IS REQUIRED

The following procedures for sheet metal preparation by sanding or media blasting are based on tests conducted by Ford Motor Company in accordance with requirements set forth in the Federal OSHA Inorganic Lead Standard 29 CFR 1910.1025.

SANDING PROCEDURE

1. Each technician performing the sanding operation MUST wear an approved respirator with high efficiency particulate filter (HEPA).

2. Technicians should use dual action sander with vacuum collection.

3. The vacuum equipment MUST be equipped with a HEPA filter on the air exhaust. Dealers are cautioned not to exhaust vacuum air into the atmosphere. Operators are cautioned to follow the manufacturer's guidelines for maintenance and the replacement of filters.

MEDIA BLASTING PROCEDURE

1. Testing has shown that plastic media blasting meets OSHA lead standard requirements and is efficient when the manufacturer's published procedures are followed.

2. The operator must wear an air supplied hood using compressed air free from carbon monoxide, oil, water, and other contamination when performing this operation. Specifics of the media blasting procedure for whole body paint removal have been previously published.

NOTE:

PLEASE READ THE CHEMICAL FACT SHEETS IN THE FIGURES.

ISSUE: A comprehensive paint repair procedure TSB has been developed for service use. It includes the following paint repair topics:

Section (A) has been superseded by TSB # 9264, dated 3/92.

(B) Exterior Color Peeling From Ultra Violet Light

(C) Lower Body Stone Protection Repair Tips

(D) Procedures For PVC Body Side Moldings

(E) Lower Body-Side Stone Chip Protection Program

(F) Surface Defect Removal Without Repainting

(G) 1991 Color Matched/Compatible Spray Primer Chart

(H) Repair For Tinted Clearcoat

(I) Frequently Used And Paintable Plastics

(J) 1992 Paint Codes

ACTION: If paint repair is required, refer to the following procedures for paint restoration.

Section A Has Been Superseded By TSB # 9264, Dated 3/92.

CAUTION: FAILURE TO THOROUGHLY RINSE THIS SURFACE COULD RESULT IN CORROSION OF ANODIZED ALUMINUM OR

STAINLESS STEEL PARTS

PROCEDURE # 2

FINISH KARE FORMULA # 1119 AND # 883 (Buffered solution not as harsh on aluminum parts)

WARNING: FOR YOUR SAFETY, USE RUBBER GLOVES, GOGGLES AND PROTECTIVE CLOTHING WHEN HANDLING THESE PRODUCTS.

1. Apply hot diluted solution with soft mitt.

2. Agitate to create suds. Suds hold the acid solution in suspension and to the surface creating greater and extended activity.

3. Allow 3 to 5 minutes dwell time.

4. Rinse with COLD WATER.

5. Apply # 883 per label instructions.

LIQUID NEUTRALIZER CONCENTRATE

1. Using a mitt, thoroughly go over the entire surface with the diluted solution (50-1) of water and # 118 Liquid Neutralizer Concentrate. Then wipe dry.

2. If the iron particles are not totally removed after 2 washings, use one or both of the following service actions.

a. Sand with micro fine sandpaper (1500 Grid or greater) in localized areas.

b. Buff with very light compound and polish with wax in localized areas.

WARNING: OUR ENVIRONMENT IS PRECIOUS - PLEASE USE PROPER DISPOSAL TECHNIQUES FOR ANY VOLATILE ORGANIC COMPOUNDS (V.O.C.'S) OR EXCESS MATERIALS.

(B) Paint Exterior Color Peeling From Ultra Violet Light

Paint may be damaged because of ultra violet light absorption through the color coat. This damage will cause the top coat to peel to the E-coat primer.

If service is required, use the following procedure to correct the concerns.

NOTE: READ THE ENTIRE SERVICE PROCEDURE BEFORE STARTING REPAIRS.

WARNING: ALWAYS WEAR A NOISHA/MSHA RECOMMENDED VAPOR/PARTICULATE RESPIRATOR AND USE OTHER RECOMMENDED SAFETY EQUIPMENT.

1. Wash the vehicle with soap and water.

2. Verify topcoat adhesion by applying a 2 inch wide masking tape strip on all body panels above and below the beltline on each panel.

a. Pull the tape up quickly.

b. Inspect the adhesive side of the tape for paint removal.

NOTE: IF PAINT WAS REMOVED DURING THE TAPE TEST, THE ENTIRE PANEL SHOULD BE STRIPPED AND REFINISHED AS NECESSARY.

3. Remove all trim (mouldings, name plates, striping, etc.) from the areas which will be repainted.

NOTE: ALL REQUIRED REPLACEMENT MOULDINGS AND STRIPES SHOULD BE ORDERED AND RECEIVED PRIOR TO REPAIRING THE CUSTOMER'S VEHICLE.

4. Wipe the entire vehicle with wax and grease remover.

^ BASF Product # 900 Prekleano

^ PPG Product # DX300

^ S-W Product # R7-K156

^ DuPont Product # 3919 S

^ Sikkens Product # M 600

5. Mask off all areas on the vehicle which are not going to be painted or will be affected by overspray (engine compartment, wheels, etc.).

6. Remove the paint to bare metal from all the areas of the vehicle which are going to be repainted. Use one of the following methods.

SAND THE AFFECTED AREAS TO BARE METAL USING 40 GRIT 3M GREEN CORPS SANDING DISCS OR EQUIVALENT AND A SOFT PAD ON A 1700 RPM POLISHER. KEEP THE POLISHER MOVING TO AVOID DEVELOPING HOT SPOTS ON THE METAL.

NOTE: CHEMICAL STRIPPING IS NOT RECOMMENDED.

NOTE: IF AVAILABLE, PAINT MAY BE REMOVED USING A PLASTIC MEDIA BLAST SYSTEM. IF THIS PROCESS IS USED, EXTRA

CARE MUST BE TAKEN DURING THE MASKING PROCESS TO PREVENT DAMAGE TO GLASS, MOULDING, ETC.

7. Blow off the entire vehicle to remove loose dust and debris.

NOTE: IF RUST IS PRESENT, USE APPROPRIATE METAL CLEANER AND CONDITIONER (PHOSPHATE COATING) OVER BARE METAL AREAS.

8. Wipe all affected areas with a fast dry enamel reducer solvent, followed by a dry wipe using a clean, lint free cloth to remove all residue.

CAUTION: KEEP WIPING UNTIL SURFACE IS COMPLETELY DRY. ANY RESIDUE WILL RESULT IN POPPING OF THE COATINGS TO

BE APPLIED FOLLOWING THIS STEP.

NOTE: THIS STEP WILL REDUCE THE POSSIBILITY OF FLASH RUST.

^ BASF Product # BR 50

^ PPG Product # DX 300

^ S-W Product # R7 K156

^ DuPont Product # 3812 S

^ Sikkens Product # 123 FAST

9. Apply two medium wet coats (1.0 mil total) of self-etching, anti-corrosion primer using the manufacturer's recommendations and flash times.

^ BASF Product # DE-17

^ PPG Product # DP EPOXY PRIMER

^ S-W Product # E2-6980

^ DuPont Product # VARIPRIME

^ Sikkens Product # WASH FILLER 580

10. Apply three medium wet coats (2.0 mils total) of acrylic urethane primer surfacer following the manufacturer's recommended procedures.

^ BASF Product # DP-20 PRIMER/SUFACER

^ PPG Product # K-36

^ S-W Product # P6-M49 OR P6-A48

^ DuPont Product # URO PRIMERFILLER

^ Sikkens Product # AUTOCRYL 3+1 FILLER

11. Sand the vehicle using one of the following methods:

^ Wet-sand by hand using 400 grit or finer sandpaper.

^ Dry-sand by hand using 320 grit or finer sandpaper.

12. Blow the entire vehicle off to remove loose dust and debris.

13. Demask (remove all paper and tape) as necessary to remove the primer and dirt buildup on the paper and tape.

14. Wipe the entire vehicle with wax and grease remover, followed by a dry wipe using a clean, lint free cloth to remove all residue.

CAUTION: KEEP WIPING UNTIL SURFACE IS COMPLETELY DRY. ANY RESIDUE WILL RESULT IN POPPING OF THE COATINGS TO

BE APPLIED FOLLOWING THIS STEP.

^ BASF Product # 901 PRE-PAINT CLEANER

^ PPG Product # DX 330

^ S-W Product # R7-K156

^ DuPont Product # 3812 S

^ Sikkens Product # M 600

15. Mask all areas on the vehicle which are not to be painted or will be affected by paint overspray (engine compartment, wheels, etc.).

NOTE: APPLY BASECOAT/CLEAR COAT ONLY TO SURFACES WHICH ORIGINALLY HAD BASECOAT/CLEAR COAT

16. Apply three medium wet coats (enough material to hide primer) of acrylic enamel base coat or acrylic urethane monocoat following the manufacturer's recommended procedure.

^ BASF Product # DIAMONT BASECOAT/Solo

^ PPG Product # DELTRON BASECOAT DBC/Deltron

^ S-W Product # ULTRA BASE/Ultra One Stage

^ DuPont Product # CHROMABASE/Cronar

^ Sikkens Product # AUTO BASE/Autocryl

17. Apply two medium wet coats of 2K acrylic urethane enamel clear coat, following manufacturer's recommended procedure.

^ BASF Product # DIAMONT CLEAR 88/89

^ PPG Product # CONCEPT 2001 DCU

^ S-W Product # CC-650 OR CC-640

^ DuPont Product # 1080 S URO CLEAR

^ Sikkens Product # AUTO CLEAR

18. After the paint is dry, demask the entire vehicle and clean up any areas which have overspray.

19. Polish the vehicle as necessary to remove any defects in the paint which may create a customer concern.

CAUTION: USE LOW SPEED (1700 RPM MAXIMUM) POLISHER.

20. Install all trim (mouldings, name plates, striping, etc.) on the vehicle which were removed prior to repainting.

21. Clean the exterior and interior of the vehicle thoroughly, including air ducts and other areas which are prone to accumulating dust. This step is essential to ensure customer satisfaction.

WARNING: OUR ENVIRONMENT IS PRECIOUS - PLEASE USE PROPER DISPOSAL TECHNIQUES FOR ANY VOLATILE ORGANIC COMPOUNDS (V.O.C.'s) OR EXCESS MATERIALS.

STRIP AND REFINISH CLAIMING METHODOLOGY

(See Figures 2 and 3 for Illustration of Claim Preparation)

LABOR

To calculate STRIP AND REFINISH Labor Hours/Labor Operations:

1. Refer to SLTS Manual REFINISH labor allowance for panel or panels being STRIPPED AND REFINISHED.

2. Multiply REFINISH labor hours by 1.6 to arrive at the TOTAL labor allowance for the STRIP AND REFINISH OPERATION.

   EXAMPLE
   Refinish Hood (Metallic) = 1.7 hrs (from SLTS Manual)
   => Strip and Refinish Hood (Metallic) = 1.7 hrs. x 1.6 = 2.7 hrs.

3. LABOR OPERATION - To indicate a STRIP AND REFINISH repair labor operation, take the REFINISH labor operation and replace the suffix with a "C".

   EXAMPLE
   Refinish Hood = P8P => Strip and Refinish Hood = P8C.

MATERIAL

To calculate strip and refinish Material Allowance:

1. Refer to SLTS Manual Refinish "Misc. Mat'l" column.

2. Divide "Misc. Mat'l" Amount by 10. Enter in "Qty" Column.

   EXAMPLE
   Misc. Mat'l for Refinish hood = 21, QTY for Strip and refinish = 21 ÷ 10 = 2.1.

3. Enter the appropriate "Unit Material Cost" from the *Material Cost Matrix* (shown below) in the "Each" column (e.g. 2k Urethane Monocoat = $17.50).

4. Multiply QTY by the appropriate UNIT MATERIAL COST. This number represents the TOTAL MATERIAL ALLOWANCE for the repair and should be entered in the "Amount" column (Qty of 2.1 x $17.50 = $36.75).

*Material Cost Matrix**

Material	*Unit Material Cost*
Enamel Monocoat	*$7.80*
2K Enamel Clearcoat	*$10.20*
2K Urethane Monocoat	*$17.50*
2K Urethane Clearcoat	*$19.20*

*UNIT MATERIAL COST MATRIX APPLIES TO STRIP AND REFINISH REPAIRS COVERED IN THIS TSB ONLY

STRIP AND REFINISH CLAIMING METHODOLOGY

The claiming instructions shown in Figure 1 are applicable to the repair of the EXTERIOR COLOR PEELING FROM ULTRA VIOLET LIGHT concern covered in this TSB only. See the SAMPLE CLAIMS, Figures 2 and 3, for examples.

(C) Lower Body Stone Protection Repair Tips

Ford has introduced a vinyl anti-stone abrasion material for the lower exterior body surfaces of selected passenger vehicles and light trucks. The anti-stone abrasion material is applied to the lower fenders, rocker panels, lower doors, quarter panel dogleg, and lower rear of quarter panel behind the wheel. The anti-stone abrasion material will usually end at a body character line.

While primarily for servicing of factory-applied protective coating, the following provides installation information. If the vehicle has experienced body damage in the factory-applied material protective

area, the sheet metal damage must be serviced prior to the application of the new protective coating.

SMALL AREAS - MINOR DEFECTS (VEHICLES WITH FACTORY SPRAYED-ON VINYL)

A small dent in the sheet metal that did not mar the vinyl surface, can possibly be corrected with proper bumping tools without damage to the vinyl coating. However, noticeable scratches or gouges (not over 1/2 inch in diameter) or dings and dents that when "ironed out" show vinyl damage, can be satisfactorily serviced with the following procedure:

1. Solvent-wipe the damaged area with "Silicone and Wax Remover."

2. Using a heat gun or lamp, soften the vinyl coating of the damaged area until it can be scraped off with a putty knife or a similar tool. If necessary, sand off any hard to remove coating using an orbital disc sander (No. 80 Disc). (The spray-on vinyl protective coatings may not be suitable for "spot" application. See Manufacturer's label for instructions.)

3. Perform necessary servicing to correct the sheet metal damage.

4. Using white bodyfiller, fill the damaged area. Follow the instructions on the label and blend the bodyfiller with the surrounding sheet metal.

5. Allow the bodyfiller to completely cure and then carefully sand the area smooth, removing any high spots.

6. Refer to "Spray Procedure" for restoration of vinyl anti-stone abrasion material.

LARGE DAMAGED AREAS - VEHICLE WITH FACTORY SPRAYED ON VINYL

Peeling or damage over a large area will necessitate removal of the factory sprayed-on vinyl coating. The following procedure is suggested.

NOTE: WHERE SHEET METAL IS DAMAGED TO THE EXTENT THAT A FENDER, DOOR, OR QUARTER PANEL REPLACEMENT IS

REQUIRED (OR IN AN INITIAL INSTALLATION), DISREGARD STEPS NO. 1 AND NO. 2.

1. Using a heat gun or lamp, soften the vinyl coating until it is pliable. Scrape coating off with a putty knife or a similar tool. If necessary, sand off any hard to remove coating using an orbital disc sander (No. 80 Disc). (The vinyl material, abrasion resistant coating may not be suitable for "spot" applications. See manufacturer's label for instructions.)

2. Perform necessary servicing to correct the sheet metal damage.

3. Refer to "Spray Procedure" for restoration of vinyl anti-stone abrasion material.

COATING APPLICATIONS

Approximately two quarts will be required for an initial installation on a passenger car or F-Series. Slightly more will be required for an Econoline. The specified dry film thickness of 15 to 20 mils (.015 to .020 inch) will require at least three, possibly four, applications of coating material, with "flash off" time between coats. Spray coat complete panels only.

The coating must be applied with commercial equipment by an experienced automotive painter. The coating must be thoroughly agitated before application. The material is heavy bodied. A pressure cup spray gun or "Rocker Schutz Gun" is recommended.

COATING PREPARATION - MASKING VEHICLE

Install suitable covers over the wheels.

NOTE: IF THE VEHICLE HAS LOWER BODY SIDE MOULDINGS (12-14 INCHES ABOVE THE "TURN UNDER" OF THE ROCKER PANEL),

THE MOULDING CAN SERVE AS THE UPPER MARGIN OF THE AREA TO BE COATED. IF THE VEHICLE DOES NOT HAVE SUITABLE MOULDINGS, A SCULPTURE OR BREAK LINE IN THE SHEET METAL CAN BE UTILIZED. THIS LINE SHOULD BE SELECTED TO ENSURE ADEQUATE PROTECTION OF THE PAINTED SURFACES.

VEHICLES WITH BODY SIDE MOULDINGS

1. Masking tape should be positioned so that the moulding lower edge is also covered. The adjoining sheet metal should be left uncovered too so anti-stone, abrasion vinyl can be applied.

VEHICLES WITHOUT BODY SIDE MOULDINGS

2. If the contour of the body side has a break line, the upper coating margin must be masked off using 3M "Fine Line" Tape.

a. The normal masking tape and paper protection for the body side should be applied first and positioned about a quarter inch above the margin line.

b. The "Fine Line" tape should then be applied over the regular masking tape with the lower edge at the upper coating margin line. Extend this "Fine Line" tape into the wheel opening, in the absence of wheel opening mouldings, allowing the flange to be coated.

c. The anti-stone abrasion coating does not adhere well to flexible plastic parts. If left exposed, they must be masked off.

d. It is not necessary to mask off the body door openings in the coating area, as they will be uniformly coated where the door margins allow the coating to enter.

NOTE: DOOR OPENING AREAS SHOULD BE CLEANED TO ASSURE COATING ADHERENCE.

COATING PREPARATION - SHEET METAL

REPAIRED SHEETMETAL

1. Scuff sand (No. 180 Grit Paper) the glossy surface of the painted areas to be coated.

2. Using a clean, lint-free cloth, solvent wipe the area to be coated with wax and grease remover.

3. Remove sanding dust using compressed air and lint-free tack cloth.

NEW SHEET METAL

1. Sand off (No. 180 Grit Paper) the prime paint in the area to be coated.

2. Using a lint-free cloth, solvent wipe the area to be coated with wax and grease remover.

3. Remove sanding dust using compressed air and a lint-free tack cloth.

NEW INSTALLATION

1. The glossy surface of the paint in the coating area must be sanded with a D/A sander. A 220/240 Grit Disc does a good, fast job. DO NOT sand through the primer.

2. Using a clean, lint-free cloth, solvent wipe the area to be coated with wax and grease remover.

3. Remove sanding dust using compressed air and a lint-free tack cloth.

SPRAY PROCEDURE

The lower exposed painted fender, rocker, and quarter panel down flanges should be protected. The vehicle must be elevated high enough so that the painter can spray this area effectively. When an initial installation is to be made, a remote two-quart capacity pressure cup makes a much more efficient tool, as the spray gun can be used closer to the floor. The spray gun, fluid hose and/or cup must be cleaned immediately after use. Refer to manufacturer's recommended cleaning procedure. Lacquer thinner can be used when the suggested clean up material is unavailable.

WARNING: WEAR A NOISHA/MSHA RECOMMENDED VAPOR/PARTICULATE RESPIRATOR AND USE ALL OTHER RECOMMENDED SAFETY EOUIPMENT.

1. After preparing the new or damaged area(s), mix either Epoxy primer or Self-etch prime, per manufacturer's label instructions, and spray bare metal areas.

^ BASF DE15 or DE17

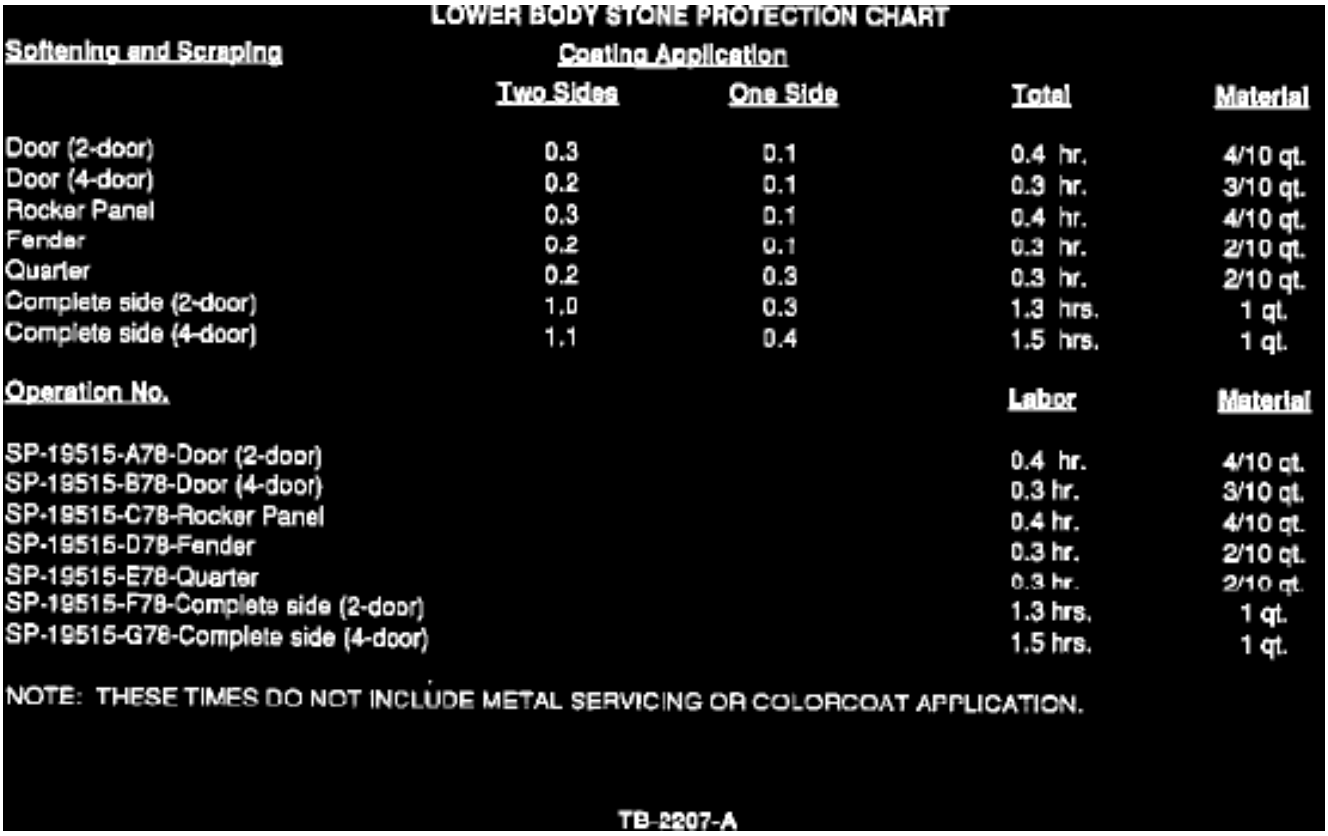
^ Sikkens Metalflex CR Primer (1 coat only)

^ DuPont Variprime

^ S-W E2G 980 GBP Etching Filler

^ PPG DP 40 (only)

2. Apply 1-2 light prime coats over the bare metal areas.



LOWER BODY STONE PROTECTION CHART

Softening and Scraping	Coating Application			
	Two Sides	One Side	Total	Material

NOTE: THESE TIMES DO NOT INCLUDE METAL SERVICING OR COLORCOAT APPLICATION.

TB-2207-A

3. Allow the material to dry for 15-20 minutes before applying the anti-stone abrasion material.

4. Mix and apply anti-stone abrasion material per manufacturer's label instructions over the primed area.

NOTE: AN ORANGE PEELED FINISH IS NORMAL WITH THESE PRODUCTS.

^ BASF Glassohyd 1109-1240/6

^ Sikkens 0TO Bodycoat

^ DuPont 123-5 Vinyl

^ S-W G/W 295 Vinyl Gravel Guard

^ PPG DX 54 Roadguard

^ 3M Rocker Schutz

NOTE: SOME ANTI-STONE ABRASION MATERIAL MAY REQUIRE A SLIGHTLY DIFFERENT MIXING PREPARATION, PROCEDURE

AND APPLICATION. SOME ANTI-STONE ABRASION MATERIALS CAN NOT BE USED FOR SPOT REPAIR. CHECK WITH THE PAINT MANUFACTURER FOR RECOMMENDATIONS ABOUT THEIR PRODUCT.

5. Allow the stone abrasion material to dry. Heat can be used to accelerate the drying time. Check the manufacturer's instructions.

COLOR COAT

The complete coated area, as well as the upper raw edge, must be covered with color coat. Mask off the upper margin line using "Fine Line" tape positioned 1/16 inch above the coating edge. Using appropriate service paint and application procedures, the protective coating area can now be finish painted with monocoat or a basecoat/clearcoat urethane system.

NOTE: IF DAMAGED SHEET METAL EXTENDS ABOVE THE PROTECTIVE COATING AREA, NORMAL PRIME/COLOR PAINT PROCEDURES SHOULD BE FOLLOWED.

CAUTION: OUR ENVIRONMENT IS PRECIOUS - PLEASE USE PROPER DISPOSAL TECHNIQUES FOR ANY VOLATILE ORGANIC

COMPOUNDS (V.O.C.'s) OR EXCESS MATERIALS.

Figure 4

Refer to the Lower Body Stone Protection Chart, Figure 4, for the material and labor hours involved.

(D) Procedure For PVC Body Side Moldings

If replacement of the body side molding is necessary, some dealer service kits will be supplied "paint to match."

The painting procedures in the following instructions (also included with the part) address materials from five (5) major aftermarket paint suppliers. Use the paint system materials you are the most

familiar with.

NOTE: CAREFULLY READ ALL LABEL WARNINGS BEFORE APPLYING THESE PRODUCTS.

WARNING: ALWAYS WEAR A NOISHA/MSHA RECOMMENDED VAPOR/PARTICULATE RESPIRATOR AND USE ALL OTHER RECOMMENDED SAFETY EQUIPMENT.

SIKKENS PRODUCTS

PREPARATION

1. Degrease with M600 wax and grease remover.

2. Scuff with # 320 dry paper or Scotchbrite 7447 (red).

3. Repeat degreasing step.

4. Spray two medium coats of Plastoflex primer. Allow 5 to 10 minutes flash between coats.

5. Allow 20 minutes flash-off at 70~ F before topcoating.

TOPCOATING

1. Mix Autocryl color with Elast-O-Actif 50:50 by volume.

2. Mix this material with 1.2.3 hardner and 1.2.3 reducer (use correct reducer for temperature) 100:50:30 by volume.

3. Apply three medium coats, allowing enough flash off to dry to a light touch.

4. Dry one hour at 140~F after 10 minutes flash off or dry 24 hours at 75~F.

PPG PRODUCTS

PPG MONO-COAT SYSTEMS

1. Solvent wipe with DX330 Acryli-clean.

2. Scuff with red Scotchbrite pad.

3. Repeat solvent wipe.

TOPCOATING

1. Mix and apply Deltron topcoat color with DX-369 Flexative per label instructions.

2. Use 40-50 PSI at the gun.

PPG BASECOAT/CLEARCOAT SYSTEMS

PREPARATION

1. Solvent wipe with SX330 Acryli-clean.

2. Scuff with red Scotchbrite pad.

3. Repeat solvent wipe.

TOPCOATING

1. Mix and apply Deltron basecoat color (DBU), with the recommended reducer for the temperature, per label instructions.

2. Mix and apply clearcoat material DBU-88 or DCU-2001, with DX-369 Flexative, per label instructions.

SHERWIN-WILLIAMS PRODUCTS

Ultrabase 7 Basecoat/Clearcoat or Ultra One Stage Acrylic Urethane Enamel

PREPARATION

1. Wash the material with a mild detergent and wipe dry.

2. Solvent wash with R7 K 156 and wipe dry.

3. Clean with a tack cloth.

4. Apply desired system with correct amount of Multi-flex, V6 V 299.

TOPCOATING

Prepare topcoating as follows:

^ S-W Ultra One Stage: (Mono-coat) 4 Parts Color 3 Parts SSR 650 Reducer 1 Part V6 V 440 or SSH 520 2 Parts V6 V 299

^ S-W UB7 Basecoat: 8 Parts Basecoat Color 8 Parts Stabilizer 1 Part V6 V 299

^ S-W UB7 Clearcoat: 4 Parts T1 C 650 Clearcoat 2 Parts T1 C 650 Reducer 1 Part CCH 690 1 Part V6 V 299

^ S-W Ultra One Stage: (Mono-coat) Apply 2-3 medium wet coats at 50 PSI

^ UB7 Basecoat: Apply 2-3 medium coats at 45 PSI

^ UB7 Clearcoat: Apply 2-3 medium coats at 50 PSI

DUPONT PRODUCTS

DUPONT CRONAR POLYOXITHANE MONOCOAT SYSTEM

PREPARATION

1. Wash the surface thoroughly with a mild detergent.

2. Clean with Prep Sol.

TOPCOATING

1. Add 8 parts of Cronar single stage enamel.

2. Add 1 part Cronar initiator 9404S.

3. Add two parts of (9475S, 9485S, or 9495S,) depending on shop temperature.

4. Add 2 parts flex-additive 9250S.

5. Mix thoroughly.

6. Spray at 45-55 PSI at the gun, 2-3 medium wet coats or until hiding.

7. If a clear coat is applied, use 9500S.

DUPONT CENTARI MONO-COAT ENAMEL SYSTEMS

PREPARATION

1. Wash the surface thoroughly with a mild detergent.

2. Clean with Prep Sol.

TOPCOATING (Follow Manufacturer's Recommendation)

1. Add 8 parts of Centari enamel color and 1 part 793S hardener.

2. Add 4 parts of (8022S, 8093S, or 8096S) reducer, depending on shop temperature.

3. Add 355S flex additive per label instructions.

4. Mix thoroughly.

5. Spray 2-3 wet coats, with 5 minutes flash time, at 50-65 PSI.

BASF PRODUCTS

The following procedure is applicable to 4 paint systems in the BASF paint line. Read individual "system" instructions carefully.

PREPARATION

1. Solvent wipe the molding with RM Pre-klean-o 900.

2. Sand with 400 grit sand paper and rinse with 901 pre-paint cleaner.

TOPCOATING BASECOAT

^ "Glasurit" 54-line color 2 vol. parts

^ 54-line reducer 1 vol. part

^ "Diamont" basecoat color 2 vol. parts

^ B R Diamont reducer 2 vol. parts

^ "Miracryl" basecoat color 2 vol. parts

^ BCR reducer 2 vol. parts

^ "Supreme Gold" basecoat color 2 vol. parts

^ LBR reducer 2 vol. parts

Apply basecoat color until hiding is achieved. Allow 3-5 minutes flash time between coats.

NOTE: USE APPROPRIATE REDUCER FOR SHOP CONDITIONS. ALLOW 15 MINUTES FLASH-OFF BEFORE SPRAYING CLEARCOAT.

TOPCOATING

Apply clearcoat per manufacturer's label instructions:

CLEARCOAT REDUCTIONS

^ DC-88 Diamont Clear 4 Vol. Parts

^ DH-44 Diamont Hardener 1 Vol. Part

^ MC-1000 Clear 4 Vol. Parts

^ 894 Hardener 1 Vol. Part

^ LC-1300 Supreme Gold Clear 4 Vol. Parts

^ LH-1301 Hardener 1 Vol. Part

^ 92354 Glasurit Clear 100 Parts

^ 521-111 Elastifier 20 Parts

^ 929-29 Hardener 60 Parts

Apply 2 wet coats with 5 to 10 minutes flash time between coats. Overnight dry or force dry at 140~F for 30 minutes.

CAUTION: OUR ENVIRONMENT IS PRECIOUS - PLEASE USE PROPER DISPOSAL TECHNIQUES FOR ANY VOLATILE ORGANIC COMPOUNDS (V.O.C.'s) OR EXCESS MATERIALS.

(E) Lower Body-Side Stone Chip Protection Program

Ford Motor Company has recently initiated a program to provide improved stone-chip protection on some vehicles and to increase the corrosion protection on cars and trucks.

Some customers are unaware of body side anti-stone chip protection which appears as wavy orange peel texture on the lower body areas.

Ford is increasing the use of PVC (poly vinyl chloride) material which is applied in a thicker coating on the lower body-side. This material has been in use on vehicles destined for the Canadian market for many years.

This PVC material is now applied at the following plants on ALL vehicles.

^ Edison - Ranger

^ Hermosillo - Escort/Tracer

^ Louisville - Ranger and Explorer

^ Ohio Truck - Econoline

^ Wayne - Escort/Tracer

This process is also planned for Kansas City, Oakville, Twin Cities and Wixom.

This material can be identified by the "orange peel" appearance and a visible "break-line" between protected and unprotected areas in the lower body areas.

CAUTION: THIS PROTECTION MUST NOT BE REMOVED IF VEHICLE IS EXPECTED TO MAINTAIN THE CORROSION PROTECTION.

Some customers have expressed concerns due to the appearance of the treated areas. These customers did not know about the extra protection this material provides their vehicle. Once explained, customers were pleased with the added protection and accepted the orange peel finish.

NOTE: DEALERS SHOULD ADVISE THEIR SALES PEOPLE, SERVICE PEOPLE, AND CUSTOMERS, OF THE REASONS AND BENEFITS

OF THIS PROTECTION. CANADIAN DEALERS STRESS THIS AS A SELLING POINT WITH THEIR SALES PEOPLE. IT IS CONSIDERED A COMPETITIVE ADVANTAGE.

(F) Surface Defect Removal Without Repainting

Exterior paint surface damage or imperfections, where the primer coat does not show through, should be restored without repainting. The restoration of gloss and luster, after the condition has been repaired, is possible with new techniques and improved materials.

The following procedure is applicable to surface conditions such as dirt particles, orange peel, runs, sags, industrial fallout stains, swirl marks, light scratches and other minor surface imperfections. For dirt particles or scratches in several localized areas, the entire panel should be refinished to maintain a uniform appearance.

PREPARATION

To repair the affected surface it must be clean and dry. Mask off adjacent panels, mouldings, stripe and character lines as required.

CAUTION: EYE PROTECTION, AND FACE MASK SHOULD BE WORN. RINGS, BRACELETS, WATCHES AND BELT BUCKLES MUST BE

REMOVED TO PREVENT ACCIDENTAL DAMAGE TO PAINT FINISH.

SERVICE PROCEDURE

1. Remove sanding marks with rubbing compound.

2. Swirl marks, evident after buffing, are removed by polishing.

3. Remove light scratches and small dirt particles with a power buffer and medium buffing compound followed with polishing.

4. Remove deeper scratches and heavy dirt particles or orange peel, by wet sanding.

5. Buff with compound to remove the sanding marks and then polish to remove the swirl marks from the buffing operation.

NOTE: PERFORM A TRIAL REPAIR WITH A SMALL AREA. FIRST, TRY POLISHING; IF THIS IS NOT SUCCESSFUL, TRY BUFFING

AND, FINALLY, USE WET SANDING TO REMOVE THE CONDITION. USE MOST EFFECTIVE TECHNIQUE ON REMAINDER OF AREAS. AN OUTLINE OF THE COMPLETE PROCEDURE AND REQUIRED MATERIALS FOLLOWS.

POLISHING - VERY MINOR SCRATCHES OR SWIRL MARKS AND/OR RESTORING A DULL FINISH

1. Apply a small amount of Meguiar's Mirror Glaze, or equivalent, to the affected panel (or pad).

2. Use a suitable electric or air powered polish/buffing wheel (1750 max. RPM) and a Meguiar's Finesse Polishing Pad, or equivalent, to polish the affected area until all swirl marks are gone and desired luster is obtained.

3. When polishing, keep the pad flat against the surface. Do not bear down. The weight of the buffer is sufficient.

CAUTION: DO NOT MIX PRODUCTS! USE A SEPARATE, DEDICATED BUFFING PAD FOR EACH PRODUCT TO ACHIEVE DESIRED

RESULTS.

Variable speed buffers are available in a variety of buffing speeds. The recommended speed range is 1200-1750 RPM.

COMPOUNDING - LIGHT SCRATCHES, SMALL DIRT PARTICLES, MINOR GRIND MARKS, AND SANDING MARKS

1. Apply Meguiar's Rubbing Compound (medium) or equivalent to the panel with a clean compound pad on the wheel.

2. Spread the compound evenly and continue buffing until the condition is removed.

3. Keep the wheel flat to the surface and use light to moderate pressure and long strokes.

4. Periodically check the finish and add compound as required.

5. When buffing is complete, polish the panel as described previously.

Twisted wool cutting pads are the most effective compounding pads to use with Glaze Machine Cleaner for removing paint defects and heavy oxidation. Following the use of a wool compounding pad, it may be necessary to polish the finish with No. 2 Mirror Glaze Hi-Tech Cleaner using a Mirror Glaze Finesse Polishing Pad to remove the deep swirl marks.

GENERAL TECHNIQUES AND HINTS

^ "Foam" buffing pads create added gloss and depth of color on all types of paint finishes without creating buffer swirl marks.

^ When "buffing out" oxidation or other paint defects with a cleaning material, use a liberal amount of material, slower buffing motion and added downward pressure to increase cutting action.

^ Always apply cleaner to buffing pad, not directly on the oxidized paint surface. Dry paint absorbs material into pores upon contact.

^ Always keep the face of the buffing pad completely flat to the surface, reducing the risk of buffer swirl marks. Watch your pad, especially on angled surfaces, to be certain that it stays flat.

^ Avoid short rapid strokes. Move the buffer slowly across the surface using long straight motions and overlap by 50% the buffing pattern left by the previous pass. This insures uniform coverage and allows both material and buffer to perform at maximum efficiency.

^ Avoid buffing directly on raised character lines. The reduced paint film on these surfaces increases the risk of paint burn through. It is best to buff up to them from each side.

^ Always use a "wet buff" technique on a basecoat/clearcoat finish. This is a precaution against buffer swirls. Stop buffing just after the product begins to break down and before an overall dry, glossy finish appears. After "wet buffing", use a towel to wipe off the excess material.

^ Always use a "dry buff" technique on light colored, conventional paint finishes. Continue buffing until the material breaks down and only a slight film remains for final wipe off.

^ If a paint blemish remains after buffing, reapply a small amount of material over the blemish. Confine your buffing strokes to the immediate area of the blemish while applying additional

downward pressure and keeping the pad flat.

NOTE: ALWAYS KEEP THE PAD MOVING AND LIMIT YOUR STROKES OVER THE BLEMISH TO PREVENT EXCESSIVE HEAT

BUILD-UP AND POSSIBLE BURN THROUGH. STOP IMMEDIATELY IF THE SURFACE BECOMES TOO HOT TO LAY THE PALM OF YOUR HAND ON IT.

NOTE: HEAT BUILD-UP: WHEN BUFFING CREATES EXCESSIVE HEAT, HAZING MAY APPEAR ACROSS THE SURFACE BEING

BUFFED AND THE PRODUCT MAY DRY LIKE A FILM AND REFUSE TO BUFF OUT. TO REMEDY, WIPE THE AREA DOWN WITH COOL WATER, DRY THE SURFACE AND RESUME BUFFING ... AT A LOWER RPM IF POSSIBLE.

NOTE: STATIC: STATIC ELECTRICITY MAY BE PRESENT ON PAINTED FIBERGLASS/PLASTIC SURFACE BEING BUFFED, THE

MATERIAL MAY DRY LIKE A FILM OR TURN "GUMMY" AND BEGIN TO BALL UP. TO REMEDY, GROUND THE SURFACE BEING BUFFED TO METAL.

WET SANDING

Paint defects and sanding marks must be completely removed without using compounds and abrasive cleaners that scar the finish.

Mirror Glaze Hi-Tech Finesse Sanding Papers provide uniformity in grit particle size and distribution. Using these precision made sanding papers, water sanding marks can be removed with Meguiar's cleaner and finesse polishing pads.

^ Typical paint defects that are repaired with this system include: dirt-in paint, solvent pop, cratering, orange peel, drips, scratches, water spots, and acid rain.

^ Always use the least abrasive (highest grit) sanding products possible to do this job.

The following wet sanding procedure utilizes light grit sand paper or sanding blocks for removal of surface damage. These materials cut quickly leaving a uniform finish requiring a minimum of buffing to restore gloss.

PROCEDURE

1. Squeeze water to flush the area to be sanded. Continue to flush water to the surface during sanding for maximum lubrication.

2. Use small circular motions to contain the abrasion to the immediate area of the defect. Keep the blocks in water when not in use.

3. If the sanding block is cutting too slow, switch to a lower grade block and resume sanding. When 90% of the defect is removed, switch to a 2000 grade Finesse Sanding Paper or Sanding Block to finish smoothing and prepare the surface for buffing.

4. Finesse Sanding Blocks can be shaped to work on any angle. When the block is wet, rub it against a dry sanding block for shaping.

5. When using Finesse Sanding Papers, wrap the paper tightly around a E-7200 Backing Pad. This pad evenly distributes pressure over the entire surface of the sanding paper. This creates a uniform sanding pattern.

6. Plan your strokes to limit the abrasion to the smallest area possible.

NOTE: ALWAYS SAND IN ONE DIRECTION AND KEEP YOUR STROKES STRAIGHT.

7. Always finish sanding with 2000 Grit Finesse Sanding Paper. This eliminates the need for compounding.

8. Buff out sanding marks by applying Meguiar's Cleaner with a Finesse "Foam" Polishing Pad. Follow with a Mirror Glaze Polish for swirl-free gloss.

WARNING: OUR ENVIRONMENT IS PRECIOUS - PLEASE USE PROPER DISPOSAL TECHNIQUES FOR ANY VOLATILE ORGANIC

COMPOUNDS (V.O.C.'s) OR EXCESS MATERIALS

RUNS AND SAGS REMOVAL

This procedure consists of shaving the run or sag flush with a commercial single edge razor blade, shaving file or sanding with a hard block and then compounding.

NOTE: IF IT IS NECESSARY TO SHAVE RUNS AND SAGS WITH A RAZOR BLADE, FIRST DULL THE CORNERS WITH SANDPAPER TO AVOID SCRATCHING THE ADJACENT PANEL FINISH.

(G) Color Compatible Spray Primer Chart

Ford has released color compatible spray primers for exterior and some interior surfaces.

Colored sprayed primers are being used by our "Best-in-Class" competition and are now being implemented at Ford in order to improve process capability and to help in minimizing unsightly paint chipping from stone abrasion. Color keyed (matched) spray primer for exterior body colors is being used in an effort to help in the elimination of unsightly paint chipping from stone abrasion.

As with "Best-In-Class" competition, the engine compartment will be left with color compatible primer only and not be topcoated as per past practice.

When any paint repair is required, remember that the vehicle may have a colored primer. Refer to the Spray Primer Chart, Figure 5. This information may be of help in correction of exterior paint color match concerns.

(H) Paint Repair For Tinted Clear Coat

Ford introduced (Early Spring, 1991) a new paint color using a tinted clearcoat. The first color to use this new system is Rio Red.

If a paint repair is necessary, refer to the following procedure for repair instructions.

BACKGROUND

The Probe production paint system for Rio Red includes a Medium Green E-Coat primer, a Light Gray spray primer, bright Rio Red (E4) basecoat and a slightly Red tinted clearcoat topcoat.

NOTE: BEFORE ANY REPAIRS ARE BEGUN, IT IS CRITICAL THAT PRIMER, RED BASECOAT AND TINTED CLEARCOAT BE SPRAYED ON A TEST PANEL. THE COLOR MATCH IN EACH STEP IS VERY IMPORTANT FOR A SUCCESSFUL REPAIR.

WARNING: ALWAYS WEAR A NOISHA/MSHA RECOMMENDED VAPOR/PARTICULATE RESPIRATOR AND USE ALL OTHER RECOMMENDED SAFETY EQUIPMENT.

SMALL SPOT REPAIR PROCEDURE

1 Wash the vehicle with detergent soap and

water.

2 Wipe the vehicle down with wax and grease

remover.

3. Sand the spot using 400 grit paper. Do not sand through the E-coat.

4. Wipe the sanded surface again with wax and grease remover/pre-cleaner.

^ BASF Product # 90 Pre-Kleano

^ PPG Product # DX 330

^ S-W Product # R7-K156

^ DuPont Product # 3919 S

^ Sikkens Product # M 600

5. Mix and apply tintable (Light Gray) self-etching or epoxy primer per manufacturer's label instructions.

NOTE: COLOR MATCH OF PRIME COAT IS KEY IN COLOR MATCH OF REPAIRED AREA.

^ BASF Product # DE 17

^ PPG Product # DP 40

^ S-W Product # E2-G973

^ DuPont Product # 615S

^ Sikkens Product # 1016

6. Mix and apply bright Rio Red base coat material per manufacturer's label instructions.

NOTE: COLOR MATCH OF BASE CLEAR COAT IS KEY IN COLOR MATCH OF REPAIRED AREA.

7. Mix and apply red tinted clearcoat material per manufacturer's label instructions.

NOTE: COLOR MATCH OF TINTED CLEAR COAT IS KEY IN COLOR MATCH OF REPAIRED AREA.

FULL PANEL REPAIR PROCEDURE

1. Wash the vehicle with detergent soap and water.

2. Wipe the vehicle down with wax and grease remover.

3. Sand the complete panel and feather edge into the next panel using 400 grit paper. Do not sand through the E-Coat primer.

4. Wipe the sanded surface with wax and grease remover.

5. Mix and apply tintable (light gray) primer per manufacturer's label instructions.

6. Mix and apply Rio Red basecoat per manufacturer's label instructions.

7. Mix and apply Red tinted clearcoat per manufacturer's label instructions.

8. Mix and apply one coat of non-tinted clearcoat per manufacturer's label instructions.

NOTE: COLOR MATCH OF EACH COAT ARE KEY TO COLOR MATCH OF FINISH REPAIR.

WARNING: OUR ENVIRONMENT IS PRECIOUS - PLEASE USE PROPER DISPOSAL TECHNIQUES FOR ANY VOLATILE ORGANIC COMPOUNDS (V.O.C's) OR EXCESS MATERIALS.

Paint: By Symptom

Technical Service Bulletin # 9384 Date: 930414

Exterior Clearcoat - Cracking/Eroding/Peeling Off

Article No. 93-8-4

April 14, 1993

PAINT - EXTERIOR CLEARCOAT "MICROCHECKING", HAZING OR PEELING

FORD: 1983-93 THUNDERBIRD 1984-93 TEMPO 1985-93 ESCORT 1986 LTD 1986-93 TAURUS 1989-93 CROWN VICTORIA, MUSTANG, PROBE

LINCOLN-MERCURY: 1983-93 COUGAR 1984-92 MARK VII 1984-93 TOPAZ 1985-89 TRACER 1986 MARQUIS 1986-93 SABLE 1988-93 CONTINENTAL, TOWN CAR 1989-93 GRAND MARQUIS 1991-93 TRACER 1993 MARK VIII

LIGHT TRUCK: 1983-93 RANGER 1986-93 AEROSTAR 1987-90 BRONCO II 1988-93 F SUPER DUTY, F-47 1991-93 ECONOLINE, EXPLORER 1992-93 F-150-350 SERIES 1993 VILLAGER

ISSUE: The clearcoat layer of the basecoat/clearcoat paint system may "microcheck" (crack and erode), turn white, flake or peel off the vehicle. This condition is noticeable on the horizontal surfaces only.

ACTION: Inspect the vehicle and if repair is necessary, refer to the following procedure for service details. This is a wet on wet procedure. Sanding is not required after the seal coat is applied.

NOTE: READ THE ENTIRE SERVICE REPAIR PROCEDURE BEFORE STARTING REPAIRS.

REPAIR PROCEDURE

WARNING: ALWAYS WEAR A NIOSH/OSHA RECOMMENDED VAPOR/PARTICULATE RESPIRATOR AND USE OTHER RECOMMENDED SAFETY EQUIPMENT.

1. Wash the vehicle with soap and water.

2. Verify clearcoat to basecoat or primer adhesion by applying a 2" wide masking tape strip on all horizontal body panels.

a. Pull the tape up quickly

b. Inspect the adhesive side for paint removal.

NOTE: IF PAINT WAS REMOVED DURING TAPE TEST, THE ENTIRE CLEARCOAT AND BASECOAT SHOULD BE REMOVED FROM THE PANEL.

3. Wipe down the areas to be repainted with wax and grease remover.

^ BASF product # 900 PreKleano or equivalent

4. Sand the affected surface with 150/240 grit sand paper. Remove only clearcoat and colorcoat, featheredge areas with 320 grit paper.

NOTE: DO NOT REMOVE SPRAY PRIMER OR E-COAT.

5. Blow off the area to remove loose dust or debris.

6. Wipe the sanded surface with wax or grease remover.

^ BASF product # 901 Prekleano or equivalent

7. Tack off area.

8. Mix and apply one coat of epoxy primer for adhesion and let dry per manufacturer's label instruction (20 - 30 minutes).

^ BASF product # DE 15, PA16, PR80 or equivalent

NOTE: DO NOT SAND THE NEWLY PRIMED AREAS.

9. Mix and apply two coats of the appropriate colored primer surface sealer.

^ BASF product # DP 21, Solo Color 1:1, then 2 parts of mixture 1 part DH 60, 30% PR80 or equivalent.

10. Mix and apply 2 coats or until hiding of basecoat per manufacturer's label instructions. Apply first coat to repair area only. Apply second coat over entire area. Allow a minimum of 15 minutes flash time before applying the clearcoat.

^ BASF # Diamont Basecoat Color and Diamont Reducer 1:1 or equivalent.

11. Mix and apply 2 coats of urethane clearcoat per manufacturer's label instructions.

^ BASF product # DC90 Diamond Clear, LH50 Diamond Hardener 2:1 or equivalent.

12. Polish if necessary.

13. Clean and detail the vehicle and return it to the customer.

Seat Back Frame: Customer Interest Passenger Seat Back - Rattles When Unoccupied

Article No. 94-14-10

07/13/94

^ SEAT - "RATTLE" - PASSENGER FRONT SEAT BACK RATTLES WHEN UNOCCUPIED

^ NOISE - "RATTLE" - PASSENGER FRONT SEAT BACK RATTLES WHEN UNOCCUPIED

LIGHT TRUCK: 1990-93 AEROSTAR, BRONCO, F-150-350 SERIES, RANGER 1991-93 EXPLORER

ISSUE: When the front passenger seat is unoccupied, the seat back may rattle due to a round pivot bushing that could allow for premature wear and looseness.

ACTION: Replace the passenger front seat back frame assembly with a new frame that has a redesigned pivot bushing.

Prior to removal, verify that the seat back is causing the concern. Obtain the proper seat back frame assembly. Refer to Application Chart in this TSB.

REMOVAL PROCEDURE

1. Remove the complete front seat assembly, including the restraint "slide bar" (if so equipped) from the vehicle. Refer to Section 01-1OA or 01-10B of the appropriate Service Manual.

2. Remove inboard pivot cover (one push pin).

3. Remove outboard side shield (2 screws).

4. Remove tip-slide adjuster rod (if so equipped).

5. Remove front seat center arm rest and link (if so equipped).

6. Remove front seat back assembly from seat cushion assembly (two (2) seat back latch upper retaining bolts and one (1) seat back frame to seat cushion pivot bolt).

7. Remove seat trim cover.

8. Remove seat back recliner latch assembly.

9. Remove seat back pad and lumbar support adjuster (if so equipped).

10. Discard old seat back frame.

INSTALLATION

1. Install seat back latch to new frame.

2. Install seat back pad to new frame.

3. Install lumbar support adjuster (if so equipped).

4. Position trimmed seat back frame assembly to seat cushion assembly and install two (2) bolts required to retain seat back latch to new frame.

NOTE:

BE SURE TO TORQUE THE BOLTS TO THE PROPER SPECIFICATIONS. REFER TO THE APPROPRIATE SERVICE MANUAL.

5. Install seat back frame to seat cushion frame pivot bolt.

NOTE:

BE SURE TO TORQUE THE BOLTS TO THE PROPER SPECIFICATIONS. REFER TO THE APPROPRIATE SERVICE MANUAL.

6. Install the center arm rest and link (if so equipped) to the seat back assembly.

NOTE:

BE SURE TO TORQUE THE BOLTS TO THE PROPER SPECIFICATIONS. REFER TO THE APPROPRIATE SERVICE MANUAL.

7. Install the tip-slide adjuster rod.

8. Install the inboard pivot cover to seat.

9. Install the outboard side shield to seat.

10. Install complete seat assembly (including "slide bar") in vehicle.

NOTE

BE SURE TO TORQUE THE BOLTS TO THE PROPER SPECIFICATIONS. REFER TO THE APPROPRIATE SERVICE MANUAL.

11. Verify proper operation of all seat functions.

12. Verify concern has been corrected.

1. Remove the complete front seat assembly, including the restraint "slide bar" (if so equipped) from the vehicle. Refer to Section 01-1OA or 01-10B of the appropriate Service Manual.

2. Remove inboard pivot cover (one push pin).

3. Remove outboard side shield (2 screws).

4. Remove tip-slide adjuster rod (if so equipped).

5. Remove front seat center arm rest and link (if so equipped).

6. Remove front seat back assembly from seat cushion assembly (two (2) seat back latch upper retaining bolts and one (1) seat back frame to seat cushion pivot bolt).

7. Remove seat trim cover.

8. Remove seat back recliner latch assembly.

9. Remove seat back pad and lumbar support adjuster (if so equipped).

10. Discard old seat back frame.

INSTALLATION

1. Install seat back latch to new frame.

2. Install seat back pad to new frame.

3. Install lumbar support adjuster (if so equipped).

4. Position trimmed seat back frame assembly to seat cushion assembly and install two (2) bolts required to retain seat back latch to new frame.

NOTE:

BE SURE TO TORQUE THE BOLTS TO THE PROPER SPECIFICATIONS. REFER TO THE APPROPRIATE SERVICE MANUAL.

5. Install seat back frame to seat cushion frame pivot bolt.

NOTE:

BE SURE TO TORQUE THE BOLTS TO THE PROPER SPECIFICATIONS. REFER TO THE APPROPRIATE SERVICE MANUAL.

6. Install the center arm rest and link (if so equipped) to the seat back assembly.

NOTE:

BE SURE TO TORQUE THE BOLTS TO THE PROPER SPECIFICATIONS. REFER TO THE APPROPRIATE SERVICE MANUAL.

7. Install the tip-slide adjuster rod.

8. Install the inboard pivot cover to seat.

9. Install the outboard side shield to seat.

10. Install complete seat assembly (including "slide bar") in vehicle.

NOTE

BE SURE TO TORQUE THE BOLTS TO THE PROPER SPECIFICATIONS. REFER TO THE APPROPRIATE SERVICE MANUAL.

11. Verify proper operation of all seat functions.

12. Verify concern has been corrected.

This TSB article is being republished in its entirety to include the latest level parts and to include a revised Service Procedure.

ISSUE

The following TSB contains information regarding the cleaning of interior leather seats and trim. Improper cleaning procedures may damage the leather. If seats are not cleaned on a regular basis (every 4-6 weeks), normal wear and tear can cause excessive soiling.

ACTION

Ford Motor Company has developed a new kit (Deluxe Leather Care Kit - F8AZ-19G253-AA) to clean soiled seats without damaging the top coat of the leather. The kit contains a leather and vinyl cleaner along with a specially formulated sponge.

Refer to the text for cleaning leather seats and trim.

The Deluxe Leather Care Kit has been tested and approved for use on all Ford and Lincoln/Mercury leather and vinyl seating surfaces, and if used as directed, should be used for service repairs. Many household cleaners and sponges are too harsh to be used on leather and may actually cause permanent damage to the surface.

Use this material on leather and vinyl seats that:

^ show excessive soiling

^ have been stained with coffee, lipstick, etc.

Refer to the instructions included in the kit for specific application procedures.

After cleaning surface with cleaner and sponge, wipe area with water and a cotton cloth.

NOTE

AVOID EXCESSIVE APPLICATION OF CLEANER ALONG STITCHING.

ISSUE

This article is to provide information on replacement hood lamp switches. The 27 degree Mercury style hood switches will no longer be available. Replacement 27 degree Mechanical switches will be available as a service replacement.

ACTION

For vehicles requiring hood lamp switch replacement, replace the 27 degree Mercury switch with new 27 degree Mechanical switch. Replace hood lamp switch per the appropriate model year Workshop Manual as needed.

Power Door Locks

Brake Switch (Cruise Control): Testing and Inspection

Perform this test only when brake application will not disconnect the speed control system.

1. Check operation of stop lamps by applying approximately 6 lbs. of pressure to brake pedal. If more than 6 lbs. is required, check brake pedal actuation and stop lamp switch.

2. If stop lamps do not function properly, check bulbs, circuit fuse or stop lamp switch.

3. If stop lamps function properly, check for battery voltage at 6-way connector using white wire w/purple stripe.

4. Depress brake pedal until stop lamps are illuminated. Check voltage at red wire w/black stripe on E-Series models, or the light green wire on Bronco and F-Series and Ranger, Bronco II, Explorer and Aerostar. The difference between the two voltage readings must not exceed 1.5 volts. If voltage is greater, a high resistance exists in the circuit and must be and corrected.

Clutch Switch: Service and Repair

1. Remove bracket mounting screw(s).
2. Disconnect electrical connector and remove switch and bracket assembly.
3. Remove switch from bracket.
4. Reverse procedure to install.

Cruise Control Brush Assembly: Service and Repair

1. Remove steering wheel pad attaching screws from behind steering wheel.

2. While pulling pad away from steering wheel, disconnect horn and speed control wire connectors and remove pad.

3. Remove retaining nuts securing the speed control switches and trim plate retainer to the steering wheel pad.

4. Disconnect wiring connector on rear of steering wheel pad assembly, then remove switch and trim retainer assembly.

5. Remove speed control switches by snapping out of plastic retainer.

6. To remove the ground brush, remove steering wheel for access.

7. Snap the ground brush assembly out of the turn signal switch.

8. Reverse procedure to install.

Cruise Control Module: Locations

I/P Components

Behind RH Side Of I/P, Near Glove Box

Cruise Control Module: Testing and Inspection

For amplifier test, substitute with a known good amplifier.

Cruise Control Servo: Testing and Inspection

1. Disconnect 8 way connector from amplifier.

2. On 1988 models, connect an ohmmeter between orange wire w/yellow hash and gray wire w/black hash at the connector. A resistance of 40-125 ohms should be obtained.

3. On 1989-92 models, connect an ohmmeter between orange wire w/yellow hash and gray wire w/black hash at the connector. A resistance of 40-70 ohms should be obtained.

4.

On 1988 models, connect an ohmmeter between the leads of orange wire w/yellow hash and white wire w/pink hash and check for a reading of 60-90 ohms.

5. On 1989-92 models, connect an ohmmeter between the leads of orange wire w/yellow hash and white wire w/pink hash and check for a reading of 100-150 ohms.

6. On all models, disconnect servo from amplifier, then start engine. Connect orange wire w/yellow hash of servo to battery positive post, then connect white wire w/pink hash to ground and momentarily touch gray wire w/black hash to ground. Servo throttle actuator should pull in and engine RPM should increase. Throttle should hold in position or slowly release. When white wire w/pink hash is removed from ground, servo should release.

7. Replace servo if servo fails to function as described. Amplifier may need replacement if orange wire w/yellow hash is shorted to either white-pink hash lead or gray-black hash lead.

Cruise Control Servo: Service and Repair

1. Raise hood, then disconnect wiring harness connector at servo assembly. On some models, it may be necessary to disconnect servo assembly at the amplifier under the dash and carefully pull harness and connector through dash panel opening.

2. Disconnect ball chain at carburetor or adjuster from accelerator cable (as equipped), then remove vacuum hose from servo assembly.

3. Remove servo assembly retaining pins and nuts, then the servo assembly from mounting bracket.

4. Reverse procedure to install.

Cruise Control Servo Cable: Adjustments

1. Remove cable retaining clip, then disengage throttle positioner.

2. Set throttle to hot idle position.

3. Pull on actuator cable to take up all slack, then while holding cable in this position, reinstall cable retaining clip.

Cruise Control Servo Cable: Service and Repair

1. Remove servo assembly, then discard cable.
2. Attach new actuator cable to servo assembly.
3. Install servo assembly.

Cruise Control

Cruise Control Switch: Testing and Inspection

1. Apply brake pedal and ensure brake lights operate. If found satisfactory, proceed to step 2. If found unsatisfactory, check stop lamps circuit.

2. Press horn pad to sound horn. If found satisfactory, proceed to step 3. If found unsatisfactory, check horn circuit.

3. Locate 6-pin connector at speed control amplifier.

4. With ignition Off and 6-pin connector still connected to amplifier, connect an ohmmeter between black wire and ground on Ranger, Bronco II, Explorer and Aerostar with mechanical cluster or black-white wire on Aerostar with electronic cluster.

5. Check resistance to ground to ensure amplifier is grounded. If amplifier is not grounded, repair and retest. If amplifier is properly grounded, turn ignition to On position while making the following voltage checks: a.

Check circuit 296 (white/purple wire) on Aerostar models or circuit 302 (dark blue wire) on Bronco II, Explorer and Ranger models. If 12 volts are present, proceed to step b. If not present, check speed control fuse and 296 circuit wire continuity.

b. Apply brake pedal and check circuit 511 (light green wire) for 12 volts on Ranger, Bronco II and Explorer or circuit 810 (red/light green wire) on Aerostar. If 12 volts is not present, check continuity between stop lamp switch and amplifier and repair as necessary. If there is continuity, replace amplifier.

c. Check circuit 151 (light blue/black wire) for approximately 7.8 volts. If 7.8 volts is not present with amplifier properly grounded and 12 volts at circuit 296 white/purple wire on Aerostar models or 302 dark blue wire on Bronco II, Explorer and Ranger models, verified, check for On button sticking. If 12 volts is present or a short circuit to ground on circuit 151 (light blue/black wire) between amplifier and steering column brush assembly. If zero volts is present and both the On button and 151 wire are functioning properly, replace amplifier and repeat test. If 7.8 volts is present, proceed to step 6.

6. Check following voltages between circuit 151 (light blue/black wire) and amplifier ground while rotating the steering wheel with horn pad switch depressed making the following checks: a.

No button pressed, 7.8 volts.

b. On, 12.0 volts.

c. Off, 0.0 volts.

d. Resume, 6.5 volts.

e. Accel, 4.5 volts.

f. Coast, 1.5 volts.

7. If values are incorrect or fluctuate, proceed to Step 8. If values are correct, horn pad switches are operating properly. Proceed to step 17.

8. With ignition Off, disconnect the 6-pin connector from amplifier, then check following resistances between circuit 151 (light blue/black wire) and amplifier ground with horn pad switch depressed while rotating steering wheel. Ohmmeter readings should as follows with switch positions as indicated: a.

Off, 0--1 ohm.

b. Accel, 646-714 ohms,

c. Coast, 114-126 ohms.

d. Resume, 2090-2310 ohms.

9. If values are incorrect or fluctuate, proceed to step 10. If values are correct, replace amplifier and repeat step 4.

10. On models except 1992 Aerostar, remove steering wheel horn pad attaching screws in back cover, then disconnect electrical connectors from wheel.

11. On 1992 Aerostar, disable airbag system as outlined in MAINTENANCE PROCEDURES Remove airbag module, then disconnect clockspring contact electrical connector at upper center area of steering wheel.

12. On all models, connect suitable ohmmeter between circuit 151 (yellow/light blue wire) and circuit 6 (dark/blue wire) on horn pad on all models, except 1992 Aerostar or black wire connector on 1992 Aerostar models. Depress On switch and check for a reading of 0-1 ohms.

12. If reading is not correct, replace switch assembly.

13. Pull steering wheel, then check for continuity of circuit 151 (light blue/black wire) and circuit 57 (black wire) between amplifier 6-pin connector and brush assembly on models except 1992 Aerostar or clockspring on 1992 Aerostar models.

14. If there is no continuity, check for continuity between 3-pin brush assembly wiring connector and brushes or clockspring at steering wheel, then between mating 3-pin connector and amplifier 6-pin connector. Repair or replace brush or clockspring assembly as necessary.

15. If there is continuity for both circuits, clean brush assembly and slip rings in a suitable solvent and lubricate with suitable lubricant.

16. Install wheel and horn pad and repeat step 4.

17. Connect a suitable ohmmeter between circuit 150 (green/white wire) and speed sensor ground circuit 563 (orange/yellow wire) on Ranger, Bronco II and Explorer or 397 (black/white wire) on Aerostar.

18. If resistance is not between 180-250 ohms, check continuity between 6-pin connector at amplifier and 2-pin speed sensor connector at transmission and repair as necessary.

19. If resistance is correct, the speed sensor wiring is functioning properly. Not all speed sensor problems can be identified by a resistance check. Replacement with a known good sensor may be required.

Cruise Control Switch: Service and Repair

1. Remove steering wheel pad attaching screws from behind steering wheel.

2. While pulling pad away from steering wheel, disconnect horn and speed control wire connectors and remove pad.

3. Remove retaining nuts securing the speed control switches and trim plate retainer to the steering wheel pad.

4. Disconnect wiring connector on rear of steering wheel pad assembly, then remove switch and trim retainer assembly.

5. Remove speed control switches by snapping out of plastic retainer.

6. To remove the ground brush, remove steering wheel for access.

7. Snap the ground brush assembly out of the turn signal switch.

8. Reverse procedure to install.

Cruise Control Vacuum Vent Solenoid: Testing and Inspection

1. Disconnect vacuum hose from the servo that leads to the dump valve.

2. Connect a hand vacuum pump to the hose, and draw vacuum. If vacuum cannot be obtained, the hose or dump valve is leaking, and should be replaced.

3. Step on brake pedal. The vacuum should be released. If not, adjust or replace the dump valve. 2.5 inches of Hg is minimum vacuum for normal servo operation. The vacuum source is a hose attached to a 5/16 inch engine vacuum fitting port on all except diesel. On diesel engines, the vacuum source is the vacuum reservoir VAC port.

Cruise Control Vacuum Vent Solenoid: Adjustments

1. Firmly hold brake pedal in the release position.

2. Push in dump valve until valve bottoms against brake pedal pad.

3. On 1989-91 models, dump valve housing must clear white plastic pad on brake pedal by .050-.10 inch with brake pedal pulled to rear most position.

Cruise Control Vacuum Vent Solenoid: Service and Repair

1. Remove vacuum hose from valve and remove bracket mounting screw.
2. Remove valve and bracket assembly.
3. Remove valve from the bracket.
4. Reverse procedure to install.

RADIO - NOISE WHILE IN AM MODE WHEN SPEED CONTROL IS ON

LIGHT TRUCK: 1990-91 RANGER 1991 EXPLORER

ISSUE: Radio static on weak to moderate strength AM radio stations only when both the radio and speed control are on, may be caused by the speed control module.

ACTION: Replace the speed control module with a new speed control module when vehicles exhibit this concern.

Cruise Control Module: Testing and Inspection

For amplifier test, substitute with a known good amplifier.

Brake Switch (Cruise Control): Testing and Inspection

Perform this test only when brake application will not disconnect the speed control system.

1. Check operation of stop lamps by applying approximately 6 lbs. of pressure to brake pedal. If more than 6 lbs. is required, check brake pedal actuation and stop lamp switch.

2. If stop lamps do not function properly, check bulbs, circuit fuse or stop lamp switch.

3. If stop lamps function properly, check for battery voltage at 6-way connector using white wire w/purple stripe.

4. Depress brake pedal until stop lamps are illuminated. Check voltage at red wire w/black stripe on E-Series models, or the light green wire on Bronco and F-Series and Ranger, Bronco II, Explorer and Aerostar. The difference between the two voltage readings must not exceed 1.5 volts. If voltage is greater, a high resistance exists in the circuit and must be and corrected.

Clutch Switch: Service and Repair

1. Remove bracket mounting screw(s).
2. Disconnect electrical connector and remove switch and bracket assembly.
3. Remove switch from bracket.
4. Reverse procedure to install.

Cruise Control

Cruise Control Switch: Testing and Inspection

1. Apply brake pedal and ensure brake lights operate. If found satisfactory, proceed to step 2. If found unsatisfactory, check stop lamps circuit.

2. Press horn pad to sound horn. If found satisfactory, proceed to step 3. If found unsatisfactory, check horn circuit.

3. Locate 6-pin connector at speed control amplifier.

4. With ignition Off and 6-pin connector still connected to amplifier, connect an ohmmeter between black wire and ground on Ranger, Bronco II, Explorer and Aerostar with mechanical cluster or black-white wire on Aerostar with electronic cluster.

5. Check resistance to ground to ensure amplifier is grounded. If amplifier is not grounded, repair and retest. If amplifier is properly grounded, turn ignition to On position while making the following voltage checks: a.

Check circuit 296 (white/purple wire) on Aerostar models or circuit 302 (dark blue wire) on Bronco II, Explorer and Ranger models. If 12 volts are present, proceed to step b. If not present, check speed control fuse and 296 circuit wire continuity.

b. Apply brake pedal and check circuit 511 (light green wire) for 12 volts on Ranger, Bronco II and Explorer or circuit 810 (red/light green wire) on Aerostar. If 12 volts is not present, check continuity between stop lamp switch and amplifier and repair as necessary. If there is continuity, replace amplifier.

c. Check circuit 151 (light blue/black wire) for approximately 7.8 volts. If 7.8 volts is not present with amplifier properly grounded and 12 volts at circuit 296 white/purple wire on Aerostar models or 302 dark blue wire on Bronco II, Explorer and Ranger models, verified, check for On button sticking. If 12 volts is present or a short circuit to ground on circuit 151 (light blue/black wire) between amplifier and steering column brush assembly. If zero volts is present and both the On button and 151 wire are functioning properly, replace amplifier and repeat test. If 7.8 volts is present, proceed to step 6.

6. Check following voltages between circuit 151 (light blue/black wire) and amplifier ground while rotating the steering wheel with horn pad switch depressed making the following checks: a.

No button pressed, 7.8 volts.

b. On, 12.0 volts.

c. Off, 0.0 volts.

d. Resume, 6.5 volts.

e. Accel, 4.5 volts.

f. Coast, 1.5 volts.

7. If values are incorrect or fluctuate, proceed to Step 8. If values are correct, horn pad switches are operating properly. Proceed to step 17.

8. With ignition Off, disconnect the 6-pin connector from amplifier, then check following resistances between circuit 151 (light blue/black wire) and amplifier ground with horn pad switch depressed while rotating steering wheel. Ohmmeter readings should as follows with switch positions as indicated: a.

Off, 0--1 ohm.

b. Accel, 646-714 ohms,

c. Coast, 114-126 ohms.

d. Resume, 2090-2310 ohms.

9. If values are incorrect or fluctuate, proceed to step 10. If values are correct, replace amplifier and repeat step 4.

10. On models except 1992 Aerostar, remove steering wheel horn pad attaching screws in back cover, then disconnect electrical connectors from wheel.

11. On 1992 Aerostar, disable airbag system as outlined in MAINTENANCE PROCEDURES Remove airbag module, then disconnect clockspring contact electrical connector at upper center area of steering wheel.

12. On all models, connect suitable ohmmeter between circuit 151 (yellow/light blue wire) and circuit 6 (dark/blue wire) on horn pad on all models, except 1992 Aerostar or black wire connector on 1992 Aerostar models. Depress On switch and check for a reading of 0-1 ohms.

12. If reading is not correct, replace switch assembly.

13. Pull steering wheel, then check for continuity of circuit 151 (light blue/black wire) and circuit 57 (black wire) between amplifier 6-pin connector and brush assembly on models except 1992 Aerostar or clockspring on 1992 Aerostar models.

14. If there is no continuity, check for continuity between 3-pin brush assembly wiring connector and brushes or clockspring at steering wheel, then between mating 3-pin connector and amplifier 6-pin connector. Repair or replace brush or clockspring assembly as necessary.

15. If there is continuity for both circuits, clean brush assembly and slip rings in a suitable solvent and lubricate with suitable lubricant.

16. Install wheel and horn pad and repeat step 4.

17. Connect a suitable ohmmeter between circuit 150 (green/white wire) and speed sensor ground circuit 563 (orange/yellow wire) on Ranger, Bronco II and Explorer or 397 (black/white wire) on Aerostar.

18. If resistance is not between 180-250 ohms, check continuity between 6-pin connector at amplifier and 2-pin speed sensor connector at transmission and repair as necessary.

19. If resistance is correct, the speed sensor wiring is functioning properly. Not all speed sensor problems can be identified by a resistance check. Replacement with a known good sensor may be required.

Cruise Control Switch: Service and Repair

1. Remove steering wheel pad attaching screws from behind steering wheel.

2. While pulling pad away from steering wheel, disconnect horn and speed control wire connectors and remove pad.

3. Remove retaining nuts securing the speed control switches and trim plate retainer to the steering wheel pad.

4. Disconnect wiring connector on rear of steering wheel pad assembly, then remove switch and trim retainer assembly.

5. Remove speed control switches by snapping out of plastic retainer.

6. To remove the ground brush, remove steering wheel for access.

7. Snap the ground brush assembly out of the turn signal switch.

8. Reverse procedure to install.

Vehicle Speed Sensor/Transducer - Cruise Control: Testing and Inspection

1. Disconnect speed sensor connector, then connect an ohmmeter between dark green/white and black wires.

2. A reading of 180-250 ohms should be obtained. A reading of 0 ohms indicates a shorted coil and an infinity reading indicates an open coil.

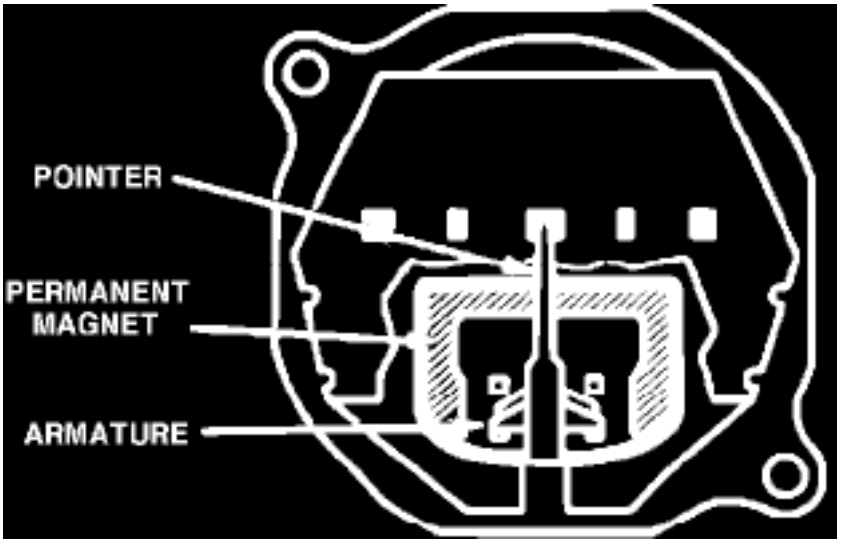
3. Replace sensor if a proper reading has not been obtained.

Vehicle Speed Sensor/Transducer - Cruise Control: Testing and Inspection

1. Disconnect speed sensor connector, then connect an ohmmeter between dark green/white and black wires.

2. A reading of 180-250 ohms should be obtained. A reading of 0 ohms indicates a shorted coil and an infinity reading indicates an open coil.

3. Replace sensor if a proper reading has not been obtained.



Ammeter Gauge: Description and Operation

The ammeter is an instrument used to indicate current flow into and out of the battery. When electrical accessories in the vehicle draw more current than the alternator can supply, current flows from the battery and the ammeter indicates a discharge (-) condition. When electrical loads of the vehicle are less than alternator output, current is available to charge the battery, and the ammeter indicates a charge (+) condition. If battery is fully charged, the voltage regulator reduces alternator output to meet only immediate vehicle electrical loads. When this happens, ammeter reads zero.

CONVENTIONAL AMMETER

Fig. 1 Conventional Type Ammeter

A conventional ammeter must be connected between battery and alternator in order to indicate current flow. This type ammeter, Fig. 1, consists of a frame to which a permanent magnet is attached. The frame also supports an armature and pointer assembly. Current in this system flows from the alternator through the ammeter, then to the battery or from the battery through the ammeter into the vehicle electrical system, depending on vehicle operating conditions. When no current flows through the ammeter, the magnet holds the pointer armature so that the pointer stands at the center of the dial. When current passes in either direction through the ammeter, the resulting magnetic field attracts the armature away from the effect of the permanent magnet, thus giving a reading proportional to the strength of the current flowing.

SHUNT TYPE AMMETER

The shunt type ammeter is actually a specifically calibrated voltmeter. It is connected to read voltage drop across a resistance wire (shunt) between the battery and alternator. The shunt is located either in the vehicle wiring or within the ammeter itself. When voltage is higher at the alternator end of the shunt, the meter indicates a charge (+) condition. When voltage is higher at the battery end of the shunt, the meter indicates a discharge (-) condition. When voltage is equal at both ends of the shunt, the meter reads zero.

Ammeter Gauge: Testing and Inspection

CONVENTIONAL AMMETER

When the ammeter apparently fails to register correctly, there may be trouble in the wiring which connects the ammeter to the alternator and battery or in the alternator or battery itself. To check the connections, first tighten the two terminal posts on the back of the ammeter. Then, following each wire from the ammeter, tighten all connections on the ignition switch, battery and alternator. Chafed, burned or broken insulation can be found by following each ammeter wire from end to end. All wires with chafed, burned or broken insulation should be repaired or replaced. After this is done, and all connections are tightened, connect the battery cable and turn on the ignition switch. The needle should point slightly to the discharge (-) side. Start the engine and run slightly above idling speed. The needle should move slowly to the charge side (+). If the pointer does not move as indicated, the ammeter is out of order and should be replaced.

SHUNT TYPE AMMETER

Ammeter accuracy can be determined by comparing reading with an ammeter of known accuracy.

1. With engine stopped and ignition switch in RUN position, switch on headlamps and heater fan. Meter should indicate a discharge (-) condition.

2. If ammeter pointer does not move, check ammeter terminals for proper connection and check for open circuit in wiring harness. If connections and wiring harness are satisfactory, ammeter is defective.

3. If ammeter indicates a charge (+) condition, wiring harness connections are reversed at ammeter.

Fuel Gauge: Description and Operation

BI-METAL FUEL INDICATOR

This fuel level indicating system consists of a sending unit attached to the fuel reservoir and a fuel gauge mounted on the instrument panel. The bi-metal fuel indicator gauge pointer is attached to a wire-wound bimetal strip which, when heated by the flow of electrical current controlled by the sender unit, produces the appropriate indication. The bi-metal fuel indicator is used with a Instrument Voltage Regulator (IVR), which controls and maintains an average pulsating voltage of 5 volts at the indicator. The fuel sender consists of a variable resistor, controlled by the action of an attached float in the fuel tank. The variable resistor consists of a screened resistive material on a ceramic substrate, which produces a resistance value. On models except Aerostar, Bronco II, Explorer and Ranger, resistance should be 10 ohms (full tank) and 70 ohms (empty tank). On Aerostar, Bronco II, Explorer and Ranger, resistance should be 145 ohms (full tank) and 22.5 ohms (empty tank).

MAGNETIC FUEL INDICATOR

This fuel level indicating system consists of a sending unit attached to the fuel reservoir and a fuel gauge mounted on the instrument panel. The magnetic fuel indicator gauge creates a polarity in the wire windings which, depending on the resistance at the sender, controls the degree of pointer rotation. This gauge operates on battery voltage. The fuel sender consists of a variable resistor, controlled by the action of an attached float in the fuel tank.

CONDITION	POSSIBLE SOURCE	ACTION
Fuel gauge shows empty at all levels of fill.	1. Loose or dirty wiring connections or short to ground in wiring.	1. Check wiring connectors and sender terminals. Repair, clean, or tighten as needed.
	2. Leaking sender float.	2. Replace sender.
	3. Missing sender float.	3. Install float. Ensure float is securely retained on sender arm.
	4. Open circuit in sender.	4. Test for correct resistance values and replace if needed.
	5. Sender arm movement obstructed.	5. INSPECT tank and sender for cause REPLACE faulty component
Fuel gauge will not read full when tank is full.	1. Wrong sender installed.	1. Check part number. Install correct part.
	2. Sender arm movement obstructed. (Float rod bent)	2. INSPECT tank and sender for cause REPLACE faulty component.
	3. Leaking float.	3. Install new sender.
	4. Sender or gauge calibration.	4. Test for correct resistance valve and replace if needed.
	5. Fuel tank not filling to rated capacity.	5. Check fuel tank fill vent for kinks or obstructions. Correct as required and fill tank to verify proper capacity.

Fig. 7 Troubleshooting Chart

TEST STEP		RESULT ▶	ACTION TO TAKE
A1	VERIFY CONDITION		
• Verify condition.		Gauge pointer does not move ▶	GO to **A2**.
		Gauge pointer moves ▶	GO to **B1**.
A2	CHECK OTHER GAUGES		
• Check power to cluster. With ignition on, observe other gauges and warning lamps for proper operation. If necessary, use voltmeter or test lamp to verify voltage at B+ terminal of cluster connector.		Other gauges and warning lamps operate properly; voltage present at cluster ▶	GO to **B1**.
		Other gauges and warning lamps do not operate properly; no voltage present at cluster ▶	REPAIR power to cluster.

TEST STEP		RESULT ▶	ACTION TO TAKE
B1	TEST BOX CHECK		
• Place ignition switch in the OFF position. • Insert Instrument Gauge System Tester, Rotunda 021-00055 in sender circuit. Disconnect circuit 14405 connector under instrument panel and connect tester to cluster side of connector. Set tester to the 22 ohm position. • Place ignition in the ON position. • Wait 60 seconds. • Read fuel gauge.		Gauge reads 1/8-3/8 or 5/8-7/8 ▶	REPLACE fuel gauge.
		Gauge reads 3/8-5/8 ▶	REPLACE anti-slosh module.
		Gauge reads E ▶	GO to **B2**.
		Pointer pegged past FULL ▶	REPLACE anti-slosh module.
		Pointer does not move ▶	REPLACE fuel gauge.
B2	TEST BOX CHECK		
• Place ignition switch in the OFF position. • Insert Instrument Gauge System Tester, Rotunda 021-00055 in sender circuit. Disconnect circuit 14405 connector under instrument panel and connect tester to cluster side of connector. Set tester to the 145 ohm position. • Wait 60 seconds. • Read fuel gauge.		Gauge reads FULL ▶	GO to **B3**.
		Gauge reads less than 7/8 ▶	REPLACE fuel gauge.

B3	SENDER WIRING CHECK		
• Check sender circuit wiring for shorts or open with ohmmeter.		Circuit OK ▶	GO to **C1**.
		Circuit Not OK ▶	SERVICE wiring.

Fuel Gauge: Pinpoint Tests

Fig. 4 Troubleshooting Chart

Fig. 5 Troubleshooting Chart

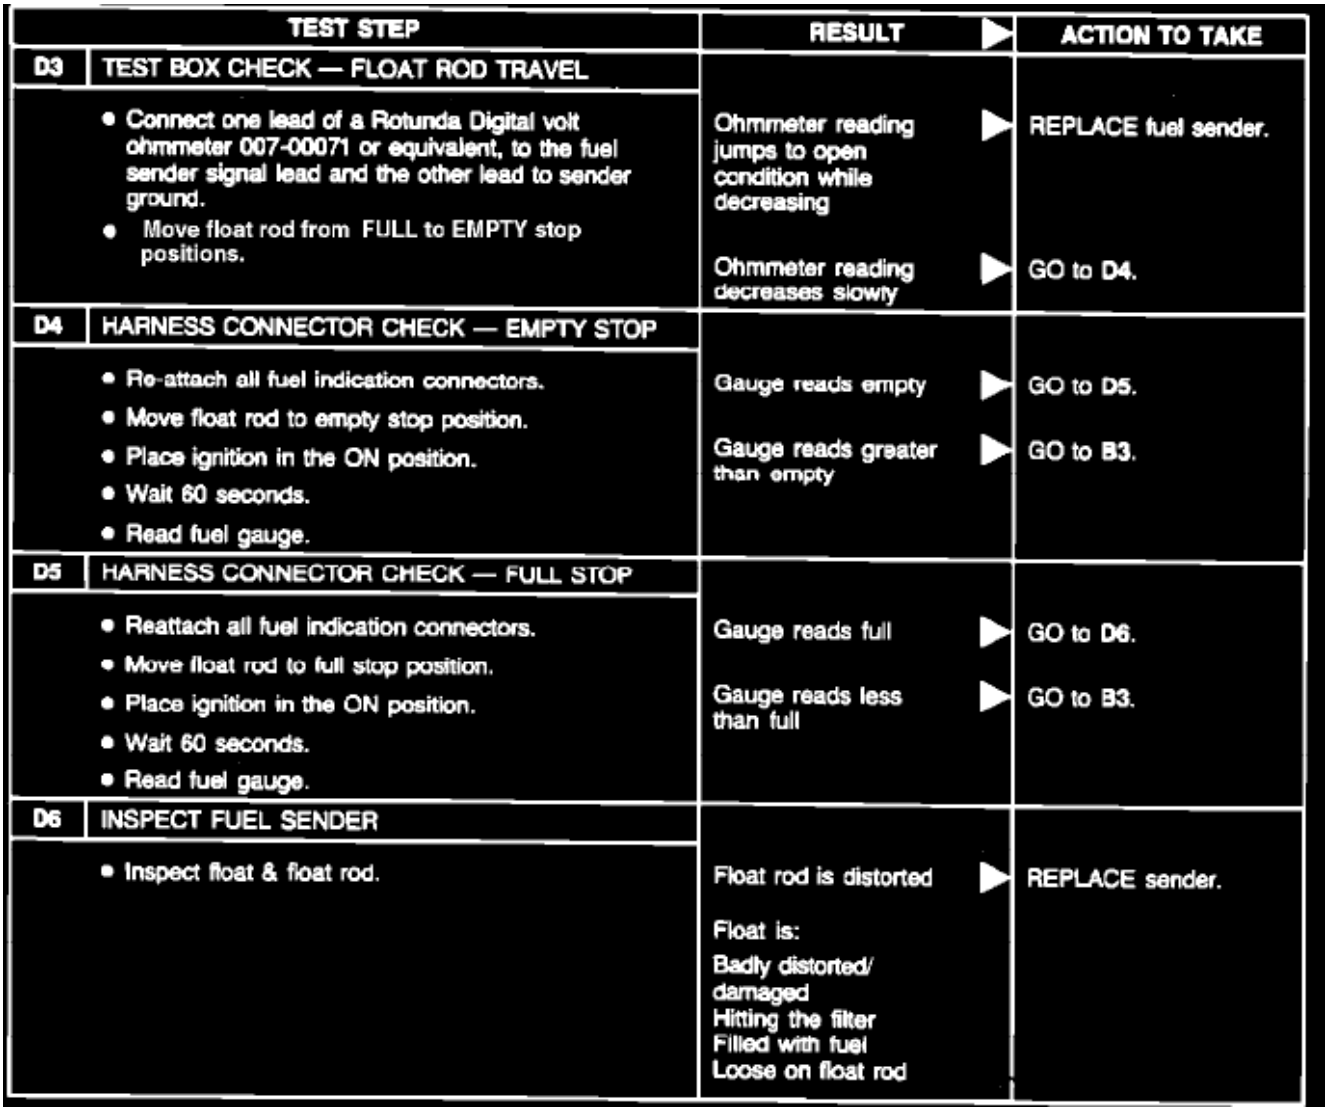
Fig. 5 Troubleshooting Chart

TEST STEP		RESULT	ACTION TO TAKE
C1	TANK INSPECTION • Inspect fuel tank for distortion or damage.	Damaged ▶ Not damaged ▶	REPLACE fuel tank. GO to D1.
D1	TEST BOX CHECK — EMPTY STOP • Connect one lead of a Rotunda Digital volt ohmmeter 007-00001 or equivalent, to the fuel sender signal lead and the other lead to sender ground. • When the float rod is against the empty stop (closest to fuel filter).	Digital volt ohmmeter read 14-18Ω ▶ Digital volt ohmmeter reads less than 14Ω or greater than 18Ω ▶	GO to D2. REPLACE fuel sender.
D2	TEST BOX CHECK — FULL STOP • Connect one lead of a Rotunda Digital volt ohmmeter 007-00071 or equivalent, to the fuel sender signal lead and the other lead to sender ground. • When the float rod is against the full stop.	Digital volt ohmmeter read 155-165Ω ▶ Digital volt ohmmeter reads less than 155Ω or greater than 165Ω. ▶	GO to D3. REPLACE fuel sender.

TEST STEP		RESULT	ACTION TO TAKE
C1	TANK INSPECTION • Inspect fuel tank for distortion or damage.	Damaged ▶ Not damaged ▶	REPLACE fuel tank. GO to D1.
D1	TEST BOX CHECK — EMPTY STOP • Connect one lead of a Rotunda Digital volt ohmmeter 007-00001 or equivalent, to the fuel sender signal lead and the other lead to sender ground. • When the float rod is against the empty stop (closest to fuel filter).	Digital volt ohmmeter read 14-18Ω ▶ Digital volt ohmmeter reads less than 14Ω or greater than 18Ω ▶	GO to D2. REPLACE fuel sender.
D2	TEST BOX CHECK — FULL STOP • Connect one lead of a Rotunda Digital volt ohmmeter 007-00071 or equivalent, to the fuel sender signal lead and the other lead to sender ground. • When the float rod is against the full stop.	Digital volt ohmmeter read 155-165Ω ▶ Digital volt ohmmeter reads less than 155Ω or greater than 165Ω. ▶	GO to D3. REPLACE fuel sender.

Fig. 6 Troubleshooting Chart

Fig. 6 Troubleshooting Chart



TEST STEP		RESULT	ACTION TO TAKE
D3	TEST BOX CHECK — FLOAT ROD TRAVEL		
• Connect one lead of a Rotunda Digital volt ohmmeter 007-00071 or equivalent, to the fuel sender signal lead and the other lead to sender ground. • Move float rod from FULL to EMPTY stop positions.		Ohmmeter reading jumps to open condition while decreasing	REPLACE fuel sender.
		Ohmmeter reading decreases slowly	GO to D4.
D4	HARNESS CONNECTOR CHECK — EMPTY STOP		
• Re-attach all fuel indication connectors. • Move float rod to empty stop position. • Place ignition in the ON position. • Wait 60 seconds. • Read fuel gauge.		Gauge reads empty	GO to D5.
		Gauge reads greater than empty	GO to B3.
D5	HARNESS CONNECTOR CHECK — FULL STOP		
• Reattach all fuel indication connectors. • Move float rod to full stop position. • Place ignition in the ON position. • Wait 60 seconds. • Read fuel gauge.		Gauge reads full	GO to D6.
		Gauge reads less than full	GO to B3.
D6	INSPECT FUEL SENDER		
• Inspect float & float rod.		Float rod is distorted	REPLACE sender.
		Float is: Badly distorted/ damaged Hitting the filter Filled with fuel Loose on float rod	

Fig. 6 Troubleshooting Chart

Fuel Gauge: Component Tests and General Diagnostics

CONSTANT VOLTAGE REGULATOR GAUGE SYSTEM (CVR)

1. Disconnect battery ground cable and remove gauge from vehicle.

2. Connect ohmmeter between gauge terminals and read coil winding resistance.

3. An upward movement of ohmmeter needle from 10 ohms to 14 ohms is normal, as test current of ohmmeter causes a temperature rise in gauge coil windings.

4. If ohmmeter reads below 10 ohms or above 14 ohms, gauge is defective.

MAGNETIC GAUGE SYSTEM

1. Ensure voltage is present at fuse panel and cluster.

2. Install gauge tester tool No. 021-00055 or equivalent, following manufacturer's instructions. This tester can be used on the CVR or Magnetic Gauge systems.

Wire Color Code Identification

NOTE: Whenever a wire is labeled with two colors; the first color listed is the basic color of the wire, and the second color is the tracer marking of the wire. If the second color is followed by by a D, the tracer is dots. If the second color is followed by an H, the tracer is hash marks.

For example: BR/O is a brown wire with an orange stripe, R/Y D is a red wire with yellow dots and BK/W H is a black wire with white hash marks.

^ WIRING - REVISED IGNITION CONTROL MODULE (ICM) CONNECTOR RETENTION - DUSTRUBUTORLESS IGNITION SYSTEM (DIS) ONLY

FORD: 1991-94 ESCORT 1992-94 CROWN VICTORIA 1993-94 TAURUS 1994 MUSTANG, THUNDERBIRD

LINCOLN-MERCURY: 1990-94 TOWN CAR 1991-94 TRACER 1992-94 GRAND MARQUIS 1993-94 MARK VIII 1994 COUGAR

LIGHT TRUCK: 1990-94 AEROSTAR, RANGER 1991-94 EXPLORER

ISSUE: Some vehicles may have a disconnect of the Ignition Control Module (ICM) connector or moisture buildup within the connector. This can cause hard to start/no start, rough idle, or "check engine light" illumination concerns. The improved gasket and connector retainer that are currently used in production are now available for service of prior model distributorless ignition systems.

ACTION: Install new Connector Sleeve Retainer Clip and a current production seal (gasket). The clip assembles in between the connector beams and the ICM which will prevent accidental disconnects. The new seal is a "solid silicone" gasket that provides improved resistance to moisture entry into the connector. Refer to the ICM Connector Harness Wire Service kit (F5CZ-14A411-AA) for service details (I.S. 6621).

AFFECTED ENGINES

^ Escort/Tracer - 1.9L

^ Crown Victoria/Grand Marquis/Town Car/Mark VIII- 4.6L

BASIC PART NO. CONDITION CODE

11572 X1

OASIS CODES: 201000, 201100, 206000

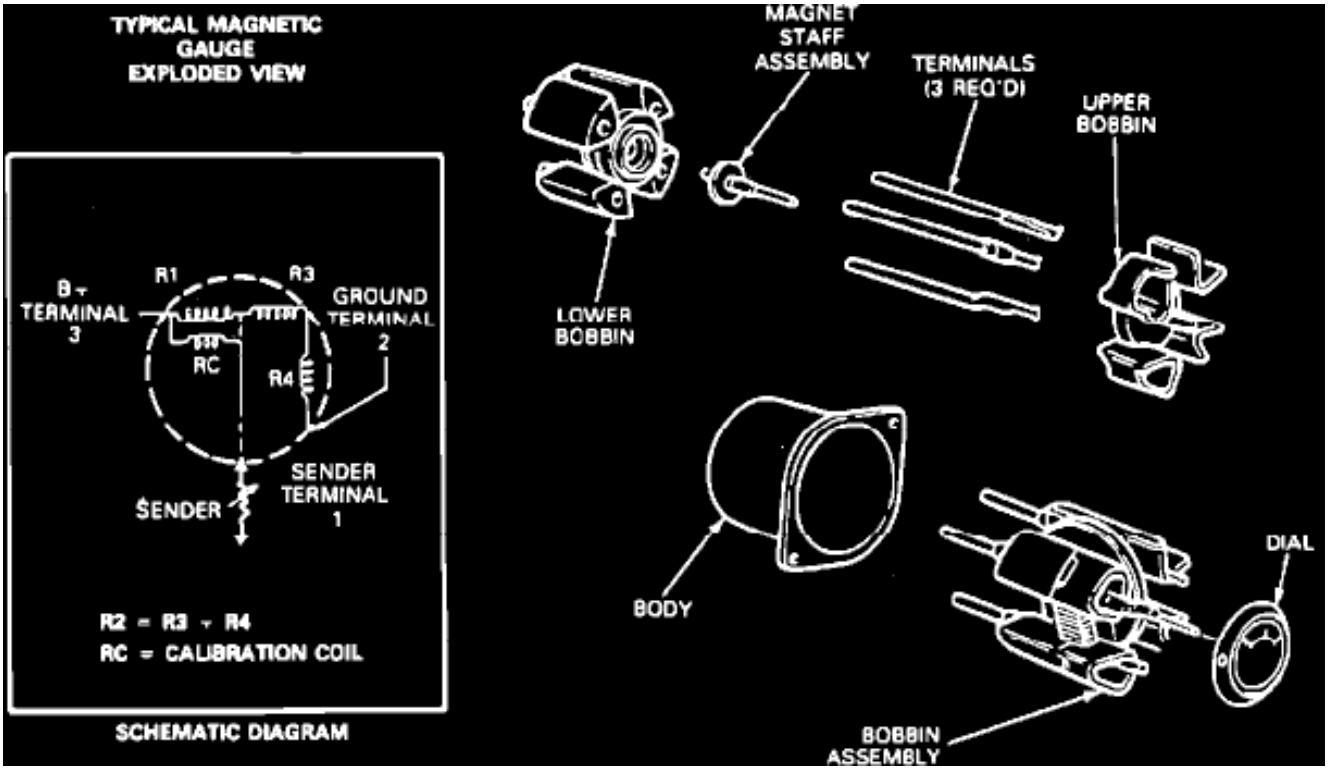
Oil Level Warning Indicator: Description and Operation

The oil pressure warning light should go on when the ignition is turned on. If it does not light, disconnect the wire from the engine unit and ground the wire to the frame or cylinder block. Then if the warning light still does not go on with the ignition switch on, replace the bulb. If the warning light goes on when the wire is grounded to the frame or cylinder block, the engine unit should be checked for being loose or poorly grounded. If the unit is found to be tight and properly grounded, it should be removed and a new one installed. (The presence of sealing compound on the threads of the engine unit will cause a poor ground). If the warning light remains lit when it normally should be out, replace the engine unit before proceeding further to determine the cause for a low pressure indication. The warning light will sometimes light up or flicker when engine is idling, even though oil pressure is adequate. However, light should go out when engine speed is increased.

Oil Level Warning Indicator: Testing and Inspection

With oil level at FULL mark on oil dipstick and engine oil warm to assure that oil drains properly from oil sensor, turn ignition on and start engine. Warning lamp should come on briefly in Start for bulb test, then go out. Turn engine off. Drain 2 quarts of oil from engine. Wait approximately 5 minutes, then restart engine. Warning lamp should come on and stay on. If warning lamp does not come on check fuse, low oil level relay, low oil level sensor and lamp.



Oil Pressure Gauge: Description and Operation

CONSTANT VOLTAGE REGULATOR GAUGE SYSTEM (CVR)

This oil pressure indicating system incorporates an instrument voltage regulator, electrical oil pressure gauge and a sending unit which are connected in series. The sending unit consists of a diaphragm, contact and a variable resistor. As oil pressure increases or decreases, the diaphragm actuates the contact on the variable resistor, which in turn controls current flow to the gauge. When oil pressure is low, resistance of the variable resistor is high, which restricts current flow to the gauge, indicating low oil pressure. As oil pressure increases, resistance of the variable resistor is lowered, permitting increased current flow to the gauge, which increases the gauge reading.

MAGNETIC GAUGE SYSTEM

Fig. 8 Magnetic Guage

The magnetic gauge movement consists of three primary coils, one of which is wound at a 90° angle to the other two. The coils form a magnetic field which varies in direction according to the variable resistance of the sender unit which is connected between two of them. A primary magnet which is attached to a shaft and pointer rotates to align to this primary field resulting in pointer position. The bobbin/coil assembly is pressed into a metal housing which is attached to the instrument cluster Fig. 8. These gauges require no adjustments, calibrations or maintenance. This gauge system does not use an IVR.

TEST STEP		RESULT ▶	ACTION TO TAKE
A1	TEMPERATURE OR OIL GAUGE INOPERATIVE		
	• Check complaint.	Gauge pointer does not move ▶	GO to Step A2.
		Gauge pointer moves ▶	GO to Step B1.

TEST STEP		RESULT ▶	ACTION TO TAKE
A2	VERIFY POWER TO CLUSTER		
	• With ignition on, observe other gauges and warning lamps for proper operation. If necessary, use voltmeter or test light to verify voltage at B+ terminal of cluster connector.	Other gauges and warning lamps operate correctly: voltage present at cluster ▶	GO to Step B1.
		Other gauges and warning lamps do not operate correctly: no voltage present at cluster ▶	SERVICE wiring to cluster.

TEST STEP		RESULT ▶	ACTION TO TAKE
B1	TESTING SENDER CIRCUIT AT LOW		
	• Insert test box in sender circuit. Disconnect connector at sender and connect test box to cluster side of connector. Set box to LOW (73 ohms).	Temperature gauge reads around the C band ▶	GO to Step B2.
		Oil reads at or below L band ▶	GO to Step B3
		Pointer does not move ▶	GO to Step B4.
B2	TESTING TEMPERATURE SENDER CIRCUIT AT HIGH		
	• TEMPERATURE GAUGE • Set test box to HIGH (9.7 ohms).	Temperature gauge reads around the H grad ▶	REPLACE sender.
		Temperature gauge does not read around the H grad ▶	GO to Step B4.
B3	TESTING ON CABLE SENDER CIRCUIT AT HIGH		
	• OIL GAUGE • Set test box to 0 ohms (short circuit).	Oil gauge reads MID SCALE or slightly above ▶	REPLACE switch.
		Oil gauge does not read MID SCALE or slightly above ▶	GO to Step B4.
B4	CHECK SENDER CIRCUIT WIRING		
	• Check sender circuit wiring and cluster flexible circuit for shorts or open with ohmmeter.	Wiring and flex circuit OK ▶	REPLACE gauge. GO to A1.
		Wiring shorted or open. Flex circuit damaged ▶	REPAIR wiring / flex circuit. GO to A1.

Oil Pressure Gauge: Pinpoint Tests

Fig. 11 Troubleshooting Chart

Fig. 11 Troubleshooting Chart

Fig. 12 Troubleshooting Chart

Oil Pressure Gauge: Component Tests and General Diagnostics

CONSTANT VOLTAGE REGULATOR GAUGE SYSTEM (CVR)

1. Disconnect battery ground cable and remove gauge from vehicle.

2. Connect ohmmeter between gauge terminals and read coil winding resistance.

3. An upward movement of ohmmeter needle from 10 ohms to 14 ohms is normal, as test current of ohmmeter causes a temperature rise in gauge coil windings.

4. If ohmmeter reads below 10 ohms or above 14 ohms, gauge is defective.

MAGNETIC GAUGE SYSTEM

1. Ensure voltage is present at fuse panel and cluster.

2. Install gauge tester tool No. 021-00055 or equivalent, following manufacturer's instructions. This tester can be used on the CVR or Magnetic Gauge systems.

Oil Pressure Gauge: Tools and Equipment

Tester tool No. 021-00055 or equivalent should be used to diagnose these type gauges, following manufacturer's instructions.

Oil Pressure Switch: Locations

Engine Compartment Components.

Lower LH Rear Of Engine

Applicable to: 2.9L/V6-179

Oil Pressure Warning Lamp/Indicator: Description and Operation

Many trucks utilize a warning light on the instrument panel in place of the conventional dash indicating gauge to warn the driver when the oil pressure is dangerously low. The warning light is wired in series with the ignition switch and the engine unit--which is an oil pressure switch. The oil pressure switch contains a diaphragm and a set of contacts. When the ignition switch is turned on, the warning light circuit is energized and the circuit is completed through the closed contacts in the pressure switch. When the engine is started, build-up of oil pressure compresses the diaphragm, opening the contacts, thereby breaking the circuit and putting out the light.

Oil Pressure Warning Lamp/Indicator: Testing and Inspection

The oil pressure warning light should go on when the ignition is turned on. If it does not light, disconnect the wire from the engine unit and ground the wire to the frame or cylinder block. Then if the warning light still does not go on with the ignition switch on, replace the bulb. If the warning light goes on when the wire is grounded to the frame or cylinder block, the engine unit should be checked for being loose or poorly grounded. If the unit is found to be tight and properly grounded, it should be removed and a new one installed. (The presence of sealing compound on the threads of the engine unit will cause a poor ground). If the warning light remains lit when it normally should be out, replace the engine unit before proceeding further to determine the cause for a low pressure indication. The warning light will sometimes light up or flicker when engine is idling, even though oil pressure is adequate. However, light should go out when engine speed is increased.

Speedometer Cable: Testing and Inspection

Most cables are broken due to lack of lubrication, or a sharp bend or kink in the housing. A cable might break because of the speedometer head mechanism binds. In such cases, the speedometer head should be repaired or replaced before a new cable or housing is installed. A ``jumpy'' pointer condition, together with a scraping noise, is due, in most instances, to a dry or kinked speedometer cable. The kinked cable rubs on the housing and winds up, slowing down the pointer. The cable then unwinds and the pointer ``jumps.'' To check for kinks, remove the cable, lay it on a flat surface and twist one end with the fingers. If it turns over smoothly the cable is not kinked. But if part of the cable flops over as it is twisted, the cable is kinked and should be replaced.

Speedometer Cable: Service and Repair Speedometer Cable Lubrication

The speedometer cable should be lubricated with special cable lubricant. Fill the ferrule on the upper end of the housing with the cable lubricant. Insert the cable in the housing, starting at the upper end. Turn the cable around carefully while feeding it into the housing. Repeat filling the ferrule except for the last six inches of cable. Too much lubricant at this point may cause the lubricant to work into the speedometer head.

Speedometer Cable: Service and Repair Speedometer Cable Replacement

During installation, if the cable sticks when inserted into the housing and will not go through, the housing is damaged inside or kinked. Be sure to check the housing from one end to the other. Straighten any sharp bends by relocating clamps or elbows. Replace housing if it is badly kinked or broken. Position cable and housing so that they lead into the head as straight as possible. Check new cable for kinks before installing it. Use wide, sweeping, gradual curves where the cable comes out of the transmission and connects to the head so the cable will not be damaged during installation. Arrange the housing so it does not lean against the engine because heat from the engine may dry out the lubricant. If inspection indicates that the cable and housing are in good condition, yet pointer action is erratic, check the speedometer head for possible binding. The speedometer drive pinion should also be checked. If the pinion is dry or its teeth are stripped, the speedometer may not register properly.

Speedometer Head: Customer Interest Speedometer - Indicates High Speed When Cold

Article No. 92-12-9

DATE: 06-03-92

SPEEDOMETER-MECHANICAL (ANALOG)-INDICATES HIGH SPEED AT LOW AMBIENT TEMPERATURES (ABOUT 20 DEGREES F OR -7 DEGREES C OR BELOW)- VEHICLES BUILT AFTER 4/1/90

FORD: 1990-92 ESCORT, MUSTANG, TAURUS, TEMPO

LINCOLN-MERCURY: 1990-92 SABLE, TOPAZ, TRACER

LIGHT TRUCK: 1990-91 AEROSTAR, BRONCO, ECONOLINE, F-150-350 SERIES 1990-92 RANGER 1991-92 EXPLORER

ISSUE: Mechanical speedometers may indicate higher than actual vehicle speed at low ambient temperatures (about 20~ F or -7~ C or below). This occurs because of insufficient lubrication at lower temperatures. The speedometer will indicate speed correctly after the vehicle warms up.

ISSUE This TSB article is a diagnostic procedure to address vehicles that exhibit lean driveability symptoms and may or may not have any Diagnostic Trouble Codes (DTCs) stored in memory.

ACTION Follow the diagnostic procedures described in the following Service Tip. The revised diagnostic procedure is a more accurate means of diagnosing the symptoms.

SERVICE TIP

MASS AIR FLOW (MAF) DISCUSSION

MAF sensors can get contaminated from a variety of sources: dirt, oil, silicon, spider webs, potting compound from the sensor itself, etc. When a MAF sensor gets contaminated, it skews the transfer function such that the sensor over-estimates air flow at idle (causes the fuel system to go rich) and under-estimates air flow at high air flows (causes fuel system to go lean). This means Long Term Fuel Trims will learn lean (negative) corrections at idle and learn rich (positive) corrections at higher air flows.

If vehicle is driven at Wide Open Throttle (WOT) or high loads, the fuel system normally goes open loop rich to provide maximum power. If the MAF sensor is contaminated, the fuel system will actually be lean because of under-estimated air flow. During open loop fuel operation, the vehicle applies Long Term Fuel Trim corrections that have been learned during closed loop operation. These corrections are often lean corrections learned at lower air flows. This combination of under-estimated air flow and lean fuel trim corrections can result in spark knock/detonation and lack of power concerns at WOT and high loads.

One of the indicators for diagnosing this condition is barometric pressure. Barometric pressure (BARO) is inferred by the Powertrain Control Module (PCM) software at part throttle and WOT (there is no actual BARO sensor on MAF-equipped vehicles, except for the 3.8L Supercharged engine). At high air flows, a contaminated MAF sensor will under-estimate air flow coming into the engine, hence the PCM infers that the vehicle is operating at a higher altitude. The BARO reading is stored in Keep Alive Memory (KAM) after it is updated. Other indicators are Long Term Fuel Trim and MAF

voltage at idle.

NOTE

THE FOLLOWING PROCEDURE MAY ALSO BE USED TO DIAGNOSE VEHICLES THAT DO NOT HAVE FUEL SYSTEM/HO2S SENSOR DTCS.

Symptoms

^ Lack of Power

^ Spark Knock/Detonation

^ Buck/Jerk

^ Hesitation/Surge on Acceleration

^ Malfunction Indicator Lamp (MIL) Illuminated -

DTCs P0171, P0172, P0174, P0175 may be stored in memory

OBDII DTCs

^ P0171, P0174 (Fuel system lean, Bank 1 or 2)

^ P0172, P0175, (Fuel system rich, Bank 1 or 2)

^ P1130, P1131, P1132, (HO2S11 lack of switching, Bank 1)

^ P1150, P1151, P1152, (HO2S21 lack of switching, Bank 2)

OBDI DTCs

^ 181, 189 (Fuel system lean, Bank 1 or 2)

^ 179, 188 (Fuel system rich, Bank 1 or 2)

^ 171, 172, 173 (HO2S11 lack of switching, Bank 1)

^ 175, 176, 177 (HO2S21 lack of switching, Bank 2)

^ 184, 185 (MAF higher/lower than expected)

^ 186, 187 (Injector pulse width higher/lower than expected)

NOTE:

DO NOT DISCONNECT THE BATTERY. IT WILL ERASE KEEP ALIVE MEMORY AND RESET LONG TERM FUEL TRIM AND BARO TO THEIR STARTING/BASE VALUES. THE BARO PARAMETER IDENTIFICATION DISPLAY (PID) IS USED FOR THIS DIAGNOSTIC PROCEDURE. ALL OBDII APPLICATIONS HAVE THIS PID AVAILABLE. THERE ARE SOME OBDI VEHICLES THAT DO NOT HAVE THE BARO PID, FOR THESE VEHICLES OMIT THE BARO CHECK AND REFER ONLY TO STEPS 2, 3, AND 4 IN THE DIAGNOSTIC PROCEDURE.

BAROMETRIC PRESSURE REFERENCE			
Barometric Pressure (in. Hg.)	Barometric Pressure (kPa)	BARO/MAP PID (Hz)	Altitude above sea level (ft)
3.5	11.8	89.3	
5	16.9	92.8	
10	33.8	104.6	
15	50.7	117.0	14,000
20	67.5	129.6	10,000
21	70.9	132.5	9,000
22	74.3	135.4	8,000
23	77.7	138.3	7,000
24	81.1	141.1	6,000
25	84.4	144.0	5,000
26	87.8	146.9	4,000
27	91.2	149.8	3,000
28	94.6	152.8	2,000
29	97.9	155.8	1,000
30	101.3	158.9	0 (sea level)
31	104.7	162.0	
31.875	107.7	164.7	

1. Look at the BARO PID. Refer to the Barometric Pressure Reference Chart in this article. At sea level, BARO should read about 159 Hz (29.91 in. Hg). As a reference, Denver, Colorado at 1524 meters (5000 ft.) altitude should be about 144 Hz (24.88 in.Hg). Normal learned BARO variability is up to +/- 6 Hz (+/- 2 in. Hg.). If BARO indicates a higher altitude than you are not at (7 or more Hz lower than expected), you may have MAF contamination. If available, Service Bay Diagnostic System (SBDS) has a Manifold Absolute Pressure (MAP) sensor that can be used as a barometric pressure reference. Use "MAP/BARO" test under "Powertrain," "Testers and Meters." Ignore the hookup screen. Connect GP2 to the reference MAP on the following screen.

NOTE

REMEMBER THAT MOST WEATHER SERVICES REPORT A LOCAL BAROMETRIC PRESSURE THAT HAS BEEN CORRECTED TO SEA LEVEL. THE BARO PID, ON THE OTHER HAND, REPORTS THE ACTUAL BAROMETRIC PRESSURE FOR THE ALTITUDE THE VEHICLE IS BEING OPERATED IN. LOCAL WEATHER CONDITIONS (HIGH AND LOW PRESSURE AREAS) WILL CHANGE THE LOCAL BAROMETRIC PRESSURE BY SEVERAL INCHES OF MERCURY (+/- 3 Hz, +/- 1 in. Hg.).

NOTE

BARO IS UPDATED ONLY WHEN THE VEHICLE IS AT HIGH THROTTLE OPENINGS. THEREFORE, A VEHICLE WHICH IS DRIVEN DOWN FROM A HIGHER ALTITUDE MAY NOT HAVE HAD AN OPPORTUNITY TO UPDATE THE BARO VALUE IN KAM. IF YOU ARE NOT CONFIDENT THAT BARO HAS BEEN UPDATED, PERFORM THREE OR FOUR HEAVY, SUSTAINED ACCELERATIONS AT GREATER THAN HALF-THROTTLE TO ALLOW BARO TO UPDATE.

2. On a fully warmed up engine, look at Long Term Fuel Trim at idle, in Neutral, A/C off, (LONGFT1 and/or LONGFT2 PIDs). If it is more negative than -12%, the fuel system has learned lean corrections which may be due to the MAF sensor over-estimating air flow at idle. Note that both Banks 1 and 2 will exhibit negative corrections for 2-bank system. If only one bank of a 2-bank system has negative corrections, the MAF sensor is probably not contaminated.

3. On a fully warmed up engine, look at MAF voltage at idle, in Neutral, A/C off (MAF V PID). If it's 30% greater than the nominal MAF V voltage listed in the Powertrain Control/Emissions Diagnosis (PC/ED) Diagnostic Value Reference Charts for your vehicle, or greater than 1.1 volts as a rough guide, the MAF sensor is over-estimating air flow at idle.

4. If at least tow of the previous three steps are true, proceed to disconnect the MAF sensor connector. This puts the vehicle into Failure Mode and Effects Management (FMEM). In FMEM mode, air flow is inferred by using rpm and throttle position instead of reading the MAF sensor. (In addition, the BARO value is reset to a base/unlearned value.) If the lean driveability symptoms go away, the MAF sensor is probably contaminated and should be replaced. If the lean driveability symptoms do not go away, go to the PC/ED Service Manual for the appropriate diagnostics.

NOTE

DUE TO INCREASINGLY STRINGENT EMISSION/OBDII REQUIREMENTS, IT IS POSSIBLE FOR SOME VEHICLES WITH MAF SENSOR CONTAMINATION TO SET FUEL SYSTEM DTCs AND ILLUMINATE THE MIL WITH NO DRIVEABILITY CONCERNS. DISCONNECTING THE MAF ON THESE VEHICLES WILL, THEREFORE, PRODUCE NO IMPROVEMENTS IN DRIVEABILITY. IN THESE CASES, IF THE BARO, LONGFT1, LONGFT2, AND MAF V PIDs INDICATE THAT THE MAF IS CONTAMINATED, PROCEED TO REPLACE THE MAF SENSOR.

After replacing the MAF sensor, disconnect the vehicle battery (5 minutes, minimum to reset KAM, or on newer vehicles, use the "KAM Reset" feature on the New Generation Star (NGS) Tester and verify that the lean driveability symptoms are gone.

^ P1150, P1151, P1152, (HO2S21 lack of switching, Bank 2)

OBDI DTCs

^ 181, 189 (Fuel system lean, Bank 1 or 2)

^ 179, 188 (Fuel system rich, Bank 1 or 2)

^ 171, 172, 173 (HO2S11 lack of switching, Bank 1)

^ 175, 176, 177 (HO2S21 lack of switching, Bank 2)

^ 184, 185 (MAF higher/lower than expected)

^ 186, 187 (Injector pulse width higher/lower than expected)

NOTE:

DO NOT DISCONNECT THE BATTERY. IT WILL ERASE KEEP ALIVE MEMORY AND RESET LONG TERM FUEL TRIM AND BARO TO THEIR STARTING/BASE VALUES. THE BARO PARAMETER IDENTIFICATION DISPLAY (PID) IS USED FOR THIS DIAGNOSTIC PROCEDURE. ALL OBDII APPLICATIONS HAVE THIS PID AVAILABLE. THERE ARE SOME OBDI VEHICLES THAT DO NOT HAVE THE BARO PID, FOR THESE VEHICLES OMIT THE BARO CHECK AND REFER ONLY TO STEPS 2, 3, AND 4 IN THE DIAGNOSTIC PROCEDURE.

BAROMETRIC PRESSURE REFERENCE

Barometric Pressure (in. Hg.)	Barometric Pressure (kPa)	BARO/MAP PID (Hz)	Altitude above sea level (ft)
3.5	11.8	89.3	
5	16.9	92.8	
10	33.8	104.6	
15	50.7	117.0	14,000
20	67.5	129.6	10,000
21	70.9	132.5	9,000
22	74.3	135.4	8,000
23	77.7	138.3	7,000
24	81.1	141.1	6,000
25	84.4	144.0	5,000
26	87.8	146.9	4,000
27	91.2	149.8	3,000
28	94.6	152.8	2,000
29	97.9	155.8	1,000
30	101.3	158.9	0 (sea level)
31	104.7	162.0	
31.875	107.7	164.7	

1. Look at the BARO PID. Refer to the Barometric Pressure Reference Chart in this article. At sea level, BARO should read about 159 Hz (29.91 in. Hg). As a reference, Denver, Colorado at 1524 meters (5000 ft.) altitude should be about 144 Hz (24.88 in.Hg). Normal learned BARO variability is up to +/- 6 Hz (+/- 2 in. Hg.). If BARO indicates a higher altitude than you are not at (7 or more Hz lower than expected), you may have MAF contamination. If available, Service Bay Diagnostic System (SBDS) has a Manifold Absolute Pressure (MAP) sensor that can be used as a barometric pressure reference. Use "MAP/BARO" test under "Powertrain," "Testers and Meters." Ignore the hookup screen. Connect GP2 to the reference MAP on the following screen.

NOTE

REMEMBER THAT MOST WEATHER SERVICES REPORT A LOCAL BAROMETRIC PRESSURE THAT HAS BEEN CORRECTED TO SEA LEVEL. THE BARO PID, ON THE OTHER HAND, REPORTS THE ACTUAL BAROMETRIC PRESSURE FOR THE ALTITUDE THE VEHICLE IS BEING OPERATED IN. LOCAL WEATHER CONDITIONS (HIGH AND LOW PRESSURE AREAS) WILL CHANGE THE LOCAL BAROMETRIC PRESSURE BY SEVERAL INCHES OF MERCURY (+/- 3 Hz, +/- 1 in. Hg.).

NOTE

BARO IS UPDATED ONLY WHEN THE VEHICLE IS AT HIGH THROTTLE OPENINGS. THEREFORE, A VEHICLE WHICH IS DRIVEN DOWN FROM A HIGHER ALTITUDE MAY NOT HAVE HAD AN OPPORTUNITY TO UPDATE THE BARO VALUE IN KAM. IF YOU ARE NOT CONFIDENT THAT BARO HAS BEEN UPDATED, PERFORM THREE OR FOUR HEAVY, SUSTAINED ACCELERATIONS AT GREATER THAN HALF-THROTTLE TO ALLOW BARO TO UPDATE.

2. On a fully warmed up engine, look at Long Term Fuel Trim at idle, in Neutral, A/C off, (LONGFT1 and/or LONGFT2 PIDs). If it is more negative than -12%, the fuel system has learned lean corrections which may be due to the MAF sensor over-estimating air flow at idle. Note that both Banks 1 and 2 will exhibit negative corrections for 2-bank system. If only one bank of a 2-bank system has negative corrections, the MAF sensor is probably not contaminated.

3. On a fully warmed up engine, look at MAF voltage at idle, in Neutral, A/C off (MAF V PID). If it's 30% greater than the nominal MAF V voltage listed in the Powertrain Control/Emissions Diagnosis (PC/ED) Diagnostic Value Reference Charts for your vehicle, or greater than 1.1 volts as a rough guide, the MAF sensor is over-estimating air flow at idle.

4. If at least tow of the previous three steps are true, proceed to disconnect the MAF sensor connector. This puts the vehicle into Failure Mode and Effects Management (FMEM). In FMEM mode, air flow is inferred by using rpm and throttle position instead of reading the MAF sensor. (In addition, the BARO value is reset to a base/unlearned value.) If the lean driveability symptoms go away, the MAF sensor is probably contaminated and should be replaced. If the lean driveability symptoms do not go away, go to the PC/ED Service Manual for the appropriate diagnostics.

NOTE

DUE TO INCREASINGLY STRINGENT EMISSION/OBDII REQUIREMENTS, IT IS POSSIBLE FOR SOME VEHICLES WITH MAF SENSOR CONTAMINATION TO SET FUEL SYSTEM DTCs AND ILLUMINATE THE MIL WITH NO DRIVEABILITY CONCERNS. DISCONNECTING THE MAF ON THESE VEHICLES WILL, THEREFORE, PRODUCE NO IMPROVEMENTS IN DRIVEABILITY. IN THESE CASES, IF THE BARO, LONGFT1, LONGFT2, AND MAF V PIDs INDICATE THAT THE MAF IS CONTAMINATED, PROCEED TO REPLACE THE MAF SENSOR.

After replacing the MAF sensor, disconnect the vehicle battery (5 minutes, minimum to reset KAM, or on newer vehicles, use the "KAM Reset" feature on the New Generation Star (NGS) Tester and verify that the lean driveability symptoms are gone.

OTHER APPLICABLE ARTICLES:: NONE WARRANTY STATUS: INFORMATION ONLY OASIS CODES: 206000, 610000, 610500, 610600, 610700, 611000, 611500, 612000, 612500, 614000, 614500, 614600, 698298

Speedometer Head: Description and Operation

Service repair procedures on the speedometer are not included as they require special tools and extreme care when making repairs and adjustment that only an experienced speedometer mechanic should attempt. The speedometer has two main parts, speedometer head and speedometer drive cable. When speedometer fails to indicate speed or mileage, cable or cable housing is probably broken. On vehicles equipped with speed control, there is a speed sensor attached to the transmission. This is used to sense the revolutions of the cable assembly and to regulate speed control.

Temperature Gauge: Customer Interest Temperature Gauge - Fluctuation/Inaccurate

Article No. 95-18-5

09/11/95

TEMPERATURE GAUGE - FLUCTUATING AND/OR INACCURATE HIGH READINGS

FORD: 1990-94 TAURUS, THUNDERBIRD 1991-93 TEMPO 1991-94 ESCORT

LINCOLN-MERCURY: 1990-94 COUGAR SABLE 1991-93 TOPAZ 1991-94 TRACER

LIGHT TRUCK: 1990-91 AEROSTAR 1990-94 RANGER 1991-94 EXPLORER

This TSB article is being republished in its entirety to correct model year application and revise the part descriptions.

ISSUE: Some vehicles may show temperature gauge fluctuations and/or inaccurate (high) readings (affected engines are 3.0L/4.0L Ranger. 4.0L Explore and 1.9L Escort/Tracer). The inaccurate (high) readings may result in a customer concern with the perception of engine overheating. This is caused by Gauge/Sender design characteristics which create a sensitive gauge indication.

ACTION: Replace the gauge and sender with a new Temperature Indication Service Kit. Refer to the following for Additional Concerns and Service Procedure for details.

ADDITIONAL CONCERNS

Please verify the following two (2) concerns before implementing the fix for the above concern.

1. Perform cooling system diagnosis per TSB 93-24-8.

2. Vehicles built from 1/1/93 to 4/1/93 may experience high temperature gauge indications which may have been due to the installation of improperly manufactured temperature sending units. The customer concern is that the gauge indication is beyond the letter "L" in the word "NORMAL". If this condition occurs, inspect the temperature sender for an "A3" stamped date code on the hex of the sending unit. If an "A3" unit is found, replace with "NON-A3" service stock.

3. 1993 Taurus/Sable 3.8L vehicles built 8/16/93 to 8/31/93 may have high temperature gauge readings caused by an incorrect temperature sending unit installed at the assembly plant. The incorrect temperature sending unit can be identified by a blue insulator around the terminal. The correct temperature sending unit has a green insulator. If a temperature sending unit with a blue insulator is found, replace it with an F1SZ-10884-A.

4. Explorer 4.0L vehicles with date code 2204 to 2274 should not be used. Any other date code outside this is acceptable even with an "A3" stamp.

NOTE:

DATE CODES ARE BASED ON THE JULIAN DATE CODE SYSTEM. THE LAST NUMBER DENOTES THE YEAR THAT THE PART WAS MANUFACTURED. FOR EXAMPLE, 2274 (1994 PART) AND 2275 (1995 PART). ANY 1995 PART MAY BE USED.

TEMPERATURE INDICATION SERVICE KIT PROCEDURE

NOTE:

THIS PROCEDURE IS PERFORMED AFTER THE ABOVE TWO (2) STEPS HAVE BEEN DONE.

The installation of the service kit will result in a pointer indicating in the approximate center of the "NORMAL" band while providing protection for a boil-over condition.

The service kit consists of:

PART NUMBER	PART NAME
F4CZ-10E922-A	Temperature Indication Kit - Base (Escort/Tracer 1.9L)
F4CZ-10E922-B	Temperature Indication Kit - With Tachometer (Escort/Tracer - 1.9L)
F43Z-10E922-A	Temperature Indication Kit - Base (Tempo/Topaz)
F46Z-10E922-A	Temperature Indication Kit - With Tachometer (Tempo/Topaz)
F4DZ-10E922-A	Temperature Indication Kit - Base (Taurus)
F44Z-10E922-A	Temperature Indication Kit - With Tachometer (Taurus/Sable)
F4SZ-10E922-A	Temperature Indication Kit - Base (Thunderbird/Cougar)
F4SZ-10E922-B	Temperature Indication Kit - With Tachometer (Thunderbird/Cougar)
F47Z-10E922-A	Temperature Indication Kit Without Tachometer (Ranger - 3.0L And 4.0L Engines)
F47Z-10E922-B	Temperature Indication Kit - With Tachometer (Explorer - 4.0L, Ranger - 3.0L And 4.0L Engines)
F49Z-10E922-A	Temperature Indication Kit (Aerostar)

^ Instructions

^ Temperature Gauge

^ Temperature Sender

The instructions will contain the following steps:

1. Remove BOTH existing temperature sender and temperature gauge from the vehicle.

NOTE:

REFER TO SECTION 13, CONVENTIONAL INSTRUMENT CLUSTER, OF THE APPROPRIATE SERVICE MANUAL FOR TEMPERATURE GAUGE REMOVAL AND INSTALLATION INSTRUCTIONS. REFER TO SECTION 03-03, COOLING SYSTEM, OF THE APPROPRIATE SERVICE MANUAL FOR TEMPERATURE SENDER REMOVAL AND INSTALLATION PROCEDURES.

2. Install BOTH service kit temperature sender and temperature gauge into the vehicle.

NOTE:

THE SERVICE KIT TEMPERATURE SENDER AND TEMPERATURE GAUGE MUST BE USED TOGETHER.

Temperature Gauge: Description and Operation

CONSTANT VOLTAGE REGULATOR GAUGE SYSTEM (CVR)

This temperature indicating system consists of a sending unit, located on the cylinder head, electrical temperature gauge and an instrument voltage regulator. As engine temperature increases or decreases, the resistance of the sending unit changes, in turn controlling current flow to the gauge. When engine temperature is low, the resistance of the sending unit is high, restricting current flow to the gauge, in turn indicating low engine temperature. As engine temperature increases, the resistance of the ending unit decreases, permitting an increased current flow to the gauge, resulting in an increased temperature reading.

MAGNETIC GAUGE SYSTEM

Fig. 8 Magnetic Guage

The magnetic gauge movement consists of three primary coils, one of which is wound at a 90° angle to the other two. The coils form a magnetic field which varies in direction according to the variable resistance of the sender unit which is connected between two of them. A primary magnet which is attached to a shaft and pointer rotates and aligns to this primary field resulting in pointer position. The bobbin/coil assembly is pressed into a metal housing which is attached to the instrument cluster, Fig. 8. These gauges require no adjustments, calibrations or maintenance. This gauge system does not use an IVR.

TEST STEP		RESULT ▶	ACTION TO TAKE
A1	TEMPERATURE OR OIL GAUGE INOPERATIVE		
	• Check complaint.	Gauge pointer does not move ▶	GO to Step A2.
		Gauge pointer moves ▶	GO to Step B1.

TEST STEP		RESULT ▶	ACTION TO TAKE
A2	VERIFY POWER TO CLUSTER		
	• With ignition on, observe other gauges and warning lamps for proper operation. If necessary, use voltmeter or test light to verify voltage at B+ terminal of cluster connector.	Other gauges and warning lamps operate correctly: voltage present at cluster ▶	GO to Step B1.
		Other gauges and warning lamps do not operate correctly: no voltage present at cluster ▶	SERVICE wiring to cluster.

TEST STEP		RESULT ▶	ACTION TO TAKE
B1	TESTING SENDER CIRCUIT AT LOW		
	• Insert test box in sender circuit. Disconnect connector at sender and connect test box to cluster side of connector. Set box to LOW (73 ohms).	Temperature gauge reads around the C band ▶	GO to Step B2.
		Oil reads at or below L band ▶	GO to Step B3
		Pointer does not move ▶	GO to Step B4.
B2	TESTING TEMPERATURE SENDER CIRCUIT AT HIGH		
	• TEMPERATURE GAUGE • Set test box to HIGH (9.7 ohms).	Temperature gauge reads around the H grad ▶	REPLACE sender.
		Temperature gauge does not read around the H grad ▶	GO to Step B4.
B3	TESTING ON CABLE SENDER CIRCUIT AT HIGH		
	• OIL GAUGE • Set test box to 0 ohms (short circuit).	Oil gauge reads MID SCALE or slightly above ▶	REPLACE switch.
		Oil gauge does not read MID SCALE or slightly above ▶	GO to Step B4.
B4	CHECK SENDER CIRCUIT WIRING		
	• Check sender circuit wiring and cluster flexible circuit for shorts or open with ohmmeter.	Wiring and flex circuit OK ▶	REPLACE gauge. GO to A1.
		Wiring shorted or open. Flex circuit damaged ▶	REPAIR wiring / flex circuit. GO to A1.

Temperature Gauge: Pinpoint Tests

Fig. 11 Troubleshooting Chart

Fig. 11 Troubleshooting Chart

Fig. 12 Troubleshooting Chart

Temperature Gauge: Component Tests and General Diagnostics

CONSTANT VOLTAGE REGULATOR GAUGE SYSTEM (CVR)

1. Disconnect battery ground cable and remove gauge from vehicle.

2. Connect ohmmeter between gauge terminals and read coil winding resistance.

3. An upward movement of ohmmeter needle from 10 ohms to 14 ohms is normal, as test current of ohmmeter causes a temperature rise in gauge coil windings.

4. If ohmmeter reads below 10 ohms or above 14 ohms, gauge is defective.

MAGNETIC GAUGE SYSTEM

1. Ensure voltage is present at fuse panel and cluster.

2. Install gauge tester tool No. 021-00055 or equivalent, following manufacturer's instructions. This tester can be used on the CVR or Magnetic Gauge systems.

Temperature Gauge: Tools and Equipment

Tester tool No. 021-00055 or equivalent should be used to diagnose these type gauges.

ISSUE: Temperature Sender F1SZ-10884-A with a build date code prior to 2774 (277th day of 1994) should be purged from your inventory and returned to your facing PDC. These parts are being made obsolete because of an incorrect crimp during assembly. Installing these parts on a vehicle could result in early loss of temperature sender function.

ACTION: Remove and return the suspect parts from your dealership's inventory. The obsolete parts should be withdrawn from your inventory and returned to your facing PDC within 30 days of this TSB.

NOTE:

USE TSB ARTICLE 93-24-8 FOR DIAGNOSIS PROCEDURE IN DETERMINING IF LOW GAUGE READINGS COULD BE ASSOCIATED WITH A TEMPERATURE SENDER CONCERN.

1. Perform 100% sort of all stock on hand.

2. Suspect stock has a build date code prior to 2774. Usable stock will have a build date code of 2774 or later.

NOTE:

DATE CODES ARE LOCATED ON THE SIDE OF THE SENDER HEX.

3. Usable stock can be returned to your inventory and released for normal sales.

4. Return suspect part (F1SZ-10884-A) to your facing PDC using the least expensive transportation.

5. If claim is processed electronically via DOES II, use return code "GB"; otherwise, complete a separate paper claim form FPS-340 using return code "J".

6. In the Remarks Section, write "Returned per TSB 95-13-2".

LIMITS

^ The returns must be received within 30 days from the date of this TSB.

^ Returns are restricted to the subject parts.

^ The parts returned must have been purchased from FCSD in accordance with Policy and Procedure Bulletin 4000.

CREDIT

Credit for parts and prepaid freight costs will be issued.

Replacement stock is available for ordering

Temperature Warning Lamp/Indicator: Description and Operation

A bimetal temperature switch located in the cylinder head controls operation of a temperature indicator light with a red lens. If engine cooling system is not functioning properly and coolant temperature exceeds a predetermined value, warning light will illuminate.

Temperature Warning Lamp/Indicator: Testing and Inspection

If the red light is not lit when engine is being cranked, check for a burned out bulb, open in light circuit, or a defective ignition switch. If red light is lit when engine is running, check wiring between light and switch for a ground, defective temperature switch, or overheated cooling system. As a test circuit to check whether the red bulb is functioning properly, a wire which is connected to the ground terminal of the ignition switch is tapped into its circuit. When the ignition is in ``Start'' (engine cranking) position, ground terminal is grounded inside the switch and the red bulb will be lit. When engine is started and the ignition switch is in the On position, test circuit is opened and bulb is then controlled by the temperature switch.

Volt Meter Gauge: Description and Operation

The voltmeter is a gauge which measures the electrical flow from the battery to indicate whether the battery output is within tolerances. The voltmeter reading can range from 13.5-14.0 volts under normal operating conditions. If an undercharge or overcharge condition is indicated for an extended period, the battery and charging system should be checked.

Volt Meter Gauge: Testing and Inspection Dash Gauge Test

CONSTANT VOLTAGE REGULATOR GAUGE SYSTEM (CVR)

1. Disconnect battery ground cable and remove gauge from vehicle.

2. Connect ohmmeter between gauge terminals and read coil winding resistance.

3. An upward movement of ohmmeter needle from 10 ohms to 14 ohms is normal, as test current of ohmmeter causes a temperature rise in gauge coil windings.

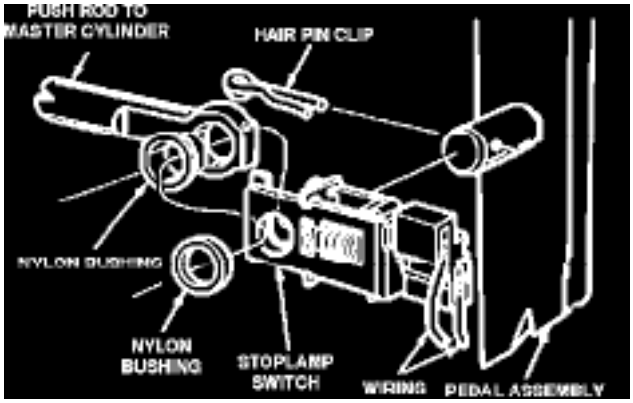
Brake And Clutch Switches

Brake Light Switch: Description and Operation

The Brake On Off (BOO) signal is sent by the brake switch when the brakes are APPLIED. The Engine Control Assembly (ECA) uses this signal to modify the operation of the torque converter clutch (if equipped), A/C compressor (if equipped), and idle speed during periods of decel and idle with the brakes APPLIED.



Brake Light Switch: Service and Repair

Fig. 12 Stop Light Switch Replacement

REMOVAL

1. Disconnect electrical connector from switch, Fig. 12.

2. Remove hairpin clip, then slide switch, pushrod, nylon washer and bushings away from pedal.

3. Remove washer, then the switch by sliding switch up or down.

INSTALLATION

1. Position switch so that U-shaped side is nearest pedal and directly over or under pin.

2. Slide switch up or down, trapping vacuum booster input rod and bushing between switch side plates.

3. Push switch and push rod assembly toward brake pedal arm, then assemble plastic washer to pin and install hairpin clip to retain assembly.

4. Connect electrical connector to switch, then check for proper operation.

Customer Notification Letter

Attachment I - Admin. and Refund Information

Administrative Information

OASIS OASIS will not contain this Owner Notification Program. Verify through OASIS if a vehicle, involved in this program, has any other outstanding Recalls or Programs. Complete all uncompleted Recall and Program service actions during a single visit by the owner.

Promptly Perform Program On: Affected vehicles with the program condition which are brought to your dealership.

Dealership Responsibilities Promptly perform this program service, if required, on all eligible vehicles. Promptly report to the "Customer Assistance Centre" at Oakville any instance in which an owner will not allow you to complete this program because of objections in scheduling or for any other reason. Advise the Company of any vehicle's ownership status change (refer Warranty and Policy Manual - Section 3.3).

Reimbursement For Program Completion And Claims Preparation Instructions Claim reimbursement through the Direct Warranty Entry (DWE) system using the RECALLS screen only (PF3 Recall Entry/Retrieval on the DWE Menu Screen). If the claim number contains more than six digits, enter only the last six digits.

NOTE:

Claim Form 1864 is no longer mailed to owners. Use a Form 6125-2, an authorized computer generated claim form or a Form 1864 as an internal repair order to support DWE Entry through the RECALLS screen. Ensure that only the RECALLS screen is used when inputting completion and reimbursement information.

Dealers without DWE capability must mail a completed Form 1864 (Company Claim Copy No. 2) to Warranty Claims Processing at Oakville for reimbursement. Forms submitted must show labor times, all parts used and their costs, the parts handling allowance, and be imprinted, dated and signed by authorized dealership personnel. All claims must show 92M78 in the Recall box.

Refunds Refund requests must be submitted on a separate claim from the program completion claim. Refund requests are governed by the following guidelines:

^

Refunds are provided only for dealer and/or owner-paid repairs directly related to this program (DRL module replacement only - parts and labor) and performed within the program coverage provision. The original copy of the paid repair order or parts invoices must be presented to any Ford or Mercury dealership.

^ Using the DWE Recall Screen, enter the following:

Administrative Allowance ..... 0.3 Hrs. Labor Code.....A Recall Code.....R92M78 Enter "REFUND INV # _____ " in the area on the claim designated for PARTS USED. Enter the owner refund amount as a "MISCELLANEOUS" cost. ^

Provide prompt refund to all eligible owners having proper documentation regardless of the source of the original service.

^ Retain the copy of the paid repair or parts invoice with a copy of the refund request in your service file for reference.

^ Dealers without DWE capability must mail their refund requests on a separate completed Form 1864 with the owner's original paid repair order or parts purchase receipt to Warranty Claims Processing. Enter the 0.3 Hrs. in Box A and "R92M78" in the Recall box of the Form. Include all amounts in the TOTAL CLAIM box.

Attachment III - Tech. Instruct./Daytime Lamp Module Locations

Technical Instructions

Correction of wiring connections and/or replacement of burned out fuses and bulbs is not covered by this program.

Description of Daytime Running Light (DRL) System Operation

The DRL System is designed to turn the Hi beam headlights ON with a reduced light output, and without illuminating the high beam indicator lamp in the instrument panel when the following conditions are met: ^

The vehicle is running.

^ The parking brake is fully released.

^ The headlight switch is in OFF position.

NOTE:

If the vehicle is equipped with an automatic lighting system, the DRL System is active until the automatic system turns on the headlights.

DRL Module Removal and Installation Procedure (Refer to Daytime Running Light Module Location Table.) Refer to the Vehicle's 1990 or 1991 Shop Manual, Section 32 "Lighting System", for Removal and Installation instructions. Mutilate and scrap the removed DRL module.

NOTE:

For the 1989 Thunderbird and Cougar cars refer to the 1990 Model Year Shop Manual.

After Installing The Replacement DRL Module Verify DRL System Function As Follows Ensure the vehicle's road wheels are blocked to preclude inadvertent vehicle movement. ^

Manual transmission in NEUTRAL.

^ Automatic Transmission in PARK. (Neutral on Heavy Trucks with Allison automatic.)

1. Parking brake applied and headlight switch OFF, start engine.

^ The headlights (Hi or Lo beam) should not be illuminated.

2. Parking brake released and headlight switch OFF, engine running.

^ The high beams should be ON at reduced intensity.

NOTE:

A comparison check for full intensity can be made using flash-to-pass or by putting headlight switch ON and switching to high beams.

a. Turn on Park Lights.

The high beams should be ON at reduced intensity.

The high beam indicator should NOT be ON.

b. Turn on headlights (LOW BEAMS).

The low beams should be ON at full intensity. The high beams should be OFF. The high beam indicator should NOT be ON.

c. Turn on headlights (HIGH BEAMS).

The high beams should be ON at full intensity. The high beam indicator should be ON.

NOTE:

LL and LTL models use quad highlight systems and are not affected by this program.

Dealer Letter

To: All Ford of Canada Dealers

Attention: Dealer Principal, Service Manager, Parts Manager

Subject: Owner Notification Program 92M78 - Extended Coverage of Daytime Running Lights Module on Certain 1989-91 Vehicles

In OASIS NO

Listings NO

Return Removed Parts NO (Mutilate and Scrap). Program Coverage Available for 36 months or 60,000 kilometers, whichever occurs first, from original warranty start date or through July 31, 1992, whichever provides greatest coverage.

Refund Provisions YES

NOTE:

Please read and circulate this bulletin to your Service and Parts Personnel. They should become familiar with this program and be able to respond to owner inquiries.

Vehicles Affected

^ All 1989-90-91 Thunderbird and Cougar

^ All 1990 Escort

^ All 1990-91 Taurus, Sable, Tempo, Topaz, Mustang, Econoline, Aerostar, Bronco, F-Series Light Trucks, F-Super Duty, Ranger, Bronco II, Explorer and Medium/Heavy Trucks (except LL/LTL and CL with quad rectangular headlights)

Reason For This Program The Daytime Running Lights (DRL) control module may malfunction. A malfunctioning DRL module can result in Daytime Running Lights that dim, flicker or go off and in some instances may remain on after the ignition is turned OFF. Normal manual Lo and Hi beam headlight operation is not affected.

Service Action Replace the Daytime Running Light (DRL) module if the customer is experiencing any of the above described symptoms.

NOTE:

Replacement of headlight bulbs or sealed beams is not covered by this program.

Refunds If all or a portion of the repair covered by the program (DRL module replacement only - parts and labor) has been paid by the owner and/or the dealer, within program coverage provisions, both the owner and/or the dealer are eligible for a refund. Company Contacts: (Dealer use only)

Owner Letter

Mailing Date

Mr. John Sample 123 Main Street Anywhere, Prov. ANA NAN Ford Motor Company of Canada, Limited (Ford) is providing an Extended Coverage Program, number "92M78", for the Daytime

Running Lights (DRL) control module. This Program provides extended coverage to owners of certain 1989 through 1991 Model Year cars and trucks. Our records show you own the 19xx (vehicle) with the serial number shown above your name and address.

Reason For This Program And Program Period: Ford is extending the coverage for the Daytime Running Lights module in your vehicle.

This extended coverage will be provided for 3 years or 60,000 kilometers, whichever occurs first, from your vehicle's Original Warranty Start Date, or until July 31, 1992, whichever gives you the

greater coverage.

Description Of DRL System Operation: The DRL System is designed to turn the Hi beam headlights ON with a reduced light output. This is accomplished when the following conditions are met: ^

the vehicle is running.

^ the parking brake is fully released.

^ the headlight switch is in OFF position.

Symptoms Of Abnormal DRL System Operation: Symptoms associated with an improperly operating DRL module, normally include reduced, flickering or no DRL illumination. In some instances, the DRL may remain on when the ignition is turned OFF. Normal Lo and Hi beam headlight operation is not affected.

No Cost Service: Should you encounter symptoms such as described above, contact your Ford or Mercury dealer. Your dealer will replace the DRL control module on your vehicle under the terms of this program at no cost to you.

NOTE:

Headlight bulb or sealed beam replacement is not covered by this program.

How Long Will It Take? The time needed for this service is less than one hour. However, due to service scheduling times, your dealer may need your vehicle for one full working day.

Call Your Dealer: Call your dealer should your vehicle experience any of the above described conditions. Ask your dealer for a service appointment and if parts are in stock. Also ask your dealer to check the OASIS system for any other recalls or programs that may be required on your vehicle. If you have leased this vehicle to another person or organization, please immediately inform the lessee of the program. When you bring your vehicle in, show the dealer this letter. If you lose the letter your dealer will still do the work, free of charge.

Refunds: A full refund is available if you paid for the service covered by this Program (Daytime Running Light Control Module replacement only - parts and labor). Please give the original copy of your paid work-order or parts receipt to your dealer. Your dealer will arrange for the refund (which could take about one month).

Changed Name, Address, Or Sold The Vehicle? If you have changed your name or address, or have sold the vehicle, please fill out the enclosed prepaid postcard. Sign and date it, and mail the card to Ford. If you cannot get the service performed, contact the Ford "Customer Assistance Centre" at the address identified in the letterhead of this letter. Please identify your vehicle's serial number in any correspondence. We are taking this action as part of our efforts to ensure your long term satisfaction with the DRL feature in your vehicle. We hope this program will confirm your continued satisfaction with your Ford built vehicle.

Technical Instructions

Owner Letter

Mailing Date

Mr. John Sample 123 Main Street Anywhere, Prov. ANA NAN Ford Motor Company of Canada, Limited (Ford) is providing an Extended Coverage Program, number "92M78", for the Daytime

Running Lights (DRL) control module. This Program provides extended coverage to owners of certain 1989 through 1991 Model Year cars and trucks. Our records show you own the 19xx (vehicle) with the serial number shown above your name and address.

Reason For This Program And Program Period: Ford is extending the coverage for the Daytime Running Lights module in your vehicle.

This extended coverage will be provided for 3 years or 60,000 kilometers, whichever occurs first, from your vehicle's Original Warranty Start Date, or until July 31, 1992, whichever gives you the

greater coverage.

Description Of DRL System Operation: The DRL System is designed to turn the Hi beam headlights ON with a reduced light output. This is accomplished when the following conditions are met: ^

the vehicle is running.

^ the parking brake is fully released.

^ the headlight switch is in OFF position.

Symptoms Of Abnormal DRL System Operation: Symptoms associated with an improperly operating DRL module, normally include reduced, flickering or no DRL illumination. In some instances, the DRL may remain on when the ignition is turned OFF. Normal Lo and Hi beam headlight operation is not affected.

No Cost Service: Should you encounter symptoms such as described above, contact your Ford or Mercury dealer. Your dealer will replace the DRL control module on your vehicle under the terms of this program at no cost to you.

NOTE:

Headlight bulb or sealed beam replacement is not covered by this program.

How Long Will It Take? The time needed for this service is less than one hour. However, due to service scheduling times, your dealer may need your vehicle for one full working day.

Call Your Dealer: Call your dealer should your vehicle experience any of the above described conditions. Ask your dealer for a service appointment and if parts are in stock. Also ask your dealer to check the OASIS system for any other recalls or programs that may be required on your vehicle. If you have leased this vehicle to another person or organization, please immediately inform the lessee of the program. When you bring your vehicle in, show the dealer this letter. If you lose the letter your dealer will still do the work, free of charge.

Refunds: A full refund is available if you paid for the service covered by this Program (Daytime Running Light Control Module replacement only - parts and labor). Please give the original copy of your paid work-order or parts receipt to your dealer. Your dealer will arrange for the refund (which could take about one month).

Changed Name, Address, Or Sold The Vehicle? If you have changed your name or address, or have sold the vehicle, please fill out the enclosed prepaid postcard. Sign and date it, and mail the card to Ford. If you cannot get the service performed, contact the Ford "Customer Assistance Centre" at the address identified in the letterhead of this letter. Please identify your vehicle's serial number in any correspondence. We are taking this action as part of our efforts to ensure your long term satisfaction with the DRL feature in your vehicle. We hope this program will confirm your continued satisfaction with your Ford built vehicle.

Turn/Stop/Hazard Lamps

Hazard Warning Switch: Service and Repair

REMOVAL

1. Disconnect battery ground cable.

2. On models with tilt steering, remove tilt lever, then the steering column collar by pressing on collar from top and bottom while removing.

3. On all models, remove lower dash panel trim cover, then the column shroud retaining screws from bottom of column shroud.

4. Remove bottom half of shroud by pulling shroud down and toward rear of vehicle. Move shift lever as required to ease shroud removal on models with automatic transmission.

5. Lift top half of shroud from column.

6. Remove two switch attaching screws, then disconnect switch from casting.

7. Disconnect three electrical connectors, using care not to damage locking tabs. Use care not to damage selector indicator cable on models with automatic transmission.

INSTALLATION

1. Install three electrical connectors, ensuring they are fully engaged. Wiring for switch is routed under selector indicator cable on models with automatic transmission.

2. Align switch mounting holes with holes in steering column casting, then install screws and torque to 18-27 inch lbs.

3.

On models with automatic transmission, verify that selector indicator is adjusted properly.

4.

On all models, position top half of steering column shroud onto column so that screw moldings on shroud seat in mounting bores in column. Place shift lever in lowest position to aid assembly on vehicles with automatic transmission.

5. Install bottom half of shroud by sliding guides in bottom half of shroud into tabs in top half.

6. Install shroud retaining screws and torque to 18.5-25.6 inch lbs.

7. On models with tilt steering, install steering column collar by pressing on top and bottom while installing on column.

8. Install tilt lever and torque to 2.2-3.6 ft. lbs.

9. On all models, install lower dash panel trim cover, then connect battery ground cable.

10. Check multi-function switch and steering column for proper operation.

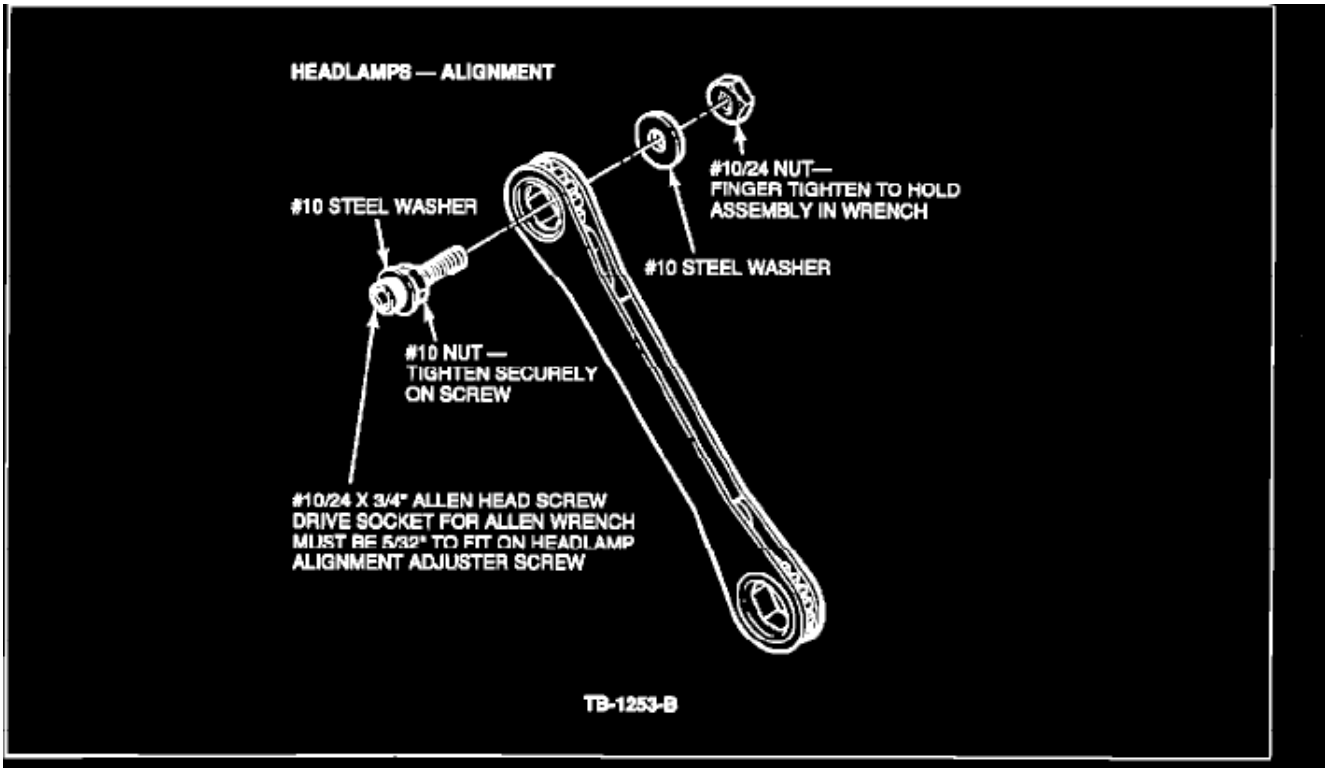

Figure 1

Headlamp Adjusting Screw: Technical Service Bulletins Headlamp - Horizontal Adjuster Difficult Access

Article No. 93-4-9

February 17, 1993

LAMP - HEADLAMP - HORIZONTAL ADJUSTER DIFFICULT TO ACCESS

LIGHT TRUCK: 1989-90 BRONCO II 1989-93 RANGER 1991-93 EXPLORER

This TSB article is being republished to include 1989-1993 Rangers and 1991-1993 Explorers.

ISSUE: The headlamp horizontal adjuster can be difficult to access because the clearance between the sheet metal and the adjuster is not large enough to allow the use of a regular socket and ratchet.

ACTION:

Assemble a headlamp horizontal adjuster specialized tool from locally obtained parts, Figure 1, to make headlamp adjustments easier. Use this tool with a ratcheting box wrench.

Headlamp Dimmer Switch: Service and Repair

REMOVAL

1. Disconnect battery ground cable.

2. On models with tilt steering, remove tilt lever, then the steering column collar by pressing on collar from top and bottom while removing.

3. On all models, remove lower dash panel trim cover, then the column shroud retaining screws from bottom of column shroud.

4. Remove bottom half of shroud by pulling shroud down and toward rear of vehicle. Move shift lever as required to ease shroud removal on models with automatic transmission.

5. Lift top half of shroud from column.

6. Remove two switch attaching screws, then disconnect switch from casting.

7. Disconnect three electrical connectors, using care not to damage locking tabs. Use care not to damage selector indicator cable on models with automatic transmission.

INSTALLATION

1. Install three electrical connectors, ensuring they are fully engaged. Wiring for switch is routed under selector indicator cable on models with automatic transmission.

2. Align switch mounting holes with holes in steering column casting, then install screws and torque to 18-27 inch lbs.

3.

On models with automatic transmission, verify that selector indicator is adjusted properly.

4.

On all models, position top half of steering column shroud onto column so that screw moldings on shroud seat in mounting bores in column. Place shift lever in lowest position to aid assembly on vehicles with automatic transmission.

5. Install bottom half of shroud by sliding guides in bottom half of shroud into tabs in top half.

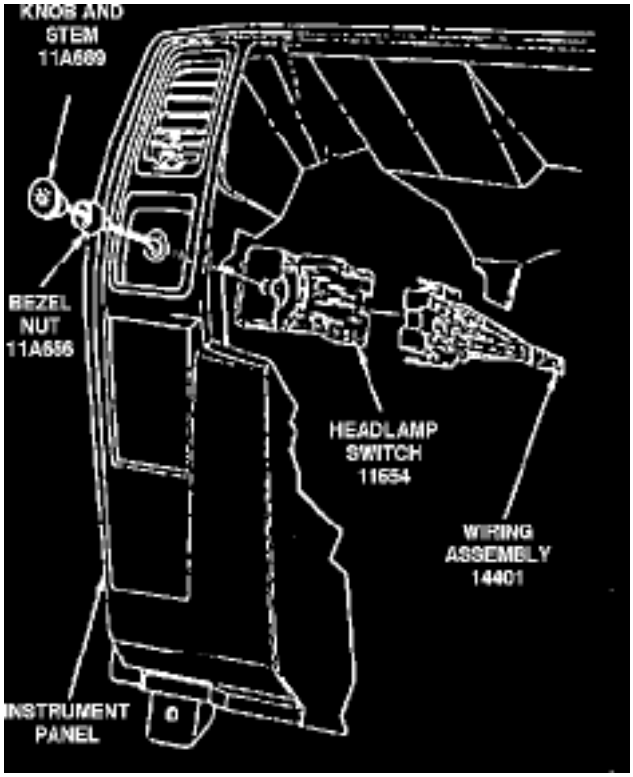
6. Install shroud retaining screws and torque to 18.5-25.6 inch lbs.

7. On models with tilt steering, install steering column collar by pressing on top and bottom while installing on column.

8. Install tilt lever and torque to 2.2-3.6 ft. lbs.

9. On all models, install lower dash panel trim cover, then connect battery ground cable.

10. Check multi-function switch and steering column for proper operation.



Headlamp Switch: Service and Repair

Fig. 11 Headlamp Switch Replacement.

1. Disconnect battery ground cable, remove ash tray assembly and two finish panel retaining screws, then the finish panel (snaps off).

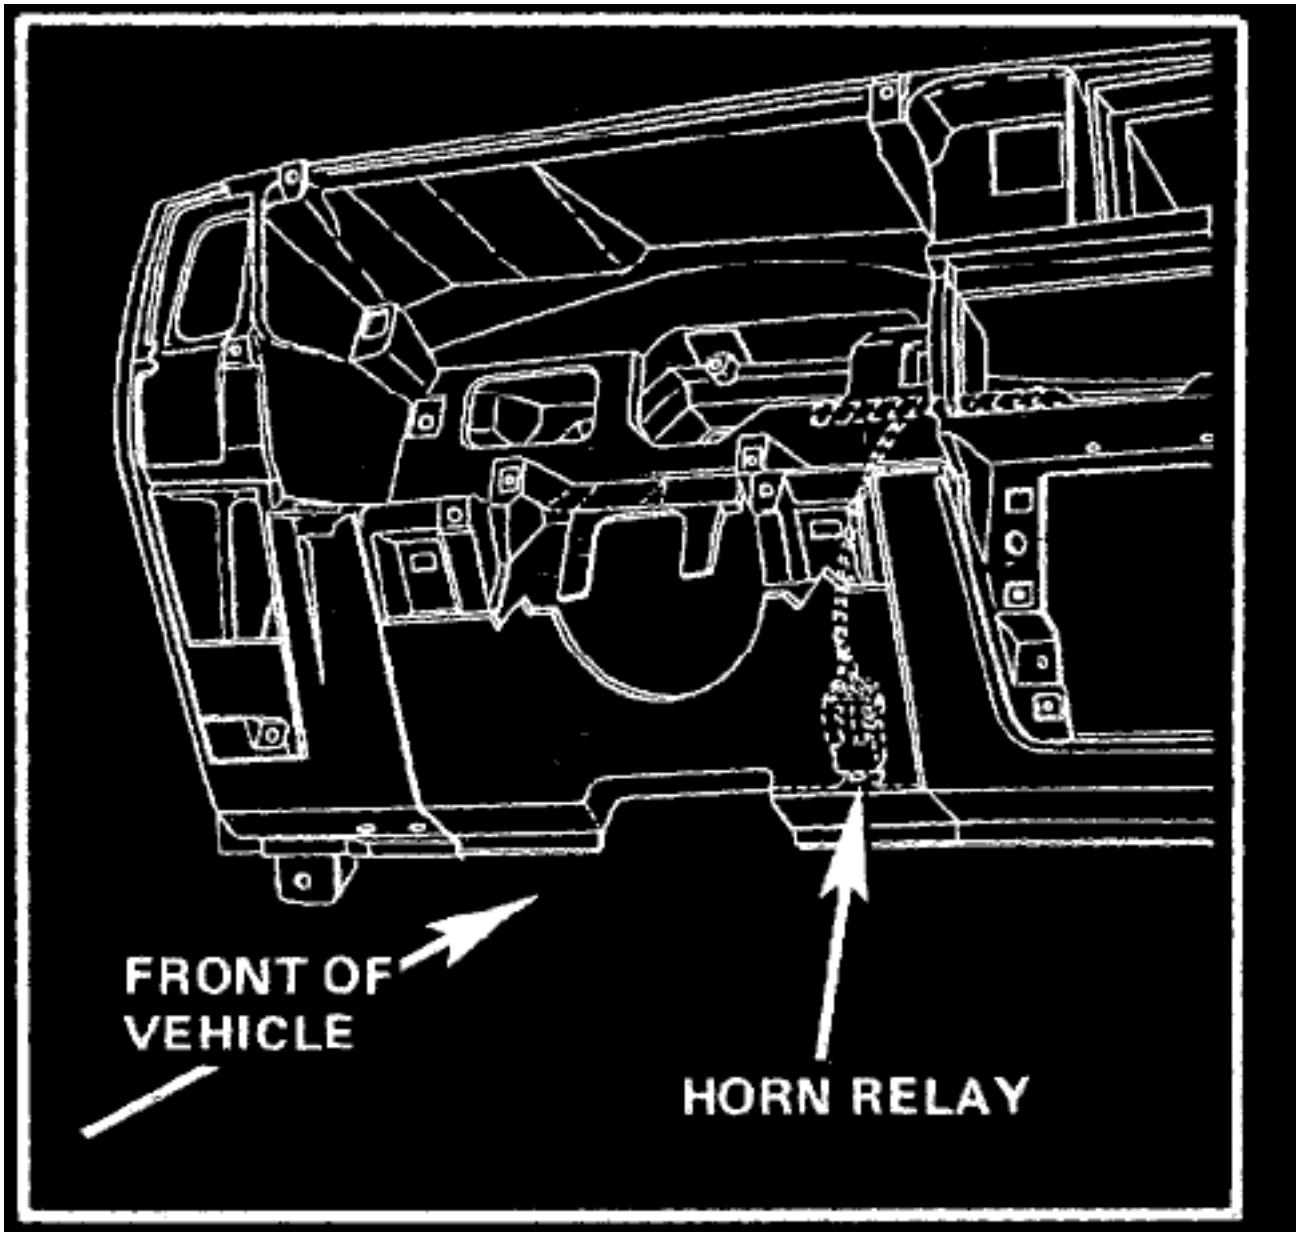
2. On Bronco II or Explorer models, remove rear window wash/wipe and heated backlit switch assembly (snaps out).

3. On Ranger models, remove storage bin (snaps out).

4. On all models, pull headlamp switch knob to ON position, then depress shaft release button on switch and remove knob and shaft assembly, Fig. 11.

5. Remove bezel nut, pull switch down through opening, disconnect electrical connector, then remove switch.

6. Reverse procedure to install.



Horn Relay: Locations

The horn relay is located behind the lower left side of the instrument panel, to the right of the steering column. It is attached to the speed control amplifier bracket. Vehicles not equipped with speed control do not use a horn relay.

Horn Relay: Testing and Inspection

Connectors should remain connected during following test.

1. Measure voltage between circuit 460 (yellow/light blue) and ground. If 12 volts are not indicated, check fuse F20A and repair or replace as required.

2. If circuit 460 (yellow/light blue) is as indicated, depress horn switch. Voltage at circuit 460 (horn relay terminal No. 4) should drop to about zero volts and horn should sound. If horn does not sound and circuit 460 remains at 12 volts, proceed to step 3.

3. Check for 12 volts at circuit 6 (yellow/light green) at horn relay terminals No. 2, if voltage is not present, replace relay, then repeat step 2.

4. If 12 volts are indicated at horn relay terminal No. 2, connect terminal No. 2 to ground. If horn sounds replace horn pad or buttons. If horn does not sound, check for 12 volts at circuit 1 (dark blue) at horn relay terminal No. 3 with terminal No. 2 grounded. If voltage is not indicated, replace relay and repeat step 2. If voltage is indicated, check horn connectors and function.

Attachment I - Admin. and Refund Information

Administrative Information

OASIS OASIS will not contain this Owner Notification Program. Verify through OASIS if a vehicle, involved in this program, has any other outstanding Recalls or Programs. Complete all uncompleted Recall and Program service actions during a single visit by the owner.

Promptly Perform Program On: Affected vehicles with the program condition which are brought to your dealership.

Dealership Responsibilities Promptly perform this program service, if required, on all eligible vehicles. Promptly report to the "Customer Assistance Centre" at Oakville any instance in which an owner will not allow you to complete this program because of objections in scheduling or for any other reason. Advise the Company of any vehicle's ownership status change (refer Warranty and Policy Manual - Section 3.3).

Reimbursement For Program Completion And Claims Preparation Instructions Claim reimbursement through the Direct Warranty Entry (DWE) system using the RECALLS screen only (PF3 Recall Entry/Retrieval on the DWE Menu Screen). If the claim number contains more than six digits, enter only the last six digits.

NOTE:

Claim Form 1864 is no longer mailed to owners. Use a Form 6125-2, an authorized computer generated claim form or a Form 1864 as an internal repair order to support DWE Entry through the RECALLS screen. Ensure that only the RECALLS screen is used when inputting completion and reimbursement information.

Dealers without DWE capability must mail a completed Form 1864 (Company Claim Copy No. 2) to Warranty Claims Processing at Oakville for reimbursement. Forms submitted must show labor times, all parts used and their costs, the parts handling allowance, and be imprinted, dated and signed by authorized dealership personnel. All claims must show 92M78 in the Recall box.

Refunds Refund requests must be submitted on a separate claim from the program completion claim. Refund requests are governed by the following guidelines:

^

Refunds are provided only for dealer and/or owner-paid repairs directly related to this program (DRL module replacement only - parts and labor) and performed within the program coverage provision. The original copy of the paid repair order or parts invoices must be presented to any Ford or Mercury dealership.

^ Using the DWE Recall Screen, enter the following:

Administrative Allowance ..... 0.3 Hrs. Labor Code.....A Recall Code.....R92M78 Enter "REFUND INV # _____ " in the area on the claim designated for PARTS USED. Enter the owner refund amount as a "MISCELLANEOUS" cost. ^

Provide prompt refund to all eligible owners having proper documentation regardless of the source of the original service.

^ Retain the copy of the paid repair or parts invoice with a copy of the refund request in your service file for reference.

^ Dealers without DWE capability must mail their refund requests on a separate completed Form 1864 with the owner's original paid repair order or parts purchase receipt to Warranty Claims Processing. Enter the 0.3 Hrs. in Box A and "R92M78" in the Recall box of the Form. Include all amounts in the TOTAL CLAIM box.

Attachment II - Labor and Parts Information

Labour Allowance Replace DRL Module (Includes Verification of DRL System Function).

Attachment III - Tech. Instruct./Daytime Lamp Module Locations

Technical Instructions

Correction of wiring connections and/or replacement of burned out fuses and bulbs is not covered by this program.

Description of Daytime Running Light (DRL) System Operation

The DRL System is designed to turn the Hi beam headlights ON with a reduced light output, and without illuminating the high beam indicator lamp in the instrument panel when the following conditions are met: ^

The vehicle is running.

^ The parking brake is fully released.

^ The headlight switch is in OFF position.

NOTE:

If the vehicle is equipped with an automatic lighting system, the DRL System is active until the automatic system turns on the headlights.

DRL Module Removal and Installation Procedure (Refer to Daytime Running Light Module Location Table.) Refer to the Vehicle's 1990 or 1991 Shop Manual, Section 32 "Lighting System", for Removal and Installation instructions. Mutilate and scrap the removed DRL module.

NOTE:

For the 1989 Thunderbird and Cougar cars refer to the 1990 Model Year Shop Manual.

After Installing The Replacement DRL Module Verify DRL System Function As Follows Ensure the vehicle's road wheels are blocked to preclude inadvertent vehicle movement. ^

Manual transmission in NEUTRAL.

^ Automatic Transmission in PARK. (Neutral on Heavy Trucks with Allison automatic.)

1. Parking brake applied and headlight switch OFF, start engine.

^ The headlights (Hi or Lo beam) should not be illuminated.

2. Parking brake released and headlight switch OFF, engine running.

^ The high beams should be ON at reduced intensity.

NOTE:

A comparison check for full intensity can be made using flash-to-pass or by putting headlight switch ON and switching to high beams.

a. Turn on Park Lights.

The high beams should be ON at reduced intensity.

The high beam indicator should NOT be ON.

b. Turn on headlights (LOW BEAMS).

The low beams should be ON at full intensity. The high beams should be OFF. The high beam indicator should NOT be ON.

c. Turn on headlights (HIGH BEAMS).

The high beams should be ON at full intensity. The high beam indicator should be ON.

NOTE:

LL and LTL models use quad highlight systems and are not affected by this program.

Daytime Running Light Module Locations

Thunderbird/Cougar In front of driver's side radiator support, vertically mounted behind bumper.

1990-1991 MODEL YEAR LOCATION

Thunderbird/Cougar In front of driver's side radiator support, vertically mounted behind bumper.

Tempo/Topaz Inside on the RH side radiator support, vertically mounted below radiator cap.

Ford Mustang Under the LH front fender apron, directly below the battery.

Taurus/Sable On the LH front fender apron, directly under the battery. (Remove LH side fender liner for access.)

Ford Escort (1190 MY Only) On the RH side of the radiator support.

Ranger/Bronco II/Explorer Inside on the LH side radiator support, at top near washer fluid reservoir.

F-Series Light Truck/Super Duty/Bronco Inside the LH radiator support below the horn assembly.

Aerostar Inside the LH front fender apron, behind the battery.

Econoline Inside the LH radiator support.

1990/91 MEDIUM/HEAVY TRUCK SERIES LOCATION

"F" (Cab and Cowl) Behind RH side instrument panel.

"C" Behind RH side instrument panel.

"CL" (Single Headlights) Behind instrument panel RH side.

"CF" (Cargo) Under hood beside windshield washer bottle.

"L" Inside engine compartment left side bulkhead.

NOTE:

LL and LTL models use quad highlight systems and are not affected by this program.

Dealer Letter

To: All Ford of Canada Dealers

Attention: Dealer Principal, Service Manager, Parts Manager

Subject: Owner Notification Program 92M78 - Extended Coverage of Daytime Running Lights Module on Certain 1989-91 Vehicles

In OASIS NO

Listings NO

Return Removed Parts NO (Mutilate and Scrap). Program Coverage Available for 36 months or 60,000 kilometers, whichever occurs first, from original warranty start date or through July 31, 1992, whichever provides greatest coverage.

Refund Provisions YES

NOTE:

Please read and circulate this bulletin to your Service and Parts Personnel. They should become familiar with this program and be able to respond to owner inquiries.

Vehicles Affected

^ All 1989-90-91 Thunderbird and Cougar

^ All 1990 Escort

^ All 1990-91 Taurus, Sable, Tempo, Topaz, Mustang, Econoline, Aerostar, Bronco, F-Series Light Trucks, F-Super Duty, Ranger, Bronco II, Explorer and Medium/Heavy Trucks (except LL/LTL and CL with quad rectangular headlights)

Reason For This Program The Daytime Running Lights (DRL) control module may malfunction. A malfunctioning DRL module can result in Daytime Running Lights that dim, flicker or go off and in some instances may remain on after the ignition is turned OFF. Normal manual Lo and Hi beam headlight operation is not affected.

Service Action Replace the Daytime Running Light (DRL) module if the customer is experiencing any of the above described symptoms.

NOTE:

Replacement of headlight bulbs or sealed beams is not covered by this program.

Refunds If all or a portion of the repair covered by the program (DRL module replacement only - parts and labor) has been paid by the owner and/or the dealer, within program coverage provisions, both the owner and/or the dealer are eligible for a refund. Company Contacts: (Dealer use only)

Technical Instructions

Owner Letter

Mailing Date

Mr. John Sample 123 Main Street Anywhere, Prov. ANA NAN Ford Motor Company of Canada, Limited (Ford) is providing an Extended Coverage Program, number "92M78", for the Daytime

Running Lights (DRL) control module. This Program provides extended coverage to owners of certain 1989 through 1991 Model Year cars and trucks. Our records show you own the 19xx (vehicle) with the serial number shown above your name and address.

Reason For This Program And Program Period: Ford is extending the coverage for the Daytime Running Lights module in your vehicle.

This extended coverage will be provided for 3 years or 60,000 kilometers, whichever occurs first, from your vehicle's Original Warranty Start Date, or until July 31, 1992, whichever gives you the

greater coverage.

Description Of DRL System Operation: The DRL System is designed to turn the Hi beam headlights ON with a reduced light output. This is accomplished when the following conditions are met: ^

the vehicle is running.

^ the parking brake is fully released.

^ the headlight switch is in OFF position.

Symptoms Of Abnormal DRL System Operation: Symptoms associated with an improperly operating DRL module, normally include reduced, flickering or no DRL illumination. In some instances, the DRL may remain on when the ignition is turned OFF. Normal Lo and Hi beam headlight operation is not affected.

No Cost Service: Should you encounter symptoms such as described above, contact your Ford or Mercury dealer. Your dealer will replace the DRL control module on your vehicle under the terms of this program at no cost to you.

NOTE:

Headlight bulb or sealed beam replacement is not covered by this program.

How Long Will It Take? The time needed for this service is less than one hour. However, due to service scheduling times, your dealer may need your vehicle for one full working day.

Call Your Dealer: Call your dealer should your vehicle experience any of the above described conditions. Ask your dealer for a service appointment and if parts are in stock. Also ask your dealer to check the OASIS system for any other recalls or programs that may be required on your vehicle. If you have leased this vehicle to another person or organization, please immediately inform the lessee of the program. When you bring your vehicle in, show the dealer this letter. If you lose the letter your dealer will still do the work, free of charge.

Refunds: A full refund is available if you paid for the service covered by this Program (Daytime Running Light Control Module replacement only - parts and labor). Please give the original copy of your paid work-order or parts receipt to your dealer. Your dealer will arrange for the refund (which could take about one month).

Changed Name, Address, Or Sold The Vehicle? If you have changed your name or address, or have sold the vehicle, please fill out the enclosed prepaid postcard. Sign and date it, and mail the card to Ford. If you cannot get the service performed, contact the Ford "Customer Assistance Centre" at the address identified in the letterhead of this letter. Please identify your vehicle's serial number in any correspondence. We are taking this action as part of our efforts to ensure your long term satisfaction with the DRL feature in your vehicle. We hope this program will confirm your continued satisfaction with your Ford built vehicle.

Administrative Information

OASIS OASIS will not contain this Owner Notification Program. Verify through OASIS if a vehicle, involved in this program, has any other outstanding Recalls or Programs. Complete all uncompleted Recall and Program service actions during a single visit by the owner.

Promptly Perform Program On: Affected vehicles with the program condition which are brought to your dealership.

Dealership Responsibilities Promptly perform this program service, if required, on all eligible vehicles. Promptly report to the "Customer Assistance Centre" at Oakville any instance in which an owner will not allow you to complete this program because of objections in scheduling or for any other reason. Advise the Company of any vehicle's ownership status change (refer Warranty and Policy Manual - Section 3.3).

Reimbursement For Program Completion And Claims Preparation Instructions Claim reimbursement through the Direct Warranty Entry (DWE) system using the RECALLS screen only (PF3 Recall Entry/Retrieval on the DWE Menu Screen). If the claim number contains more than six digits, enter only the last six digits.

NOTE:

Claim Form 1864 is no longer mailed to owners. Use a Form 6125-2, an authorized computer generated claim form or a Form 1864 as an internal repair order to support DWE Entry through the RECALLS screen. Ensure that only the RECALLS screen is used when inputting completion and reimbursement information.

Dealers without DWE capability must mail a completed Form 1864 (Company Claim Copy No. 2) to Warranty Claims Processing at Oakville for reimbursement. Forms submitted must show labor times, all parts used and their costs, the parts handling allowance, and be imprinted, dated and signed by authorized dealership personnel. All claims must show 92M78 in the Recall box.

Refunds Refund requests must be submitted on a separate claim from the program completion claim. Refund requests are governed by the following guidelines:

^

Refunds are provided only for dealer and/or owner-paid repairs directly related to this program (DRL module replacement only - parts and labor) and performed within the program coverage provision. The original copy of the paid repair order or parts invoices must be presented to any Ford or Mercury dealership.

^ Using the DWE Recall Screen, enter the following:

Administrative Allowance ..... 0.3 Hrs. Labor Code.....A Recall Code.....R92M78 Enter "REFUND INV # _____ " in the area on the claim designated for PARTS USED. Enter the owner refund amount as a "MISCELLANEOUS" cost. ^

Provide prompt refund to all eligible owners having proper documentation regardless of the source of the original service.

^ Retain the copy of the paid repair or parts invoice with a copy of the refund request in your service file for reference.

^ Dealers without DWE capability must mail their refund requests on a separate completed Form 1864 with the owner's original paid repair order or parts purchase receipt to Warranty Claims Processing. Enter the 0.3 Hrs. in Box A and "R92M78" in the Recall box of the Form. Include all amounts in the TOTAL CLAIM box.

Mr. John Sample 123 Main Street Anywhere, Prov. ANA NAN Ford Motor Company of Canada, Limited (Ford) is providing an Extended Coverage Program, number "92M78", for the Daytime

Running Lights (DRL) control module. This Program provides extended coverage to owners of certain 1989 through 1991 Model Year cars and trucks. Our records show you own the 19xx (vehicle) with the serial number shown above your name and address.

Reason For This Program And Program Period: Ford is extending the coverage for the Daytime Running Lights module in your vehicle.

This extended coverage will be provided for 3 years or 60,000 kilometers, whichever occurs first, from your vehicle's Original Warranty Start Date, or until July 31, 1992, whichever gives you the

greater coverage.

Description Of DRL System Operation: The DRL System is designed to turn the Hi beam headlights ON with a reduced light output. This is accomplished when the following conditions are met: ^

the vehicle is running.

^ the parking brake is fully released.

^ the headlight switch is in OFF position.

Symptoms Of Abnormal DRL System Operation: Symptoms associated with an improperly operating DRL module, normally include reduced, flickering or no DRL illumination. In some instances, the DRL may remain on when the ignition is turned OFF. Normal Lo and Hi beam headlight operation is not affected.

No Cost Service: Should you encounter symptoms such as described above, contact your Ford or Mercury dealer. Your dealer will replace the DRL control module on your vehicle under the terms of this program at no cost to you.

NOTE:

Headlight bulb or sealed beam replacement is not covered by this program.

How Long Will It Take? The time needed for this service is less than one hour. However, due to service scheduling times, your dealer may need your vehicle for one full working day.

Call Your Dealer: Call your dealer should your vehicle experience any of the above described conditions. Ask your dealer for a service appointment and if parts are in stock. Also ask your dealer to check the OASIS system for any other recalls or programs that may be required on your vehicle. If you have leased this vehicle to another person or organization, please immediately inform the lessee of the program. When you bring your vehicle in, show the dealer this letter. If you lose the letter your dealer will still do the work, free of charge.

Refunds: A full refund is available if you paid for the service covered by this Program (Daytime Running Light Control Module replacement only - parts and labor). Please give the original copy of your paid work-order or parts receipt to your dealer. Your dealer will arrange for the refund (which could take about one month).

Changed Name, Address, Or Sold The Vehicle? If you have changed your name or address, or have sold the vehicle, please fill out the enclosed prepaid postcard. Sign and date it, and mail the card to Ford. If you cannot get the service performed, contact the Ford "Customer Assistance Centre" at the address identified in the letterhead of this letter. Please identify your vehicle's serial number in any correspondence. We are taking this action as part of our efforts to ensure your long term satisfaction with the DRL feature in your vehicle. We hope this program will confirm your continued satisfaction with your Ford built vehicle.

Horn Relay: Locations

The horn relay is located behind the lower left side of the instrument panel, to the right of the steering column. It is attached to the speed control amplifier bracket. Vehicles not equipped with speed control do not use a horn relay.

Horn Relay: Testing and Inspection

Connectors should remain connected during following test.

1. Measure voltage between circuit 460 (yellow/light blue) and ground. If 12 volts are not indicated, check fuse F20A and repair or replace as required.

2. If circuit 460 (yellow/light blue) is as indicated, depress horn switch. Voltage at circuit 460 (horn relay terminal No. 4) should drop to about zero volts and horn should sound. If horn does not sound and circuit 460 remains at 12 volts, proceed to step 3.

3. Check for 12 volts at circuit 6 (yellow/light green) at horn relay terminals No. 2, if voltage is not present, replace relay, then repeat step 2.

4. If 12 volts are indicated at horn relay terminal No. 2, connect terminal No. 2 to ground. If horn sounds replace horn pad or buttons. If horn does not sound, check for 12 volts at circuit 1 (dark blue) at horn relay terminal No. 3 with terminal No. 2 grounded. If voltage is not indicated, replace relay and repeat step 2. If voltage is indicated, check horn connectors and function.

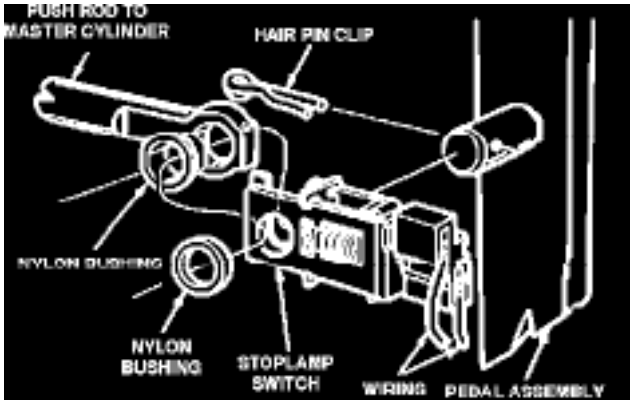
Brake And Clutch Switches

Brake Light Switch: Description and Operation

The Brake On Off (BOO) signal is sent by the brake switch when the brakes are APPLIED. The Engine Control Assembly (ECA) uses this signal to modify the operation of the torque converter clutch (if equipped), A/C compressor (if equipped), and idle speed during periods of decel and idle with the brakes APPLIED.



Brake Light Switch: Service and Repair

Fig. 12 Stop Light Switch Replacement

REMOVAL

1. Disconnect electrical connector from switch, Fig. 12.

2. Remove hairpin clip, then slide switch, pushrod, nylon washer and bushings away from pedal.

3. Remove washer, then the switch by sliding switch up or down.

INSTALLATION

1. Position switch so that U-shaped side is nearest pedal and directly over or under pin.

2. Slide switch up or down, trapping vacuum booster input rod and bushing between switch side plates.

3. Push switch and push rod assembly toward brake pedal arm, then assemble plastic washer to pin and install hairpin clip to retain assembly.

4. Connect electrical connector to switch, then check for proper operation.

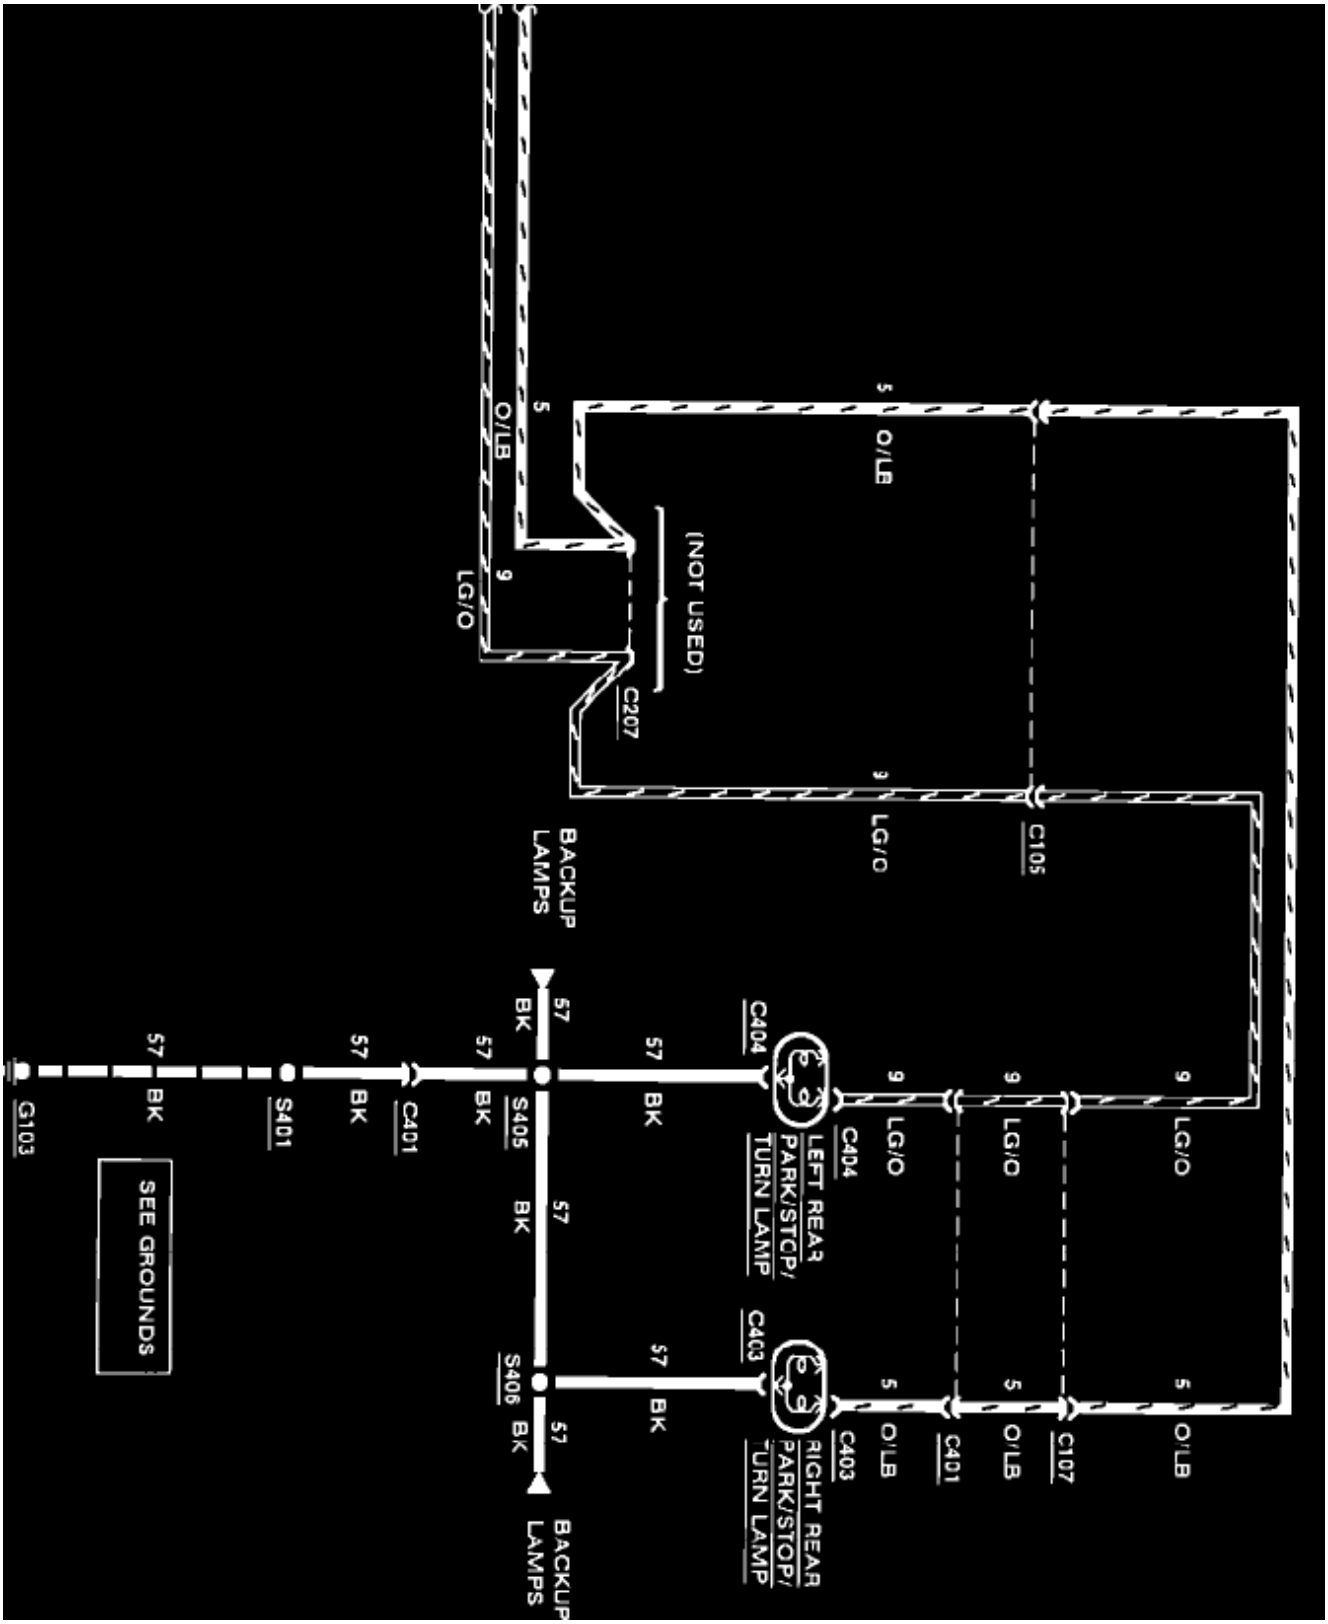
Turn/Stop/Hazard Lamps



Turn/Stop/Hazard Lamps

Hazard Warning Switch: Service and Repair

REMOVAL

1. Disconnect battery ground cable.

2. On models with tilt steering, remove tilt lever, then the steering column collar by pressing on collar from top and bottom while removing.

3. On all models, remove lower dash panel trim cover, then the column shroud retaining screws from bottom of column shroud.

4. Remove bottom half of shroud by pulling shroud down and toward rear of vehicle. Move shift lever as required to ease shroud removal on models with automatic transmission.

5. Lift top half of shroud from column.

6. Remove two switch attaching screws, then disconnect switch from casting.

7. Disconnect three electrical connectors, using care not to damage locking tabs. Use care not to damage selector indicator cable on models with automatic transmission.

INSTALLATION

1. Install three electrical connectors, ensuring they are fully engaged. Wiring for switch is routed under selector indicator cable on models with automatic transmission.

2. Align switch mounting holes with holes in steering column casting, then install screws and torque to 18-27 inch lbs.

3.

On models with automatic transmission, verify that selector indicator is adjusted properly.

4.

On all models, position top half of steering column shroud onto column so that screw moldings on shroud seat in mounting bores in column. Place shift lever in lowest position to aid assembly on vehicles with automatic transmission.

5. Install bottom half of shroud by sliding guides in bottom half of shroud into tabs in top half.

6. Install shroud retaining screws and torque to 18.5-25.6 inch lbs.

7. On models with tilt steering, install steering column collar by pressing on top and bottom while installing on column.

8. Install tilt lever and torque to 2.2-3.6 ft. lbs.

9. On all models, install lower dash panel trim cover, then connect battery ground cable.

10. Check multi-function switch and steering column for proper operation.

1. Install three electrical connectors, ensuring they are fully engaged. Wiring for switch is routed under selector indicator cable on models with automatic transmission.

2. Align switch mounting holes with holes in steering column casting, then install screws and torque to 18-27 inch lbs.

3.

On models with automatic transmission, verify that selector indicator is adjusted properly.

4.

On all models, position top half of steering column shroud onto column so that screw moldings on shroud seat in mounting bores in column. Place shift lever in lowest position to aid assembly on vehicles with automatic transmission.

5. Install bottom half of shroud by sliding guides in bottom half of shroud into tabs in top half.

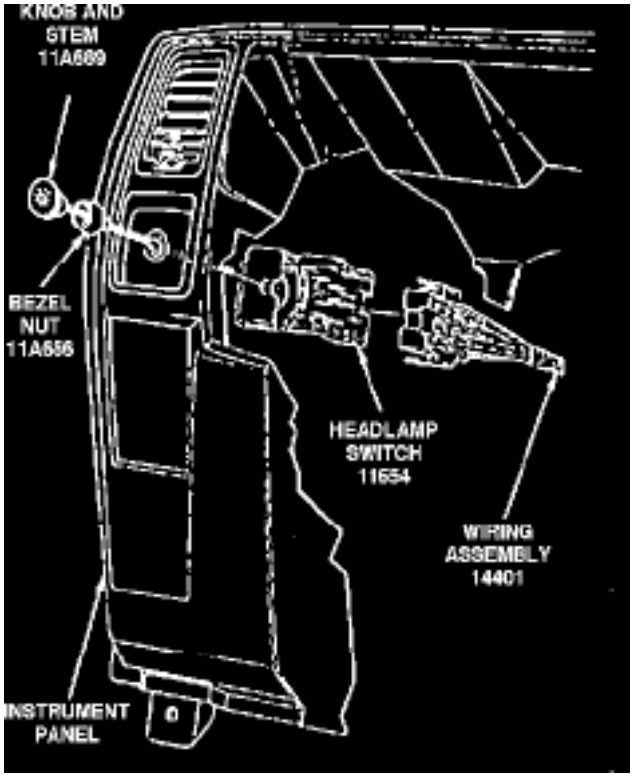
6. Install shroud retaining screws and torque to 18.5-25.6 inch lbs.

7. On models with tilt steering, install steering column collar by pressing on top and bottom while installing on column.

8. Install tilt lever and torque to 2.2-3.6 ft. lbs.

9. On all models, install lower dash panel trim cover, then connect battery ground cable.

10. Check multi-function switch and steering column for proper operation.



Headlamp Switch: Service and Repair

Fig. 11 Headlamp Switch Replacement.

1. Disconnect battery ground cable, remove ash tray assembly and two finish panel retaining screws, then the finish panel (snaps off).

2. On Bronco II or Explorer models, remove rear window wash/wipe and heated backlit switch assembly (snaps out).

3. On Ranger models, remove storage bin (snaps out).

4. On all models, pull headlamp switch knob to ON position, then depress shaft release button on switch and remove knob and shaft assembly, Fig. 11.

5. Remove bezel nut, pull switch down through opening, disconnect electrical connector, then remove switch.

6. Reverse procedure to install.

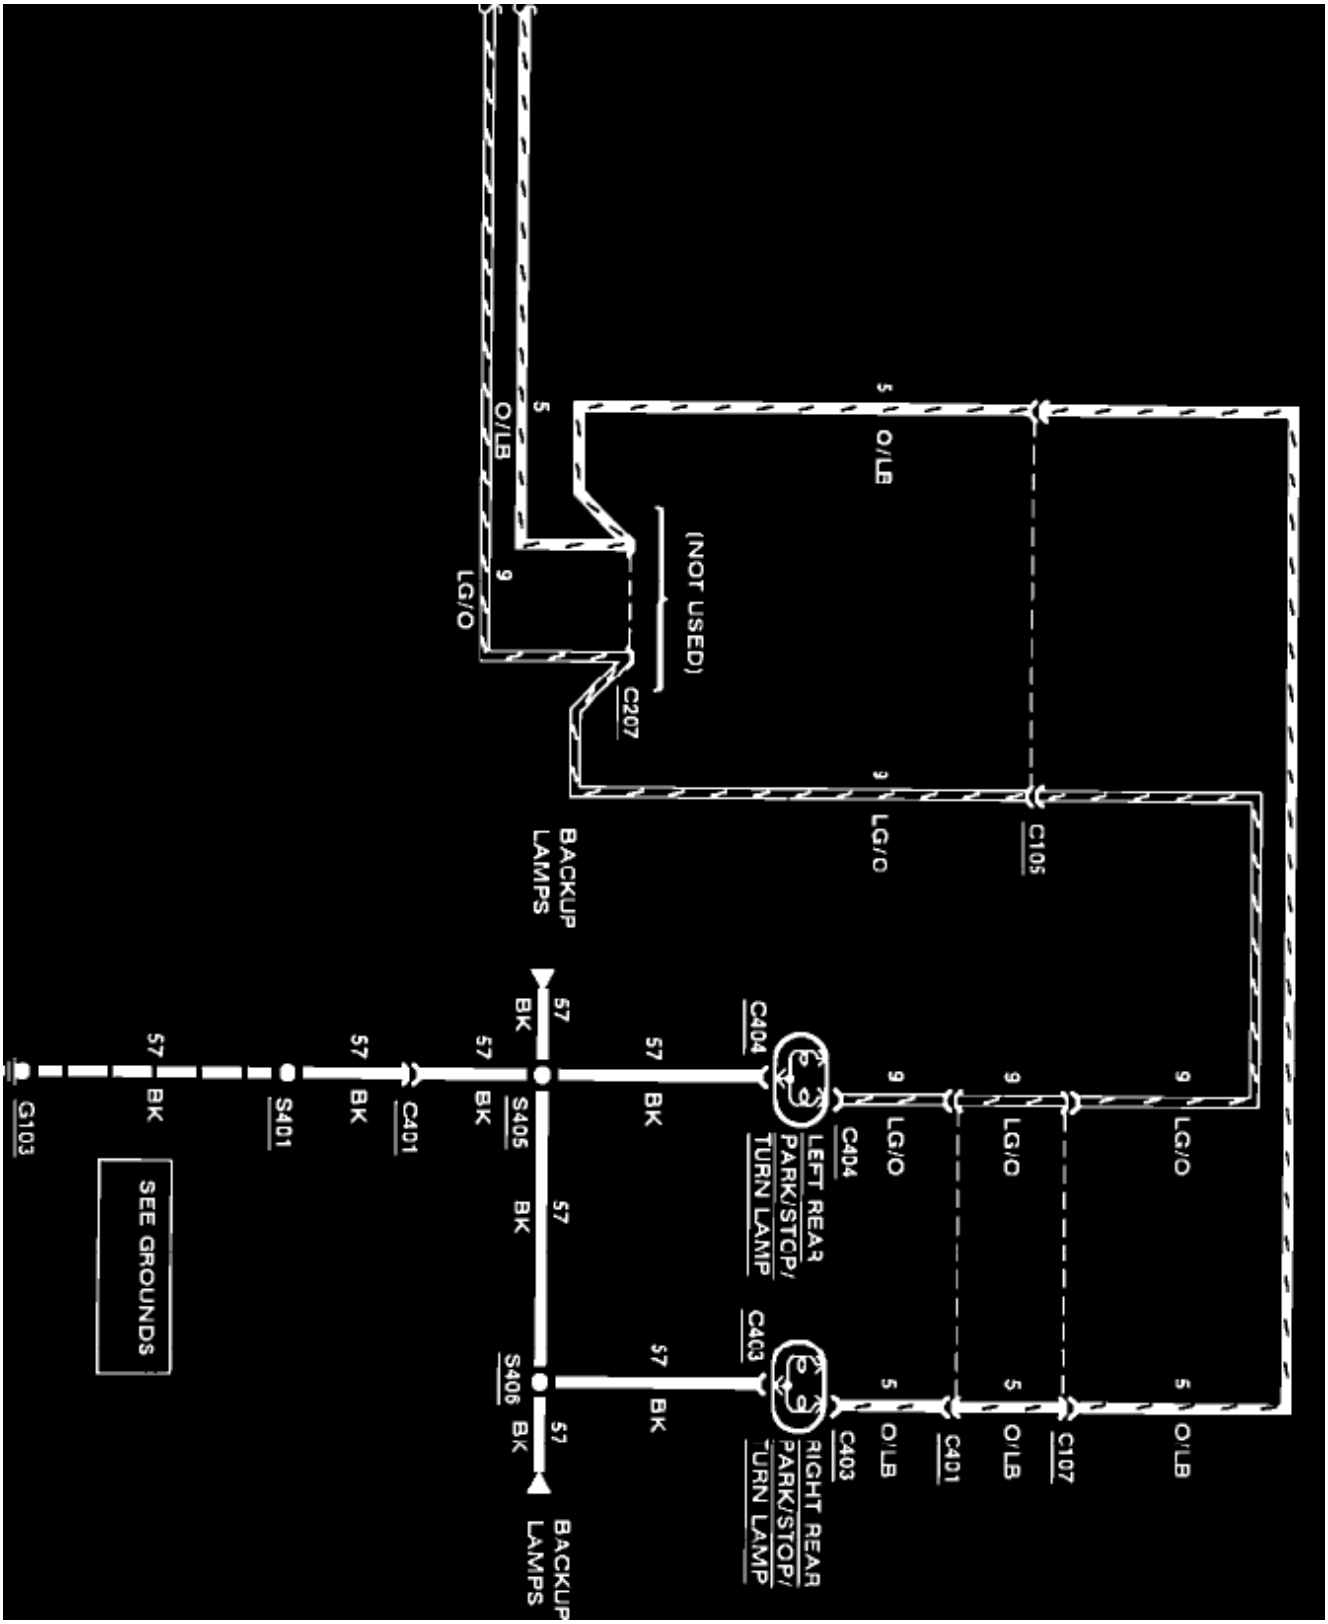
Turn Signal Switch: Electrical Diagrams

Turn/Stop/Hazard Lamps



Turn/Stop/Hazard Lamps

Turn Signal Switch: Service and Repair

REMOVAL

1. Disconnect battery ground cable.

2. On models with tilt steering, remove tilt lever, then the steering column collar by pressing on collar from top and bottom while removing.

3. On all models, remove lower dash panel trim cover, then the column shroud retaining screws from bottom of column shroud.

4. Remove bottom half of shroud by pulling shroud down and toward rear of vehicle. Move shift lever as required to ease shroud removal on models with automatic transmission.

5. Lift top half of shroud from column.

6. Remove two switch attaching screws, then disconnect switch from casting.

7. Disconnect three electrical connectors, using care not to damage locking tabs. Use care not to damage selector indicator cable on models with automatic transmission.

INSTALLATION

1. Install three electrical connectors, ensuring they are fully engaged. Wiring for switch is routed under selector indicator cable on models with automatic transmission.

2. Align switch mounting holes with holes in steering column casting, then install screws and torque to 18-27 inch lbs.

3.

On models with automatic transmission, verify that selector indicator is adjusted properly.

4.

On all models, position top half of steering column shroud onto column so that screw moldings on shroud seat in mounting bores in column. Place shift lever in lowest position to aid assembly on vehicles with automatic transmission.

5. Install bottom half of shroud by sliding guides in bottom half of shroud into tabs in top half.

6. Install shroud retaining screws and torque to 18.5-25.6 inch lbs.

7. On models with tilt steering, install steering column collar by pressing on top and bottom while installing on column.

8. Install tilt lever and torque to 2.2-3.6 ft. lbs.

9. On all models, install lower dash panel trim cover, then connect battery ground cable.

10. Check multi-function switch and steering column for proper operation.

ELECTRICAL - REVISED MECHANICAL HOOD LAMP SWITCH TO REPLACE OLD STYLE MERCURY HOOD LAMP SWITCH

FORD: 1987-1995 TAURUS 1988-1991 CROWN VICTORIA 1989 THUNDERBIRD 1989-1996 MUSTANG 1994-1996 THUNDERBIRD 1990 BRONCO II 1990-1996 RANGER 1991-1996 BRONCO 1994-2001 EXPLORER 1997-2001 F-150 2000-2001 EXCURSION 2002 EXPEDITION

LINCOLN: 1989-1994 CONTINENTAL 1990-1992 MARK VII 1990-1996 TOWN CAR 1993-1995 MARK VIII 2002 NAVIGATOR

MERCURY: 1987-1995 SABLE 1988-1991 GRAND MARQUIS 1989 COUGAR 1994-1996 COUGAR 1997-2001 MOUNTAINEER

ISSUE

This article is to provide information on replacement hood lamp switches. The 27 degree Mercury style hood switches will no longer be available. Replacement 27 degree Mechanical switches will be available as a service replacement.

ACTION

For vehicles requiring hood lamp switch replacement, replace the 27 degree Mercury switch with new 27 degree Mechanical switch. Replace hood lamp switch per the appropriate model year Workshop Manual as needed.

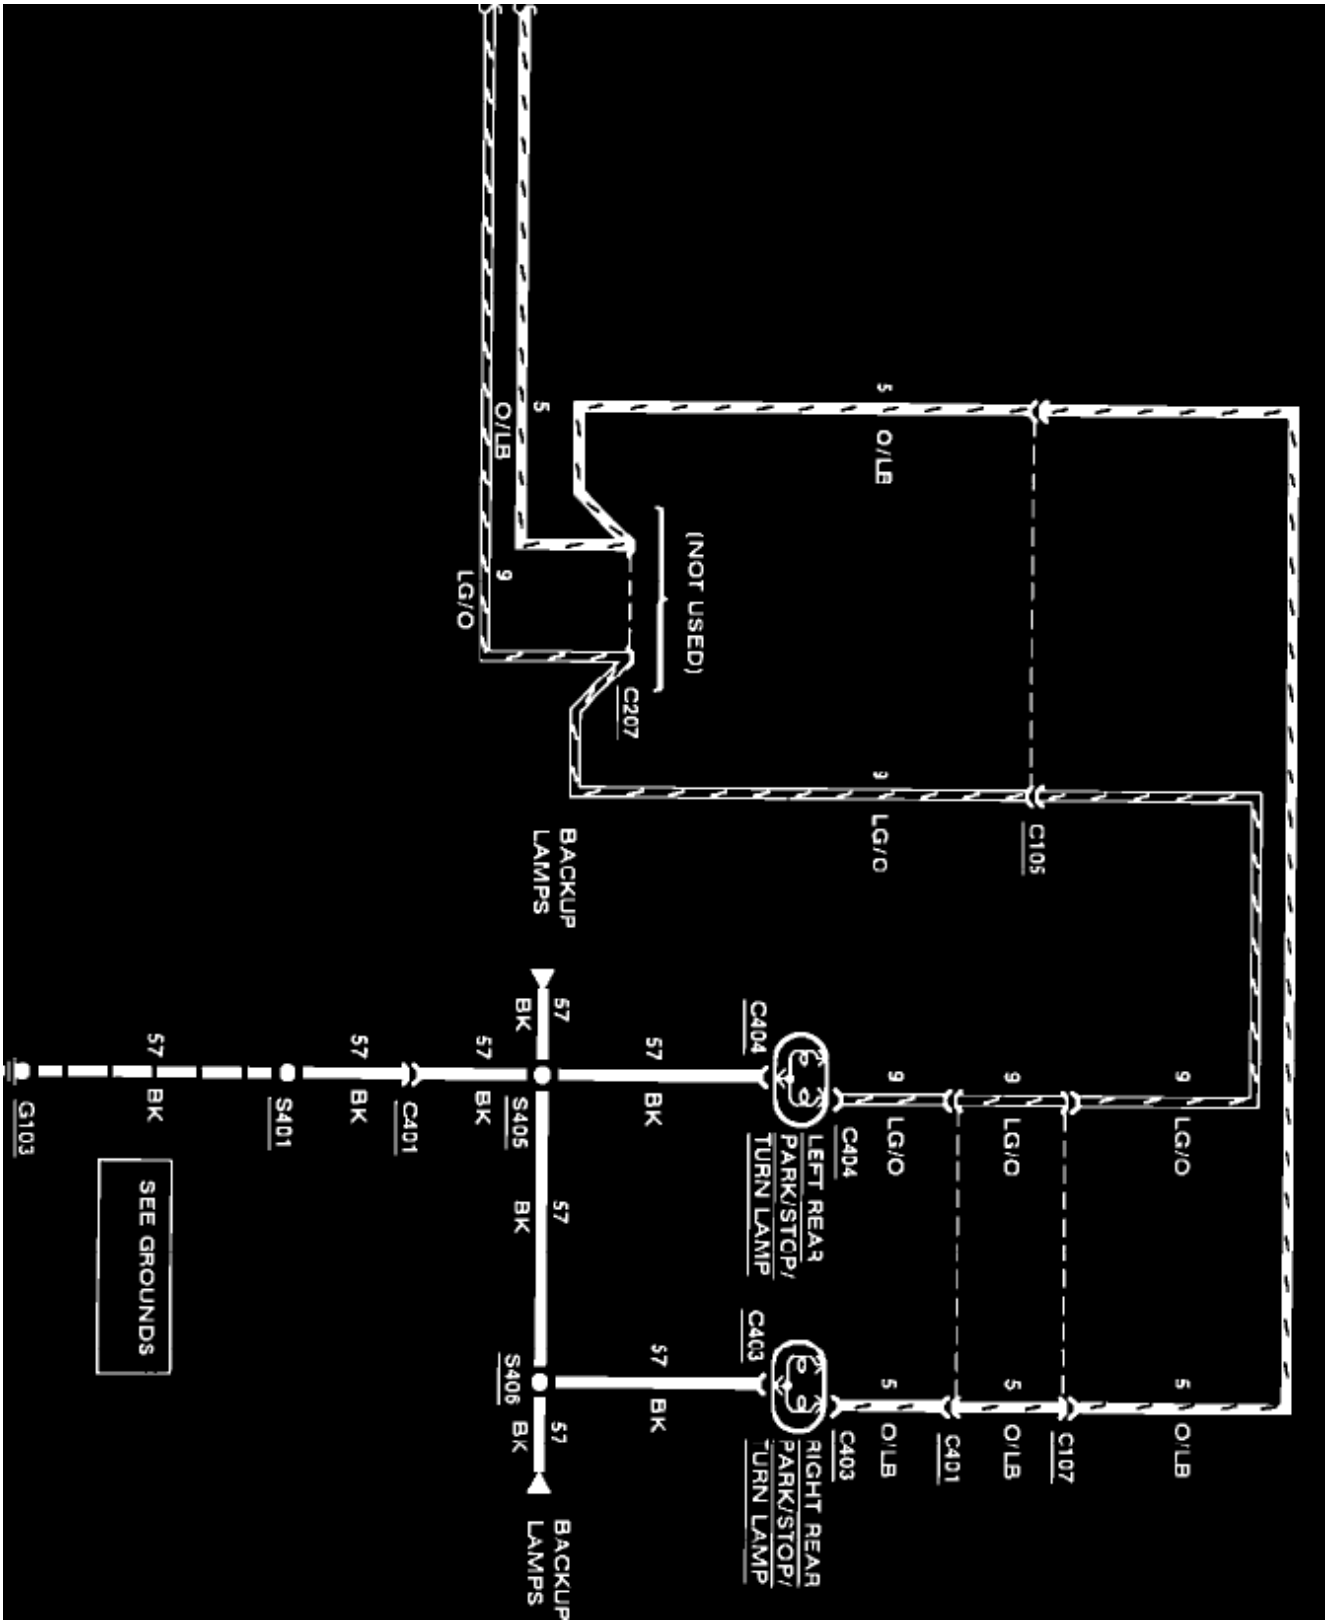
Turn Signal Switch: Electrical Diagrams

Turn/Stop/Hazard Lamps



Turn/Stop/Hazard Lamps

Turn Signal Switch: Service and Repair

REMOVAL

1. Disconnect battery ground cable.

2. On models with tilt steering, remove tilt lever, then the steering column collar by pressing on collar from top and bottom while removing.

3. On all models, remove lower dash panel trim cover, then the column shroud retaining screws from bottom of column shroud.

4. Remove bottom half of shroud by pulling shroud down and toward rear of vehicle. Move shift lever as required to ease shroud removal on models with automatic transmission.

5. Lift top half of shroud from column.

6. Remove two switch attaching screws, then disconnect switch from casting.

7. Disconnect three electrical connectors, using care not to damage locking tabs. Use care not to damage selector indicator cable on models with automatic transmission.

INSTALLATION

1. Install three electrical connectors, ensuring they are fully engaged. Wiring for switch is routed under selector indicator cable on models with automatic transmission.

2. Align switch mounting holes with holes in steering column casting, then install screws and torque to 18-27 inch lbs.

3.

On models with automatic transmission, verify that selector indicator is adjusted properly.

4.

On all models, position top half of steering column shroud onto column so that screw moldings on shroud seat in mounting bores in column. Place shift lever in lowest position to aid assembly on vehicles with automatic transmission.

5. Install bottom half of shroud by sliding guides in bottom half of shroud into tabs in top half.

6. Install shroud retaining screws and torque to 18.5-25.6 inch lbs.

7. On models with tilt steering, install steering column collar by pressing on top and bottom while installing on column.

8. Install tilt lever and torque to 2.2-3.6 ft. lbs.

9. On all models, install lower dash panel trim cover, then connect battery ground cable.

10. Check multi-function switch and steering column for proper operation.

Power Window Motor: Service and Repair

Removal

1. Disconnect battery ground cable.

NOTE: On vehicles equipped with EEC, when the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the EEC processor relearns its adaptive strategy. The vehicle may need to be driven 10 miles or more to relearn the strategy.

2. Remove door trim panel and watershield. See: Body and Frame/Doors, Hood and Trunk/Doors

3. Disconnect power window motor wire from wire harness connector.

4. Remove motor and regulator assembly.

5. Remove motor and drive from regulator (three retaining screws).

Installation

1. Install new motor and drive assembly to regulator. Tighten motor retaining screws to 5.6-9.6 N-m (50-84 in-lb).

2. Install motor and regulator assembly in door.

3. Connect power window motor wiring, and battery ground cable.

4. Check window operation.

5. Make sure door drain holes are open.

6. Install watershield and trim panel. See: Body and Frame/Doors, Hood and Trunk/Doors

This TSB article is being republished in its entirety to update the model years.

ISSUE: Customers with concerns of glass fogging (film) and with the chemicals that cause this fog can be advised that Ford Motor Company has extensively tested this material and found that it is not a health hazard. The film is caused by some of the chemicals used during the manufacture of the interior trim.

ACTION: At the present time, there is no known field fix to prevent the window fogging, however, glass cleaner such as Ford Glass Cleaner (E4AZ-19C507-AA) has been found to be the best for film removal.

Window Glass: Technical Service Bulletins Glass - Iridescence or Mottling In Tempered Glass

Article No. 93-21-1

10/13/93

GLASS - "IRIDESCENCE" OR "MOTTLING" IN TEMPERED GLASS

FORD: 1984-94 CROWN VICTORIA, ESCORT, MUSTANG, TEMPO, THUNDERBIRD 1986-88 EXP 1986-94 TAURUS 1989-93 FESTIVA

LINCOLN-MERCURY: 1984-86 CAPRI 1984-87 LYNX 1984-92 MARK VII 1984-94 COUGAR, GRAND MARQUIS, TOPAZ, TOWN CAR 1986-94 SABLE 1988-89 TRACER 1988-94 CONTINENTAL 1991-94 CAPRI, TRACER 1993-94 MARK VIII

LIGHT TRUCK: 1984-90 BRONCO II 1984-94 ECONOLINE, F-150-350 SERIES, RANGER 1986-94 AEROSTAR 1991-94 EXPLORER 1993-94 VILLAGER

ISSUE: Vehicles may exhibit iridescent spots or "mottling" in tempered glass under some lighting conditions. This condition is caused by the tempering process.

ACTION: Explain to customers that "iridescence" or "mottling" of tempered glass is a normal condition and that glass replacement is neither warranted nor necessarily effective in resolving the condition.

DESCRIPTION OF CONDITION

The somewhat iridescent grayish or blueish and fairly geometric spots detected in side and rear window tempered glass are characteristic of tempered glass.

The mottled appearance is noted only under certain conditions of lighting. The occurrence of mottling does not affect glass quality or durability and cannot be reduced by scouring the glass surface.

The boldness of the mottled pattern in a given glass may vary, depending upon lighting conditions, but may appear intensified if viewed through polarized sunglasses.

CAUSES OF CONDITION

Atmospheric dust and other angular reflections can cause changes in the polarized properties of natural light. This polarization, combined with the light polarizing properties imparted to tempered glass by the forces of tension and compression (during the tempering process), cause the iridescent or mottled appearance.

These are the same forces of compression and tension which make tempered glass so remarkably strong. Windshields, which are annealed rather than tempered, do not exhibit iridescence.

Window Regulator: Technical Service Bulletins Power Window Regulator - Counterbalance Spring

Article No. 91-19-5 09/18/91

WINDOW - POWER - REGULATOR COUNTERBALANCE SPRING - REMOVAL AND INSTALLATION PROCEDURES - (FRONT DOORS ONLY ON LIGHT TRUCKS)

FORD: 1983-85 EXP 1983-90 ESCORT 1983-91 CROWN VICTORIA, MUSTANG, THUNDERBIRD 1984-91 TEMPO 1986-91 TAURUS

LINCOLN-MERCURY: 1983 LN7 1983-86 CAPRI 1983-87 LYNX 1983-91 COUGAR, GRAND MARQUIS, TOWN CAR 1984-91 TOPAZ 1986-91 SABLE

LIGHT TRUCK: 1990-91 RANGER 1991 EXPLORER

ISSUE: A removal and installation procedure has been developed for replacing the power window regulator counterbalance spring. This procedure is not published in the Car or Light Truck Shop Manuals.

ACTION: If service is required, use the following removal and installation procedure to replace the power window regulator counterbalance spring.

REMOVAL

WARNING: COUNTERBALANCE SPRINGS IMPROPERLY REMOVED CAN CAUSE INJURY. BE SURE TO USE THE FOLLOWING PROCEDURE TO MINIMIZE THE RISK.

1. Remove the regulator assembly from the door per the appropriate service manual instructions.

2. Place the regulator in the full-up position, if possible, to partially relieve the spring load.

3. Clamp the regulator so that no rotational movement is possible.

4. Note position of spring center bar relative to slotted pivot pin for reassembly later.

WARNING: THE COUNTERBALANCE SPRING IS PRE-TORQUED, CAREFUL HANDLING IS REQUIRED TO MINIMIZE RISK OF PERSONAL INJURY.

5. Using "Vicegrips" (or an equivalent tool) proceed as follows:

a. Grip the counterbalance spring hook at the retaining pin.

b. Carefully lift high enough to clear the pin.

c. Allow the spring to unwind to a free position, about 1/3 to 1/2 turn.

6. Remove the motor from the mounting plate. Regulator can now be discarded.

INSTALLATION

1. Place the regulator in the full-up position to ease assembly.

2. Reattach the motor to the mounting plate and clamp the regulator so that no rotational movement is allowed.

3. Place the spring center bar on the slotted pivot pin as noted in Step 4 of the removal procedure.

4. With "Vicegrips" (or an equivalent tool) on the spring hook, carefully wind the spring to the retainer pin. Make sure that the spring is properly seated below the pin shoulder.

WARNING: THE SPRING MAY CAUSE INJURY IF NOT PROPERLY SEATED BELOW THE SHOULDER ON THE RETAINING PIN BECAUSE THE SPRING COULD SLIP OFF THE PIN.

5. Cycle the regulator making sure the spring coils constrict as the window glass travels down. This insures that the coil is in the proper position.

6. Replace the regulator in the door per the Shop Manual instructions.

URETHANE MOUNTED GLASS MATERIAL

USAGE PROCEDURE

REMOVAL

1. If necessary, remove the windshield wiper mounting arm, pivot shafts and leaf screen along cowl. Remove the inside rear view mirror, all windshield garnish mouldings, A-pillar mouldings and lower headliner.

2. Use Rotunda Interior Cut-Out Knife (164-R2450 or 164-R2451) or equivalent to cut urethane. Refer to the manufacturer's instructions when using tool.

CAUTION:

USE CARE WHEN CUTTING THROUGH SEAL TO AVOID DAMAGE TO THE INSTRUMENT PANEL, REAR PACKAGE TRAY, HEADLINER OR INTERIOR TRIM.

3. Remove glass from vehicle using a suitable glass removal tool.

INSTALLATION

1. Trim the urethane left on the flange with a utility knife or razor blade until the surface is smooth and free of cuts. Even up the urethane remaining on the pinch weld so it is all at the same level (approximately 1/16" or 1.6 mm).

2. Apply Essex Urethane Pinchweld Primer U-413 to any sheet metal that has been exposed along the pinch weld. Let dry for a minimum of 6-10 minutes before proceeding. Do not apply primer to existing urethane bead.

3. Properly align glass to body. Place the glass in the opening and center it from top to bottom and side to side with about equal clearance on all sides. Using masking tape or crayon, make alignment points on each of the four (4) sides of the glass and body.

4. Remove the windshield from the vehicle and place it inside up, on a low stable work surface.

5. Clean the glass with a non-alcohol based glass cleaner such as Essex Glass And Surface Cleaner GC-800.

6. Install rear view mirror bracket. Refer to the appropriate Service Manual for installation details.

7. Apply two (2) coats of Urethane Glass Prep U-401 to inner edge of the windshield. Wipe off material immediately after each application.

NOTE:

WIPE OFF URETHANE GLASS PREP U-401 IMMEDIATELY AFTER EACH APPLICATION.

8. Apply Essex Primer U-402 to the same glass area as U-401. Allow to dry 5 minutes.

9. Install foam dam tape on pinch weld, if required.

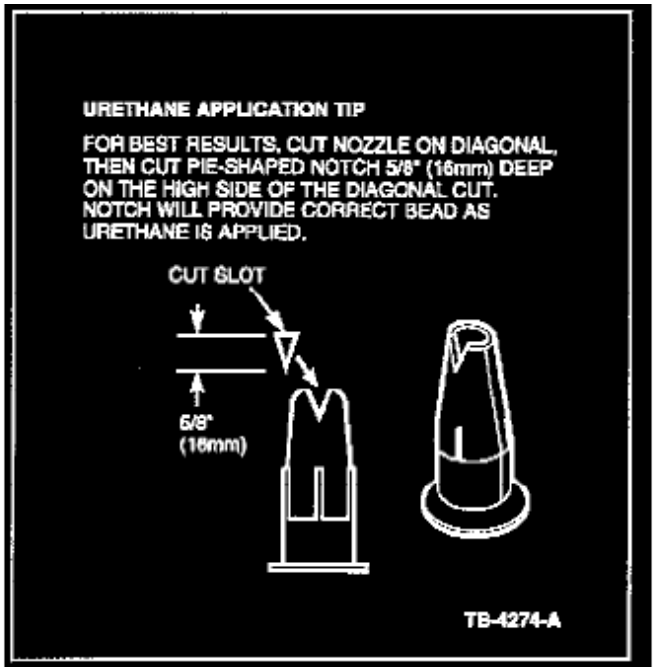

Figure 1

ESSEX URETHANE GLASS INSTALLATION PRODUCTS			
Product	**Package Size**	**Essex Part Number**	**Shelf Life**
Essex Urethane Glass Prep	4 Fl. Oz.	U-401	6 Months
Essex Urethane Glass Primer	4 Fl. Oz.	U-402	6 Months
Essex Urethane Pinch Weld Primer	4 Fl. Oz.	U-413	6 Months
Essex Urethane Auto Glass Adhesive	10.5 Oz.	U-400HV	9 Months
Norton Foam Dam Tape	20' Roll	NFD-3229	
Essex Glass And Surface Cleaner	22 Oz.	GC-800	

10. Cut the nozzle of the Essex Urethane Auto Glass Adhesive U-4OOHV (Figure 1) and apply a triangular bead of urethane 5/8" (16 mm) by 3/8" (9 mm) wide around the perimeter of the pinch weld.

11. Install the glass into the opening taking care to align the marks previously designated. Press glass into place until full contact is made with urethane adhesive. Glass must be installed before urethane skins over.

NOTE:

BEFORE INSTALLING GLASS, OPEN THE WINDOWS TO PREVENT THE GLASS FROM BEING PUSHED OUT BY AIR PRESSURE IF A DOOR IS CLOSED.

12. If necessary, reinstall all mouldings and trim previously removed.

CAUTION:

WHEN REPLACING URETHANE INSTALLED GLASS, THE VEHICLE SHOULD NOT BE DRIVEN UNTIL THE URETHANE HAS CURED. THIS WILL PREVENT THE GLASS FROM BEING JARRED OUT OF POSITION AND HELP ENSURE APPROPRIATE WINDSHIELD RETENTION TO MEET SAFETY AND STRUCTURAL REQUIREMENTS.

NOTE:

USE ONLY URETHANE FOR SERVICE OF AIR AND WATER LEAKS ON URETHANE INSTALLED GLASS.

These products are required for urethane mounted glass replacement:

To locate the nearest distributor of Essex glass replacement products, contact the following locations:

Wiper Switch: Testing and Inspection

Fig. 5 Wiper Switch Continuity Test. 1988 Bronco II & Ranger

Fig. 6 Wiper Switch Continuity Test. Except 88 Bronco II & Ranger

1. Check continuity between switch terminals, Figs 5 and 6.

2. To detect marginal operation of switch, move switch lever while each reading is being taken.

3. If switch does not show continuity or if poor continuity exists at any switch position, replace switch.

Wiper Switch: Service and Repair Rear Wiper Switch

1. Disconnect battery ground cable, then remove ashtray and instrument cluster trim panel.

2. Remove switch mounting bezel containing switches, then disconnect switch electrical connector and remove switch.

3. Reverse procedure to install, checking wiper operation.

Wiper Switch: Service and Repair Windshield Wiper Switch

REMOVAL

1. Disconnect battery ground cable (two ground cables on diesel engines).

2. On models with tilt steering, remove upper extension shroud by squeezing at six and twelve o'clock positions and popping free of retaining plate at three o'clock position.

3. On all models, remove steering column shroud halves.

4. Remove turn signal switch lever by grasping and using a twisting and pulling motion while pulling lever straight out from switch.

5. Peel back foam shield from switch, then disconnect electrical connectors.

6. Remove two switch attaching screws, then the switch.

INSTALLATION

1. Align switch mounting holes with holes in lock cylinder housing, then install screws and torque to 18-26 inch lbs.

2. Adhere foam shield to switch, then install switch lever by aligning key on lever with keyway in switch and pushing lever in until fully engaged.

3. Connect electrical connectors, then install steering column shroud halves.

4. On models with tilt steering, install upper extension shroud.

5.

On all models, connect battery ground cable.

Wiper Control Module: Locations

I/P Components

Behind Center Of I/P, LH Side Of Ashtray Assembly

Wiper Gear Box: Service and Repair

REMOVAL

1. Cycle windshield wipers until they are in straight up position, then turn ignition switch to Off position.

2. Disconnect battery ground cable (two ground cables on diesel engines), then the wiper motor electrical connector.

3. Remove righthand wiper arm and blade assembly, then the righthand pivot nut and allow linkage to drop into cowl.

4. Remove linkage access cover from righthand side of dash panel.

5. Release wiper motor retaining clip, then slide clip back until it clears nib on crank pin, and remove the clip. The wiper motor retaining clip can be reached through the access cover opening.

6. Remove wiper linkage from motor crank pin.

7. Slide righthand pivot shaft and linkage assembly out through right hand access cover opening.

8. Remove lefthand wiper arm and blade assembly.

9. Remove lefthand linkage access cover and pivot nut, then lower linkage and slide out through access cover opening. Lefthand and righthand pivot and linkage assemblies are serviced separately.

INSTALLATION

1. Install clip onto lefthand linkage, ensuring clip is fully seated. Do not install linkage on motor crank pin, then attempt to install clip.

2. Slide lefthand pivot shaft and linkage assembly through lefthand access opening, positioning pivot shaft in place.

3. Install lefthand pivot shaft nut and torque to 88-110 ft. lbs.

4. Install lefthand linkage cover.

5. Slide righthand pivot shaft and linkage assembly through righthand access opening, positioning pivot shaft in place.

6. Connect wiper motor electrical connector, then install clip onto righthand linkage, ensuring clip is fully seated. Do not install linkage on motor crank pin, then attempt to install clip.

7. Install lefthand linkage onto motor crank pin, then the righthand linkage onto crank pin, pulling linkage onto pin until it snaps into place. Clip is properly installed if nib is protruding through center of clip.

8. Install righthand wiper pivot shaft and nut and torque to 84-110 inch lbs.

9. Connect battery ground cable (two ground cables on diesel engines), turn ignition switch to On position, turn wiper switch Off so wiper motor will park, then turn ignition switch to Off position.

10. Install righthand linkage access cover, then the right and lefthand wiper blade and arm assemblies and check for proper operation.

Wiper Motor: Testing and Inspection

Fig. 3 Wiper Motor Current Draw Test. Except Aerostar

Fig. 4 Wiper Motor Current Draw Test. Aerostar

1. Disconnect positive battery cable.

2. Disconnect linkage from motor and the electrical connector.

3. Connect green lead from multimeter to battery positive post, Fig. 3 and 4.

4. Connect positive lead of tester first to low speed connection and then to high speed connection at electrical connector. Current draw should not exceed 3 amps.

Wiper Motor: Service and Repair Front Wiper Motor

REMOVAL

1. Cycle windshield wipers until they are in straight up position, then turn ignition switch to Off position.

2. Disconnect battery ground cable (two ground cables on diesel engines), then the wiper motor electrical connector.

3. Remove righthand wiper arm and blade assembly, then the righthand pivot nut and allow linkage to drop into cowl.

4. Remove linkage access cover from righthand side of dash panel.

5. Release wiper motor retaining clip, then slide clip back until it clears nib on crank pin, and remove the clip. The wiper motor retaining clip can be reached through the access cover opening.

6. Remove wiper linkage from motor crank pin.

7. Remove motor attaching screws and the motor.

INSTALLATION

1. Install wiper motor and torque attaching screws to 60-85 inch lbs.

2. Connect wiper motor electrical connector, then install clip onto righthand linkage, ensuring clip is fully seated. Do not install linkage on motor crank pin, then attempt to install clip.

3. Install lefthand linkage onto motor crank pin, then the righthand linkage onto crank pin, pulling linkage onto pin until it snaps into place. Clip is properly installed if nib is protruding through center of clip.

4. Install righthand wiper pivot shaft and nut and torque to 84-110 inch lbs.

5. Connect battery ground cable (two ground cables on diesel engines), turn ignition switch to On position, turn wiper switch Off so wiper motor will park, then turn ignition switch to Off position.

6. Install righthand linkage access cover, then the righthand wiper blade and arm assembly and check for proper operation.

Wiper Motor: Service and Repair Rear Wiper Motor

REMOVAL

1. Disconnect battery ground cable, then remove wiper arm and blade assembly.

2. Remove liftgate inner trim panel, then the motor bracket attaching screw.

3. Pull motor assembly out of rubber grommet, disconnect motor electrical connector and disengage wiring locator pins, then remove motor assembly.

INSTALLATION

1. Position motor in liftgate rubber grommet and install attaching screws.

2. Connect motor electrical connector and install wiring locator pins.

3. Install wiper arm and blade assembly, then connect battery ground cable, and check for proper operation of wiper.

4. Install liftgate inner trim panel.

Wiper Switch: Testing and Inspection

Fig. 5 Wiper Switch Continuity Test. 1988 Bronco II & Ranger

Fig. 6 Wiper Switch Continuity Test. Except 88 Bronco II & Ranger

1. Check continuity between switch terminals, Figs 5 and 6.

2. To detect marginal operation of switch, move switch lever while each reading is being taken.

3. If switch does not show continuity or if poor continuity exists at any switch position, replace switch.

Wiper Switch: Service and Repair Rear Wiper Switch

1. Disconnect battery ground cable, then remove ashtray and instrument cluster trim panel.

2. Remove switch mounting bezel containing switches, then disconnect switch electrical connector and remove switch.

3. Reverse procedure to install, checking wiper operation.
