
^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for

cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

Operation Description

WARRANTY STATUS: Eligible Under Warranty

Coverage As Stated In The Text Of This Article

OPERATION DESCRIPTION TIME

912507A Idle Air By-Pass Valve 0.5 Hr.

Cleaning - 1983-85 Escort, EXP, LN7, LYNX 1.6L EFI.

912507B Idle Air By-Pass Valve 0.5 Hr.

Cleaning - 1986-91 Escort 1.9L EFI, 1986/87 EXP, Lynx 1.9L EFI, 1991 Tracer 1.9L EFI.

912507C Idle Air By Pass Valve 0.5 Hr.

Cleaning - 1984-87 Mustang 2.3L T/C, 1986/87 Capri, Cougar 2.3L T/C, 1984-88 T-Bird 2.3L T/C, 1987/92 Mustang 2.3L EFI.

912507D Idle By-Pass Valve Cleaning 0.6 Hr.

- 1988-91 Tempo, Topaz 2.3L HSC, 1985-92 Ranger 2.3L EFI.

912507E Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1986/87 Aerostar 2.3L EFI, 1985 Bronco II 2.3L EFI.

912507F Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1986-90 Bronco II 2.9L EFI, 1986-92 Ranger 2.9L EFI.

912507G Idle Air By-Pass Valve 0.6 Hr.

Cleaning - 1991/92 Probe 3.0L EFI, 1986-91 Taurus 3.0L EFI, 1987-91 Sable 3.0L EFI.

912507H Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1986-91 Aerostar 3.0L EFI, 1991 Ranger 3.0L EFI.

912507I Idle Air By-Pass Valve 0.6 Hr.

Cleaning - 1988 Continental, Cougar, Taurus, T-Bird, Sable 3.8L EFI. 1988 Cougar, T-Bird 3.8L S/C.

912507J Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1990-92 Aerostar 4.0L EFI, 1990 Bronco II 4.0L EFI, 1991/92 Explorer 4.0L EFI, 1990-92 Ranger 4.0L EFI.

912507K Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1987-92 Bronco 4.9L EFI, 1987-92 F-Series 4.9L EFI, 1987/90 Econoline (Without Rear Heater) 4.9L EFI, 1991/92 Econoline (All) 4.9L EFI.

912507L Idle Air By-Pass Valve 0.6 Hr.

Cleaning - 1986-88 Cougar, T-Bird 5.0L EFI, 1986-87 Continental, Mark VII 5.OL EFI, 1986/91 Crn - Victoria, Grn - Marquis 5.0L EFI, 1986-92 Mark VII 5.0L HO, 1982-92 Mustang 5.0L HO.

912507M Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1985-92 Bronco, E-Series, F-Series 5.0L EFI.

912507N Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1988-90 Bronco, F-Series 5.8L. 1991 Econo, F-Series, Bronco 5.8L (Do not Clean Solenoid, Calib; 1-64E-R10, 1-64H-R10, 1-64J-R10, 1-64K-R10, 1-64M-R10, 1-64P-R10, 1-64R-R10, 1-75A-R00, 1-76A-R00, 1-76B-R00, 1-76C-R00.

912507O Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1991/92 F And B Series, 7.0L EFI.

912507P Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1987-92 E-Series, F-Series 7.5L EFI.

912507Q Throttle Body And Idle Air 0.9 Hr.

By-Pass Valve Cleaning - 1989/90 Probe 3.0L EFI.

912507R Throttle Body And Idle Air 0.8 Hr.

By-Pass Valve Cleaning - 1987-90 Econoline (With Rear Heat) 4.9L EFI.

912507S Throttle Body And Idle Air 0.9 Hr.

By-Pass Valve Cleaning - 1988-90 Econoline 5.8L EFI.

912507T Service Kit Install - All Cars 1.0 Hr.

And Light Trucks (Except Aerostar And Econoline) - Refer To The Service Procedure Application

Charts, For Vehicle Application.

912507U Service Kit Install - 1.2 Hr.

Aerostar, Econoline - Refer To Service Procedure Application Charts - For Vehicle Application.

Engine - Hard Cold Starts/Hesitation/Stalls On Start-Up

Article No. 91-25-7

12/13/91

^ HARD COLD START - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

^ HESITATION/STALLS - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

FORD: 1983-87 EXP 1983-91 ESCORT 1984-90 MUSTANG, THUNDERBIRD 1986-90 TAURUS 1986-91 CROWN VICTORIA 1988-90 TEMPO

LINCOLN-MERCURY: 1983-85 LN7 1983-87 LYNX 1984-88 CAPRI 1984-90 COUGAR 1986-90 CONTINENTAL, MARK VII, SABLE 1986-91 GRAND MARQUIS, TOWN CAR 1988-90 TOPAZ 1991 TRACER

LIGHT TRUCK: 1985-90 BRONCO II, BRONCO 1985-91 ECONOLINE, F-150-350 SERIES 1985-92 RANGER 1986-91 AEROSTAR 1991 EXPLORER

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

SERVICE KIT -9F939-

APPLICATION CHART — EFI PORT FUEL INJECTION ENGINES

MODEL YEAR	CAR APPLICATION	ENGINE
1983-85	ESCORT GT/LYNX, EXP/LN7	1.6L EFI
1986-87	ESCORT GT/LYNX, EXP	1.9L EFI
1988-90	ESCORT GT	1.9L EFI
1991	ESCORT/TRACER	1.9L EFI
1987-90	MUSTANG	2.3L EFI
1984-86	THUNDERBIRD/COUGAR, MUSTANG/CAPRI	2.3L TC
1988-90	TEMPO/TOPAZ	2.3L HO/HSC
1986-90	TAURUS/SABLE	3.0L EFI
1988-90*	TAURUS/SABLE	3.8L EFI
1988-90	THUNDERBIRD/COUGAR	3.8L EFI/SC

**** 1991 MODEL YEAR ALL CALIBRATIONS **EXCEPT** 1-97A-R00, 1-98A-R00, 1-98B-R00, 1-98C-R00, 1-98E-R00 AND 1-98F-R00.

TB-2432-A

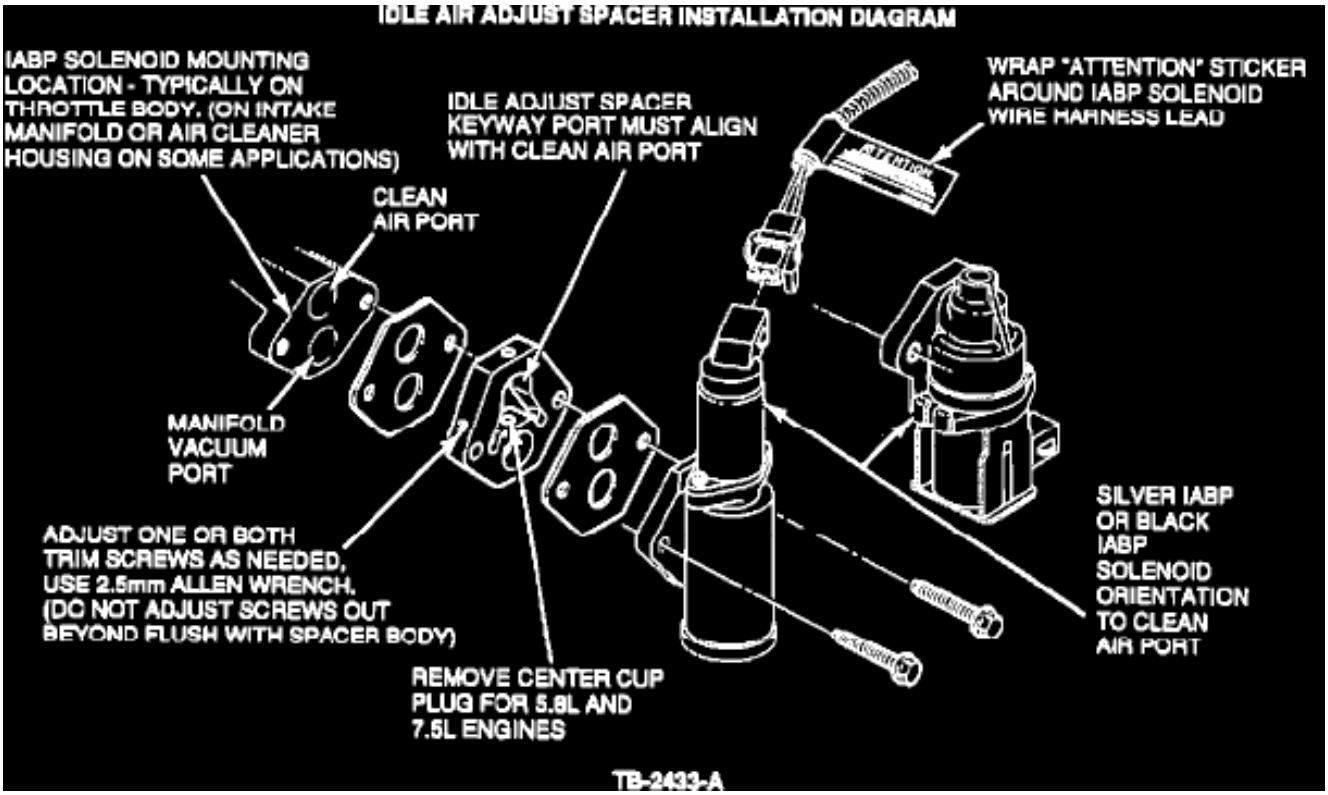
Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.

The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets



^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

Figure 5

The EFI throttle body idle speed adjustment procedures for the various model year passenger cars and light trucks are outlined in step-by-step procedures featured in Figures 3, 4 and 5. Select the appropriate procedure for the vehicle involved and adjust the throttle body idle RPM accordingly, after service kit installation.

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for

cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

Engine Idle Adjustment Procedures - Revision

ENGINE/EMISSIONS DIAGNOSIS SHOP MANUAL - 1991 - SECTION 9 - IDLE ADJUST PROCEDURES REVISED FOR APPLICATIONS WITHOUT SLUDGE TOLERANT THROTTLE BODY Article No. 90-25B-2 FORD:

1991 PROBE

LIGHT TRUCK: 1991 AEROSTAR, EXPLORER, RANGER

ISSUE: The Idle Adjust Procedures in the 1991 Engine/Emissions Diagnosis Shop Manual have been revised to cover applications that do not have the sludge tolerant throttle body. These are 1991 Aerostar, Explorer, and Ranger trucks with 4.0L engines. The 3.0L Probe has a sludge tolerant throttle body.

ACTION: Refer to the pages following this TSB article for the revised procedures.

NOTE: A SLUDGE TOLERANT THROTTLE BODY IS IDENTIFIED BY A 91TF-AA PREFIX AND SUFFIX IN THE PART NUMBER.

OTHER APPLICABLE ARTICLES: None WARRANTY STATUS: INFORMATION ONLY

Component Descriptions

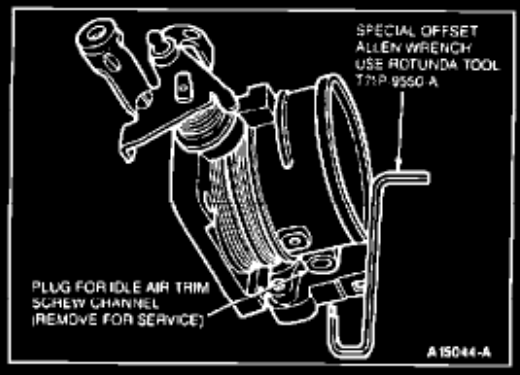

Figure 6

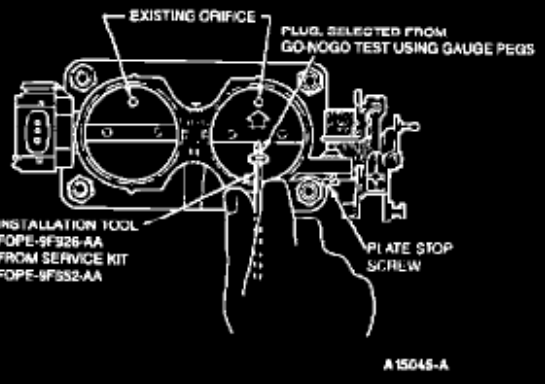

1. Remove air inlet tube(s) from throttle body.
2. Select the proper color plug by using the Go/NoGo gauge pegs included with the service kit FOPE-9F852-AA.
3. Starting with the largest diameter gauge peg, attempt to insert it through the throttle plate orifice.
4. If the gauge peg goes through the orifice, use the corresponding color plug.
   If it does not go through, proceed with the next smaller gauge peg for Go/NoGo Test.

NOTE: It is important that the largest Go/NoGo combination is used to determine the proper plug size.

5. If the smallest gauge peg does not go through the orifice, use the reamer bit and handle included with the service kit to enlarge the plate orifice. Wipe bearing grease on both sides of the plate orifice and on the reamer bit to hold the brass chips. After reaming, wipe the plate clean and then return to Step 3 to determine the proper plug size.
6. Using the installation tool from the service kit, push the plug into the orifice until bottoming out at the throttle plate.
7. Open and snap shut the throttle several times to verify proper plug retention.
8. Reconnect air inlet tube(s).
9. Reset idle rpm per engine requirement using the throttle plate stop screw.

Figure 7

Idle Airflow Adjust Procedure For All EFI and SEFI Systems

- Cooling system filled
- Engine at operating temperature
- Proper fuel pressure and no exhaust smoke
- Heater, A/C, and other accessories OFF
- Correct/clean PCV system if required
- Ignition timing set to specification
- EEC-IV diagnostics have been performed and vehicle malfunction indicated Service output codes have been resolved

Procedure

Choose procedure A, B, C or D from the table below for the engine being serviced. (The applications with self-test idle speed check provisions use procedure 'A' or 'C' and those without use procedure 'B' or 'D' depending on car or truck). An asterisk (*) below shows only applications without sludge tolerant throttle body design.

Procedure 'A' for Passenger Cars with Self-Test Idle Speed Check Provisions

DELETION

(USE ONLY STEPS MARKED 'X' FOR THE ENGINE BEING SERVICED)	2.5L	3.0L	3.8L	3.8L SC	4.6L 2V	5.0L HO THUNDERBIRD COUGAR
1 Activate engine running self-test	X	X	X	X	X	X
2 After Service Code 11 or 111 has been displayed, wait 4 seconds then quickly unlatch and within 4 seconds latch the STI button	X	X	X	X	X	X
3 A single pulse code indicates the entry mode, then observe the Self-Test Output (STO) of the STAR Tester in Item 4. If adjustment is required in Item 4, refer to possible causes listed in previous section and correct them as required and then continue with this procedure if necessary.	X	X	X	X	X	X
4 (A) Constant tone, solid light or "STO LO" readout means base idle rpm is within range. To exit test, unlatch STI button, then wait four seconds for reinitialization (after 10 minutes it will exit by itself).	X	X	X	X	X	X
(B) Beeping tone, flashing light, or "STO LO" readout at (8 Hz) indicates TP sensor is out of range due to over adjustment; adjustment may be required.	X	X	X	X	X	X
(C) Beeping tone, flashing light, or "STO LO" readout at (4 Hz) indicates base idle rpm is too fast, adjustment is required, go to Step 6.	X	X	X	X	X	X
(D) Beeping tone, flashing light, or "STO LO" readout at (1 Hz) indicates base idle rpm is too slow, adjustment is required, go to Step 5.	X	X	X	X	X	X
5 If rpm is too slow, follow applicable procedure for the engine being serviced.	X	X	X	X	X	X
A. Do not clean the throttle body, turn the air trim screw counter-clockwise until conditions in Step 4(A) are satisfied for air trim location. (See Figure 5 or 6).				X	X	X
B. Do not clean the throttle body. Check for the plate orifice plug. If there is no plug turn screw clockwise until conditions in Step 4(A) are satisfied. If there is a plug from previous service remove plug and then adjust screw in either direction as required. Screw must be in contact with the lever pad after adjustment.	X	X	X			
6 If rpm is too high, follow applicable procedure for the engine being serviced	X	X	X	X	X	X
A. Do not clean the throttle body, turn the air trim screw clockwise until conditions in Step 4(A) are satisfied for air trim screw location (see Figure 5 or 6).				X	X	X
B Turn engine OFF	X	X	X			
a. Block off the orifice in the throttle plate temporarily with tape. If the orifice already has a plug from previous service, go to Step (C)	X	X	X			
b. Restart the engine and check idle speed using Self-Test (mass air packages require air intake hose to be reattached first). If engine stalled, crack open the plate with plate stop screw. (Figure 4)	X	X	X			
c. If rpm continues to be fast, perform test in Step 7 if TPS output code is within range, remove tape, go to Section 2 for other causes. If out of range adjust screw for proper TPS code (lever pad must be in contact with screw after adjustment). If rpm is still fast, terminate this procedure and - go to Section 2 for other possible causes.	X	X	X			
d. However, if rpm drops to or below the desired level, as indicated by Self-Test Output tone, turn the engine off disconnect air cleaner hose, remove the tape.	X	X	X			
e. Install the plug with proper color code depending on throttle plate orifice size - see Fig. 7 for installation procedure.	X	X	X			
f. Reconnect the air cleaner hose - start the engine turn the plate stop screw clockwise (do not turn it counter-clockwise as this may cause the throttle plate to stick at idle) until conditions in Step 4A are satisfied.	X	X	X			
7 Run KOEO Self-Test for proper TPS output code.	X	X	X			
8 Verify the throttle is not stuck in the bore and linkage is not preventing throttle from closing.	X	X	X			
9 On automatic overdrive transmission (AOD) applications check TV pressure adjustment		X	X

Engine Idle Adjustment Procedures - Revision

ENGINE/EMISSIONS DIAGNOSIS SHOP MANUAL - 1991 - SECTION 9 - IDLE ADJUST PROCEDURES REVISED FOR APPLICATIONS WITHOUT SLUDGE TOLERANT THROTTLE BODY Article No. 90-25B-2 FORD:

1991 PROBE

LIGHT TRUCK: 1991 AEROSTAR, EXPLORER, RANGER

ISSUE: The Idle Adjust Procedures in the 1991 Engine/Emissions Diagnosis Shop Manual have been revised to cover applications that do not have the sludge tolerant throttle body. These are 1991 Aerostar, Explorer, and Ranger trucks with 4.0L engines. The 3.0L Probe has a sludge tolerant throttle body.

ACTION: Refer to the pages following this TSB article for the revised procedures.

NOTE: A SLUDGE TOLERANT THROTTLE BODY IS IDENTIFIED BY A 91TF-AA PREFIX AND SUFFIX IN THE PART NUMBER.

OTHER APPLICABLE ARTICLES: None WARRANTY STATUS: INFORMATION ONLY

Component Descriptions

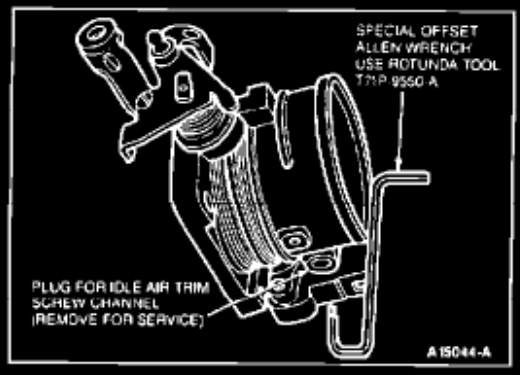

Figure 6

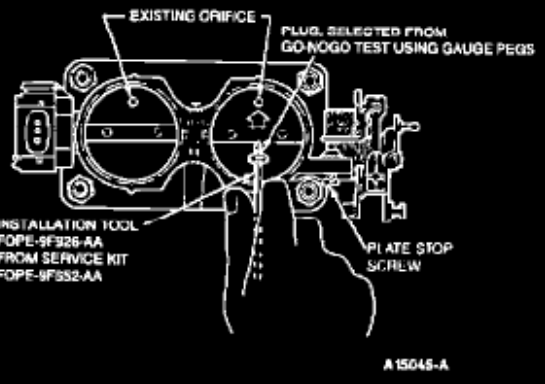

1. Remove air inlet tube(s) from throttle body.
2. Select the proper color plug by using the Go/NoGo gauge pegs included with the service kit FOPE-9F852-AA.
3. Starting with the largest diameter gauge peg, attempt to insert it through the throttle plate orifice.
4. If the gauge peg goes through the orifice, use the corresponding color plug.
   If it does not go through, proceed with the next smaller gauge peg for Go/NoGo Test.

NOTE: It is important that the largest Go/NoGo combination is used to determine the proper plug size.

5. If the smallest gauge peg does not go through the orifice, use the reamer bit and handle included with the service kit to enlarge the plate orifice. Wipe bearing grease on both sides of the plate orifice and on the reamer bit to hold the brass chips. After reaming, wipe the plate clean and then return to Step 3 to determine the proper plug size.
6. Using the installation tool from the service kit, push the plug into the orifice until bottoming out at the throttle plate.
7. Open and snap shut the throttle several times to verify proper plug retention.
8. Reconnect air inlet tube(s).
9. Reset idle rpm per engine requirement using the throttle plate stop screw.

Figure 7

Idle Airflow Adjust Procedure For All EFI and SEFI Systems

- Cooling system filled
- Engine at operating temperature
- Proper fuel pressure and no exhaust smoke
- Heater, A/C, and other accessories OFF
- Correct/clean PCV system if required
- Ignition timing set to specification
- EEC-IV diagnostics have been performed and vehicle malfunction indicated Service output codes have been resolved

Procedure

Choose procedure A, B, C or D from the table below for the engine being serviced. (The applications with self-test idle speed check provisions use procedure 'A' or 'C' and those without use procedure 'B' or 'D' depending on car or truck). An asterisk (*) below shows only applications without sludge tolerant throttle body design.

Procedure 'A' for Passenger Cars with Self-Test Idle Speed Check Provisions

DELETION

(USE ONLY STEPS MARKED 'X' FOR THE ENGINE BEING SERVICED)	2.5L	3.0L	3.8L	3.8L SC	4.6L 2V	5.0L HO THUNDERBIRD COUGAR
1 Activate engine running self-test	X	X	X	X	X	X
2 After Service Code 11 or 111 has been displayed, wait 4 seconds then quickly unlatch and within 4 seconds latch the STI button	X	X	X	X	X	X
3 A single pulse code indicates the entry mode, then observe the Self-Test Output (STO) of the STAR Tester in Item 4. If adjustment is required in Item 4, refer to possible causes listed in previous section and correct them as required and then continue with this procedure if necessary.	X	X	X	X	X	X
4 (A) Constant tone, solid light or "STO LO" readout means base idle rpm is within range. To exit test, unlatch STI button, then wait four seconds for reinitialization (after 10 minutes it will exit by itself).	X	X	X	X	X	X
(B) Beeping tone, flashing light, or "STO LO" readout at (8 Hz) indicates TP sensor is out of range due to over adjustment; adjustment may be required.	X	X	X	X	X	X
(C) Beeping tone, flashing light, or "STO LO" readout at (4 Hz) indicates base idle rpm is too fast, adjustment is required, go to Step 6.	X	X	X	X	X	X
(D) Beeping tone, flashing light, or "STO LO" readout at (1 Hz) indicates base idle rpm is too slow, adjustment is required, go to Step 5.	X	X	X	X	X	X
5 If rpm is too slow, follow applicable procedure for the engine being serviced.	X	X	X	X	X	X
A. Do not clean the throttle body, turn the air trim screw counter-clockwise until conditions in Step 4(A) are satisfied for air trim location. (See Figure 5 or 6).				X	X	X
B. Do not clean the throttle body. Check for the plate orifice plug. If there is no plug turn screw clockwise until conditions in Step 4(A) are satisfied. If there is a plug from previous service remove plug and then adjust screw in either direction as required. Screw must be in contact with the lever pad after adjustment.	X	X	X			
6 If rpm is too high, follow applicable procedure for the engine being serviced	X	X	X	X	X	X
A. Do not clean the throttle body, turn the air trim screw clockwise until conditions in Step 4(A) are satisfied for air trim screw location (see Figure 5 or 6).				X	X	X
B Turn engine OFF	X	X	X			
a. Block off the orifice in the throttle plate temporarily with tape. If the orifice already has a plug from previous service, go to Step (C)	X	X	X			
b. Restart the engine and check idle speed using Self-Test (mass air packages require air intake hose to be reattached first). If engine stalled, crack open the plate with plate stop screw. (Figure 4)	X	X	X			
c. If rpm continues to be fast, perform test in Step 7 if TPS output code is within range, remove tape, go to Section 2 for other causes. If out of range adjust screw for proper TPS code (lever pad must be in contact with screw after adjustment). If rpm is still fast, terminate this procedure and - go to Section 2 for other possible causes.	X	X	X			
d. However, if rpm drops to or below the desired level, as indicated by Self-Test Output tone, turn the engine off disconnect air cleaner hose, remove the tape.	X	X	X			
e. Install the plug with proper color code depending on throttle plate orifice size - see Fig. 7 for installation procedure.	X	X	X			
f. Reconnect the air cleaner hose - start the engine turn the plate stop screw clockwise (do not turn it counter-clockwise as this may cause the throttle plate to stick at idle) until conditions in Step 4A are satisfied.	X	X	X			
7 Run KOEO Self-Test for proper TPS output code.	X	X	X			
8 Verify the throttle is not stuck in the bore and linkage is not preventing throttle from closing.	X	X	X			
9 On automatic overdrive transmission (AOD) applications check TV pressure adjustment		X	X			

DELETION

Procedure 'D' for Trucks with No Self-Test Idle Speed Check Provisions

16 Start engine and stabilize for two minutes, then goose engine and let it return to idle, lightly depress and release the accelerator. Let engine idle, if idle problem still exists go to Section 2 for other possible causes.	X	X	X	X	X	X 2/	X 2/	X	X
17 On Automatic Overdrive Transmission (AOD) applications, check TV pressure adjustment.						X			

NOTE 1: On 5.0L and 5.8L, only in Step 9. If you must turn the plate stop screw in, shut engine off, make estimated adjustment. Start engine, repeat Steps 7,8,9.

2/ In Step 16, engine rpm oscillation may be caused by the throttle plate open far enough to expose the canister purge ports. To verify this, disconnect purge port and plug. If the problem is resolved, close the throttle plate just enough to eliminate oscillations.

3/ For 1991 1/2 use procedure 'C'.

Revised 12/90

Idle Speed: By Symptom

Technical Service Bulletin # 91257 Date: 911213

Engine - Hard Cold Starts/Hesitation/Stalls On Start-Up

Article No. 91-25-7

12/13/91

^ HARD COLD START - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

^ HESITATION/STALLS - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

FORD: 1983-87 EXP 1983-91 ESCORT 1984-90 MUSTANG, THUNDERBIRD 1986-90 TAURUS 1986-91 CROWN VICTORIA 1988-90 TEMPO

LINCOLN-MERCURY: 1983-85 LN7 1983-87 LYNX 1984-88 CAPRI 1984-90 COUGAR 1986-90 CONTINENTAL, MARK VII, SABLE 1986-91 GRAND MARQUIS, TOWN CAR 1988-90 TOPAZ 1991 TRACER

LIGHT TRUCK: 1985-90 BRONCO II, BRONCO 1985-91 ECONOLINE, F-150-350 SERIES 1985-92 RANGER 1986-91 AEROSTAR 1991 EXPLORER

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

TB-2432-A

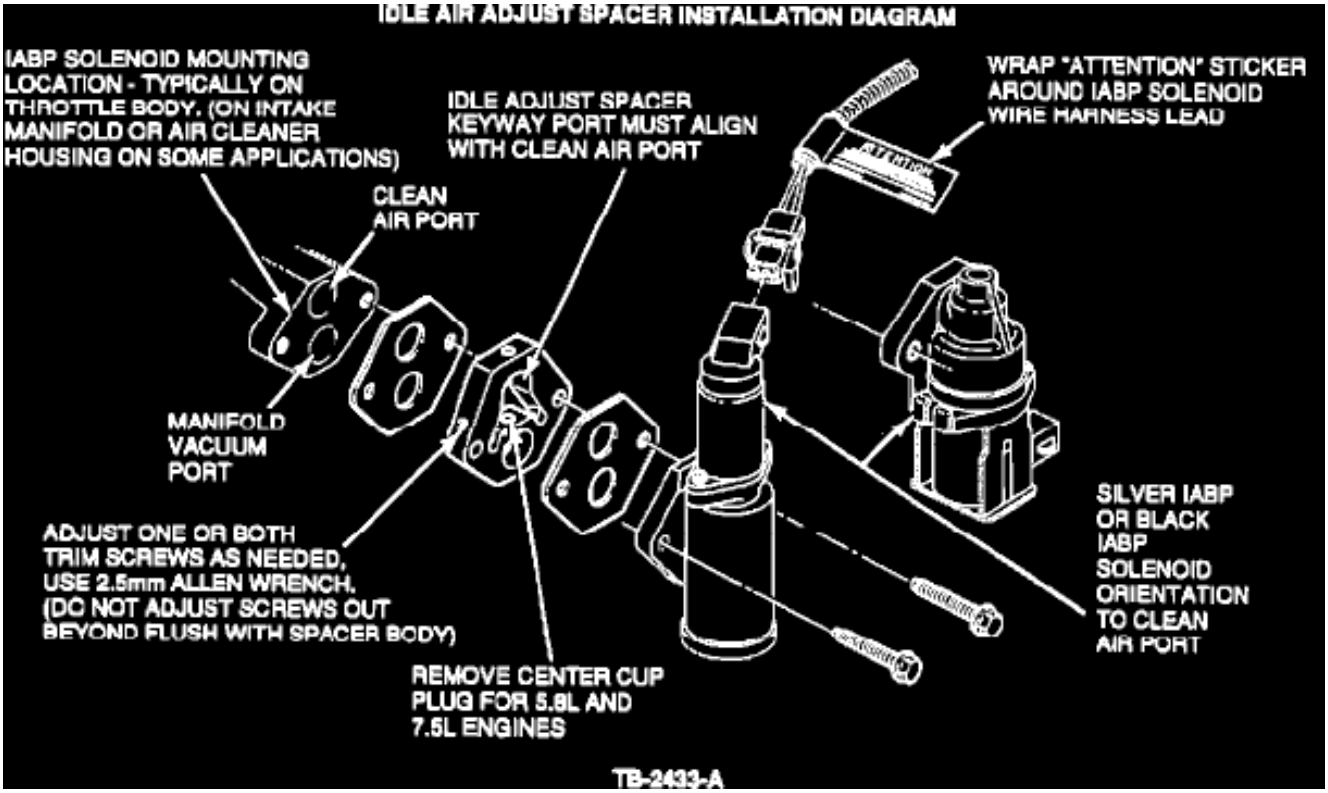
Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.

The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets



^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

Figure 5

The EFI throttle body idle speed adjustment procedures for the various model year passenger cars and light trucks are outlined in step-by-step procedures featured in Figures 3, 4 and 5. Select the appropriate procedure for the vehicle involved and adjust the throttle body idle RPM accordingly, after service kit installation.

Figure 11

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

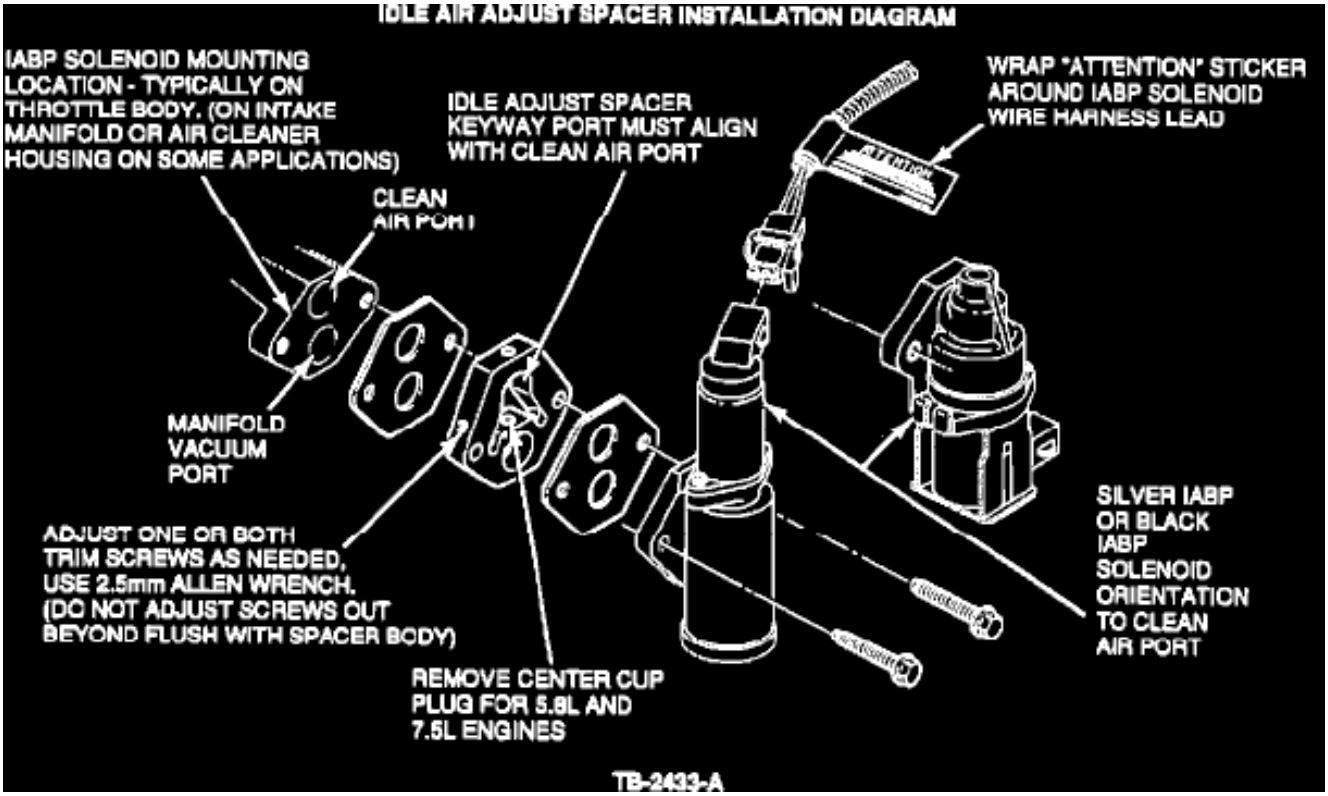
TB-2432-A

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.



The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets

^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

Idle Speed: Adjustments With 90TF-AA Throttle Body

*** UPDATED BY TSB 9111B4, 6/14/91; TSB 9025B2, 12/90

NOTE: The curb and fast idle speeds are controlled by the Engine Control Assembly (ECA) and the Idle Speed Control Bypass Air Valve (ISC-BPA). The ISC-BPA valve is not adjustable. A large increase or decrease in closed plate airflow from the calibrated level will not allow this device to control the speed.

REMEMBER

A change in idle airflow can occur not only at the throttle body, but other areas as well. You should enter the idle speed procedure only after other possible causes in the following areas are eliminated.

^ Contamination within the idle speed control device

^ Lack of fuel system control (excessively rich or lean)

^ Throttle sticking or binding

^ Engine not reaching operating temperature

^ Incorrect ignition timing

^ Incorrect or clogged PCV system

^ Vacuum leaks (intake manifold, vacuum hoses, vacuum reservoirs, power brake booster etc.

VERIFY

^ Transmission is in PARK (A/T), or NEUTRAL (M/T)

^ Parking brake is applied (automatic brake disconnected where applicable)

^ Wheels blocked

^ Engine at operating temperature

^ Proper fuel pressure and no exhaust smoke

^ Correct and clean PCV system

^ Heater, A/C, and other accessories OFF

^ Ignition timing is set to specification

^ EEC-IV diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved.

STEP 1

With the engine OFF, connect a tachometer, according to manufacturer's instructions. Disconnect the negative (-) terminal of the battery for 5 minutes, then reconnect it.

STEP 2

START the engine and let stabilize for two minutes. Goose the accelerator and let the engine return to idle. Lightly depress and release the accelerator, then let engine idle.

STEP 3

If the engine is not idling properly, turn the engine OFF, and disconnect Idle Speed Control Air Bypass Solenoid.

STEP 4

START and RUN the engine at 2500 rpm for 30 seconds.

STEP 5

Place the transmission is in PARK (A/T), or NEUTRAL (M/T).

STEP 6

Using a tachometer, verify idle rpm is 675 +50/-125 rpm.

RPM TOO LOW a.

Turn the plate stop screw to reach an idle speed of 675 +/- 25 rpm.

NOTE: During engine break-in reduce the idle rpm by 100 rpm. RPM TOO HIGH a.

Turn the plate stop screw clockwise until 675 +/- 25 rpm is achieved.

STEP 7

Turn the engine OFF, and repeat Steps 4, 5, and 6, if necessary.

STEP 8

Run the KOEO Self-Test for proper TPS code output.

STEP 9

Turn the engine OFF, and disconnect the battery for at least 5 minutes.

STEP 10

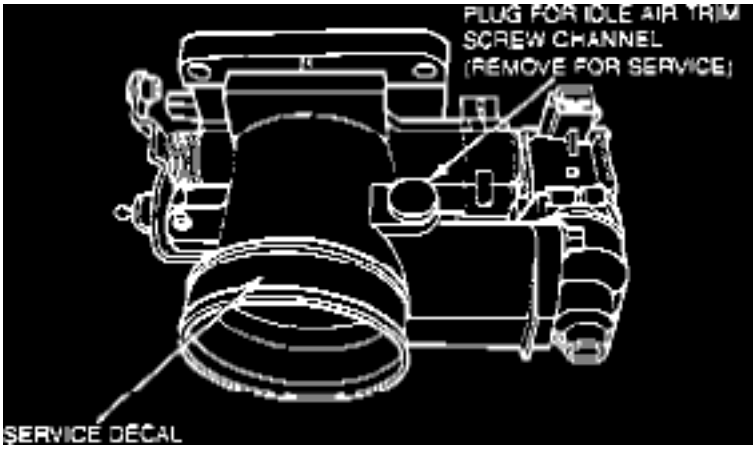
Reconnect the Idle Speed Control Air Bypass Solenoid. Verify the throttle plate is not stuck in the bore, and the linkage is not preventing throttle from closing.

STEP 11

START the engine and idle for two minutes. Goose the accelerator and let the engine return to idle. Lightly depress and release the accelerator, then let engine idle. ^

If idle problem still exists, proceed to DIAGNOSIS AND TESTING PROCEDURES/TESTING PROCEDURES/QUICK TEST AND

DIAGNOSTIC AIDS/VISUAL INSPECTION for other possible causes.



Idle Speed: Adjustments With 91TF-AA Throttle Body

*** UPDATED BY TSB 91-11B-4 6/14/91

NOTE: The curb and fast idle speeds are controlled by the Engine Control Assembly (ECA) and the Idle Speed Control Bypass Air Valve (ISC-BPA). The ISC-BPA valve is not adjustable. A large increase or decrease in closed plate airflow from the calibrated level will not allow this device to control the speed. The idle speed setting procedure has been revised considerably to reflect the expanded application of the Self-Test idle speed options and because the throttle body incorporates an orifice in the throttle plate to control idle airflow as part of the sludge tolerant design.

Air Trim Screw Channel Cover

Throttle bodies with sludge tolerant design (introduced 1991 1/2 model vehicles) are clearly identified with a Yellow/Black decal. This decal warns that the throttle plate stop screw must not be adjusted counterclockwise (backed off), as this will not reduce the engine speed but may cause the throttle plate to stick in the bore. Backing out the screw may be required if the throttle body has been previously serviced (a plug in the throttle plate orifice may be present) or the plate stop screw tampered with (TPS Self-Test output out of range). The decal also warns that the throttle body must NOT be cleaned inside the bore, as this cleaning will impair the sensitive coating. The sludge accumulation will not affect the idle air flow. The cleaning procedure for the ISC-BPA still applies.

REMEMBER

A change in idle airflow can occur not only at the throttle body, but other areas as well. You should enter the idle speed procedure only after other possible causes in the following areas are eliminated.

^ Contamination within the idle speed control device

^ Lack of fuel system control (excessively rich or lean)

^ Throttle sticking or binding

^ Engine not reaching operating temperature

^ Incorrect ignition timing

^ Incorrect or clogged PCV system

^ Vacuum leaks (intake manifold, vacuum hoses, vacuum reservoirs, power brake booster etc.

VERIFY

^ Transmission is in PARK (A/T), or NEUTRAL (M/T)

^ Parking brake is applied (automatic brake disconnected where applicable)

^ Wheels blocked

^ Engine at operating temperature

^ Proper fuel pressure and no exhaust smoke

^ Correct and clean PCV system

^ Heater, A/C, and other accessories OFF

^ Ignition timing is set to specification

^ EEC-IV diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved.

STEP 1

With the engine OFF, connect a tachometer, according to manufacturer's instructions. Disconnect the negative (-) terminal of the battery for 5 minutes, then reconnect it.

STEP 2

START the engine and let stabilize for two minutes. Goose the accelerator and let the engine return to idle. Lightly depress and release the accelerator, then let engine idle.

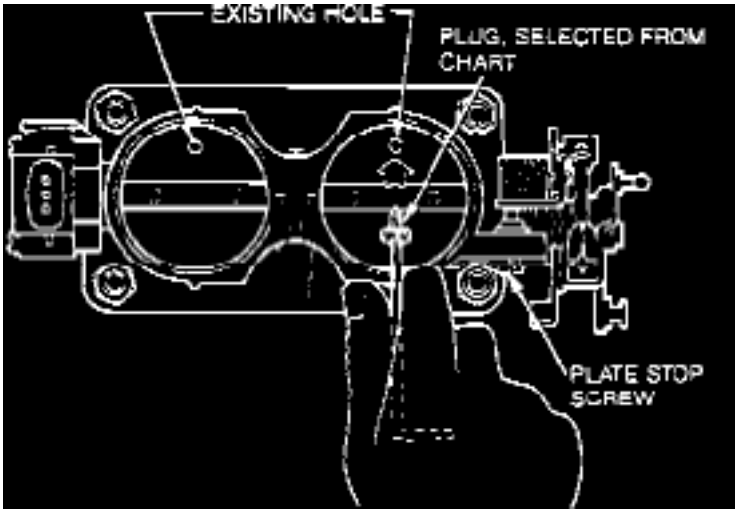
STEP 3

If the engine is not idling properly, turn the engine OFF, and disconnect Idle Speed Control Air Bypass Solenoid.

STEP 4

START and RUN the engine at 2500 rpm for 30 seconds.

STEP 5



Place the transmission is in PARK (A/T), or NEUTRAL (M/T).

STEP 6

Using a tachometer, verify idle rpm is 675 +50/-120 rpm.

Throttle Plate Orifice Plug

NOTE: A plug in the throttle body orifice will decrease idle rpm. Where as an orifice without a plug will increase idle rpm. Orifice plugs and installation tools are available in service kit # FOPZ-9F652-A.

RPM TOO LOW a.

Do not clean the throttle body, check for the plate orifice plug. ^

If there is no plug, turn the screw clockwise to the desired rpm.

^ If there is a plug from previous service, remove the plug, and adjust the screw in either direction as required. NOTE: Screw must be in contact with the lever pad after adjustment.

RPM TOO HIGH a.

Turn the engine OFF.

b. Disconnect air cleaner hose.

c. Temporarily block the orifice in the throttle plate with tape. If the orifice already has a plug from previous service proceed to Step (e).

d. RESTART the engine, and check the idle speed, using a tachometer. NOTE: On vehicles with Mass Air Flow Sensors, reconnect the air intake duct hose before checking rpm. If the engine stalls, crack open the plate stop screw, but DO NOT over adjust.

e. If rpm continues to be fast, perform KOEO Self-Test. ^

If TPS output code is within range, remove tape from throttle plate, and check for other possible causes.

^ If TPS output is out of range, adjust screw for proper TPS code. Lever must be in contact with the screw.

^ If rpm is still fast, terminate this procedure, then check for other possible causes.

f. If rpm drops to 675 or lower, or engine stalls, turn the engine OFF, disconnect the air cleaner hose, and remove tape from throttle plate.

g. Install the plug with proper color code depending on throttle plate orifice size.

h. Reconnect the air cleaner hose. START the engine, and check the idle rpm using a tachometer. Turn the plate stop screw clockwise until 675 +/- 25 rpm is achieved. NOTE: Do not turn the plate stop screw counterclockwise. This may cause the throttle plate to stick at idle.

STEP 7

Turn the engine OFF, and repeat Steps 4, 5, and 6.

STEP 8

Run the KOEO Self-Test for proper TPS code output.

STEP 9

Turn the engine OFF, and disconnect the battery for at least 5 minutes.

STEP 10

Reconnect the Idle Speed Control Air Bypass Solenoid. Verify the throttle plate is not stuck in the bore, and the linkage is not preventing throttle from closing.

STEP 11

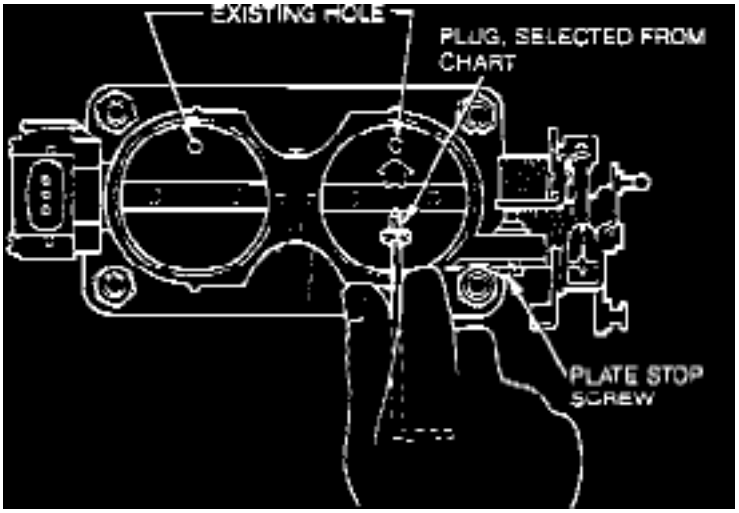
START the engine and idle for two minutes. Goose the accelerator and let the engine return to idle. Lightly depress and release the accelerator, then let engine idle. ^

If idle problem still exists, proceed to DIAGNOSIS AND TESTING PROCEDURES/TESTING PROCEDURES/QUICK TEST AND DIAGNOSTIC AIDS/VISUAL INSPECTION for other possible causes.

PROCEDURES FOR PLUG INSTALLATION

STEP 1

Remove air inlet tube(s) from throttle body.



Throttle Plate Orifice Plug

STEP 2

Select the proper color plug by using the Go/No-Go gauge pegs, included in the service kit (FOPZ-9F652-A).

STEP 3

Starting with the largest diameter gauge peg, attempt to insert through the throttle plate orifice.

STEP 4

If the gauge peg goes through the orifice, use the corresponding color plug. If the gauge peg does not go through, proceed with the next smaller gauge peg for Go/No-Go Test. NOTE: It is important that the largest Go/No-Go combination is used to determine the proper plug size.

STEP 5

If the smallest gauge peg does not go through the orifice, use the reamer bit and handle included with the service kit to enlarge the plate orifice. Wipe bearing grease on both sides of the plate orifice and on the reamer bit to hold the brass chips. After reaming, wipe plate clean and then return to Step 3 to determine the proper plug size.

STEP 6

Using the installation tool from the service kit, push the plug into the orifice until bottoming out at the throttle plate.

STEP 7

Open and snap closed the throttle several times to verify proper plug retention.

STEP 8

Reconnect the air inlet tube(s).

STEP 9

Reset idle rpm per engine requirement using the throttle plate stop screw.

Air Cleaner Fresh Air Duct/Hose: Technical Service Bulletins Engine - Water Entry Through Air Intake System

Article No. 94-3-8

02/09/94

^ AIR INTAKE - 2.9L, 3.0L, 4.0L EFI ENGINES - WATER ENTRY THROUGH AIR INTAKE SYSTEM

^ ENGINE - 2.9L, 3.0L, 4.0L EFI - POSSIBLE INTERNAL DAMAGE FROM WATER ENTRY THROUGH AIR INTAKE SYSTEM

LIGHT TRUCK: 1986-90 BRONCO II 1986-94 RANGER 1991-94 EXPLORER

This article is being republished in its entirety to add 1993-94 4.0L Ranger, 1993-94 3.0L Ranger and 1993-94 4.0L Explorer vehicles.

ISSUE: Reports have been received of internal engine damage caused by water entering the engine through the air intake system. This condition may occur when the vehicle is driven in normal wet conditions, such as water splash/spray from other vehicles, or when driven through shallow water. Improvements were made to the EFI engine air intake systems that have greatly reduced the number of reported incidences.

ACTION: Dealers should be assured that warranty repairs will be covered unless there Is evidence of owner misuse. This warranty repair policy will remain effective unless you are notified that a waterproof air intake system has been released.

OTHER APPLICABLE ARTICLES: NONE SUPERSEDES: 91-21-10 WARRANTY STATUS: INFORMATION ONLY OASIS CODES: 497000, 499000

Fuel Pressure Release: Service and Repair

CAUTION: FUEL SUPPLY LINES ON EFI ENGINES WILL REMAIN PRESSURIZED FOR SOME PERIOD OF TIME AFTER THE ENGINE IS SHUT OFF. THIS PRESSURE MUST BE RELIEVED BEFORE SERVICING OF THE FUEL SYSTEM IS BEGUN.

FUEL SYSTEM PRESSURE RELIEF - EFI ENGINES

Before opening the fuel system on vehicles with EFI engines, relieve fuel pressure as follows: 1. Locate and disconnect the electrical connection to either the fuel pump relay, the inertia switch or the in-line high pressure fuel pump.

2. Crank engine for approximately ten seconds.

Note: Engine may start and run for a short time. If so, crank engine an additional 5 seconds after engine stalls.

3. Re-connect the electrical connector that was disconnected in step 1 and disconnect battery ground cable.

Alternative Method

Some EFI vehicles have a port (fitting) on the fuel rail used for measuring fuel pressure. If so equipped, use the following method: -

Install fuel pressure relief tool No. T80L-9974-B or equivalent to measuring port on engine fuel rail.

- Position drain hose in suitable container, then depress relief button.

DELETION

Revised 5/91

Octane Adjust

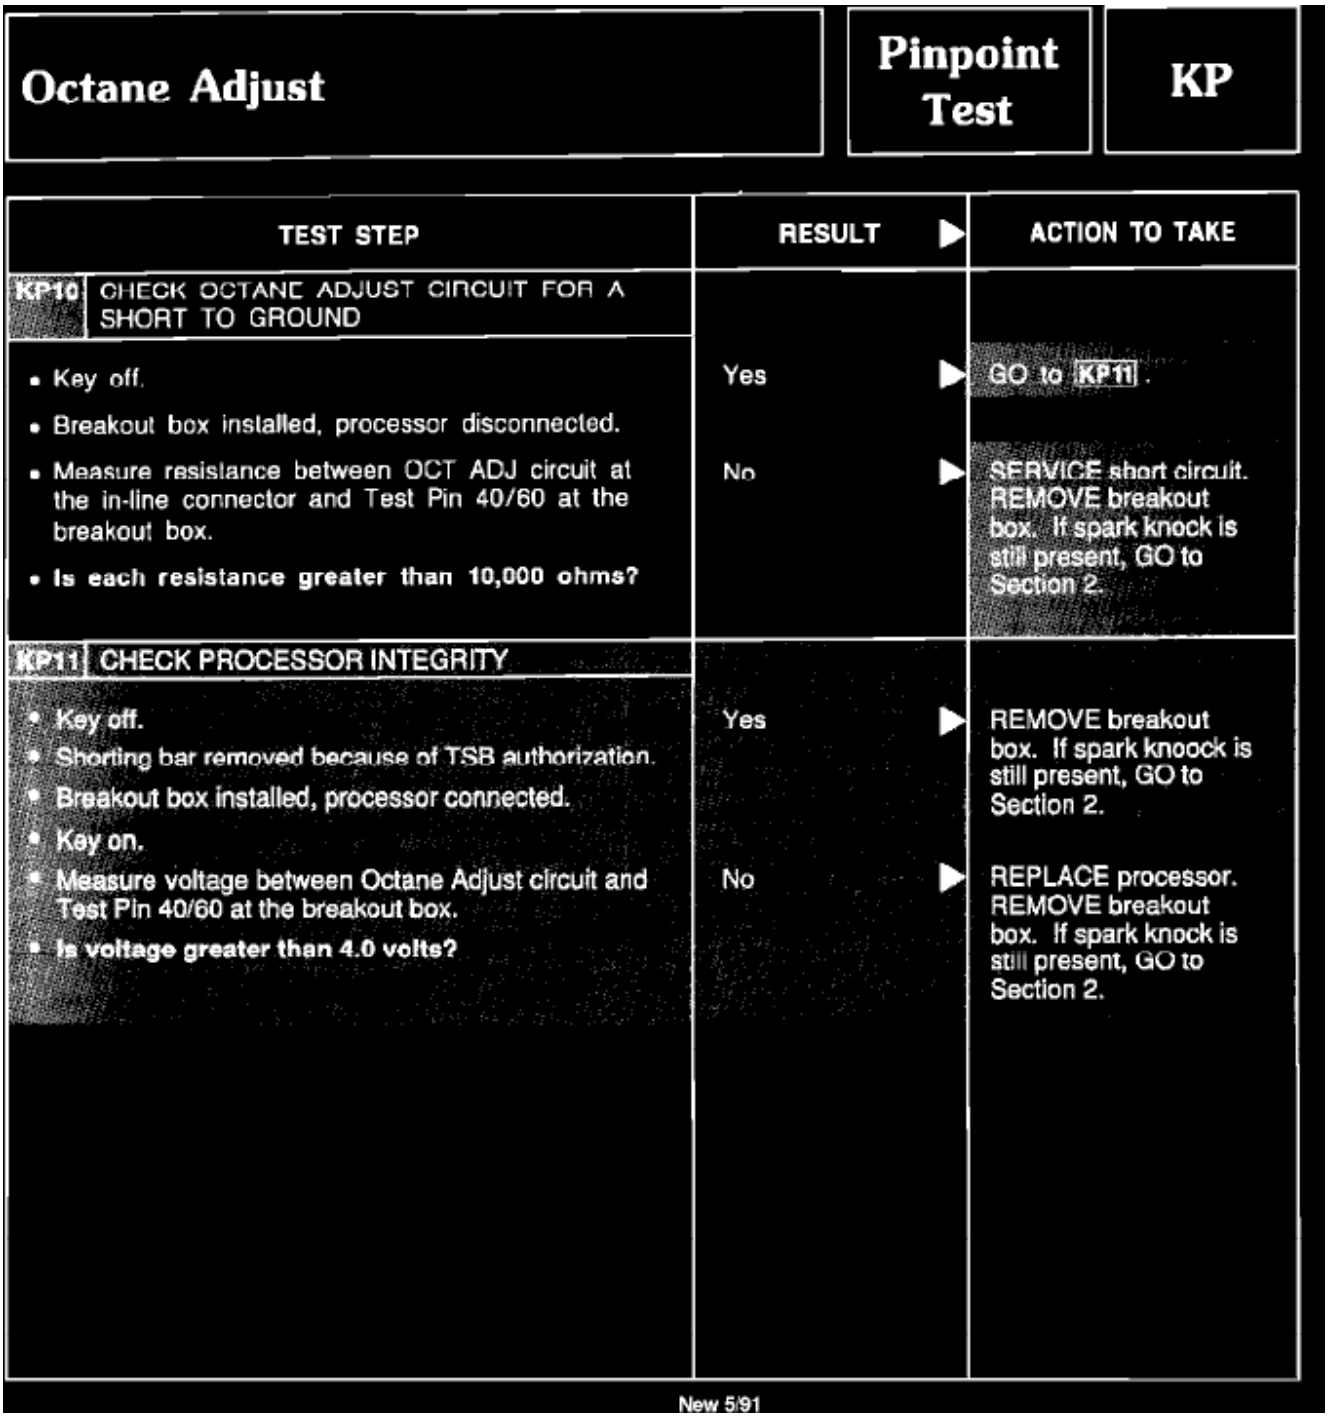
Pinpoint Test **KP**

TEST STEP	RESULT ▶	ACTION TO TAKE
KP1 VISUALLY INSPECT OCTANE ADJUST IN-LINE CONNECTOR SERVICE CODE 57/341		
Service Code 57/341 indicates Octane Adjust shorting bar is not in or the OCT ADJ circuit is open. • Key off. • Visually inspect Octane Adjust in-line connector. • **Is the shorting bar removed?**	Yes ▶ No ▶	GO to KP2. GO to KP4.
KP2 CHECK FOR MODIFICATION DECAL		
• Is there a modification decal attached to the vehicle indicating that the Octane Adjust shorting bar was removed?	Yes ▶ No ▶	Testing complete. If vehicle has spark knock concern, GO to Section 2. GO to KP3.
KP3 CHECK FOR SERVICE CODE 57/341		
• Replace Octane Adjust shorting bar. • Key off. • Activate self-test. • **Is service code 57/341 present?**	Yes ▶ No ▶	GO to KP4. Testing complete. EEC system OK.
KP4 CHECK CONTINUITY OF OCTANE ADJUST CIRCUIT		
NOTE: There should be continuity from OCT ADJ circuit thru the in-line connector and shorting bar to SIG RTN circuit. • Key off. • Disconnect processor 60 pin connector. Inspect for damaged or pushed out pins, corrosion, loose wires, etc. Service as necessary. • Install breakout box, leave processor disconnected. • Measure resistance between Test Pin 46 and OCT ADJ Test Pin at the breakout box (see schematic for appropriate OCT ADJ circuit test pin). • **Is the resistance less than 5 ohms?**	Yes ▶ No ▶	REPLACE processor. REMOVE breakout box. RERUN Quick Test. SERVICE open OCT ADJ circuit or shorting bar or SIG RTN circuit. REMOVE breakout box. RERUN Quick Test.

Octane Adjust

Pinpoint Test **KP**

TEST STEP	RESULT	ACTION TO TAKE
KP5 CHECK FOR SERVICE CODE 11 • Start engine and idle vehicle at operating temperature. • Key off. • Activate self-test. • Key on, engine off. • **Is service code 11 or 111 present?**	Yes ▶ No ▶	GO to KP6. **For service code 57/341:** GO to KP1. **For all other codes:** RETURN to Quick Test.
KP6 VERIFY IN-LINE CONNECTOR SHORTING BAR IS INSTALLED • Key off. • Visually inspect Octane Adjust in-line connector. • **Is shorting bar installed?**	Yes ▶ No ▶	GO to KP8. GO to KP7.
KP7 CHECK FOR MODIFICATION DECAL • Is there a modification decal attached to the vehicle indicating that the Octane Adjust shorting bar was removed?	Yes ▶ No ▶	GO to KP10. REPLACE shorting bar. GO to Section 2 to address spark knock concern.
KP8 CHECK FOR TSB • Is there a Technical Service Bulletin (TSB) authorizing the removal of the Octane Adjust shorting bar?	Yes ▶ No ▶	GO to KP9. GO to Section 2 to address spark knock concern.
KP9 REMOVE SHORTING BAR • Remove shorting bar only if there is a TSB authorization. • Drive vehicle to verify spark knock. • **Is spark knock present?**	Yes ▶ No ▶	GO to KP10. Testing complete. EEC system OK.



Octane Adjust | **Pinpoint Test** | **KP**

TEST STEP	RESULT ▶	ACTION TO TAKE
KP10 CHECK OCTANE ADJUST CIRCUIT FOR A SHORT TO GROUND • Key off. • Breakout box installed, processor disconnected. • Measure resistance between OCT ADJ circuit at the in-line connector and Test Pin 40/60 at the breakout box. • **Is each resistance greater than 10,000 ohms?**	Yes ▶	GO to KP11.
	No ▶	SERVICE short circuit. REMOVE breakout box. If spark knock is still present, GO to Section 2.
KP11 CHECK PROCESSOR INTEGRITY • Key off. • Shorting bar removed because of TSB authorization. • Breakout box installed, processor connected. • Key on. • Measure voltage between Octane Adjust circuit and Test Pin 40/60 at the breakout box. • **Is voltage greater than 4.0 volts?**	Yes ▶	REMOVE breakout box. If spark knoock is still present, GO to Section 2.
	No ▶	REPLACE processor. REMOVE breakout box. If spark knock is still present, GO to Section 2.

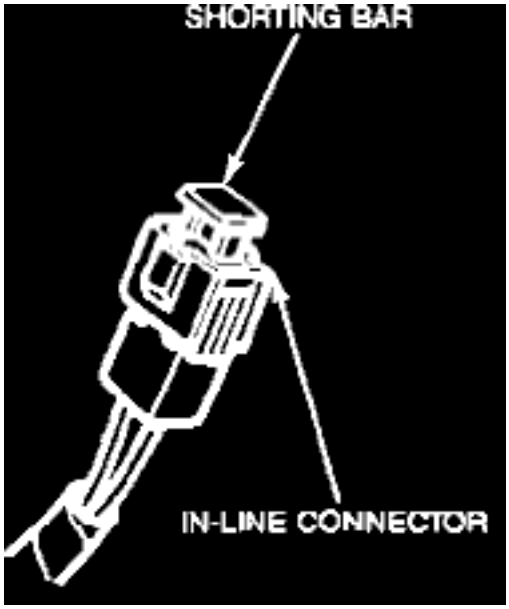
Ignition Timing Connector: Locations

Component Location

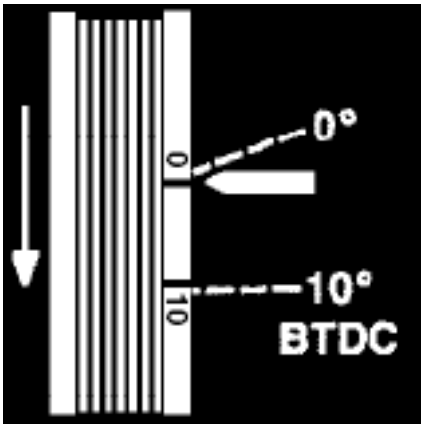
The SPOUT connector (SAW check connector C127) is located at the RH front of the engine compartment in front of the battery.



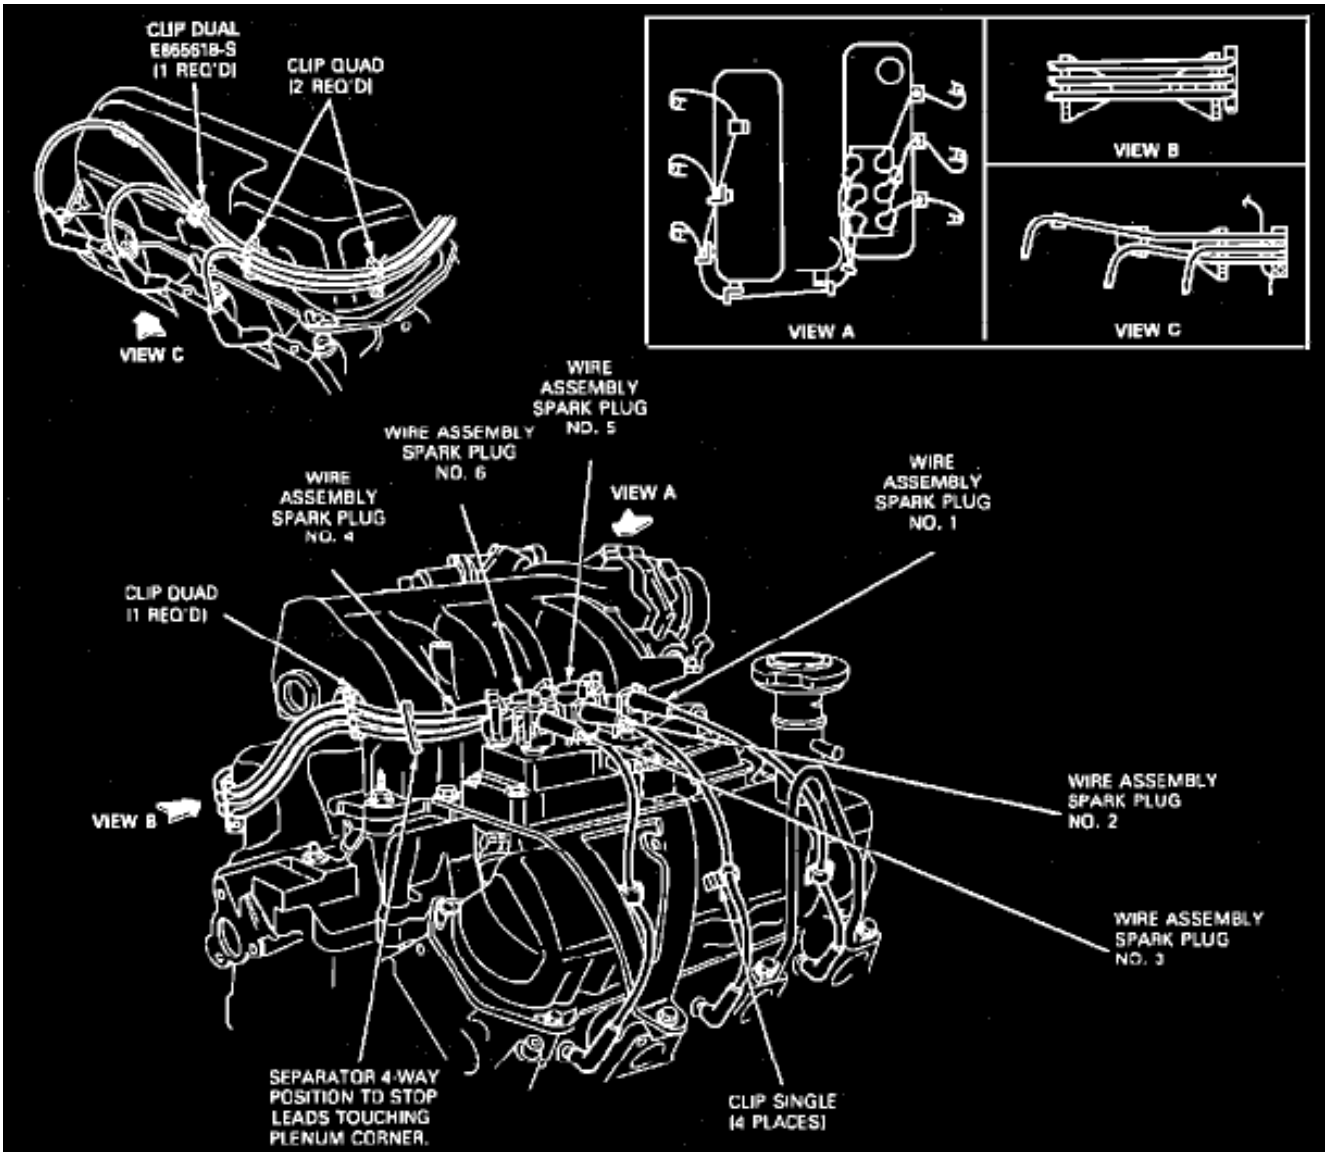
Ignition Timing Connector: Description and Operation

In-line Connector With Shorting Bar

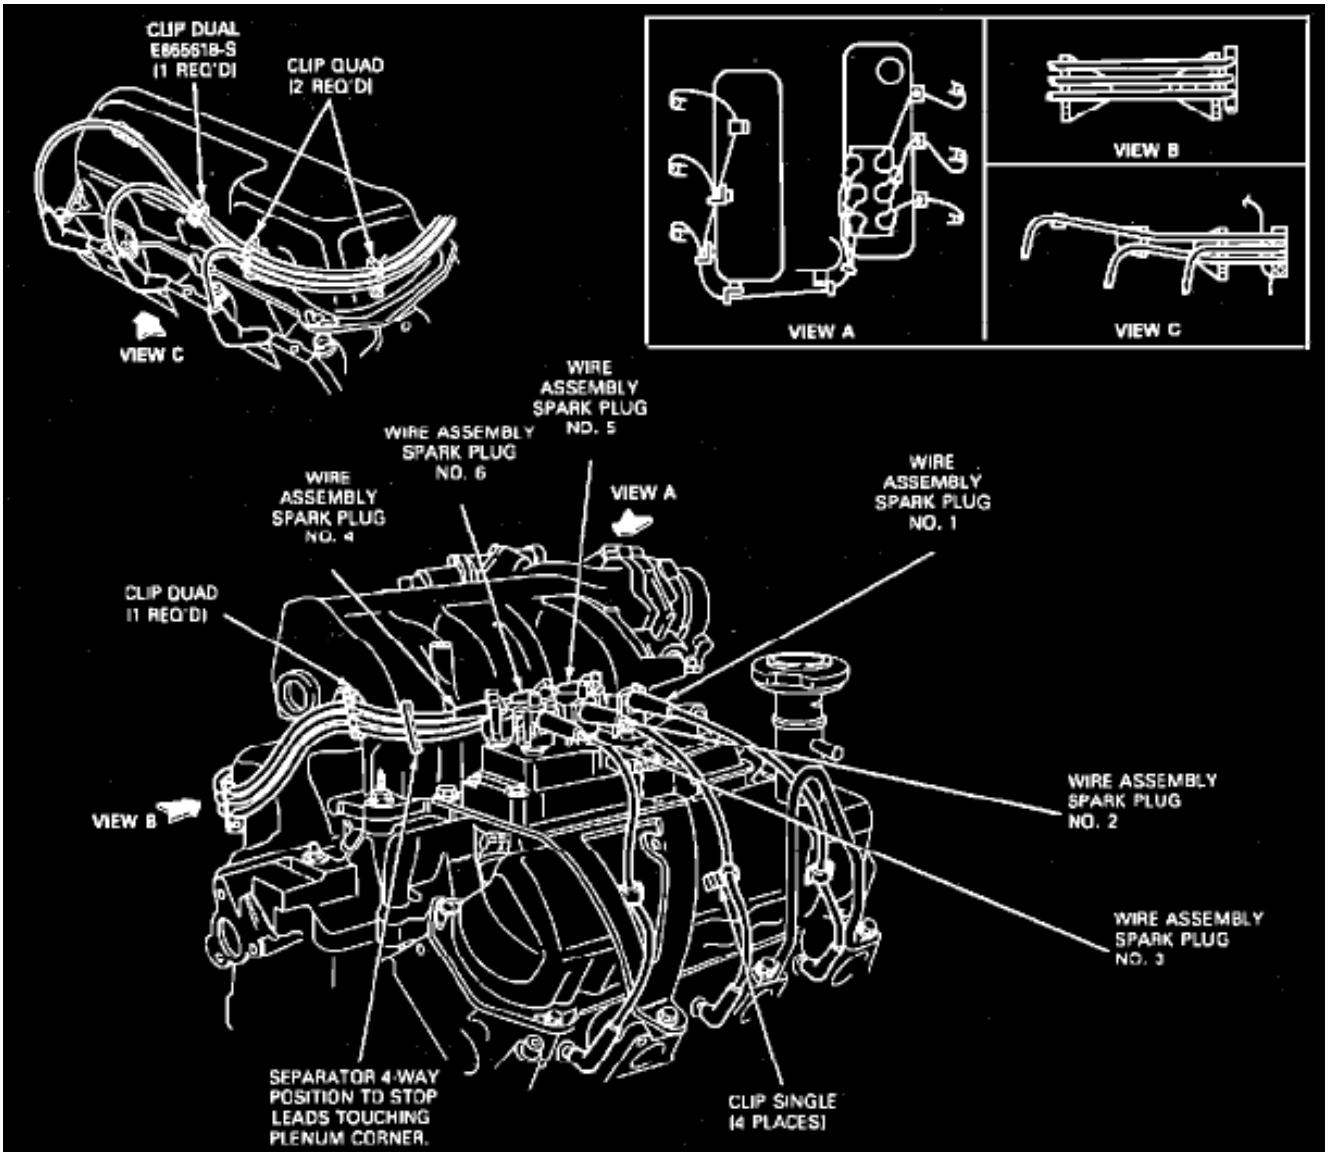
The octane adjustment switch is used to retard the ignition timing three to four degrees. When the switch jumper is INSTALLED, the timing is normal. With the jumper REMOVED, the timing is retarded. This is done to allow for optimum spark advance for effective combustion of the air/fuel mixture.



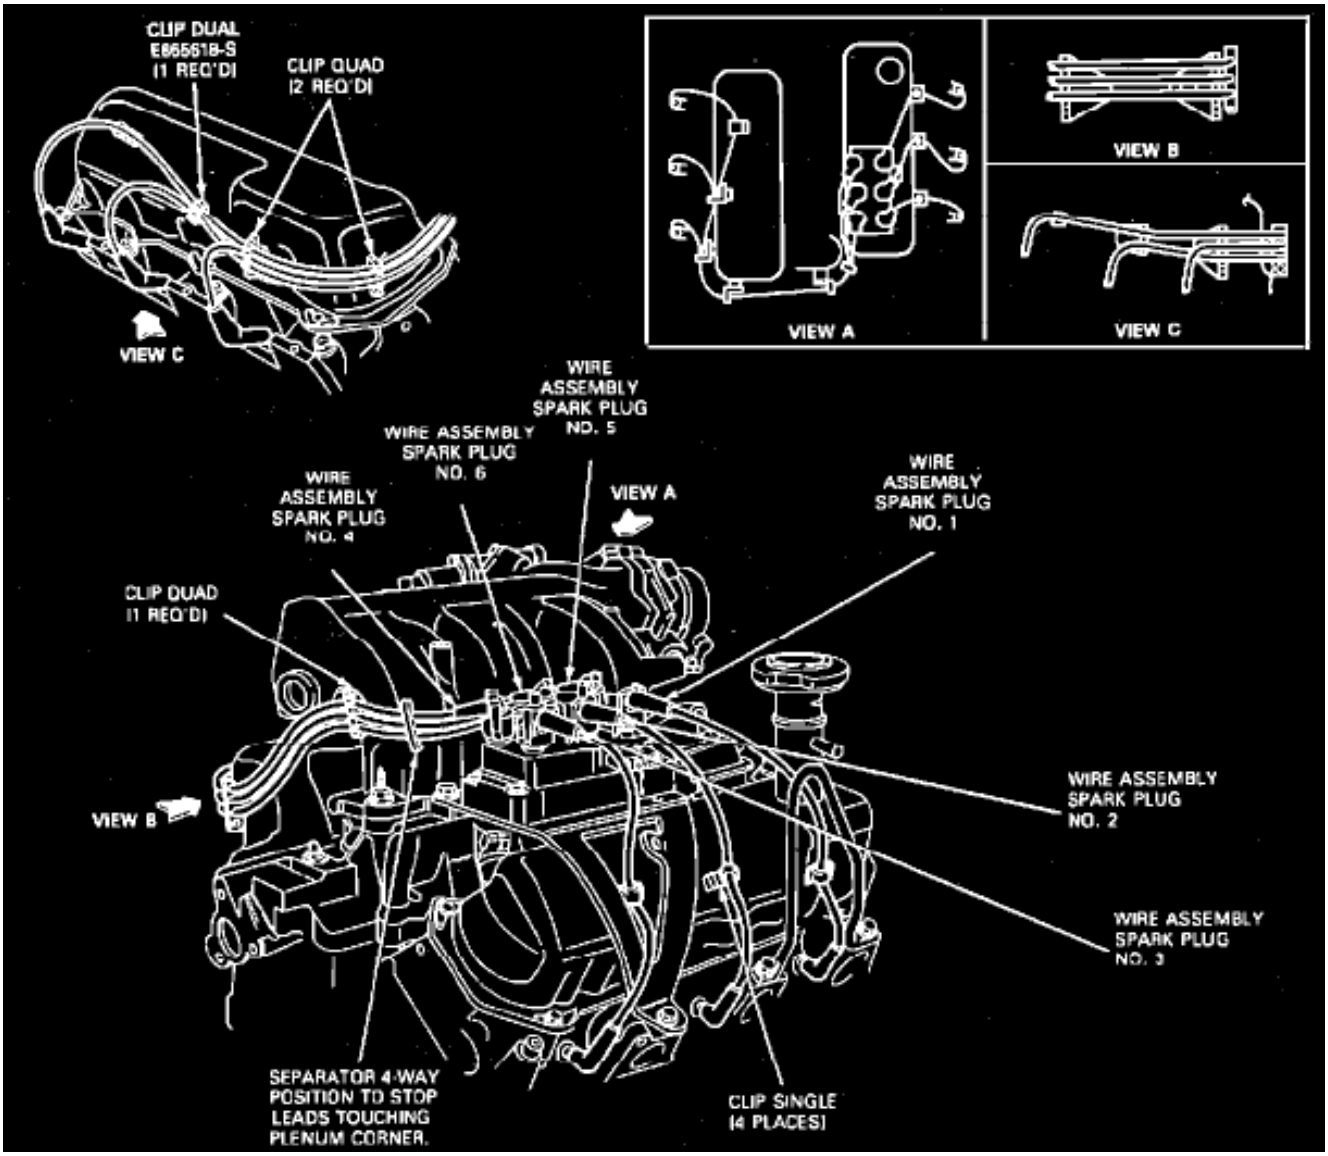
Timing Marks



Spark Plug Wire Assembly



Spark Plug Wire Assembly



Ignition Cable: Service and Repair

Spark Plug Wire Assembly

Removal:

1. When removing spark plug wires from the spark plugs, use the spark plug wire remover T74P-6666-A or equivalent. Grasp and twist the boot back and forth on the plug insulator to free the boot.

2. Use the special tool or equivalent to pull the boot from the plug. Do not pull on the wire directly, as it may become separated from the connector inside the boot.

3. To remove the wires from the coil pack, squeeze the locking tabs of the coil wire retainer and remove using a twisting and pulling motion. Do not pull on the wire.

INSTALLATION:

CAUTION: Proper installation of spark plug wires is critical to vehicle operation. If one spark plug wire is not properly installed on the spark plug or ignition coil, both spark plugs connected to that coil may not fire under load.

1. Whenever a high tension wire is removed for any reason from a spark plug or ignition coil, or a new high tension wire is installed, Silicone Dielectric Compound D7AZ-19A331-A or equivalent must be applied to the boot prior to installation. Using a small tool, coat the entire interior surface of the boot.

2. Install each wire on the proper ignition coil terminal. The terminal cylinder numbers are identified on the ignition coil pack. Ensure that both coil boot retainer locking tabs have engaged.

3. Remove the wire retaining brackets from the old wiring set and install the brackets on the new wires in the same position. Install the wires and retaining brackets on the engine.

4. Connect the wires to the proper Spark plugs.

Spark Plug: Customer Interest Engine - Loss of Power At High Engine Speeds

Article No. 92-3-8

01/29/92

LOSS OF POWER - 4.0L - AT HIGH ENGINE SPEEDS BETWEEN 3800 AND 4700 RPM - CANADIAN VEHICLES

LIGHT TRUCK: 1990-92 RANGER 1991-92 EXPLORER

ISSUE: A loss of power may occur at engine speeds between 3800 and 4700 RPM under wide open throttle. After several months use, this can be caused by an interaction between MMT (octane enhancer additive in Canadian fuel) contaminated spark plugs and the EDIS (Electronic Distributorless Ignition System) module. A check engine light concern may be present with Self-Test Codes 18 (212 three digit code) and 45 in continuous memory.

ACTION: If service is required, confirm the concern and, if necessary, replace the EDIS module and spark plugs. Refer to the following procedure for service details.

1. Confirm the customer concern by accelerating the vehicle at wide open throttle from 3000 RPM to 4700 RPM with the transmission in second gear.

^ If the vehicle exhibits a loss of power (caused by fuel shutoff of one of the fuel banks) in this RPM range, follow Steps 2 and 3.

^ Otherwise, follow the Powertrain Control/Emissions Diagnosis Manual's diagnostic procedures.

NOTE:

FUEL SHUTOFF (REV. LIMITER) AT 4850 RPM FOR AUTOMATICS AND 5200 RPM FOR MANUAL TRANSMISSIONS IS NORMAL AND SHOULD NOT BE CONFUSED WITH THIS CONCERN.

2. Replace all the spark plugs.

3. Replace the EDIS module (F1TZ-12KO72-B).

NOTE:

THIS MODULE WILL ELIMINATE THE PREMATURE FUEL SHUTOFF CONCERN. THE RED DEPOSITS ON THE SPARK PLUGS WILL STILL OCCUR AFTER TIME. THIS IS CONSIDERED NORMAL FOR THIS TYPE OF FUEL.

ISSUE This TSB article is a diagnostic procedure to address vehicles that exhibit lean driveability symptoms and may or may not have any Diagnostic Trouble Codes (DTCs) stored in memory.

ACTION Follow the diagnostic procedures described in the following Service Tip. The revised diagnostic procedure is a more accurate means of diagnosing the symptoms.

SERVICE TIP

MASS AIR FLOW (MAF) DISCUSSION

MAF sensors can get contaminated from a variety of sources: dirt, oil, silicon, spider webs, potting compound from the sensor itself, etc. When a MAF sensor gets contaminated, it skews the transfer function such that the sensor over-estimates air flow at idle (causes the fuel system to go rich) and under-estimates air flow at high air flows (causes fuel system to go lean). This means Long Term Fuel Trims will learn lean (negative) corrections at idle and learn rich (positive) corrections at higher air flows.

If vehicle is driven at Wide Open Throttle (WOT) or high loads, the fuel system normally goes open loop rich to provide maximum power. If the MAF sensor is contaminated, the fuel system will actually be lean because of under-estimated air flow. During open loop fuel operation, the vehicle applies Long Term Fuel Trim corrections that have been learned during closed loop operation. These corrections are often lean corrections learned at lower air flows. This combination of under-estimated air flow and lean fuel trim corrections can result in spark knock/detonation and lack of power concerns at WOT and high loads.

One of the indicators for diagnosing this condition is barometric pressure. Barometric pressure (BARO) is inferred by the Powertrain Control Module (PCM) software at part throttle and WOT (there is no actual BARO sensor on MAF-equipped vehicles, except for the 3.8L Supercharged engine). At high air flows, a contaminated MAF sensor will under-estimate air flow coming into the engine, hence the PCM infers that the vehicle is operating at a higher altitude. The BARO reading is stored in Keep Alive Memory (KAM) after it is updated. Other indicators are Long Term Fuel Trim and MAF

voltage at idle.

NOTE

THE FOLLOWING PROCEDURE MAY ALSO BE USED TO DIAGNOSE VEHICLES THAT DO NOT HAVE FUEL SYSTEM/HO2S SENSOR DTCS.

Symptoms

^ Lack of Power

^ Spark Knock/Detonation

^ Buck/Jerk

^ Hesitation/Surge on Acceleration

^ Malfunction Indicator Lamp (MIL) Illuminated -

DTCs P0171, P0172, P0174, P0175 may be stored in memory

OBDII DTCs

^ P0171, P0174 (Fuel system lean, Bank 1 or 2)

^ P0172, P0175, (Fuel system rich, Bank 1 or 2)

^ P1130, P1131, P1132, (HO2S11 lack of switching, Bank 1)

^ P1150, P1151, P1152, (HO2S21 lack of switching, Bank 2)

OBDI DTCs

^ 181, 189 (Fuel system lean, Bank 1 or 2)

^ 179, 188 (Fuel system rich, Bank 1 or 2)

^ 171, 172, 173 (HO2S11 lack of switching, Bank 1)

^ 175, 176, 177 (HO2S21 lack of switching, Bank 2)

^ 184, 185 (MAF higher/lower than expected)

^ 186, 187 (Injector pulse width higher/lower than expected)

NOTE:

DO NOT DISCONNECT THE BATTERY. IT WILL ERASE KEEP ALIVE MEMORY AND RESET LONG TERM FUEL TRIM AND BARO TO THEIR STARTING/BASE VALUES. THE BARO PARAMETER IDENTIFICATION DISPLAY (PID) IS USED FOR THIS DIAGNOSTIC PROCEDURE. ALL OBDII APPLICATIONS HAVE THIS PID AVAILABLE. THERE ARE SOME OBDI VEHICLES THAT DO NOT HAVE THE BARO PID, FOR THESE VEHICLES OMIT THE BARO CHECK AND REFER ONLY TO STEPS 2, 3, AND 4 IN THE DIAGNOSTIC PROCEDURE.

BAROMETRIC PRESSURE REFERENCE			
Barometric Pressure (in. Hg.)	Barometric Pressure (kPa)	BARO/MAP PID (Hz)	Altitude above sea level (ft)
3.5	11.8	89.3	
5	16.9	92.8	
10	33.8	104.6	
15	50.7	117.0	14,000
20	67.5	129.6	10,000
21	70.9	132.5	9,000
22	74.3	135.4	8,000
23	77.7	138.3	7,000
24	81.1	141.1	6,000
25	84.4	144.0	5,000
26	87.8	146.9	4,000
27	91.2	149.8	3,000
28	94.6	152.8	2,000
29	97.9	155.8	1,000
30	101.3	158.9	0 (sea level)
31	104.7	162.0	
31.875	107.7	164.7	

1. Look at the BARO PID. Refer to the Barometric Pressure Reference Chart in this article. At sea level, BARO should read about 159 Hz (29.91 in. Hg). As a reference, Denver, Colorado at 1524 meters (5000 ft.) altitude should be about 144 Hz (24.88 in.Hg). Normal learned BARO variability is up to +/- 6 Hz (+/- 2 in. Hg.). If BARO indicates a higher altitude than you are not at (7 or more Hz lower than expected), you may have MAF contamination. If available, Service Bay Diagnostic System (SBDS) has a Manifold Absolute Pressure (MAP) sensor that can be used as a barometric pressure reference. Use "MAP/BARO" test under "Powertrain," "Testers and Meters." Ignore the hookup screen. Connect GP2 to the reference MAP on the following screen.

NOTE

REMEMBER THAT MOST WEATHER SERVICES REPORT A LOCAL BAROMETRIC PRESSURE THAT HAS BEEN CORRECTED TO SEA LEVEL. THE BARO PID, ON THE OTHER HAND, REPORTS THE ACTUAL BAROMETRIC PRESSURE FOR THE ALTITUDE THE VEHICLE IS BEING OPERATED IN. LOCAL WEATHER CONDITIONS (HIGH AND LOW PRESSURE AREAS) WILL CHANGE THE LOCAL BAROMETRIC PRESSURE BY SEVERAL INCHES OF MERCURY (+/- 3 Hz, +/- 1 in. Hg.).

NOTE

BARO IS UPDATED ONLY WHEN THE VEHICLE IS AT HIGH THROTTLE OPENINGS. THEREFORE, A VEHICLE WHICH IS DRIVEN DOWN FROM A HIGHER ALTITUDE MAY NOT HAVE HAD AN OPPORTUNITY TO UPDATE THE BARO VALUE IN KAM. IF YOU ARE NOT CONFIDENT THAT BARO HAS BEEN UPDATED, PERFORM THREE OR FOUR HEAVY, SUSTAINED ACCELERATIONS AT GREATER THAN HALF-THROTTLE TO ALLOW BARO TO UPDATE.

2. On a fully warmed up engine, look at Long Term Fuel Trim at idle, in Neutral, A/C off, (LONGFT1 and/or LONGFT2 PIDs). If it is more negative than -12%, the fuel system has learned lean corrections which may be due to the MAF sensor over-estimating air flow at idle. Note that both Banks 1 and 2 will exhibit negative corrections for 2-bank system. If only one bank of a 2-bank system has negative corrections, the MAF sensor is probably not contaminated.

3. On a fully warmed up engine, look at MAF voltage at idle, in Neutral, A/C off (MAF V PID). If it's 30% greater than the nominal MAF V voltage listed in the Powertrain Control/Emissions Diagnosis (PC/ED) Diagnostic Value Reference Charts for your vehicle, or greater than 1.1 volts as a rough guide, the MAF sensor is over-estimating air flow at idle.

4. If at least tow of the previous three steps are true, proceed to disconnect the MAF sensor connector. This puts the vehicle into Failure Mode and Effects Management (FMEM). In FMEM mode, air flow is inferred by using rpm and throttle position instead of reading the MAF sensor. (In addition, the BARO value is reset to a base/unlearned value.) If the lean driveability symptoms go away, the MAF sensor is probably contaminated and should be replaced. If the lean driveability symptoms do not go away, go to the PC/ED Service Manual for the appropriate diagnostics.

NOTE

DUE TO INCREASINGLY STRINGENT EMISSION/OBDII REQUIREMENTS, IT IS POSSIBLE FOR SOME VEHICLES WITH MAF SENSOR CONTAMINATION TO SET FUEL SYSTEM DTCs AND ILLUMINATE THE MIL WITH NO DRIVEABILITY CONCERNS. DISCONNECTING THE MAF ON THESE VEHICLES WILL, THEREFORE, PRODUCE NO IMPROVEMENTS IN DRIVEABILITY. IN THESE CASES, IF THE BARO, LONGFT1, LONGFT2, AND MAF V PIDs INDICATE THAT THE MAF IS CONTAMINATED, PROCEED TO REPLACE THE MAF SENSOR.

After replacing the MAF sensor, disconnect the vehicle battery (5 minutes, minimum to reset KAM, or on newer vehicles, use the "KAM Reset" feature on the New Generation Star (NGS) Tester and verify that the lean driveability symptoms are gone.

^ 184, 185 (MAF higher/lower than expected)

^ 186, 187 (Injector pulse width higher/lower than expected)

NOTE:

DO NOT DISCONNECT THE BATTERY. IT WILL ERASE KEEP ALIVE MEMORY AND RESET LONG TERM FUEL TRIM AND BARO TO THEIR STARTING/BASE VALUES. THE BARO PARAMETER IDENTIFICATION DISPLAY (PID) IS USED FOR THIS DIAGNOSTIC PROCEDURE. ALL OBDII APPLICATIONS HAVE THIS PID AVAILABLE. THERE ARE SOME OBDI VEHICLES THAT DO NOT HAVE THE BARO PID, FOR THESE VEHICLES OMIT THE BARO CHECK AND REFER ONLY TO STEPS 2, 3, AND 4 IN THE DIAGNOSTIC PROCEDURE.

BAROMETRIC PRESSURE REFERENCE			
Barometric Pressure (in. Hg.)	Barometric Pressure (kPa)	BARO/MAP PID (Hz)	Altitude above sea level (ft)
3.5	11.8	89.3	
5	16.9	92.8	
10	33.8	104.6	
15	50.7	117.0	14,000
20	67.5	129.6	10,000
21	70.9	132.5	9,000
22	74.3	135.4	8,000
23	77.7	138.3	7,000
24	81.1	141.1	6,000
25	84.4	144.0	5,000
26	87.8	146.9	4,000
27	91.2	149.8	3,000
28	94.6	152.8	2,000
29	97.9	155.8	1,000
30	101.3	158.9	0 (sea level)
31	104.7	162.0	
31.875	107.7	164.7	

1. Look at the BARO PID. Refer to the Barometric Pressure Reference Chart in this article. At sea level, BARO should read about 159 Hz (29.91 in. Hg). As a reference, Denver, Colorado at 1524 meters (5000 ft.) altitude should be about 144 Hz (24.88 in.Hg). Normal learned BARO variability is up to +/- 6 Hz (+/- 2 in. Hg.). If BARO indicates a higher altitude than you are not at (7 or more Hz lower than expected), you may have MAF contamination. If available, Service Bay Diagnostic System (SBDS) has a Manifold Absolute Pressure (MAP) sensor that can be used as a barometric pressure reference. Use "MAP/BARO" test under "Powertrain," "Testers and Meters." Ignore the hookup screen. Connect GP2 to the reference MAP on the following screen.

NOTE

REMEMBER THAT MOST WEATHER SERVICES REPORT A LOCAL BAROMETRIC PRESSURE THAT HAS BEEN CORRECTED TO SEA LEVEL. THE BARO PID, ON THE OTHER HAND, REPORTS THE ACTUAL BAROMETRIC PRESSURE FOR THE ALTITUDE THE VEHICLE IS BEING OPERATED IN. LOCAL WEATHER CONDITIONS (HIGH AND LOW PRESSURE AREAS) WILL CHANGE THE LOCAL BAROMETRIC PRESSURE BY SEVERAL INCHES OF MERCURY (+/- 3 Hz, +/- 1 in. Hg.).

NOTE

BARO IS UPDATED ONLY WHEN THE VEHICLE IS AT HIGH THROTTLE OPENINGS. THEREFORE, A VEHICLE WHICH IS DRIVEN DOWN FROM A HIGHER ALTITUDE MAY NOT HAVE HAD AN OPPORTUNITY TO UPDATE THE BARO VALUE IN KAM. IF YOU ARE NOT CONFIDENT THAT BARO HAS BEEN UPDATED, PERFORM THREE OR FOUR HEAVY, SUSTAINED ACCELERATIONS AT GREATER THAN HALF-THROTTLE TO ALLOW BARO TO UPDATE.

2. On a fully warmed up engine, look at Long Term Fuel Trim at idle, in Neutral, A/C off, (LONGFT1 and/or LONGFT2 PIDs). If it is more negative than -12%, the fuel system has learned lean corrections which may be due to the MAF sensor over-estimating air flow at idle. Note that both Banks 1 and 2 will exhibit negative corrections for 2-bank system. If only one bank of a 2-bank system has negative corrections, the MAF sensor is probably not contaminated.

3. On a fully warmed up engine, look at MAF voltage at idle, in Neutral, A/C off (MAF V PID). If it's 30% greater than the nominal MAF V voltage listed in the Powertrain Control/Emissions Diagnosis (PC/ED) Diagnostic Value Reference Charts for your vehicle, or greater than 1.1 volts as a rough guide, the MAF sensor is over-estimating air flow at idle.

4. If at least tow of the previous three steps are true, proceed to disconnect the MAF sensor connector. This puts the vehicle into Failure Mode and Effects Management (FMEM). In FMEM mode, air flow is inferred by using rpm and throttle position instead of reading the MAF sensor. (In addition, the BARO value is reset to a base/unlearned value.) If the lean driveability symptoms go away, the MAF sensor is probably contaminated and should be replaced. If the lean driveability symptoms do not go away, go to the PC/ED Service Manual for the appropriate diagnostics.

NOTE

DUE TO INCREASINGLY STRINGENT EMISSION/OBDII REQUIREMENTS, IT IS POSSIBLE FOR SOME VEHICLES WITH MAF SENSOR CONTAMINATION TO SET FUEL SYSTEM DTCs AND ILLUMINATE THE MIL WITH NO DRIVEABILITY CONCERNS. DISCONNECTING THE MAF ON THESE VEHICLES WILL, THEREFORE, PRODUCE NO IMPROVEMENTS IN DRIVEABILITY. IN THESE CASES, IF THE BARO, LONGFT1, LONGFT2, AND MAF V PIDs INDICATE THAT THE MAF IS CONTAMINATED, PROCEED TO REPLACE THE MAF SENSOR.

After replacing the MAF sensor, disconnect the vehicle battery (5 minutes, minimum to reset KAM, or on newer vehicles, use the "KAM Reset" feature on the New Generation Star (NGS) Tester and verify that the lean driveability symptoms are gone.

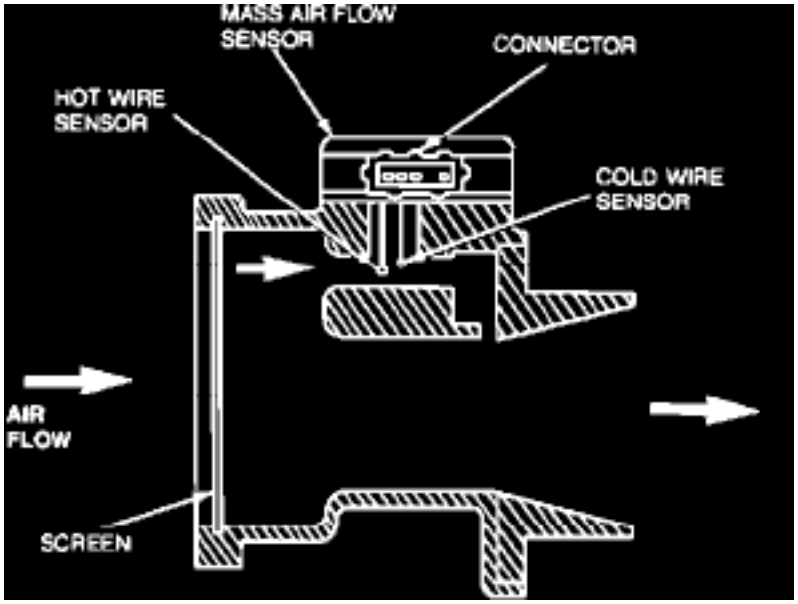
Mass Air Flow (MAF) Sensor



Mass Air Flow (MAF) Sensor: Description and Operation

Mass Air Flow Sensor

The Mass AirFlow (MAF) sensor, located between the air filter and the throttle body, is used to measure the mass of the air entering the engine due to volumetric displacement. The MAF sensor operates on the principle that if a mass is maintained at a constant temperature above the ambient environment, then the thermal loss is proportional to the mass flow of the cooling medium it is subjected to. The electronic module of the MAF sensor heats a wire element to 392°F (200°C) above ambient temperature. As air passes through the sensor, the air cools the wire element. The MAF sensor supplies more power to the wire to keep it at a constant temperature difference. When a drop in power useage occurs, the MAF sends a signal to the Engine Control Assembly (ECA) indicating the drop. The signal increases with the airflow into the engine.

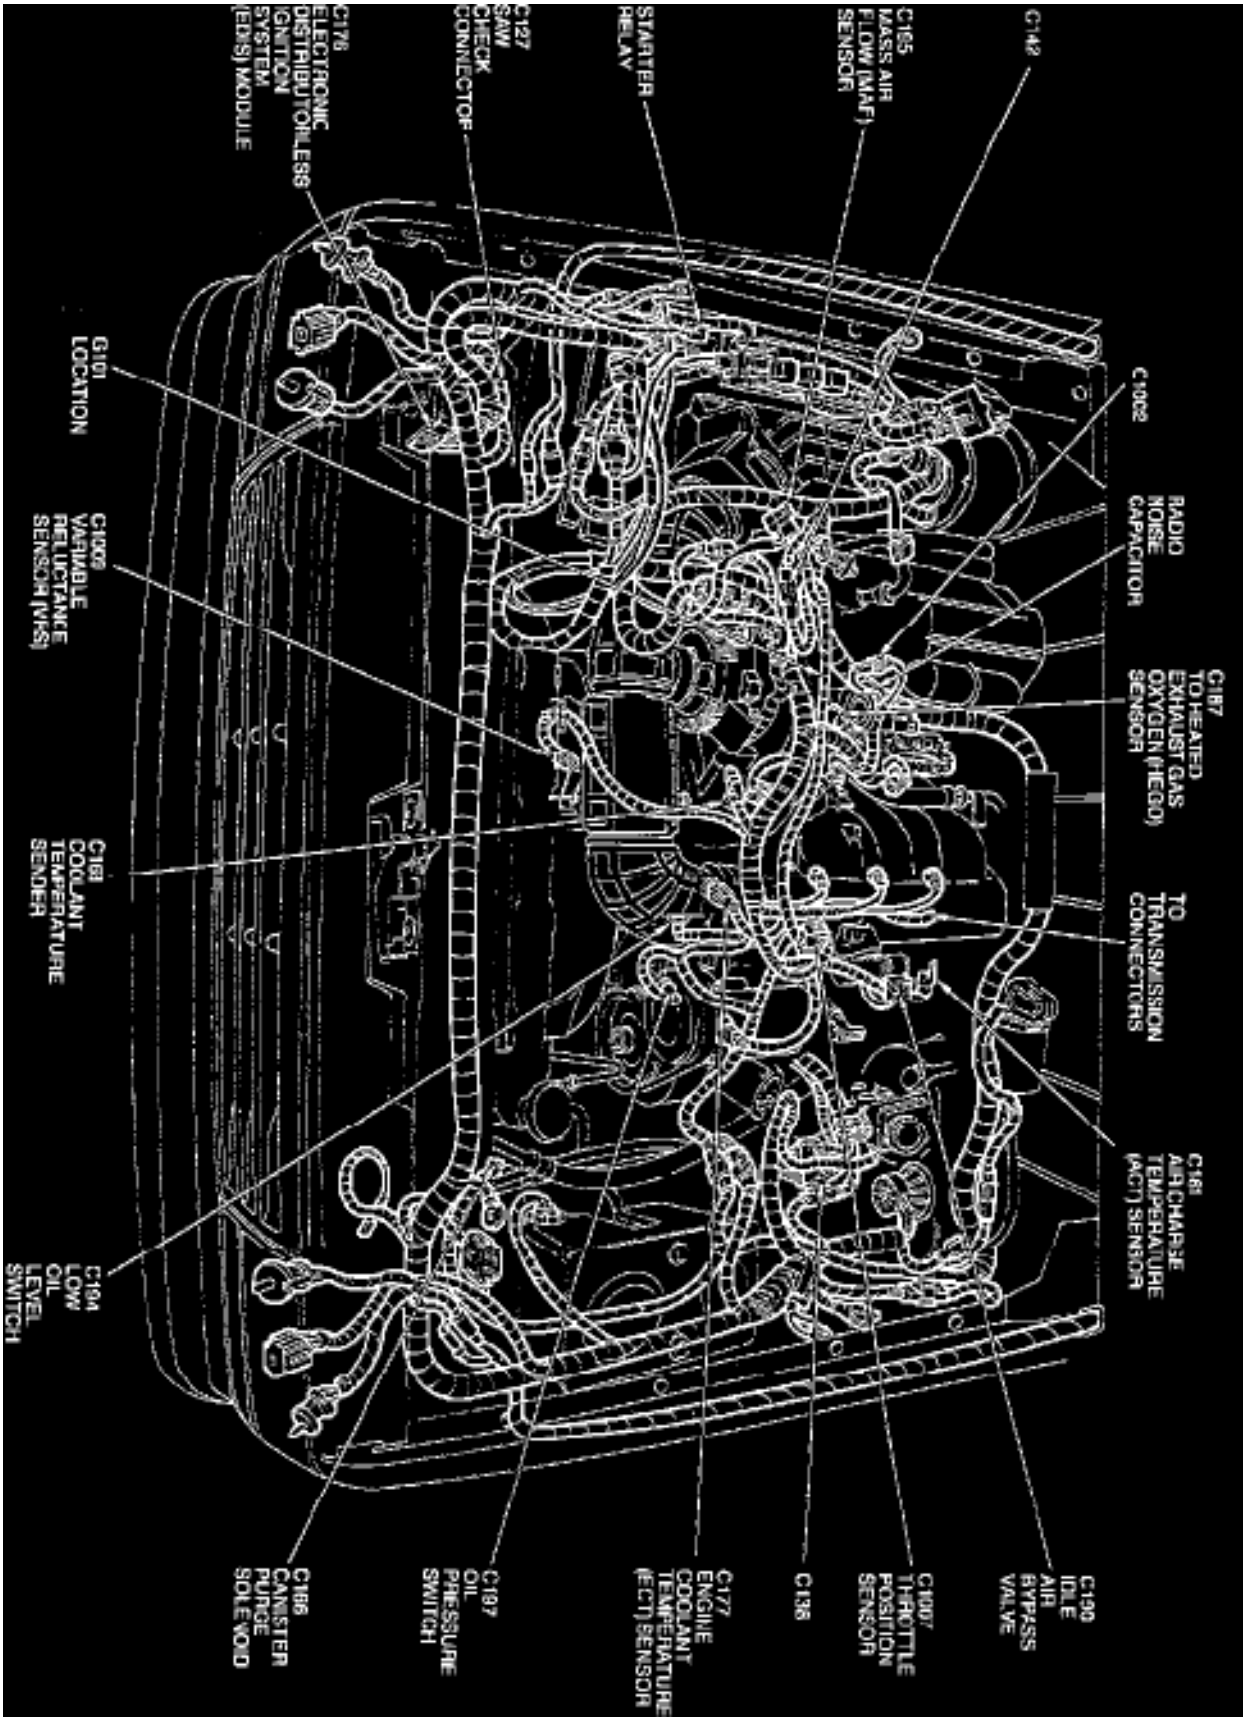
Ford Workshop Manuals > Powertrain Management > Computers and Control Systems > Intake Air Temperature Sensor > Component Information > Locations

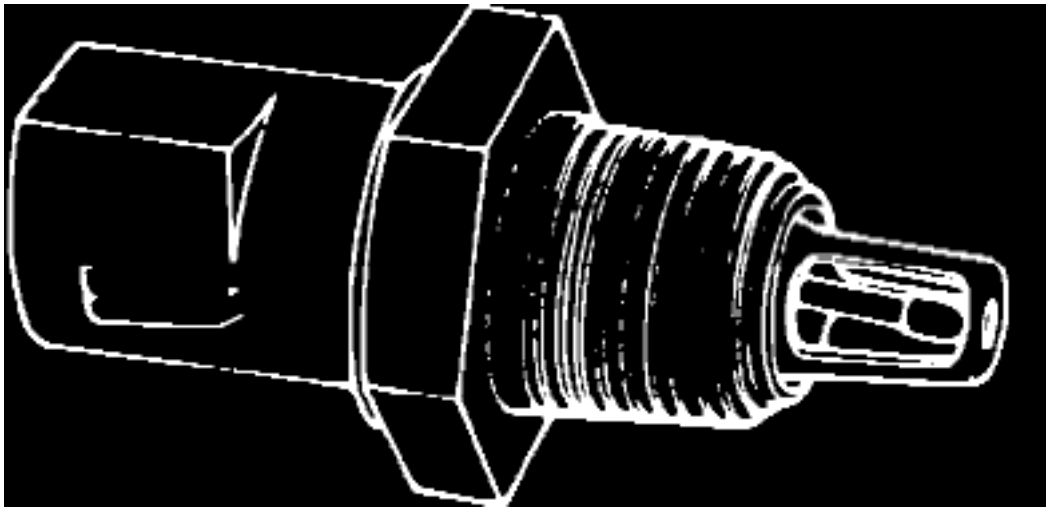


Intake Air Temperature Sensor: Locations

Engine Compartment Components.

Top LH Side Of Engine

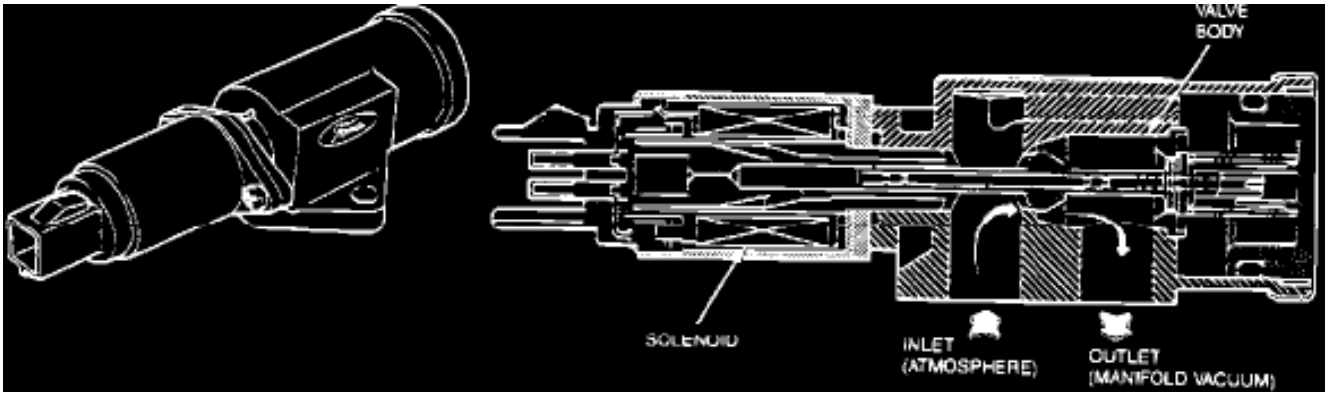
Applicable to: 4.0L/V6-244



Intake Air Temperature Sensor: Description and Operation

Air Charge Temperature (ACT) Sensor

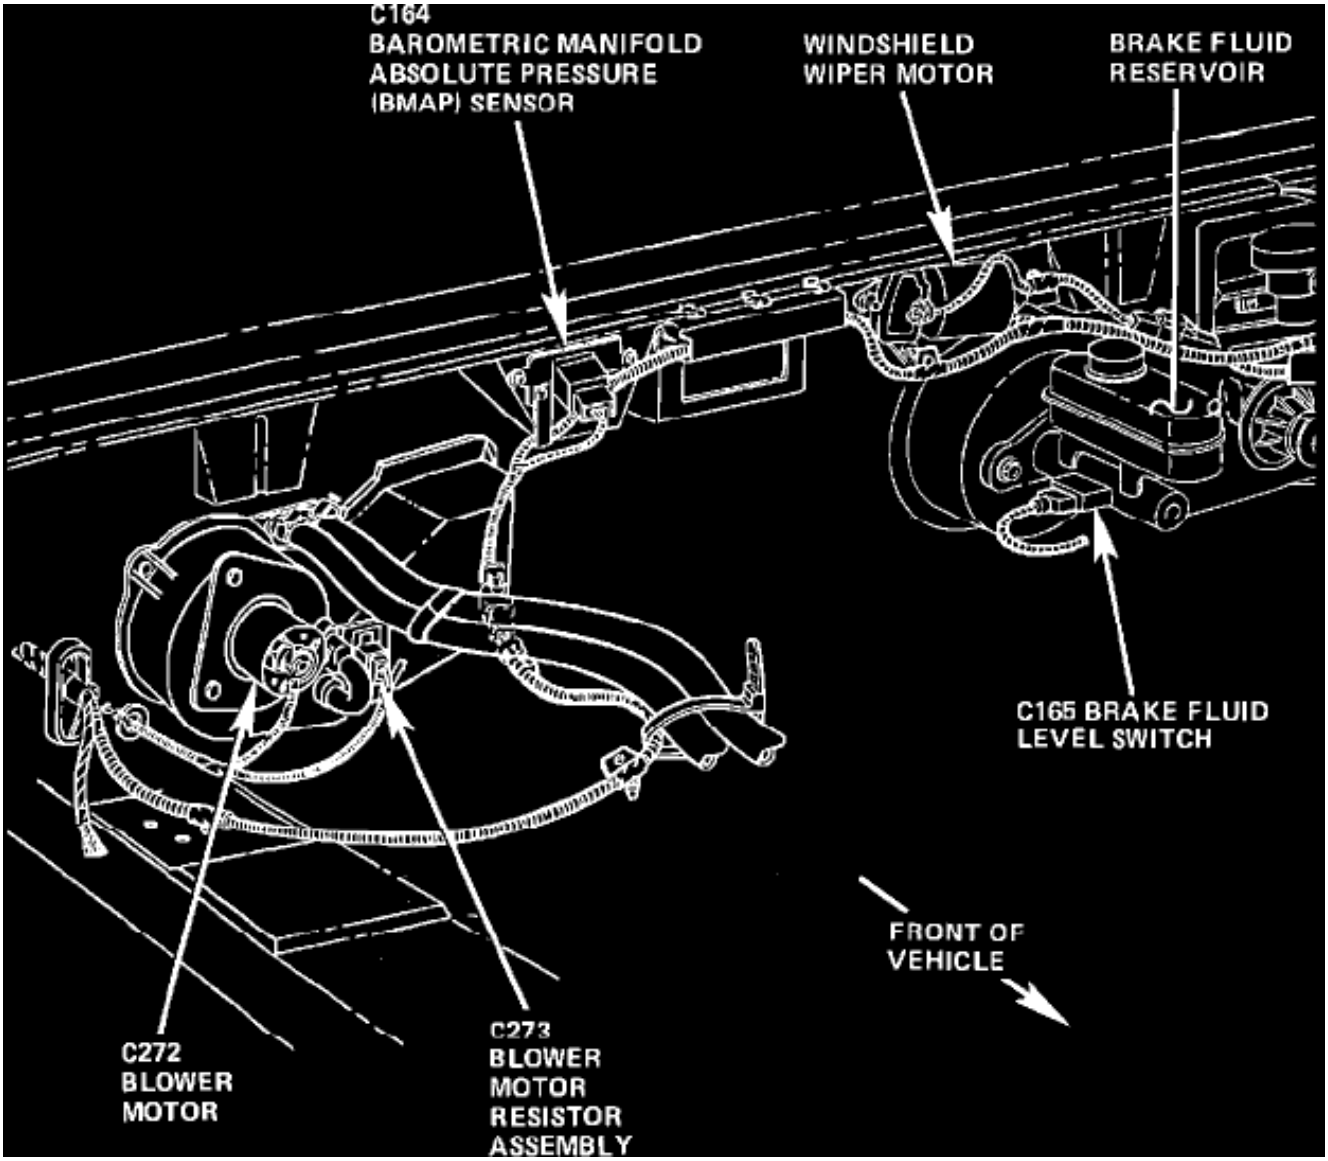
The Air Charge Temperature (ACT) sensor is threaded into the intake air passage with a sensing element extending into the air chamber. The ACT sensor is a negative temperature coefficient sensor, meaning that as the temperature of the sensor increases, the resistance will decrease. As the resistance value changes, the signal sensed by the Engine Control Assembly (ECA) will also change. The ECA reads the varying sensor resistance and determines the air charge temperature, using this information to optimize the air/fuel mixture. The ACT sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.



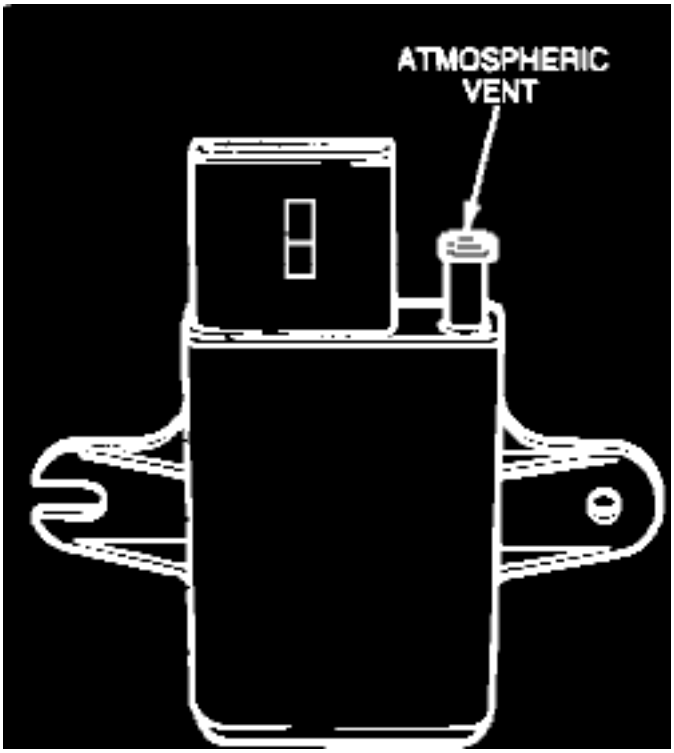
Auxiliary Air Valve (Idle Speed): Description and Operation

Idle Air Bypass Valve

The Idle Speed Control Bypass Air (ISC-BPA) valve is used to control engine idle speed and is operated by the Engine Control Assembly (ECA). This valve allows air to pass around the throttle plates to control cold engine fast idle, no touch start, over temperature idle boost and engine idle load correction.



Barometric/manifold Absolute Pressure (BMAP) Sensor



Barometric Pressure Sensor: Description and Operation

Barometric Pressure Sensor

The Barometric Pressure (BP) sensor is a frequency generating device that produces a varying signal depending on the amount of atmospheric (barometric) pressure. The Engine Control Assembly (ECA) monitors the frequency emitted from the BP sensor and converts the signal to atmospheric pressure. The ECA uses this reading to update the barometric pressure value stored in RAM memory. The ECA uses the input from the BP sensor to optimize the air/fuel ratio, ignition timing adjustment, and EGR flow control. The BP sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

Coolant Temperature Sensor/Switch (For Computer): Description and Operation

Engine Coolant Temperature Sensor

The Engine Coolant Temperature (ECT) sensor is threaded into a coolant passage with the sensing bulb extending into the coolant. The ECT sensor is a negative temperature coefficient sensor, meaning that as the temperature of the sensor increases, the resistance will decrease. As the resistance value changes, the signal sensed by the Engine Control Assembly (ECA) also changes. The ECA reads the varying sensor resistance and determines the engine operating temperature, using this information to optimize the air/fuel mixture and ignition timing. The ECT sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

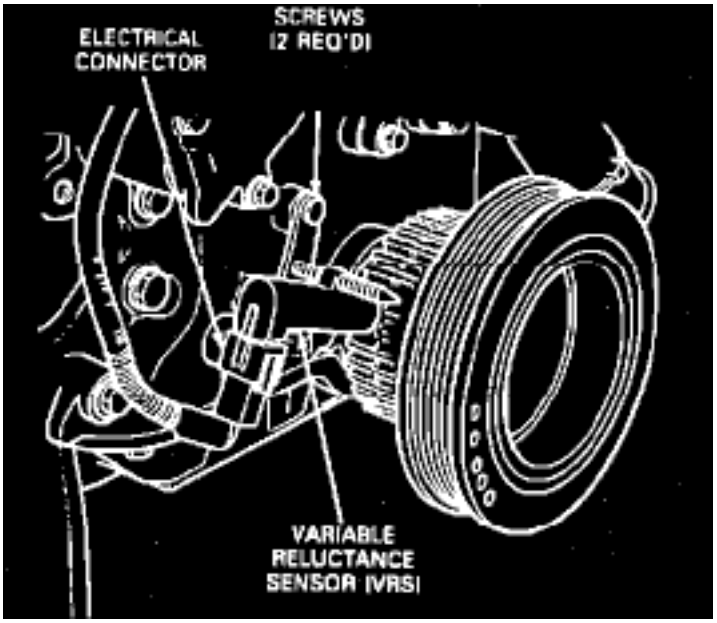
Crankshaft Position Sensor: Description and Operation

Crankshaft Timing Sensor

The crankshaft timing sensor is a variable reluctance type sensor. It is triggered by a 35 tooth trigger wheel tooth configuration machined into the rear of the crankshaft dampener. The signal generated by this sensor is called a Variable Reluctance Sensor (VRS) signal. The VRS signal provides the base timing and rpm information to the EDIS module. Base timing is set at 10° and is not adjustable.



Crankshaft Position Sensor: Service and Repair

Variable Reluctance (Crankshaft Position) Sensor

REMOVAL:

1. Disconnect the negative battery cable.

2. Disconnect the sensor electrical connector from the wiring harness.

3. Remove the Variable Reluctance (Crankshaft Position) Sensor mounting bolts and remove the sensor.

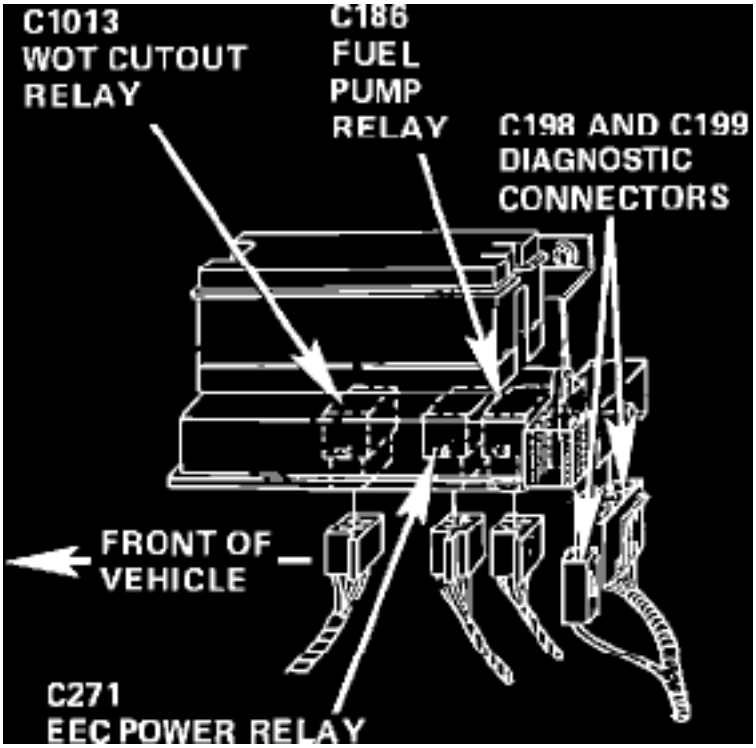
INSTALLATION:

1. Position the Variable Reluctance (Crankshaft Position) Sensor assembly on the engine.

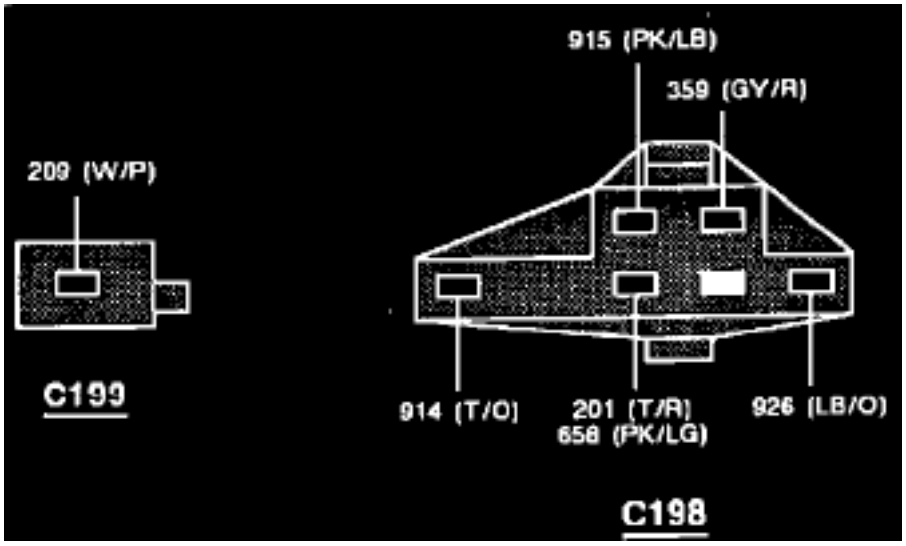
2. Install the two sensor attaching bolts and tighten to specified torque. (SEE SPECIFICATIONS/MECHANICAL)

3. Route the sensor wiring harness and connect the electrical connector to the sensor.

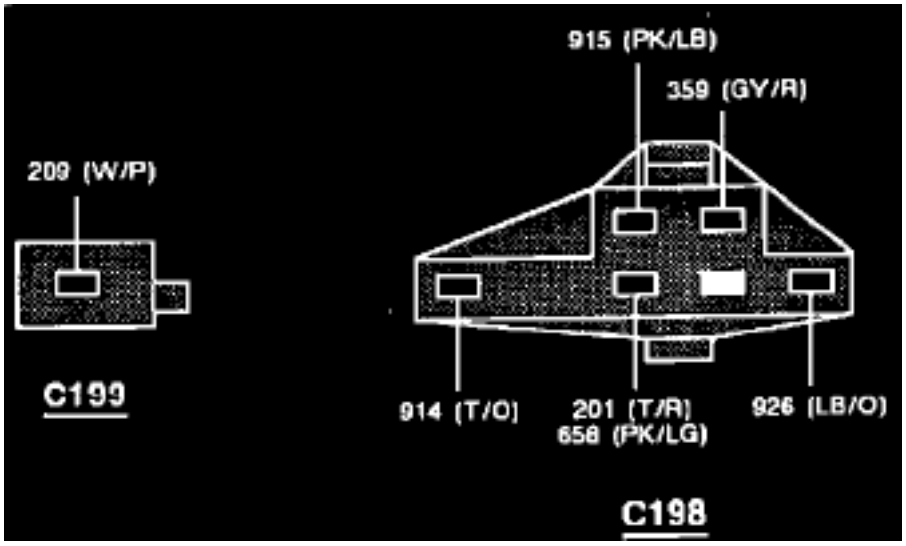
4. Connect the negative battery cable.



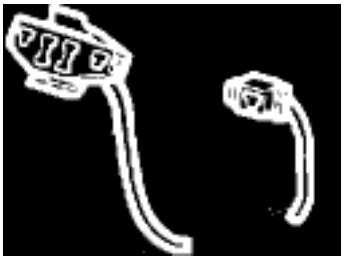
Relay And Diagnostic Connectors



Diagnostic Connector



Diagnostic Connector



Diagnostic Mode Switch/Connector: Description and Operation

Diagnostic Connector

The diagnostic connector is used to access the diagnostic mode of the Engine Control Assembly (ECA).

Engine Control Module: Customer Interest Exhaust System - Sulfur Odor

Article No. 93-24-19

11/24/93

EXHAUST - 4.0L - SULFUR ODOR

LIGHT TRUCK: 1990-93 RANGER 1991-93 EXPLORER

This TSB article is being republished in its entirety to correct the model application.

CALIBRATION: 0-58A-R00, 0-58P-R00, 1-58A-R10, 1-58P-R10, 2-58A-R00, 2-58P-R00, 0-58B-R00, 0-58R-R00, 1-58B-R10, 1-58R-R10, 2-58B-R00, 2-58R-R00

WARNING: THIS MODIFICATION IS AUTHORIZED ONLY FOR THE LISTED ENGINE. PERFORMING THIS MODIFICATION ON OTHER ENGINE CALIBRATIONS IS UNAUTHORIZED AND COULD CREATE LIABILITY UNDER APPLICABLE FEDERAL OR LOCAL LAWS.

ISSUE: An objectionable exhaust sulfur odor may be experienced during various driving conditions. This may be caused by the operating strategy of the EEC IV processor or by the catalytic converter, depending on the particular application.

ACTION: Use the following procedure to determine if a new EEC IV processor or a new catalytic converter is required. Vehicles previously serviced by TSB 93-3-17 may already have had the processor changed.

1. Perform the diagnostic procedure in the 1993 Powertrain Control/Emissions Diagnosis Service Manual, Page 2A-73. Service as required.

2. If the vehicle is a 1991-1992 Explorer with automatic transmission and the sulfur odor still exists:

a. Verify the processor part number. If not already updated, install a new EEC IV processor. Refer to the EEC IV Processor Application Chart contained in this TSB article for correct parts usage.

NOTE: THE BAP SENSOR IS NOT REQUIRED WITH THE NEW POWERTRAIN CONTROL MODULE BUT MAY REMAIN CONNECTED WITHOUT INTERFERENCE.

b. For 1991 models only, in addition to the standard entries on the Authorized Modifications Decal, write in the following instructions: "USE 1992 POWERTRAIN CONTROL/EMISSION DIAGNOSIS SERVICE MANUAL".

3. If the vehicle is:

a. a 1991-1992 Explorer with manual transmission,

b. a 1993 California Ranger/Explorer (automatic or manual transmission), or

Wire Color Code Identification

NOTE: Whenever a wire is labeled with two colors; the first color listed is the basic color of the wire, and the second color is the tracer marking of the wire. If the second color is followed by by a D, the tracer is dots. If the second color is followed by an H, the tracer is hash marks.

For example: BR/O is a brown wire with an orange stripe, R/Y D is a red wire with yellow dots and BK/W H is a black wire with white hash marks.

BL: Blue BK: Black

BR: Brown DB: Dark Blue DG: Dark Green GR: Green GY: Gray LB: Light Blue LG: Light Green N: Natural

O: Orange

PK: Pink R: Red

P: Purple

T: Tan

V: Violet

W: White

Y: Yellow

Pin locations given for reference only. Probing 60 pin connector with DVOM probe will result in permanent damage to the pin connectors. Always probe as directed, using the Breakout Box.

ECA Connector Pin Identification

Engine Control Module: Description and Operation Electronic Control Assembly (ECA)

The Electronic Control Assembly (ECA) receives ignition ground and Profile Ignition Pickup (PIP) signals from the EDIS module then generates a Spark Angle Word (SAW) output signal based on fuel, air and other sensor information. An IDM signal is received from the EDIS module to determine if a failure mode should be recorded. For diagnosis and testing of the ECA refer to "COMPUTERIZED ENGINE CONTROLS".

Engine Control Module: Description and Operation Failure Mode Effects Management

PURPOSE

Operating mode that attempts to keep the vehicle driveable in the event of certain Electronic Engine Control (EEC) or ignition system failures.

Engine Control Module: Service and Repair

The processor stores data about vehicle operating conditions and uses this information to compensate for component tolerances. When an emission related component is replaced, Keep Alive Memory (KAM) should be cleared to erase the data stored by the processor from the original component.

1. With the ignition switch OFF, disconnect the negative battery cable for a minimum of five minutes, then reconnect the cable.

2. Operate the vehicle for a minimum of ten miles to allow the Engine Control Assembly (ECA) to relearn values for optimum driveability and performance. NOTE: Distance varies with vehicle application.

Technical Service Bulletin # 91257 Date: 911213

Engine - Hard Cold Starts/Hesitation/Stalls On Start-Up

Article No. 91-25-7

12/13/91

^ HARD COLD START - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

^ HESITATION/STALLS - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

FORD: 1983-87 EXP 1983-91 ESCORT 1984-90 MUSTANG, THUNDERBIRD 1986-90 TAURUS 1986-91 CROWN VICTORIA 1988-90 TEMPO

LINCOLN-MERCURY: 1983-85 LN7 1983-87 LYNX 1984-88 CAPRI 1984-90 COUGAR 1986-90 CONTINENTAL, MARK VII, SABLE 1986-91 GRAND MARQUIS, TOWN CAR 1988-90 TOPAZ 1991 TRACER

LIGHT TRUCK: 1985-90 BRONCO II, BRONCO 1985-91 ECONOLINE, F-150-350 SERIES 1985-92 RANGER 1986-91 AEROSTAR 1991 EXPLORER

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

SERVICE KIT -9F939-

*** 1991 MODEL YEAR BUILT BEFORE 1/91
**** 1991 MODEL YEAR ALL CALIBRATIONS **EXCEPT** 1-97A-R00, 1-98A-R00, 1-98B-R00, 1-98C-R00, 1-98E-R00 AND 1-98F-R00.

TB-2432-A

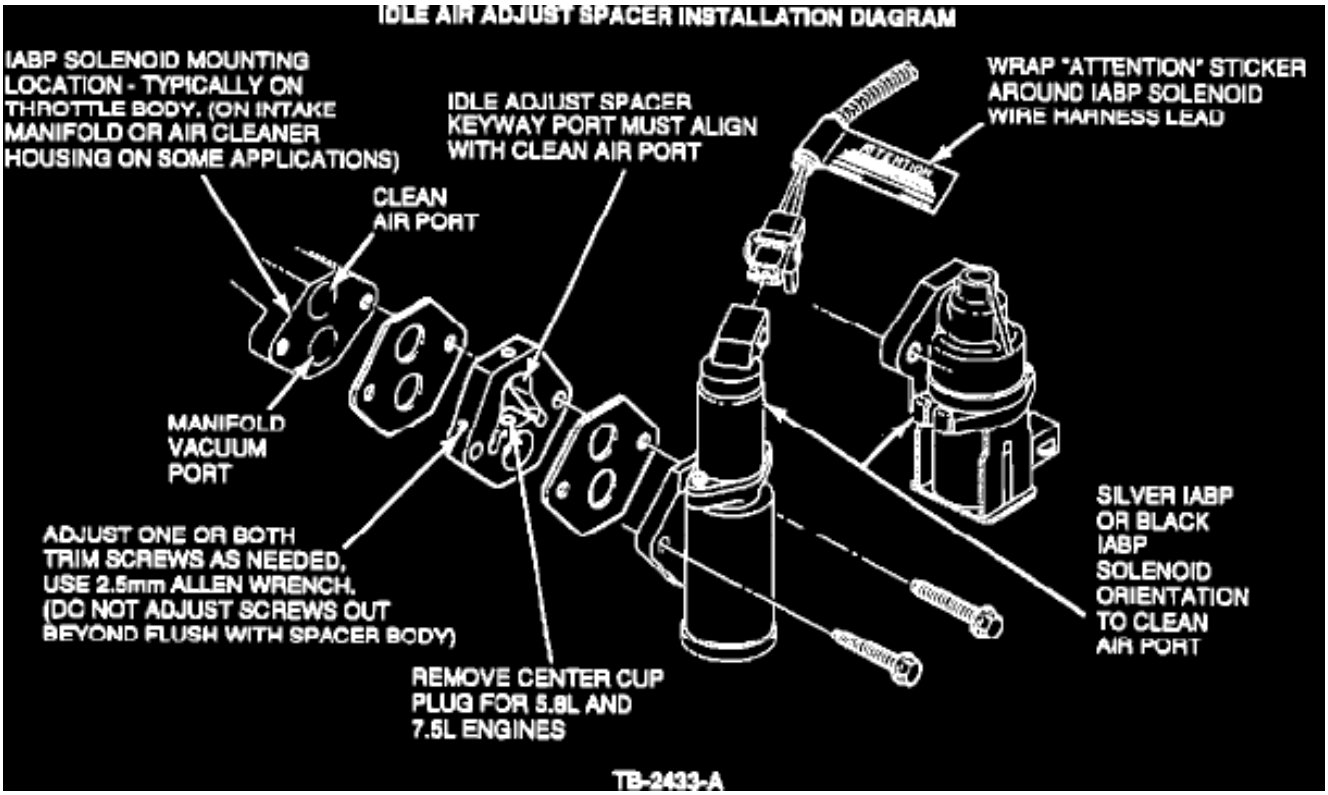
Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.

The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets



^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for

cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

TB-2432-A

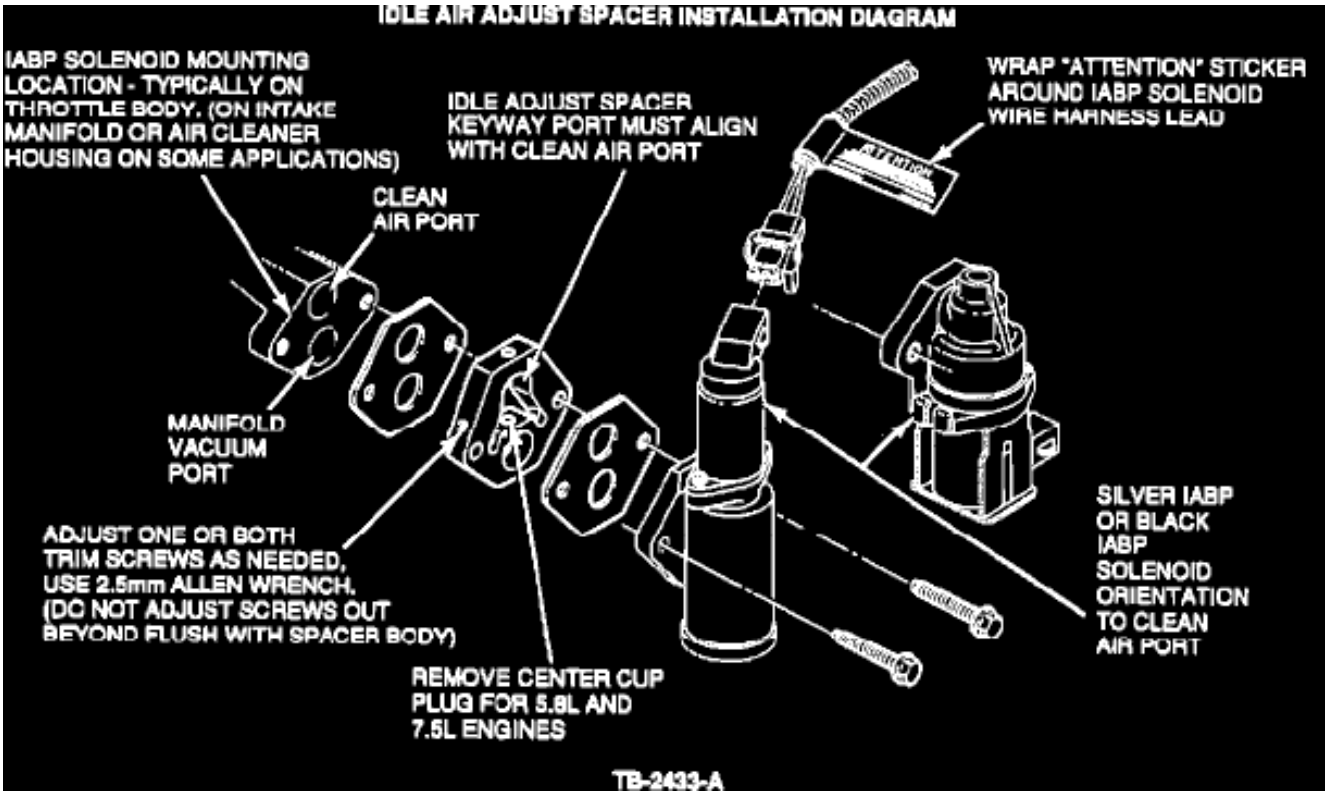
Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.

The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets



^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

Figure 5

The EFI throttle body idle speed adjustment procedures for the various model year passenger cars and light trucks are outlined in step-by-step procedures featured in Figures 3, 4 and 5. Select the appropriate procedure for the vehicle involved and adjust the throttle body idle RPM accordingly, after service kit installation.

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for

cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

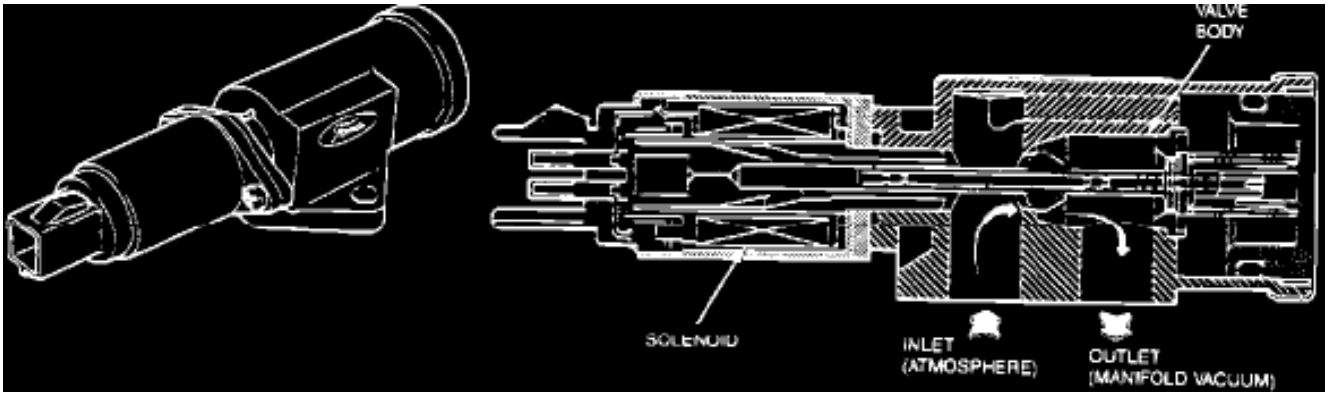
Idle Speed/Throttle Actuator - Electronic: Locations

Engine Compartment Components.

Top LH Side Of Engine

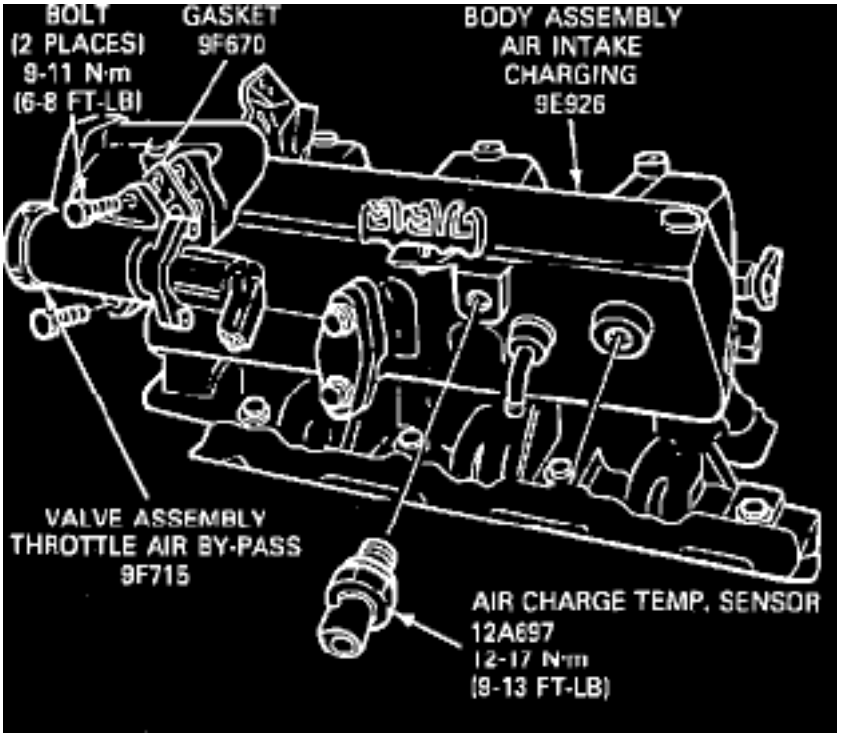
Applicable to: 4.0L/V6-244



Idle Speed/Throttle Actuator - Electronic: Description and Operation

Idle Air Bypass Valve

The Idle Speed Control Bypass Air (ISC-BPA) valve is used to control engine idle speed and is operated by the Engine Control Assembly (ECA). This valve allows air to pass around the throttle plates to control cold engine fast idle, no touch start, over temperature idle boost and engine idle load correction.



Idle Speed/Throttle Actuator - Electronic: Service and Repair

Intake Manifold

1. Disconnect the Idle Speed Control By-Pass Air (ISC-BPA) valve assembly connector from the wiring harness.

2. Remove the two ISC-BPA retaining bolts.

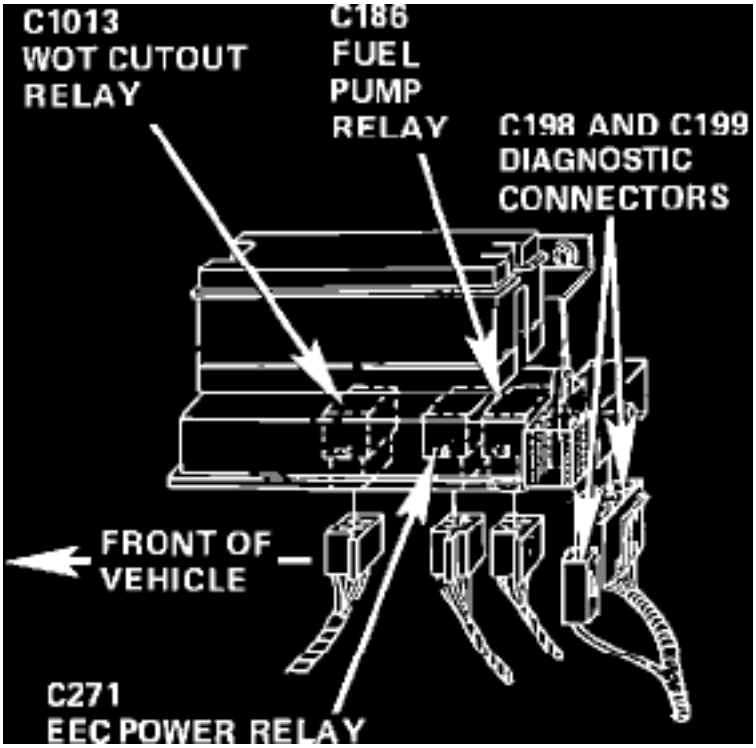
3. Remove the ISC-BPA valve and gasket.

4. Clean the gasket mating surfaces. NOTE: If scraping is necessary, use care not to damage ISC-BPA valve or throttle body gasket surfaces, or drop material into the throttle body.

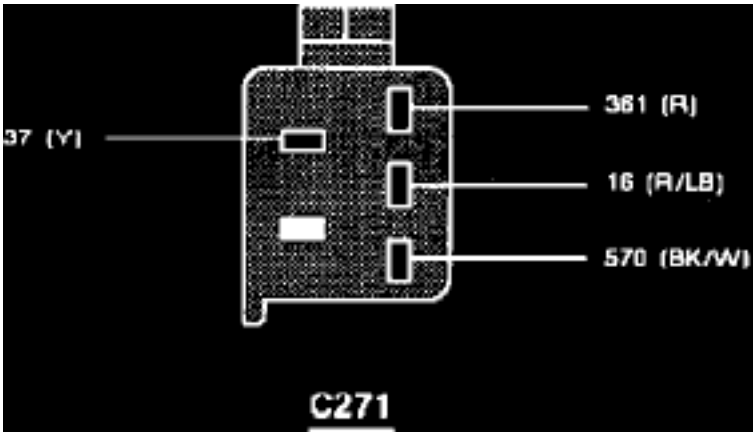
5. Install the gasket and ISC-BPA valve on the throttle body.

6. Install the retaining screws, torquing them to 72-96 lb. in. (9-11 N-m).

7. Connect the electrical connection for the ISC-BPA valve.



Relay And Diagnostic Connectors



EEC-IV Power Relay Connector

Main Relay (Computer/Fuel System): Description and Operation

The Engine Control Assembly (ECA) receives its operating voltage from the Electronic Engine Control (EEC) power relay. When the ignition switch is turned ON, the normally OPEN contact points of the relay CLOSE and supply power to the ECA. The control coil circuit of the relay contains a diode, wired in series, to prevent relay operation if the battery polarity is reversed, preventing damage to the ECA.

LIGHT TRUCK: 1990-94 AEROSTAR, RANGER 1991-94 EXPLORER

ISSUE: Some vehicles may have a disconnect of the Ignition Control Module (ICM) connector or moisture buildup within the connector. This can cause hard to start/no start, rough idle, or "check engine light" illumination concerns. The improved gasket and connector retainer that are currently used in production are now available for service of prior model distributorless ignition systems.

ACTION: Install new Connector Sleeve Retainer Clip and a current production seal (gasket). The clip assembles in between the connector beams and the ICM which will prevent accidental disconnects. The new seal is a "solid silicone" gasket that provides improved resistance to moisture entry into the connector. Refer to the ICM Connector Harness Wire Service kit (F5CZ-14A411-AA) for service details (I.S. 6621).

AFFECTED ENGINES

This TSB article is being republished in its entirety to update model applicability and to revise the part number of the Low Volatility Sealant.

ISSUE: EGO sensors can be contaminated if volatile types of silicone are used when servicing the engine. Volatile silicones can migrate throughout the system during the first one hundred hours of service. They are commonly found in liquid "silicone rubber" sealants and gasket material. These products are commonly sold in tubes and caulking-type cartridges.

ACTION: When service is performed on the engine, only use new low volatility silicone sealant (F1AZ-19662-A) where specified. Also replace the contaminated EGO sensor if required.

CAUTION: DO NOT SUBSTITUTE CONVENTIONAL SILICONE RUBBER SEALANTS WHEN LOW VOLATILITY SILICONE SEALANT IS SPECIFIED.

Oxygen Sensor: Description and Operation

Heated Oxygen Sensor

The Heated Exhaust Gas Oxygen (HEGO) sensor is threaded into the exhaust manifold with a sampling tip extending into the exhaust stream. The sensor is a zirconium dioxide ceramic thimble with platinum surface electrodes. The ceramic thimble is oxygen ion conductive and generates voltage due to the oxygen content difference between the atmosphere and the exhaust gas. The sensor will generate a voltage signal between 0 volts (lean condition) and 1.1 volts (rich condition). The ECU reads this signal to achieve an air/fuel ratio of 14.7:1 when operating in CLOSED LOOP. The HEGO sensor must operate above 600°F. To quickly heat up the sensor, a heating element is incorporated into the sensor. The HEGO sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

Oxygen Sensor: Service and Repair

The oxygen sensor has a permanently attached wire and connector. This should not be removed, since the removal will affect proper operation of the oxygen sensor.

1. Disconnect electrical connector from oxygen sensor.

2. Using a suitable oxygen sensor wrench, carefully remove the sensor from exhaust manifold or pipe. The oxygen sensor may be difficult to remove when engine temperature is below 120°F. CAUTION: Excessive force may damage threads in exhaust manifold or pipe.

3. If a new sensor is being used, install the new sensor into the manifold or pipe.

4. If an old sensor is being reused, coat threads with anti-seize compound, then install the sensor into the manifold or pipe.

5. Torque the oxygen sensor to 30-36 lb. ft. (40-50 N-m), and reconnect the electrical connector.

Engine Control Module: Customer Interest Exhaust System - Sulfur Odor

Article No. 93-24-19

11/24/93

EXHAUST - 4.0L - SULFUR ODOR

LIGHT TRUCK: 1990-93 RANGER 1991-93 EXPLORER

This TSB article is being republished in its entirety to correct the model application.

CALIBRATION: 0-58A-R00, 0-58P-R00, 1-58A-R10, 1-58P-R10, 2-58A-R00, 2-58P-R00, 0-58B-R00, 0-58R-R00, 1-58B-R10, 1-58R-R10, 2-58B-R00, 2-58R-R00

WARNING: THIS MODIFICATION IS AUTHORIZED ONLY FOR THE LISTED ENGINE. PERFORMING THIS MODIFICATION ON OTHER ENGINE CALIBRATIONS IS UNAUTHORIZED AND COULD CREATE LIABILITY UNDER APPLICABLE FEDERAL OR LOCAL LAWS.

ISSUE: An objectionable exhaust sulfur odor may be experienced during various driving conditions. This may be caused by the operating strategy of the EEC IV processor or by the catalytic converter, depending on the particular application.

ACTION: Use the following procedure to determine if a new EEC IV processor or a new catalytic converter is required. Vehicles previously serviced by TSB 93-3-17 may already have had the processor changed.

1. Perform the diagnostic procedure in the 1993 Powertrain Control/Emissions Diagnosis Service Manual, Page 2A-73. Service as required.

2. If the vehicle is a 1991-1992 Explorer with automatic transmission and the sulfur odor still exists:

a. Verify the processor part number. If not already updated, install a new EEC IV processor. Refer to the EEC IV Processor Application Chart contained in this TSB article for correct parts usage.

NOTE: THE BAP SENSOR IS NOT REQUIRED WITH THE NEW POWERTRAIN CONTROL MODULE BUT MAY REMAIN CONNECTED WITHOUT INTERFERENCE.

b. For 1991 models only, in addition to the standard entries on the Authorized Modifications Decal, write in the following instructions: "USE 1992 POWERTRAIN CONTROL/EMISSION DIAGNOSIS SERVICE MANUAL".

3. If the vehicle is:

a. a 1991-1992 Explorer with manual transmission,

b. a 1993 California Ranger/Explorer (automatic or manual transmission), or

Engine Control Module: All Technical Service Bulletins Exhaust System - Sulfur Odor

Article No. 93-24-19

11/24/93

EXHAUST - 4.0L - SULFUR ODOR

LIGHT TRUCK: 1990-93 RANGER 1991-93 EXPLORER

This TSB article is being republished in its entirety to correct the model application.

CALIBRATION: 0-58A-R00, 0-58P-R00, 1-58A-R10, 1-58P-R10, 2-58A-R00, 2-58P-R00, 0-58B-R00, 0-58R-R00, 1-58B-R10, 1-58R-R10, 2-58B-R00, 2-58R-R00

WARNING: THIS MODIFICATION IS AUTHORIZED ONLY FOR THE LISTED ENGINE. PERFORMING THIS MODIFICATION ON OTHER ENGINE CALIBRATIONS IS UNAUTHORIZED AND COULD CREATE LIABILITY UNDER APPLICABLE FEDERAL OR LOCAL LAWS.

ISSUE: An objectionable exhaust sulfur odor may be experienced during various driving conditions. This may be caused by the operating strategy of the EEC IV processor or by the catalytic converter, depending on the particular application.

ACTION: Use the following procedure to determine if a new EEC IV processor or a new catalytic converter is required. Vehicles previously serviced by TSB 93-3-17 may already have had the processor changed.

1. Perform the diagnostic procedure in the 1993 Powertrain Control/Emissions Diagnosis Service Manual, Page 2A-73. Service as required.

2. If the vehicle is a 1991-1992 Explorer with automatic transmission and the sulfur odor still exists:

a. Verify the processor part number. If not already updated, install a new EEC IV processor. Refer to the EEC IV Processor Application Chart contained in this TSB article for correct parts usage.

NOTE: THE BAP SENSOR IS NOT REQUIRED WITH THE NEW POWERTRAIN CONTROL MODULE BUT MAY REMAIN CONNECTED WITHOUT INTERFERENCE.

b. For 1991 models only, in addition to the standard entries on the Authorized Modifications Decal, write in the following instructions: "USE 1992 POWERTRAIN CONTROL/EMISSION DIAGNOSIS SERVICE MANUAL".

3. If the vehicle is:

a. a 1991-1992 Explorer with manual transmission,

b. a 1993 California Ranger/Explorer (automatic or manual transmission), or

Wire Color Code Identification

NOTE: Whenever a wire is labeled with two colors; the first color listed is the basic color of the wire, and the second color is the tracer marking of the wire. If the second color is followed by by a D, the tracer is dots. If the second color is followed by an H, the tracer is hash marks.

For example: BR/O is a brown wire with an orange stripe, R/Y D is a red wire with yellow dots and BK/W H is a black wire with white hash marks.

Pin locations given for reference only. Probing 60 pin connector with DVOM probe will result in permanent damage to the pin connectors. Always probe as directed, using the Breakout Box.

ECA Connector Pin Identification

Engine Control Module: Description and Operation Electronic Control Assembly (ECA)

The Electronic Control Assembly (ECA) receives ignition ground and Profile Ignition Pickup (PIP) signals from the EDIS module then generates a Spark Angle Word (SAW) output signal based on fuel, air and other sensor information. An IDM signal is received from the EDIS module to determine if a failure mode should be recorded. For diagnosis and testing of the ECA refer to "COMPUTERIZED ENGINE CONTROLS".

Engine Control Module: Description and Operation Failure Mode Effects Management

PURPOSE

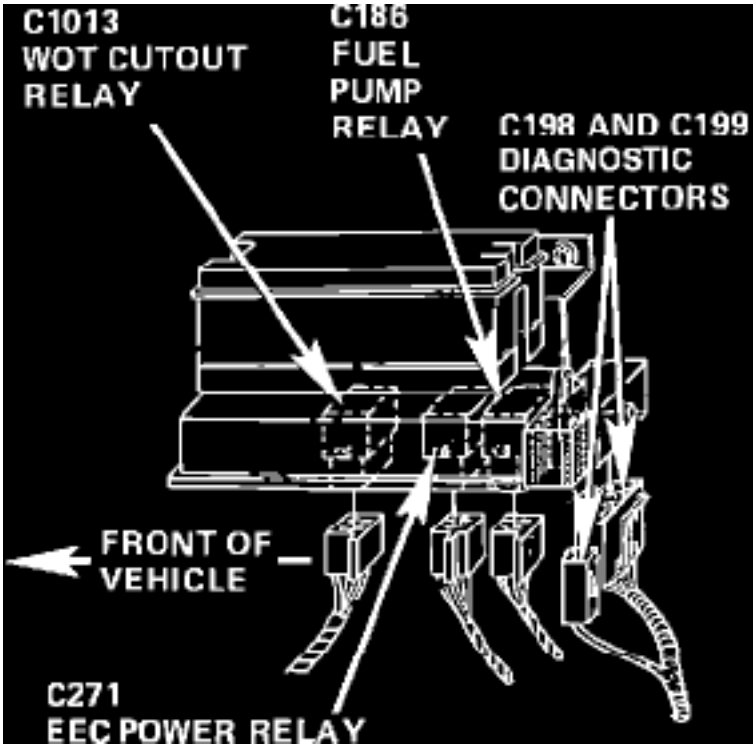
Operating mode that attempts to keep the vehicle driveable in the event of certain Electronic Engine Control (EEC) or ignition system failures.

Engine Control Module: Service and Repair

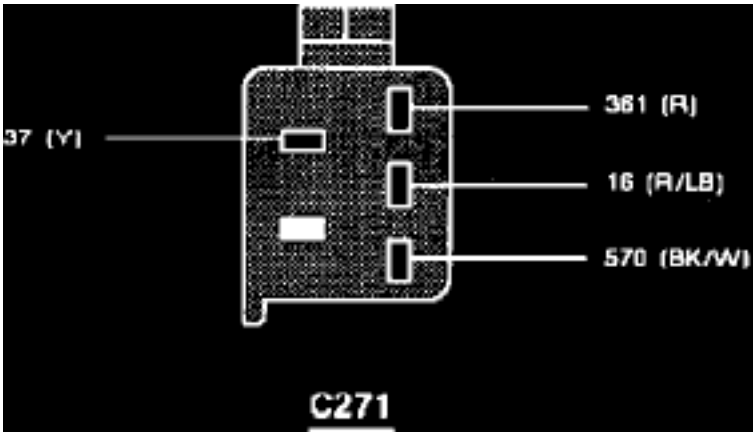
The processor stores data about vehicle operating conditions and uses this information to compensate for component tolerances. When an emission related component is replaced, Keep Alive Memory (KAM) should be cleared to erase the data stored by the processor from the original component.

1. With the ignition switch OFF, disconnect the negative battery cable for a minimum of five minutes, then reconnect the cable.

2. Operate the vehicle for a minimum of ten miles to allow the Engine Control Assembly (ECA) to relearn values for optimum driveability and performance. NOTE: Distance varies with vehicle application.



Relay And Diagnostic Connectors



EEC-IV Power Relay Connector

Main Relay (Computer/Fuel System): Description and Operation

The Engine Control Assembly (ECA) receives its operating voltage from the Electronic Engine Control (EEC) power relay. When the ignition switch is turned ON, the normally OPEN contact points of the relay CLOSE and supply power to the ECA. The control coil circuit of the relay contains a diode, wired in series, to prevent relay operation if the battery polarity is reversed, preventing damage to the ECA.

Mass Air Flow (MAF) Sensor: Customer Interest Engine - Lean Driveability Symptoms

Article No. 98-23-10

11/23/98

MASS AIR FLOW (MAF) - SENSOR CONTAMINATION - SERVICE TIP

ISSUE This TSB article is a diagnostic procedure to address vehicles that exhibit lean driveability symptoms and may or may not have any Diagnostic Trouble Codes (DTCs) stored in memory.

ACTION Follow the diagnostic procedures described in the following Service Tip. The revised diagnostic procedure is a more accurate means of diagnosing the symptoms.

SERVICE TIP

MASS AIR FLOW (MAF) DISCUSSION

MAF sensors can get contaminated from a variety of sources: dirt, oil, silicon, spider webs, potting compound from the sensor itself, etc. When a MAF sensor gets contaminated, it skews the transfer function such that the sensor over-estimates air flow at idle (causes the fuel system to go rich) and under-estimates air flow at high air flows (causes fuel system to go lean). This means Long Term Fuel Trims will learn lean (negative) corrections at idle and learn rich (positive) corrections at higher air flows.

If vehicle is driven at Wide Open Throttle (WOT) or high loads, the fuel system normally goes open loop rich to provide maximum power. If the MAF sensor is contaminated, the fuel system will actually be lean because of under-estimated air flow. During open loop fuel operation, the vehicle applies Long Term Fuel Trim corrections that have been learned during closed loop operation. These corrections are often lean corrections learned at lower air flows. This combination of under-estimated air flow and lean fuel trim corrections can result in spark knock/detonation and lack of power concerns at WOT and high loads.

One of the indicators for diagnosing this condition is barometric pressure. Barometric pressure (BARO) is inferred by the Powertrain Control Module (PCM) software at part throttle and WOT (there is no actual BARO sensor on MAF-equipped vehicles, except for the 3.8L Supercharged engine). At high air flows, a contaminated MAF sensor will under-estimate air flow coming into the engine, hence the PCM infers that the vehicle is operating at a higher altitude. The BARO reading is stored in Keep Alive Memory (KAM) after it is updated. Other indicators are Long Term Fuel Trim and MAF

voltage at idle.

NOTE

THE FOLLOWING PROCEDURE MAY ALSO BE USED TO DIAGNOSE VEHICLES THAT DO NOT HAVE FUEL SYSTEM/HO2S SENSOR DTCS.

Symptoms

^ Lack of Power

^ Spark Knock/Detonation

^ Buck/Jerk

^ Hesitation/Surge on Acceleration

^ Malfunction Indicator Lamp (MIL) Illuminated -

DTCs P0171, P0172, P0174, P0175 may be stored in memory

OBDII DTCs

^ P0171, P0174 (Fuel system lean, Bank 1 or 2)

^ P0172, P0175, (Fuel system rich, Bank 1 or 2)

^ P1130, P1131, P1132, (HO2S11 lack of switching, Bank 1)

^ P1150, P1151, P1152, (HO2S21 lack of switching, Bank 2)

OBDI DTCs

^ 181, 189 (Fuel system lean, Bank 1 or 2)

^ 179, 188 (Fuel system rich, Bank 1 or 2)

^ 171, 172, 173 (HO2S11 lack of switching, Bank 1)

^ 175, 176, 177 (HO2S21 lack of switching, Bank 2)

^ 184, 185 (MAF higher/lower than expected)

^ 186, 187 (Injector pulse width higher/lower than expected)

NOTE:

DO NOT DISCONNECT THE BATTERY. IT WILL ERASE KEEP ALIVE MEMORY AND RESET LONG TERM FUEL TRIM AND BARO TO THEIR STARTING/BASE VALUES. THE BARO PARAMETER IDENTIFICATION DISPLAY (PID) IS USED FOR THIS DIAGNOSTIC PROCEDURE. ALL OBDII APPLICATIONS HAVE THIS PID AVAILABLE. THERE ARE SOME OBDI VEHICLES THAT DO NOT HAVE THE BARO PID, FOR THESE VEHICLES OMIT THE BARO CHECK AND REFER ONLY TO STEPS 2, 3, AND 4 IN THE DIAGNOSTIC PROCEDURE.

BAROMETRIC PRESSURE REFERENCE			
Barometric Pressure (in. Hg.)	Barometric Pressure (kPa)	BARO/MAP PID (Hz)	Altitude above sea level (ft)
3.5	11.8	89.3	
5	16.9	92.8	
10	33.8	104.6	
15	50.7	117.0	14,000
20	67.5	129.6	10,000
21	70.9	132.5	9,000
22	74.3	135.4	8,000
23	77.7	138.3	7,000
24	81.1	141.1	6,000
25	84.4	144.0	5,000
26	87.8	146.9	4,000
27	91.2	149.8	3,000
28	94.6	152.8	2,000
29	97.9	155.8	1,000
30	101.3	158.9	0 (sea level)
31	104.7	162.0	
31.875	107.7	164.7	

1. Look at the BARO PID. Refer to the Barometric Pressure Reference Chart in this article. At sea level, BARO should read about 159 Hz (29.91 in. Hg). As a reference, Denver, Colorado at 1524 meters (5000 ft.) altitude should be about 144 Hz (24.88 in.Hg). Normal learned BARO variability is up to +/- 6 Hz (+/- 2 in. Hg.). If BARO indicates a higher altitude than you are not at (7 or more Hz lower than expected), you may have MAF contamination. If available, Service Bay Diagnostic System (SBDS) has a Manifold Absolute Pressure (MAP) sensor that can be used as a barometric pressure reference. Use "MAP/BARO" test under "Powertrain," "Testers and Meters." Ignore the hookup screen. Connect GP2 to the reference MAP on the following screen.

NOTE

REMEMBER THAT MOST WEATHER SERVICES REPORT A LOCAL BAROMETRIC PRESSURE THAT HAS BEEN CORRECTED TO SEA LEVEL. THE BARO PID, ON THE OTHER HAND, REPORTS THE ACTUAL BAROMETRIC PRESSURE FOR THE ALTITUDE THE VEHICLE IS BEING OPERATED IN. LOCAL WEATHER CONDITIONS (HIGH AND LOW PRESSURE AREAS) WILL CHANGE THE LOCAL BAROMETRIC PRESSURE BY SEVERAL INCHES OF MERCURY (+/- 3 Hz, +/- 1 in. Hg.).

NOTE

BARO IS UPDATED ONLY WHEN THE VEHICLE IS AT HIGH THROTTLE OPENINGS. THEREFORE, A VEHICLE WHICH IS DRIVEN DOWN FROM A HIGHER ALTITUDE MAY NOT HAVE HAD AN OPPORTUNITY TO UPDATE THE BARO VALUE IN KAM. IF YOU ARE NOT CONFIDENT THAT BARO HAS BEEN UPDATED, PERFORM THREE OR FOUR HEAVY, SUSTAINED ACCELERATIONS AT GREATER THAN HALF-THROTTLE TO ALLOW BARO TO UPDATE.

2. On a fully warmed up engine, look at Long Term Fuel Trim at idle, in Neutral, A/C off, (LONGFT1 and/or LONGFT2 PIDs). If it is more negative than -12%, the fuel system has learned lean corrections which may be due to the MAF sensor over-estimating air flow at idle. Note that both Banks 1 and 2 will exhibit negative corrections for 2-bank system. If only one bank of a 2-bank system has negative corrections, the MAF sensor is probably not contaminated.

3. On a fully warmed up engine, look at MAF voltage at idle, in Neutral, A/C off (MAF V PID). If it's 30% greater than the nominal MAF V voltage listed in the Powertrain Control/Emissions Diagnosis (PC/ED) Diagnostic Value Reference Charts for your vehicle, or greater than 1.1 volts as a rough guide, the MAF sensor is over-estimating air flow at idle.

4. If at least tow of the previous three steps are true, proceed to disconnect the MAF sensor connector. This puts the vehicle into Failure Mode and Effects Management (FMEM). In FMEM mode, air flow is inferred by using rpm and throttle position instead of reading the MAF sensor. (In addition, the BARO value is reset to a base/unlearned value.) If the lean driveability symptoms go away, the MAF sensor is probably contaminated and should be replaced. If the lean driveability symptoms do not go away, go to the PC/ED Service Manual for the appropriate diagnostics.

NOTE

DUE TO INCREASINGLY STRINGENT EMISSION/OBDII REQUIREMENTS, IT IS POSSIBLE FOR SOME VEHICLES WITH MAF SENSOR CONTAMINATION TO SET FUEL SYSTEM DTCs AND ILLUMINATE THE MIL WITH NO DRIVEABILITY CONCERNS. DISCONNECTING THE MAF ON THESE VEHICLES WILL, THEREFORE, PRODUCE NO IMPROVEMENTS IN DRIVEABILITY. IN THESE CASES, IF THE BARO, LONGFT1, LONGFT2, AND MAF V PIDs INDICATE THAT THE MAF IS CONTAMINATED, PROCEED TO REPLACE THE MAF SENSOR.

After replacing the MAF sensor, disconnect the vehicle battery (5 minutes, minimum to reset KAM, or on newer vehicles, use the "KAM Reset" feature on the New Generation Star (NGS) Tester and verify that the lean driveability symptoms are gone.

ISSUE This TSB article is a diagnostic procedure to address vehicles that exhibit lean driveability symptoms and may or may not have any Diagnostic Trouble Codes (DTCs) stored in memory.

ACTION Follow the diagnostic procedures described in the following Service Tip. The revised diagnostic procedure is a more accurate means of diagnosing the symptoms.

SERVICE TIP

MASS AIR FLOW (MAF) DISCUSSION

MAF sensors can get contaminated from a variety of sources: dirt, oil, silicon, spider webs, potting compound from the sensor itself, etc. When a MAF sensor gets contaminated, it skews the transfer function such that the sensor over-estimates air flow at idle (causes the fuel system to go rich) and under-estimates air flow at high air flows (causes fuel system to go lean). This means Long Term Fuel Trims will learn lean (negative) corrections at idle and learn rich (positive) corrections at higher air flows.

If vehicle is driven at Wide Open Throttle (WOT) or high loads, the fuel system normally goes open loop rich to provide maximum power. If the MAF sensor is contaminated, the fuel system will actually be lean because of under-estimated air flow. During open loop fuel operation, the vehicle applies Long Term Fuel Trim corrections that have been learned during closed loop operation. These corrections are often lean corrections learned at lower air flows. This combination of under-estimated air flow and lean fuel trim corrections can result in spark knock/detonation and lack of power concerns at WOT and high loads.

One of the indicators for diagnosing this condition is barometric pressure. Barometric pressure (BARO) is inferred by the Powertrain Control Module (PCM) software at part throttle and WOT (there is no actual BARO sensor on MAF-equipped vehicles, except for the 3.8L Supercharged engine). At high air flows, a contaminated MAF sensor will under-estimate air flow coming into the engine, hence the PCM infers that the vehicle is operating at a higher altitude. The BARO reading is stored in Keep Alive Memory (KAM) after it is updated. Other indicators are Long Term Fuel Trim and MAF

voltage at idle.

NOTE

THE FOLLOWING PROCEDURE MAY ALSO BE USED TO DIAGNOSE VEHICLES THAT DO NOT HAVE FUEL SYSTEM/HO2S SENSOR DTCS.

Symptoms

^ Lack of Power

^ Spark Knock/Detonation

^ Buck/Jerk

^ Hesitation/Surge on Acceleration

^ Malfunction Indicator Lamp (MIL) Illuminated -

DTCs P0171, P0172, P0174, P0175 may be stored in memory

OBDII DTCs

^ P0171, P0174 (Fuel system lean, Bank 1 or 2)

^ P0172, P0175, (Fuel system rich, Bank 1 or 2)

^ P1130, P1131, P1132, (HO2S11 lack of switching, Bank 1)

^ P1150, P1151, P1152, (HO2S21 lack of switching, Bank 2)

OBDI DTCs

^ 181, 189 (Fuel system lean, Bank 1 or 2)

^ 179, 188 (Fuel system rich, Bank 1 or 2)

^ 171, 172, 173 (HO2S11 lack of switching, Bank 1)

^ 175, 176, 177 (HO2S21 lack of switching, Bank 2)

^ 184, 185 (MAF higher/lower than expected)

^ 186, 187 (Injector pulse width higher/lower than expected)

NOTE:

DO NOT DISCONNECT THE BATTERY. IT WILL ERASE KEEP ALIVE MEMORY AND RESET LONG TERM FUEL TRIM AND BARO TO THEIR STARTING/BASE VALUES. THE BARO PARAMETER IDENTIFICATION DISPLAY (PID) IS USED FOR THIS DIAGNOSTIC PROCEDURE. ALL OBDII APPLICATIONS HAVE THIS PID AVAILABLE. THERE ARE SOME OBDI VEHICLES THAT DO NOT HAVE THE BARO PID, FOR THESE VEHICLES OMIT THE BARO CHECK AND REFER ONLY TO STEPS 2, 3, AND 4 IN THE DIAGNOSTIC PROCEDURE.

BAROMETRIC PRESSURE REFERENCE

Barometric Pressure (in. Hg.)	Barometric Pressure (kPa)	BARO/MAP PID (Hz)	Altitude above sea level (ft)
3.5	11.8	89.3	
5	16.9	92.8	
10	33.8	104.6	
15	50.7	117.0	14,000
20	67.5	129.6	10,000
21	70.9	132.5	9,000
22	74.3	135.4	8,000
23	77.7	138.3	7,000
24	81.1	141.1	6,000
25	84.4	144.0	5,000
26	87.8	146.9	4,000
27	91.2	149.8	3,000
28	94.6	152.8	2,000
29	97.9	155.8	1,000
30	101.3	158.9	0 (sea level)
31	104.7	162.0	
31.875	107.7	164.7	

1. Look at the BARO PID. Refer to the Barometric Pressure Reference Chart in this article. At sea level, BARO should read about 159 Hz (29.91 in. Hg). As a reference, Denver, Colorado at 1524 meters (5000 ft.) altitude should be about 144 Hz (24.88 in.Hg). Normal learned BARO variability is up to +/- 6 Hz (+/- 2 in. Hg.). If BARO indicates a higher altitude than you are not at (7 or more Hz lower than expected), you may have MAF contamination. If available, Service Bay Diagnostic System (SBDS) has a Manifold Absolute Pressure (MAP) sensor that can be used as a barometric pressure reference. Use "MAP/BARO" test under "Powertrain," "Testers and Meters." Ignore the hookup screen. Connect GP2 to the reference MAP on the following screen.

NOTE

REMEMBER THAT MOST WEATHER SERVICES REPORT A LOCAL BAROMETRIC PRESSURE THAT HAS BEEN CORRECTED TO SEA LEVEL. THE BARO PID, ON THE OTHER HAND, REPORTS THE ACTUAL BAROMETRIC PRESSURE FOR THE ALTITUDE THE VEHICLE IS BEING OPERATED IN. LOCAL WEATHER CONDITIONS (HIGH AND LOW PRESSURE AREAS) WILL CHANGE THE LOCAL BAROMETRIC PRESSURE BY SEVERAL INCHES OF MERCURY (+/- 3 Hz, +/- 1 in. Hg.).

NOTE

BARO IS UPDATED ONLY WHEN THE VEHICLE IS AT HIGH THROTTLE OPENINGS. THEREFORE, A VEHICLE WHICH IS DRIVEN DOWN FROM A HIGHER ALTITUDE MAY NOT HAVE HAD AN OPPORTUNITY TO UPDATE THE BARO VALUE IN KAM. IF YOU ARE NOT CONFIDENT THAT BARO HAS BEEN UPDATED, PERFORM THREE OR FOUR HEAVY, SUSTAINED ACCELERATIONS AT GREATER THAN HALF-THROTTLE TO ALLOW BARO TO UPDATE.

2. On a fully warmed up engine, look at Long Term Fuel Trim at idle, in Neutral, A/C off, (LONGFT1 and/or LONGFT2 PIDs). If it is more negative than -12%, the fuel system has learned lean corrections which may be due to the MAF sensor over-estimating air flow at idle. Note that both Banks 1 and 2 will exhibit negative corrections for 2-bank system. If only one bank of a 2-bank system has negative corrections, the MAF sensor is probably not contaminated.

3. On a fully warmed up engine, look at MAF voltage at idle, in Neutral, A/C off (MAF V PID). If it's 30% greater than the nominal MAF V voltage listed in the Powertrain Control/Emissions Diagnosis (PC/ED) Diagnostic Value Reference Charts for your vehicle, or greater than 1.1 volts as a rough guide, the MAF sensor is over-estimating air flow at idle.

4. If at least tow of the previous three steps are true, proceed to disconnect the MAF sensor connector. This puts the vehicle into Failure Mode and Effects Management (FMEM). In FMEM mode, air flow is inferred by using rpm and throttle position instead of reading the MAF sensor. (In addition, the BARO value is reset to a base/unlearned value.) If the lean driveability symptoms go away, the MAF sensor is probably contaminated and should be replaced. If the lean driveability symptoms do not go away, go to the PC/ED Service Manual for the appropriate diagnostics.

NOTE

DUE TO INCREASINGLY STRINGENT EMISSION/OBDII REQUIREMENTS, IT IS POSSIBLE FOR SOME VEHICLES WITH MAF SENSOR CONTAMINATION TO SET FUEL SYSTEM DTCs AND ILLUMINATE THE MIL WITH NO DRIVEABILITY CONCERNS. DISCONNECTING THE MAF ON THESE VEHICLES WILL, THEREFORE, PRODUCE NO IMPROVEMENTS IN DRIVEABILITY. IN THESE CASES, IF THE BARO, LONGFT1, LONGFT2, AND MAF V PIDs INDICATE THAT THE MAF IS CONTAMINATED, PROCEED TO REPLACE THE MAF SENSOR.

After replacing the MAF sensor, disconnect the vehicle battery (5 minutes, minimum to reset KAM, or on newer vehicles, use the "KAM Reset" feature on the New Generation Star (NGS) Tester and verify that the lean driveability symptoms are gone.

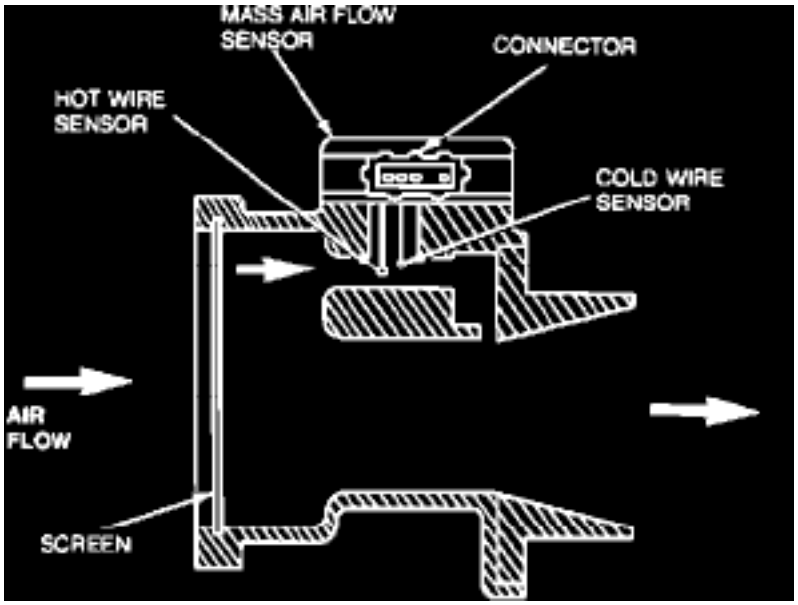
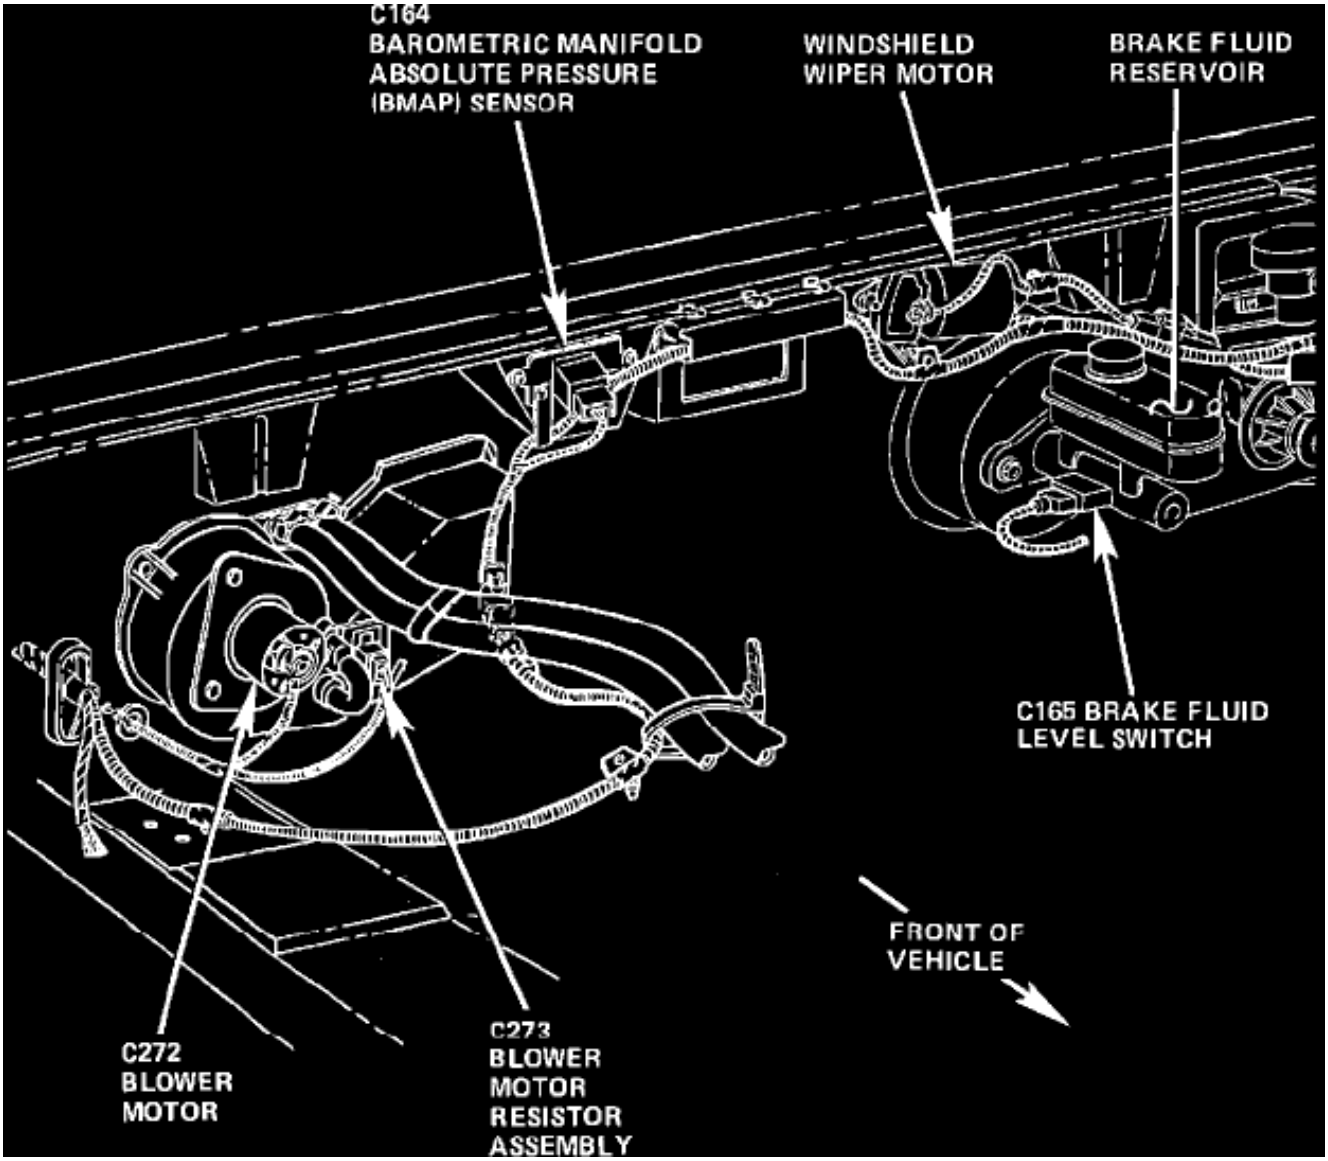
Mass Air Flow (MAF) Sensor



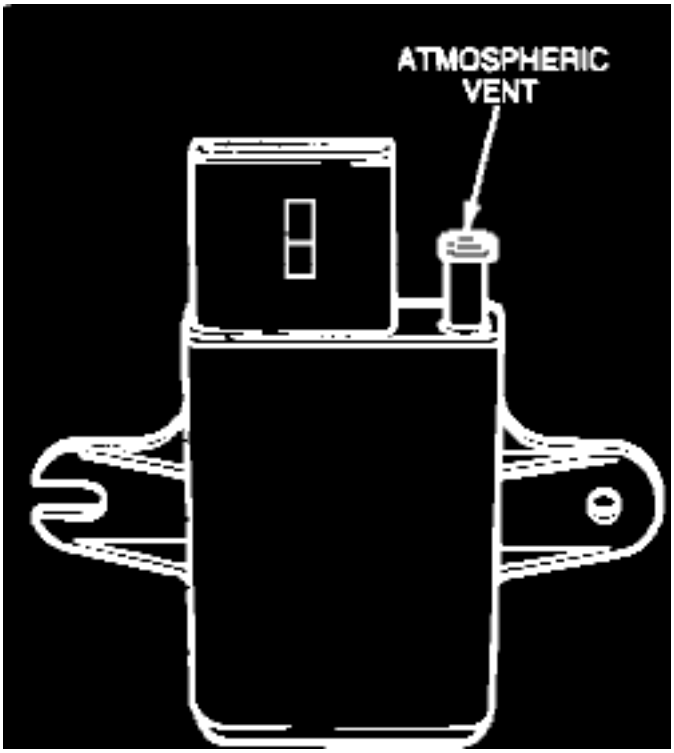
Mass Air Flow (MAF) Sensor: Description and Operation

Mass Air Flow Sensor

The Mass AirFlow (MAF) sensor, located between the air filter and the throttle body, is used to measure the mass of the air entering the engine due to volumetric displacement. The MAF sensor operates on the principle that if a mass is maintained at a constant temperature above the ambient environment, then the thermal loss is proportional to the mass flow of the cooling medium it is subjected to. The electronic module of the MAF sensor heats a wire element to 392°F (200°C) above ambient temperature. As air passes through the sensor, the air cools the wire element. The MAF sensor supplies more power to the wire to keep it at a constant temperature difference. When a drop in power useage occurs, the MAF sends a signal to the Engine Control Assembly (ECA) indicating the drop. The signal increases with the airflow into the engine.



Barometric/manifold Absolute Pressure (BMAP) Sensor



Barometric Pressure Sensor: Description and Operation

Barometric Pressure Sensor

The Barometric Pressure (BP) sensor is a frequency generating device that produces a varying signal depending on the amount of atmospheric (barometric) pressure. The Engine Control Assembly (ECA) monitors the frequency emitted from the BP sensor and converts the signal to atmospheric pressure. The ECA uses this reading to update the barometric pressure value stored in RAM memory. The ECA uses the input from the BP sensor to optimize the air/fuel ratio, ignition timing adjustment, and EGR flow control. The BP sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

Coolant Temperature Sensor/Switch (For Computer): Description and Operation

Engine Coolant Temperature Sensor

The Engine Coolant Temperature (ECT) sensor is threaded into a coolant passage with the sensing bulb extending into the coolant. The ECT sensor is a negative temperature coefficient sensor, meaning that as the temperature of the sensor increases, the resistance will decrease. As the resistance value changes, the signal sensed by the Engine Control Assembly (ECA) also changes. The ECA reads the varying sensor resistance and determines the engine operating temperature, using this information to optimize the air/fuel mixture and ignition timing. The ECT sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

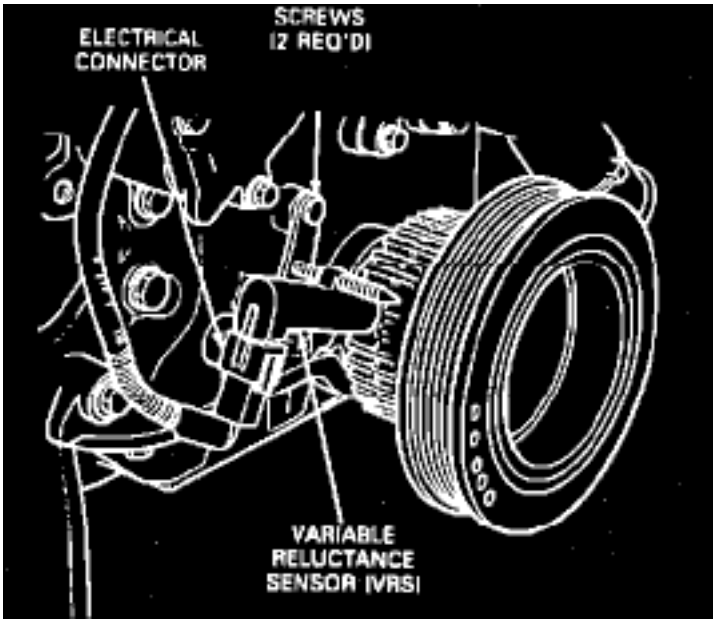
Crankshaft Position Sensor: Description and Operation

Crankshaft Timing Sensor

The crankshaft timing sensor is a variable reluctance type sensor. It is triggered by a 35 tooth trigger wheel tooth configuration machined into the rear of the crankshaft dampener. The signal generated by this sensor is called a Variable Reluctance Sensor (VRS) signal. The VRS signal provides the base timing and rpm information to the EDIS module. Base timing is set at 10° and is not adjustable.



Crankshaft Position Sensor: Service and Repair

Variable Reluctance (Crankshaft Position) Sensor

REMOVAL:

1. Disconnect the negative battery cable.

2. Disconnect the sensor electrical connector from the wiring harness.

3. Remove the Variable Reluctance (Crankshaft Position) Sensor mounting bolts and remove the sensor.

INSTALLATION:

1. Position the Variable Reluctance (Crankshaft Position) Sensor assembly on the engine.

2. Install the two sensor attaching bolts and tighten to specified torque. (SEE SPECIFICATIONS/MECHANICAL)

3. Route the sensor wiring harness and connect the electrical connector to the sensor.

4. Connect the negative battery cable.

This TSB article is being republished in its entirety to update model applicability and to revise the part number of the Low Volatility Sealant.

ISSUE: EGO sensors can be contaminated if volatile types of silicone are used when servicing the engine. Volatile silicones can migrate throughout the system during the first one hundred hours of service. They are commonly found in liquid "silicone rubber" sealants and gasket material. These products are commonly sold in tubes and caulking-type cartridges.

ACTION: When service is performed on the engine, only use new low volatility silicone sealant (F1AZ-19662-A) where specified. Also replace the contaminated EGO sensor if required.

CAUTION: DO NOT SUBSTITUTE CONVENTIONAL SILICONE RUBBER SEALANTS WHEN LOW VOLATILITY SILICONE SEALANT IS SPECIFIED.

Oxygen Sensor: Description and Operation

Heated Oxygen Sensor

The Heated Exhaust Gas Oxygen (HEGO) sensor is threaded into the exhaust manifold with a sampling tip extending into the exhaust stream. The sensor is a zirconium dioxide ceramic thimble with platinum surface electrodes. The ceramic thimble is oxygen ion conductive and generates voltage due to the oxygen content difference between the atmosphere and the exhaust gas. The sensor will generate a voltage signal between 0 volts (lean condition) and 1.1 volts (rich condition). The ECU reads this signal to achieve an air/fuel ratio of 14.7:1 when operating in CLOSED LOOP. The HEGO sensor must operate above 600°F. To quickly heat up the sensor, a heating element is incorporated into the sensor. The HEGO sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

Oxygen Sensor: Service and Repair

The oxygen sensor has a permanently attached wire and connector. This should not be removed, since the removal will affect proper operation of the oxygen sensor.

1. Disconnect electrical connector from oxygen sensor.

2. Using a suitable oxygen sensor wrench, carefully remove the sensor from exhaust manifold or pipe. The oxygen sensor may be difficult to remove when engine temperature is below 120°F. CAUTION: Excessive force may damage threads in exhaust manifold or pipe.

3. If a new sensor is being used, install the new sensor into the manifold or pipe.

4. If an old sensor is being reused, coat threads with anti-seize compound, then install the sensor into the manifold or pipe.

5. Torque the oxygen sensor to 30-36 lb. ft. (40-50 N-m), and reconnect the electrical connector.

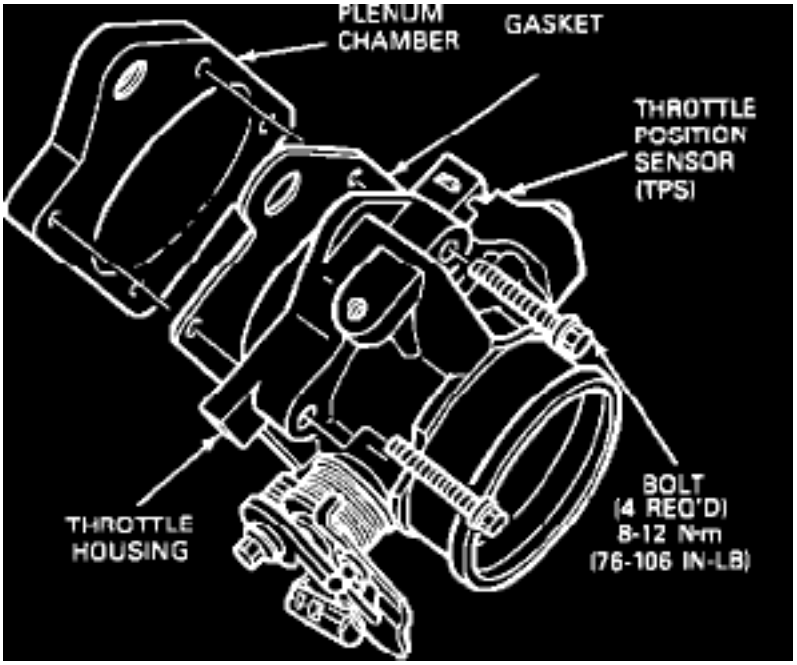
Throttle Position Sensor: Locations

Engine Compartment Components.

Top LH Front Of Engine

Applicable to: 4.0L/V6-244



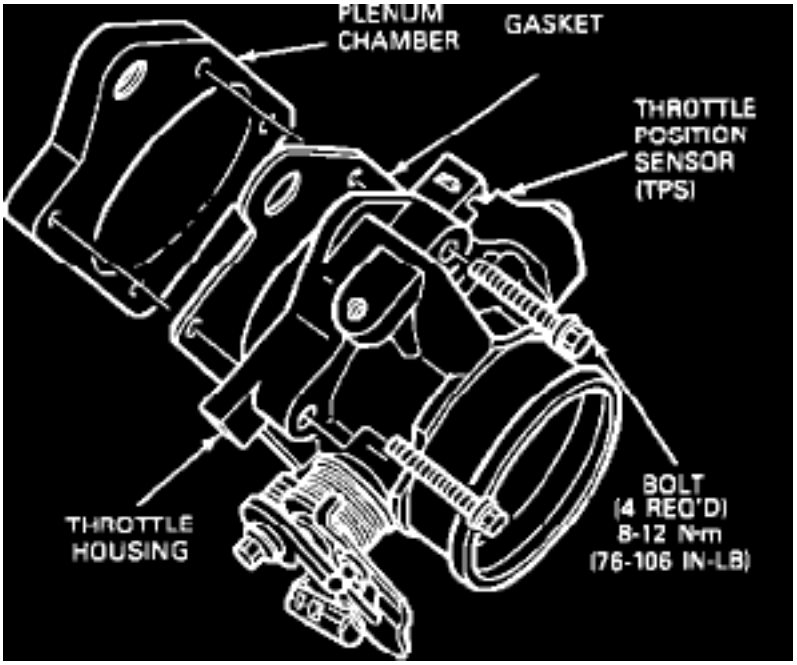
Throttle Position Sensor: Description and Operation

Throttle Body Assembly

The Throttle Position (TP) sensor, mounted on the throttle body, is a potentiometer that monitors throttle plate angle and sends a signal to the Engine Control Assembly (ECA). The TP sensor contains a pivot arm that moves along a curved resistor. One of the sensor leads supplies a five (5) volt reference signal (sent by the ECA) to the resistor. The second lead is used to ground the resistor. The third lead is for the voltage signal to the ECA. As the throttle plates move, the pivot arm moves along the curved resistor and receives a varying voltage signal. The ECA reads this signal and converts it into throttle plate angle. The voltage signal ranges from approximately one (1) volt at idle to approximately five (5) volts at wide open throttle. The TP sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

Throttle Position Sensor: Adjustments

The Throttle Position (TP) sensor is non-adjustable. If the voltage readings are out of range, the sensor must be replaced.



Throttle Position Sensor: Service and Repair

Throttle Body Assembly

1. Disconnect the Throttle Position (TP) sensor from the wiring harness.

2. If reinstalling the same TP sensor, mark the position of the TP sensor by scribing a mark on the sensor and throttle body.

3. Remove the TP sensor retaining screws, then remove the TP sensor and gasket.

4. Install a new gasket and the TP sensor, positioning the throttle position sensor so that the connector is facing rearward. Rotate the TP sensor clockwise to align the scribe mark (from step 2).

5. Install the TP sensor retaining screws, tightening to 11-16 lb. in. (1.2-1.8 N-m).

6. Connect the TP sensor electrical connector.

NOTE: The TP sensor is not adjustable.

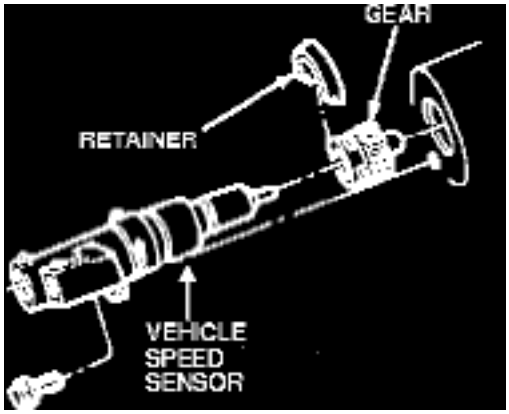
Vehicle Speed Sensor



Vehicle Speed Sensor: Description and Operation

Vehicle Speed Sensor

The Vehicle Speed Sensor (VSS) is a magnetic pulse generator driven by the transmission speedometer gear. The VSS produces 16 AC signals per revolution and sends this signal to the Engine Control Unit (ECA). The ECA converts this signal to a vehicle speed value and stores that value in RAM memory. The ECA uses this value to aid in controlling torque converter lock-up, coolant fan control, vehicle speed control, air/fuel ratio, and igniting timing.

Vehicle Speed Sensor: Service and Repair

1. Separate electrical connector leading to the amplifier assembly.

2. Disconnect upper and lower speedometer cables at the speed sensor. Remove speed sensor.

3. Reverse procedure to install.

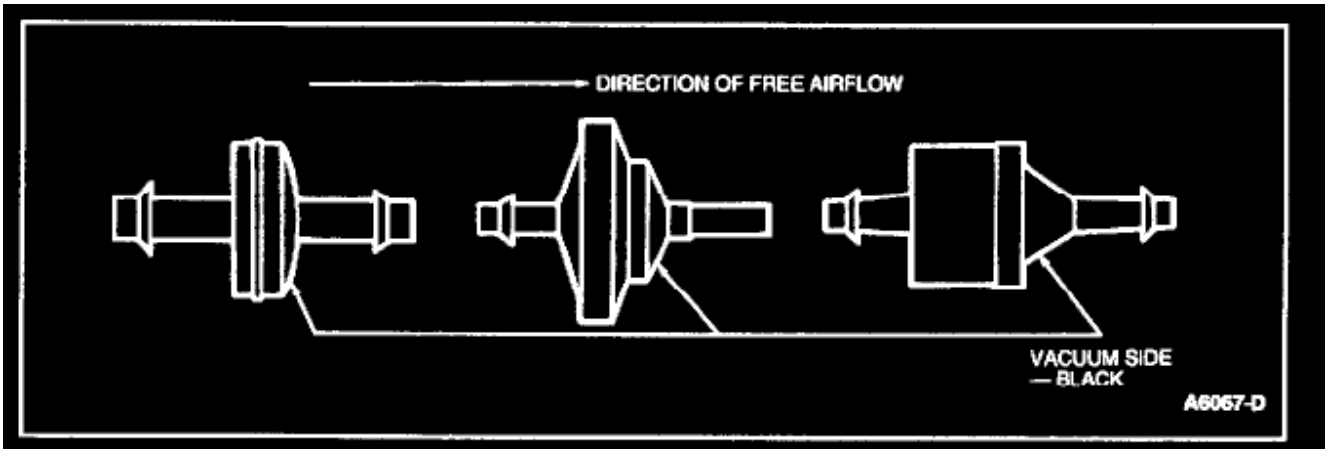

Figure 125: Vacuum Check Valve

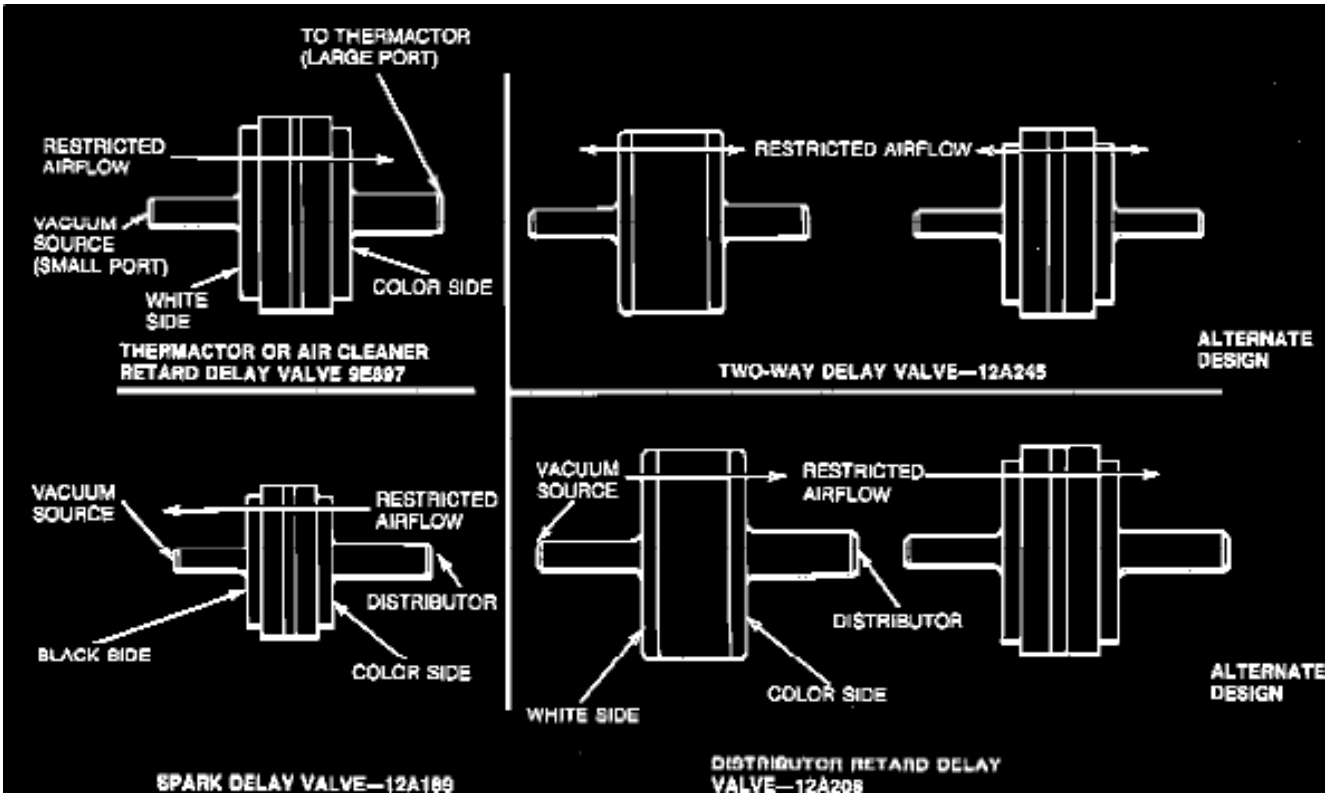
Vacuum Check Valve: Description and Operation

Vacuum Check Valve

The Vacuum Check Valve allows vacuum to be applied in one direction only. The check valve is designed maintain a steady vacuum application to a component or within a vacuum line. This helps to reduce any rapid fluctuations and/or sudden drops in the vacuum signal, due to engine load or acceleration. When vacuum is applied to one side of the check valve, it should hold. When applied to the other side of the check valve, vacuum should not be drawn allowing free airflow.



Vacuum Delay Valve: Description and Operation

The Vacuum Delay Valve (VDV) is usually located within the vacuum hose routing or harness assembly. These valves are designed to decrease the rate at which vacuum is applied to or released from a component.

Types Of Vacuum Delay Valves

There are three basic types of Delay Valves

VACUUM DELAY VALVE (VDV) - Delays the application of vacuum to a vacuum-operated component.

VACUUM RETARD DELAY VALVE (VRDV) - Delays the loss of a vacuum signal to a component when source vacuum decreases suddenly. May be used to delay the release of vacuum from any diaphragm as a momentary trap for vacuum.

TWO-WAY DELAY VALVE (DV-TW) - Delays vacuum equally in either direction. This valve is commonly used in Evaporative Emission Controls and can be inserted in the vacuum line in either direction.

Catalytic Converter: Customer Interest Exhaust System - Sulfur Odor

Article No. 93-24-19

11/24/93

EXHAUST - 4.0L - SULFUR ODOR

LIGHT TRUCK: 1990-93 RANGER 1991-93 EXPLORER

This TSB article is being republished in its entirety to correct the model application.

CALIBRATION: 0-58A-R00, 0-58P-R00, 1-58A-R10, 1-58P-R10, 2-58A-R00, 2-58P-R00, 0-58B-R00, 0-58R-R00, 1-58B-R10, 1-58R-R10, 2-58B-R00, 2-58R-R00

WARNING: THIS MODIFICATION IS AUTHORIZED ONLY FOR THE LISTED ENGINE. PERFORMING THIS MODIFICATION ON OTHER ENGINE CALIBRATIONS IS UNAUTHORIZED AND COULD CREATE LIABILITY UNDER APPLICABLE FEDERAL OR LOCAL LAWS.

ISSUE: An objectionable exhaust sulfur odor may be experienced during various driving conditions. This may be caused by the operating strategy of the EEC IV processor or by the catalytic converter, depending on the particular application.

ACTION: Use the following procedure to determine if a new EEC IV processor or a new catalytic converter is required. Vehicles previously serviced by TSB 93-3-17 may already have had the processor changed.

1. Perform the diagnostic procedure in the 1993 Powertrain Control/Emissions Diagnosis Service Manual, Page 2A-73. Service as required.

2. If the vehicle is a 1991-1992 Explorer with automatic transmission and the sulfur odor still exists:

a. Verify the processor part number. If not already updated, install a new EEC IV processor. Refer to the EEC IV Processor Application Chart contained in this TSB article for correct parts usage.

NOTE: THE BAP SENSOR IS NOT REQUIRED WITH THE NEW POWERTRAIN CONTROL MODULE BUT MAY REMAIN CONNECTED WITHOUT INTERFERENCE.

b. For 1991 models only, in addition to the standard entries on the Authorized Modifications Decal, write in the following instructions: "USE 1992 POWERTRAIN CONTROL/EMISSION DIAGNOSIS SERVICE MANUAL".

3. If the vehicle is:

a. a 1991-1992 Explorer with manual transmission,

b. a 1993 California Ranger/Explorer (automatic or manual transmission), or

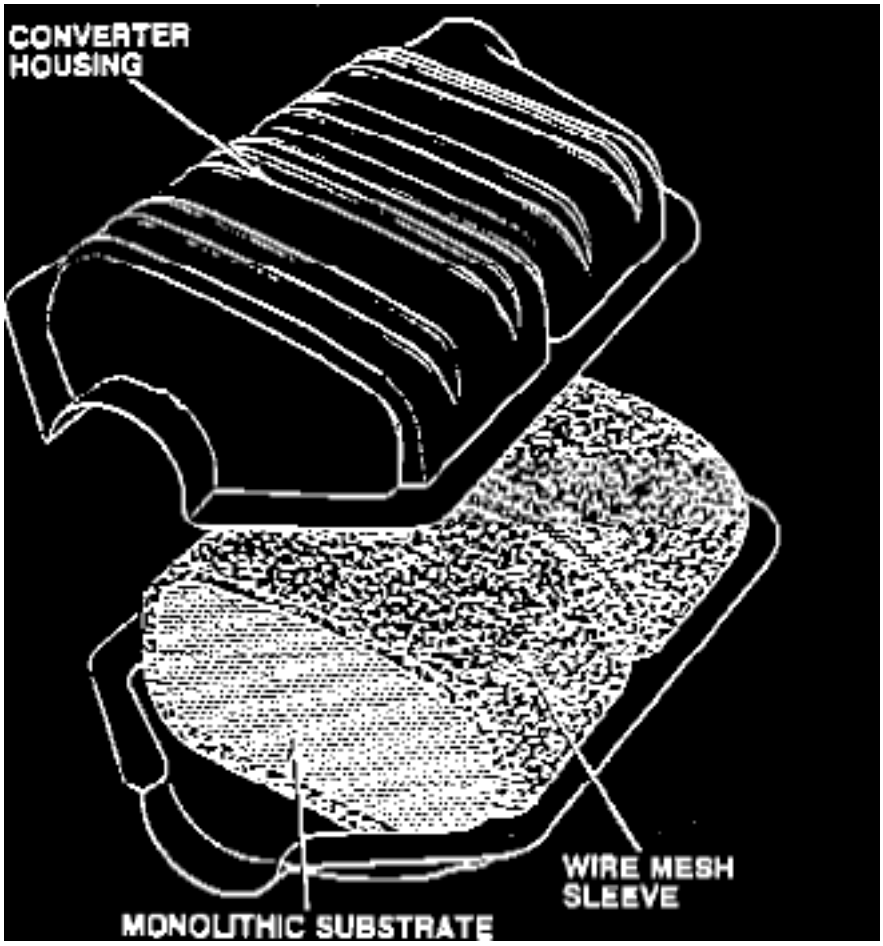
Exhaust System w/Catalytic Converter



Catalytic Converter: Description and Operation

The Catalytic Converter is mounted under the vehicles body within the exhaust system, and is designed to convert harmful exhaust gas pollutants, Carbon Monoxide (CO), Hydrocarbons (HC), and Oxides of Nitrogen (NOx) to harmless by-products of Nitrogen (N), Carbon Dioxide (CO2) and water vapor (H2O) through a catalytic chemical reaction.

Single Brick Catalytic Converter

Two types of converters in use today are the Conventional Oxidation Converter (COC) and Oxidation-Reduction Converter. Both consists of two stamped aluminum or stainless steel pieces welded together to form a round or oval housing.

Oval-type converters contain tiny pellets that are impregnated with the catalyzing element(s). Although this type of converter is known to create a fair amount of exhaust restriction, it is less expensive to manufacture and in some vehicle models contaminated pellets may be replaced. The round-type converter contains one or more ceramic monolithic honeycomb substrates. The substrate bricks or beds are impregnated with the catalyzing element(s), then covered by a wire mesh sleeve for insulation and protection from shock and severe jolts. A diffuser inside the shell allows the exhaust gases to flow uniformly over the entire area of the substrate.

THE OXIDATION REACTION

In order to change HC and CO into harmless materials, the catalytic elements (platinum and palladium) start an oxidation, or burning, reaction in the catalytic converter. Oxidation is the addition of oxygen to an element or compound. If there is not already enough oxygen in the exhaust, a secondary air supply system is incorporated into the vehicle's design for additional air injection. During the oxidation process, Oxygen (O2) mixes with the excess HC and CO to form H2O and CO2. During the oxidation reaction process, considerable heat (900~F to 1,600~F) is generated. Caution should be taken while working on or around the catalytic converter and other exhaust system components.

THE REDUCTION REACTION

Reduction is the opposite of oxidation, or the chemical removal of oxygen from a material. The reduction reaction changes NOx to harmless nitrogen (N) and (CO2) by chemically moving the oxygen from the NOx compound to the CO compound. The catalytic elements required for the reduction process are platinum and rhodium.

The Three-Way Catalytic Converter (TWC) is designed to reduce all three exhaust pollutants, but works best to reduce NOx when the CO level of the exhaust is between 0.8 and 1.5 percent. As the CO level increases or decreases from that percentage, the 3-way converters efficiency decreases. Exhaust gas first passes through the catalyst, where NOx is reduced to N2 and CO2; then through the catalyst where HC and CO are changed to H2O and CO2. The Light-Off Catalytic Converter (LOC) is a single bed oxidation-type converter, and is mounted to the exhaust manifold ahead of the main converter. The LOC primarily used in controlling HC and CO emissions during cold engine warm-up, while the main converter has not yet reached operating temperature. Heat from the exhaust manifold rapidly warms the LOC in order to start the Oxidation Process, which is then continued at the main converter. The Light-Off Catalytic Converter is also referred to as a Pre-Cat or a Mini-Cat by other vehicle manufacturers.

Catalytic Converter: Testing and Inspection

NOTE: A blocked or restricted exhaust system usually results in loss or lack of power or popping through the intake. Verify that this condition is not caused by ignition or timing problems, then proceed with diagnosis.

1. Visually inspect exhaust system for collapsed pipes, holes and cracks. Replace any damaged components.

2. Attach vacuum gauge to intake manifold vacuum source.

3. Connect a tachometer.

4. START engine and observe vacuum gauge needle.

5. Gradually increase the engine rpm to 2000 with the transmission in NEUTRAL. NOTE: The vacuum gauge reading may be normal when the engine is first started and idled. However, excessive restriction in the exhaust system will cause the vacuum gauge needle to drop to a low point even while the engine is idling.

6. Decrease rpm to idle speed. With the engine rpm at 2000, did manifold vacuum reach above 16 inches? If so, there is no restriction within the exhaust system. Refer to Diagnosis by Symptom/Lack of Power. If not, proceed to next step.

7. With vacuum gauge and tachometer still in place.

8. Gradually increase the engine rpm from base idle to 2000 rpm with the transmission in NEUTRAL.

9. While maintaining increased engine rpm, observe the RATE of speed of the vacuum gauge needle as it falls and rises. NOTE: a.

On a non-restricted system the needle will drop to zero and then quickly return to the normal setting without delay.

b. On a restricted system, as the engine rpm is increased to 2000 the vacuum gauge needle will slowly drop to zero and slowly rise to normal.

c. The rate of speed at which the vacuum gauge needle returns to the normal setting is much slower on a restricted system than on a non-restricted system.

10. Decrease engine rpm to base idle.

11. Was needle return rate much slower than that of a non-restricted system? If not, there is no restriction within the exhaust system. Refer to LACK OF POWER/DIAGNOSIS BY SYMPTOM. If so, proceed to next step.

12. Turn OFF engine.

13. Disconnect exhaust system at the muffler(s).

14. Repeat vacuum test.

15. Did manifold vacuum reach above 16". If so, replace muffler(s). If not, proceed to next step.

16. Turn OFF engine.

17. Disconnect exhaust system at catalytic converter(s).

18. Repeat vacuum test.

19. Did manifold vacuum reach above 16". If so, replace converter(s). If not, proceed to next step.

20. Turn OFF engine.

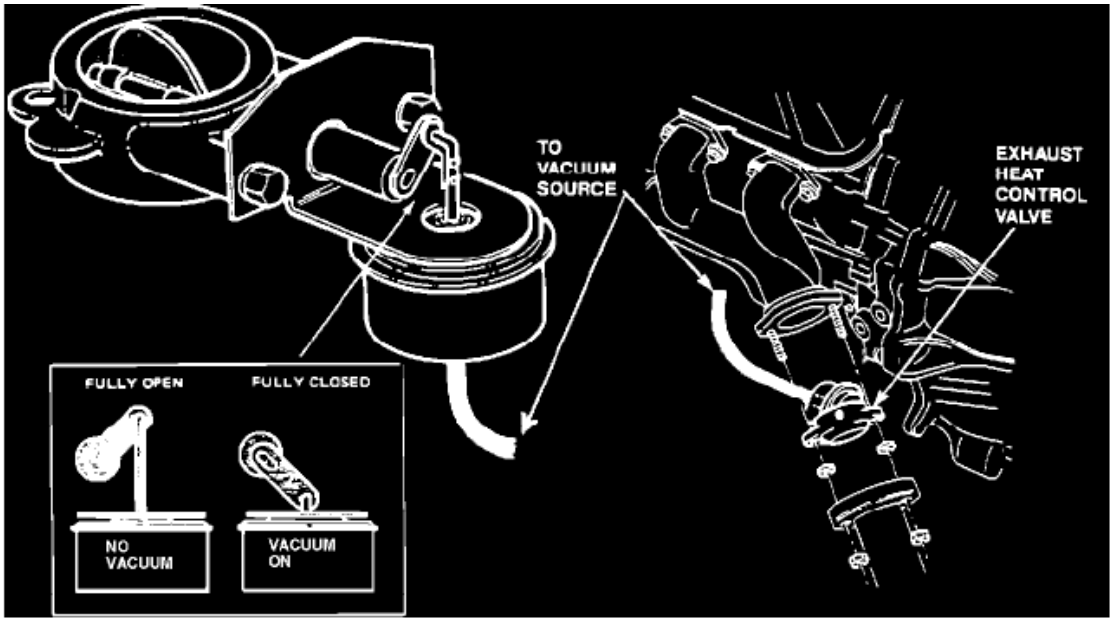
21. Disconnect exhaust system at exhaust manifold(s).

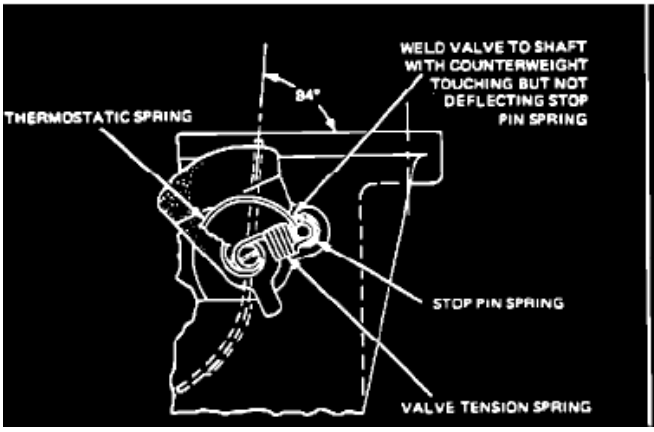
22. Repeat vacuum test.

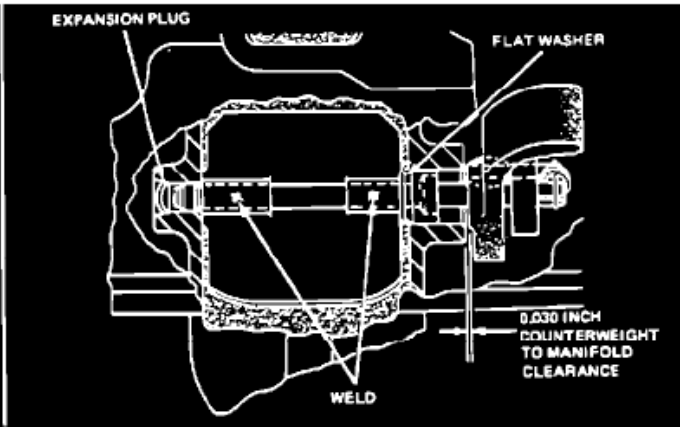
23. Did manifold vacuum reach above 16". If so, restriction is located between exhaust manifold(s) and catalytic converter(s). If not, proceed to next step.

24. Remove the exhaust manifold(s) and inspect the ports for casting flash by dropping a length of chain into each port. NOTE: Do not use a wire or a lamp to check ports. The restriction may be large enough for the wire or light to pass through but small enough to cause excessive back pressure at high rpm.

25. Is a restriction present? If so, remove casting flash or replace exhaust manifold. If not, refer to LACK OF POWER/DIAGNOSIS BY SYMPTOM.







Exhaust Heat Control Valve: Testing and Inspection

VACUUM OPERATED HEAT CONTROL VALVE

Vacuum Operated Heat Control Valve

1. Connect a hand vacuum pump to the vacuum motor of the Heat Control Valve.

2. Apply and trap 10-15" vacuum (33.77-67.54 kPa).

3. The valve must close and lose no more than 2" vacuum (6.75 kPa) in 60 seconds.

4. When vacuum is released, the valve must open. If results differ from above, replace the HCV.

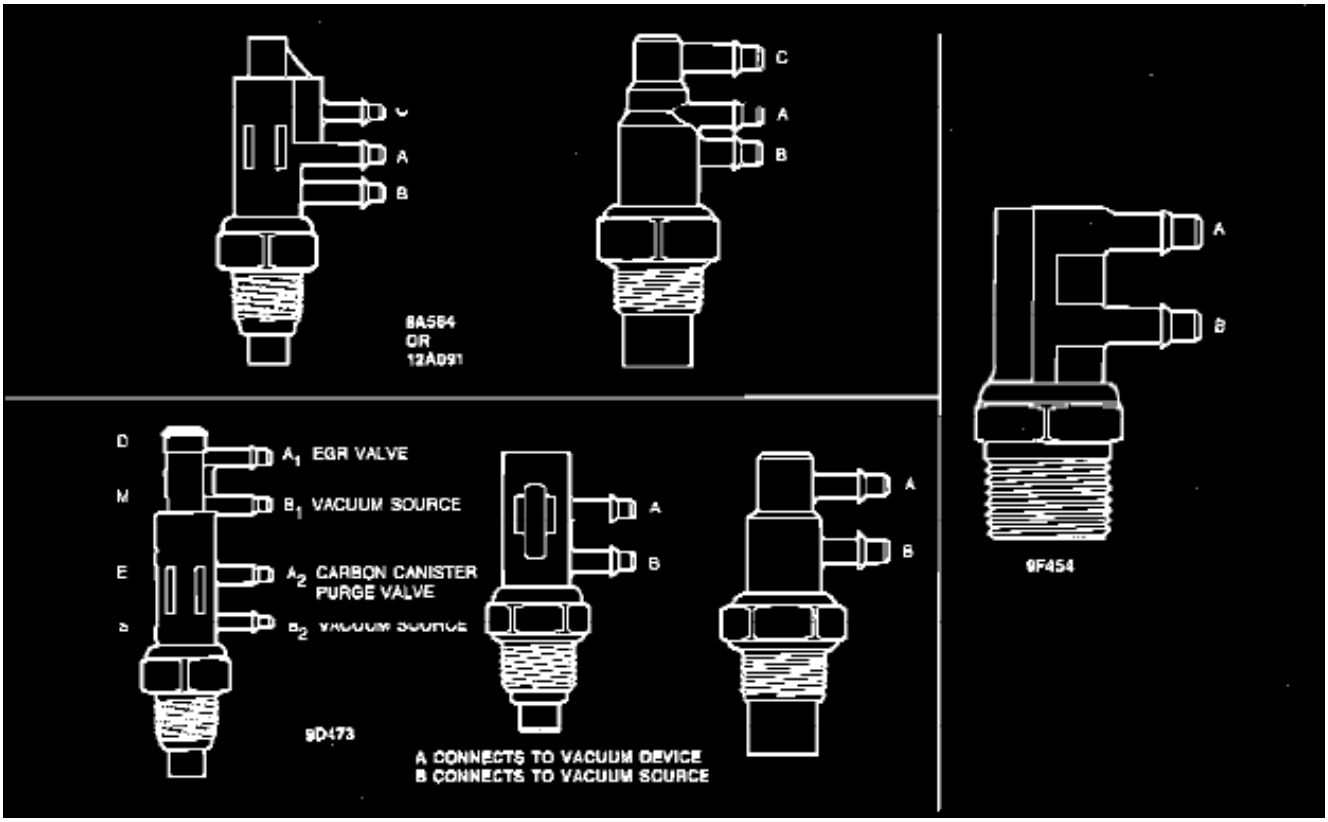
BIMETAL HEAT CONTROL VALVE

Bi-metal Spring Heat Control Valve

1. Visually inspect the heat control valve for any abnormal conditions.

2. Check the valve and thermostatic spring operation by manually rotating the valve shaft. Valve must move freely and return to the closed position when the spring is cold.

3. Lubricate the valve and shaft with graphite lubricant or equivalent.



Thermal Vacuum Valve: Description and Operation Vacuum Control Valve

Vacuum Control Valves are designed to operate according to engine coolant temperature and are usually threaded into the engine block or manifold. Based on the wax pellet sensing bulb principle and theory, the Vacuum Control Valve directs and supplies vacuum to other emission control components. The Bimetal principle is used with the 2-port (9F454) VCV.

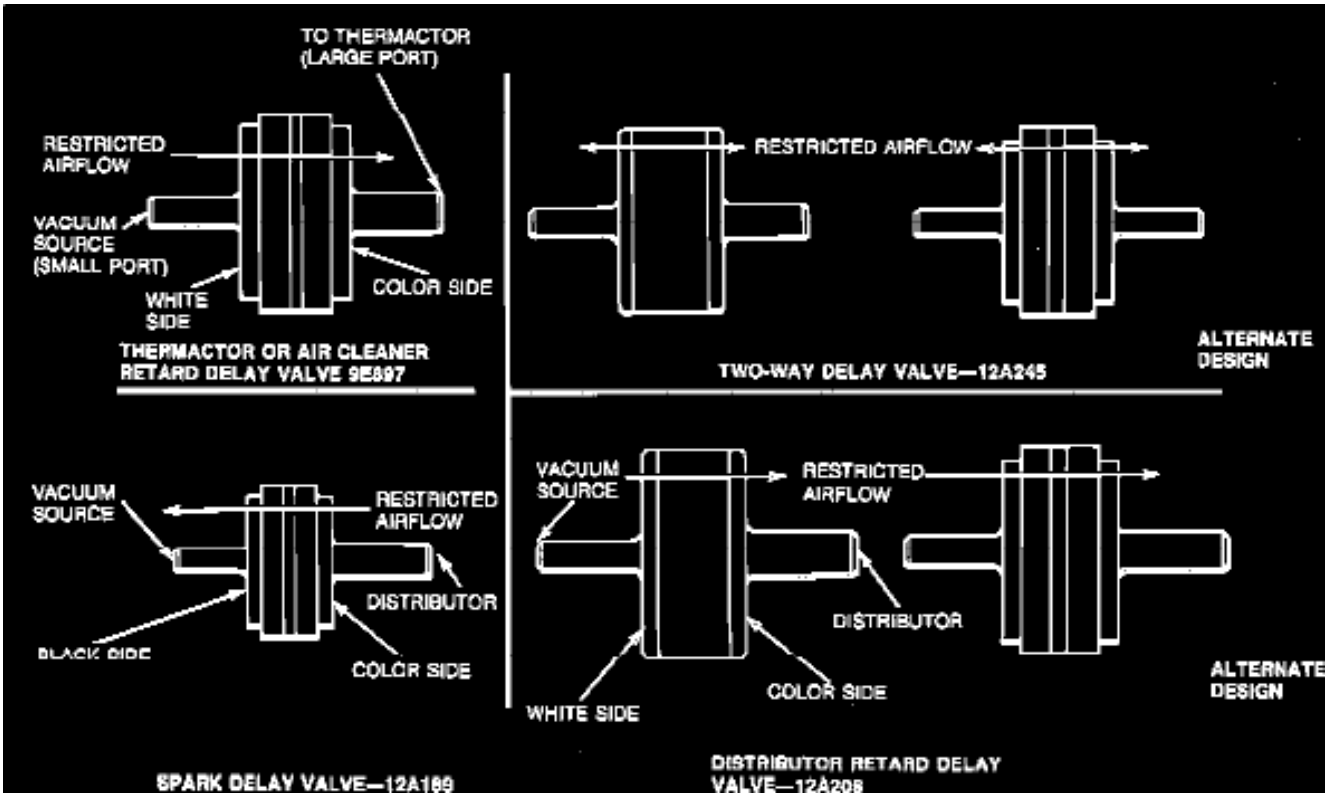
2-, 3-, and 4-Port Vacuum Valves

The 2-port VCV opens to supply vacuum at a pre-determined engine coolant temperature calibration.

The 4-port VCV operates the same as the 2-port. Vacuum is supplied to two different components that are calibrated for the same temperature.

The 3-port VCV directs vacuum from the center port to the upper port during cold engine operation. After the engine reaches operating temperature, the upper port closes and the lower is opened.

For example during cold engine warm-up, vacuum from the center port passes through the upper port to be applied to the Heat Control Valve. After engine warm-up, the upper port closes, the lower port opens, and vacuum passes through to be applied to the purge control device. Vacuum is controlled by a normally closed vacuum solenoid.



Thermal Vacuum Valve: Description and Operation Vacuum Delay Valves

The Vacuum Delay Valve (VDV) is usually located within the vacuum hose routing or harness assembly. These valves are designed to decrease the rate at which vacuum is applied to or released from a component.

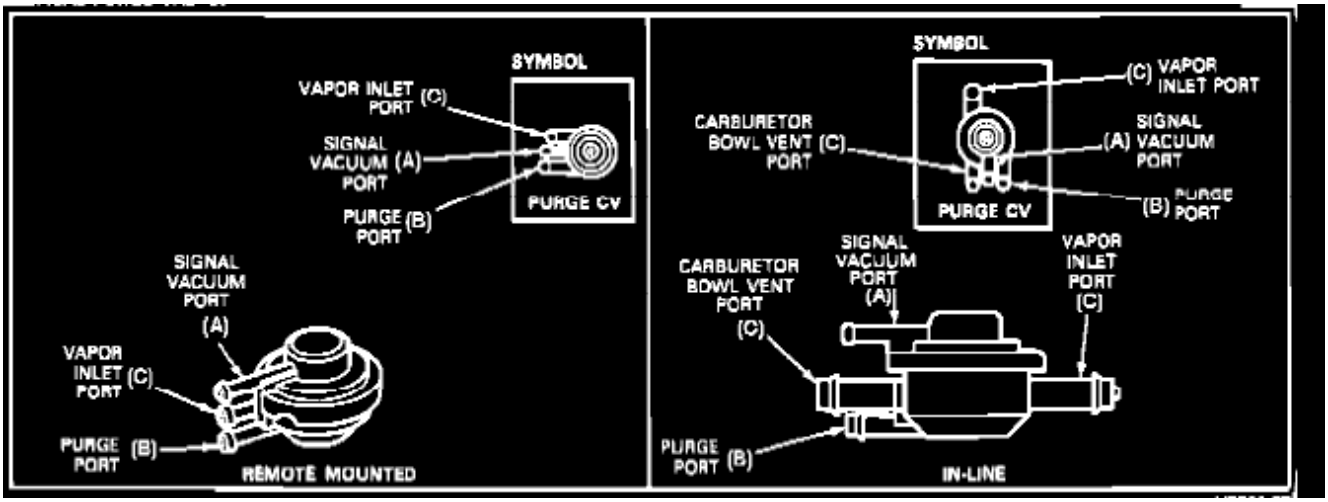
Types Of Vacuum Delay Valves

There are three basic types of Delay Valves

VACUUM DELAY VALVE (VDV) - Delays the application of vacuum to a vacuum-operated component.

VACUUM RETARD DELAY VALVE (VRDV) - Delays the loss of a vacuum signal to a component when source vacuum decreases suddenly. May be used to delay the release of vacuum from any diaphragm as a momentary trap for vacuum.

TWO-WAY DELAY VALVE (DV-TW) - Delays vacuum equally in either direction. This valve is commonly used in Evaporative Emission Controls and can be inserted in the vacuum line in either direction.



Canister Purge Control Valve: Testing and Inspection

Vacuum Operated Purge Control Valve

CAUTION: DO NOT apply vacuum to Port C of the purge control valve. Doing so may dislodge the internal diaphragm causing permanent damage.

1. Vacuum applied to Port A only, should not pass through. If flow occurs, replace valve.

2. Vacuum applied to Port B only, should not pass through. If flow occurs, replace valve. NOTE: Slight flow should be indicated with the following valves: E5VE-9B963-AA, E4VE-9B963-AA, and E77E-9B963-AA.

3. After applying and maintaining a vacuum of 16" to Port A, apply vacuum to Port B with a second hand vacuum pump. Vacuum to Port B should pass through.

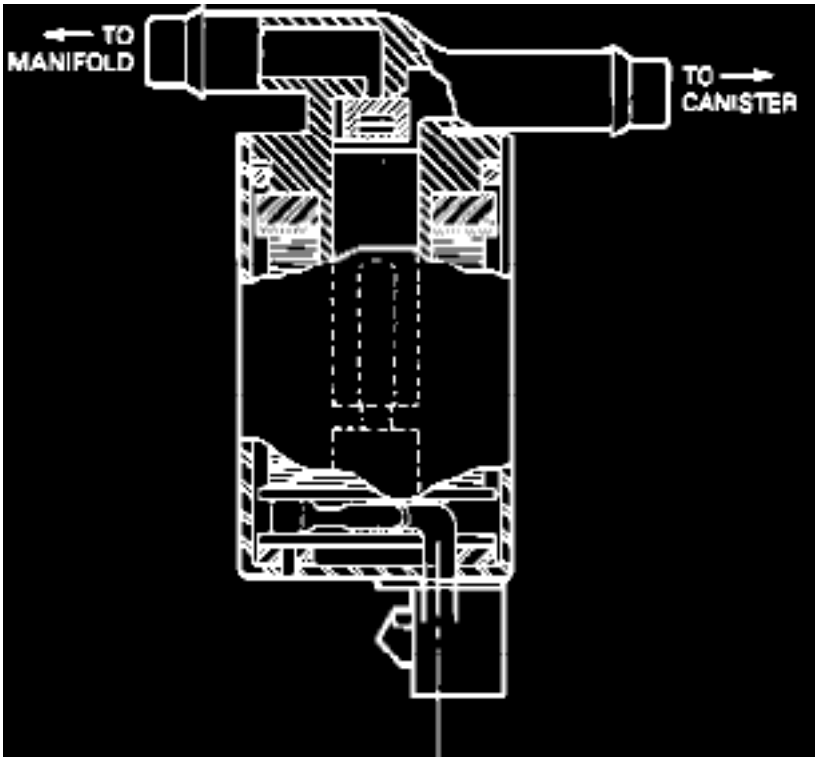
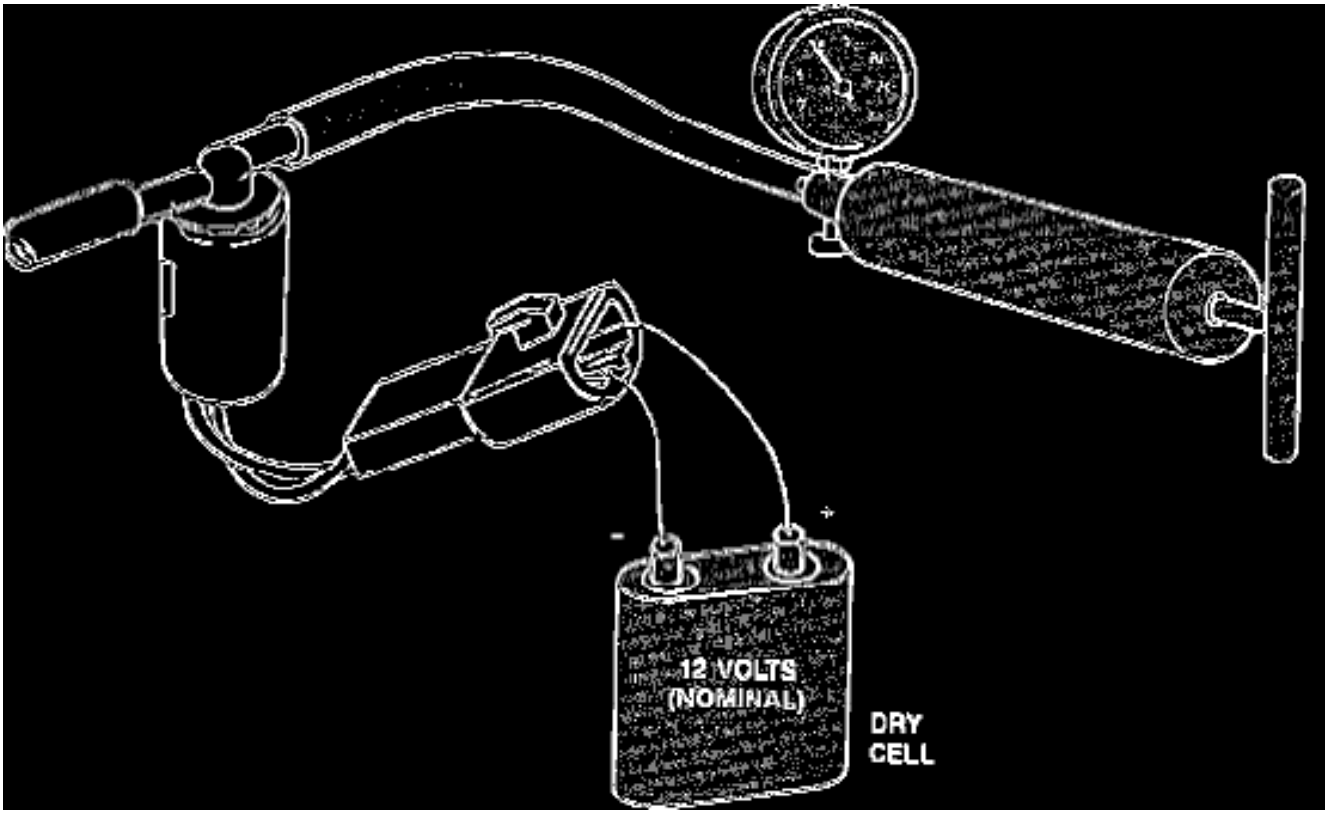
EVAP Components For Canister Purge



Canister Purge Solenoid: Description and Operation

Canister Purge Solenoid

Canister purging is regulated by a Purge Control Solenoid Valve, which is electronically controlled by the EEC-IV Module. The normally closed solenoid valve is located within the vapor line between the charcoal canister and the throttle body vacuum fitting. The solenoid valve is designed to block fuel vapors from entering the intake manifold, while the engine is not running, and allows precise control of canister purging. In order to calculate the timing and duration that the canister is purged, the EEC-IV Module monitors engine speed, load, and temperature until conditions are favorable. When the solenoid valve is opened, manifold vacuum is applied to the canister, and the fuel vapors are drawn into the induction system to be consumed. As the fuel vapors are being purged, fresh air is drawn into the charcoal canister from under the fresh air inlet cap, located on top of the canister.



Canister Purge Solenoid: Testing and Inspection

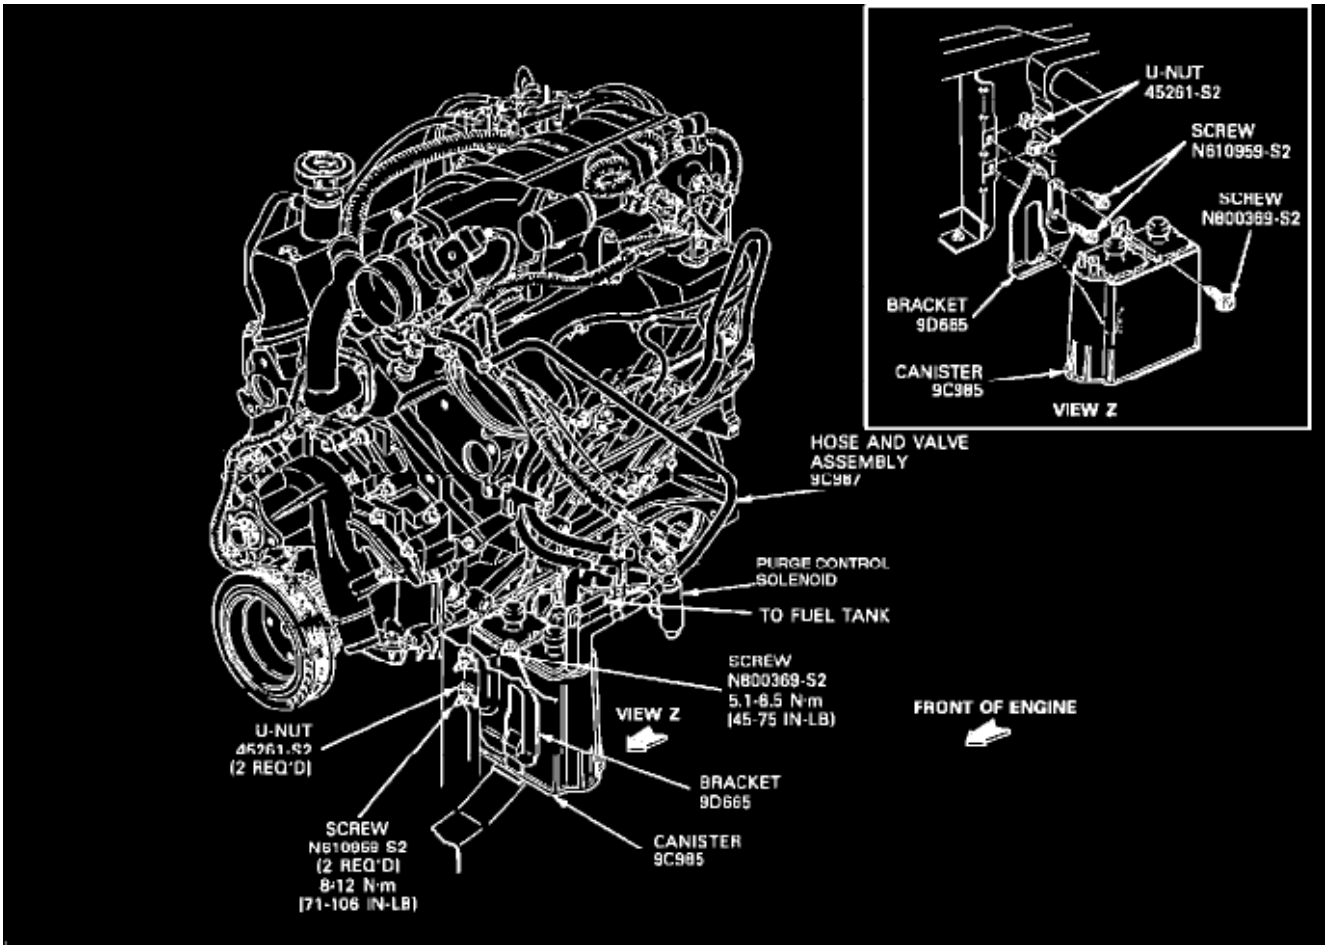
Testing The Purge Solenoid

1. Disconnect the electrical connector at the canister purge solenoid.

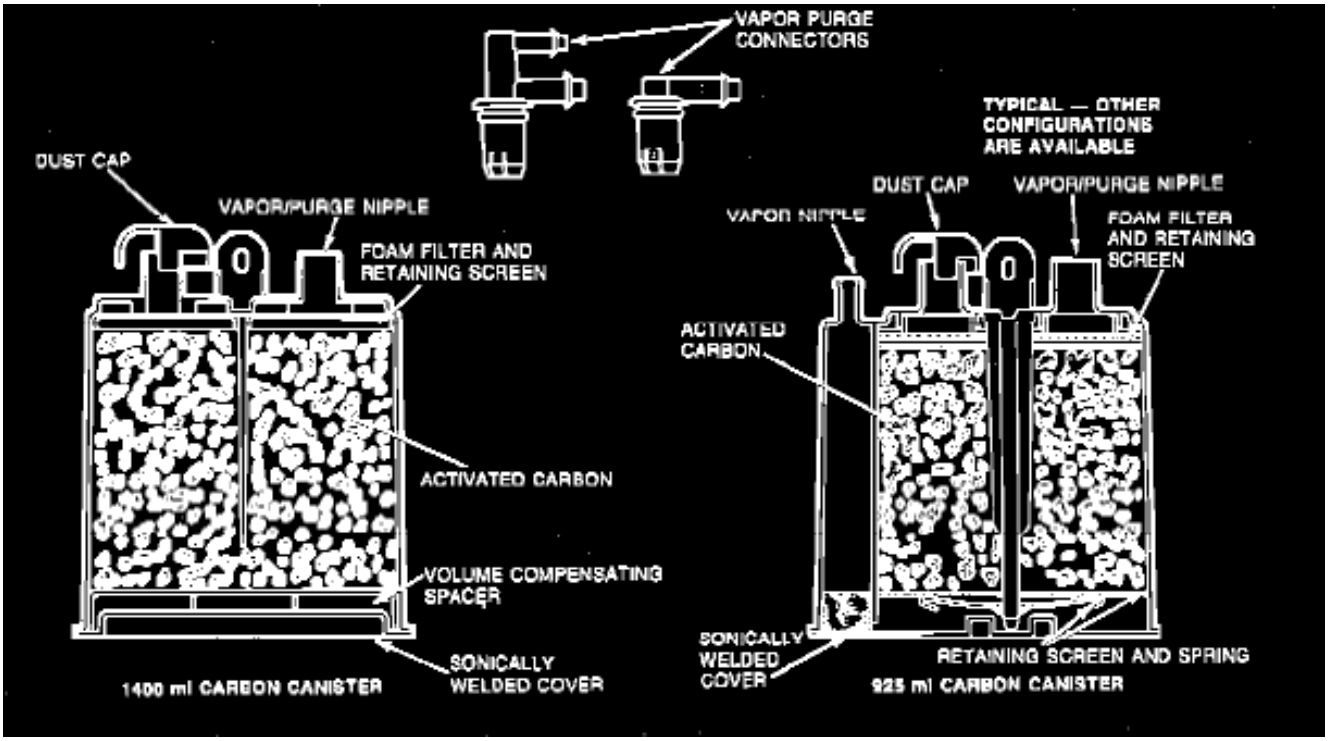
2. Connect a vacuum pump to the source vacuum nipple of the solenoid, and apply 5" vacuum. Vacuum should NOT leak. If it does, replace the solenoid.

3. Connect jumper wires to the electrical terminals of the solenoid.

4. While applying vacuum to the source vacuum nipple, energize the solenoid by connecting jumper wires from a 12 volt battery to the electrical terminals of the solenoid. The valve should open, allowing vacuum to pass through. If it does not, replace the solenoid.



EVAP Components For Canister Purge

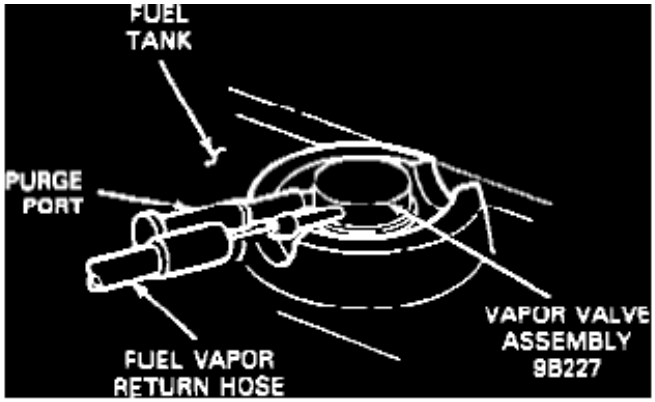


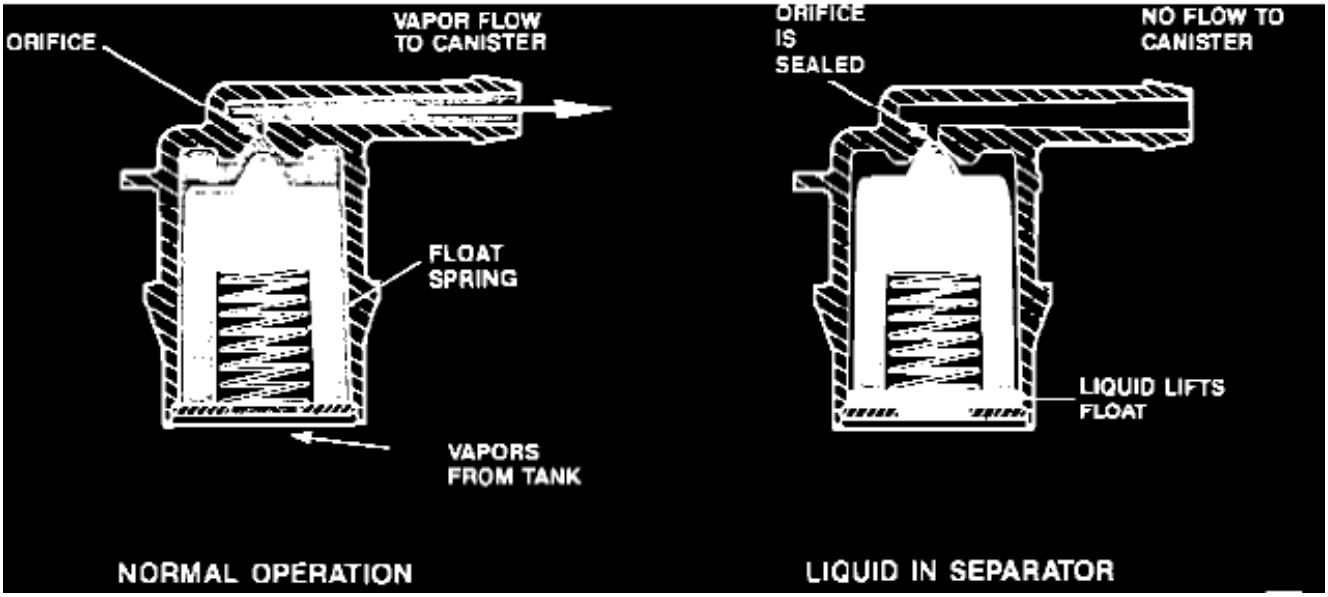
Charcoal Canister: Description and Operation

Carbon Canisters, Typical

The Charcoal Canister is normally located within the engine compartment, or along the frame rail, and is filled with activated charcoal granules. Activated charcoal is used as a vapor trap because of its great surface area, holding up to one-third its own weight in fuel vapors. Each gram of activated charcoal has a surface area of 1,100 square meters, or more than a quarter acre.

The canister is connected to the fuel tank by a vapor hose with an in-line metering-type vapor valve. Another vacuum/vapor hose connects the canister to the intake manifold. This second hose may contain an in-line purge control valve or solenoid. The charcoal canister receives and stores fuel vapors, when the engine is OFF or when the vapors are not being routed directly to the induction system, while the engine is running. During purge conditions, as manifold vacuum is applied to the canister, fresh air enters the Evaporative Emission System through the fuel filler caps vents. The fresh air passes over the charcoal in the canister allowing the stored fuel vapors to pass into the induction system for burning.





Liquid Vapor Separator: Description and Operation

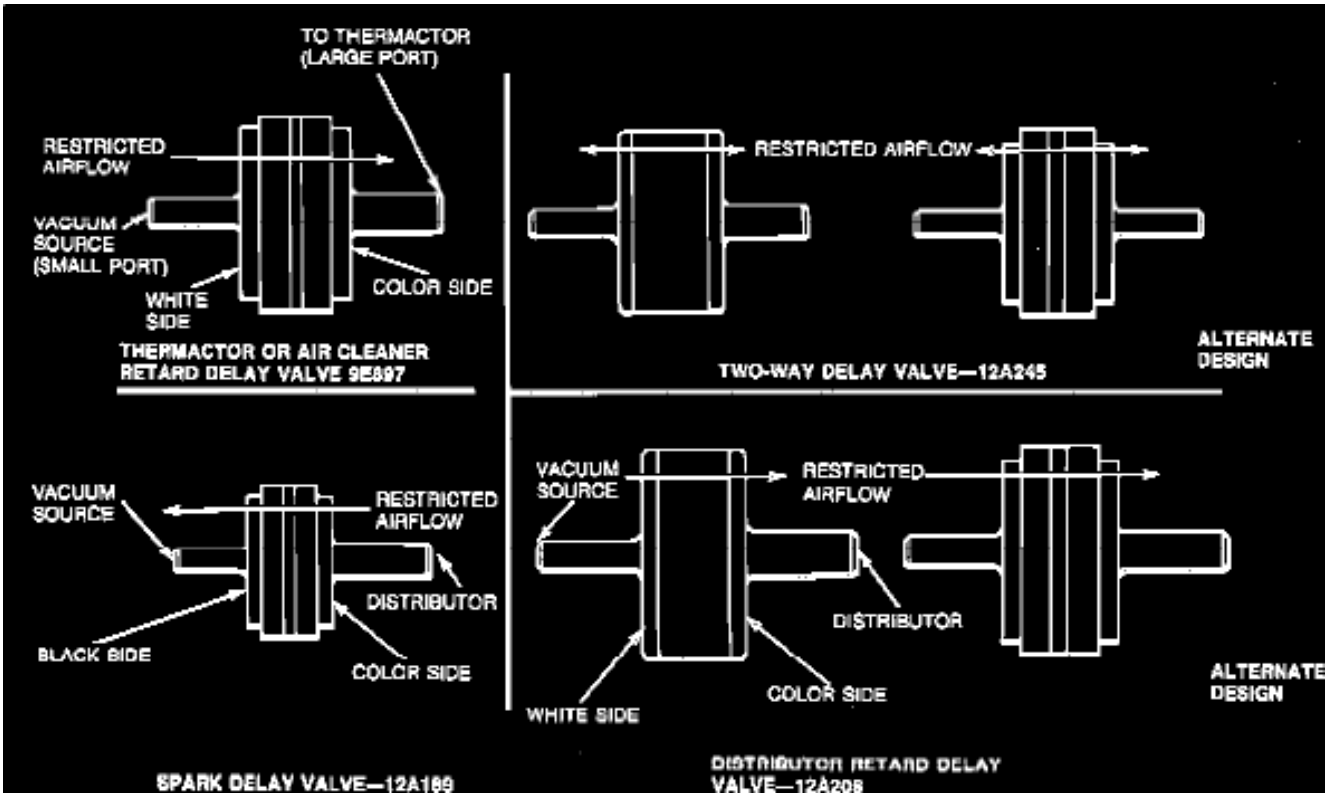
Fuel Tank Vapor Vent Valve

The Fuel Tank Vapor Valve is mounted in the top of the fuel tank and permits fuel vapors to be vented to the charcoal canister, while restricting liquid fuel. A rubber grommet provides a tight seal around the valve in order to provide a sealed fuel system.

Fuel Tank Fuel/Vapor Separator Operation

As fuel vapors are generated, they enter the valve from the bottom, rise upward past the float, and out through a single vapor line. If liquid fuel should enter the valve assembly, the float will rise upward and close the orifice. As the fuel is drained back into the fuel tank, the spring attached to the underside of the valve pulls the float downward, exposing the orifice. If the fuel vapor line to the canister becomes kinked or plugged, causing extreme pressures to build inside the fuel tank, the

vapor valves purge port opens to provide pressure relief. NOTE: In the event of vehicle roll-over, the float closes off the valve, preventing fuel from escaping and saturating the charcoal canister.



Vacuum Delay Valve: Description and Operation

The Vacuum Delay Valve (VDV) is usually located within the vacuum hose routing or harness assembly. These valves are designed to decrease the rate at which vacuum is applied to or released from a component.

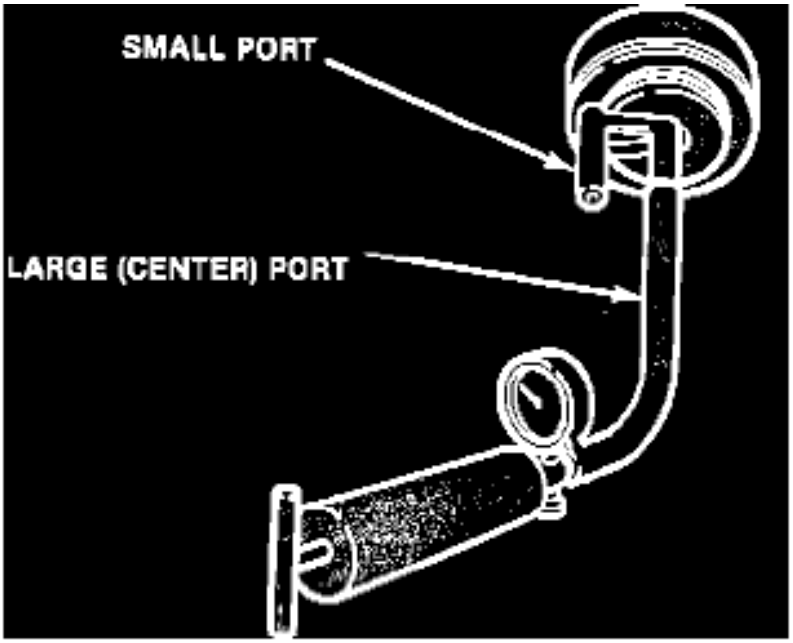
Types Of Vacuum Delay Valves

There are three basic types of Delay Valves

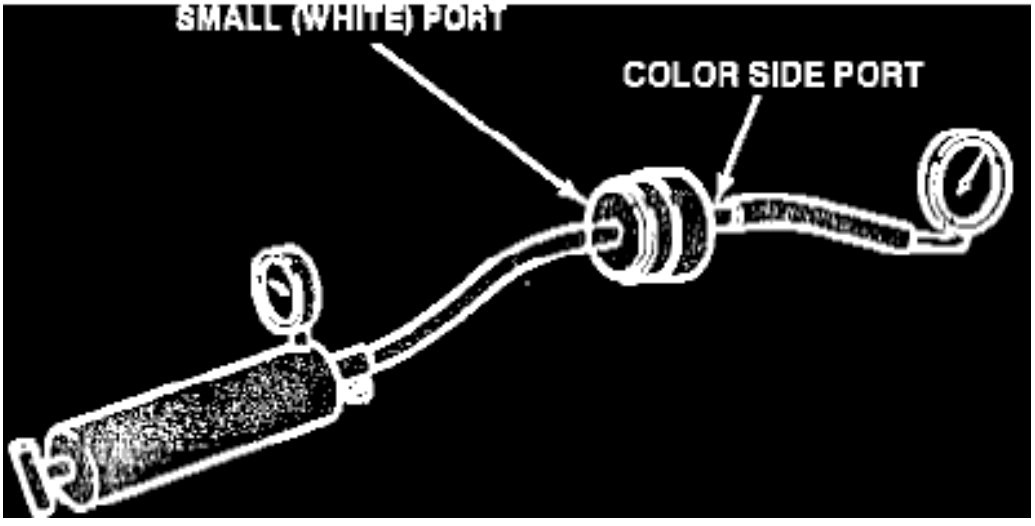
VACUUM DELAY VALVE (VDV) - Delays the application of vacuum to a vacuum-operated component.

VACUUM RETARD DELAY VALVE (VRDV) - Delays the loss of a vacuum signal to a component when source vacuum decreases suddenly. May be used to delay the release of vacuum from any diaphragm as a momentary trap for vacuum.

TWO-WAY DELAY VALVE (DV-TW) - Delays vacuum equally in either direction. This valve is commonly used in Evaporative Emission Controls and can be inserted in the vacuum line in either direction.



SMALL PORT
LARGE (CENTER) PORT



SMALL (WHITE) PORT
COLOR SIDE PORT

Vacuum Delay Valve: Testing and Inspection

Cold Weather Modulator Test

1. Attach a vacuum pump the large center port of the CWM (Cold Weather Modulator/Retard Delay Valve).

2. Cool the CWM, apply vacuum. Vacuum must hold.

3. Warm the CWM, apply vacuum. Vacuum must be released.

VACUUM RETARD DELAY VALVE (VRDV) TEST

Retard Delay Valve Test

1. Attach a vacuum pump to the small (white) port of the valve.

2. Attach a vacuum gauge to the large (colored) port of the valve.

3. Apply 10" vacuum and hold.

4. Verify gauge reads 10" vacuum, then release vacuum from pump to valve.

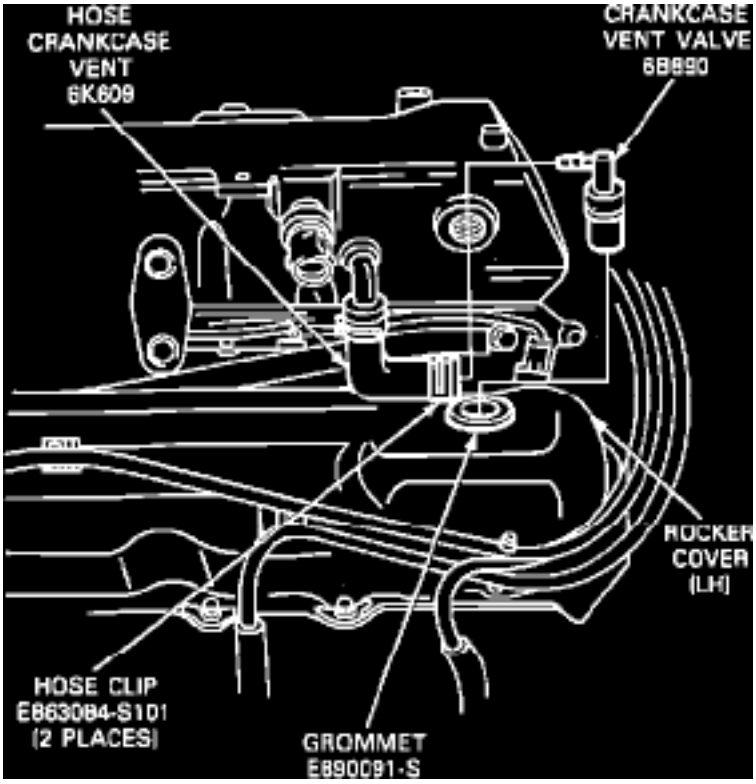
5. Count the seconds it takes the vacuum to drop from 8" to 0" of vacuum. Replace the sensor if it fails, according to the chart below.

Color Code Delay Time

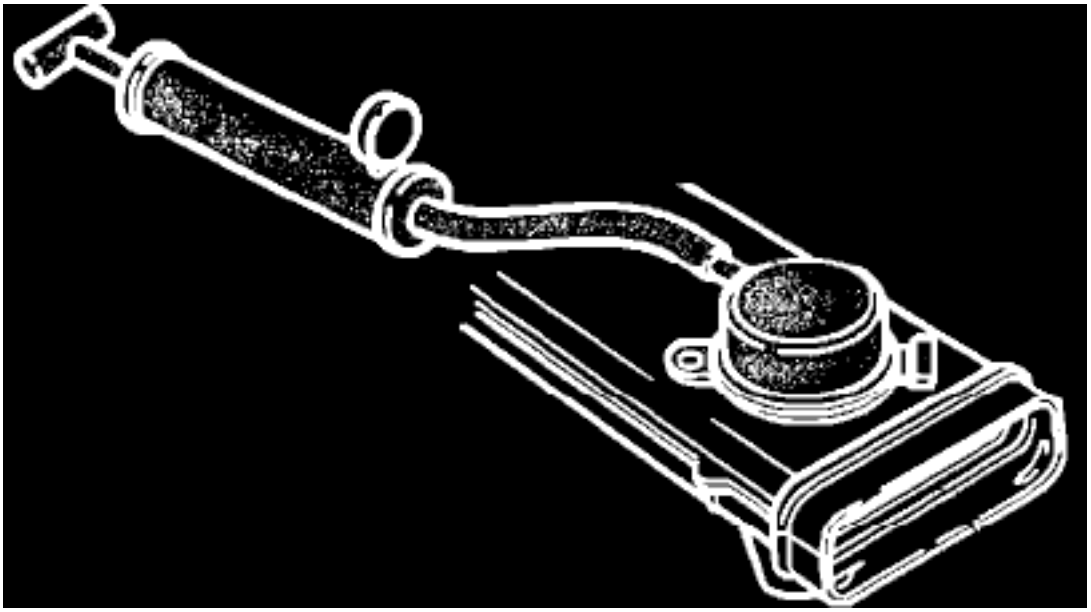
Red 15-28 seconds

Blue 9-20 seconds

Pink 4-12 seconds



PCV Valve And Hose Connections

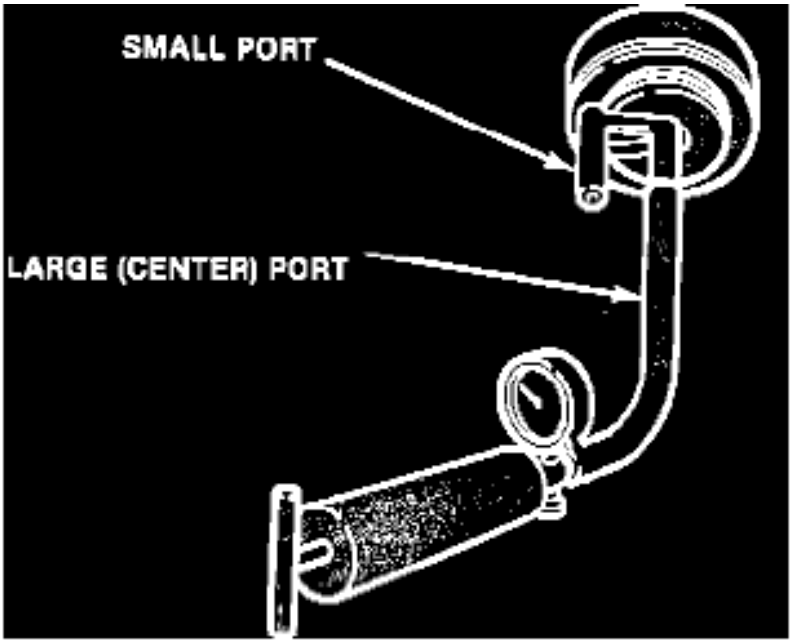


Thermostatic Air Cleaner Vacuum Motor: Testing and Inspection

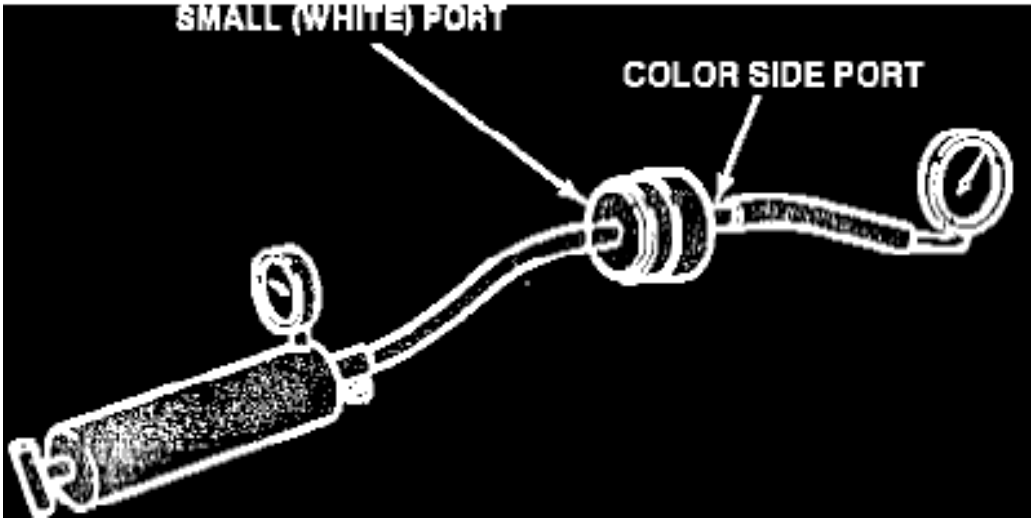
Air Door Vacuum Motor Test

1. Verify that the air door is in the closed to heated air position and that the vacuum motor stem and the air door are connected, by looking up into the snorkel.

2. Remove vacuum hose from motor, connect a vacuum pump, and apply 10-15" vacuum. Air door should be in the open to heated air position and must remain so for two minutes with vacuum trapped. When vacuum is released the door should move to the closed to heated air position.



SMALL PORT
LARGE (CENTER) PORT



SMALL (WHITE) PORT

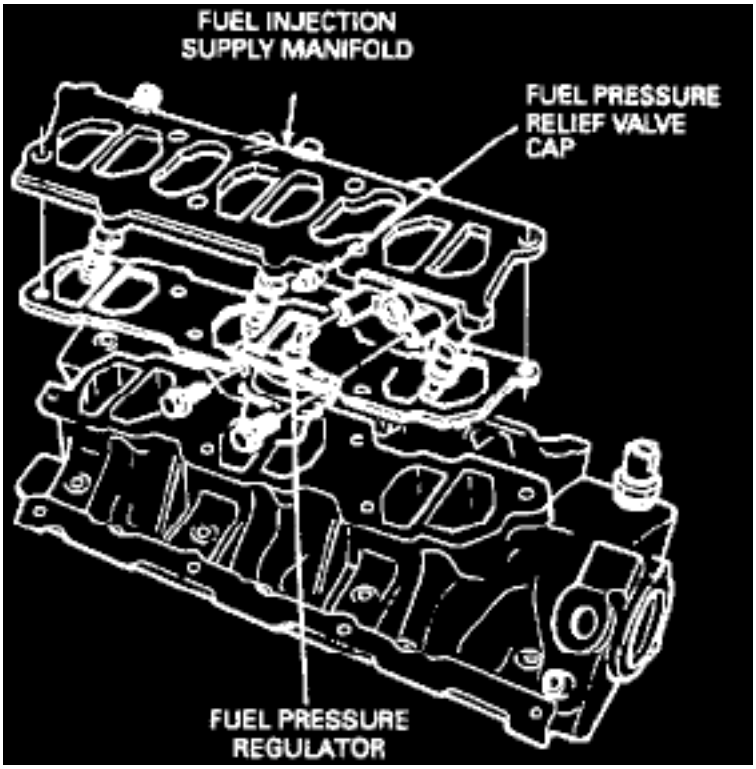
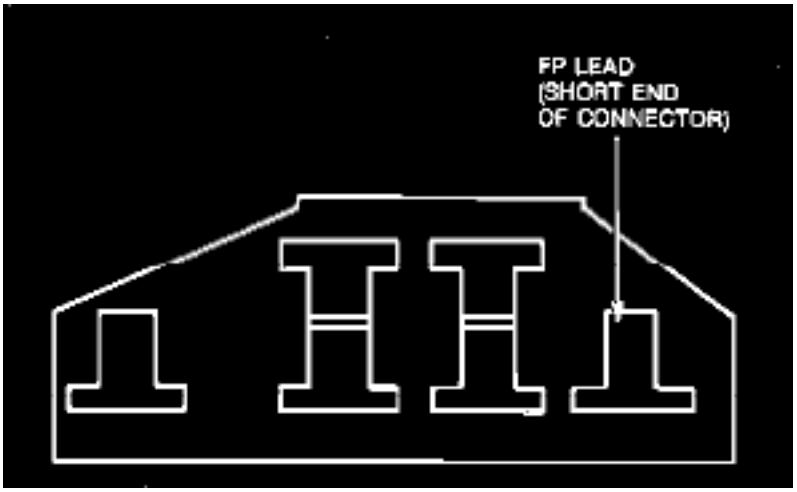
Fuel Pressure: Specifications

Key On Engine Off 35 - 45 psi

Key On Engine Running 30 - 40 psi



Fuel Injection Supply Manifold



Fuel Pressure: Testing and Inspection

STO Connector

STATIC PRESSURE TEST

1. Check for adequate fuel supply. 2. Turn key OFF 3. Install fuel pressure gauge to test port on fuel rail. 4. Install test lead to fuel pump lead of STO test connector. 5. Turn Key On Engine Off (KOEO). 6. Ground test lead to run fuel pump. 7. Check to determine if fuel pressure is within acceptable limits. Refer to SPECIFICATIONS.

a. If pressure is low but greater than 3 psi (indicates fuel pump is running but not enough pressure) check for:

^ Plugged fuel filter

^ Kinked fuel line

^ Low voltage to pump (should be within 0.5 volts of battery voltage at connector).

^ Disconnect the fuel return line and note if fuel is being returned during this low pressure condition. If fuel is being returned, replace the fuel pressure regulator. Reconnect the fuel return line.

b. If pressure is less than 3 psi (pump not running) check for:

^ Defective fuse link

^ Inertia switch open

^ Wiring at fuel pump/tank connector loose or open

^ Fuel pump ground connection at chassis loose or defective

^ Improper fuel pump relay operation

If fuel supply and return lines are OK, and electrical supply and ground are OK, and fuel pressure is still low, replace fuel pump.

DYNAMIC PRESSURE TEST

1. Disconnect and plug the vacuum line to the pressure regulator.

2. Start engine and run at idle. Check to determine if fuel pressure is within acceptable limits.

a. If pressure is low check for:

^ Plugged fuel filter ^ Restricted fuel line ^ Low voltage to pump (should be within 0.5 volts of battery voltage at connector).

3. Reconnect the vacuum line to the regulator.

If fuel supply and return lines are OK, and electrical supply and ground is OK, and fuel pressure is still low, replace fuel pump.

LEAKAGE TEST

1. Momentarily activate fuel pump by grounding test lead. Raise pressure to approximate operating pressure. 2. Remove ground from test lead and note pressure on gauge. Pressure should remain within 2 psi for 3 minutes after lead is ungrounded.

a. If pressure is not maintained check for leaking fuel

^ Lines ^ Connectors ^ Injectors

b. Disconnect fuel return line and plug engine side. Momentarily activate fuel pump by grounding test lead. Raise pressure to approximate

operating pressure. If pressure holds replace regulator and retest. Reconnect the fuel return line.

If pressure is not maintained replace fuel pump.

Fuel Pressure Release: Service and Repair

CAUTION: FUEL SUPPLY LINES ON EFI ENGINES WILL REMAIN PRESSURIZED FOR SOME PERIOD OF TIME AFTER THE ENGINE IS SHUT OFF. THIS PRESSURE MUST BE RELIEVED BEFORE SERVICING OF THE FUEL SYSTEM IS BEGUN.

FUEL SYSTEM PRESSURE RELIEF - EFI ENGINES

Before opening the fuel system on vehicles with EFI engines, relieve fuel pressure as follows: 1. Locate and disconnect the electrical connection to either the fuel pump relay, the inertia switch or the in-line high pressure fuel pump.

2. Crank engine for approximately ten seconds.

Note: Engine may start and run for a short time. If so, crank engine an additional 5 seconds after engine stalls.

3. Re-connect the electrical connector that was disconnected in step 1 and disconnect battery ground cable.

Alternative Method

Some EFI vehicles have a port (fitting) on the fuel rail used for measuring fuel pressure. If so equipped, use the following method: -

Install fuel pressure relief tool No. T80L-9974-B or equivalent to measuring port on engine fuel rail.

- Position drain hose in suitable container, then depress relief button.

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

TB-2432-A

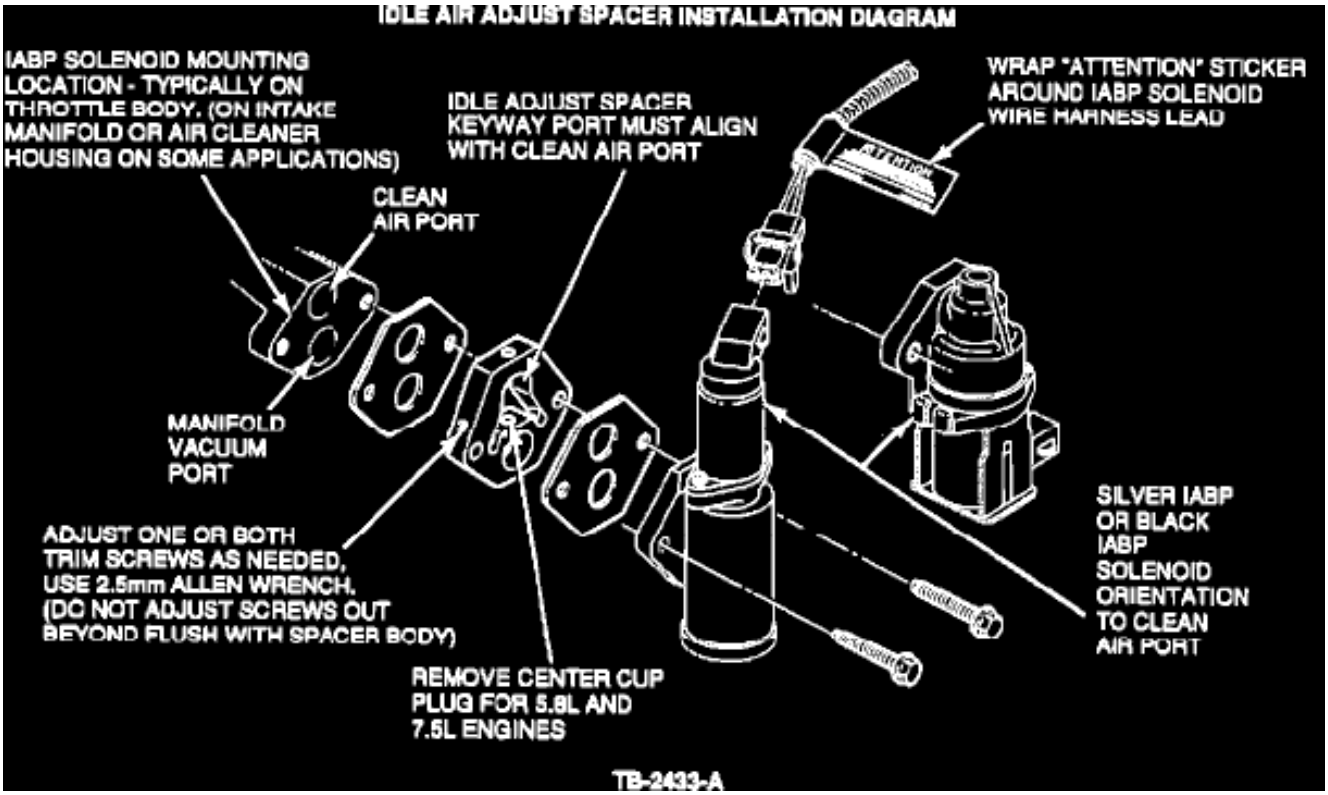
Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.

The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets



^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

Figure 5

The EFI throttle body idle speed adjustment procedures for the various model year passenger cars and light trucks are outlined in step-by-step procedures featured in Figures 3, 4 and 5. Select the appropriate procedure for the vehicle involved and adjust the throttle body idle RPM accordingly, after service kit installation.

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for

cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

^ HESITATION/STALLS - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

FORD: 1983-87 EXP 1983-91 ESCORT 1984-90 MUSTANG, THUNDERBIRD 1986-90 TAURUS 1986-91 CROWN VICTORIA 1988-90 TEMPO

LINCOLN-MERCURY: 1983-85 LN7 1983-87 LYNX 1984-88 CAPRI 1984-90 COUGAR 1986-90 CONTINENTAL, MARK VII, SABLE 1986-91 GRAND MARQUIS, TOWN CAR 1988-90 TOPAZ 1991 TRACER

LIGHT TRUCK: 1985-90 BRONCO II, BRONCO 1985-91 ECONOLINE, F-150-350 SERIES 1985-92 RANGER 1986-91 AEROSTAR 1991 EXPLORER

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

SERVICE KIT -9F939-

APPLICATION CHART — EFI PORT FUEL INJECTION ENGINES

MODEL YEAR	CAR APPLICATION	ENGINE
1983-85	ESCORT GT/LYNX, EXP/LN7	1.6L EFI
1986-87	ESCORT GT/LYNX, EXP	1.9L EFI
1988-90	ESCORT GT	1.9L EFI
1991	ESCORT/TRACER	1.9L EFI
1987-90	MUSTANG	2.3L EFI
1984-86	THUNDERBIRD/COUGAR, MUSTANG/CAPRI	2.3L TC
1988-90	TEMPO/TOPAZ	2.3L HO/HSC
1986-90	TAURUS/SABLE	3.0L EFI
1988-90*	TAURUS/SABLE	3.8L EFI

NOT APPLICABLE FOR 1991 MODEL YEAR EXCEPT WHERE LISTED
NOT APPLICABLE FOR 1992 MODEL YEAR EXCEPT WHERE LISTED

* CUT OUT HOOD INSULATION PAD, IF NECESSARY, TO AVOID POSSIBLE CONTACT WITH THE IABP SOLENOID.
** 1990 MODEL YEAR BUILT BEFORE 5/90
*** 1991 MODEL YEAR BUILT BEFORE 1/91
**** 1991 MODEL YEAR ALL CALIBRATIONS **EXCEPT** 1-97A-R00, 1-98A-R00, 1-98B-R00, 1-98C-R00, 1-98E-R00 AND 1-98F-R00.

TB-2432-A

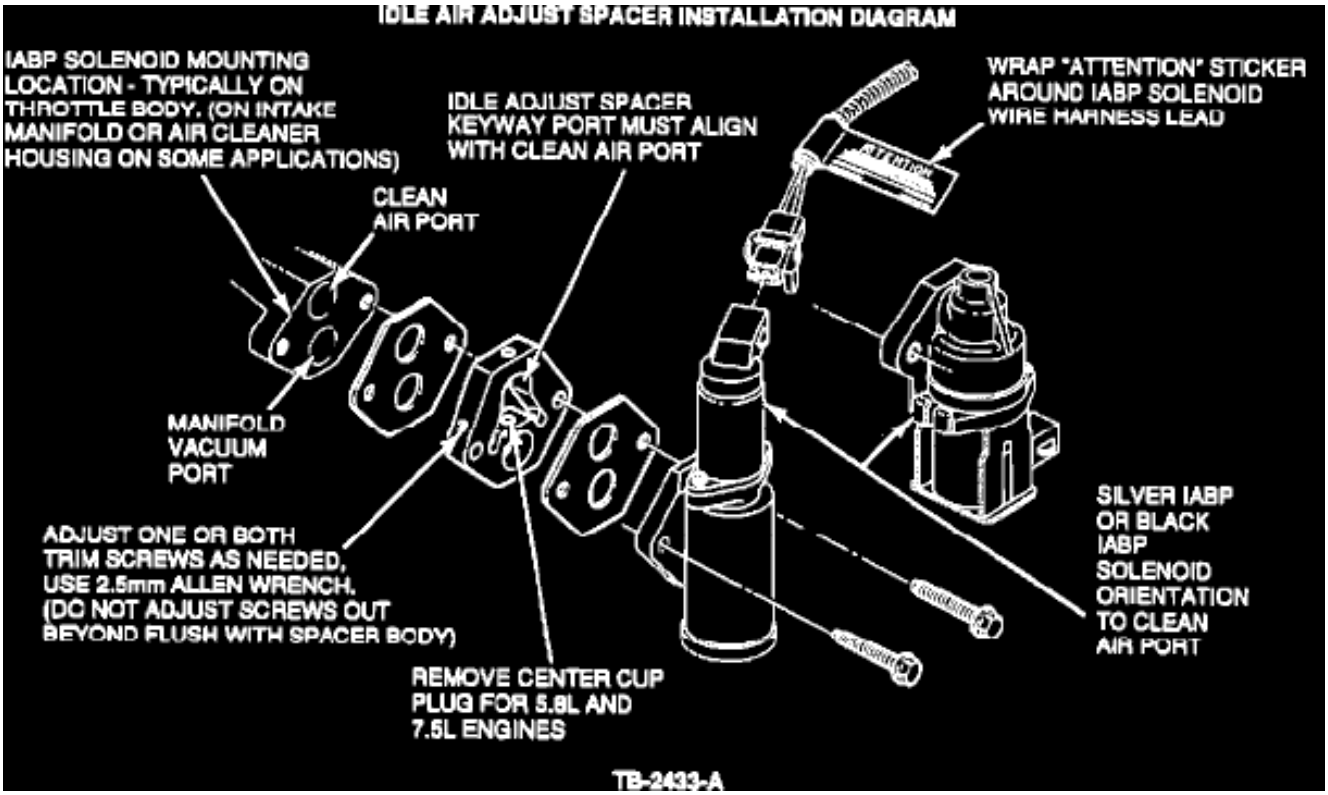
Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.

The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets



^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for

cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

Engine Idle Adjustment Procedures - Revision

ENGINE/EMISSIONS DIAGNOSIS SHOP MANUAL - 1991 - SECTION 9 - IDLE ADJUST PROCEDURES REVISED FOR APPLICATIONS WITHOUT SLUDGE TOLERANT THROTTLE BODY Article No. 90-25B-2 FORD:

1991 PROBE

LIGHT TRUCK: 1991 AEROSTAR, EXPLORER, RANGER

ISSUE: The Idle Adjust Procedures in the 1991 Engine/Emissions Diagnosis Shop Manual have been revised to cover applications that do not have the sludge tolerant throttle body. These are 1991 Aerostar, Explorer, and Ranger trucks with 4.0L engines. The 3.0L Probe has a sludge tolerant throttle body.

ACTION: Refer to the pages following this TSB article for the revised procedures.

NOTE: A SLUDGE TOLERANT THROTTLE BODY IS IDENTIFIED BY A 91TF-AA PREFIX AND SUFFIX IN THE PART NUMBER.

OTHER APPLICABLE ARTICLES: None WARRANTY STATUS: INFORMATION ONLY

Component Descriptions

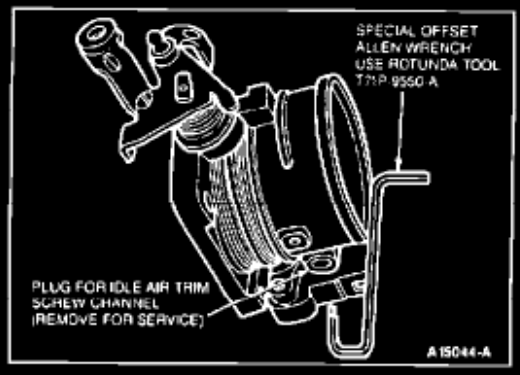

Figure 6

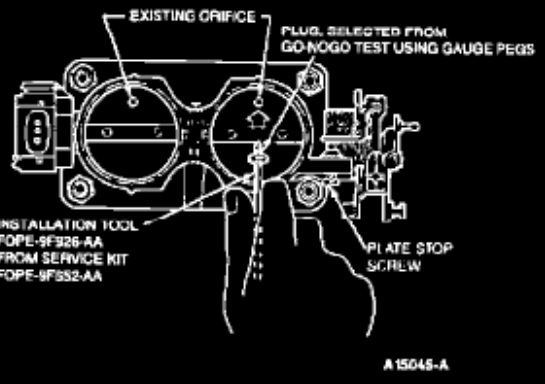

1. Remove air inlet tube(s) from throttle body.
2. Select the proper color plug by using the Go/NoGo gauge pegs included with the service kit FOPE-9F852-AA.
3. Starting with the largest diameter gauge peg, attempt to insert it through the throttle plate orifice.
4. If the gauge peg goes through the orifice, use the corresponding color plug.
   If it does not go through, proceed with the next smaller gauge peg for Go/NoGo Test.

NOTE: It is important that the largest Go/NoGo combination is used to determine the proper plug size.

5. If the smallest gauge peg does not go through the orifice, use the reamer bit and handle included with the service kit to enlarge the plate orifice. Wipe bearing grease on both sides of the plate orifice and on the reamer bit to hold the brass chips. After reaming, wipe the plate clean and then return to Step 3 to determine the proper plug size.
6. Using the installation tool from the service kit, push the plug into the orifice until bottoming out at the throttle plate.
7. Open and snap shut the throttle several times to verify proper plug retention.
8. Reconnect air inlet tube(s).
9. Reset idle rpm per engine requirement using the throttle plate stop screw.

Figure 7

Idle Airflow Adjust Procedure For All EFI and SEFI Systems

- Cooling system filled
- Engine at operating temperature
- Proper fuel pressure and no exhaust smoke
- Heater, A/C, and other accessories OFF
- Correct/clean PCV system if required
- Ignition timing set to specification
- EEC-IV diagnostics have been performed and vehicle malfunction indicated Service output codes have been resolved

Procedure

Choose procedure A, B, C or D from the table below for the engine being serviced. (The applications with self-test idle speed check provisions use procedure 'A' or 'C' and those without use procedure 'B' or 'D' depending on car or truck). An asterisk (*) below shows only applications without sludge tolerant throttle body design.

DELETION

2 - Procedure 'D' for 1991 except F-250 with 0-64K calibration and procedure C for 1991 E-250 with 0-64K calibration and for all 1991 1/2

3 - Sludge tolerant throttle body introduced 1991 1/2

See Fig. 4 for typical plate atop screw location referred to in the attached procedure.

See Fig. 5 and 6 for air trim screw location referred to in the attached procedure A.

See Fig. 7 for plug installation (in the plate orifice) procedure referred to in the attached procedures.

Procedure 'A' for Passenger Cars with Self-Test Idle Speed Check Provisions

DELETION

(USE ONLY STEPS MARKED 'X' FOR THE ENGINE BEING SERVICED)	2.5L	3.0L	3.8L	3.8L SC	4.6L 2V	5.0L HO THUNDERBIRD COUGAR
1 Activate engine running self-test	X	X	X	X	X	X
2 After Service Code 11 or 111 has been displayed, wait 4 seconds then quickly unlatch and within 4 seconds latch the STI button	X	X	X	X	X	X
3 A single pulse code indicates the entry mode, then observe the Self-Test Output (STO) of the STAR Tester in Item 4. If adjustment is required in Item 4, refer to possible causes listed in previous section and correct them as required and then continue with this procedure if necessary.	X	X	X	X	X	X
4 (A) Constant tone, solid light or "STO LO" readout means base idle rpm is within range. To exit test, unlatch STI button, then wait four seconds for reinitialization (after 10 minutes it will exit by itself).	X	X	X	X	X	X
(B) Beeping tone, flashing light, or "STO LO" readout at (8 Hz) indicates TP sensor is out of range due to over adjustment; adjustment may be required.	X	X	X	X	X	X
(C) Beeping tone, flashing light, or "STO LO" readout at (4 Hz) indicates base idle rpm is too fast, adjustment is required, go to Step 6.	X	X	X	X	X	X
(D) Beeping tone, flashing light, or "STO LO" readout at (1 Hz) indicates base idle rpm is too slow, adjustment is required, go to Step 5.	X	X	X	X	X	X
5 If rpm is too slow, follow applicable procedure for the engine being serviced.	X	X	X	X	X	X
A. Do not clean the throttle body, turn the air trim screw counter-clockwise until conditions in Step 4(A) are satisfied for air trim location. (See Figure 5 or 6).				X	X	X
B. Do not clean the throttle body. Check for the plate orifice plug. If there is no plug turn screw clockwise until conditions in Step 4(A) are satisfied. If there is a plug from previous service remove plug and then adjust screw in either direction as required. Screw must be in contact with the lever pad after adjustment.	X	X	X			
6 If rpm is too high, follow applicable procedure for the engine being serviced	X	X	X	X	X	X
A. Do not clean the throttle body, turn the air trim screw clockwise until conditions in Step 4(A) are satisfied for air trim screw location (see Figure 5 or 6).				X	X	X
B Turn engine OFF	X	X	X			
a. Block off the orifice in the throttle plate temporarily with tape. If the orifice already has a plug from previous service, go to Step (C)	X	X	X			
b. Restart the engine and check idle speed using Self-Test (mass air packages require air intake hose to be reattached first). If engine stalled, crack open the plate with plate stop screw. (Figure 4)	X	X	X			
c. If rpm continues to be fast, perform test in Step 7 if TPS output code is within range, remove tape, go to Section 2 for other causes. If out of range adjust screw for proper TPS code (lever pad must be in contact with screw after adjustment). If rpm is still fast, terminate this procedure and - go to Section 2 for other possible causes.	X	X	X			
d. However, if rpm drops to or below the desired level, as indicated by Self-Test Output tone, turn the engine off disconnect air cleaner hose, remove the tape.	X	X	X			
e. Install the plug with proper color code depending on throttle plate orifice size - see Fig. 7 for installation procedure.	X	X	X			
f. Reconnect the air cleaner hose - start the engine turn the plate stop screw clockwise (do not turn it counter-clockwise as this may cause the throttle plate to stick at idle) until conditions in Step 4A are satisfied.	X	X	X			
7 Run KOEO Self-Test for proper TPS output code.	X	X	X			
8 Verify the throttle is not stuck in the bore and linkage is not preventing throttle from closing.	X	X	X			
9 On automatic overdrive transmission (AOD) applications check TV pressure adjustment		X	X

Procedure 'D' for Trucks with No Self-Test Idle Speed Check Provisions (Continued)

USE ONLY STEPS MARKED "X" FOR THE ENGINE BEING SERVICED (Continued)	2.3L EFI OHC	2.9L EFI	3.0L EFI	4.0L EFI WITH 81TF-AA THROTTLE BODY	4.0L EFI WITH 90TF-AA THROTTLE BODY	5.0L EFI (NON-E4OD)	5.8L EFI D/8500 ALL 1991 EXCEPT F-250 D-64K CALIBRATION 3/	7.5L EFI 1991	7.5L EFI 1991 1/2
i. Reconnect the air cleaner hose — start the engine. Check idle rpm using a tachometer. Turn the plate stop screw clockwise (do not turn it counter-clockwise as this may cause the throttle plate to stick at idle) to the nominal rpm ±25 rpm shown in Step 9.	X		X	X		X	X		X
10 Shut engine off and repeat Steps 7, 8 and 9 if necessary.	X	X	X	X	X				
11 Run KOEO Self Test for proper TPS output code.	X	X	X	X	X	X	X	X	X
12 Shut engine off and disconnect battery for 5 minutes minimum.	X	X	X	X	X	X	X		
13 Remove feeler gauge from throttle plate stop screw and throttle lever pad.						X	X		
14 Reconnect SPOUT line.	X					X	X		
15 Engine off (reconnect idle speed control-air bypass solenoid. Verify that the throttle is not stuck in the bore and linkage is not preventing throttle from closing.	X	X	X	X	X	X	X	X	X
16 Start engine and stabilize for two minutes, then goose engine and let it return to idle, lightly depress and release the accelerator. Let engine idle, if idle problem still exists go to Section 2 for other possible causes.	X	X	X	X	X	X 2/	X 2/	X	X
17 On Automatic Overdrive Transmission (AOD) applications, check TV pressure adjustment.						X			

NOTE 1: On 5.0L and 5.8L, only in Step 9. If you must turn the plate stop screw in, shut engine off, make estimated adjustment. Start engine, repeat Steps 7,8,9.

2/ In Step 16, engine rpm oscillation may be caused by the throttle plate open far enough to expose the canister purge ports. To verify this, disconnect purge port and plug. If the problem is resolved, close the throttle plate just enough to eliminate oscillations.

3/ For 1991 1/2 use procedure 'C'.

Engine Idle Adjustment Procedures - Revision

ENGINE/EMISSIONS DIAGNOSIS SHOP MANUAL - 1991 - SECTION 9 - IDLE ADJUST PROCEDURES REVISED FOR APPLICATIONS WITHOUT SLUDGE TOLERANT THROTTLE BODY Article No. 90-25B-2 FORD:

1991 PROBE

LIGHT TRUCK: 1991 AEROSTAR, EXPLORER, RANGER

ISSUE: The Idle Adjust Procedures in the 1991 Engine/Emissions Diagnosis Shop Manual have been revised to cover applications that do not have the sludge tolerant throttle body. These are 1991 Aerostar, Explorer, and Ranger trucks with 4.0L engines. The 3.0L Probe has a sludge tolerant throttle body.

ACTION: Refer to the pages following this TSB article for the revised procedures.

NOTE: A SLUDGE TOLERANT THROTTLE BODY IS IDENTIFIED BY A 91TF-AA PREFIX AND SUFFIX IN THE PART NUMBER.

OTHER APPLICABLE ARTICLES: None WARRANTY STATUS: INFORMATION ONLY

Component Descriptions

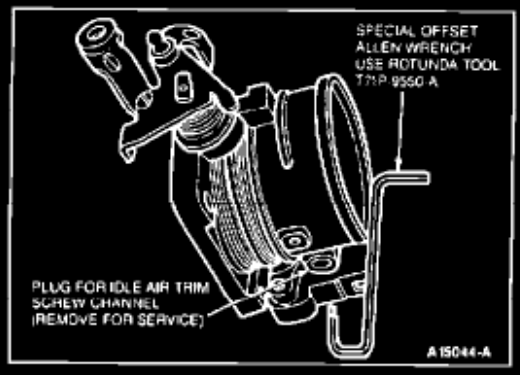

Figure 6

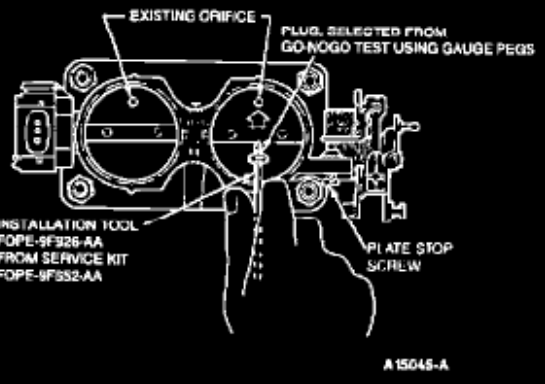

1. Remove air inlet tube(s) from throttle body.
2. Select the proper color plug by using the Go/NoGo gauge pegs included with the service kit FOPE-9F852-AA.
3. Starting with the largest diameter gauge peg, attempt to insert it through the throttle plate orifice.
4. If the gauge peg goes through the orifice, use the corresponding color plug.
   If it does not go through, proceed with the next smaller gauge peg for Go/NoGo Test.

NOTE: It is important that the largest Go/NoGo combination is used to determine the proper plug size.

5. If the smallest gauge peg does not go through the orifice, use the reamer bit and handle included with the service kit to enlarge the plate orifice. Wipe bearing grease on both sides of the plate orifice and on the reamer bit to hold the brass chips. After reaming, wipe the plate clean and then return to Step 3 to determine the proper plug size.
6. Using the installation tool from the service kit, push the plug into the orifice until bottoming out at the throttle plate.
7. Open and snap shut the throttle several times to verify proper plug retention.
8. Reconnect air inlet tube(s).
9. Reset idle rpm per engine requirement using the throttle plate stop screw.

Figure 7

Idle Airflow Adjust Procedure For All EFI and SEFI Systems

- Cooling system filled
- Engine at operating temperature
- Proper fuel pressure and no exhaust smoke
- Heater, A/C, and other accessories OFF
- Correct/clean PCV system if required
- Ignition timing set to specification
- EEC-IV diagnostics have been performed and vehicle malfunction indicated Service output codes have been resolved

Procedure

Choose procedure A, B, C or D from the table below for the engine being serviced. (The applications with self-test idle speed check provisions use procedure 'A' or 'C' and those without use procedure 'B' or 'D' depending on car or truck). An asterisk (*) below shows only applications without sludge tolerant throttle body design.

CAR			TRUCK

DELETION

2 - Procedure 'D' for 1991 except F-250 with 0-64K calibration and procedure C for 1991 E-250 with 0-64K calibration and for all 1991 1/2

3 - Sludge tolerant throttle body introduced 1991 1/2

See Fig. 4 for typical plate atop screw location referred to in the attached procedure.

See Fig. 5 and 6 for air trim screw location referred to in the attached procedure A.

See Fig. 7 for plug installation (in the plate orifice) procedure referred to in the attached procedures.

Procedure 'A' for Passenger Cars with Self-Test Idle Speed Check Provisions

DELETION

(USE ONLY STEPS MARKED 'X' FOR THE ENGINE BEING SERVICED)	2.5L	3.0L	3.8L	3.8L SC	4.6L 2V	5.0L HO THUNDERBIRD COUGAR
1 Activate engine running self-test	X	X	X	X	X	X
2 After Service Code 11 or 111 has been displayed, wait 4 seconds then quickly unlatch and within 4 seconds latch the STI button	X	X	X	X	X	X
3 A single pulse code indicates the entry mode, then observe the Self-Test Output (STO) of the STAR Tester in Item 4. If adjustment is required in Item 4, refer to possible causes listed in previous section and correct them as required and then continue with this procedure if necessary.	X	X	X	X	X	X
4 (A) Constant tone, solid light or "STO LO" readout means base idle rpm is within range. To exit test, unlatch STI button, then wait four seconds for reinitialization (after 10 minutes it will exit by itself).	X	X	X	X	X	X
(B) Beeping tone, flashing light, or "STO LO" readout at (8 Hz) indicates TP sensor is out of range due to over adjustment; adjustment may be required.	X	X	X	X	X	X
(C) Beeping tone, flashing light, or "STO LO" readout at (4 Hz) indicates base idle rpm is too fast, adjustment is required, go to Step 6.	X	X	X	X	X	X
(D) Beeping tone, flashing light, or "STO LO" readout at (1 Hz) indicates base idle rpm is too slow, adjustment is required, go to Step 5.	X	X	X	X	X	X
5 If rpm is too slow, follow applicable procedure for the engine being serviced.	X	X	X	X	X	X
A. Do not clean the throttle body, turn the air trim screw counter-clockwise until conditions in Step 4(A) are satisfied for air trim location. (See Figure 5 or 6).				X	X	X
B. Do not clean the throttle body. Check for the plate orifice plug. If there is no plug turn screw clockwise until conditions in Step 4(A) are satisfied. If there is a plug from previous service remove plug and then adjust screw in either direction as required. Screw must be in contact with the lever pad after adjustment.	X	X	X			
6 If rpm is too high, follow applicable procedure for the engine being serviced	X	X	X	X	X	X
A. Do not clean the throttle body, turn the air trim screw clockwise until conditions in Step 4(A) are satisfied for air trim screw location (see Figure 5 or 6).				X	X	X
B Turn engine OFF	X	X	X			
a. Block off the orifice in the throttle plate temporarily with tape. If the orifice already has a plug from previous service, go to Step (C)	X	X	X			
b. Restart the engine and check idle speed using Self-Test (mass air packages require air intake hose to be reattached first). If engine stalled, crack open the plate with plate stop screw. (Figure 4)	X	X	X			
c. If rpm continues to be fast, perform test in Step 7 if TPS output code is within range, remove tape, go to Section 2 for other causes. If out of range adjust screw for proper TPS code (lever pad must be in contact with screw after adjustment). If rpm is still fast, terminate this procedure and - go to Section 2 for other possible causes.	X	X	X			
d. However, if rpm drops to or below the desired level, as indicated by Self-Test Output tone, turn the engine off disconnect air cleaner hose, remove the tape.	X	X	X			
e. Install the plug with proper color code depending on throttle plate orifice size - see Fig. 7 for installation procedure.	X	X	X			
f. Reconnect the air cleaner hose - start the engine turn the plate stop screw clockwise (do not turn it counter-clockwise as this may cause the throttle plate to stick at idle) until conditions in Step 4A are satisfied.	X	X	X			
7 Run KOEO Self-Test for proper TPS output code.	X	X	X			
8 Verify the throttle is not stuck in the bore and linkage is not preventing throttle from closing.	X	X	X			
9 On automatic overdrive transmission (AOD) applications check TV pressure adjustment		X	X

Procedure 'D' for Trucks with No Self-Test Idle Speed Check Provisions (Continued)

USE ONLY STEPS MARKED "X" FOR THE ENGINE BEING SERVICED (Continued)	2.3L EFI OHC	2.9L EFI	3.0L EFI	4.0L EFI WITH 81TF-AA THROTTLE BODY	4.0L EFI WITH 90TF-AA THROTTLE BODY	5.0L EFI (NON-E4OD)	5.8L EFI D/8500 ALL 1991 EXCEPT F-250 D-64K CALIBRATION 3/	7.5L EFI 1991	7.5L EFI 1991 1/2
i. Reconnect the air cleaner hose — start the engine. Check idle rpm using a tachometer. Turn the plate stop screw clockwise (do not turn it counter-clockwise as this may cause the throttle plate to stick at idle) to the nominal rpm ±25 rpm shown in Step 9.	X		X	X		X	X		X
10 Shut engine off and repeat Steps 7, 8 and 9 if necessary.	X	X	X	X	X				
11 Run KOEO Self Test for proper TPS output code.	X	X	X	X	X	X	X	X	X
12 Shut engine off and disconnect battery for 5 minutes minimum.	X	X	X	X	X	X	X		
13 Remove feeler gauge from throttle plate stop screw and throttle lever pad.						X	X		
14 Reconnect SPOUT line.	X					X	X		
15 Engine off reconnect idle speed control-air bypass solenoid. Verify that the throttle is not stuck in the bore and linkage is not preventing throttle from closing.	X	X	X	X	X	X	X	X	X
16 Start engine and stabilize for two minutes, then goose engine and let it return to idle, lightly depress and release the accelerator. Let engine idle, if idle problem still exists go to Section 2 for other possible causes.	X	X	X	X	X	X 2/	X 2/	X	X
17 On Automatic Overdrive Transmission (AOD) applications, check TV pressure adjustment.						X			

NOTE 1: On 5.0L and 5.8L, only in Step 9. If you must turn the plate stop screw in, shut engine off, make estimated adjustment. Start engine, repeat Steps 7,8,9.

2/ In Step 16, engine rpm oscillation may be caused by the throttle plate open far enough to expose the canister purge ports. To verify this, disconnect purge port and plug. If the problem is resolved, close the throttle plate just enough to eliminate oscillations.

3/ For 1991 1/2 use procedure 'C'.

Revised 12/90

Idle Speed: By Symptom

Engine - Hard Cold Starts/Hesitation/Stalls On Start-Up

Article No. 91-25-7

12/13/91

^ HARD COLD START - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

^ HESITATION/STALLS - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

FORD: 1983-87 EXP 1983-91 ESCORT 1984-90 MUSTANG, THUNDERBIRD 1986-90 TAURUS 1986-91 CROWN VICTORIA 1988-90 TEMPO

LINCOLN-MERCURY: 1983-85 LN7 1983-87 LYNX 1984-88 CAPRI 1984-90 COUGAR 1986-90 CONTINENTAL, MARK VII, SABLE 1986-91 GRAND MARQUIS, TOWN CAR 1988-90 TOPAZ 1991 TRACER

LIGHT TRUCK: 1985-90 BRONCO II, BRONCO 1985-91 ECONOLINE, F-150-350 SERIES 1985-92 RANGER 1986-91 AEROSTAR 1991 EXPLORER

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

SERVICE KIT -9F939-

TB-2432-A

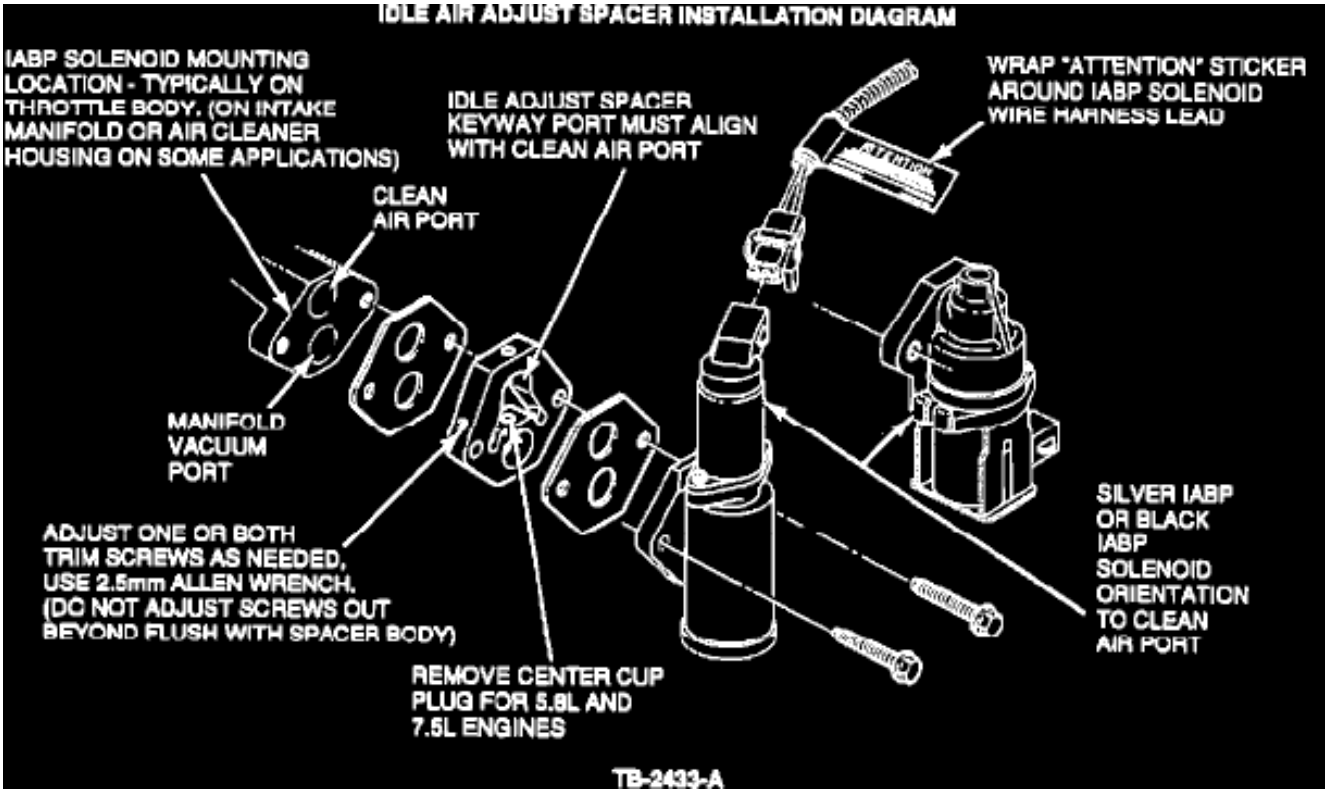
Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.

The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets



^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

Figure 5

The EFI throttle body idle speed adjustment procedures for the various model year passenger cars and light trucks are outlined in step-by-step procedures featured in Figures 3, 4 and 5. Select the appropriate procedure for the vehicle involved and adjust the throttle body idle RPM accordingly, after service kit installation.

Figure 11

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

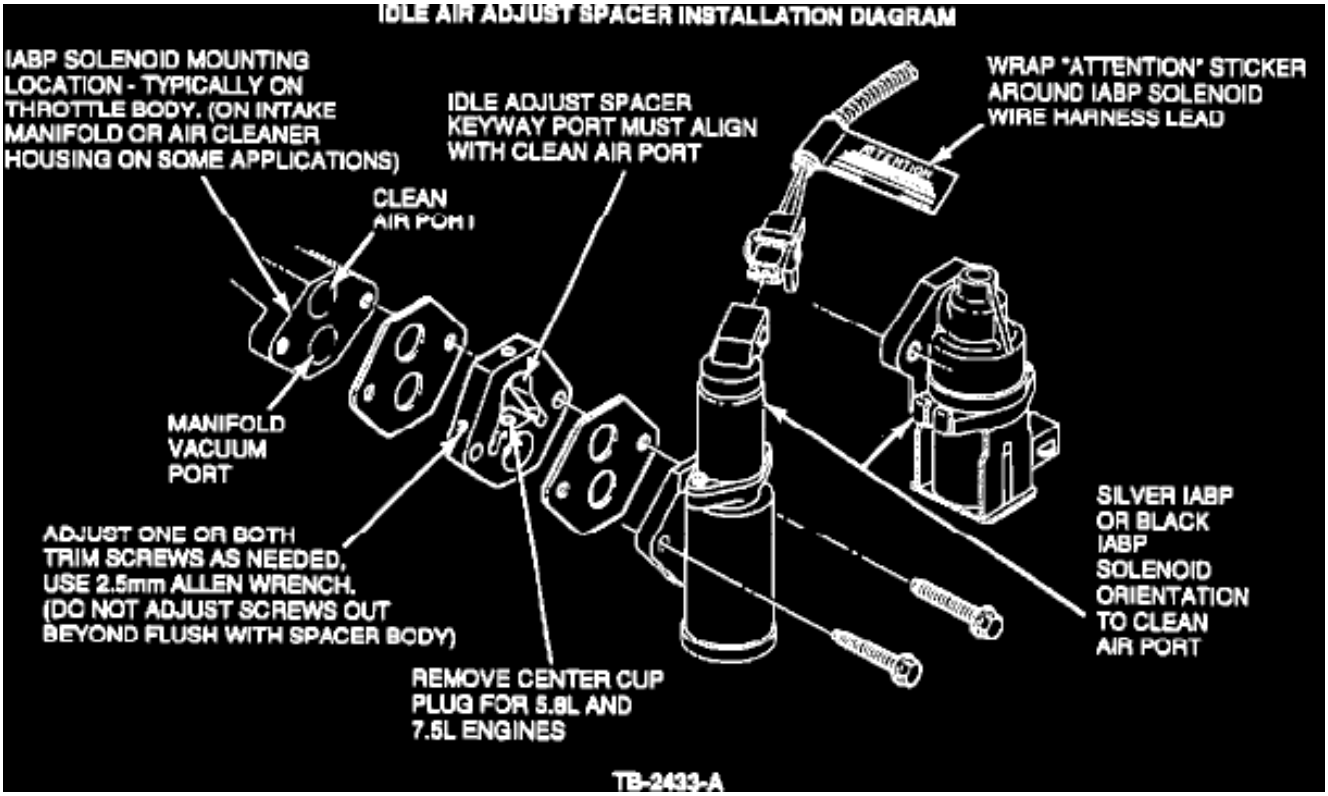
TB-2432-A

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.



The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets

^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

Figure 11

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

Idle Speed: Adjustments With 90TF-AA Throttle Body

*** UPDATED BY TSB 9111B4, 6/14/91; TSB 9025B2, 12/90

NOTE: The curb and fast idle speeds are controlled by the Engine Control Assembly (ECA) and the Idle Speed Control Bypass Air Valve (ISC-BPA). The ISC-BPA valve is not adjustable. A large increase or decrease in closed plate airflow from the calibrated level will not allow this device to control the speed.

REMEMBER

A change in idle airflow can occur not only at the throttle body, but other areas as well. You should enter the idle speed procedure only after other possible causes in the following areas are eliminated.

^ Contamination within the idle speed control device

^ Lack of fuel system control (excessively rich or lean)

^ Throttle sticking or binding

^ Engine not reaching operating temperature

^ Incorrect ignition timing

^ Incorrect or clogged PCV system

^ Vacuum leaks (intake manifold, vacuum hoses, vacuum reservoirs, power brake booster etc.

VERIFY

^ Transmission is in PARK (A/T), or NEUTRAL (M/T)

^ Parking brake is applied (automatic brake disconnected where applicable)

^ Wheels blocked

^ Engine at operating temperature

^ Proper fuel pressure and no exhaust smoke

^ Correct and clean PCV system

^ Heater, A/C, and other accessories OFF

^ Ignition timing is set to specification

^ EEC-IV diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved.

STEP 1

With the engine OFF, connect a tachometer, according to manufacturer's instructions. Disconnect the negative (-) terminal of the battery for 5 minutes, then reconnect it.

STEP 2

START the engine and let stabilize for two minutes. Goose the accelerator and let the engine return to idle. Lightly depress and release the accelerator, then let engine idle.

STEP 3

If the engine is not idling properly, turn the engine OFF, and disconnect Idle Speed Control Air Bypass Solenoid.

STEP 4

START and RUN the engine at 2500 rpm for 30 seconds.

STEP 5

Place the transmission is in PARK (A/T), or NEUTRAL (M/T).

STEP 6

Using a tachometer, verify idle rpm is 675 +50/-125 rpm.

RPM TOO LOW a.

Turn the plate stop screw to reach an idle speed of 675 +/- 25 rpm.

NOTE: During engine break-in reduce the idle rpm by 100 rpm. RPM TOO HIGH a.

Turn the plate stop screw clockwise until 675 +/- 25 rpm is achieved.

STEP 7

Turn the engine OFF, and repeat Steps 4, 5, and 6, if necessary.

STEP 8

Run the KOEO Self-Test for proper TPS code output.

STEP 9

Turn the engine OFF, and disconnect the battery for at least 5 minutes.

STEP 10

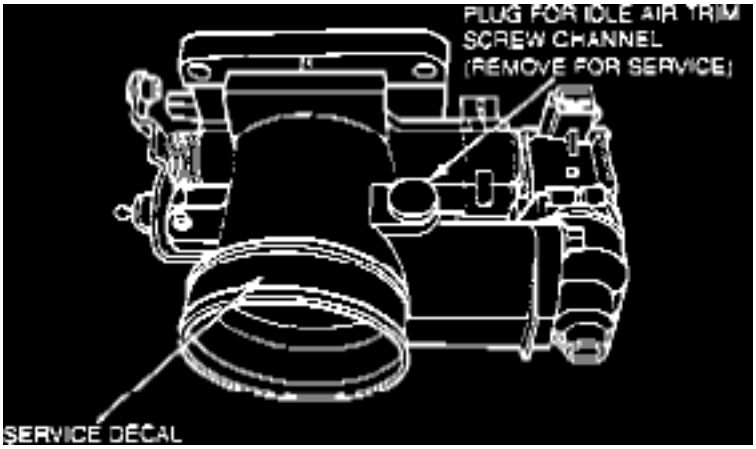
Reconnect the Idle Speed Control Air Bypass Solenoid. Verify the throttle plate is not stuck in the bore, and the linkage is not preventing throttle from closing.

STEP 11

START the engine and idle for two minutes. Goose the accelerator and let the engine return to idle. Lightly depress and release the accelerator, then let engine idle. ^

If idle problem still exists, proceed to DIAGNOSIS AND TESTING PROCEDURES/TESTING PROCEDURES/QUICK TEST AND

DIAGNOSTIC AIDS/VISUAL INSPECTION for other possible causes.



Idle Speed: Adjustments With 91TF-AA Throttle Body

*** UPDATED BY TSB 91-11B-4 6/14/91

NOTE: The curb and fast idle speeds are controlled by the Engine Control Assembly (ECA) and the Idle Speed Control Bypass Air Valve (ISC-BPA). The ISC-BPA valve is not adjustable. A large increase or decrease in closed plate airflow from the calibrated level will not allow this device to control the speed. The idle speed setting procedure has been revised considerably to reflect the expanded application of the Self-Test idle speed options and because the throttle body incorporates an orifice in the throttle plate to control idle airflow as part of the sludge tolerant design.

Air Trim Screw Channel Cover

Throttle bodies with sludge tolerant design (introduced 1991 1/2 model vehicles) are clearly identified with a Yellow/Black decal. This decal warns that the throttle plate stop screw must not be adjusted counterclockwise (backed off), as this will not reduce the engine speed but may cause the throttle plate to stick in the bore. Backing out the screw may be required if the throttle body has been previously serviced (a plug in the throttle plate orifice may be present) or the plate stop screw tampered with (TPS Self-Test output out of range). The decal also warns that the throttle body must NOT be cleaned inside the bore, as this cleaning will impair the sensitive coating. The sludge accumulation will not affect the idle air flow. The cleaning procedure for the ISC-BPA still applies.

REMEMBER

A change in idle airflow can occur not only at the throttle body, but other areas as well. You should enter the idle speed procedure only after other possible causes in the following areas are eliminated.

^ Contamination within the idle speed control device

^ Lack of fuel system control (excessively rich or lean)

^ Throttle sticking or binding

^ Engine not reaching operating temperature

^ Incorrect ignition timing

^ Incorrect or clogged PCV system

^ Vacuum leaks (intake manifold, vacuum hoses, vacuum reservoirs, power brake booster etc.

VERIFY

^ Transmission is in PARK (A/T), or NEUTRAL (M/T)

^ Parking brake is applied (automatic brake disconnected where applicable)

^ Wheels blocked

^ Engine at operating temperature

^ Proper fuel pressure and no exhaust smoke

^ Correct and clean PCV system

^ Heater, A/C, and other accessories OFF

^ Ignition timing is set to specification

^ EEC-IV diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved.

STEP 1

With the engine OFF, connect a tachometer, according to manufacturer's instructions. Disconnect the negative (-) terminal of the battery for 5 minutes, then reconnect it.

STEP 2

START the engine and let stabilize for two minutes. Goose the accelerator and let the engine return to idle. Lightly depress and release the accelerator, then let engine idle.

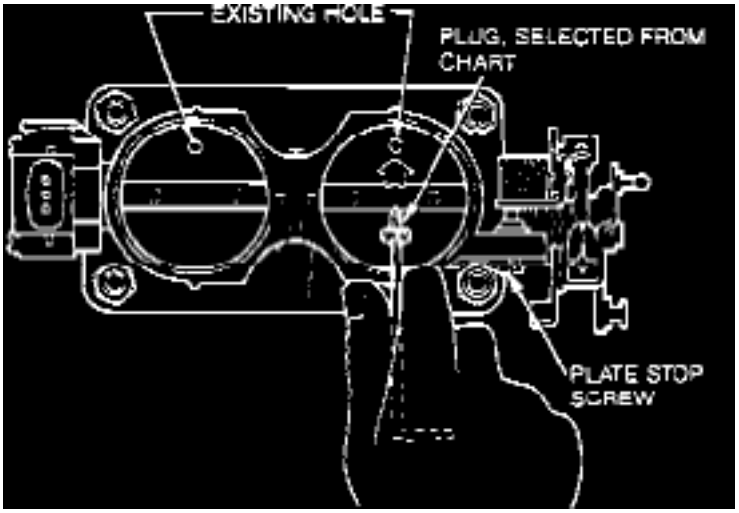
STEP 3

If the engine is not idling properly, turn the engine OFF, and disconnect Idle Speed Control Air Bypass Solenoid.

STEP 4

START and RUN the engine at 2500 rpm for 30 seconds.

STEP 5



Place the transmission is in PARK (A/T), or NEUTRAL (M/T).

STEP 6

Using a tachometer, verify idle rpm is 675 +50/-120 rpm.

Throttle Plate Orifice Plug

NOTE: A plug in the throttle body orifice will decrease idle rpm. Where as an orifice without a plug will increase idle rpm. Orifice plugs and installation tools are available in service kit # FOPZ-9F652-A.

RPM TOO LOW a.

Do not clean the throttle body, check for the plate orifice plug. ^

If there is no plug, turn the screw clockwise to the desired rpm.

^ If there is a plug from previous service, remove the plug, and adjust the screw in either direction as required. NOTE: Screw must be in contact with the lever pad after adjustment.

RPM TOO HIGH a.

Turn the engine OFF.

b. Disconnect air cleaner hose.

c. Temporarily block the orifice in the throttle plate with tape. If the orifice already has a plug from previous service proceed to Step (e).

d. RESTART the engine, and check the idle speed, using a tachometer. NOTE: On vehicles with Mass Air Flow Sensors, reconnect the air intake duct hose before checking rpm. If the engine stalls, crack open the plate stop screw, but DO NOT over adjust.

e. If rpm continues to be fast, perform KOEO Self-Test. ^

If TPS output code is within range, remove tape from throttle plate, and check for other possible causes.

^ If TPS output is out of range, adjust screw for proper TPS code. Lever must be in contact with the screw.

^ If rpm is still fast, terminate this procedure, then check for other possible causes.

f. If rpm drops to 675 or lower, or engine stalls, turn the engine OFF, disconnect the air cleaner hose, and remove tape from throttle plate.

g. Install the plug with proper color code depending on throttle plate orifice size.

h. Reconnect the air cleaner hose. START the engine, and check the idle rpm using a tachometer. Turn the plate stop screw clockwise until 675 +/- 25 rpm is achieved. NOTE: Do not turn the plate stop screw counterclockwise. This may cause the throttle plate to stick at idle.

STEP 7

Turn the engine OFF, and repeat Steps 4, 5, and 6.

STEP 8

Run the KOEO Self-Test for proper TPS code output.

STEP 9

Turn the engine OFF, and disconnect the battery for at least 5 minutes.

STEP 10

Reconnect the Idle Speed Control Air Bypass Solenoid. Verify the throttle plate is not stuck in the bore, and the linkage is not preventing throttle from closing.

STEP 11

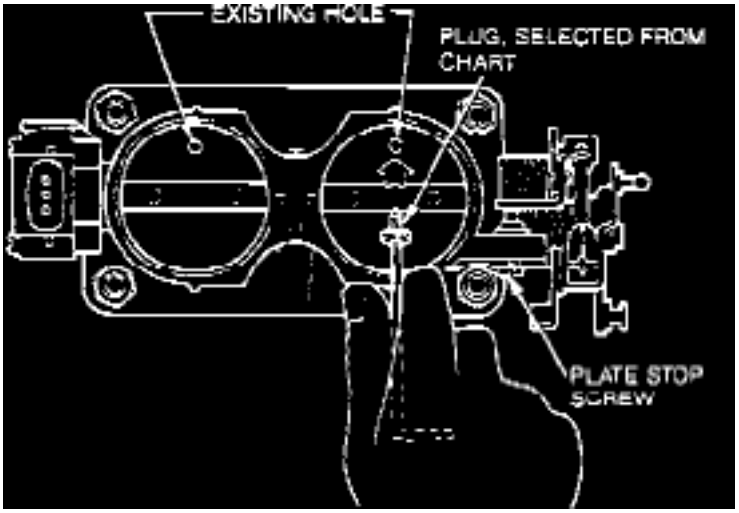
START the engine and idle for two minutes. Goose the accelerator and let the engine return to idle. Lightly depress and release the accelerator, then let engine idle. ^

If idle problem still exists, proceed to DIAGNOSIS AND TESTING PROCEDURES/TESTING PROCEDURES/QUICK TEST AND DIAGNOSTIC AIDS/VISUAL INSPECTION for other possible causes.

PROCEDURES FOR PLUG INSTALLATION

STEP 1

Remove air inlet tube(s) from throttle body.



Throttle Plate Orifice Plug

STEP 2

Select the proper color plug by using the Go/No-Go gauge pegs, included in the service kit (FOPZ-9F652-A).

STEP 3

Starting with the largest diameter gauge peg, attempt to insert through the throttle plate orifice.

STEP 4

If the gauge peg goes through the orifice, use the corresponding color plug. If the gauge peg does not go through, proceed with the next smaller gauge peg for Go/No-Go Test. NOTE: It is important that the largest Go/No-Go combination is used to determine the proper plug size.

STEP 5

If the smallest gauge peg does not go through the orifice, use the reamer bit and handle included with the service kit to enlarge the plate orifice. Wipe bearing grease on both sides of the plate orifice and on the reamer bit to hold the brass chips. After reaming, wipe plate clean and then return to Step 3 to determine the proper plug size.

STEP 6

Using the installation tool from the service kit, push the plug into the orifice until bottoming out at the throttle plate.

STEP 7

Open and snap closed the throttle several times to verify proper plug retention.

STEP 8

Reconnect the air inlet tube(s).

STEP 9

Reset idle rpm per engine requirement using the throttle plate stop screw.

Air Cleaner Fresh Air Duct/Hose: Technical Service Bulletins Engine - Water Entry Through Air Intake System

Article No. 94-3-8

02/09/94

^ AIR INTAKE - 2.9L, 3.0L, 4.0L EFI ENGINES - WATER ENTRY THROUGH AIR INTAKE SYSTEM

^ ENGINE - 2.9L, 3.0L, 4.0L EFI - POSSIBLE INTERNAL DAMAGE FROM WATER ENTRY THROUGH AIR INTAKE SYSTEM

LIGHT TRUCK: 1986-90 BRONCO II 1986-94 RANGER 1991-94 EXPLORER

This article is being republished in its entirety to add 1993-94 4.0L Ranger, 1993-94 3.0L Ranger and 1993-94 4.0L Explorer vehicles.

ISSUE: Reports have been received of internal engine damage caused by water entering the engine through the air intake system. This condition may occur when the vehicle is driven in normal wet conditions, such as water splash/spray from other vehicles, or when driven through shallow water. Improvements were made to the EFI engine air intake systems that have greatly reduced the number of reported incidences.

ACTION: Dealers should be assured that warranty repairs will be covered unless there Is evidence of owner misuse. This warranty repair policy will remain effective unless you are notified that a waterproof air intake system has been released.

ISSUE This TSB article is a diagnostic procedure to address vehicles that exhibit lean driveability symptoms and may or may not have any Diagnostic Trouble Codes (DTCs) stored in memory.

ACTION Follow the diagnostic procedures described in the following Service Tip. The revised diagnostic procedure is a more accurate means of diagnosing the symptoms.

SERVICE TIP

MASS AIR FLOW (MAF) DISCUSSION

MAF sensors can get contaminated from a variety of sources: dirt, oil, silicon, spider webs, potting compound from the sensor itself, etc. When a MAF sensor gets contaminated, it skews the transfer function such that the sensor over-estimates air flow at idle (causes the fuel system to go rich) and under-estimates air flow at high air flows (causes fuel system to go lean). This means Long Term Fuel Trims will learn lean (negative) corrections at idle and learn rich (positive) corrections at higher air flows.

If vehicle is driven at Wide Open Throttle (WOT) or high loads, the fuel system normally goes open loop rich to provide maximum power. If the MAF sensor is contaminated, the fuel system will actually be lean because of under-estimated air flow. During open loop fuel operation, the vehicle applies Long Term Fuel Trim corrections that have been learned during closed loop operation. These corrections are often lean corrections learned at lower air flows. This combination of under-estimated air flow and lean fuel trim corrections can result in spark knock/detonation and lack of power concerns at WOT and high loads.

One of the indicators for diagnosing this condition is barometric pressure. Barometric pressure (BARO) is inferred by the Powertrain Control Module (PCM) software at part throttle and WOT (there is no actual BARO sensor on MAF-equipped vehicles, except for the 3.8L Supercharged engine). At high air flows, a contaminated MAF sensor will under-estimate air flow coming into the engine, hence the PCM infers that the vehicle is operating at a higher altitude. The BARO reading is stored in Keep Alive Memory (KAM) after it is updated. Other indicators are Long Term Fuel Trim and MAF

voltage at idle.

NOTE

THE FOLLOWING PROCEDURE MAY ALSO BE USED TO DIAGNOSE VEHICLES THAT DO NOT HAVE FUEL SYSTEM/HO2S SENSOR DTCS.

Symptoms

^ Lack of Power

^ Spark Knock/Detonation

^ Buck/Jerk

^ Hesitation/Surge on Acceleration

^ Malfunction Indicator Lamp (MIL) Illuminated -

DTCs P0171, P0172, P0174, P0175 may be stored in memory

OBDII DTCs

^ P0171, P0174 (Fuel system lean, Bank 1 or 2)

^ P0172, P0175, (Fuel system rich, Bank 1 or 2)

^ P1130, P1131, P1132, (HO2S11 lack of switching, Bank 1)

^ P1150, P1151, P1152, (HO2S21 lack of switching, Bank 2)

OBDI DTCs

^ 181, 189 (Fuel system lean, Bank 1 or 2)

^ 179, 188 (Fuel system rich, Bank 1 or 2)

^ 171, 172, 173 (HO2S11 lack of switching, Bank 1)

^ 175, 176, 177 (HO2S21 lack of switching, Bank 2)

^ 184, 185 (MAF higher/lower than expected)

^ 186, 187 (Injector pulse width higher/lower than expected)

NOTE:

DO NOT DISCONNECT THE BATTERY. IT WILL ERASE KEEP ALIVE MEMORY AND RESET LONG TERM FUEL TRIM AND BARO TO THEIR STARTING/BASE VALUES. THE BARO PARAMETER IDENTIFICATION DISPLAY (PID) IS USED FOR THIS DIAGNOSTIC PROCEDURE. ALL OBDII APPLICATIONS HAVE THIS PID AVAILABLE. THERE ARE SOME OBDI VEHICLES THAT DO NOT HAVE THE BARO PID, FOR THESE VEHICLES OMIT THE BARO CHECK AND REFER ONLY TO STEPS 2, 3, AND 4 IN THE DIAGNOSTIC PROCEDURE.

BAROMETRIC PRESSURE REFERENCE

Barometric Pressure (in. Hg.)	Barometric Pressure (kPa)	BARO/MAP PID (Hz)	Altitude above sea level (ft)
3.5	11.8	89.3	
5	16.9	92.8	
10	33.8	104.6	
15	50.7	117.0	14,000
20	67.5	129.6	10,000
21	70.9	132.5	9,000
22	74.3	135.4	8,000
23	77.7	138.3	7,000
24	81.1	141.1	6,000
25	84.4	144.0	5,000
26	87.8	146.9	4,000
27	91.2	149.8	3,000
28	94.6	152.8	2,000
29	97.9	155.8	1,000
30	101.3	158.9	0 (sea level)
31	104.7	162.0	
31.875	107.7	164.7	

1. Look at the BARO PID. Refer to the Barometric Pressure Reference Chart in this article. At sea level, BARO should read about 159 Hz (29.91 in. Hg). As a reference, Denver, Colorado at 1524 meters (5000 ft.) altitude should be about 144 Hz (24.88 in.Hg). Normal learned BARO variability is up to +/- 6 Hz (+/- 2 in. Hg.). If BARO indicates a higher altitude than you are not at (7 or more Hz lower than expected), you may have MAF contamination. If available, Service Bay Diagnostic System (SBDS) has a Manifold Absolute Pressure (MAP) sensor that can be used as a barometric pressure reference. Use "MAP/BARO" test under "Powertrain," "Testers and Meters." Ignore the hookup screen. Connect GP2 to the reference MAP on the following screen.

NOTE

REMEMBER THAT MOST WEATHER SERVICES REPORT A LOCAL BAROMETRIC PRESSURE THAT HAS BEEN CORRECTED TO SEA LEVEL. THE BARO PID, ON THE OTHER HAND, REPORTS THE ACTUAL BAROMETRIC PRESSURE FOR THE ALTITUDE THE VEHICLE IS BEING OPERATED IN. LOCAL WEATHER CONDITIONS (HIGH AND LOW PRESSURE AREAS) WILL CHANGE THE LOCAL BAROMETRIC PRESSURE BY SEVERAL INCHES OF MERCURY (+/- 3 Hz, +/- 1 in. Hg.).

NOTE

BARO IS UPDATED ONLY WHEN THE VEHICLE IS AT HIGH THROTTLE OPENINGS. THEREFORE, A VEHICLE WHICH IS DRIVEN DOWN FROM A HIGHER ALTITUDE MAY NOT HAVE HAD AN OPPORTUNITY TO UPDATE THE BARO VALUE IN KAM. IF YOU ARE NOT CONFIDENT THAT BARO HAS BEEN UPDATED, PERFORM THREE OR FOUR HEAVY, SUSTAINED ACCELERATIONS AT GREATER THAN HALF-THROTTLE TO ALLOW BARO TO UPDATE.

2. On a fully warmed up engine, look at Long Term Fuel Trim at idle, in Neutral, A/C off, (LONGFT1 and/or LONGFT2 PIDs). If it is more negative than -12%, the fuel system has learned lean corrections which may be due to the MAF sensor over-estimating air flow at idle. Note that both Banks 1 and 2 will exhibit negative corrections for 2-bank system. If only one bank of a 2-bank system has negative corrections, the MAF sensor is probably not contaminated.

3. On a fully warmed up engine, look at MAF voltage at idle, in Neutral, A/C off (MAF V PID). If it's 30% greater than the nominal MAF V voltage listed in the Powertrain Control/Emissions Diagnosis (PC/ED) Diagnostic Value Reference Charts for your vehicle, or greater than 1.1 volts as a rough guide, the MAF sensor is over-estimating air flow at idle.

4. If at least tow of the previous three steps are true, proceed to disconnect the MAF sensor connector. This puts the vehicle into Failure Mode and Effects Management (FMEM). In FMEM mode, air flow is inferred by using rpm and throttle position instead of reading the MAF sensor. (In addition, the BARO value is reset to a base/unlearned value.) If the lean driveability symptoms go away, the MAF sensor is probably contaminated and should be replaced. If the lean driveability symptoms do not go away, go to the PC/ED Service Manual for the appropriate diagnostics.

NOTE

DUE TO INCREASINGLY STRINGENT EMISSION/OBDII REQUIREMENTS, IT IS POSSIBLE FOR SOME VEHICLES WITH MAF SENSOR CONTAMINATION TO SET FUEL SYSTEM DTCs AND ILLUMINATE THE MIL WITH NO DRIVEABILITY CONCERNS. DISCONNECTING THE MAF ON THESE VEHICLES WILL, THEREFORE, PRODUCE NO IMPROVEMENTS IN DRIVEABILITY. IN THESE CASES, IF THE BARO, LONGFT1, LONGFT2, AND MAF V PIDs INDICATE THAT THE MAF IS CONTAMINATED, PROCEED TO REPLACE THE MAF SENSOR.

After replacing the MAF sensor, disconnect the vehicle battery (5 minutes, minimum to reset KAM, or on newer vehicles, use the "KAM Reset" feature on the New Generation Star (NGS) Tester and verify that the lean driveability symptoms are gone.

ISSUE This TSB article is a diagnostic procedure to address vehicles that exhibit lean driveability symptoms and may or may not have any Diagnostic Trouble Codes (DTCs) stored in memory.

ACTION Follow the diagnostic procedures described in the following Service Tip. The revised diagnostic procedure is a more accurate means of diagnosing the symptoms.

SERVICE TIP

MASS AIR FLOW (MAF) DISCUSSION

MAF sensors can get contaminated from a variety of sources: dirt, oil, silicon, spider webs, potting compound from the sensor itself, etc. When a MAF sensor gets contaminated, it skews the transfer function such that the sensor over-estimates air flow at idle (causes the fuel system to go rich) and under-estimates air flow at high air flows (causes fuel system to go lean). This means Long Term Fuel Trims will learn lean (negative) corrections at idle and learn rich (positive) corrections at higher air flows.

If vehicle is driven at Wide Open Throttle (WOT) or high loads, the fuel system normally goes open loop rich to provide maximum power. If the MAF sensor is contaminated, the fuel system will actually be lean because of under-estimated air flow. During open loop fuel operation, the vehicle applies Long Term Fuel Trim corrections that have been learned during closed loop operation. These corrections are often lean corrections learned at lower air flows. This combination of under-estimated air flow and lean fuel trim corrections can result in spark knock/detonation and lack of power concerns at WOT and high loads.

One of the indicators for diagnosing this condition is barometric pressure. Barometric pressure (BARO) is inferred by the Powertrain Control Module (PCM) software at part throttle and WOT (there is no actual BARO sensor on MAF-equipped vehicles, except for the 3.8L Supercharged engine). At high air flows, a contaminated MAF sensor will under-estimate air flow coming into the engine, hence the PCM infers that the vehicle is operating at a higher altitude. The BARO reading is stored in Keep Alive Memory (KAM) after it is updated. Other indicators are Long Term Fuel Trim and MAF

voltage at idle.

NOTE

THE FOLLOWING PROCEDURE MAY ALSO BE USED TO DIAGNOSE VEHICLES THAT DO NOT HAVE FUEL SYSTEM/HO2S SENSOR DTCS.

Symptoms

^ Lack of Power

^ Spark Knock/Detonation

^ Buck/Jerk

^ Hesitation/Surge on Acceleration

^ Malfunction Indicator Lamp (MIL) Illuminated -

DTCs P0171, P0172, P0174, P0175 may be stored in memory

OBDII DTCs

^ P0171, P0174 (Fuel system lean, Bank 1 or 2)

^ P0172, P0175, (Fuel system rich, Bank 1 or 2)

^ P1130, P1131, P1132, (HO2S11 lack of switching, Bank 1)

^ P1150, P1151, P1152, (HO2S21 lack of switching, Bank 2)

OBDI DTCs

^ 181, 189 (Fuel system lean, Bank 1 or 2)

^ 179, 188 (Fuel system rich, Bank 1 or 2)

^ 171, 172, 173 (HO2S11 lack of switching, Bank 1)

^ 175, 176, 177 (HO2S21 lack of switching, Bank 2)

^ 184, 185 (MAF higher/lower than expected)

^ 186, 187 (Injector pulse width higher/lower than expected)

NOTE:

DO NOT DISCONNECT THE BATTERY. IT WILL ERASE KEEP ALIVE MEMORY AND RESET LONG TERM FUEL TRIM AND BARO TO THEIR STARTING/BASE VALUES. THE BARO PARAMETER IDENTIFICATION DISPLAY (PID) IS USED FOR THIS DIAGNOSTIC PROCEDURE. ALL OBDII APPLICATIONS HAVE THIS PID AVAILABLE. THERE ARE SOME OBDI VEHICLES THAT DO NOT HAVE THE BARO PID, FOR THESE VEHICLES OMIT THE BARO CHECK AND REFER ONLY TO STEPS 2, 3, AND 4 IN THE DIAGNOSTIC PROCEDURE.

BAROMETRIC PRESSURE REFERENCE

Barometric Pressure (in. Hg.)	Barometric Pressure (kPa)	BARO/MAP PID (Hz)	Altitude above sea level (ft)
3.5	11.8	89.3	
5	16.9	92.8	
10	33.8	104.6	
15	50.7	117.0	14,000
20	67.5	129.6	10,000
21	70.9	132.5	9,000
22	74.3	135.4	8,000
23	77.7	138.3	7,000
24	81.1	141.1	6,000
25	84.4	144.0	5,000
26	87.8	146.9	4,000
27	91.2	149.8	3,000
28	94.6	152.8	2,000
29	97.9	155.8	1,000
30	101.3	158.9	0 (sea level)
31	104.7	162.0	
31.875	107.7	164.7	

1. Look at the BARO PID. Refer to the Barometric Pressure Reference Chart in this article. At sea level, BARO should read about 159 Hz (29.91 in. Hg). As a reference, Denver, Colorado at 1524 meters (5000 ft.) altitude should be about 144 Hz (24.88 in.Hg). Normal learned BARO variability is up to +/- 6 Hz (+/- 2 in. Hg.). If BARO indicates a higher altitude than you are not at (7 or more Hz lower than expected), you may have MAF contamination. If available, Service Bay Diagnostic System (SBDS) has a Manifold Absolute Pressure (MAP) sensor that can be used as a barometric pressure reference. Use "MAP/BARO" test under "Powertrain," "Testers and Meters." Ignore the hookup screen. Connect GP2 to the reference MAP on the following screen.

NOTE

REMEMBER THAT MOST WEATHER SERVICES REPORT A LOCAL BAROMETRIC PRESSURE THAT HAS BEEN CORRECTED TO SEA LEVEL. THE BARO PID, ON THE OTHER HAND, REPORTS THE ACTUAL BAROMETRIC PRESSURE FOR THE ALTITUDE THE VEHICLE IS BEING OPERATED IN. LOCAL WEATHER CONDITIONS (HIGH AND LOW PRESSURE AREAS) WILL CHANGE THE LOCAL BAROMETRIC PRESSURE BY SEVERAL INCHES OF MERCURY (+/- 3 Hz, +/- 1 in. Hg.).

NOTE

BARO IS UPDATED ONLY WHEN THE VEHICLE IS AT HIGH THROTTLE OPENINGS. THEREFORE, A VEHICLE WHICH IS DRIVEN DOWN FROM A HIGHER ALTITUDE MAY NOT HAVE HAD AN OPPORTUNITY TO UPDATE THE BARO VALUE IN KAM. IF YOU ARE NOT CONFIDENT THAT BARO HAS BEEN UPDATED, PERFORM THREE OR FOUR HEAVY, SUSTAINED ACCELERATIONS AT GREATER THAN HALF-THROTTLE TO ALLOW BARO TO UPDATE.

2. On a fully warmed up engine, look at Long Term Fuel Trim at idle, in Neutral, A/C off, (LONGFT1 and/or LONGFT2 PIDs). If it is more negative than -12%, the fuel system has learned lean corrections which may be due to the MAF sensor over-estimating air flow at idle. Note that both Banks 1 and 2 will exhibit negative corrections for 2-bank system. If only one bank of a 2-bank system has negative corrections, the MAF sensor is probably not contaminated.

3. On a fully warmed up engine, look at MAF voltage at idle, in Neutral, A/C off (MAF V PID). If it's 30% greater than the nominal MAF V voltage listed in the Powertrain Control/Emissions Diagnosis (PC/ED) Diagnostic Value Reference Charts for your vehicle, or greater than 1.1 volts as a rough guide, the MAF sensor is over-estimating air flow at idle.

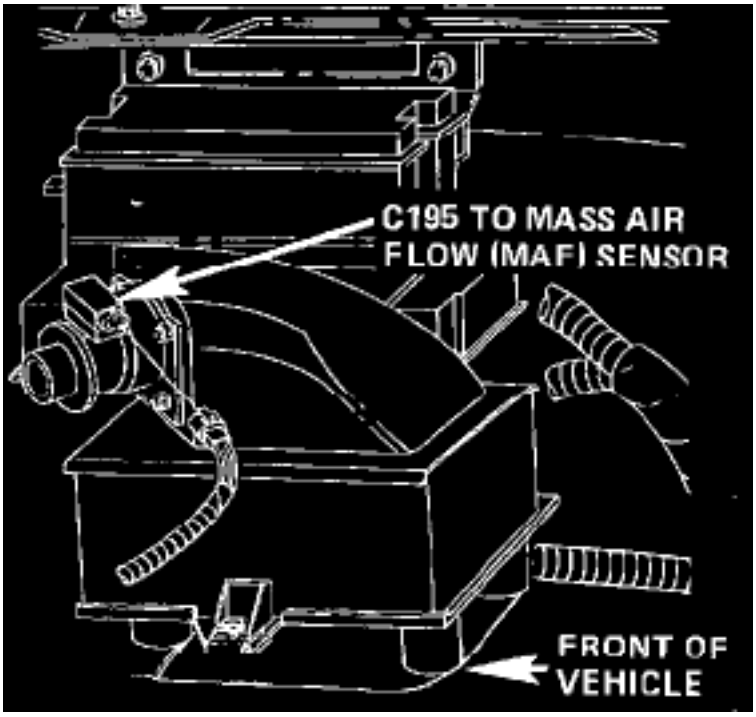
4. If at least tow of the previous three steps are true, proceed to disconnect the MAF sensor connector. This puts the vehicle into Failure Mode and Effects Management (FMEM). In FMEM mode, air flow is inferred by using rpm and throttle position instead of reading the MAF sensor. (In addition, the BARO value is reset to a base/unlearned value.) If the lean driveability symptoms go away, the MAF sensor is probably contaminated and should be replaced. If the lean driveability symptoms do not go away, go to the PC/ED Service Manual for the appropriate diagnostics.

NOTE

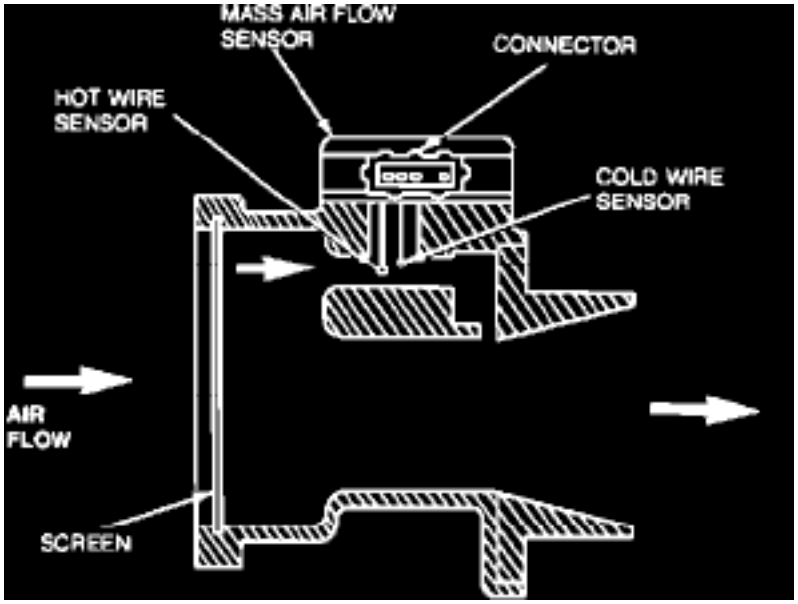
DUE TO INCREASINGLY STRINGENT EMISSION/OBDII REQUIREMENTS, IT IS POSSIBLE FOR SOME VEHICLES WITH MAF SENSOR CONTAMINATION TO SET FUEL SYSTEM DTCs AND ILLUMINATE THE MIL WITH NO DRIVEABILITY CONCERNS. DISCONNECTING THE MAF ON THESE VEHICLES WILL, THEREFORE, PRODUCE NO IMPROVEMENTS IN DRIVEABILITY. IN THESE CASES, IF THE BARO, LONGFT1, LONGFT2, AND MAF V PIDs INDICATE THAT THE MAF IS CONTAMINATED, PROCEED TO REPLACE THE MAF SENSOR.

After replacing the MAF sensor, disconnect the vehicle battery (5 minutes, minimum to reset KAM, or on newer vehicles, use the "KAM Reset" feature on the New Generation Star (NGS) Tester and verify that the lean driveability symptoms are gone.

OTHER APPLICABLE ARTICLES:: NONE WARRANTY STATUS: INFORMATION ONLY OASIS CODES: 206000, 610000, 610500, 610600, 610700, 611000, 611500, 612000, 612500, 614000, 614500, 614600, 698298



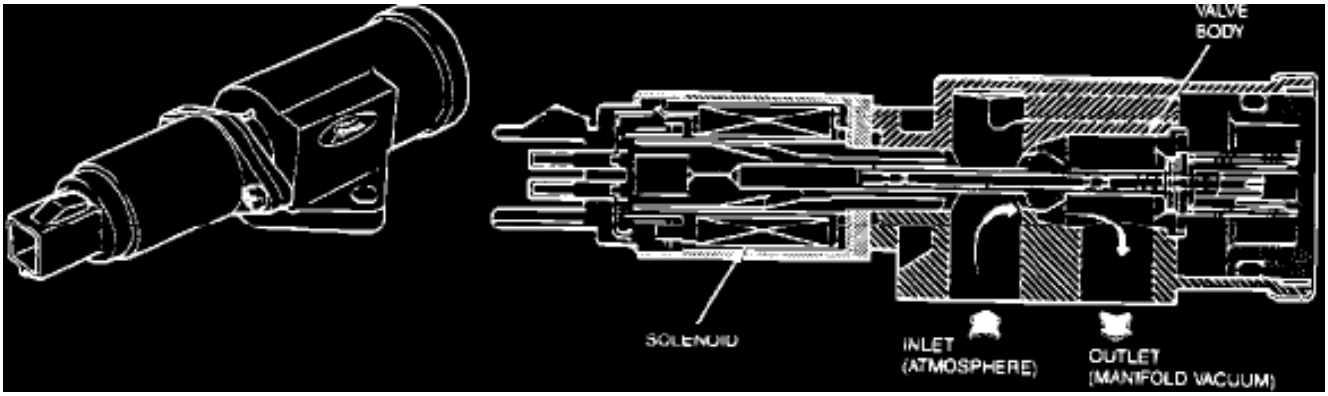
Mass Air Flow (MAF) Sensor



Mass Air Flow (MAF) Sensor: Description and Operation

Mass Air Flow Sensor

The Mass AirFlow (MAF) sensor, located between the air filter and the throttle body, is used to measure the mass of the air entering the engine due to volumetric displacement. The MAF sensor operates on the principle that if a mass is maintained at a constant temperature above the ambient environment, then the thermal loss is proportional to the mass flow of the cooling medium it is subjected to. The electronic module of the MAF sensor heats a wire element to 392°F (200°C) above ambient temperature. As air passes through the sensor, the air cools the wire element. The MAF sensor supplies more power to the wire to keep it at a constant temperature difference. When a drop in power useage occurs, the MAF sends a signal to the Engine Control Assembly (ECA) indicating the drop. The signal increases with the airflow into the engine.



Auxiliary Air Valve (Idle Speed): Description and Operation

Idle Air Bypass Valve

The Idle Speed Control Bypass Air (ISC-BPA) valve is used to control engine idle speed and is operated by the Engine Control Assembly (ECA). This valve allows air to pass around the throttle plates to control cold engine fast idle, no touch start, over temperature idle boost and engine idle load correction.

PART NUMBER	PART NAME
PM-3	Motorcraft Carburetor Tune-up Cleaner

Fuel: Customer Interest Engine - Carbon Knock On Acceleration

Article No: 01-19-7

10/01/01

^ ENGINE - 4.0L OHV - CARBON KNOCK ON ACCELERATION

^ NOISE - CARBON KNOCK ON ACCELERATION - VEHICLES EQUIPPED WITH 4.0L OHV ENGINE ONLY

FORD: 1990-1997 AEROSTAR 1990-2000 EXPLORER, RANGER

ISSUE Some vehicles equipped with the 4.0L OHV engine may exhibit an engine noise which may be perceived by the customer as a piston/connecting rod bearing knock. This carbon knock is heard only under load during the drive cycle. Carbon knock is a customer drive duty-cycle phenomenon that cannot be repaired with an engine exchange. This may be caused by carbon build-up within the combustion chamber.

ACTION Verify condition. If normal diagnostics fail to correct the condition, de-carbon the combustion chamber to help quiet the carbon knock noise. Refer to the following Service Procedure for details.

SERVICE PROCEDURE

1. Use Motorcraft Carburetor Tune-up Cleaner PM-3.

2. Carbon removal: a.

Disconnect canister purge line from throttle body.

b. Attach a vacuum line to the canister purge port.

c. At hot engine idle, allow the engine to ingest 1/2 to 2/3 of a can of Motorcraft Carburetor Tune-up Cleaner. Use caution not to ingest too quickly due to potential hydro-lock issues.

d Shut engine off and allow it to soak for one hour.

e. Start engine, allow engine to ingest the remainder of the Motorcraft Carburetor Tune-up Gleaner.

f. Remove vacuum line and re-install canister purge line.

g. Road test vehicle at 3500 RPM for 2-3 miles.

h. Repeat above procedure two times for a total of three times.

i. Change oil and filter.

3. Review the customers' driving habits. The recommended drive cycle should include daily periods of engine operation above 3,000 RPM, such as a brisk acceleration from a stop position. This will

break/burn the carbon off the piston head.

4. Use regular unleaded fuel, 87 Octane. Mid-grade and Premium fuels may increase the probability of carbon buildup, leading to a knock noise.

ISSUE: Rough idle, hesitation, poor throttle response, induction backfire and stalls during cold start/warm up may be caused by the poor volatility of some high octane premium grade unleaded fuels (91 octane or higher (R+M)/2). When compared to regular grade unleaded fuel (87 octane (R+M)/2), high octane premium grade unleaded fuel may cause long crank time.

ACTION: Use a regular grade unleaded fuel in all vehicles, except where a premium unleaded fuel is recommended in the Owner Guide. If lean air-fuel type symptoms are experienced, determine the grade and brand of fuel used and offer the following service tips.

^ Advise those using a higher octane grade fuel to switch to a regular grade unleaded fuel. For those using a regular grade fuel, advise them to try another brand.

^ Do not advise using a higher octane unleaded fuel than is recommended for that specific engine. Ford engines are designed to perform best using a high quality regular grade unleaded fuel.

^ Only advise using a higher octane unleaded fuel to avoid potentially damaging spark knock or ping, but do so only after mechanical fixes are ineffective.

NOTE: ALL UNLEADED GASOLINES USED SHOULD CONTAIN DETERGENT ADDITIVES THAT ARE ADVERTISED AS HAVING "KEEP CLEAN" OR "CLEAN UP" PERFORMANCE FOR BOTH INTAKE VALVES AND FUEL INJECTORS.

This TSB article is being republished in its entirety to expand vehicle model coverage and revise the text.

ISSUE Some vehicles using winter blend fuels may exhibit a stall on start up and a no restart, hard start condition or a no start condition in unseasonably hot weather (greater than 27°C/80°F). These concerns may be related to fuel volatility from winter blend fuels during winter-spring and autumn-winter transitions and may result in a fuel pump vapor lock condition. This condition may appear to be a fuel pump failure but may be caused by winter blend fuel.

ACTION Refer to the following text for further information.

NOTE

FUEL TANK ADDITIVES WILL NOT RESOLVE THESE CONCERNS BECAUSE VAPOR FORMS FROM CAVITATION WITHIN THE FUEL PUMP.

FILLING THE TANK TO FULL MAY BE EFFECTIVE. ADVISE CUSTOMER TO USE THE RECOMMENDED OCTANE GRADE PER OWNER MANUAL AND NOT A HIGHER GRADE.

Explain to the customer that this concern may be due to a low tank level of winter blend fuel combined with unseasonably warm weather. Advise customer that filling the fuel tank to full may be effective in resolving this concern. Also, advise customer to use the recommended octane grade per their Owner Manual and not a higher grade.

BACKGROUND Gasolines are seasonally adjusted, meaning they have higher volatility (vaporize easier) in the winter and lower volatility in the summer. Government mandates to improve air quality have resulted in significant changes to gasolines, such as the mandatory use of oxygenates (ethanol, methyl tertiary butyl ether (MTBE), and others) in the winter or the reduction of Reid Vapor Pressure (RVP) in the summer. The addition of oxygenates (especially ethanol) increases volatility while the reduction of RVP reduces volatility.

Gasoline distribution practices often do not allow branded marketers to have much control over their gasoline's volatility other than RVP. Oxygenate (e.g., ethanol, MTBE) use is more dependent on local gasoline markets, rather than specific marketers practice. Therefore, it is difficult to recommend specific brands to avoid volatility related complaints.

LIGHT TRUCK: 1983-96 BRONCO, ECONOLINE, F-150-350 SERIES, RANGER 1984-90 BRONCO II 1986-96 AEROSTAR 1987-96 F SUPER DUTY 1991-96 EXPLORER 1993-96 VILLAGER 1995-96 WINDSTAR

ISSUE: California introduced CaRFG around March 1, 1996 and statewide it must be available at all service stations by June 1, 1996 to help reduce emissions and improve gasoline quality. It will replace the traditional gasoline sold in Northern California and improve the reformulated gasoline that has been sold in Southern California since January 1995. California Air Resources Board (CARB) projects smog forming emissions from motor vehicles to be reduced by about 15 percent.

ACTION: The following text is provided to give some answers to some commonly asked questions by our customers.

POSITION

Ford Motor Company recommends the use of CaRFG as a cost effective means of reducing emissions to provide cleaner air. We have participated in vehicle and laboratory testing of CaRFG to make sure it is acceptable for our customers' use. There are no unusual vehicle performance concerns expected based upon these studies. The use of CaRFG will not affect Ford's new vehicle and/or emissions warranty.

WHAT DOES CaRFG CONSIST OF?

CaRFG consists of the same basic components as other gasolines, but it reduces pollution because of its cleaner burning components. Features are:

^ reduced aromatic hydrocarbons to form less smog emissions

^ added oxygenates to reduce emissions

^ decreases the amount of fuel evaporating from the vehicle

^ lowered sulfur content to provide more efficient operation of the vehicle's catalytic converter

^ reduced benzene by about one-half

IS CaRFG MORE HAZARDOUS THAN CONVENTIONAL GASOLINES?

CaRFG is a hazardous substance like conventional gasoline. Precautions should continue to be taken to avoid exposure to vapors or liquid when it is pumped or handled. It should never be siphoned or swallowed.

HOW WILL CaRFG AFFECT VEHICLE PERFORMANCE?

Properly blended CaRFG should have no adverse effect on vehicle performance or the durability of engine and fuel system components. Its basic properties are not significantly different than other cleaner burning gasolines that have been used in the U.S. for several years.

If the vehicle is a certified California calibration 1996 or later model year, it was designed to operate on CaRFG gasoline. The vehicle will operate satisfactorily on gasolines in the other 49 states, but emission control system performance may be affected. Using gasolines other than CaRFG have substantially increased emissions from motor vehicles.

WILL THE USE OF CaRFG AFFECT CALIFORNIA VEHICLE WARRANTY?

No. The coverage of Ford's new vehicle warranty is not affected. In fact, Ford Owner Guides have consistently approved the use of properly blended reformulated gasolines containing oxygenates. Further information about properly fueling your vehicle is included in the Owner Guide.

WILL FUEL ECONOMY BE AFFECTED?

A very small reduction in fuel economy of less than one-half mile per gallon is possible if the customer was using gasoline without oxygenates. This is attributed to the lower energy content of oxygenates which have been in all Southern California gasolines since January of 1995 and in some gasolines since the 1970's.

Many factors affect fuel economy like driving habits, vehicle maintenance, weather conditions, etc. Fuel economy can vary by more than a mile per gallon from one fill-up to the next with the same gasolines.

For further details see TSB Article 95-12-2 for customer expectations regarding fuel economy.

ARE SPECIAL ADDITIVES NECESSARY FOR CaRFG?

No. It is not necessary to add anything to the vehicle fuel tank after the gasoline is purchased from the service station. California regulations require deposit control additives in CaRFG to minimize port fuel injector and intake valve deposits.

WILL OLDER VEHICLES OPERATE SATISFACTORILY WITH THE NEW CaRFG?

Older vehicles are expected to operate satisfactorily on CaRFG because vehicles have been operating on gasolines similar to CaRFG for a number of years. However, considerable testing indicates that older, high mileage vehicles are more susceptible to fuel system problems due to age and normal wear and tear regardless of whether they are operated on conventional or CaRFG gasolines. Owners of these older vehicles are encouraged to follow their vehicle manufacturer's recommendations regarding vehicle maintenance.

WILL THE SMELL BE DIFFERENT THAN CONVENTIONAL GASOLINE?

CaRFG is not expected to smell different than the gasoline most vehicles are currently using. If an unusual odor is noticed, it would probably be from oxygenates. Most service stations use vapor recovery systems to minimize the release of gasoline vapors while refueling.

The use of CaRFG should result in little or no "rotten egg" smell from the exhaust because CaRFG has much lower sulfur than conventional gasoline.

WAS CaRFG TESTED BEFORE INTRODUCTION?

It was tested for over five million miles in more than 800 vehicles under the guidance of CARB including experts representing automobile manufacturers, gasoline suppliers, fleet operations and government. There was no increase in problems identified with the use of CaRFG.

DOES CaRFG COST MORE?

The price at the pump cannot be accurately predicted, although a modest increase is likely. The price of CaRFG is subject to the competitive forces in the marketplace. Many factors including production costs, supply and demand, weather, crude oil prices, and taxes affect gasoline prices.

WHERE CAN I GET MORE INFORMATION ON CaRFG?

Additional information within the state of California on CaRFG is available from the California Air Resources Board toll-free at 1-800-922-7349 (within California only).

ISSUE: Rough idle, hesitation, poor throttle response, induction backfire and stalls during cold start/warm up may be caused by the poor volatility of some high octane premium grade unleaded fuels (91 octane or higher (R+M)/2). When compared to regular grade unleaded fuel (87 octane (R+M)/2), high octane premium grade unleaded fuel may cause long crank time.

ACTION: Use a regular grade unleaded fuel in all vehicles, except where a premium unleaded fuel is recommended in the Owner Guide. If lean air-fuel type symptoms are experienced, determine the grade and brand of fuel used and offer the following service tips.

^ Advise those using a higher octane grade fuel to switch to a regular grade unleaded fuel. For those using a regular grade fuel, advise them to try another brand.

^ Do not advise using a higher octane unleaded fuel than is recommended for that specific engine. Ford engines are designed to perform best using a high quality regular grade unleaded fuel.

^ Only advise using a higher octane unleaded fuel to avoid potentially damaging spark knock or ping, but do so only after mechanical fixes are ineffective.

NOTE: ALL UNLEADED GASOLINES USED SHOULD CONTAIN DETERGENT ADDITIVES THAT ARE ADVERTISED AS HAVING "KEEP CLEAN" OR "CLEAN UP" PERFORMANCE FOR BOTH INTAKE VALVES AND FUEL INJECTORS.

This TSB article is being republished in its entirety to expand vehicle model coverage and revise the text.

ISSUE Some vehicles using winter blend fuels may exhibit a stall on start up and a no restart, hard start condition or a no start condition in unseasonably hot weather (greater than 27°C/80°F). These concerns may be related to fuel volatility from winter blend fuels during winter-spring and autumn-winter transitions and may result in a fuel pump vapor lock condition. This condition may appear to be a fuel pump failure but may be caused by winter blend fuel.

ACTION Refer to the following text for further information.

NOTE

FUEL TANK ADDITIVES WILL NOT RESOLVE THESE CONCERNS BECAUSE VAPOR FORMS FROM CAVITATION WITHIN THE FUEL PUMP.

FILLING THE TANK TO FULL MAY BE EFFECTIVE. ADVISE CUSTOMER TO USE THE RECOMMENDED OCTANE GRADE PER OWNER MANUAL AND NOT A HIGHER GRADE.

Explain to the customer that this concern may be due to a low tank level of winter blend fuel combined with unseasonably warm weather. Advise customer that filling the fuel tank to full may be effective in resolving this concern. Also, advise customer to use the recommended octane grade per their Owner Manual and not a higher grade.

BACKGROUND Gasolines are seasonally adjusted, meaning they have higher volatility (vaporize easier) in the winter and lower volatility in the summer. Government mandates to improve air quality have resulted in significant changes to gasolines, such as the mandatory use of oxygenates (ethanol, methyl tertiary butyl ether (MTBE), and others) in the winter or the reduction of Reid Vapor Pressure (RVP) in the summer. The addition of oxygenates (especially ethanol) increases volatility while the reduction of RVP reduces volatility.

Gasoline distribution practices often do not allow branded marketers to have much control over their gasoline's volatility other than RVP. Oxygenate (e.g., ethanol, MTBE) use is more dependent on local gasoline markets, rather than specific marketers practice. Therefore, it is difficult to recommend specific brands to avoid volatility related complaints.

LIGHT TRUCK: 1983-96 BRONCO, ECONOLINE, F-150-350 SERIES, RANGER 1984-90 BRONCO II 1986-96 AEROSTAR 1987-96 F SUPER DUTY 1991-96 EXPLORER 1993-96 VILLAGER 1995-96 WINDSTAR

ISSUE: California introduced CaRFG around March 1, 1996 and statewide it must be available at all service stations by June 1, 1996 to help reduce emissions and improve gasoline quality. It will replace the traditional gasoline sold in Northern California and improve the reformulated gasoline that has been sold in Southern California since January 1995. California Air Resources Board (CARB) projects smog forming emissions from motor vehicles to be reduced by about 15 percent.

ACTION: The following text is provided to give some answers to some commonly asked questions by our customers.

POSITION

Ford Motor Company recommends the use of CaRFG as a cost effective means of reducing emissions to provide cleaner air. We have participated in vehicle and laboratory testing of CaRFG to make sure it is acceptable for our customers' use. There are no unusual vehicle performance concerns expected based upon these studies. The use of CaRFG will not affect Ford's new vehicle and/or emissions warranty.

WHAT DOES CaRFG CONSIST OF?

CaRFG consists of the same basic components as other gasolines, but it reduces pollution because of its cleaner burning components. Features are:

^ reduced aromatic hydrocarbons to form less smog emissions

^ added oxygenates to reduce emissions

^ decreases the amount of fuel evaporating from the vehicle

^ lowered sulfur content to provide more efficient operation of the vehicle's catalytic converter

^ reduced benzene by about one-half

IS CaRFG MORE HAZARDOUS THAN CONVENTIONAL GASOLINES?

CaRFG is a hazardous substance like conventional gasoline. Precautions should continue to be taken to avoid exposure to vapors or liquid when it is pumped or handled. It should never be siphoned or swallowed.

HOW WILL CaRFG AFFECT VEHICLE PERFORMANCE?

Properly blended CaRFG should have no adverse effect on vehicle performance or the durability of engine and fuel system components. Its basic properties are not significantly different than other cleaner burning gasolines that have been used in the U.S. for several years.

If the vehicle is a certified California calibration 1996 or later model year, it was designed to operate on CaRFG gasoline. The vehicle will operate satisfactorily on gasolines in the other 49 states, but emission control system performance may be affected. Using gasolines other than CaRFG have substantially increased emissions from motor vehicles.

WILL THE USE OF CaRFG AFFECT CALIFORNIA VEHICLE WARRANTY?

No. The coverage of Ford's new vehicle warranty is not affected. In fact, Ford Owner Guides have consistently approved the use of properly blended reformulated gasolines containing oxygenates. Further information about properly fueling your vehicle is included in the Owner Guide.

WILL FUEL ECONOMY BE AFFECTED?

A very small reduction in fuel economy of less than one-half mile per gallon is possible if the customer was using gasoline without oxygenates. This is attributed to the lower energy content of oxygenates which have been in all Southern California gasolines since January of 1995 and in some gasolines since the 1970's.

Many factors affect fuel economy like driving habits, vehicle maintenance, weather conditions, etc. Fuel economy can vary by more than a mile per gallon from one fill-up to the next with the same gasolines.

For further details see TSB Article 95-12-2 for customer expectations regarding fuel economy.

ARE SPECIAL ADDITIVES NECESSARY FOR CaRFG?

No. It is not necessary to add anything to the vehicle fuel tank after the gasoline is purchased from the service station. California regulations require deposit control additives in CaRFG to minimize port fuel injector and intake valve deposits.

WILL OLDER VEHICLES OPERATE SATISFACTORILY WITH THE NEW CaRFG?

Older vehicles are expected to operate satisfactorily on CaRFG because vehicles have been operating on gasolines similar to CaRFG for a number of years. However, considerable testing indicates that older, high mileage vehicles are more susceptible to fuel system problems due to age and normal wear and tear regardless of whether they are operated on conventional or CaRFG gasolines. Owners of these older vehicles are encouraged to follow their vehicle manufacturer's recommendations regarding vehicle maintenance.

WILL THE SMELL BE DIFFERENT THAN CONVENTIONAL GASOLINE?

CaRFG is not expected to smell different than the gasoline most vehicles are currently using. If an unusual odor is noticed, it would probably be from oxygenates. Most service stations use vapor recovery systems to minimize the release of gasoline vapors while refueling.

The use of CaRFG should result in little or no "rotten egg" smell from the exhaust because CaRFG has much lower sulfur than conventional gasoline.

WAS CaRFG TESTED BEFORE INTRODUCTION?

It was tested for over five million miles in more than 800 vehicles under the guidance of CARB including experts representing automobile manufacturers, gasoline suppliers, fleet operations and government. There was no increase in problems identified with the use of CaRFG.

DOES CaRFG COST MORE?

The price at the pump cannot be accurately predicted, although a modest increase is likely. The price of CaRFG is subject to the competitive forces in the marketplace. Many factors including production costs, supply and demand, weather, crude oil prices, and taxes affect gasoline prices.

WHERE CAN I GET MORE INFORMATION ON CaRFG?

Additional information within the state of California on CaRFG is available from the California Air Resources Board toll-free at 1-800-922-7349 (within California only).

OTHER APPLICABLE ARTICLES: 95-12-2

WARRANTY STATUS: INFORMATION ONLY

OASIS CODES: 404000, 623000

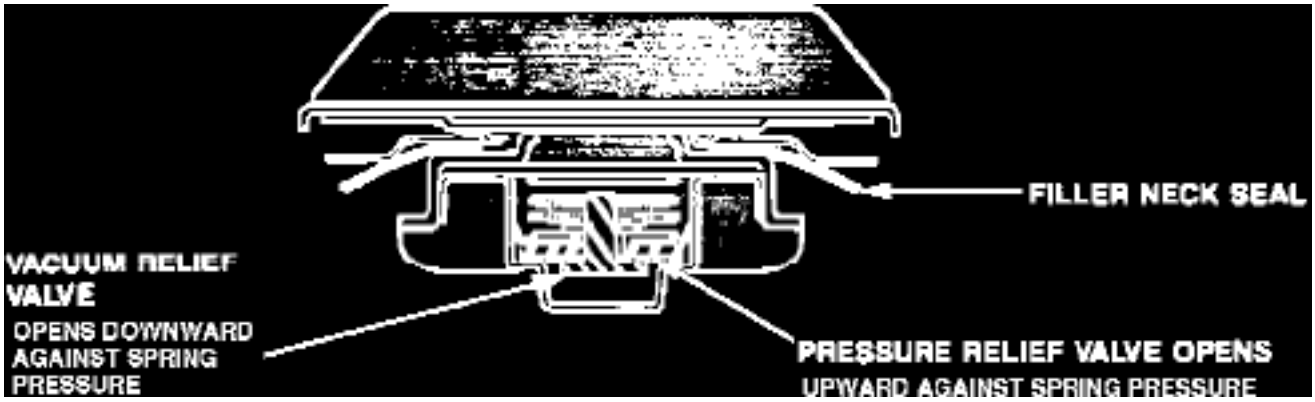
Fuel: Testing and Inspection

A fuel sample should be drawn from the bottom of the fuel tank so that any water present in the tank will be detected. The sample should be bright and clear. If the sample appears cloudy, or contaminated with water (as indicated by a layer at the bottom of the sample), this procedure should not be used, and the fuel system should be cleaned. 1. Using a 100 ml cylinder with 1 ml graduation marks, fill to the 90 ml mark. 2.

Add 10 ml of water to bring the total fluid volume to 100 ml and install a stopper.

3. Shake vigorously for 10 to 15 seconds. 4. Carefully loosen the stopper to release pressure. 5. Close the stopper and shake vigorously again for 10 to 15 seconds. 6. Put the graduated cylinder on a level surface for approximately 5 minutes to allow adequate liquid separation.

If alcohol is present in the fuel, the volume of the lower layer (which would now contain both alcohol and water) will be greater than 10 ml. For example, if the volume of the lower layer is increased to 15 ml, it will indicate at least 5 percent alcohol in the fuel. The actual amount of alcohol may be somewhat greater because this procedure does not extract all of the alcohol from the fuel.



Fuel Filler Cap: Description and Operation

The pressure-vacuum filler cap is designed to hold a slight pressure on the fuel. Since the evaporation rate decreases under slightly higher pressures, the cap helps to reduce evaporative emissions.

Fuel Tank Pressure/Vacuum Filler Cap

A rubber seal around the inside lip of the cap prevents fuel vapor from escaping to the atmosphere, as well as prevent fuel from spilling in the event of vehicle roll-over.

When vacuum in the tank exceeds a pressure differential of 0.5 psi to atmospheric pressure, the vacuum relief valve will allow atmospheric pressure to enter the tank.

If fuel tank pressure becomes 1.8 psi above atmospheric pressure, the pressure relief portion of the cap will open to the atmosphere.

Fuel Pressure Release: Service and Repair

CAUTION: FUEL SUPPLY LINES ON EFI ENGINES WILL REMAIN PRESSURIZED FOR SOME PERIOD OF TIME AFTER THE ENGINE IS SHUT OFF. THIS PRESSURE MUST BE RELIEVED BEFORE SERVICING OF THE FUEL SYSTEM IS BEGUN.

FUEL SYSTEM PRESSURE RELIEF - EFI ENGINES

Before opening the fuel system on vehicles with EFI engines, relieve fuel pressure as follows: 1. Locate and disconnect the electrical connection to either the fuel pump relay, the inertia switch or the in-line high pressure fuel pump.

2. Crank engine for approximately ten seconds.

Note: Engine may start and run for a short time. If so, crank engine an additional 5 seconds after engine stalls.

3. Re-connect the electrical connector that was disconnected in step 1 and disconnect battery ground cable.

Alternative Method

Some EFI vehicles have a port (fitting) on the fuel rail used for measuring fuel pressure. If so equipped, use the following method: -

Install fuel pressure relief tool No. T80L-9974-B or equivalent to measuring port on engine fuel rail.

- Position drain hose in suitable container, then depress relief button.

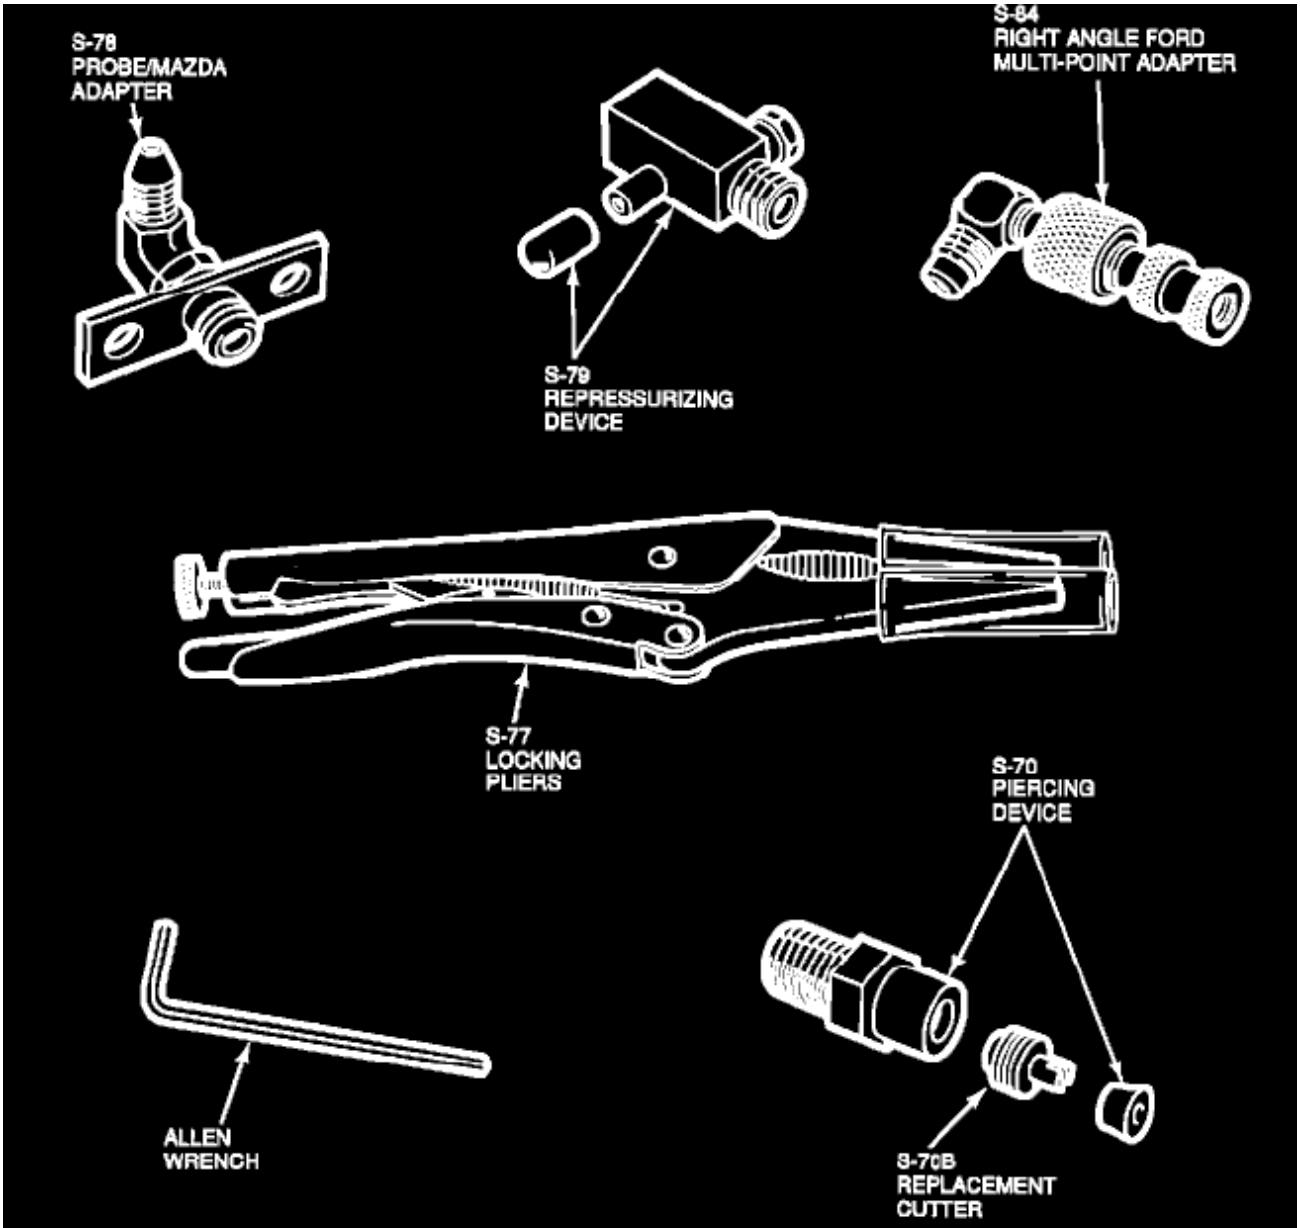
ISSUE: The Motorcraft fuel injector cleaning system consists of:



NEW FEATURES

As a result of suggestions from technicians in the field, a variety of new kit parts and features are now available in the CM-1000 (all vehicles) or the CM-1002 "Ford-Only" kit:

- A patented repressurizing device (Part #S-79. This device ensures that all the cleaner is used and that the empty container can be disposed of without special handling.
- An improved, longer lasting pressure regulator
- A replacement cutter for the S-70 piercing device (Part #S-70)
- A new piercing device made entirely of steel (Part #S-70)
- A right angle Ford Multi-point (Schrader valve) adaptor (Part #S-84). This adaptor makes it easier to connect to the Schrader valve on vehicles that are hard to access.
- A Probe/Mazda adaptor that replaces the fuel rail pressure regulator during the cleaning process (Part #S-78)
- A replacement depressor for the S-36 supply hose (Part #S-36d)
- A depressor for the Multi-point adaptor (Part #S-20d)

The following improvements are only available in the CM-1000 (all vehicles) kit (or by special order):

- New locking pliers for clamping hoses (Part #S-77)
- Fuel-resistant foam drawer liners
- A parts and adaptor location chart

Figure 2

TB-3671-A

^ The original all-car fuel injector cleaning kit (CM1000),

^ The new Ford-application fuel injector kit (CM 1002) and

^ Motorcraft Pressurized fuel injector cleaner (CM1001).

The Motorcraft Fuel injector cleaning method was introduced in TSB 91-19-3 as an alternate to the Rotunda Fuel Injector Tester / Cleaner, and is reimbursable as specified in the Service Labor Time Standards Manual. The Motorcraft injector cleaning system is available from the regular Parts Distribution System or from local Motorcraft Distributors.

ACTION: No action is required.

NOTE:

THIS TSB ARTICLE SUMMARIZES THE QUESTIONS ASKED MOST FREQUENTLY BY CALLERS TO THE MOTORCRAFT "800" LINE ABOUT THE MOTORCRAFT FUEL INJECTOR CLEANING METHOD. ALSO, A TOLL-FREE NUMBER IS AVAILABLE FOR ORDERING CLEANING KIT PARTS, OBTAINING INFORMATION AND MAKING SUGGESTIONS.

Q. Why do we sometimes experience insufficient pressure to completely empty a cleaning can?

A. If the can is pierced properly, you will seldom experience problems with inadequate pressure. However, to further reduce those instances of insufficient pressure to complete the cleaning process, Motorcraft recently made available a re-pressurizing device (S-79), which is included with all CM1000 and CM1002 kits, and is also available separately. The device allows service personnel to repressurize the can using compressed air whenever there is too little pressure to complete the cleaning procedure.

Although there have been some cases of actual low can pressure, by far, the largest number of low pressure complaints have been due to improper can piercing. For best results, In addition to being hung upside-down, during the cleaning process, the can must also be upside-down pierced.

Q. Why is it imperative that the can be pierced upside-down?

A. Motorcraft fuel injector cleaner and the pressurizing gas are packaged together in an aerosol can. The piercing device contains a seal, which is intended to seal against the threaded cup of the can before it is pierced. When using a new piercing device with a new seal, the can needn't be upside-down. However, after a few cans have been pierced, the piercing device seal becomes compressed, and piercing can take place before the seal makes full contact with the can.

The gas is always at the top of the can. Thus, if the can is pierced right-side up, the gas can rapidly escape before the seal makes full contact, resulting in insufficient pressure to do the cleaning job.

If the can is upside-down when pierced, the liquid cleaner is in contact with the component being pierced, and the worst that can happen before the seal makes contact is the loss of a few drops of cleaner.

Service personnel sometimes question the need to pierce the CM1001 cans upside-down, particularly if they have had experience with another injector cleaner packaged in what is referred to as a "barrier pack" can. In this case, the cleaner is in an inner aluminum tube which is surrounded by the pressurizing agent. In a barrier pack can, the pressurizing agent cannot escape unless a small rubber plug at the bottom of the can is removed.

Q. Why isn't CM1001 packaged in a barrier pack can?

A. There are several reasons. First, Motorcraft wants to provide an environmentally safe package, so it was decided to use compressed air or nitrogen to provide the pressure. It was not possible to use either of these gasses in the barrier pack cans since the cans cannot contain the required pressure for compressed air or nitrogen. Barrier cans generally use liquid propellant mixtures, and pressure is limited to 65-70 psig.

Also, with the barrier pack, upon completion of the cleaning procedure, a small amount of product remains in the collapsed inner tube, and the outer shell still contains the liquid propellant, which requires proper disposal. When the CM1001 can is empty, neither product nor pressurizing gas remains in the can.

Finally, the barrier pack can is considerably more expensive, and Motorcraft wanted to offer the most cost-effective cleaner possible.

Q. How can dealers obtain replacement and supplemental parts?

ISSUE: A new warranty-reimbursable method is now available for cleaning standard design pintle fuel injectors. (Deposit Resistant Injectors "DRI's" do not require cleaning.) This new method is an alternate to the current procedure which utilizes the Rotunda Fuel lnjector Tester/Cleaner and is reimbursable as specified in the Labor Time Standards Manual.

ACTION: If standard design pintle fuel injectors require cleaning, use the new cleaning method which utilizes Motorcraft Pressurized Fuel lnjector Cleaner (CM-1001) and the Motorcraft Fuel Injection Cleaning Kit (CM-1000). Both of these items are available from the regular Parts Distribution System or the local Motorcraft Distributor.

The kit features:

^ Application for most Ford and Lincoln-Mercury EFI vehicles.

^ Application for most other domestic and import EFI vehicles.

^ Effective for both central and multi-port EFI systems.

^ Quick and easy hook up.

^ Uses pre-mixed Motorcraft Pressurized Fuel Injector Cleaner.

^ Environmentally-compatible can pressurizing.

^ Steel wire-reinforced hoses.

^ Easy-to-follow illustrated Instruction Manual provides step-by-step connection and cleaning procedures.

^ Includes replacement parts kit with seals, washers, regulator diaphragms and dust caps.

^ Full 1-year Manufacturer's Warranty on defects in materials and/or workmanship.

^ Completely reorderable components.

Fuel Injector

REMOVAL

1. Remove fuel tank cap and release pressure from fuel system by opening the fuel pressure relief valve.

2. Remove upper intake manifold as outlined in this section.

3. Remove fuel supply manifold as outlined in this section.

4. Carefully remove electrical harness connectors from individual injectors as required.

5. Remove injector retaining clips as required.

6. Grasping injector body, pull up while gently rocking injector from side to side.

Fuel Injector

7. Inspect injector o-rings (two per injector) for signs of deterioration. Replace as required.

8. Inspect injector "plastic hat" (covering the injector pintle) and washer for signs of deterioration. Replace as required. If has is missing, look for in in intake manifold.

INSTALLATION

1. Lubricate new o-rings with light grade oil and install two on each injector.

NOTE: Never use silicone grease. It will clog the injector(s). 2.

Install injector(s), using a light twisting, pushing motion.

3. Install fuel supply manifold. Replace retainer clips if distorted.

Fuel Injector: Description and Operation

Fuel Injector

The fuel injector nozzles are electro-mechanical devices which meter and atomize fuel delivered to the engine. The injectors are mounted in the lower intake manifold and positioned so that their tips are directing fuel just ahead of the engine intake valves. This specialized solenoid has an armature and a needle or ball valve with a spring that holds the needle or ball closed against the valve seat. The armature opens the valve when it receives a current pulse from the system computer. When the solenoid is energized, it unseats the valve to inject fuel. The injector always opens the same distance, and the fuel pressure is maintained at a constant value by the pressure regulator. The amount of fuel delivered by the injector depends on the amount of time that the nozzle is open. This is the injector pulse width: the time in milliseconds that the nozzle is open. An electrical signal from the Electronic Control Assembly (ECA) activates the injector solenoid causing the pintle to move inward off the seat, allowing fuel to flow through the orifice. Atomization of the fuel is obtained by contouring the pintle at the point at where the fuel separates.

Fuel Injector: Testing and Inspection

NOTE: Make sure injectors have been cleaned with an approved cleaner prior to testing.

The injector balance test is done to verify a balance distribution of fuel to all cylinders. Start by hooking up a fuel pressure gauge at the schrader valve or Inline before the fuel pressure regulator (refer to gauge manufacturer instructions). Pressurize fuel rail by turning ignition on engine off (fuel pump energized). The pressure should rise to maximum working pressure. Refer to SPECIFICATIONS. Remove injector harness connector and connect an injector pulse tester, pulse one injector at a time. Allow pressure to rise and stabilize in between each injector tested.

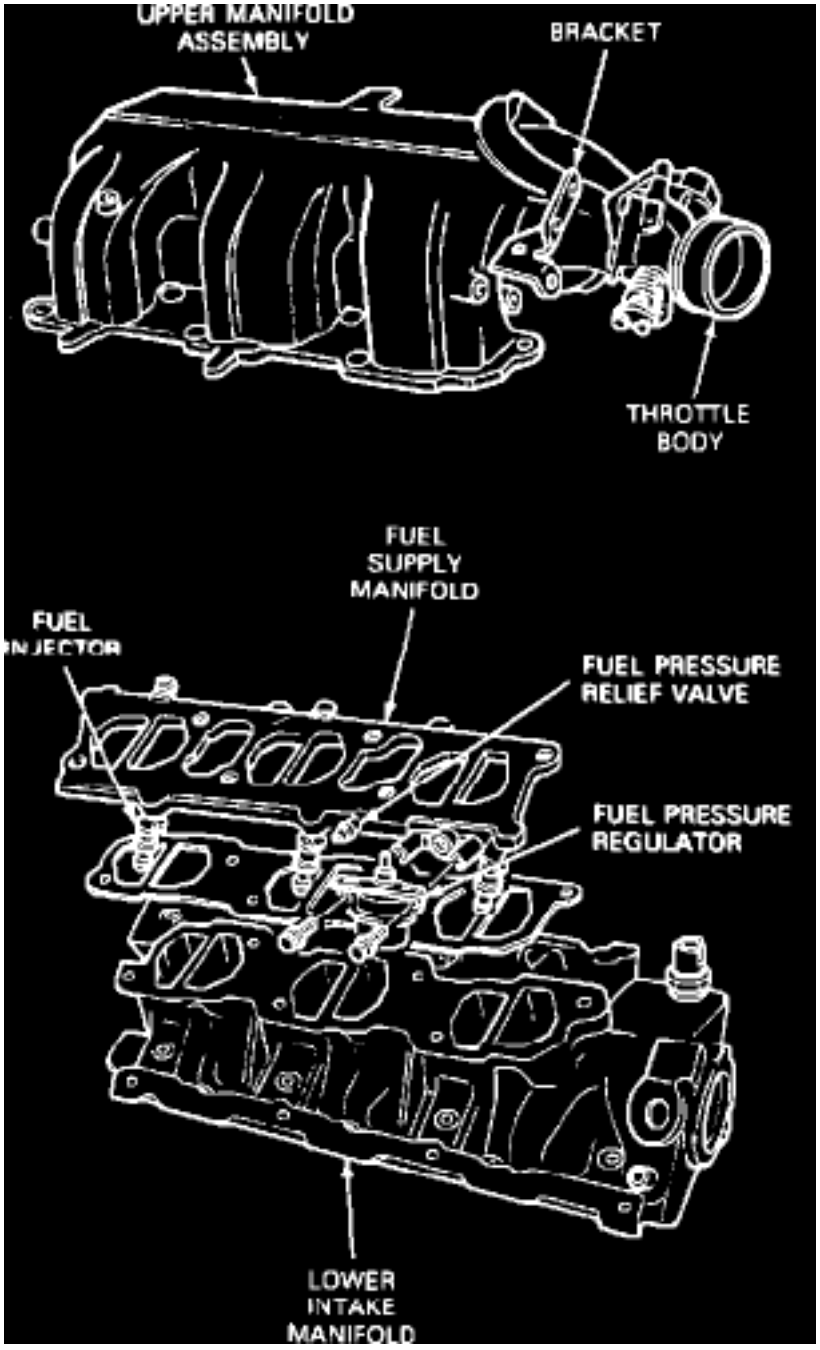
NOTE: The time each injector is pulsed is very important. Each injector should be pulsed at the same time interval, (example . . 1 ms each).

The rate of drop should be even across all the injectors. All pressure drops should be within 3% of each other, if not replace injector.

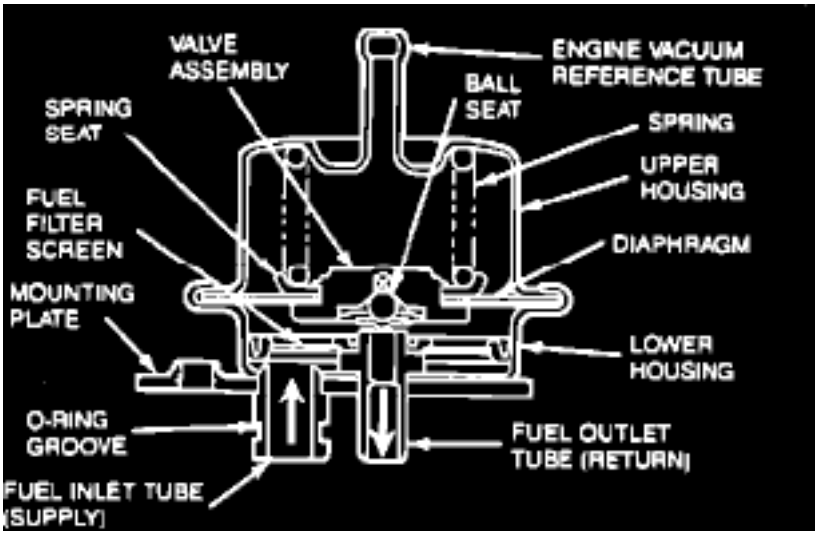
If there is no pressure drop when injector is pulsed, verify there is a good connection between the injector and pulse tester. If connection is good, a check of the injector circuit is required. First, check the resistance of the injector, if resistance is OK verify there is power to injector by reconnecting the injector harness connector and start the engine, use a "Noid" light to check for pulses (light off and on). If it does not light this is an indication of a problem in the injection to ECM circuit. Refer to COMPUTERIZED ENGINE CONTROLS for further testing. If light pulses, recheck pressure drop to verify malfunction.

NOTE:

It may not be possible to connect a noid light to the harness while connected to injector. If this is the case, connect noid to removed harness and check pulses.



Air Intake Manifold



Fuel Pressure Regulator: Description and Operation

Fuel Pressure Regulator

The pressure regulator and fuel pump work together to maintain the required constant pressure at the injector tips. The regulator consists of a spring-loaded diaphragm-operated valve in a metal housing. The pressure regulator is located on the fuel supply manifold and installed on the return (downstream) side of the injectors. Downstream regulation minimizes fuel pressure pulsations caused by pressure drop across the injectors as the nozzles open. This design ensures positive fuel pressure at the injectors at all times and holds residual pressure in the lines when the engine is off. The pressure regulator used in a multipoint injection system has an intake manifold connection on the regulator vacuum chamber. This allows fuel pressure to be modulated by a combination of spring pressure and manifold vacuum acting on the diaphragm. Fuel in excess of that used by the engine, is bypassed through the regulator and returns to the fuel tank. The regulator shuts off the return line when the fuel pump is not running. This maintains pressure at the injectors for easy restarting and reduced vapor lock.

TEST STEP	RESULT ▶	ACTION TO TAKE
CHECK DIAPHRAGM INTEGRITY • Remove fuel tank filler cap. • **Release the fuel pressure from the fuel charging system at the schrader valve on the fuel rail.** • Install fuel pressure gauge. • Start and run engine for 10 seconds. • Turn engine off and wait 10 seconds. • Start and run engine again for 10 seconds. • Turn engine off. • Remove the vacuum hose from the fuel pressure regulator • Is fuel present at the vacuum port?	Yes ▶	REPLACE the fuel pressure regulator.
	No ▶	GO to **Check Regulator Valve Pressure.** RECONNECT vacuum hose.
CHECK REGULATOR VALVE PRESSURE • Start and run engine for 30 seconds. • Turn engine off. • Observe fuel pressure gauge. • Does fuel pressure drop more than 5 psi (34 kPa) after 60 seconds?	Yes ▶	**SERVICE leaks. REPEAT this Test Step if fuel pressure still drops. REPLACE regulator.**
	No ▶	**GO to Check Valve Seat Leakage.**
CHECK VALVE SEAT LEAKAGE • Release the fuel pressure from the fuel charging system. **See Check Diaphragm Integrity.** • Remove the fuel pressure regulator. • Inspect gasket and O-ring for cracks and cuts, or other defects. • Connect a hand held vacuum pump to the fuel return tube (7/32 in. diameter tube, centered on base plate). • Apply 20 in-Hg vacuum. • Does vacuum drop below 10 in.-Hg within 10 seconds?	Yes ▶	REPLACE fuel pressure regulator.

Fuel Pressure Regulator: Service and Repair

Fuel Pressure Regulator

REMOVAL

1. Release pressure from fuel system at fuel pressure relief valve (Schrader) on fuel rail assembly. To gain access to fuel pressure relief valve, valve cap must first be removed.

2. Remove vacuum line at pressure regulator.

3. Disconnect the fuel return line from the fuel pressure regulator as follows: a. Disengage the locking tabs on the connector retainer and separate the retainer halves. b. Inspect the visible internal portion of the fitting for dirt accumulation. Clean the fitting before disassembly. c. To disengage the fitting from the regulator insert a fuel line coupling key into the slots in the coupling. d. Using the tool, pull the fitting from the regulator.

4. Remove two retaining screws from regulator housing.

5. Remove presure regulator assembly o-ring and washer. Discard washer and inspect o-ring for signs of cracks or deterioration.

6. Inspect fuel return tube for kinks and abrasions.

INSTALLATION

1. Install new washer and o-ring on regulator.

2. Lubricate fuel pressure regulator o-ring with a light oil.

NOTE: Never use silicone grease. It will clog the injectors. 3.

Ensure surfaces of fuel pressure regulator and fuel injection manifold are clean.

4. Install fuel pressure regulator on injector manifold. Tighten the retaining screws. Refer to SPECIFICATIONS.

5. Install vacuum line to regulator.

6. Install the fuel return line to the fuel presure regulator by pushing it onto the fuel pressure regulator line up to the shoulder on the regulator line.

CAUTION: The connector should grip the regulator line securely.

Fuel Pressure Regulator

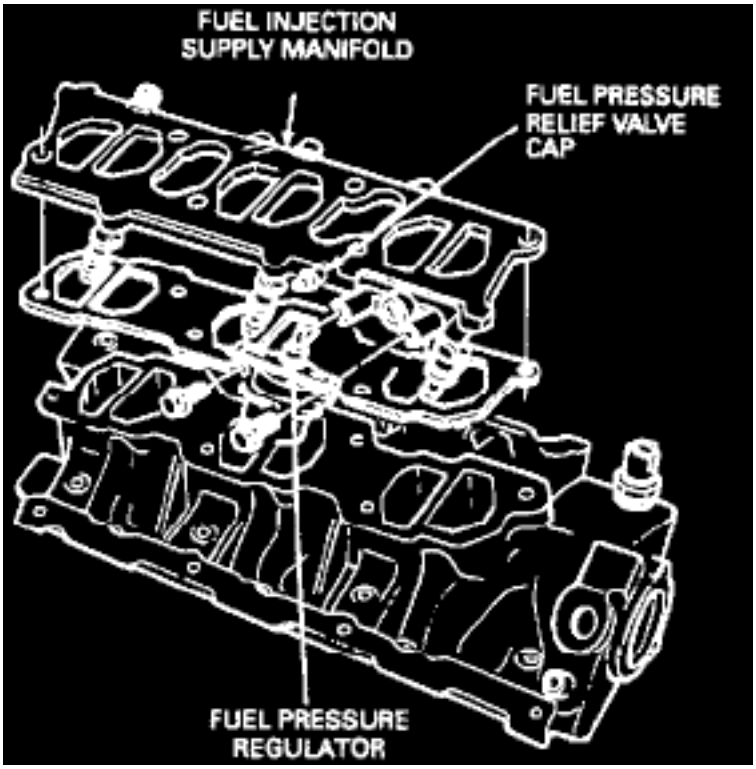
7. Install the connector retainer and snap the two halves of the retainer together.

8. Install the cap on the relief valve if removed.

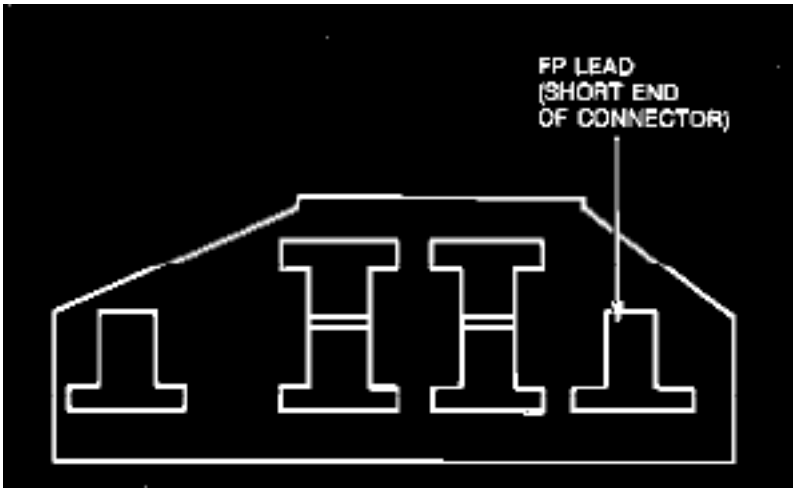
Fuel Pressure: Specifications

Key On Engine Off 35 - 45 psi

Key On Engine Running 30 - 40 psi



Fuel Injection Supply Manifold



Fuel Pressure: Testing and Inspection

STO Connector

STATIC PRESSURE TEST

1. Check for adequate fuel supply. 2. Turn key OFF 3. Install fuel pressure gauge to test port on fuel rail. 4. Install test lead to fuel pump lead of STO test connector. 5. Turn Key On Engine Off (KOEO). 6. Ground test lead to run fuel pump. 7. Check to determine if fuel pressure is within acceptable limits. Refer to SPECIFICATIONS.

a. If pressure is low but greater than 3 psi (indicates fuel pump is running but not enough pressure) check for:

^ Plugged fuel filter

^ Kinked fuel line

^ Low voltage to pump (should be within 0.5 volts of battery voltage at connector).

^ Disconnect the fuel return line and note if fuel is being returned during this low pressure condition. If fuel is being returned, replace the fuel pressure regulator. Reconnect the fuel return line.

b. If pressure is less than 3 psi (pump not running) check for:

^ Defective fuse link

^ Inertia switch open

^ Wiring at fuel pump/tank connector loose or open

^ Fuel pump ground connection at chassis loose or defective

^ Improper fuel pump relay operation

If fuel supply and return lines are OK, and electrical supply and ground are OK, and fuel pressure is still low, replace fuel pump.

DYNAMIC PRESSURE TEST

1. Disconnect and plug the vacuum line to the pressure regulator.

2. Start engine and run at idle. Check to determine if fuel pressure is within acceptable limits.

a. If pressure is low check for:

^ Plugged fuel filter ^ Restricted fuel line ^ Low voltage to pump (should be within 0.5 volts of battery voltage at connector).

3. Reconnect the vacuum line to the regulator.

If fuel supply and return lines are OK, and electrical supply and ground is OK, and fuel pressure is still low, replace fuel pump.

LEAKAGE TEST

1. Momentarily activate fuel pump by grounding test lead. Raise pressure to approximate operating pressure. 2. Remove ground from test lead and note pressure on gauge. Pressure should remain within 2 psi for 3 minutes after lead is ungrounded.

a. If pressure is not maintained check for leaking fuel

^ Lines ^ Connectors ^ Injectors

b. Disconnect fuel return line and plug engine side. Momentarily activate fuel pump by grounding test lead. Raise pressure to approximate

operating pressure. If pressure holds replace regulator and retest. Reconnect the fuel return line.

If pressure is not maintained replace fuel pump.

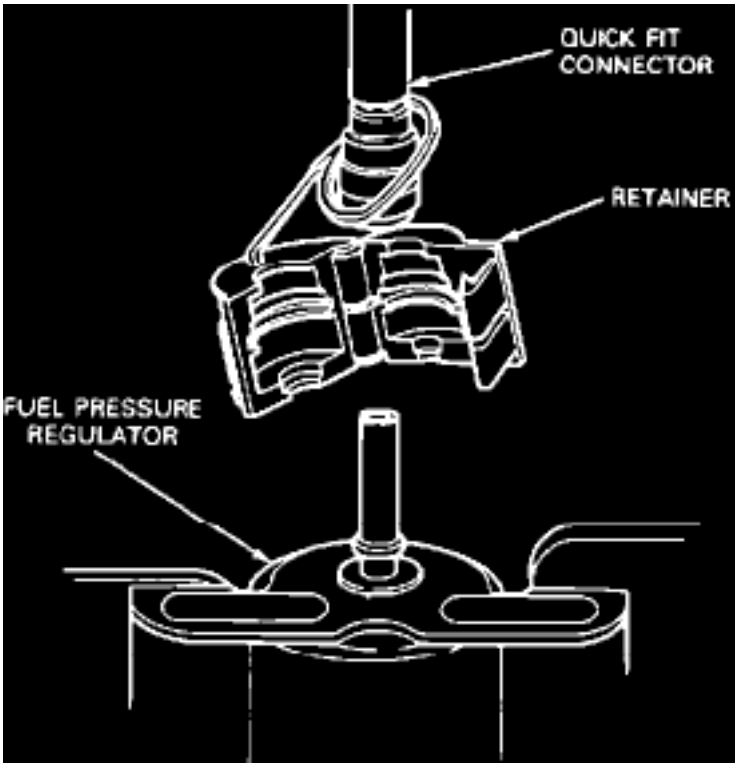
Fuel Pump Relay Connector

Fuel Pump Relay: Description and Operation

When the ignition switch is turned ON, the Electronic Engine Control (EEC) power relay is ENERGIZED, providing power to the fuel pump relay. Fuel pump power is provided through the fuel pump relay contacts and an inertia switch. If the ignition switch is not turned to the START position in approximately one second, a timer circuit in the Engine Control Assembly (ECA) will open the ground circuit to the fuel pump relay, causing the fuel pump relay contacts to OPEN. This action stops the power supply to the fuel pump. When the ignition switch is turned to the START position, the ECA closes the ground circuit to the fuel pump relay, resuming operation of the fuel pump. After the engine switch is returned to the ON position, power to the fuel pump is supplied through the fuel pump relay. The ECA monitors engine speed and OPENS the fuel pump relay ground circuit if the engine speed drops below 120 rpm.



Fuel Injection Supply Manifold Assembly: Service and Repair

REMOVAL

1. Thoroughly clean the engine.

2. Release pressure from fuel system at fuel pressure relief valve (Schrader) on fuel rail assembly. To gain access to fuel pressure relief valve, valve cap must first be removed.

3. Remove the upper intake manifold assembly as outlined in this section.

4. Disconnect the fuel supply line fitting at the fuel manifold.

5. Disconnect the fuel return line from the fuel pressure regulator as follows: a. Disengage the locking tabs on the connector retainer and separate the retainer halves. b. Inspect the visible internal portion of the fitting for dirt accumulation. Clean the fitting before disassembly. c. To disengage the fitting from the regulator, push the fitting toward the regulator, insert the finger on fuel line coupling key, into the slots in the

coupling.

d. Using the tool, pull the fitting from the regulator.

NOTE: If the fitting has been properly disengaged, the fitting should slide off the regulator with minimum effort. 6.

Remove the six Torx(R) head stud bolts retaining the fuel manifold and remove the manifold.

7. Remove the injectors from the fuel supply manifold and wipe cup clean with a clean, dry cloth.

INSTALLATION

1. Make sure the injector caps are clean and free of contamination. Inspect injector o-rings. Replace if required.

CAUTION: Do not attempt to clean the injector pintle or metering orifice with brushes or tools.

2. Carefully wipe the injector recesses in the manifold and make sure they are free of contamination. Light grease the recesses.

CAUTION: Do not use silicone grease to lubricate o-rings. Silicone grease can plug injectors.

3. Locate the three injectors on the RH side recesses of the intake manifold. Then locate the three on the left.

4. Position the fuel supply manifold and press down firmly until the injectors are fully seated in the fuel supply manifold and lower intake manifold. The fuel supply manifold should be fully seated on the lower intake manifold.

5. Install the six Torx(R) head stud bolts and tighten. Refer to SPECIFICATIONS.

6. Install the fuel supply line and tighten the fitting to 20-24 N-m (15-18 ft. lb)

7. Install the fuel return line to the fuel pressure regulator by pushing it onto the fuel pressure regulator line up to the shoulder on the regulator line.

CAUTION:

The connector should grip the regulator line securely.

Fuel Pressure Regulator

8. Install the connector retainer and snap the two halves of the retainer together.

9. Install the upper intake manifold as detailed in this section.

10. After the upper intake manifold has been install and before the fuel injector wire connectors have been connected, turn the key to the "ON" position.

This will cause the fuel pump to run for 2-3 seconds and pressurize the system.

11. Using a clean paper towel, check for leaks where the fuel injector is installed into the fuel rail. 12. Install the injector wire connectors and the vacuum line to the regulator. 13. Install the air inlet tube from the throttle body to the air cleaner. 14. Start the engine and let it idle for two minutes. 15. Turn the engine off and check for fuel leaks where the fuel injector is installed in the fuel manifold and the intake manifold.

Fuel Return Line: Technical Service Bulletins Nylon Fuel Lines - Servicing Procedure

Article No. 92-12-16

DATE: 06-03-92

FUEL LINES-NYLON-SERVICING PROCEDURE

LIGHT TRUCK: 1985-92 F-150-350 SERIES 1986-90 BRONCO II 1986-92 AEROSTAR, BRONCO, ECONOLINE, RANGER 1988-92 F SUPER DUTY 1991-92 EXPLORER

ISSUE: Metal fuel lines and connectors have been replaced with nylon lines and connectors on the subject vehicles. A procedure has been developed for servicing damaged nylon fuel lines.

ACTION: If a nylon fuel line requires service, use the following procedure.

FUEL SYSTEM SERVICE PROCEDURE FOR NYLON FUEL TUBES AND PUSH CONNECT FITTINGS

FUEL LINES AND HOSES

WARNING: FUEL SUPPLY LINES ON VEHICLES WITH FUEL INJECTED ENGINES WILL REMAIN PRESSURIZED FOR LONG PERIODS OF TIME AFTER ENGINE SHUT DOWN WHICH COULD RESULT IN PERSONAL INJURY. THE PRESSURE MUST BE RELIEVED, AS OUTLINED PER THE FUEL SYSTEM PRESSURE RELIEF PROCEDURE, BEFORE SERVICING THE FUEL SYSTEM. READ ALL CAUTIONARY NOTES PRIOR TO RELIEVING THE PRESSURIZED FUEL SYSTEM.

FUEL TUBES - PLASTIC (NYLON)

CAUTION: FORD APPROVED NYLON FUEL TUBING IS MADE FROM MATERIAL WHICH HAS BEEN TESTED AND PROVEN TO BE ACCEPTABLE FOR USE WITH COMMERCIALLY AVAILABLE FUELS. IT IS ALSO RESISTANT TO MOST ENVIRONMENTAL CONDITIONS. AVOID USING ALTERNATE TUBING MATERIALS. USE OF NON-APPROVED TUBING COULD POSE A HAZARD IN SERVICE.

CAUTION: PLASTIC FUEL TUBES MUST NOT BE REPAIRED USING HOSE AND HOSE CLAMPS. PUSH CONNECT FITTINGS CANNOT BE REPAIRED EXCEPT TO REPLACE THE RETAINING CLIPS. IF THE PLASTIC TUBES OR PUSH CONNECT FITTINGS BECOME DAMAGED AND LEAK, APPROVED SERVICE PARTS MUST BE USED TO SERVICE THE FUEL LINES.

MAJOR SERVICE OPERATIONS - FUEL LINES

Vehicles equipped with nylon fuel tubes and push connect fittings have three (3) types of service that can be performed to the fuel lines...

^ Replacing nylon tubing (splicing nylon to nylon)

^ Replacing push connector fittings

^ Replacing damaged push connect tube ends.

NOTE: FORMED SECTIONS (BENDS) OF NYLON FUEL LINES CANNOT BE REPAIRED USING STRAIGHT TUBING. STRAIGHT SERVICE TUBING WILL KINK IF BENT. FORMED NYLON FUEL LINE IS REOUIRED TO REPLACE THE DAMAGED SECTION.

SPLICING NYLON TO NYLON

1. Relieve the fuel system pressure as outlined in the Service Manual. Read the previously cited Warning prior to relieving the pressurized fuel system.

2. Cut out the damaged section of tubing (straight non-formed sections only) and retain as a guide.

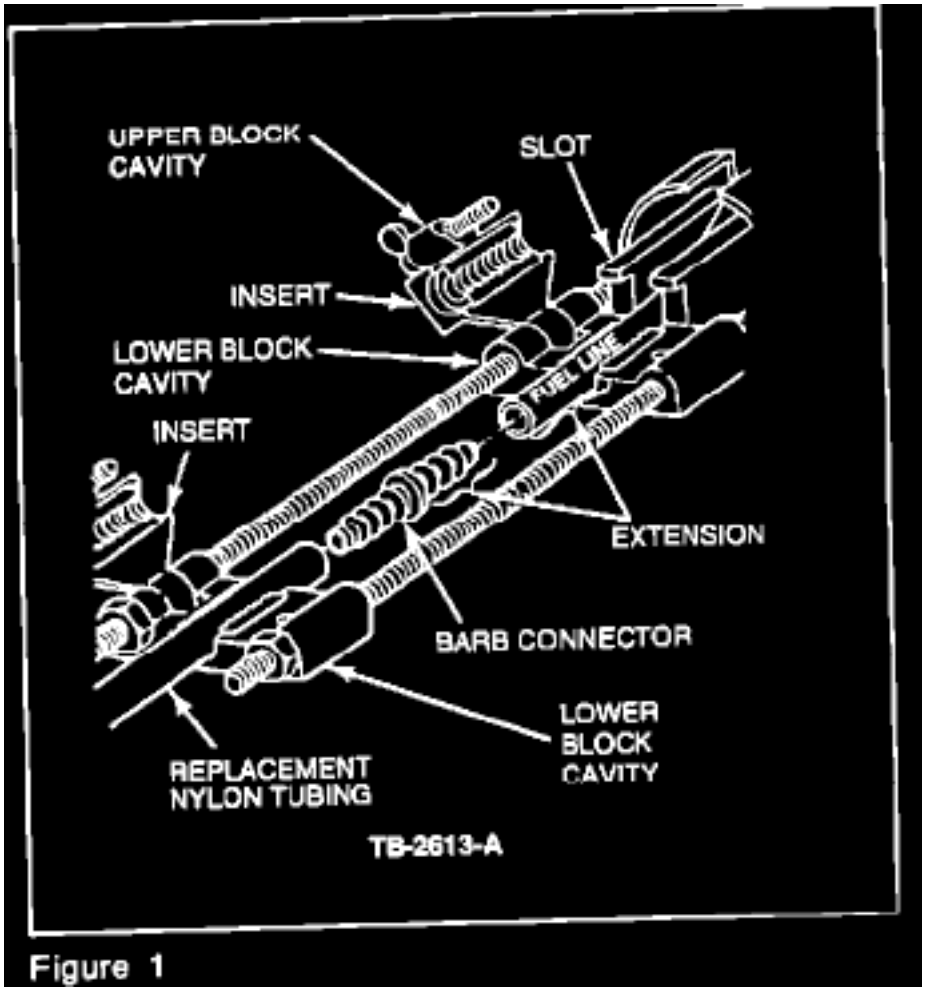


Figure 1

3. Cut a section of nylon service tubing, type 11 or 12, of the same diameter and length as the damaged section of tubing.

NOTE: TYPE 11 OR 12 NYLON SERVICE TUBING IS AVAILABLE IN 6.3MM (1/4"), 7.9MM (5/16") AND 9.5MM (3/8") DIAMETER SIZES.

4. Select the proper nylon barbed connector(s) for completing the splice...

^ 7.9mm (5/16") - Part Number (N806120-S)

^ 9.5mm (3/8") - Part Number (N806119-S)

Two (2) in-line connectors are required for each splice.

NOTE: TO MAKE INSERTION OF THE BARB CONNECTORS INTO THE NYLON LINE EASIER, THE TUBE END MAY BE SOAKED IN A CUP OF BOILING WATER FOR ONE (1) MINUTE BEFORE PUSHING THE BARB CONNECTOR INTO THE NYLON. USE ROTUNDA TOOL 134-000001 OR EQUIVALENT TO ASSIST IN ASSEMBLY.

5. Set up Rotunda Tool 134-000001 for in-line splice as shown in Figure 1.

a. Select the proper inserts for the fuel line size and install into both sets of upper and lower block cavities.

b. Connect the block cavity to the ratcheting rod of the Rotunda Tool with the slot in line with the slot in the ratcheting tool barrel

c. Install both sets of upper and lower block cavities to the threaded rods of the ratcheting tool, Figure 1.

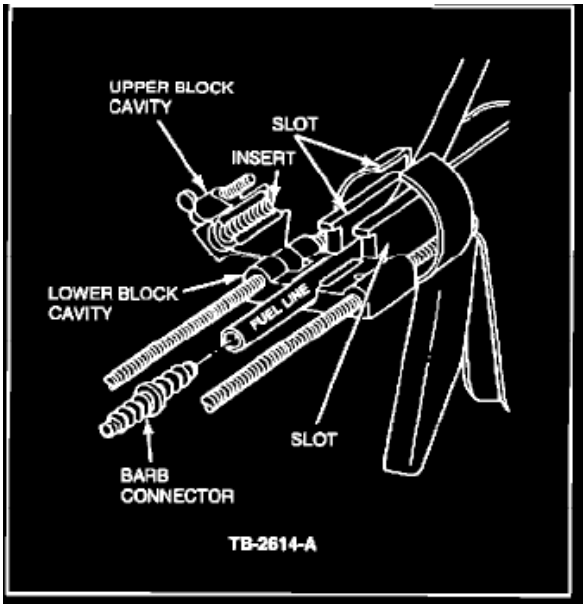

Figure 2

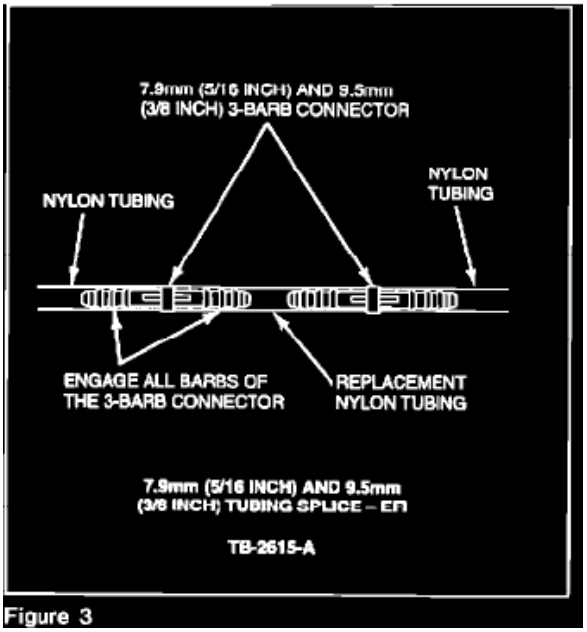

Figure 3

d. Install one fuel line into the lower block cavity closest to the ratcheting end of the tool so that the extension of the fuel line is slightly greater than the barb length of the connector, Figure 2.

e. Route the fuel line through the slot in the tool, Figure 2.

f. Close the upper block cavity onto the lower block cavity and tighten the thumb screw securely.

g. Place the replacement tubing in the forward lower block cavity and repeat Steps d and e.

h. Place the barb connector between the ends of the lines to be spliced and ratchet the tool until the nylon line has covered all three (3) barbs of the connector on both ends.

i. After completing the splice, unscrew the thumb screws and release the lines. Repeat Steps d through h on the opposite line end to complete the splice.

6. The completed fuel line splice is shown in Figure 3.

7. Install any remaining clips which were removed for this service. Check to be sure the fuel lines are secure in the original clips.

8. Start the engine and check for leaks.

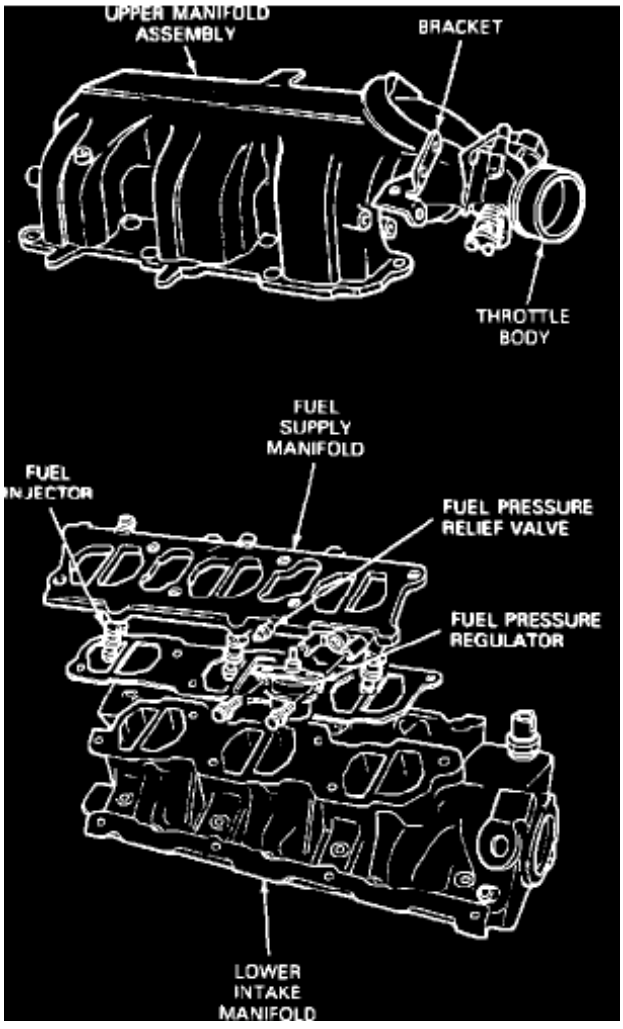
HAIRPIN CLIP CONNECTOR



Fuel Return Line: Description and Operation

Hairpin Clip Connector

FUEL LINES AND CONNECTORS Fuel injection systems often use special kinds of fittings to ensure leakproof connections. Some high-pressure fittings use O-ring seals instead of the traditional flare connections. The O-rings are made of special materials that can withstand contact with gasoline and alcohol-blend fuels. Whenever you replace one of these O-rings, you must use a new part specifically designed for fuel system service. The O-rings used in air conditioning systems are not satisfactory. Ford uses nylon fuel tubing with several unique push-connect fittings. Special barbed connectors are required to join sections of nylon tubing together. Connectors that join nylon to steel tubing also have barbed ends for the nylon lines, but they use O-rings to seal the steel line. Ford uses two kinds of retainer clips on these connectors. Fittings for 5/16 and 3/8 inch lines have hairpin clips. Fittings for 1/4 inch lines have duckbill clips.

Air Intake Manifold

FUEL SUPPLY MANIFOLD The fuel supply manifold assembly delivers high pressure fuel from the vehicle fuel supply line to the six fuel injectors. The assembly consists of two preformed tubes or stampings, one for fuel supply and one for fuel return. The fuel pressure manifold assembly has six injector connectors, a mounting flange for the fuel pressure regulator, and is mounted to the lower manifold assembly.

TYPICAL SECTION
VAPOR VALVE ASSEMBLY WITH
FLOAT VALVE AND INTERNAL SPRING

Fuel Filler System

FUEL TANK FILLER NECK

To prevent accidental filling with other than unleaded fuel, vehicles that require unleaded fuel have a special filler tube. This filler tube has a restriction in it so that the only nozzles that can be inserted are the smaller diameter nozzles of pumps dispensing unleaded fuel.

It is recommended that the amount of fuel put in the tank when filling be limited to the automatic pump shutoff. Due to the expansion of fuel during temperature increases, or overfilling ("topping off") can cause fuel overflow at the filler cap when the vehicle is standing or the cap is removed. If the vehicle has two tanks, use fuel from both tanks after fill-up to reduce fuel levels.

Orifice Rollover Valve

ORIFICE/ROLLOVER VALVE ASSEMBLY The orifice valve tends to meter the amount of fuel vapor passing out of the tank. The fuel vapors trapped in the sealed fuel tank are vented through the orifice fuel tank vapor valve assembly. The vapors then leave the valve assembly through a single vapor line and continue to the carbon canister in the engine compartment for storage, until they are purged to the engine.

SEALED FILL CAP The sealed cap incorporates a built-in pressure-vacuum relief valve. Fuel system vacuum relief is provided after approximately .5 inch vacuum is reached inside the tank. Pressure relief is provided when pressure inside the tank builds up approximately 1.8 psi. Under normal operating conditions, the fill cap operates as a check valve preventing vapors from escaping the tank through the cap.

VAPOR VENT In-tank venting provides a vapor space above the gasoline surface in the fuel tank. This area is sufficient to permit adequate breathing space for the tank vapor valve assembly under all static and most dynamic condition.

Fuel Supply Line: Customer Interest Fuel Line - Knocking Noises

Article No. 93-5-11

March 3, 1993

^ FUEL SYSTEM - 4.0L - FUEL LINE "KNOCKING" NOISE

^ NOISE - "KNOCKING" FROM FUEL LINE - 4.0L

LIGHT TRUCK: 1990-92 AEROSTAR, RANGER 1991-92 EXPLORER

This TSB is being republished in its entirety to include additional actions for 1990 model year trucks.

ISSUE: A fuel line "knocking" noise, which sounds like a bearing/piston noise, may occur. This noise is more audible at lower ambient temperatures - below 45~ (7~ C). This noise is caused by hydraulic pulsations in the fuel line.

ACTION: Install a new fuel line assembly (F2TZ-9J338-M). Refer to the following procedure for service details. This repair applies to 1990-92 Rangers, 1991-92 Explorers and 1990-92 Aerostars built before 12-1-91.

1. Confirm that the vehicle has a fuel system knocking concern.

a. Operate the engine at idle.

b. Place a mechanic's stethoscope on the fuel supply line in the engine compartment to verify that the knocking source is in the fuel line.

c. If a fuel line knocking noise is diagnosed, proceed to Step 2.

WARNING: FOLLOW ALL PRE AND POST SERVICE SAFETY PROCEDURES THAT ARE REQUIRED WHEN WORKING ON FUEL SYSTEM COMPONENTS.

2. Remove the fuel supply manifold. Refer to the appropriate Light Truck Service Manual, Section 03-04D, for fuel supply manifold assembly removal procedure.

3. Locate the engine/chassis fuel line couplings in the engine compartment.

a. Remove the fuel line safety clips. Refer to the 1991 Aerostar, Explorer, Ranger Truck Service Manual, Page 10-01-10, for removal information.

b. Disconnect the fuel line spring lock connectors.

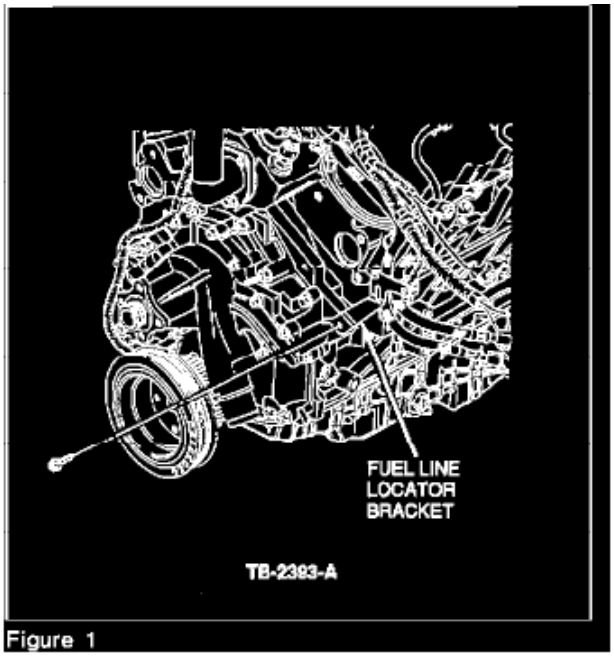

Figure 1

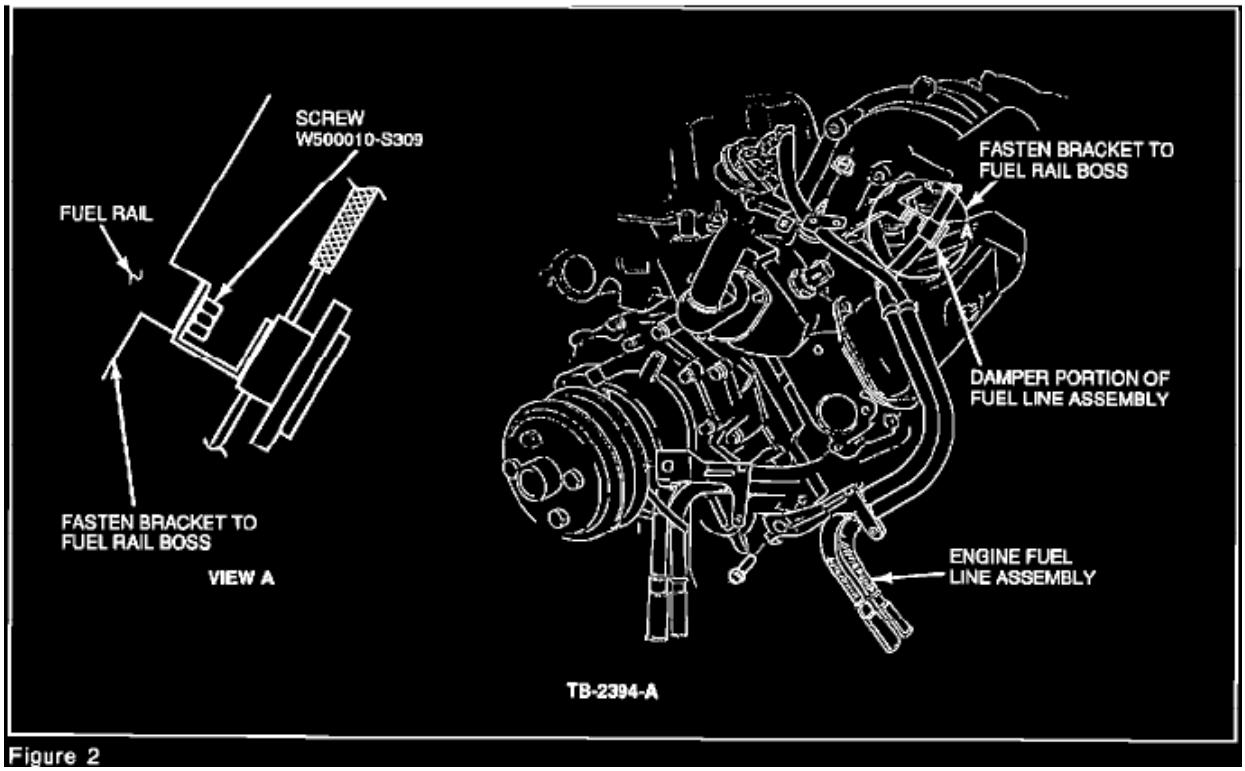

Figure 2

4. Remove the fuel line bracket/cylinder block bolt as shown in Figure 1.

5. Install the new fuel supply manifold (F1TZ-9D280-B). Refer to the appropriate Light Truck Service Manual, Section 03-04D, "Fuel Supply Manifold Assembly - Installation" procedure, Steps 1 to 5 only.

6. Install a new fuel line assembly (F2TZ-9J338-M). Refer to Steps 6, 7 and 8 of the Service Manual procedure.

7. Fasten the fuel line assembly bracket to the cylinder block. Tighten the bolts to 30-41 lb.ft. (40-55 N-m).

8. Locate and fasten the damper portion of the fuel line assembly to the fuel supply manifold using screw (W500010-S309) as shown in Figure 2. Tighten to 6-7 lb.ft. (8-9 N-m).

9. Continue with the "Fuel Supply Manifold Assembly - Installation procedure in the Service Manual, Steps 9 to 13.

10. Connect the fuel line spring lock connectors and reinstall safety clips.

11. Complete the "Fuel Supply Manifold Assembly - Installation" procedure in the Service Manual, Steps 14 and 15.

PART NUMBER	PART NAME	CLASS
F1TZ-9D280-B	Fuel Supply Manifold	C
F2TZ-9J338-M	Fuel Line Assembly (1991/92 Model Vehicles)	C
W500010-S309	M6 Screw	C
F0TZ-9E436-A	Gasket (Fuel Rail - 2 Req.)	B
F1TZ-9C968-A	Pressure Regulator (1990 Models Only)	B
F0TZ-9J338-G	Fuel Line Assembly (1990 Models Only)	C

WARNING: FOLLOW ALL SAFETY/LEAK CHECK PROCEDURES THAT ARE DETAILED IN THE LIGHT TRUCK SERVICE MANUAL FOR FUEL SYSTEM COMPONENTS.

ADDITIONAL ACTIONS FOR 1990 MODEL YEAR TRUCKS

1. After fuel supply manifold removal, follow the "Fuel Pressure Regulator" removal procedure.

2. After "Fuel Supply Manifold - Installation" Step 5, install a new pressure regulator (F1TZ-9C968-A).

3. Install a new fuel line assembly (F0TZ-9J338-G).

Fuel Supply Line: All Technical Service Bulletins Fuel Line - Knocking Noises

Article No. 93-5-11

March 3, 1993

^ FUEL SYSTEM - 4.0L - FUEL LINE "KNOCKING" NOISE

^ NOISE - "KNOCKING" FROM FUEL LINE - 4.0L

LIGHT TRUCK: 1990-92 AEROSTAR, RANGER 1991-92 EXPLORER

This TSB is being republished in its entirety to include additional actions for 1990 model year trucks.

ISSUE: A fuel line "knocking" noise, which sounds like a bearing/piston noise, may occur. This noise is more audible at lower ambient temperatures - below 45~ (7~ C). This noise is caused by hydraulic pulsations in the fuel line.

ACTION: Install a new fuel line assembly (F2TZ-9J338-M). Refer to the following procedure for service details. This repair applies to 1990-92 Rangers, 1991-92 Explorers and 1990-92 Aerostars built before 12-1-91.

1. Confirm that the vehicle has a fuel system knocking concern.

a. Operate the engine at idle.

b. Place a mechanic's stethoscope on the fuel supply line in the engine compartment to verify that the knocking source is in the fuel line.

c. If a fuel line knocking noise is diagnosed, proceed to Step 2.

WARNING: FOLLOW ALL PRE AND POST SERVICE SAFETY PROCEDURES THAT ARE REQUIRED WHEN WORKING ON FUEL SYSTEM COMPONENTS.

2. Remove the fuel supply manifold. Refer to the appropriate Light Truck Service Manual, Section 03-04D, for fuel supply manifold assembly removal procedure.

3. Locate the engine/chassis fuel line couplings in the engine compartment.

a. Remove the fuel line safety clips. Refer to the 1991 Aerostar, Explorer, Ranger Truck Service Manual, Page 10-01-10, for removal information.

b. Disconnect the fuel line spring lock connectors.

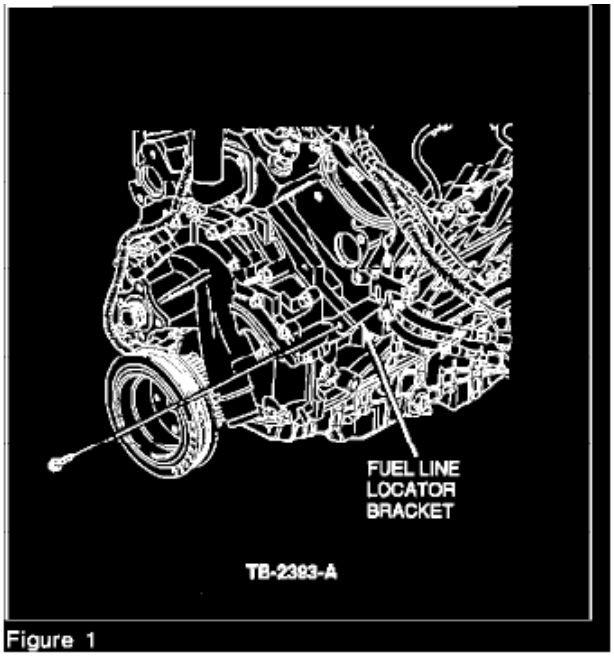

Figure 1

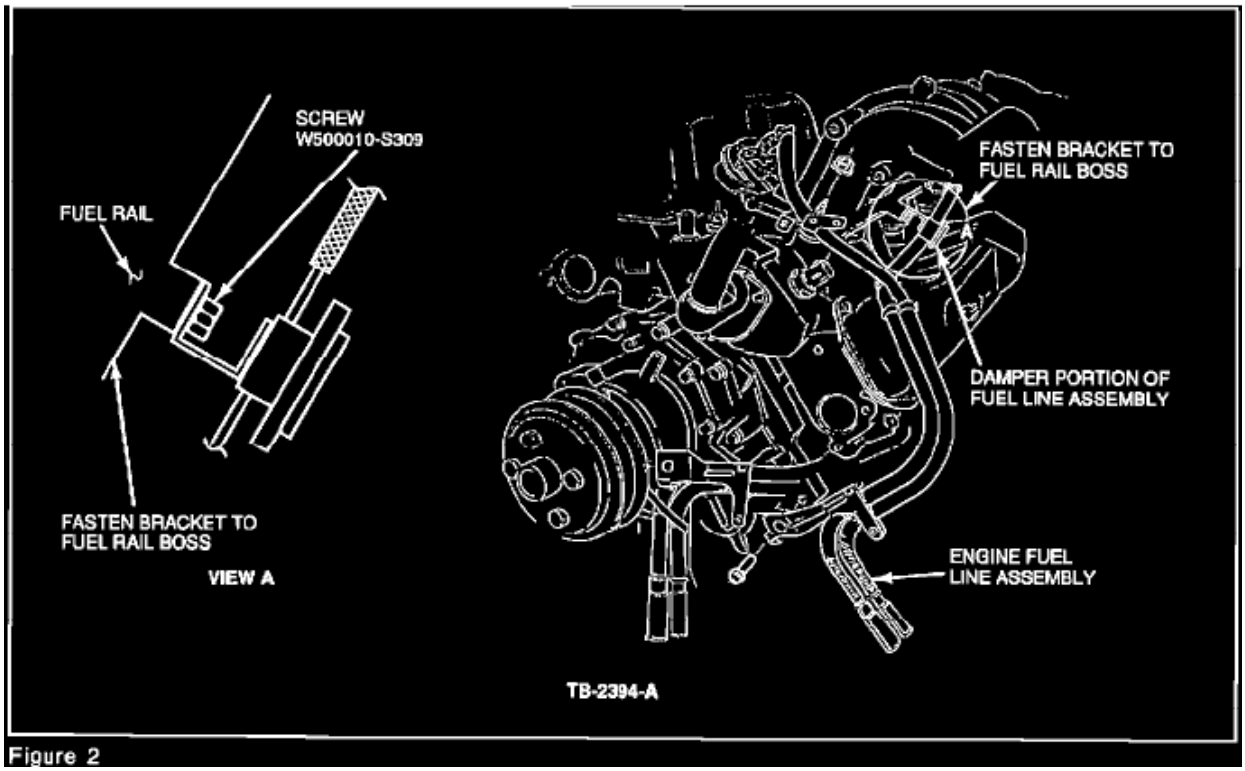

Figure 2

4. Remove the fuel line bracket/cylinder block bolt as shown in Figure 1.

5. Install the new fuel supply manifold (F1TZ-9D280-B). Refer to the appropriate Light Truck Service Manual, Section 03-04D, "Fuel Supply Manifold Assembly - Installation" procedure, Steps 1 to 5 only.

6. Install a new fuel line assembly (F2TZ-9J338-M). Refer to Steps 6, 7 and 8 of the Service Manual procedure.

7. Fasten the fuel line assembly bracket to the cylinder block. Tighten the bolts to 30-41 lb.ft. (40-55 N-m).

8. Locate and fasten the damper portion of the fuel line assembly to the fuel supply manifold using screw (W500010-S309) as shown in Figure 2. Tighten to 6-7 lb.ft. (8-9 N-m).

9. Continue with the "Fuel Supply Manifold Assembly - Installation procedure in the Service Manual, Steps 9 to 13.

10. Connect the fuel line spring lock connectors and reinstall safety clips.

11. Complete the "Fuel Supply Manifold Assembly - Installation" procedure in the Service Manual, Steps 14 and 15.

FUEL LINES-NYLON-SERVICING PROCEDURE

LIGHT TRUCK: 1985-92 F-150-350 SERIES 1986-90 BRONCO II 1986-92 AEROSTAR, BRONCO, ECONOLINE, RANGER 1988-92 F SUPER DUTY 1991-92 EXPLORER

ISSUE: Metal fuel lines and connectors have been replaced with nylon lines and connectors on the subject vehicles. A procedure has been developed for servicing damaged nylon fuel lines.

ACTION: If a nylon fuel line requires service, use the following procedure.

FUEL SYSTEM SERVICE PROCEDURE FOR NYLON FUEL TUBES AND PUSH CONNECT FITTINGS

FUEL LINES AND HOSES

WARNING: FUEL SUPPLY LINES ON VEHICLES WITH FUEL INJECTED ENGINES WILL REMAIN PRESSURIZED FOR LONG PERIODS OF TIME AFTER ENGINE SHUT DOWN WHICH COULD RESULT IN PERSONAL INJURY. THE PRESSURE MUST BE RELIEVED, AS OUTLINED PER THE FUEL SYSTEM PRESSURE RELIEF PROCEDURE, BEFORE SERVICING THE FUEL SYSTEM. READ ALL CAUTIONARY NOTES PRIOR TO RELIEVING THE PRESSURIZED FUEL SYSTEM.

FUEL TUBES - PLASTIC (NYLON)

CAUTION: FORD APPROVED NYLON FUEL TUBING IS MADE FROM MATERIAL WHICH HAS BEEN TESTED AND PROVEN TO BE ACCEPTABLE FOR USE WITH COMMERCIALLY AVAILABLE FUELS. IT IS ALSO RESISTANT TO MOST ENVIRONMENTAL CONDITIONS. AVOID USING ALTERNATE TUBING MATERIALS. USE OF NON-APPROVED TUBING COULD POSE A HAZARD IN SERVICE.

CAUTION: PLASTIC FUEL TUBES MUST NOT BE REPAIRED USING HOSE AND HOSE CLAMPS. PUSH CONNECT FITTINGS CANNOT BE REPAIRED EXCEPT TO REPLACE THE RETAINING CLIPS. IF THE PLASTIC TUBES OR PUSH CONNECT FITTINGS BECOME DAMAGED AND LEAK, APPROVED SERVICE PARTS MUST BE USED TO SERVICE THE FUEL LINES.

MAJOR SERVICE OPERATIONS - FUEL LINES

Vehicles equipped with nylon fuel tubes and push connect fittings have three (3) types of service that can be performed to the fuel lines...

^ Replacing nylon tubing (splicing nylon to nylon)

^ Replacing push connector fittings

^ Replacing damaged push connect tube ends.

NOTE: FORMED SECTIONS (BENDS) OF NYLON FUEL LINES CANNOT BE REPAIRED USING STRAIGHT TUBING. STRAIGHT SERVICE TUBING WILL KINK IF BENT. FORMED NYLON FUEL LINE IS REOUIRED TO REPLACE THE DAMAGED SECTION.

SPLICING NYLON TO NYLON

1. Relieve the fuel system pressure as outlined in the Service Manual. Read the previously cited Warning prior to relieving the pressurized fuel system.

2. Cut out the damaged section of tubing (straight non-formed sections only) and retain as a guide.

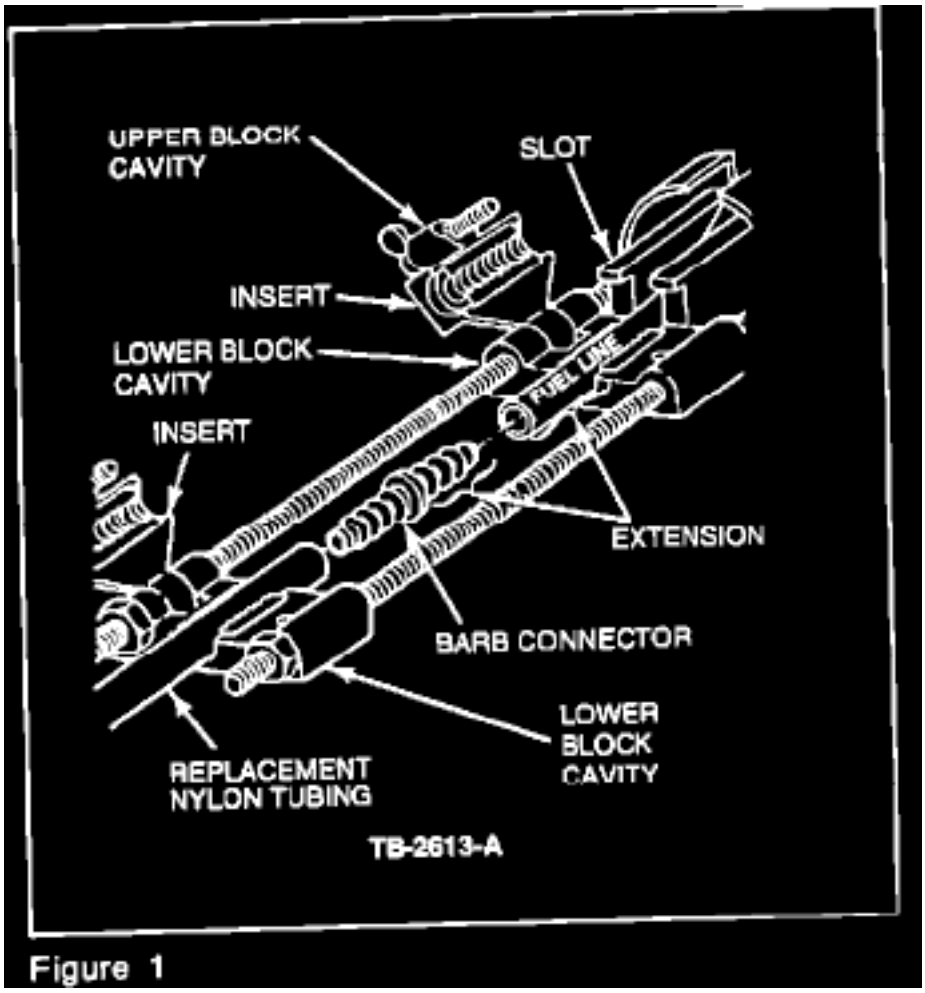

Figure 1

3. Cut a section of nylon service tubing, type 11 or 12, of the same diameter and length as the damaged section of tubing.

NOTE: TYPE 11 OR 12 NYLON SERVICE TUBING IS AVAILABLE IN 6.3MM (1/4"), 7.9MM (5/16") AND 9.5MM (3/8") DIAMETER SIZES.

4. Select the proper nylon barbed connector(s) for completing the splice...

^ 7.9mm (5/16") - Part Number (N806120-S)

^ 9.5mm (3/8") - Part Number (N806119-S)

Two (2) in-line connectors are required for each splice.

NOTE: TO MAKE INSERTION OF THE BARB CONNECTORS INTO THE NYLON LINE EASIER, THE TUBE END MAY BE SOAKED IN A CUP OF BOILING WATER FOR ONE (1) MINUTE BEFORE PUSHING THE BARB CONNECTOR INTO THE NYLON. USE ROTUNDA TOOL 134-000001 OR EQUIVALENT TO ASSIST IN ASSEMBLY.

5. Set up Rotunda Tool 134-000001 for in-line splice as shown in Figure 1.

a. Select the proper inserts for the fuel line size and install into both sets of upper and lower block cavities.

b. Connect the block cavity to the ratcheting rod of the Rotunda Tool with the slot in line with the slot in the ratcheting tool barrel

c. Install both sets of upper and lower block cavities to the threaded rods of the ratcheting tool, Figure 1.

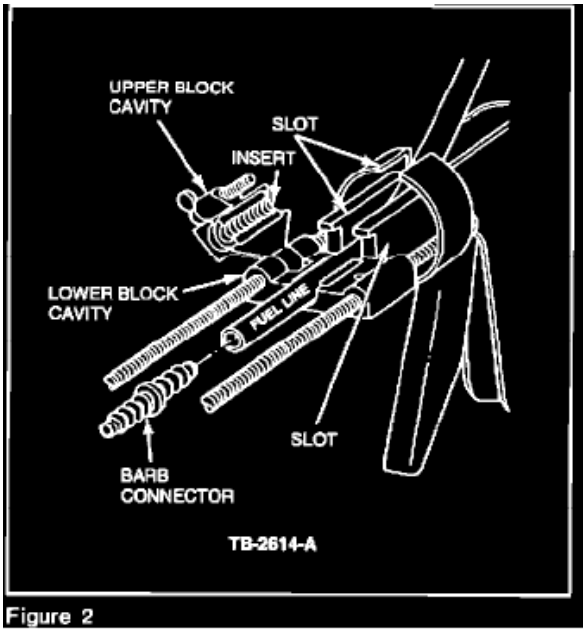

Figure 2

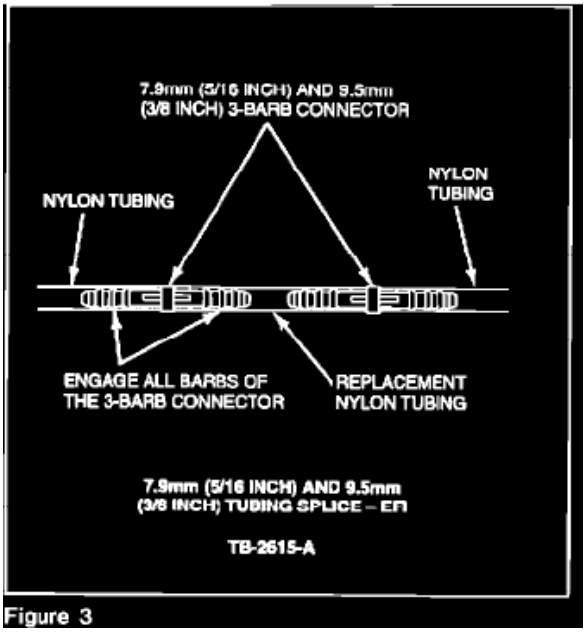

Figure 3

d. Install one fuel line into the lower block cavity closest to the ratcheting end of the tool so that the extension of the fuel line is slightly greater than the barb length of the connector, Figure 2.

e. Route the fuel line through the slot in the tool, Figure 2.

f. Close the upper block cavity onto the lower block cavity and tighten the thumb screw securely.

g. Place the replacement tubing in the forward lower block cavity and repeat Steps d and e.

h. Place the barb connector between the ends of the lines to be spliced and ratchet the tool until the nylon line has covered all three (3) barbs of the connector on both ends.

i. After completing the splice, unscrew the thumb screws and release the lines. Repeat Steps d through h on the opposite line end to complete the splice.

6. The completed fuel line splice is shown in Figure 3.

7. Install any remaining clips which were removed for this service. Check to be sure the fuel lines are secure in the original clips.

8. Start the engine and check for leaks.

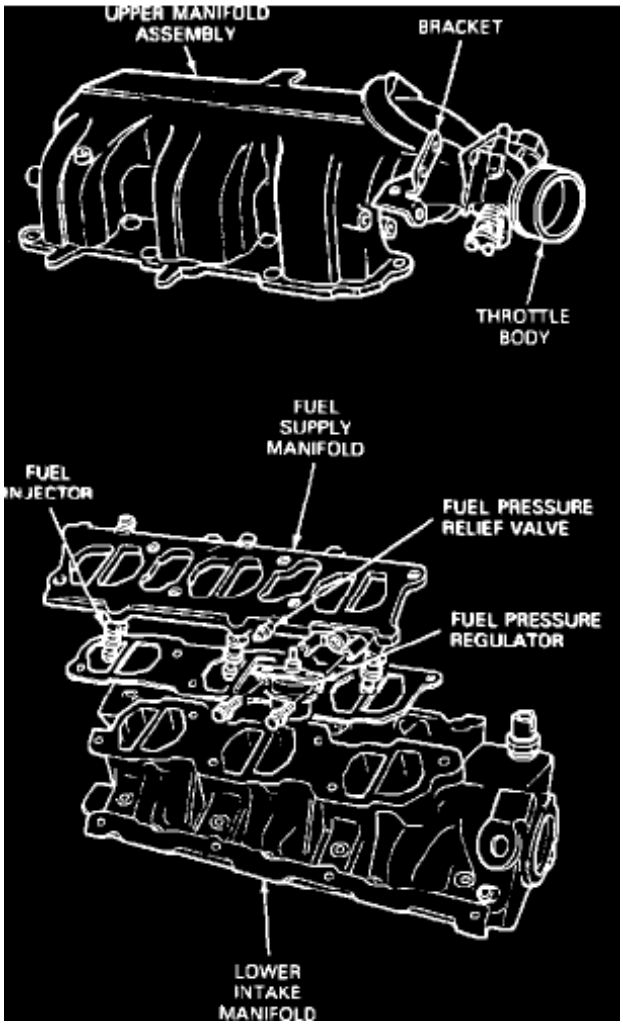
HAIRPIN CLIP CONNECTOR



Fuel Supply Line: Description and Operation

Hairpin Clip Connector

FUEL LINES AND CONNECTORS Fuel injection systems often use special kinds of fittings to ensure leakproof connections. Some high-pressure fittings use O-ring seals instead of the traditional flare connections. The O-rings are made of special materials that can withstand contact with gasoline and alcohol-blend fuels. Whenever you replace one of these O-rings, you must use a new part specifically designed for fuel system service. The O-rings used in air conditioning systems are not satisfactory. Ford uses nylon fuel tubing with several unique push-connect fittings. Special barbed connectors are required to join sections of nylon tubing together. Connectors that join nylon to steel tubing also have barbed ends for the nylon lines, but they use O-rings to seal the steel line. Ford uses two kinds of retainer clips on these connectors. Fittings for 5/16 and 3/8 inch lines have hairpin clips. Fittings for 1/4 inch lines have duckbill clips.

Air Intake Manifold

FUEL SUPPLY MANIFOLD The fuel supply manifold assembly delivers high pressure fuel from the vehicle fuel supply line to the six fuel injectors. The assembly consists of two preformed tubes or stampings, one for fuel supply and one for fuel return. The fuel pressure manifold assembly has six injector connectors, a mounting flange for the fuel pressure regulator, and is mounted to the lower manifold assembly.

Fuel Filler System

FUEL TANK FILLER NECK

To prevent accidental filling with other than unleaded fuel, vehicles that require unleaded fuel have a special filler tube. This filler tube has a restriction in it so that the only nozzles that can be inserted are the smaller diameter nozzles of pumps dispensing unleaded fuel.

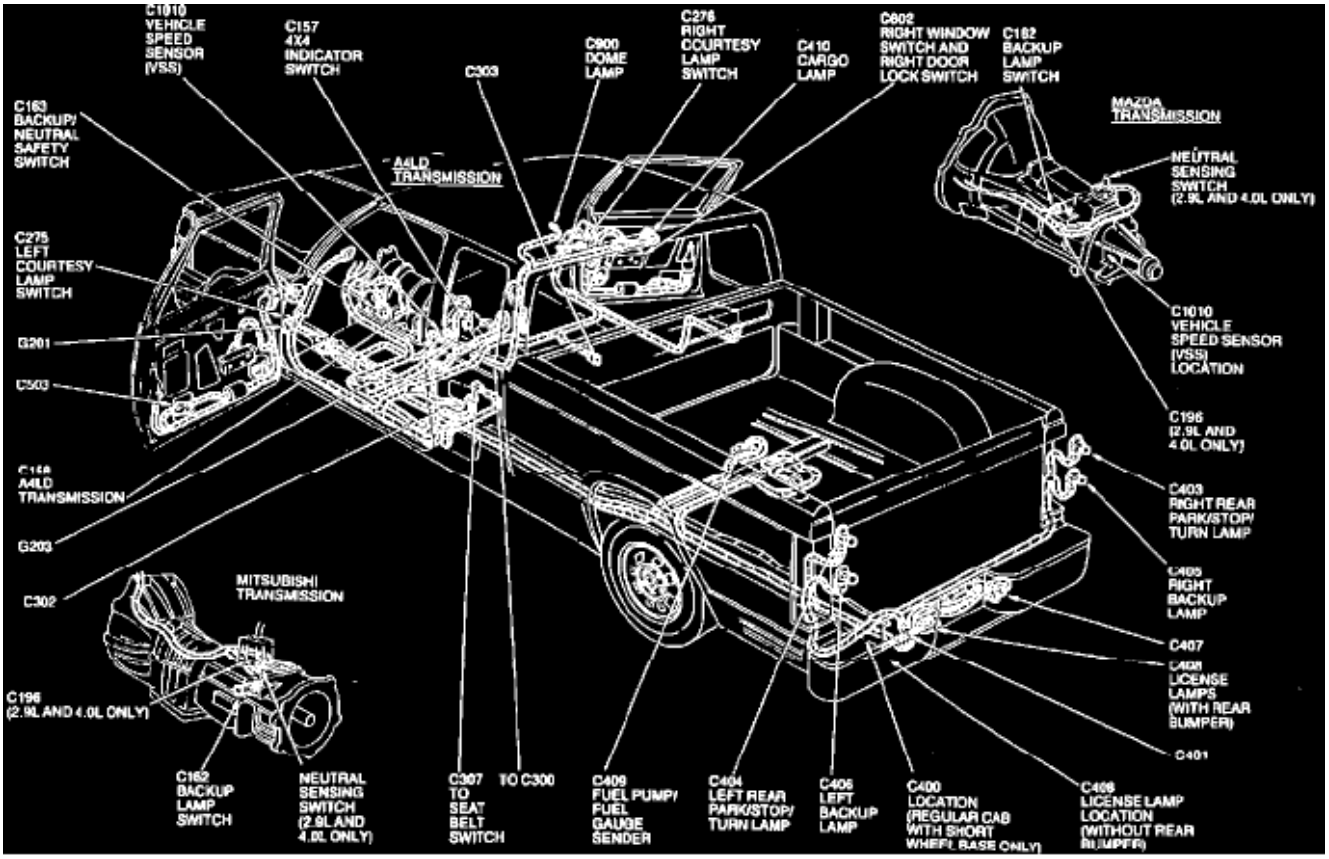
It is recommended that the amount of fuel put in the tank when filling be limited to the automatic pump shutoff. Due to the expansion of fuel during temperature increases, or overfilling ("topping off") can cause fuel overflow at the filler cap when the vehicle is standing or the cap is removed. If the vehicle has two tanks, use fuel from both tanks after fill-up to reduce fuel levels.

Orifice Rollover Valve

ORIFICE/ROLLOVER VALVE ASSEMBLY The orifice valve tends to meter the amount of fuel vapor passing out of the tank. The fuel vapors trapped in the sealed fuel tank are vented through the orifice fuel tank vapor valve assembly. The vapors then leave the valve assembly through a single vapor line and continue to the carbon canister in the engine compartment for storage, until they are purged to the engine.

SEALED FILL CAP The sealed cap incorporates a built-in pressure-vacuum relief valve. Fuel system vacuum relief is provided after approximately .5 inch vacuum is reached inside the tank. Pressure relief is provided when pressure inside the tank builds up approximately 1.8 psi. Under normal operating conditions, the fill cap operates as a check valve preventing vapors from escaping the tank through the cap.

VAPOR VENT In-tank venting provides a vapor space above the gasoline surface in the fuel tank. This area is sufficient to permit adequate breathing space for the tank vapor valve assembly under all static and most dynamic condition.



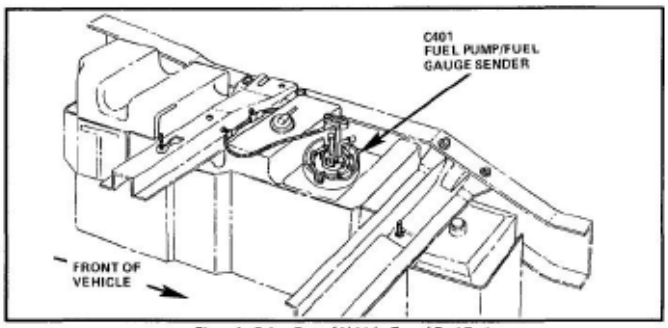


Figure 1 - Below Rear of Vehicle, Top of Fuel Tank

Fuel Gauge Sender: Locations

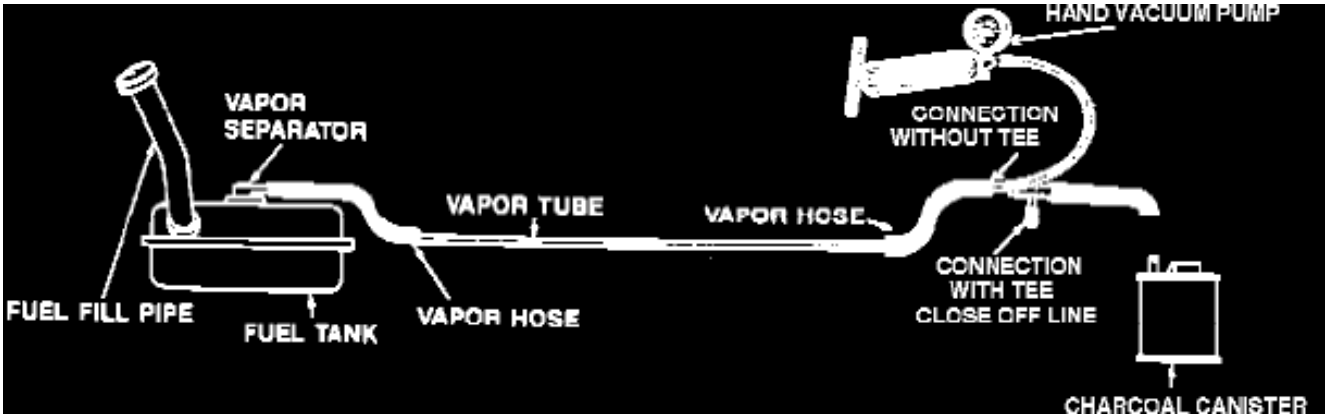
Below Rear Of Vehicle, Top Center Of Fuel Tank



Fuel Tank Pressure Release Valve: Testing and Inspection

Testing Fuel Tank Ventilation System

1. Check for broken seals at the filler cap, filler neck, the tank vapor vent valve, and between hose/tubing connections. Make repairs as necessary.

2. Check the vacuum and vapor hoses for kinks, cuts, cracks, and blockage. Make repairs as necessary.

3. Connect a hand vacuum pump to the fuel tank vapor vent line at the canister.

4. Apply 2.5 inches of vacuum. CAUTION: DO NOT apply any more than 2.5" vacuum. Vacuum should hold. If not, inspect hoses for leakage points.

5. Open the fuel tank filler cap. Applied vacuum at the pump should drop to 0 immediately. If not, inspect hoses for blockage.

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

TB-2432-A

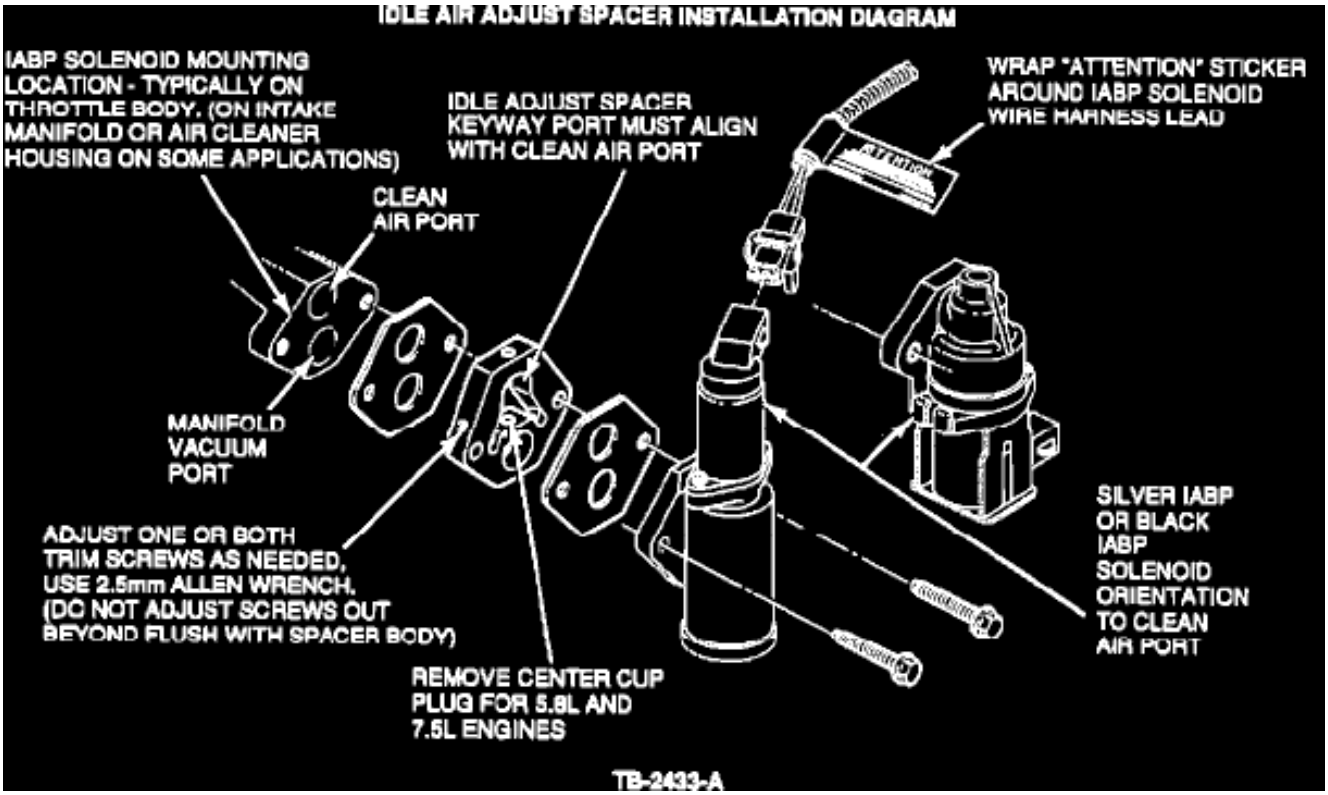
Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.

The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets



^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for

cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

Engine - Hard Cold Starts/Hesitation/Stalls On Start-Up

Article No. 91-25-7

12/13/91

^ HARD COLD START - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

^ HESITATION/STALLS - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

FORD: 1983-87 EXP 1983-91 ESCORT 1984-90 MUSTANG, THUNDERBIRD 1986-90 TAURUS 1986-91 CROWN VICTORIA 1988-90 TEMPO

LINCOLN-MERCURY: 1983-85 LN7 1983-87 LYNX 1984-88 CAPRI 1984-90 COUGAR 1986-90 CONTINENTAL, MARK VII, SABLE 1986-91 GRAND MARQUIS, TOWN CAR 1988-90 TOPAZ 1991 TRACER

LIGHT TRUCK: 1985-90 BRONCO II, BRONCO 1985-91 ECONOLINE, F-150-350 SERIES 1985-92 RANGER 1986-91 AEROSTAR 1991 EXPLORER

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

SERVICE KIT -9F939-

APPLICATION CHART — EFI PORT FUEL INJECTION ENGINES

MODEL YEAR	CAR APPLICATION	ENGINE

**** 1991 MODEL YEAR ALL CALIBRATIONS **EXCEPT** 1-97A-R00, 1-98A-R00, 1-98B-R00, 1-98C-R00, 1-98E-R00 AND 1-98F-R00.

TB-2432-A

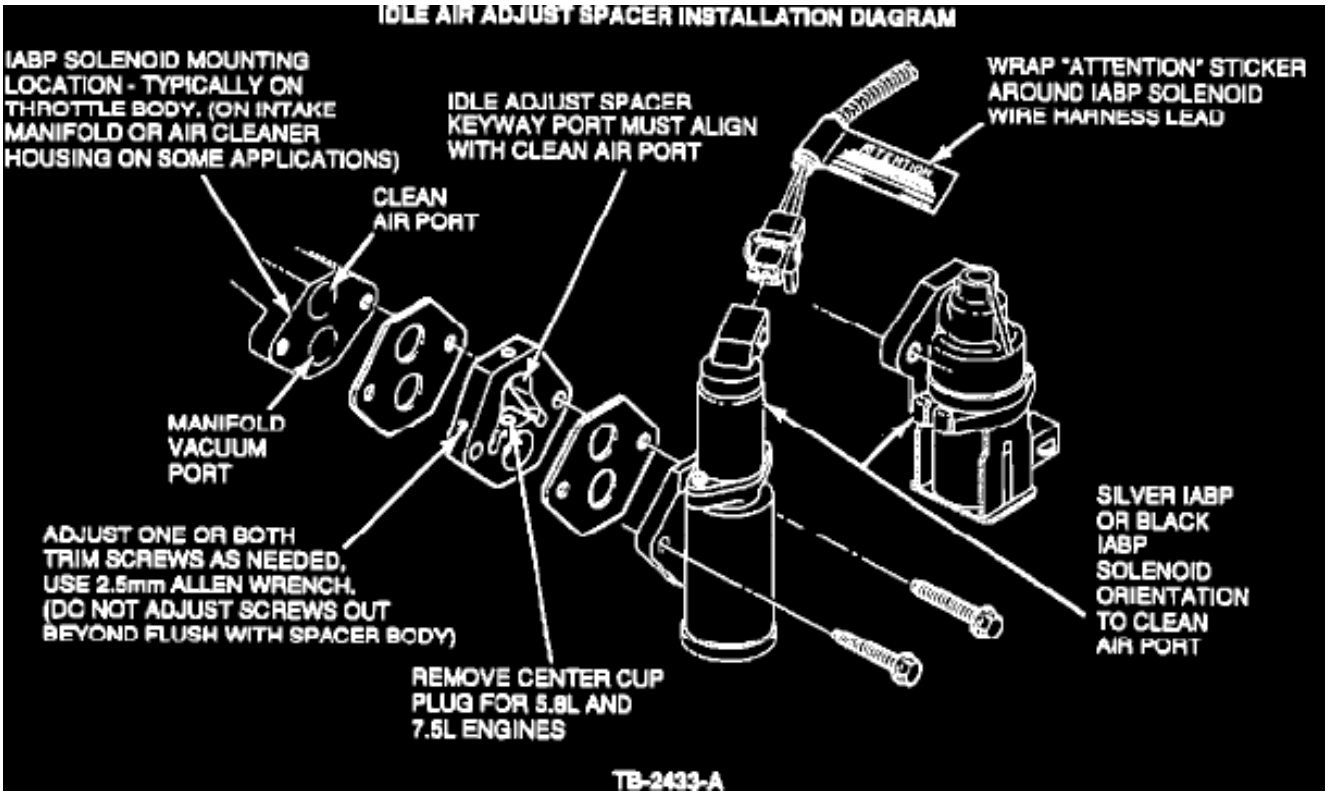
Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.

The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets



^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for

cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

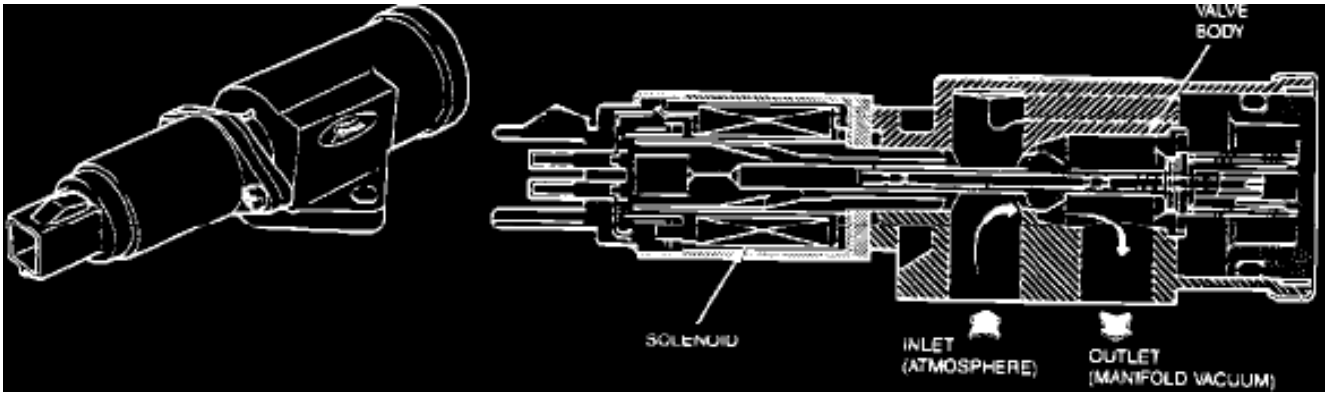
Idle Speed/Throttle Actuator - Electronic: Locations

Engine Compartment Components.

Top LH Side Of Engine

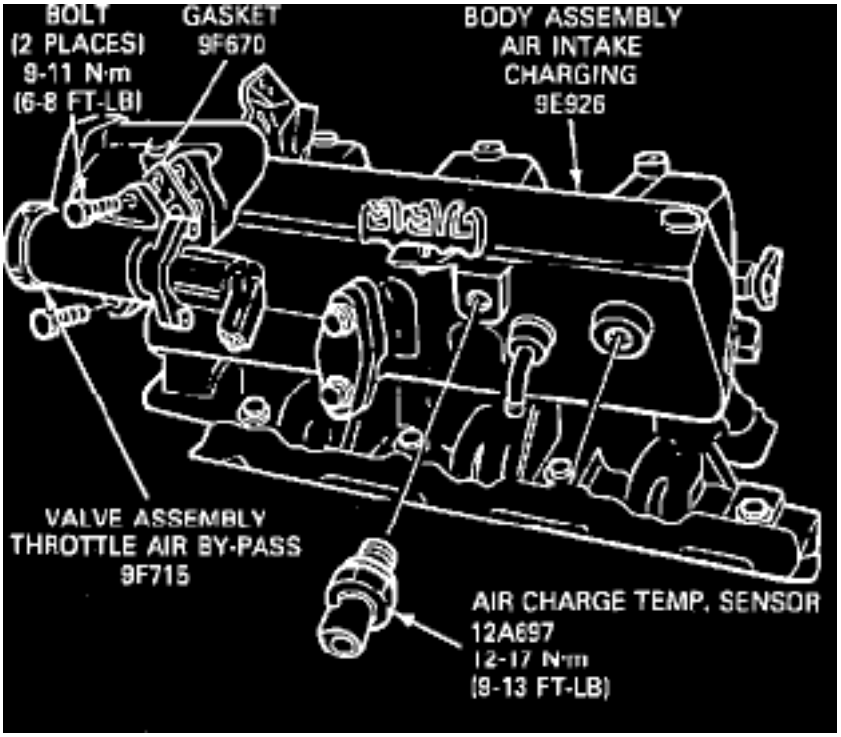
Applicable to: 4.0L/V6-244



Idle Speed/Throttle Actuator - Electronic: Description and Operation

Idle Air Bypass Valve

The Idle Speed Control Bypass Air (ISC-BPA) valve is used to control engine idle speed and is operated by the Engine Control Assembly (ECA). This valve allows air to pass around the throttle plates to control cold engine fast idle, no touch start, over temperature idle boost and engine idle load correction.



Idle Speed/Throttle Actuator - Electronic: Service and Repair

Intake Manifold

1. Disconnect the Idle Speed Control By-Pass Air (ISC-BPA) valve assembly connector from the wiring harness.

2. Remove the two ISC-BPA retaining bolts.

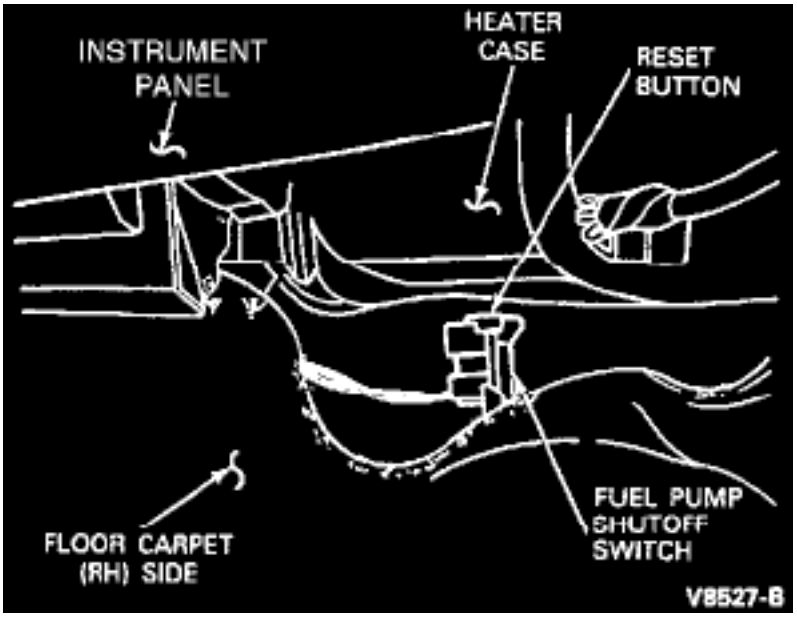
3. Remove the ISC-BPA valve and gasket.

4. Clean the gasket mating surfaces. NOTE: If scraping is necessary, use care not to damage ISC-BPA valve or throttle body gasket surfaces, or drop material into the throttle body.

5. Install the gasket and ISC-BPA valve on the throttle body.

6. Install the retaining screws, torquing them to 72-96 lb. in. (9-11 N-m).

7. Connect the electrical connection for the ISC-BPA valve.



Fuel Pump Inertia Switch: Locations

Inertia Switch

The inertia switch is located below the instrument panel, to the right of the transmission hump.

Fuel Pump Inertia Switch: Description and Operation

Typical Inertia Fuel Shut-Off Switch

The inertia switch is used to open the power circuit to the fuel pump, or the control circuit to the fuel pump relay, in case of an accident. The inertia switch must be manually reset by pushing the reset button located on top of the inertia switch.

Operation of the inertia switch is as follows:

A steel ball is held in place by a magnet. When a sharp impact occurs, the ball breaks loose from the magnet, rolls up a conical ramp and strikes a target plate, which opens the electrical contacts.

Fuel Pump Inertia Switch: Service and Repair

TO RESET SWITCH 1.

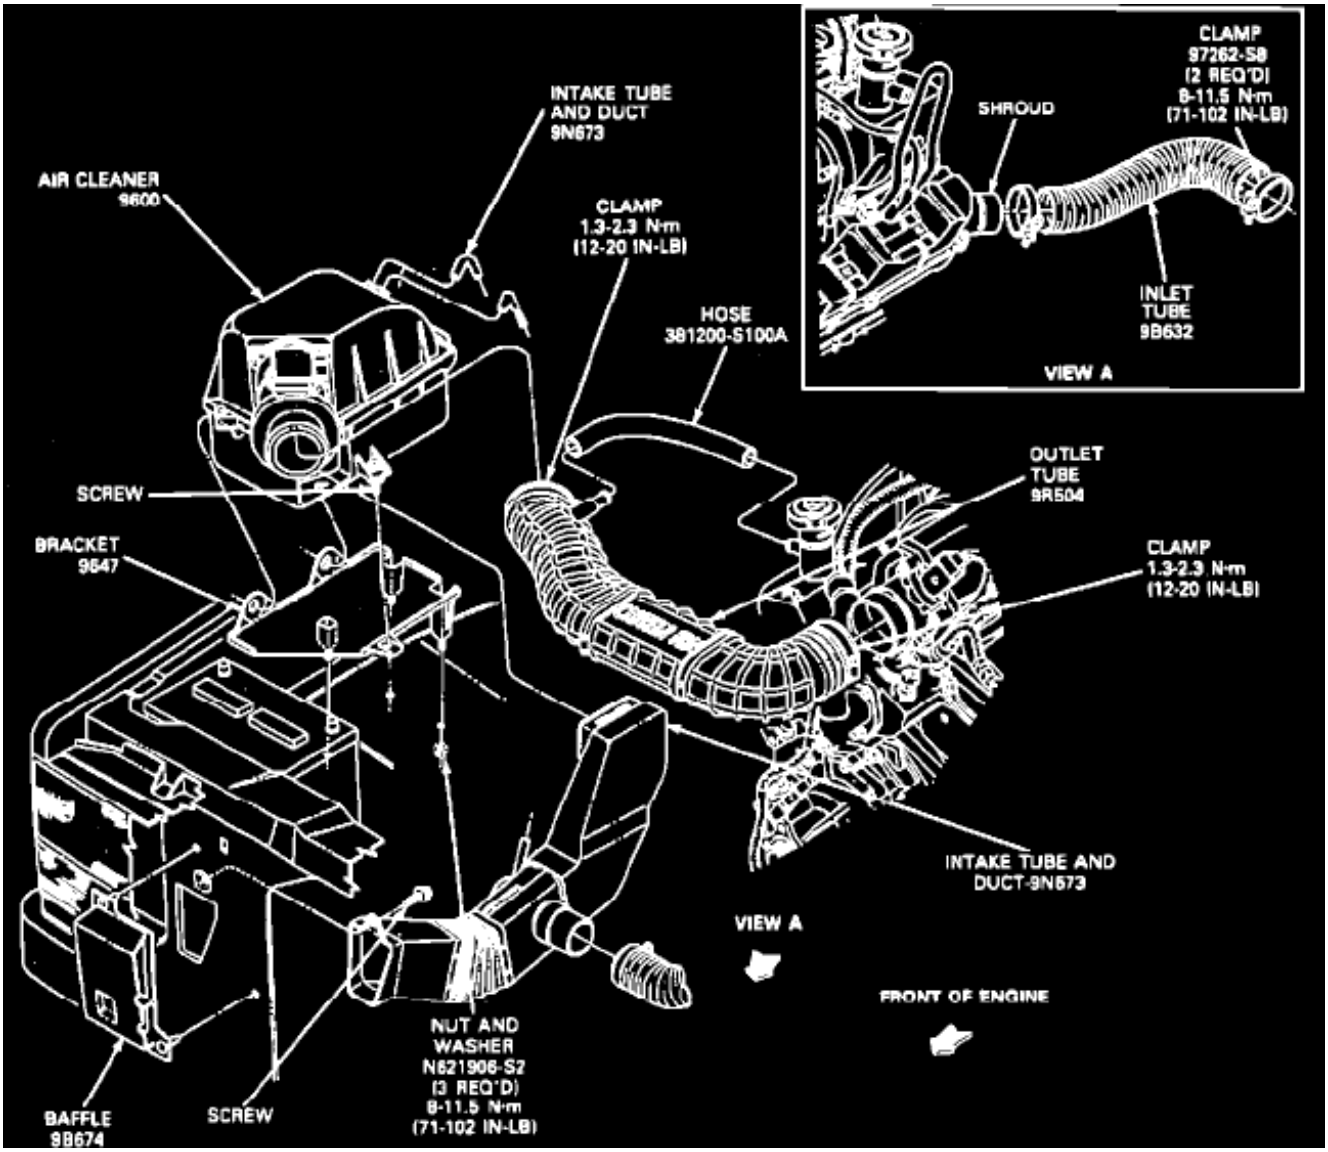
Turn ignition switch to OFF.

2. Check for leaking fuel in the engine compartment, fuel lines and tank(s).

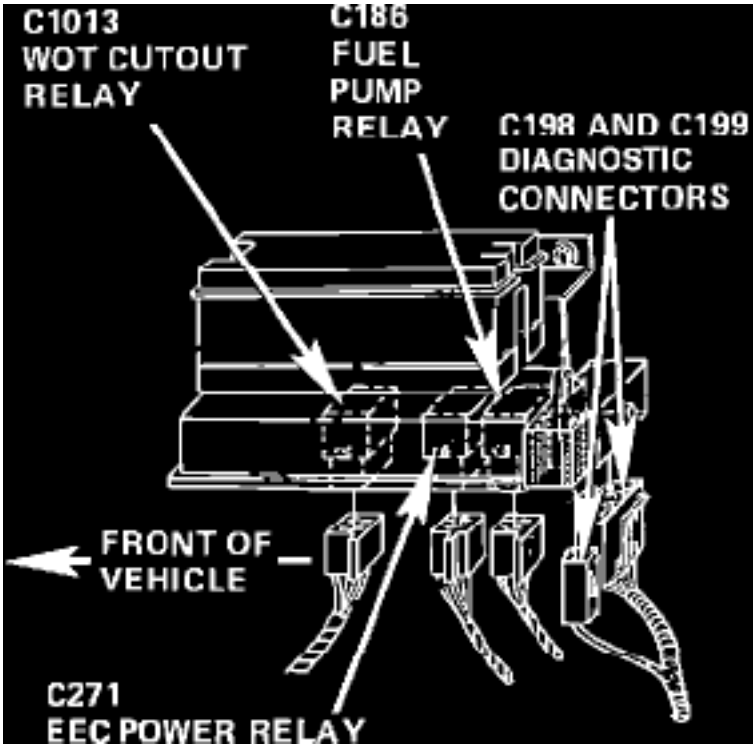
3. If no fuel leak is apparent, reset the switch by pushing the reset button on the top of the switch.

4. Turn ignition switch to START for a few seconds, then to OFF.

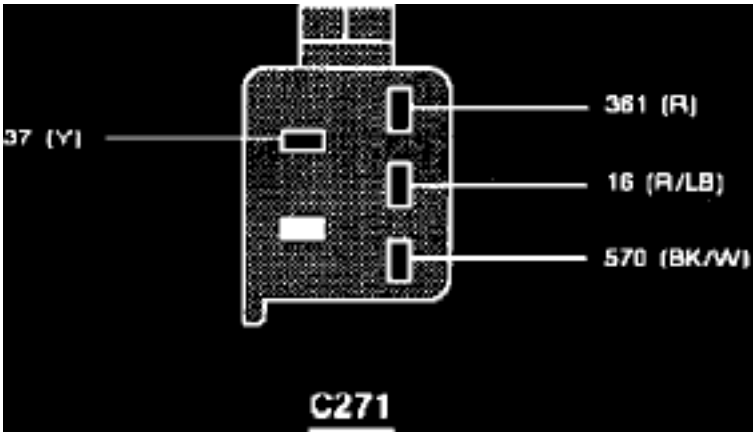
5. Again, check for leaking fuel.



Inlet Air Temperature Control System



Relay And Diagnostic Connectors



EEC-IV Power Relay Connector

Main Relay (Computer/Fuel System): Description and Operation

The Engine Control Assembly (ECA) receives its operating voltage from the Electronic Engine Control (EEC) power relay. When the ignition switch is turned ON, the normally OPEN contact points of the relay CLOSE and supply power to the ECA. The control coil circuit of the relay contains a diode, wired in series, to prevent relay operation if the battery polarity is reversed, preventing damage to the ECA.

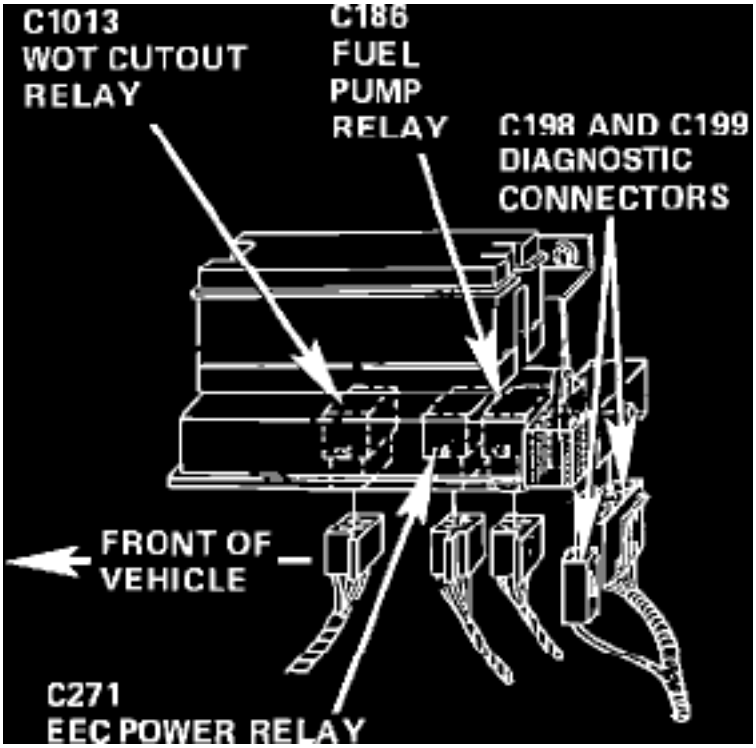
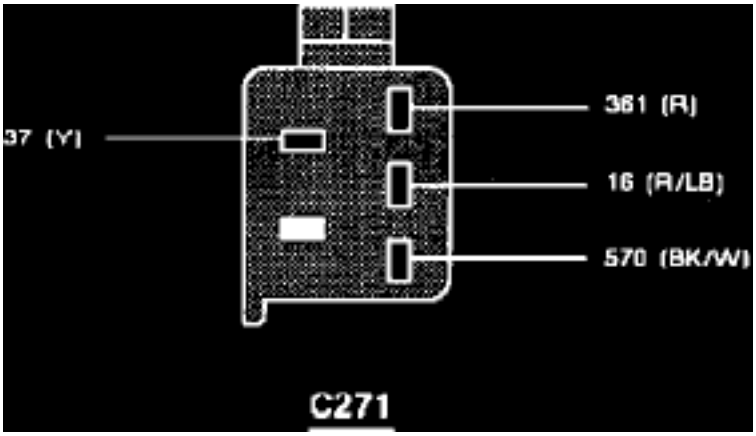
Fuel Pump Relay Connector

Fuel Pump Relay: Description and Operation

When the ignition switch is turned ON, the Electronic Engine Control (EEC) power relay is ENERGIZED, providing power to the fuel pump relay. Fuel pump power is provided through the fuel pump relay contacts and an inertia switch. If the ignition switch is not turned to the START position in approximately one second, a timer circuit in the Engine Control Assembly (ECA) will open the ground circuit to the fuel pump relay, causing the fuel pump relay contacts to OPEN. This action stops the power supply to the fuel pump. When the ignition switch is turned to the START position, the ECA closes the ground circuit to the fuel pump relay, resuming operation of the fuel pump. After the engine switch is returned to the ON position, power to the fuel pump is supplied through the fuel pump relay. The ECA monitors engine speed and OPENS the fuel pump relay ground circuit if the engine speed drops below 120 rpm.



Relay And Diagnostic Connectors



EEC-IV Power Relay Connector

Main Relay (Computer/Fuel System): Description and Operation

The Engine Control Assembly (ECA) receives its operating voltage from the Electronic Engine Control (EEC) power relay. When the ignition switch is turned ON, the normally OPEN contact points of the relay CLOSE and supply power to the ECA. The control coil circuit of the relay contains a diode, wired in series, to prevent relay operation if the battery polarity is reversed, preventing damage to the ECA.

ISSUE This TSB article is a diagnostic procedure to address vehicles that exhibit lean driveability symptoms and may or may not have any Diagnostic Trouble Codes (DTCs) stored in memory.

ACTION Follow the diagnostic procedures described in the following Service Tip. The revised diagnostic procedure is a more accurate means of diagnosing the symptoms.

SERVICE TIP

MASS AIR FLOW (MAF) DISCUSSION

MAF sensors can get contaminated from a variety of sources: dirt, oil, silicon, spider webs, potting compound from the sensor itself, etc. When a MAF sensor gets contaminated, it skews the transfer function such that the sensor over-estimates air flow at idle (causes the fuel system to go rich) and under-estimates air flow at high air flows (causes fuel system to go lean). This means Long Term Fuel Trims will learn lean (negative) corrections at idle and learn rich (positive) corrections at higher air flows.

If vehicle is driven at Wide Open Throttle (WOT) or high loads, the fuel system normally goes open loop rich to provide maximum power. If the MAF sensor is contaminated, the fuel system will actually be lean because of under-estimated air flow. During open loop fuel operation, the vehicle applies Long Term Fuel Trim corrections that have been learned during closed loop operation. These corrections are often lean corrections learned at lower air flows. This combination of under-estimated air flow and lean fuel trim corrections can result in spark knock/detonation and lack of power concerns at WOT and high loads.

One of the indicators for diagnosing this condition is barometric pressure. Barometric pressure (BARO) is inferred by the Powertrain Control Module (PCM) software at part throttle and WOT (there is no actual BARO sensor on MAF-equipped vehicles, except for the 3.8L Supercharged engine). At high air flows, a contaminated MAF sensor will under-estimate air flow coming into the engine, hence the PCM infers that the vehicle is operating at a higher altitude. The BARO reading is stored in Keep Alive Memory (KAM) after it is updated. Other indicators are Long Term Fuel Trim and MAF

voltage at idle.

NOTE

THE FOLLOWING PROCEDURE MAY ALSO BE USED TO DIAGNOSE VEHICLES THAT DO NOT HAVE FUEL SYSTEM/HO2S SENSOR DTCS.

Symptoms

^ Lack of Power

^ Spark Knock/Detonation

^ Buck/Jerk

^ Hesitation/Surge on Acceleration

^ Malfunction Indicator Lamp (MIL) Illuminated -

DTCs P0171, P0172, P0174, P0175 may be stored in memory

OBDII DTCs

^ P0171, P0174 (Fuel system lean, Bank 1 or 2)

^ P0172, P0175, (Fuel system rich, Bank 1 or 2)

^ P1130, P1131, P1132, (HO2S11 lack of switching, Bank 1)

^ P1150, P1151, P1152, (HO2S21 lack of switching, Bank 2)

OBDI DTCs

^ 181, 189 (Fuel system lean, Bank 1 or 2)

^ 179, 188 (Fuel system rich, Bank 1 or 2)

^ 171, 172, 173 (HO2S11 lack of switching, Bank 1)

^ 175, 176, 177 (HO2S21 lack of switching, Bank 2)

^ 184, 185 (MAF higher/lower than expected)

^ 186, 187 (Injector pulse width higher/lower than expected)

NOTE:

DO NOT DISCONNECT THE BATTERY. IT WILL ERASE KEEP ALIVE MEMORY AND RESET LONG TERM FUEL TRIM AND BARO TO THEIR STARTING/BASE VALUES. THE BARO PARAMETER IDENTIFICATION DISPLAY (PID) IS USED FOR THIS DIAGNOSTIC PROCEDURE. ALL OBDII APPLICATIONS HAVE THIS PID AVAILABLE. THERE ARE SOME OBDI VEHICLES THAT DO NOT HAVE THE BARO PID, FOR THESE VEHICLES OMIT THE BARO CHECK AND REFER ONLY TO STEPS 2, 3, AND 4 IN THE DIAGNOSTIC PROCEDURE.

BAROMETRIC PRESSURE REFERENCE

Barometric Pressure (in. Hg.)	Barometric Pressure (kPa)	BARO/MAP PID (Hz)	Altitude above sea level (ft)
3.5	11.8	89.3	
5	16.9	92.8	
10	33.8	104.6	
15	50.7	117.0	14,000
20	67.5	129.6	10,000
21	70.9	132.5	9,000
22	74.3	135.4	8,000
23	77.7	138.3	7,000
24	81.1	141.1	6,000
25	84.4	144.0	5,000
26	87.8	146.9	4,000
27	91.2	149.8	3,000
28	94.6	152.8	2,000
29	97.9	155.8	1,000
30	101.3	158.9	0 (sea level)
31	104.7	162.0	
31.875	107.7	164.7	

1. Look at the BARO PID. Refer to the Barometric Pressure Reference Chart in this article. At sea level, BARO should read about 159 Hz (29.91 in. Hg). As a reference, Denver, Colorado at 1524 meters (5000 ft.) altitude should be about 144 Hz (24.88 in.Hg). Normal learned BARO variability is up to +/- 6 Hz (+/- 2 in. Hg.). If BARO indicates a higher altitude than you are not at (7 or more Hz lower than expected), you may have MAF contamination. If available, Service Bay Diagnostic System (SBDS) has a Manifold Absolute Pressure (MAP) sensor that can be used as a barometric pressure reference. Use "MAP/BARO" test under "Powertrain," "Testers and Meters." Ignore the hookup screen. Connect GP2 to the reference MAP on the following screen.

NOTE

REMEMBER THAT MOST WEATHER SERVICES REPORT A LOCAL BAROMETRIC PRESSURE THAT HAS BEEN CORRECTED TO SEA LEVEL. THE BARO PID, ON THE OTHER HAND, REPORTS THE ACTUAL BAROMETRIC PRESSURE FOR THE ALTITUDE THE VEHICLE IS BEING OPERATED IN. LOCAL WEATHER CONDITIONS (HIGH AND LOW PRESSURE AREAS) WILL CHANGE THE LOCAL BAROMETRIC PRESSURE BY SEVERAL INCHES OF MERCURY (+/- 3 Hz, +/- 1 in. Hg.).

NOTE

BARO IS UPDATED ONLY WHEN THE VEHICLE IS AT HIGH THROTTLE OPENINGS. THEREFORE, A VEHICLE WHICH IS DRIVEN DOWN FROM A HIGHER ALTITUDE MAY NOT HAVE HAD AN OPPORTUNITY TO UPDATE THE BARO VALUE IN KAM. IF YOU ARE NOT CONFIDENT THAT BARO HAS BEEN UPDATED, PERFORM THREE OR FOUR HEAVY, SUSTAINED ACCELERATIONS AT GREATER THAN HALF-THROTTLE TO ALLOW BARO TO UPDATE.

2. On a fully warmed up engine, look at Long Term Fuel Trim at idle, in Neutral, A/C off, (LONGFT1 and/or LONGFT2 PIDs). If it is more negative than -12%, the fuel system has learned lean corrections which may be due to the MAF sensor over-estimating air flow at idle. Note that both Banks 1 and 2 will exhibit negative corrections for 2-bank system. If only one bank of a 2-bank system has negative corrections, the MAF sensor is probably not contaminated.

3. On a fully warmed up engine, look at MAF voltage at idle, in Neutral, A/C off (MAF V PID). If it's 30% greater than the nominal MAF V voltage listed in the Powertrain Control/Emissions Diagnosis (PC/ED) Diagnostic Value Reference Charts for your vehicle, or greater than 1.1 volts as a rough guide, the MAF sensor is over-estimating air flow at idle.

4. If at least tow of the previous three steps are true, proceed to disconnect the MAF sensor connector. This puts the vehicle into Failure Mode and Effects Management (FMEM). In FMEM mode, air flow is inferred by using rpm and throttle position instead of reading the MAF sensor. (In addition, the BARO value is reset to a base/unlearned value.) If the lean driveability symptoms go away, the MAF sensor is probably contaminated and should be replaced. If the lean driveability symptoms do not go away, go to the PC/ED Service Manual for the appropriate diagnostics.

NOTE

DUE TO INCREASINGLY STRINGENT EMISSION/OBDII REQUIREMENTS, IT IS POSSIBLE FOR SOME VEHICLES WITH MAF SENSOR CONTAMINATION TO SET FUEL SYSTEM DTCs AND ILLUMINATE THE MIL WITH NO DRIVEABILITY CONCERNS. DISCONNECTING THE MAF ON THESE VEHICLES WILL, THEREFORE, PRODUCE NO IMPROVEMENTS IN DRIVEABILITY. IN THESE CASES, IF THE BARO, LONGFT1, LONGFT2, AND MAF V PIDs INDICATE THAT THE MAF IS CONTAMINATED, PROCEED TO REPLACE THE MAF SENSOR.

After replacing the MAF sensor, disconnect the vehicle battery (5 minutes, minimum to reset KAM, or on newer vehicles, use the "KAM Reset" feature on the New Generation Star (NGS) Tester and verify that the lean driveability symptoms are gone.

ISSUE This TSB article is a diagnostic procedure to address vehicles that exhibit lean driveability symptoms and may or may not have any Diagnostic Trouble Codes (DTCs) stored in memory.

ACTION Follow the diagnostic procedures described in the following Service Tip. The revised diagnostic procedure is a more accurate means of diagnosing the symptoms.

SERVICE TIP

MASS AIR FLOW (MAF) DISCUSSION

MAF sensors can get contaminated from a variety of sources: dirt, oil, silicon, spider webs, potting compound from the sensor itself, etc. When a MAF sensor gets contaminated, it skews the transfer function such that the sensor over-estimates air flow at idle (causes the fuel system to go rich) and under-estimates air flow at high air flows (causes fuel system to go lean). This means Long Term Fuel Trims will learn lean (negative) corrections at idle and learn rich (positive) corrections at higher air flows.

If vehicle is driven at Wide Open Throttle (WOT) or high loads, the fuel system normally goes open loop rich to provide maximum power. If the MAF sensor is contaminated, the fuel system will actually be lean because of under-estimated air flow. During open loop fuel operation, the vehicle applies Long Term Fuel Trim corrections that have been learned during closed loop operation. These corrections are often lean corrections learned at lower air flows. This combination of under-estimated air flow and lean fuel trim corrections can result in spark knock/detonation and lack of power concerns at WOT and high loads.

One of the indicators for diagnosing this condition is barometric pressure. Barometric pressure (BARO) is inferred by the Powertrain Control Module (PCM) software at part throttle and WOT (there is no actual BARO sensor on MAF-equipped vehicles, except for the 3.8L Supercharged engine). At high air flows, a contaminated MAF sensor will under-estimate air flow coming into the engine, hence the PCM infers that the vehicle is operating at a higher altitude. The BARO reading is stored in Keep Alive Memory (KAM) after it is updated. Other indicators are Long Term Fuel Trim and MAF

voltage at idle.

NOTE

THE FOLLOWING PROCEDURE MAY ALSO BE USED TO DIAGNOSE VEHICLES THAT DO NOT HAVE FUEL SYSTEM/HO2S SENSOR DTCS.

Symptoms

^ Lack of Power

^ Spark Knock/Detonation

^ Buck/Jerk

^ Hesitation/Surge on Acceleration

^ Malfunction Indicator Lamp (MIL) Illuminated -

DTCs P0171, P0172, P0174, P0175 may be stored in memory

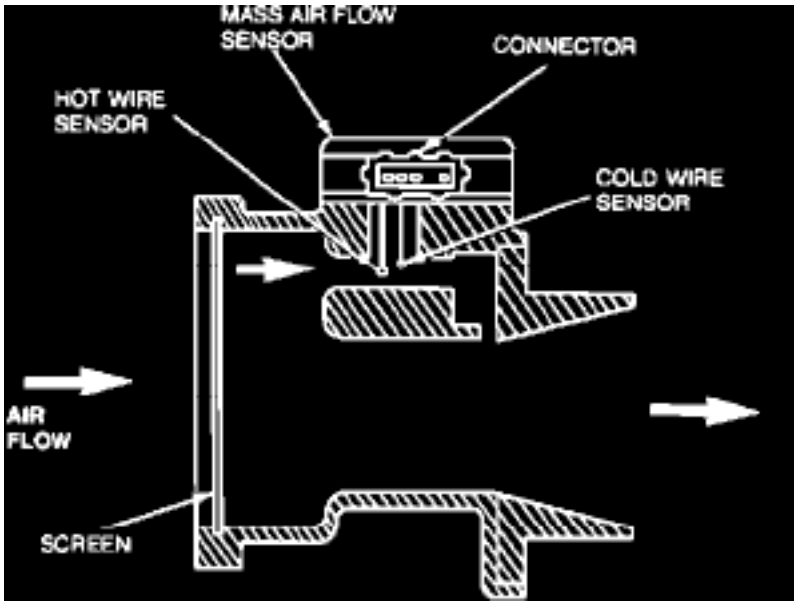
Mass Air Flow (MAF) Sensor



Mass Air Flow (MAF) Sensor: Description and Operation

Mass Air Flow Sensor

The Mass AirFlow (MAF) sensor, located between the air filter and the throttle body, is used to measure the mass of the air entering the engine due to volumetric displacement. The MAF sensor operates on the principle that if a mass is maintained at a constant temperature above the ambient environment, then the thermal loss is proportional to the mass flow of the cooling medium it is subjected to. The electronic module of the MAF sensor heats a wire element to 392°F (200°C) above ambient temperature. As air passes through the sensor, the air cools the wire element. The MAF sensor supplies more power to the wire to keep it at a constant temperature difference. When a drop in power useage occurs, the MAF sends a signal to the Engine Control Assembly (ECA) indicating the drop. The signal increases with the airflow into the engine.

Wire Color Code Identification

NOTE: Whenever a wire is labeled with two colors; the first color listed is the basic color of the wire, and the second color is the tracer marking of the wire. If the second color is followed by by a D, the tracer is dots. If the second color is followed by an H, the tracer is hash marks.

For example: BR/O is a brown wire with an orange stripe, R/Y D is a red wire with yellow dots and BK/W H is a black wire with white hash marks.

Fuel Pump Inertia Switch: Description and Operation

Typical Inertia Fuel Shut-Off Switch

The inertia switch is used to open the power circuit to the fuel pump, or the control circuit to the fuel pump relay, in case of an accident. The inertia switch must be manually reset by pushing the reset button located on top of the inertia switch.

Operation of the inertia switch is as follows:

A steel ball is held in place by a magnet. When a sharp impact occurs, the ball breaks loose from the magnet, rolls up a conical ramp and strikes a target plate, which opens the electrical contacts.

Fuel Pump Inertia Switch: Service and Repair

TO RESET SWITCH 1.

Turn ignition switch to OFF.

2. Check for leaking fuel in the engine compartment, fuel lines and tank(s).

3. If no fuel leak is apparent, reset the switch by pushing the reset button on the top of the switch.

4. Turn ignition switch to START for a few seconds, then to OFF.

5. Again, check for leaking fuel.

Ford Ranger 4wd Workshop Manual (V6-245 4.0L (1991))

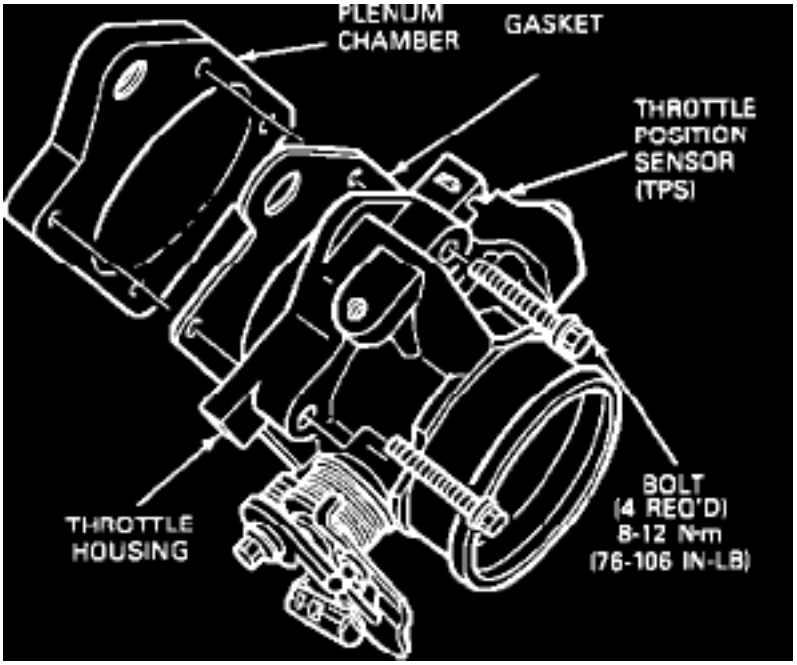
Throttle Position Sensor: Locations

Engine Compartment Components.

Top LH Front Of Engine

Applicable to: 4.0L/V6-244



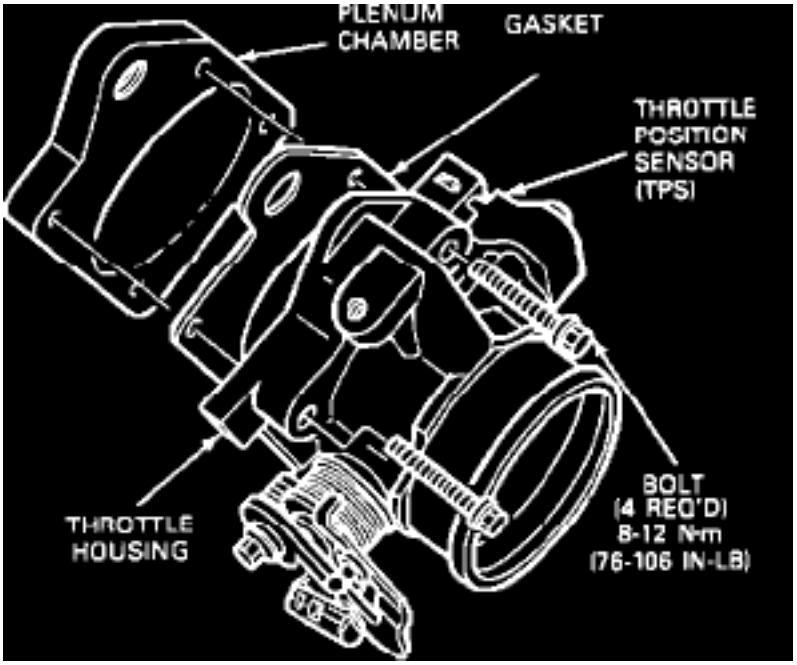
Throttle Position Sensor: Description and Operation

Throttle Body Assembly

The Throttle Position (TP) sensor, mounted on the throttle body, is a potentiometer that monitors throttle plate angle and sends a signal to the Engine Control Assembly (ECA). The TP sensor contains a pivot arm that moves along a curved resistor. One of the sensor leads supplies a five (5) volt reference signal (sent by the ECA) to the resistor. The second lead is used to ground the resistor. The third lead is for the voltage signal to the ECA. As the throttle plates move, the pivot arm moves along the curved resistor and receives a varying voltage signal. The ECA reads this signal and converts it into throttle plate angle. The voltage signal ranges from approximately one (1) volt at idle to approximately five (5) volts at wide open throttle. The TP sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

Throttle Position Sensor: Adjustments

The Throttle Position (TP) sensor is non-adjustable. If the voltage readings are out of range, the sensor must be replaced.



Throttle Position Sensor: Service and Repair

Throttle Body Assembly

1. Disconnect the Throttle Position (TP) sensor from the wiring harness.

2. If reinstalling the same TP sensor, mark the position of the TP sensor by scribing a mark on the sensor and throttle body.

3. Remove the TP sensor retaining screws, then remove the TP sensor and gasket.

4. Install a new gasket and the TP sensor, positioning the throttle position sensor so that the connector is facing rearward. Rotate the TP sensor clockwise to align the scribe mark (from step 2).

5. Install the TP sensor retaining screws, tightening to 11-16 lb. in. (1.2-1.8 N-m).

6. Connect the TP sensor electrical connector.

NOTE: The TP sensor is not adjustable.

Technical Service Bulletin # 91257 Date: 911213

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

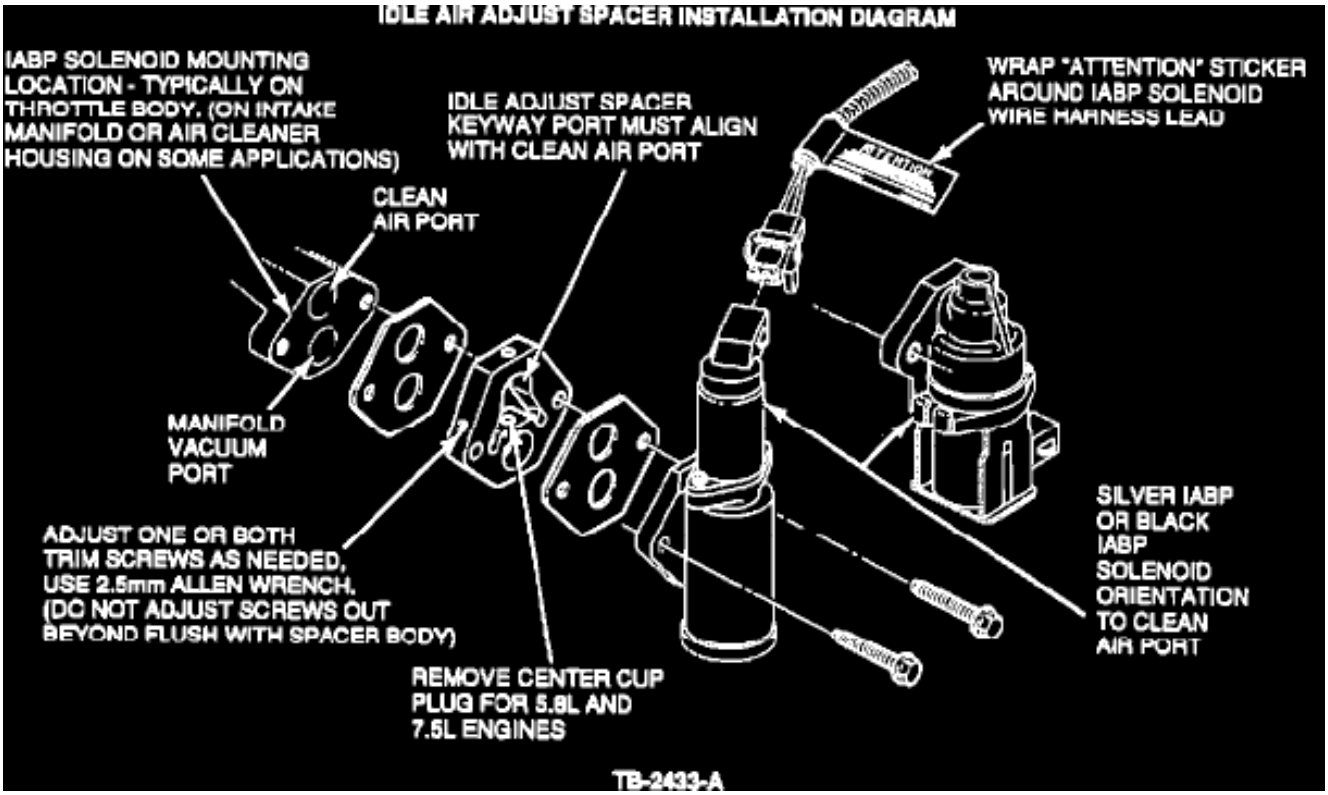
Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.

The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets



^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for

cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

Operation Description

WARRANTY STATUS: Eligible Under Warranty

Coverage As Stated In The Text Of This Article

OPERATION DESCRIPTION TIME

912507A Idle Air By-Pass Valve 0.5 Hr.

Cleaning - 1983-85 Escort, EXP, LN7, LYNX 1.6L EFI.

912507B Idle Air By-Pass Valve 0.5 Hr.

Cleaning - 1986-91 Escort 1.9L EFI, 1986/87 EXP, Lynx 1.9L EFI, 1991 Tracer 1.9L EFI.

912507C Idle Air By Pass Valve 0.5 Hr.

Cleaning - 1984-87 Mustang 2.3L T/C, 1986/87 Capri, Cougar 2.3L T/C, 1984-88 T-Bird 2.3L T/C, 1987/92 Mustang 2.3L EFI.

912507D Idle By-Pass Valve Cleaning 0.6 Hr.

- 1988-91 Tempo, Topaz 2.3L HSC, 1985-92 Ranger 2.3L EFI.

912507E Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1986/87 Aerostar 2.3L EFI, 1985 Bronco II 2.3L EFI.

912507F Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1986-90 Bronco II 2.9L EFI, 1986-92 Ranger 2.9L EFI.

912507G Idle Air By-Pass Valve 0.6 Hr.

Cleaning - 1991/92 Probe 3.0L EFI, 1986-91 Taurus 3.0L EFI, 1987-91 Sable 3.0L EFI.

912507H Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1986-91 Aerostar 3.0L EFI, 1991 Ranger 3.0L EFI.

912507I Idle Air By-Pass Valve 0.6 Hr.

Cleaning - 1988 Continental, Cougar, Taurus, T-Bird, Sable 3.8L EFI. 1988 Cougar, T-Bird 3.8L S/C.

912507J Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1990-92 Aerostar 4.0L EFI, 1990 Bronco II 4.0L EFI, 1991/92 Explorer 4.0L EFI, 1990-92 Ranger 4.0L EFI.

912507K Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1987-92 Bronco 4.9L EFI, 1987-92 F-Series 4.9L EFI, 1987/90 Econoline (Without Rear Heater) 4.9L EFI, 1991/92 Econoline (All) 4.9L EFI.

912507L Idle Air By-Pass Valve 0.6 Hr.

Cleaning - 1986-88 Cougar, T-Bird 5.0L EFI, 1986-87 Continental, Mark VII 5.OL EFI, 1986/91 Crn - Victoria, Grn - Marquis 5.0L EFI, 1986-92 Mark VII 5.0L HO, 1982-92 Mustang 5.0L HO.

912507M Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1985-92 Bronco, E-Series, F-Series 5.0L EFI.

912507N Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1988-90 Bronco, F-Series 5.8L. 1991 Econo, F-Series, Bronco 5.8L (Do not Clean Solenoid, Calib; 1-64E-R10, 1-64H-R10, 1-64J-R10, 1-64K-R10, 1-64M-R10, 1-64P-R10, 1-64R-R10, 1-75A-R00, 1-76A-R00, 1-76B-R00, 1-76C-R00.

912507O Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1991/92 F And B Series, 7.0L EFI.

912507P Idle Air By-Pass Valve 0.7 Hr.

Cleaning - 1987-92 E-Series, F-Series 7.5L EFI.

912507Q Throttle Body And Idle Air 0.9 Hr.

By-Pass Valve Cleaning - 1989/90 Probe 3.0L EFI.

912507R Throttle Body And Idle Air 0.8 Hr.

By-Pass Valve Cleaning - 1987-90 Econoline (With Rear Heat) 4.9L EFI.

912507S Throttle Body And Idle Air 0.9 Hr.

By-Pass Valve Cleaning - 1988-90 Econoline 5.8L EFI.

912507T Service Kit Install - All Cars 1.0 Hr.

And Light Trucks (Except Aerostar And Econoline) - Refer To The Service Procedure Application

Charts, For Vehicle Application.

912507U Service Kit Install - 1.2 Hr.

Aerostar, Econoline - Refer To Service Procedure Application Charts - For Vehicle Application.

Engine - Hard Cold Starts/Hesitation/Stalls On Start-Up

Article No. 91-25-7

12/13/91

^ HARD COLD START - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

^ HESITATION/STALLS - DURING INITIAL START-UP, IDLE OR DECEL - EFI ENGINES - SLUDGE IN THROTTLE BODY AND/OR IDLE AIR BY-PASS VALVE

FORD: 1983-87 EXP 1983-91 ESCORT 1984-90 MUSTANG, THUNDERBIRD 1986-90 TAURUS 1986-91 CROWN VICTORIA 1988-90 TEMPO

LINCOLN-MERCURY: 1983-85 LN7 1983-87 LYNX 1984-88 CAPRI 1984-90 COUGAR 1986-90 CONTINENTAL, MARK VII, SABLE 1986-91 GRAND MARQUIS, TOWN CAR 1988-90 TOPAZ 1991 TRACER

LIGHT TRUCK: 1985-90 BRONCO II, BRONCO 1985-91 ECONOLINE, F-150-350 SERIES 1985-92 RANGER 1986-91 AEROSTAR 1991 EXPLORER

ISSUE: Hard cold starts, hesitation and stalls on initial start-up or during idle or decel may be caused by sludge in the throttle body and/or idle by-pass valve. Sludge deposits or oil film on the throttle body bore and plate or the idle air by-pass valve may cause one or more of the following conditions.

^ Hard Cold Start

^ Stall On Initial Start-Up

^ Stall During Idle

^ Stall During Decel

^ Rough Idle

^ Rolling Idle

^ Hesitation During Acceleration

ACTION: A new idle air by-pass service kit (F2PZ-9F939-A) is now available for service use to correct sludge contamination concerns of the throttle bore and plate only. It eliminates the need to clean the majority of past model throttle body applications. Cleaning is not required on sludge tolerant throttle body designs released for 1991 and newer model years.

SERVICE KIT -9F939-

APPLICATION CHART — EFI PORT FUEL INJECTION ENGINES

MODEL YEAR	CAR APPLICATION	ENGINE
1983-85	ESCORT GT/LYNX, EXP/LN7	1.6L EFI
1986-87	ESCORT GT/LYNX, EXP	1.9L EFI
1988-90	ESCORT GT	1.9L EFI
1991	ESCORT/TRACER	1.9L EFI
1987-90	MUSTANG	2.3L EFI
1984-86	THUNDERBIRD/COUGAR, MUSTANG/CAPRI	2.3L TC
1988-90	TEMPO/TOPAZ	2.3L HO/HSC

TB-2432-A

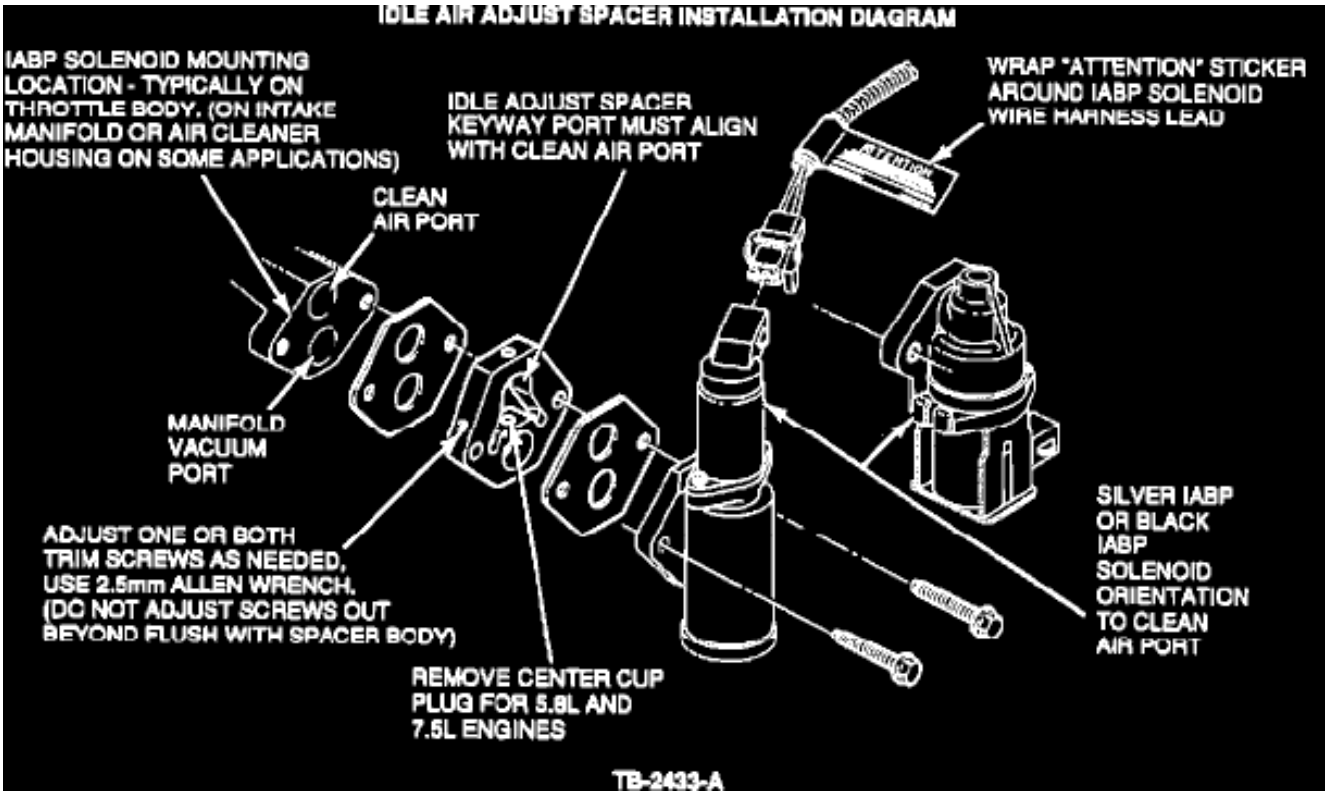
Figure 1

Install an idle air by-pass service kit (F2PZ-9F939-A) as applicable to provide a permanent correction for symptoms caused by throttle body sludge deposits. Refer to the instruction sheet included in the kit for installation details. Refer to Figure 1 for a specific application list of EFI (port fuel Injection) engines involved in this TSB article.

The idle air by-pass service kit (F2PZ-9F939-A) includes the following items.

^ One (1) Idle Adjust Spacer

^ Two (2) Gaskets



^ Two (2) Attaching Bolts

^ One (1) "Attention" Sticker

^ One (1) Instruction Sheet

Figure 2

Refer to Figure 2 for a pictorial of the kits components.

NOTE: EFFECTIVE WITH THIS TSB, THROTTLE BODY CLEANING IS NO LONGER COVERED UNDER 5/50 EMISSIONS WARRANTY,

UNLESS AS SPECIFIED IN THE FOLLOWING APPLICATION CHARTS. FAILURE TO FOLLOW THE CORRECT PROCEDURE MAY RESULT IN THE CLAIM BEING DISALLOWED.

The idle air adjust spacer incorporates sludge tolerant design features that eliminate throttle body sludge related conditions. Once installed, throttle body cleaning is not allowed and periodic adjustment of the throttle body is not required.

Procedures, Warranty and Labor

CHECKS TO MAKE PRIOR TO SERVICE KIT INSTALLATION

Confirm that the following items are not causing the idle quality concern before proceeding with the service kit installation.

^ Contamination within the idle air by-pass solenoid

^ Lack of fuel system control (excessively rich or lean)

^ Ignition timing change

^ Incorrect or malfunctioning EGR system

^ Incorrect or malfunctioning cooling system

^ Vacuum leaks (air intake manifold, vacuum hoses, vacuum reservoirs, power brake booster where applicable)

^ EEC diagnostics have been performed and vehicle malfunction indicated service output codes have been resolved and cleared.

If any of the areas listed above are found to be at fault, correct them before proceeding with the service kit installation.

Idle Speed Adjustment

WARNING: BEFORE PROCEEDING WITH THE IDLE SPEED ADJUSTMENT, VERIFY THAT THE FOLLOWING ITEMS ARE TAKEN CARE

OF PROPERLY.

^ The transmission is in PARK or Neutral.

^ The parking brake is applied.

^ The wheels are properly blocked.

^ The engine is at operating temperature.

^ The heater, A/C, cooling fan and other accessories are OFF.

Figure 5

The EFI throttle body idle speed adjustment procedures for the various model year passenger cars and light trucks are outlined in step-by-step procedures featured in Figures 3, 4 and 5. Select the appropriate procedure for the vehicle involved and adjust the throttle body idle RPM accordingly, after service kit installation.

TA-24428

THROTTLE BODY AND IDLE AIR BY-PASS SOLENOID SERVICE PROCEDURE

Detailed application charts for throttle body and idle air by-pass solenoid service procedures by engine VIN # /engine displacement/vehicle application and model year are shown in Figures 6 through 11. Refer to these charts to see if the service kit is to be installed and which service cleaning procedure, if any, is to be used.

SERVICE CLEANING PROCEDURES

The following items should be noted prior to beginning the service cleaning procedure.

^ Confirm that the correct service cleaning procedure is identified in the Application Charts, Figures 6-11, for the vehicle/engine combination being

serviced.

^ Do not clean throttle bodies identified to accept service kit (F2PZ-9F939-A), IDLE AIR ADJUST SPACER.

^ Use a 1" (25.4 mm) to 1-1/2" (38.1 mm) wire stemmed horse hair or nylon bottle cleaner type brush.

^ Use rubber gloves and eye protection.

^ Do not clean throttle bodies identified with a yellow/black "ATTENTION" label.

^ Do not clean "Black" plastic air by-pass valves. Refer to TSB 89-13-8 for service details.

^ Do not run vehicles with air flow meters when the air duct is removed.

^ Do not use carburetor cleaner as a cleaning solvent. Use Carburetor Tune-up Cleaner (D9AZ-19579-AA).

Procedure # 1

THROTTLE BODY AND IDLE AIR BY-PASS VALVE CLEANING

CAUTION: DO NOT RUN VEHICLES EQUIPPED WITH AIR FLOW METERS DURING THE CLEANING PROCEDURE. IF THERE IS A

YELLOW/BLACK "ATTENTION" LABEL ON THE THROTTLE BODY ADVISING NOT TO CLEAN, OR IF THE VEHICLE IS IDENTIFIED AS ACCEPTING SERVICE KIT (F2PZ-9F939-A), USE PROCEDURE # 2 FOR IDLE AIR BY-PASS VALVE CLEANING ONLY.

1. Plug the actuator into the connector in the Rotunda Cleaner/Tester, Tool 113-00009.

2. Remove the air duct to the throttle body inlet.

3. Disoonnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine. Do not start engines that have air flow meters.

6. Spray just enough Carburetor Tune-up Cleaner (D9AZ-19579-AA) into the throttle bore to wet the bore and throttle plate.

7. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

8. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

9. After a fifteen (15) minute soak, saturate the cleaning brush with solvent and scrub between the throttle body bore and plate while holding the throttle wide open.

NOTE: IT IS NECESSARY TO APPLY SOME PRESSURE ON THE BRUSH WHILE SCRUBBING.

10. Repeat saturating the brush and scrubbing for one (1) to two (2) minutes, making sure to reach into the corners where the throttle shaft meets the bore wall.

11. Start the actuator and the start the engine. Do not start engines that have air flow meters.

12. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute to wash away residue. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

13. Spray Carburetor Tune-up Cleaner into the idle by-pass valve passage leading to the inlet of the valve for up to one (1) minute. Do not spray for longer than six (6) continuous seconds on engines that have air flow meters and are not running.

14. Stop actuator and stop engine, if running.

NOTE: MAKE SURE THE THROTTLE PLATES OPERATE FREELY AND CLOSE PROPERLY.

15. Reinstall the air duct.

16. Start and run the engine for about one (1) minute to dry out the solvent residue.

17. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

18. Disconnect the actuator from the idle air by-pass valve.

19. Reattach the control signal lead to the air by-pass valve.

20. Check engine for normal operation. It may be necessary to reset the idle speed due to a previous adjustment for an idle concern. (Refer to the respective Powertrain/Emissions Diagnosis Service Manual, Throttle Body Section, for idle speed adjust procedure.)

Procedure # 2 Idle Air By-Pass Valve Cleaning Only

CAUTION: THIS CLEANING PROCEDURE MAY BE USED WITH SLUDGE TOLERANT THROTTLE BODIES WHICH ARE IDENTIFIED

WITH A YELLOW/BLACK "ATTENTION" LABEL AND THOSE USING SERVICE KIT (F2PZ-9F939-A). NO ATTEMPT SHOULD BE MADE TO CLEAN THROTTLE BODY BORE/PLATE AREA BY DIRECT SPRAYING OR SCRUBBING. DO NOT RUN VEHICLES WITH AIR FLOW METERS DURING CLEANING PROCEDURE.

1. Plug the actuator into the connector in the Rotunda Air By-Pass Valve Adapter 113-00009, or equivalent.

2. Remove the air duct to the throttle body inlet.

3. Disconnect the idle air by-pass valve signal lead.

4. Attach the actuator harness plug to the idle air by-pass valve.

5. Start the actuator and then start the engine.

NOTE: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

6. Spray the Carburetor Tune-up Cleaner for about five (5) seconds into the idle air by-pass valve inlet passage while the actuator is operating.

CAUTION: AVOID DIRECT SPRAYING ON THROTTLE PLATE/BORE AREA.

7. Stop the engine and actuator. Let everything soak for fifteen (15) minutes.

8. Start the actuator and the start the engine.

CAUTION: DO NOT START ENGINES THAT HAVE AIR FLOW METERS.

9. Spray Carburetor Tune-up Cleaner into the throttle bore for up to one (1) minute.

CAUTION: DO NOT SPRAY FOR LONGER THAN SIX (6) CONTINUOUS SECONDS ON ENGINES THAT HAVE AIR FLOW METERS AND

ARE NOT RUNNING.

10. Stop actuator and stop engine if running.

11. Reinstall the air duct.

12. Start and run the engine for about one (1) minute to dry out the solvent residue.

13. Operate the actuator to make sure the solvent is purged from the idle by-pass valve.

14. Disconnect the actuator from the idle air by-pass valve.

15. Reattach the control signal lead to the air by-pass valve.

16. Check engine for normal operation.

NOTE: IT SHOULD NOT BE NECESSARY TO RESET THE IDLE SPEED SINCE ONLY THE IDLE AIR BY-PASS VALVE WAS SERVICED IN THIS PROCEDURE

Warranty Coverage

Throttle bodies and idle air by-pass valves on all EFI (Port Fuel Injection) engines through the 1992 model year that can be cleaned (as identified in the application charts) are covered under 5/50 Emissions Warranty Coverage.

For those throttle bodies identified as having sludge tolerant designs or using service kit (F2PZ-9F939-A) where cleaning is not allowed per the application charts, the warranty claims for

cleaning will not be reimbursed even within the 12/12 warranty coverage period. Cleaning is not allowed. Service kit installation (single time) is covered under 5/50 emission warranty.

Labor Standards Operations

The labor operations shown in the following Operation/Description/Time columns are identified by procedure number and vehicle line. Specific engines for various vehicles are identified in the sludge cleaning procedure application charts. The throttle body cleaning operations with combinations and the air by-pass valve cleaning combinations will appear in future Labor Manuals under the following operation numbers.

^ 9926 B - Throttle body and idle air by-pass valve cleaning

^ 9926 B2 - Adjust idle speed

^ 9715 A - Air by-pass valve cleaning only

^ 9715 A1 - Adjust idle speed

Component Descriptions

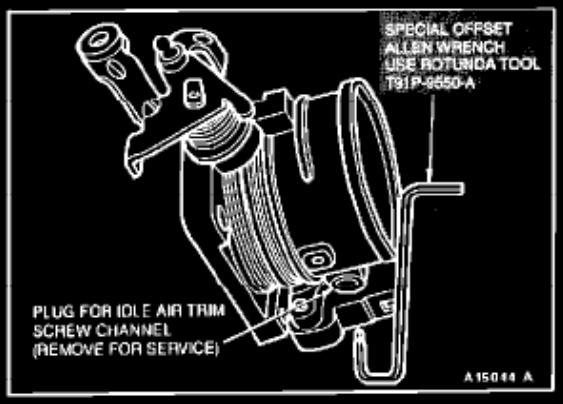

Figure 6

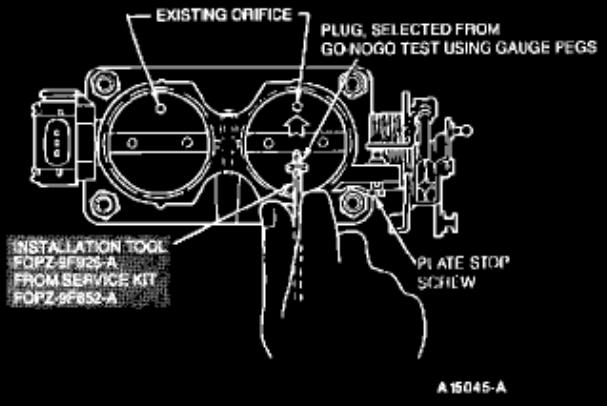

1. Remove air inlet tube(s) from throttle body.
2. Select the proper color plug by using the Go/NoGo gauge pegs included with the service kit FOPZ-9F652-A.
3. Starting with the largest diameter gauge peg, attempt to insert it through the throttle plate orifice.
4. If the gauge peg goes through the orifice, use the corresponding color plug.
   If it does not go through, proceed with the next smaller gauge peg for Go/NoGo Test.

NOTE: It is important that the largest Go/NoGo combination is used to determine the proper plug size.

5. If the smallest gauge peg does not go through the orifice, use the reamer bit and handle included with the service kit to enlarge the plate orifice. Wipe bearing grease on both sides of the plate orifice and on the reamer bit to hold the brass chips. After reaming, wipe the plate clean and then return to Step 3 to determine the proper plug size.
6. Using the installation tool from the service kit, push the plug into the orifice until bottoming out at the throttle plate.
7. Open and snap shut the throttle several times to verify proper plug retention.
8. Reconnect air inlet tube(s).
9. Reset idle rpm per engine requirement using the throttle plate stop screw.

Figure 7

Idle Airflow Adjust Procedure For All EFI and SEFI Systems

- Cooling system filled
- Engine at operating temperature
- Proper fuel pressure and no exhaust smoke
- Heater, A/C, and other accessories OFF
- Correct/clean PCV system if required
- Ignition timing set to specification
- EEC-IV diagnostics have been performed and vehicle malfunction indicated Service output codes have been resolved

Procedure

Choose procedure A, B, C or D from the table below for the engine being serviced. (The applications with self-test idle speed check provisions use procedure 'A' or 'C' and those without use procedure 'B' or 'D' depending on car or truck). An asterisk (*) below shows only applications without sludge tolerant throttle body design.

CAR

Procedure 'B' for Passenger Cars with No Self-Test Idle Speed Check Provisions

(USE ONLY STEPS MARKED 'X' FOR THE ENGINE BEING SERVICED)	1.9L SEFI	2.3L EFI HSC	2.3L EFI OHC	3.0L SHO	5.0L SEFI Grand Marquis Crown Victoria	5.0L HO Mustang Mark
1 Engine off, disconnect the negative (–) terminal of the battery for five minutes, then reconnect it.	X	X	X	X	X	X
2 Start engine and stabilize for two minutes,then goose engine and let it return to idle, lightly depress and release the accelerator and let engine idle. Does engine idle properly? **NOTE: If electric fan comes on wait until it turn itself off.**	X	X	X	X		
3 If engine does not idle properly proceed with this procedure.	X	X	X	X	X	X[1]
4 Unplug SPOUT line and verify ignition timing is base 12 deg BTDC (refer to decal).		X		X		
5 Remove PCV hose from intake manifold and plug it. Remove CAMP hose from intake manifold and connect Rotunda Tool T89P-9600-AH between PCV and CAMP ports.				X		
6 Remove PCV hose at the PCV valve and install .200 inch dia orifice (TOOL T86P-9600-A).		X				
7 Shut engine off and install a .025" feeler gauge between plate stop screw and throttle lever.						X
8 Disconnect the idle speed control air bypass solenoid.	X	X	X	X		
9 Start engine and run at rpm/time (no touch start).	2000/60 sec	2500/30 sec	1500/30 sec	Idle		Idle
10 Place automatic transmission in PARK, manual transmission in NEUTRAL.	Park	Drive	Park	Neutral	Park	Park
11 Engine off, back out throttle plate stop screw. Clear off the throttle lever pad.					X	
12 With a .010 in feeler gauge between the plate stop screw and throttle lever pad, turn the screw in until contact.					1 7/8 Turns	
13 Check idle rpm to the range using a tachometer.	600±150	A 950±150 M 1550±200	A 650±150 M600±150	800±30		675±50
A. If rpm is too low	X	X	X	X		X
a. Turn the plate stop screw to the value shown in Step 13 ±25 rpm (during engine break-in reduce the rpm by 100)	X			X		
b. Do not clean the throttle body, check for the plate orifice plug. If there is no plug, turn screw clockwise to the desired rpm. Rpm ±25, if there is plug from previous service, remove plug and then adjust screw in either direction as required. Screw must be in contact with the lever pad after adjustment.		X	X			X[2]
B. If rpm is too high	X	X	X	X		X
a. Turn the plate stop screw to the value shown in Step 13 ±25 rpm.	X			X		
b. Turn engine off.		X	X			X
c. Disconnect air cleaner hose		X	X			X
d. Block off the orifice in the throttle plate temporarily with tape. If the orifice already has a plug from previous service, go to Step f.		X	X			X
e. Restart the engine and check idle speed using a tachometer (mass air applications will require air cleaner hose to be to be reattached before rpm check. If engine stalled, crack open the plate with stop screw. Do not over adjust.		X	X			X
f. If rpm continues to be fast, perform test in Step 16. If TPS output code is within range, remove tape, go to Section 2 for other causes. If out of range, adjust screw for proper TPS code. Lever pad must in contact the screw. If rpm is still fast terminate this procedure and go to Section 2 for other possible causes.		X	X			
g. If rpm drops to value in Step 13 or below engine or engine stalls turn the engine off, disconnect air cleaner hose, remove the tape.		X	X			X
h. Install the plug with proper color code depending on orifice size — See Fig. 7 for installation procedure.		X	X			X
i. Reconnect the air cleaner hose — start the engine. Check idle rpm using a tachometer. Turn the plate stop screw clockwise (do not turn it counter-clockwise as this may cause the throttle plate to stick at idle) to the nominal rpm ±25 rpm shown in Step 13.		X	X			X
14 Remove the feeler gauge between plate stop screw and throttle lever.						X[2]
15 Shut engine off and disconnect battery for 5 minutes minimum.				X		X
16 Run KOEO Self-Test for proper TPS output code.		X	X			X

Engine Idle Adjustment Procedures - Revision

ENGINE/EMISSIONS DIAGNOSIS SHOP MANUAL - 1991 - SECTION 9 - IDLE ADJUST PROCEDURES REVISED FOR APPLICATIONS WITHOUT SLUDGE TOLERANT THROTTLE BODY Article No. 90-25B-2 FORD:

1991 PROBE

LIGHT TRUCK: 1991 AEROSTAR, EXPLORER, RANGER

ISSUE: The Idle Adjust Procedures in the 1991 Engine/Emissions Diagnosis Shop Manual have been revised to cover applications that do not have the sludge tolerant throttle body. These are 1991 Aerostar, Explorer, and Ranger trucks with 4.0L engines. The 3.0L Probe has a sludge tolerant throttle body.

ACTION: Refer to the pages following this TSB article for the revised procedures.

NOTE: A SLUDGE TOLERANT THROTTLE BODY IS IDENTIFIED BY A 91TF-AA PREFIX AND SUFFIX IN THE PART NUMBER.

OTHER APPLICABLE ARTICLES: None WARRANTY STATUS: INFORMATION ONLY

Component Descriptions

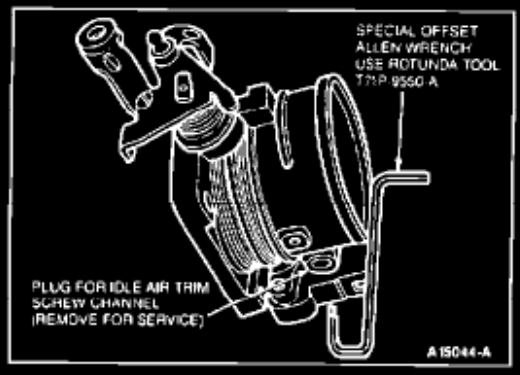

Figure 6

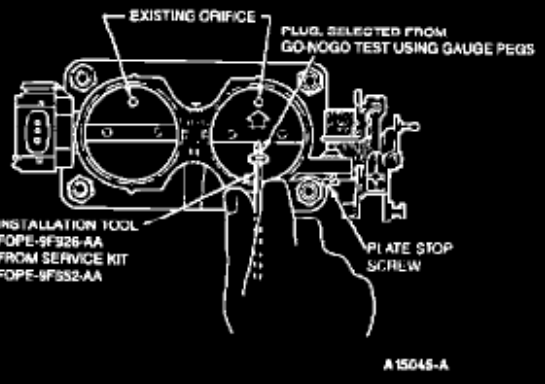

1. Remove air inlet tube(s) from throttle body.
2. Select the proper color plug by using the Go/NoGo gauge pegs included with the service kit FOPE-9F852-AA.
3. Starting with the largest diameter gauge peg, attempt to insert it through the throttle plate orifice.
4. If the gauge peg goes through the orifice, use the corresponding color plug.
   If it does not go through, proceed with the next smaller gauge peg for Go/NoGo Test.

NOTE: It is important that the largest Go/NoGo combination is used to determine the proper plug size.

5. If the smallest gauge peg does not go through the orifice, use the reamer bit and handle included with the service kit to enlarge the plate orifice. Wipe bearing grease on both sides of the plate orifice and on the reamer bit to hold the brass chips. After reaming, wipe the plate clean and then return to Step 3 to determine the proper plug size.
6. Using the installation tool from the service kit, push the plug into the orifice until bottoming out at the throttle plate.
7. Open and snap shut the throttle several times to verify proper plug retention.
8. Reconnect air inlet tube(s).
9. Reset idle rpm per engine requirement using the throttle plate stop screw.

Figure 7

Idle Airflow Adjust Procedure For All EFI and SEFI Systems

- Cooling system filled
- Engine at operating temperature
- Proper fuel pressure and no exhaust smoke
- Heater, A/C, and other accessories OFF
- Correct/clean PCV system if required
- Ignition timing set to specification
- EEC-IV diagnostics have been performed and vehicle malfunction indicated Service output codes have been resolved

Procedure

Choose procedure A, B, C or D from the table below for the engine being serviced. (The applications with self-test idle speed check provisions use procedure 'A' or 'C' and those without use procedure 'B' or 'D' depending on car or truck). An asterisk (*) below shows only applications without sludge tolerant throttle body design.

CAR			TRUCK		
ENGINE CID	VEHICLE LINES	PROCEDURE	ENGINE CID	VEHICLE LINES	PROCEDURE
1.9L SEFI *	All	B	2.3L EFI OHC	All	D
2.3L EFI HSC	All	B	2.9L EFI *	All	D

5.0L HO	Mustang, Mark VII	B	7.5L EFI - 1991 1/2	All	D

DELETION

2 - Procedure 'D' for 1991 except F-250 with 0-64K calibration and procedure C for 1991 E-250 with 0-64K calibration and for all 1991 1/2

3 - Sludge tolerant throttle body introduced 1991 1/2

See Fig. 4 for typical plate atop screw location referred to in the attached procedure.

See Fig. 5 and 6 for air trim screw location referred to in the attached procedure A.

See Fig. 7 for plug installation (in the plate orifice) procedure referred to in the attached procedures.

Procedure 'A' for Passenger Cars with Self-Test Idle Speed Check Provisions

DELETION

(USE ONLY STEPS MARKED 'X' FOR THE ENGINE BEING SERVICED)	2.5L	3.0L	3.8L	3.8L SC	4.6L 2V	5.0L HO THUNDERBIRD COUGAR
1 Activate engine running self-test	X	X	X	X	X	X
2 After Service Code 11 or 111 has been displayed, wait 4 seconds then quickly unlatch and within 4 seconds latch the STI button	X	X	X	X	X	X
3 A single pulse code indicates the entry mode, then observe the Self-Test Output (STO) of the STAR Tester in Item 4. If adjustment is required in Item 4, refer to possible causes listed in previous section and correct them as required and then continue with this procedure if necessary.	X	X	X	X	X	X
4 (A) Constant tone, solid light or "STO LO" readout means base idle rpm is within range. To exit test, unlatch STI button, then wait four seconds for reinitialization (after 10 minutes it will exit by itself).	X	X	X	X	X	X
(B) Beeping tone, flashing light, or "STO LO" readout at (8 Hz) indicates TP sensor is out of range due to over adjustment; adjustment may be required.	X	X	X	X	X	X
(C) Beeping tone, flashing light, or "STO LO" readout at (4 Hz) indicates base idle rpm is too fast, adjustment is required, go to Step 6.	X	X	X	X	X	X
(D) Beeping tone, flashing light, or "STO LO" readout at (1 Hz) indicates base idle rpm is too slow, adjustment is required, go to Step 5.	X	X	X	X	X	X
5 If rpm is too slow, follow applicable procedure for the engine being serviced.	X	X	X	X	X	X
A. Do not clean the throttle body, turn the air trim screw counter-clockwise until conditions in Step 4(A) are satisfied for air trim location. (See Figure 5 or 6).				X	X	X
B. Do not clean the throttle body. Check for the plate orifice plug. If there is no plug turn screw clockwise until conditions in Step 4(A) are satisfied. If there is a plug from previous service remove plug and then adjust screw in either direction as required. Screw must be in contact with the lever pad after adjustment.	X	X	X			
6 If rpm is too high, follow applicable procedure for the engine being serviced	X	X	X	X	X	X
A. Do not clean the throttle body, turn the air trim screw clockwise until conditions in Step 4(A) are satisfied for air trim screw location (see Figure 5 or 6).				X	X	X
B Turn engine OFF	X	X	X			
a. Block off the orifice in the throttle plate temporarily with tape. If the orifice already has a plug from previous service, go to Step (C)	X	X	X			
b. Restart the engine and check idle speed using Self-Test (mass air packages require air intake hose to be reattached first). If engine stalled, crack open the plate with plate stop screw. (Figure 4)	X	X	X			
c. If rpm continues to be fast, perform test in Step 7 if TPS output code is within range, remove tape, go to Section 2 for other causes. If out of range adjust screw for proper TPS code (lever pad must be in contact with screw after adjustment). If rpm is still fast, terminate this procedure and - go to Section 2 for other possible causes.	X	X	X			
d. However, if rpm drops to or below the desired level, as indicated by Self-Test Output tone, turn the engine off disconnect air cleaner hose, remove the tape.	X	X	X			
e. Install the plug with proper color code depending on throttle plate orifice size - see Fig. 7 for installation procedure.	X	X	X			
f. Reconnect the air cleaner hose - start the engine turn the plate stop screw clockwise (do not turn it counter-clockwise as this may cause the throttle plate to stick at idle) until conditions in Step 4A are satisfied.	X	X	X			
7 Run KOEO Self-Test for proper TPS output code.	X	X	X			
8 Verify the throttle is not stuck in the bore and linkage is not preventing throttle from closing.	X	X	X			
9 On automatic overdrive transmission (AOD) applications check TV pressure adjustment		X	X

i. Reconnect the air cleaner hose — start the engine. Check idle rpm using a tachometer. Turn the plate stop screw clockwise (do not turn it counter-clockwise as this may cause the throttle plate to stick at idle) to the nominal rpm ±25 rpm shown in Step 9.	X		X	X		X	X		X
10 Shut engine off and repeat Steps 7, 8 and 9 if necessary.	X	X	X	X	X				
11 Run KOEO Self Test for proper TPS output code.	X	X	X	X	X	X	X	X	X
12 Shut engine off and disconnect battery for 5 minutes minimum.	X	X	X	X	X	X	X		
13 Remove feeler gauge from throttle plate stop screw and throttle lever pad.						X	X		
14 Reconnect SPOUT line.	X					X	X		
15 Engine off (reconnect idle speed control-air bypass solenoid. Verify that the throttle is not stuck in the bore and linkage is not preventing throttle from closing.	X	X	X	X	X	X	X	X	X
16 Start engine and stabilize for two minutes, then goose engine and let it return to idle, lightly depress and release the accelerator. Let engine idle, if idle problem still exists go to Section 2 for other possible causes.	X	X	X	X	X	X 2/	X 2/	X	X
17 On Automatic Overdrive Transmission (AOD) applications, check TV pressure adjustment.						X			

NOTE 1: On 5.0L and 5.8L, only in Step 9. If you must turn the plate stop screw in, shut engine off, make estimated adjustment. Start engine, repeat Steps 7,8,9.

2/ In Step 16, engine rpm oscillation may be caused by the throttle plate open far enough to expose the canister purge ports. To verify this, disconnect purge port and plug. If the problem is resolved, close the throttle plate just enough to eliminate oscillations.

3/ For 1991 1/2 use procedure 'C'.

Engine Idle Adjustment Procedures - Revision

ENGINE/EMISSIONS DIAGNOSIS SHOP MANUAL - 1991 - SECTION 9 - IDLE ADJUST PROCEDURES REVISED FOR APPLICATIONS WITHOUT SLUDGE TOLERANT THROTTLE BODY Article No. 90-25B-2 FORD:

1991 PROBE

LIGHT TRUCK: 1991 AEROSTAR, EXPLORER, RANGER

ISSUE: The Idle Adjust Procedures in the 1991 Engine/Emissions Diagnosis Shop Manual have been revised to cover applications that do not have the sludge tolerant throttle body. These are 1991 Aerostar, Explorer, and Ranger trucks with 4.0L engines. The 3.0L Probe has a sludge tolerant throttle body.

ACTION: Refer to the pages following this TSB article for the revised procedures.

NOTE: A SLUDGE TOLERANT THROTTLE BODY IS IDENTIFIED BY A 91TF-AA PREFIX AND SUFFIX IN THE PART NUMBER.

OTHER APPLICABLE ARTICLES: None WARRANTY STATUS: INFORMATION ONLY

Component Descriptions

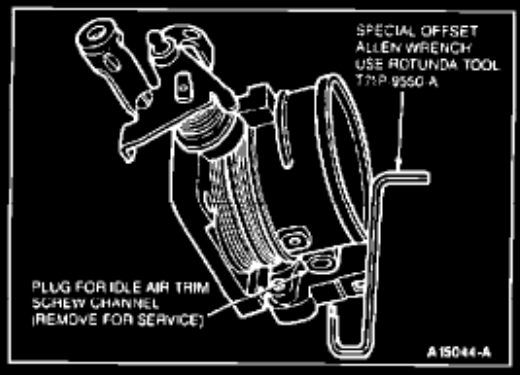

Figure 6

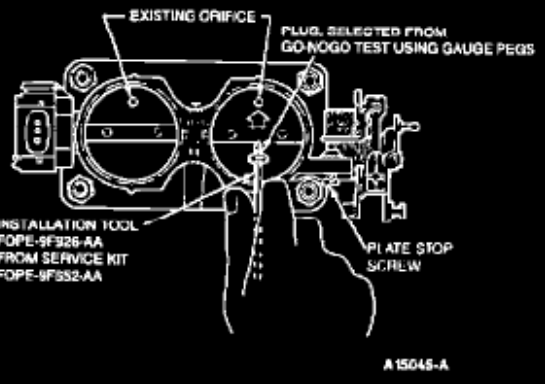

1. Remove air inlet tube(s) from throttle body.
2. Select the proper color plug by using the Go/NoGo gauge pegs included with the service kit FOPE-9F852-AA.
3. Starting with the largest diameter gauge peg, attempt to insert it through the throttle plate orifice.
4. If the gauge peg goes through the orifice, use the corresponding color plug.
   If it does not go through, proceed with the next smaller gauge peg for Go/NoGo Test.

NOTE: It is important that the largest Go/NoGo combination is used to determine the proper plug size.

5. If the smallest gauge peg does not go through the orifice, use the reamer bit and handle included with the service kit to enlarge the plate orifice. Wipe bearing grease on both sides of the plate orifice and on the reamer bit to hold the brass chips. After reaming, wipe the plate clean and then return to Step 3 to determine the proper plug size.
6. Using the installation tool from the service kit, push the plug into the orifice until bottoming out at the throttle plate.
7. Open and snap shut the throttle several times to verify proper plug retention.
8. Reconnect air inlet tube(s).
9. Reset idle rpm per engine requirement using the throttle plate stop screw.

Procedure 'A' for Passenger Cars with Self-Test Idle Speed Check Provisions

DELETION

(USE ONLY STEPS MARKED 'X' FOR THE ENGINE BEING SERVICED)	2.5L	3.0L	3.8L	3.8L SC	4.6L 2V	5.0L HO THUNDERBIRD COUGAR
1 Activate engine running self-test	X	X	X	X	X	X
2 After Service Code 11 or 111 has been displayed, wait 4 seconds then quickly unlatch and within 4 seconds latch the STI button	X	X	X	X	X	X
3 A single pulse code indicates the entry mode, then observe the Self-Test Output (STO) of the STAR Tester in Item 4. If adjustment is required in Item 4, refer to possible causes listed in previous section and correct them as required and then continue with this procedure if necessary.	X	X	X	X	X	X
4 (A) Constant tone, solid light or "STO LO" readout means base idle rpm is within range. To exit test, unlatch STI button, then wait four seconds for reinitialization (after 10 minutes it will exit by itself).	X	X	X	X	X	X
(B) Beeping tone, flashing light, or "STO LO" readout at (8 Hz) indicates TP sensor is out of range due to over adjustment; adjustment may be required.	X	X	X	X	X	X
(C) Beeping tone, flashing light, or "STO LO" readout at (4 Hz) indicates base idle rpm is too fast, adjustment is required, go to Step 6.	X	X	X	X	X	X
(D) Beeping tone, flashing light, or "STO LO" readout at (1 Hz) indicates base idle rpm is too slow, adjustment is required, go to Step 5.	X	X	X	X	X	X
5 If rpm is too slow, follow applicable procedure for the engine being serviced.	X	X	X	X	X	X
A. Do not clean the throttle body, turn the air trim screw counter-clockwise until conditions in Step 4(A) are satisfied for air trim location. (See Figure 5 or 6).				X	X	X
B. Do not clean the throttle body. Check for the plate orifice plug. If there is no plug turn screw clockwise until conditions in Step 4(A) are satisfied. If there is a plug from previous service remove plug and then adjust screw in either direction as required. Screw must be in contact with the lever pad after adjustment.	X	X	X			
6 If rpm is too high, follow applicable procedure for the engine being serviced	X	X	X	X	X	X
A. Do not clean the throttle body, turn the air trim screw clockwise until conditions in Step 4(A) are satisfied for air trim screw location (see Figure 5 or 6).				X	X	X
B Turn engine OFF	X	X	X			
a. Block off the orifice in the throttle plate temporarily with tape. If the orifice already has a plug from previous service, go to Step (C)	X	X	X			
b. Restart the engine and check idle speed using Self-Test (mass air packages require air intake hose to be reattached first). If engine stalled, crack open the plate with plate stop screw. (Figure 4)	X	X	X			
c. If rpm continues to be fast, perform test in Step 7 if TPS output code is within range, remove tape, go to Section 2 for other causes. If out of range adjust screw for proper TPS code (lever pad must be in contact with screw after adjustment). If rpm is still fast, terminate this procedure and - go to Section 2 for other possible causes.	X	X	X			
d. However, if rpm drops to or below the desired level, as indicated by Self-Test Output tone, turn the engine off disconnect air cleaner hose, remove the tape.	X	X	X			
e. Install the plug with proper color code depending on throttle plate orifice size - see Fig. 7 for installation procedure.	X	X	X			
f. Reconnect the air cleaner hose - start the engine turn the plate stop screw clockwise (do not turn it counter-clockwise as this may cause the throttle plate to stick at idle) until conditions in Step 4A are satisfied.	X	X	X			
7 Run KOEO Self-Test for proper TPS output code.	X	X	X			
8 Verify the throttle is not stuck in the bore and linkage is not preventing throttle from closing.	X	X	X			
9 On automatic overdrive transmission (AOD) applications check TV pressure adjustment		X	X

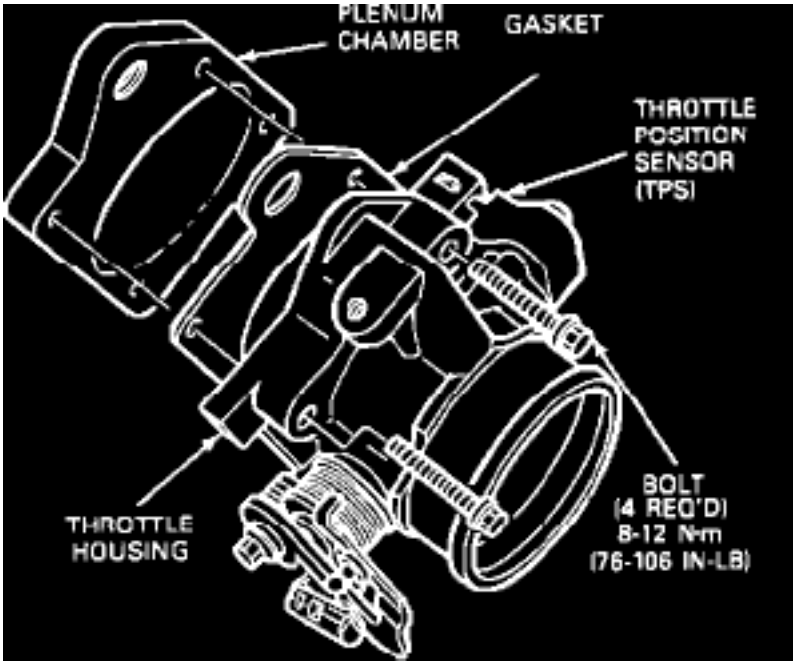
11 Run KOEO Self Test for proper TPS output code.	X	X	X	X	X	X	X	X	X
12 Shut engine off and disconnect battery for 5 minutes minimum.	X	X	X	X	X	X	X		
13 Remove feeler gauge from throttle plate stop screw and throttle lever pad.						X	X		
14 Reconnect SPOUT line.	X					X	X		
15 Engine off (reconnect idle speed control--air bypass solenoid. Verify that the throttle is not stuck in the bore and linkage is not preventing throttle from closing.	X	X	X	X	X	X	X	X	X
16 Start engine and stabilize for two minutes, then goose engine and let it return to idle, lightly depress and release the accelerator. Let engine idle, if idle problem still exists go to Section 2 for other possible causes.	X	X	X	X	X	X 2/	X 2/	X	X
17 On Automatic Overdrive Transmission (AOD) applications, check TV pressure adjustment.						X			

NOTE 1: On 5.0L and 5.8L, only in Step 9. If you must turn the plate stop screw in, shut engine off, make estimated adjustment. Start engine, repeat Steps 7,8,9.

2/ In Step 16, engine rpm oscillation may be caused by the throttle plate open far enough to expose the canister purge ports. To verify this, disconnect purge port and plug. If the problem is resolved, close the throttle plate just enough to eliminate oscillations.

3/ For 1991 1/2 use procedure 'C'.

Revised 12/90



Throttle Body: Description and Operation

Throttle Body Assembly

The air intake throttle body assembly controls airflow to the engine through a single butterfly-type valve. The throttle position is controlled by a conventional cable through throttle linkage. The body is a single-piece die casting made of aluminum. It has a single bore with an air bypass channel around the throttle plate. This bypass channel provides engine idle control as regulated by an air bypass valve assembly mounted directly to the throttle body. The valve assembly is an electro-mechanical device controlled by the EEC-IV computer. It incorporates a linear actuator which positions a variable area metering valve. Other features of the air intake throttle body assembly include: a.

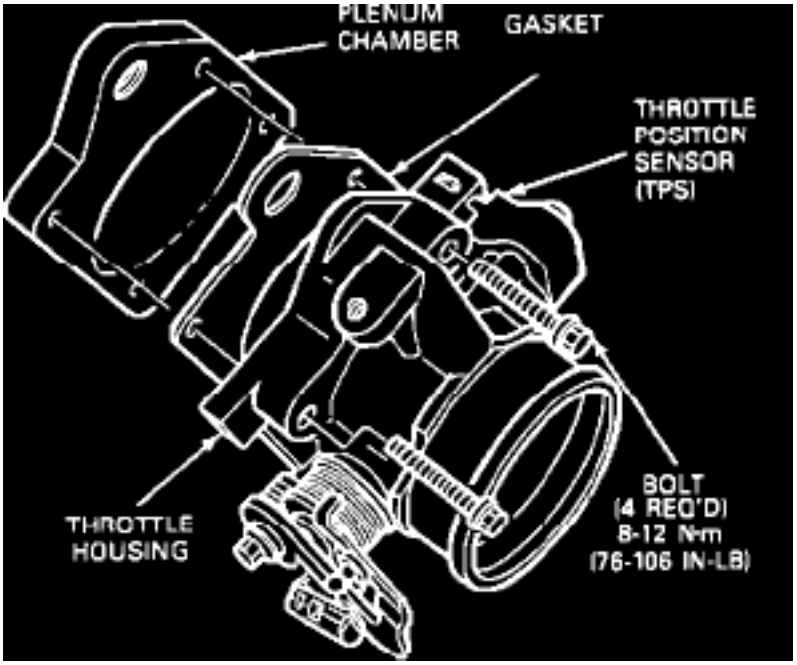
An adjustment screw to set the throttle plate at idle position. This screw is pre-set at the factory.

b. A pre-set stop to locate the WOT position.

c. A throttle body mounted throttle position sensor.

d. Provision for EGR valve and sensor mounting.

e. Individual vacuum taps (as required) for PCV, EVAP and vacuum sensing EEC sensors and controls.



Throttle Body: Service and Repair

Throttle Body Assembly

INSTALLATION

1. Ensure that both throttle body and upper intake manifold gasket surfaces are clean.

NOTE: If scraping is necessary, be careful not to damage gasket surfaces of throttle body and upper manifold assemblies, or allow material to drop into

manifold.

2. Install throttle body gasket on two screws installed in the throttle body.

3. Install throttle body to upper intake manifold. See procedure in the section.

4. Secure throttle body assembly to upper intake manifold with two remaining screws. Refer to SPECIFICATIONS.

5. Connect throttle position sensor electrical connector.

6. Connect canister purge hose to fitting beneath throttle body.

7. Install the snow/ice shield.

ACCELERATOR PEDAL AND THROTTLE BODY DIAGNOSIS PROCEDURE		
CONDITION	**POSSIBLE SOURCE**	**ACTION**
Accelerator pedal is hard to push down or it feels rough, raspy and/or sticky.	•Full pedal travel to WOT is restricted.	Go to Test A.
	•Worn or damaged cable.	Go to Test C.
	•Restricted pedal operation.	Adjust carpet, mat or wiring as required.
High engine idle speed.	•Cable ball socket extends beyond the throttle lever ball stud.	Refer to the throttle body diagnosis procedure in the appropriate section of the Powertrain Control/Emission Control Diagnosis Manual.
	•Restricted pedal operation.	Adjust carpet, mat or wiring as required.
	•Worn or damaged cable.	Go to Test C.

TEST A		
PROCEDURE	**RESULT**	**ACTION**
Disconnect the cable from the throttle body. Make sure the disconnected end of the cable does not come in contact with any of the surrounding parts. Operate the pedal by hand. Is full travel of the pedal to WOT restricted?	Yes No	Adjust insulator or trim items as required. Go to Test B.

Throttle Cable/Linkage: Technical Service Bulletins Accelerator Cable - Service Procedures/Tips

Article No. 94-15-16

07/27/94

^ ACCELERATOR CABLE - NEW SERVICE PROCEDURES - SERVICE TIPS

^ ACCELERATOR CABLE - SERVICE TIPS - REVISED DIAGNOSTIC PROCEDURES

LIGHT TRUCK: 1989-94 AEROSTAR, BRONCO, ECONOLINE, F-150-350 SERIES, RANGER 1991-94 EXPLORER

ISSUE: Some Accelerator Cables are being replaced without an accurate check for cable wear or damage. Some cables may be replaced unnecessarily.

ACEELERATOR PEDAL AND THROTTLE BODY DIAGNOSIS

TEST A

TEST B		
PROCEDURE	**RESULT**	**ACTION**
Cable end should remain disconnected from the throttle body.	Yes	Refer to the throttle body diagnosis procedure in the appropriate section in the Powertrain Control/Emission Diagnosis Manual.
Operate the pedal by foot. Is the pedal operation smooth?	No	Check the foot pedal assembly for free operation or check for worn or damaged cable by following Test C.

TEST C (ALL VEHICLES EXCEPT WINDSTAR)		
PROCEDURE	**RESULT**	**ACTION**
Disconnect the cable end from the ball stud at the throttle body.	Yes	If yes to any of the questions, replace the cable as required. Refer to the appropriate Service Manual for removal and installation procedures.
Make sure the disconnected end of the cable does not come in contact with any of the surrounding parts. From inside the vehicle, pull the cable wire through its entire travel. Does it feel rough, sticky or restricted?	No	If no to all of the questions, the cable is functioning properly. Refer to the appropriate section of the Powertrain Control/Emission Diagnosis Manual for throttle body diagnosis procedures and adjustments or adjust carpet as required.
When you let go of the wire after pulling on it, does the wire stick or hesitate to return to its original position? Compress the spring at the throttle body end of the cable. Does the spring stick or fail to return to its original position at a rapid rate when released?		

TEST B

TEST C (EXCEPT WINDSTAR)

TEST C (WINDSTAR ONLY)		
PROCEDURE	**RESULT**	**ACTION**
Disconnect the cable from the cam at the throttle body. Make sure the disconnected end of the cable does not come in contact with any of the surrounding parts.	Yes	If yes to any question, replace the cable as required. Refer to the 1995 Windstar Service Manual for removal and installation procedures.
Is the wire kinked, frayed or damaged? Pull the cable wire through its entire travel from the dash panel end and then from the throttle body end. Does it feel sticky, rough or restricted?	No	If no to all questions, the cable is functioning properly. Refer to the throttle body diagnosis procedures in the appropriate section of the Powertrain Control/Emission Diagnosis Manual or adjust carpet as required.

TEST C (WINDSTAR)

ACTION: Refer to the Diagnostic Charts for the proper service procedure if an Accelerator Cable concern is suspected.

Follow the instructions carefully, and do not replace the accelerator cable before it is examined and determined to be worn or damaged.

NOTE:

ACCELERATOR CABLE SHOULD NOT BE LUBRICATED AND IS NOT SERVICEABLE.

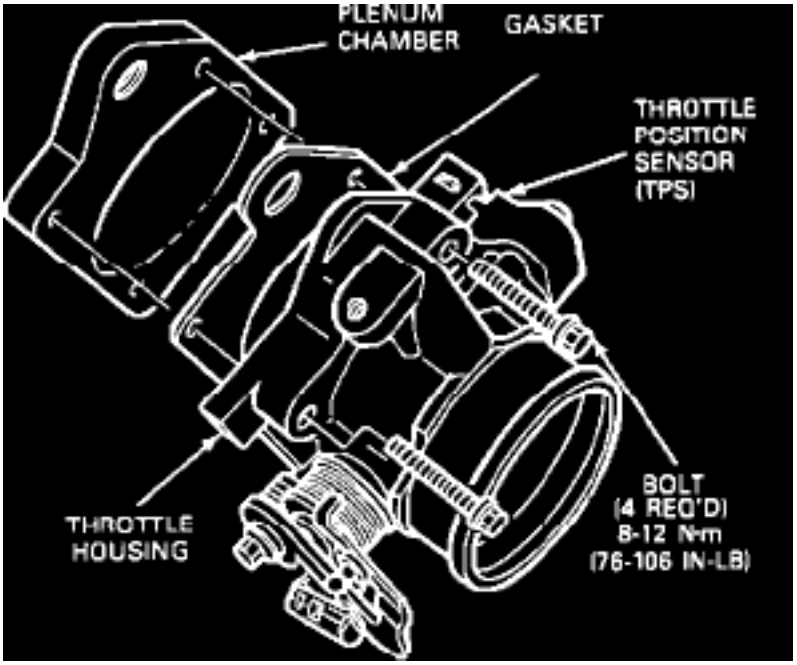
Throttle Position Sensor: Locations

Engine Compartment Components.

Top LH Front Of Engine

Applicable to: 4.0L/V6-244



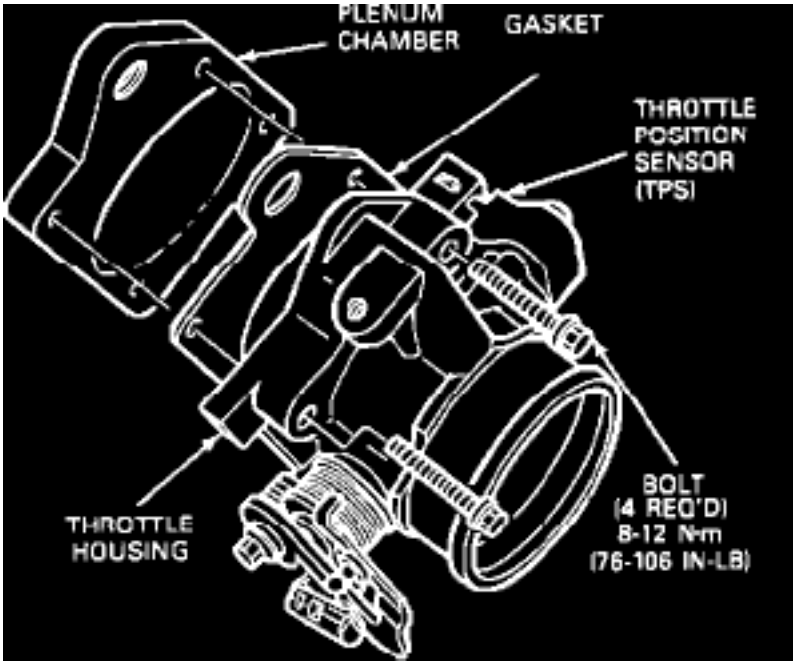
Throttle Position Sensor: Description and Operation

Throttle Body Assembly

The Throttle Position (TP) sensor, mounted on the throttle body, is a potentiometer that monitors throttle plate angle and sends a signal to the Engine Control Assembly (ECA). The TP sensor contains a pivot arm that moves along a curved resistor. One of the sensor leads supplies a five (5) volt reference signal (sent by the ECA) to the resistor. The second lead is used to ground the resistor. The third lead is for the voltage signal to the ECA. As the throttle plates move, the pivot arm moves along the curved resistor and receives a varying voltage signal. The ECA reads this signal and converts it into throttle plate angle. The voltage signal ranges from approximately one (1) volt at idle to approximately five (5) volts at wide open throttle. The TP sensor will also set a fault code when the ECA determines the output signal to be out of the normal operating range.

Throttle Position Sensor: Adjustments

The Throttle Position (TP) sensor is non-adjustable. If the voltage readings are out of range, the sensor must be replaced.



Throttle Position Sensor: Service and Repair

Throttle Body Assembly

1. Disconnect the Throttle Position (TP) sensor from the wiring harness.

2. If reinstalling the same TP sensor, mark the position of the TP sensor by scribing a mark on the sensor and throttle body.

3. Remove the TP sensor retaining screws, then remove the TP sensor and gasket.

4. Install a new gasket and the TP sensor, positioning the throttle position sensor so that the connector is facing rearward. Rotate the TP sensor clockwise to align the scribe mark (from step 2).

5. Install the TP sensor retaining screws, tightening to 11-16 lb. in. (1.2-1.8 N-m).

6. Connect the TP sensor electrical connector.

NOTE: The TP sensor is not adjustable.

Octane Adjust	Pinpoint Test	KP

Note

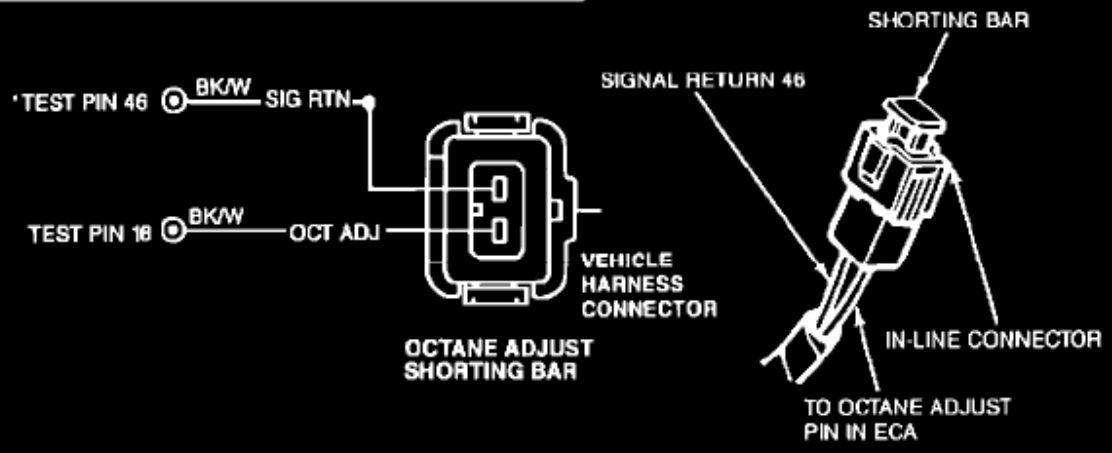
You should enter this Pinpoint Test only when directed here from Quick Test Step 7.0.

Remember

This Pinpoint Test is intended to diagnose only the following:

- Harness circuits: Signal Return, Octane Adjust
- Octane shorting bar connector

Pinpoint Test Schematic



OCTANE ADJUST SHORTING BAR LOCATIONS

APPLICATION	LOCATION
2.3L EFI Truck	Passenger side of fender apron, taped to the self-test connector.
3.0L SEFI SHO	Driver side of engine, tie wrapped to a bracket above the transmission.
3.8L SEFI SC	Passenger side of engine between shock tower mount and firewall next to self-test connector.

*TEST PINS LOCATED ON BREAKOUT BOX.
ALL HARNESS CONNECTORS VIEWED INTO MATING SURFACE.

A9686-D

NOTE: Use a higher octane grade of fuel to address the spark knock concern.
DO NOT remove the Octane Adjust shorting bar unless you have been directed by an application specific Technical Service Bulletin.

DELETION

Revised 5/91

Octane Adjust	Pinpoint Test	KP

TEST STEP	RESULT ▶	ACTION TO TAKE
KP1 VISUALLY INSPECT OCTANE ADJUST IN-LINE CONNECTOR SERVICE CODE 57/341		
Service Code 57/341 indicates Octane Adjust shorting bar is not in or the OCT ADJ circuit is open. • Key off. • Visually inspect Octane Adjust in-line connector. • **Is the shorting bar removed?**	Yes ▶	GO to KP2.
	No ▶	GO to KP4.
KP2 CHECK FOR MODIFICATION DECAL		
• Is there a modification decal attached to the vehicle indicating that the Octane Adjust shorting bar was removed?	Yes ▶	Testing complete. If vehicle has spark knock concern, GO to Section 2.
	No ▶	GO to KP3.
KP3 CHECK FOR SERVICE CODE 57/341		
• Replace Octane Adjust shorting bar. • Key off. • Activate self-test. • **Is service code 57/341 present?**	Yes ▶	GO to KP4.
	No ▶	Testing complete. EEC system OK.
KP4 CHECK CONTINUITY OF OCTANE ADJUST CIRCUIT		
NOTE: There should be continuity from OCT ADJ circuit thru the in-line connector and shorting bar to SIG RTN circuit. • Key off. • Disconnect processor 60 pin connector. Inspect for damaged or pushed out pins, corrosion, loose wires, etc. Service as necessary. • Install breakout box, leave processor disconnected • Measure resistance between Test Pin 46 and OCT ADJ Test Pin at the breakout box (see schematic for appropriate OCT ADJ circuit test pin). • **Is the resistance less than 5 ohms?**	Yes ▶	REPLACE processor. REMOVE breakout box. RERUN Quick Test.
	No ▶	SERVICE open OCT ADJ circuit or shorting bar or SIG RTN circuit. REMOVE breakout box. RERUN Quick Test.

Revised 5/91

Octane Adjust

Pinpoint Test **KP**

TEST STEP	RESULT ▶	ACTION TO TAKE
KP5 CHECK FOR SERVICE CODE 11 • Start engine and idle vehicle at operating temperature. • Key off. • Activate self-test. • Key on, engine off. • **Is service code 11 or 111 present?**	Yes ▶ No ▶	GO to KP6. **For service code 57/341:** GO to KP1. **For all other codes:** RETURN to Quick Test.
KP6 VERIFY IN-LINE CONNECTOR SHORTING BAR IS INSTALLED • Key off. • Visually inspect Octane Adjust in-line connector. • **Is shorting bar installed?**	Yes ▶ No ▶	GO to KP8. GO to KP7.
KP7 CHECK FOR MODIFICATION DECAL • Is there a modification decal attached to the vehicle indicating that the Octane Adjust shorting bar was removed?	Yes ▶ No ▶	GO to KP10. REPLACE shorting bar. GO to Section 2 to address spark knock concern.
KP8 CHECK FOR TSB • Is there a Technical Service Bulletin (TSB) authorizing the removal of the Octane Adjust shorting bar?	Yes ▶ No ▶	GO to KP9. GO to Section 2 to address spark knock concern.
KP9 REMOVE SHORTING BAR • Remove shorting bar only if there is a TSB authorization. • Drive vehicle to verify spark knock. • **Is spark knock present?**	Yes ▶ No ▶	GO to KP10. Testing complete. EEC system OK.

Revised 5/91

Octane Adjust

Pinpoint Test **KP**

TEST STEP	RESULT	ACTION TO TAKE
KP10 CHECK OCTANE ADJUST CIRCUIT FOR A SHORT TO GROUND • Key off. • Breakout box installed, processor disconnected. • Measure resistance between OCT ADJ circuit at the in-line connector and Test Pin 40/60 at the breakout box. • **Is each resistance greater than 10,000 ohms?**	Yes ▶	GO to **KP11**.
	No ▶	SERVICE short circuit. REMOVE breakout box. If spark knock is still present, GO to Section 2.
KP11 CHECK PROCESSOR INTEGRITY • Key off. • Shorting bar removed because of TSB authorization. • Breakout box installed, processor connected. • Key on. • Measure voltage between Octane Adjust circuit and Test Pin 40/60 at the breakout box. • **Is voltage greater than 4.0 volts?**	Yes ▶	REMOVE breakout box. If spark knoock is still present, GO to Section 2.
	No ▶	REPLACE processor. REMOVE breakout box. If spark knock is still present, GO to Section 2.

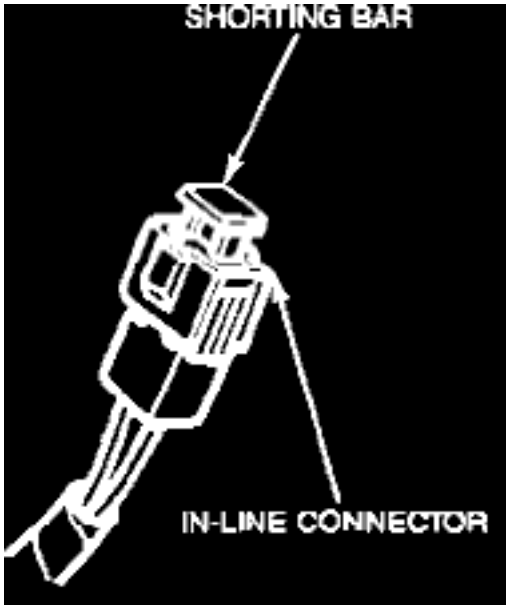
Ignition Timing Connector: Locations

Component Location

The SPOUT connector (SAW check connector C127) is located at the RH front of the engine compartment in front of the battery.



Ignition Timing Connector: Description and Operation

In-line Connector With Shorting Bar

The octane adjustment switch is used to retard the ignition timing three to four degrees. When the switch jumper is INSTALLED, the timing is normal. With the jumper REMOVED, the timing is retarded. This is done to allow for optimum spark advance for effective combustion of the air/fuel mixture.

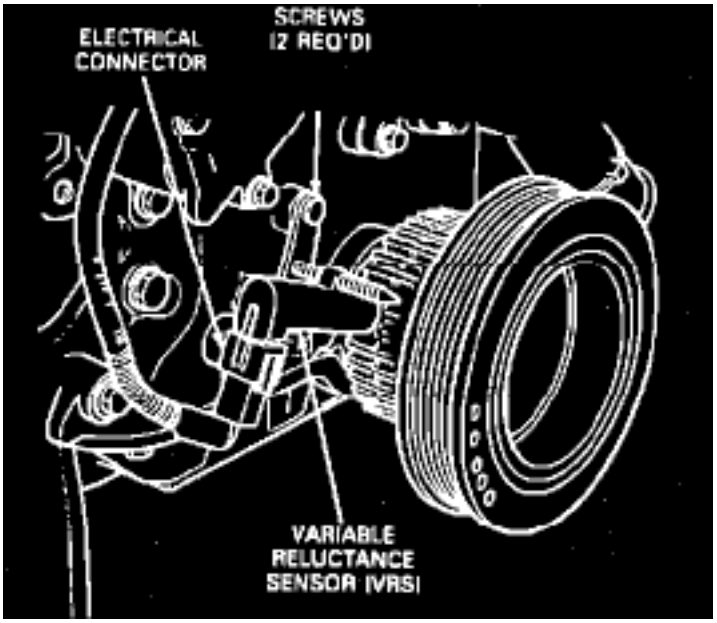
Crankshaft Position Sensor: Description and Operation

Crankshaft Timing Sensor

The crankshaft timing sensor is a variable reluctance type sensor. It is triggered by a 35 tooth trigger wheel tooth configuration machined into the rear of the crankshaft dampener. The signal generated by this sensor is called a Variable Reluctance Sensor (VRS) signal. The VRS signal provides the base timing and rpm information to the EDIS module. Base timing is set at 10° and is not adjustable.



Crankshaft Position Sensor: Service and Repair

Variable Reluctance (Crankshaft Position) Sensor

REMOVAL:

1. Disconnect the negative battery cable.

2. Disconnect the sensor electrical connector from the wiring harness.

3. Remove the Variable Reluctance (Crankshaft Position) Sensor mounting bolts and remove the sensor.

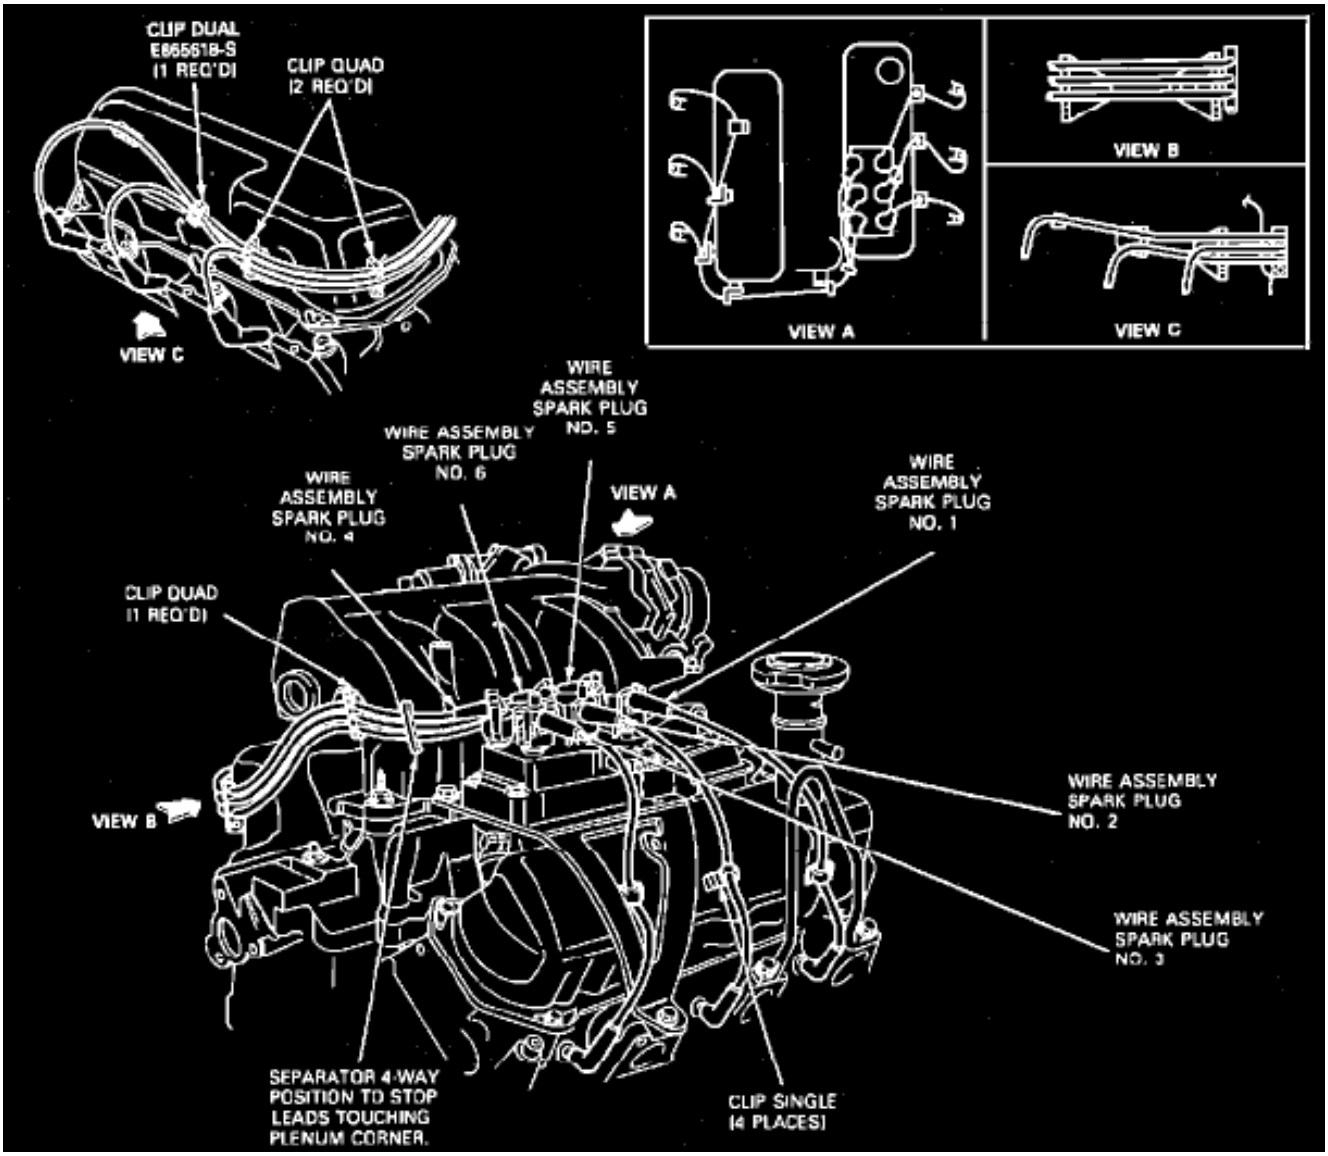
INSTALLATION:

1. Position the Variable Reluctance (Crankshaft Position) Sensor assembly on the engine.

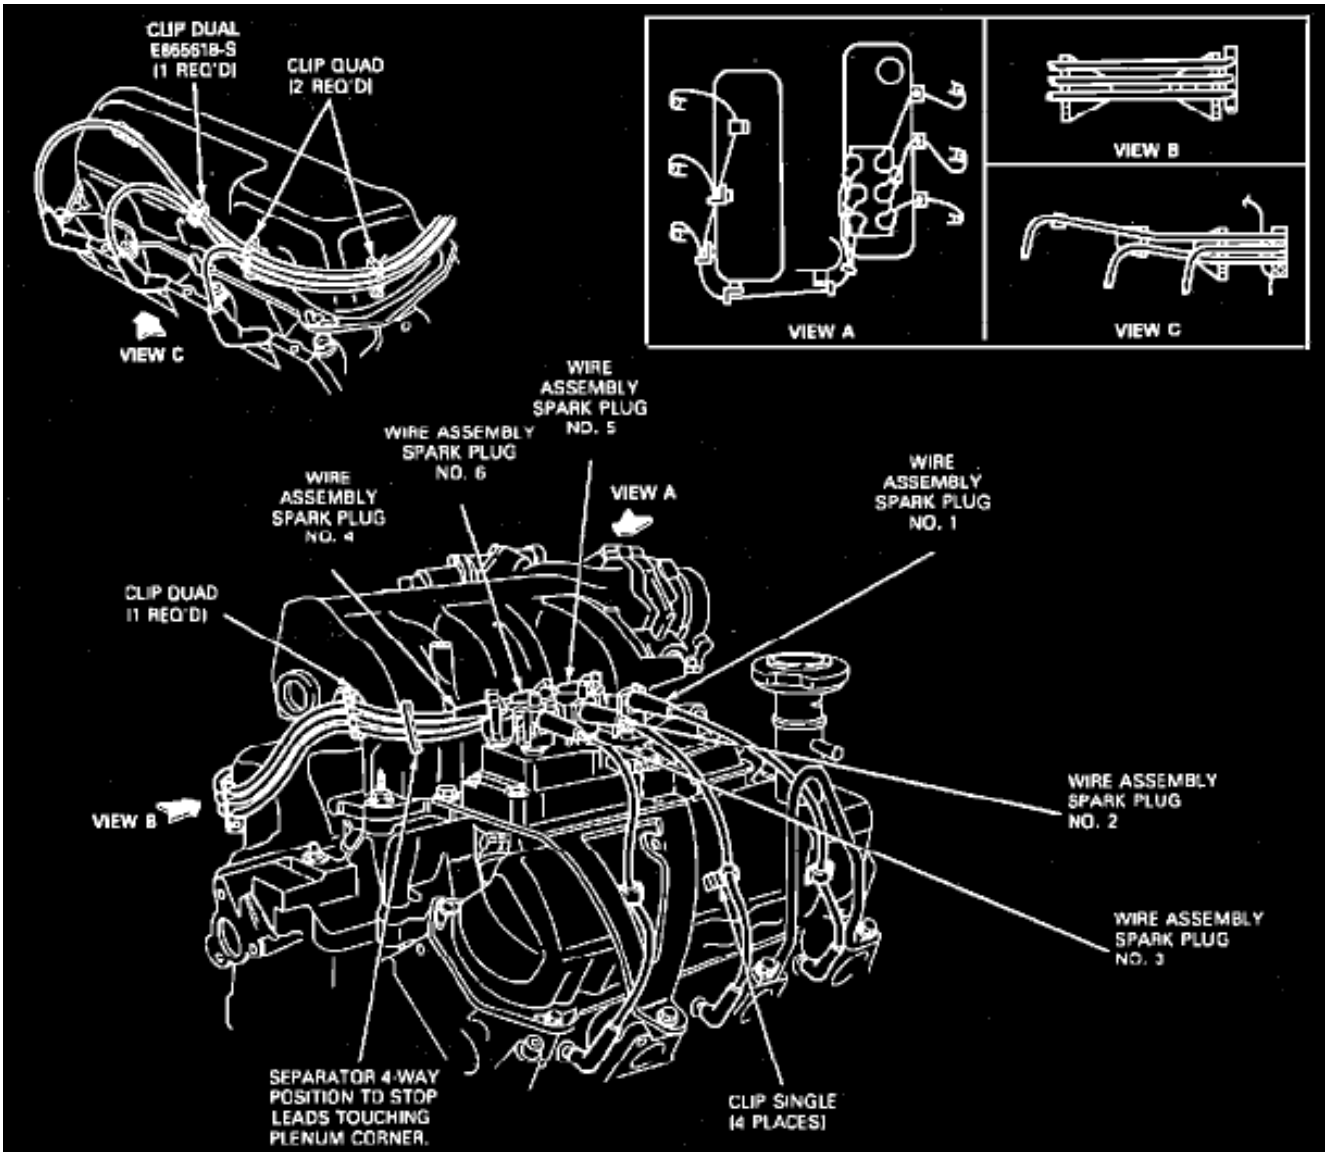
2. Install the two sensor attaching bolts and tighten to specified torque. (SEE SPECIFICATIONS/MECHANICAL)

3. Route the sensor wiring harness and connect the electrical connector to the sensor.

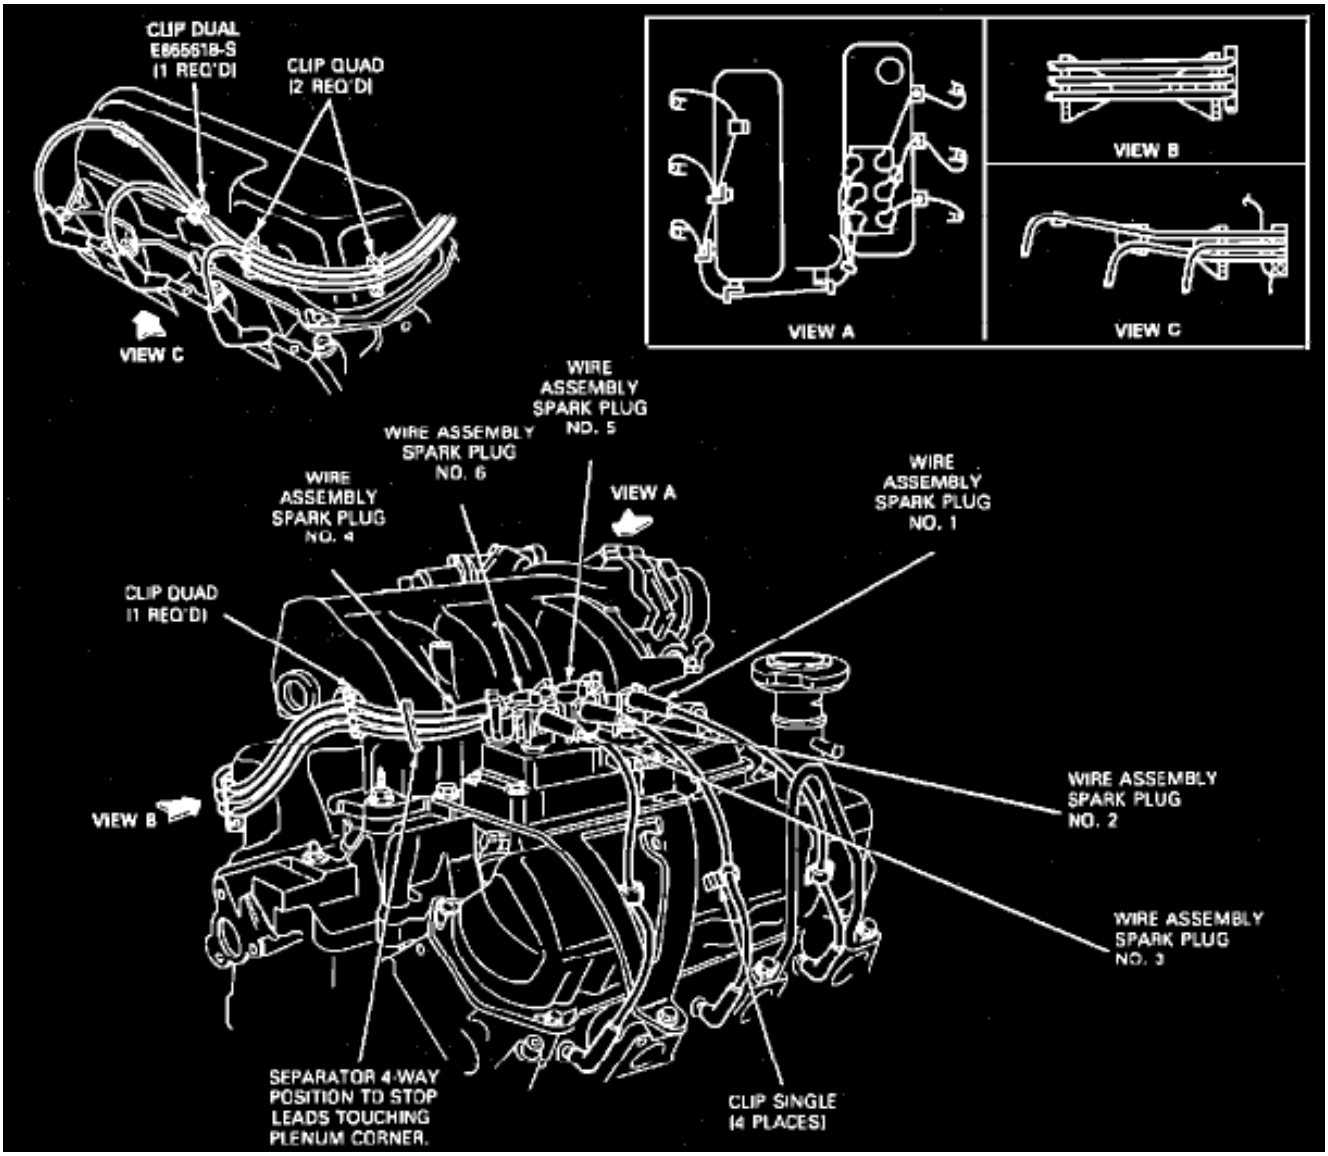
4. Connect the negative battery cable.



Spark Plug Wire Assembly



Spark Plug Wire Assembly



Ignition Cable: Service and Repair

Spark Plug Wire Assembly

Removal:

1. When removing spark plug wires from the spark plugs, use the spark plug wire remover T74P-6666-A or equivalent. Grasp and twist the boot back and forth on the plug insulator to free the boot.

2. Use the special tool or equivalent to pull the boot from the plug. Do not pull on the wire directly, as it may become separated from the connector inside the boot.

3. To remove the wires from the coil pack, squeeze the locking tabs of the coil wire retainer and remove using a twisting and pulling motion. Do not pull on the wire.

INSTALLATION:

CAUTION: Proper installation of spark plug wires is critical to vehicle operation. If one spark plug wire is not properly installed on the spark plug or ignition coil, both spark plugs connected to that coil may not fire under load.

1. Whenever a high tension wire is removed for any reason from a spark plug or ignition coil, or a new high tension wire is installed, Silicone Dielectric Compound D7AZ-19A331-A or equivalent must be applied to the boot prior to installation. Using a small tool, coat the entire interior surface of the boot.

2. Install each wire on the proper ignition coil terminal. The terminal cylinder numbers are identified on the ignition coil pack. Ensure that both coil boot retainer locking tabs have engaged.

3. Remove the wire retaining brackets from the old wiring set and install the brackets on the new wires in the same position. Install the wires and retaining brackets on the engine.

4. Connect the wires to the proper Spark plugs.

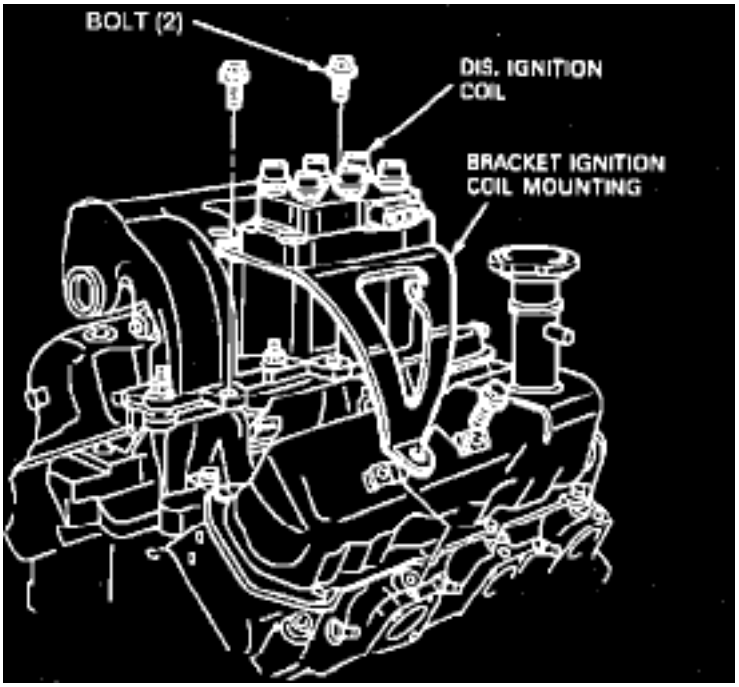
Ignition Coil: Description and Operation

Coil Pack

The ignition coil pack contains three separate ignition coils, controlled by the EDIS module through three coil leads. Each ignition coil fires two spark plugs simultaneously; one plug on the compression stroke and one on the exhaust stroke. The spark plug fired on the exhaust stroke uses very little of the ignition coils stored energy. The Majority of energy is used by spark plug on the compression stroke. Since these two spark plugs are connected in series, firing voltage of one plug will be negative with respect to ground, while voltage of the other will be positive with respect to ground.

PIN 1 (COIL 1 PRIMARY) IS THE GROUND PATH TO PIN 10 OF THE EDIS MODULE PIN 2 (COIL 3 PRIMARY) IS THE GROUND PATH TO PIN 11 OF THE EDIS MODULE PIN 3 (COIL 2 PRIMARY) IS THE GROUND PATH TO PIN 12 OF THE EDIS MODULE PIN 4 PROVIDES BATTERY VOLTAGE FOR THE COIL PRIMARY CIRCUITS



Ignition Coil: Service and Repair

Coil Pack Assembly

REMOVAL:

1. Disconnect the negative battery cable.

2. Disconnect the electrical connector from the coil pack.

3. Remove the spark plug wires by squeezing the locking tabs to release the coil boot retainers.

4. Remove the coil pack mounting screws and remove the coil pack.

INSTALLATION:

1. Install the coil pack and mounting screws, and tighten to specified torque. (SEE SPECIFICATIONS/MECHANICAL)

2. Connect the spark plug wires and connect the electrical connector to the coil pack.

3. Connect the negative battery cable.

Ignition Control Module: Customer Interest Engine - Loss of Power At High Engine Speeds

Article No. 92-3-8

01/29/92

LOSS OF POWER - 4.0L - AT HIGH ENGINE SPEEDS BETWEEN 3800 AND 4700 RPM - CANADIAN VEHICLES

LIGHT TRUCK: 1990-92 RANGER 1991-92 EXPLORER

ISSUE: A loss of power may occur at engine speeds between 3800 and 4700 RPM under wide open throttle. After several months use, this can be caused by an interaction between MMT (octane enhancer additive in Canadian fuel) contaminated spark plugs and the EDIS (Electronic Distributorless Ignition System) module. A check engine light concern may be present with Self-Test Codes 18 (212 three digit code) and 45 in continuous memory.

ACTION: If service is required, confirm the concern and, if necessary, replace the EDIS module and spark plugs. Refer to the following procedure for service details.

1. Confirm the customer concern by accelerating the vehicle at wide open throttle from 3000 RPM to 4700 RPM with the transmission in second gear.

^ If the vehicle exhibits a loss of power (caused by fuel shutoff of one of the fuel banks) in this RPM range, follow Steps 2 and 3.

^ Otherwise, follow the Powertrain Control/Emissions Diagnosis Manual's diagnostic procedures.

NOTE:

FUEL SHUTOFF (REV. LIMITER) AT 4850 RPM FOR AUTOMATICS AND 5200 RPM FOR MANUAL TRANSMISSIONS IS NORMAL AND SHOULD NOT BE CONFUSED WITH THIS CONCERN.

2. Replace all the spark plugs.

3. Replace the EDIS module (F1TZ-12KO72-B).

NOTE:

THIS MODULE WILL ELIMINATE THE PREMATURE FUEL SHUTOFF CONCERN. THE RED DEPOSITS ON THE SPARK PLUGS WILL STILL OCCUR AFTER TIME. THIS IS CONSIDERED NORMAL FOR THIS TYPE OF FUEL.

LINCOLN-MERCURY: 1990-94 TOWN CAR 1991-94 TRACER 1992-94 GRAND MARQUIS 1993-94 MARK VIII 1994 COUGAR

LIGHT TRUCK: 1990-94 AEROSTAR, RANGER 1991-94 EXPLORER

ISSUE: Some vehicles may have a disconnect of the Ignition Control Module (ICM) connector or moisture buildup within the connector. This can cause hard to start/no start, rough idle, or "check engine light" illumination concerns. The improved gasket and connector retainer that are currently used in production are now available for service of prior model distributorless ignition systems.

ACTION: Install new Connector Sleeve Retainer Clip and a current production seal (gasket). The clip assembles in between the connector beams and the ICM which will prevent accidental disconnects. The new seal is a "solid silicone" gasket that provides improved resistance to moisture entry into the connector. Refer to the ICM Connector Harness Wire Service kit (F5CZ-14A411-AA) for service details (I.S. 6621).

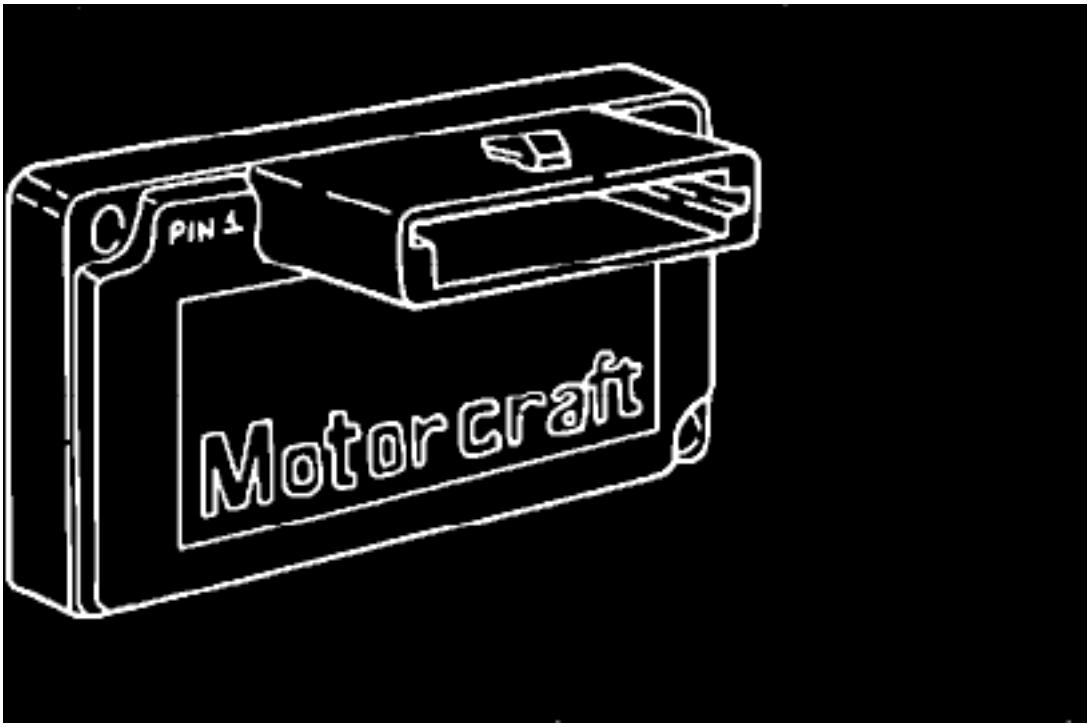
Electronic Distributorless Ignition System (EDIS) Module Connector



Ignition Control Module: Description and Operation

Module And Pin-Out

The EDIS module receives the Variable Reluctance Sensor (VRS) signal from the crankshaft sensor and the Spark Advance Word (SAW) signal from the EEC IV module. During normal operation, Profile Ignition Pickup (PIP) is sent to the EEC IV module from the EDIS module, providing base timing and RPM information. The VRS signal provides the EDIS module with the information required to synchronize the ignition coils for proper firing sequence. The Spark Angle Word (SAW) signal is a pulse width modulated signal and contains the optimum spark timing information. Spark angle is determined by the EDIS module using a zero excess dwell control routine.

Ignition Control Module: Service and Repair

REMOVAL:

Ignition Module

1. Disconnect both battery cables, then remove the battery from the vehicle. 2. Disconnect the electrical connector from the ignition module.

NOTE: To disconnect the module connector, push on the connector where it says PUSH, then slide the connector from the module.

3. Remove the ignition module retaining bolt and remove the module by sliding the assembly up until it is released from the teardrop shaped hole in

the sheet metal.

INSTALLATION:

1. Place the module on the sheet metal so the retaining rivet passes through the hole, then slide the module down into position. Install the retaining

bolt. Torque to 22-31 in lb (2.2-3.5 Nm).

2. Connect the electrical connector to the module. 3. Install the battery and cables.

^ ENGINE/EMISSIONS DIAGNOSIS MANUAL - 1991 - PAGES 6-305 THROUGH 6-307 - PINPOINT TEST KP REVISED TO PROVIDE ADDITIONAL INFORMATION CONCERNING REMOVAL OF OCTANE ADJUST SHORTING BAR

FORD: 1989-91 TAURUS, THUNDERBIRD 1991 ESCORT, MUSTANG

LINCOLN-MERCURY: 1989-90 COUGAR 1991 TRACER

LIGHT TRUCK: 1989-91 RANGER 1991 AEROSTAR, EXPLORER

ISSUE: Additional information regarding removal of the Octane Adjust Shorting Bar is required to assure compliance with Federal (EPA) Emission Standards. The following Manuals are affected on the pages indicated:

^ 1989 Engine/Emissions Diagnosis Page 17-289

^ 1990 Engine/Emissions Diagnosis Page 17-329

^ 1991 Engine/Emissions Diagnosis Page 5-22 and Pages 6-305 through 307

ACTION: Refer to the pages in this TSB article for the additional information.

OTHER APPLICABLE ARTICLES: NONE WARRANTY STATUS: INFORMATION ONLY OASIS CODES: 690000

Octane Adjust	Pinpoint Test	KP

Note

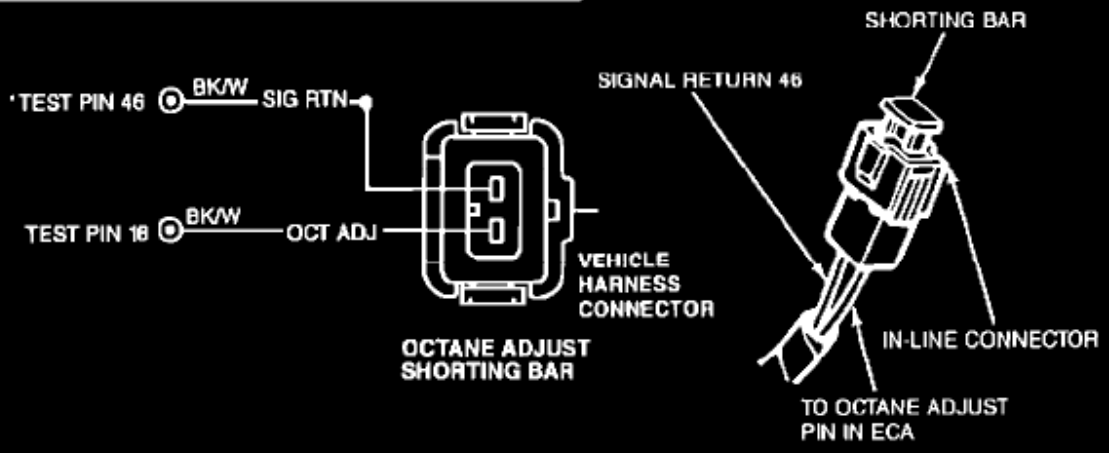
You should enter this Pinpoint Test only when directed here from Quick Test Step 7.0.

Remember

This Pinpoint Test is intended to diagnose only the following:

- Harness circuits: Signal Return, Octane Adjust
- Octane shorting bar connector

Pinpoint Test Schematic



OCTANE ADJUST SHORTING BAR LOCATIONS

APPLICATION	LOCATION
2.3L EFI Truck	Passenger side of fender apron, taped to the self-test connector.
3.0L SEFI SHO	Driver side of engine, tie wrapped to a bracket above the transmission.
3.8L SEFI SC	Passenger side of engine between shock tower mount and firewall next to self-test connector.

*TEST PINS LOCATED ON BREAKOUT BOX.
ALL HARNESS CONNECTORS VIEWED INTO MATING SURFACE.

A9686-D

NOTE: Use a higher octane grade of fuel to address the spark knock concern.
DO NOT remove the Octane Adjust shorting bar unless you have been directed by an application specific Technical Service Bulletin.

Revised 5/91

Octane Adjust

Pinpoint Test

KP

Octane Adjust Shorting Bar Locations

Application	Location
1.9L MA SEFI	Near EEC-IV power relay, fuel pump relay and processor in passenger compartment.
2.3L EFI Truck	Passenger side of fender apron, taped to the Self-Test connector.
3.0L SEFI SHO	Driver side of engine, tie wrapped to a bracket above the transmission.
3.8L SEFI SC	Passenger side of engine between shock tower mount and firewall next to Self-Test connector.
4.0L MA EFI Aerostar	Driver side, engine cowl near windshield wiper motor take-out (alongside MAP take-out).
4.0L MA EFI Ranger/ Bronco II	Passenger side of fender apron, taped to the Self-Test connector.

Test Pin 18 (44 and 43) OCT ADJ

DELETION

Revised 5/91

Octane Adjust — Pinpoint Test KP

TEST STEP	RESULT	ACTION TO TAKE
KP1 VISUALLY INSPECT OCTANE ADJUST IN-LINE CONNECTOR SERVICE CODE 57/341 Service Code 57/341 indicates Octane Adjust shorting bar is not in or the OCT ADJ circuit is open. • Key off. • Visually inspect Octane Adjust in-line connector. • **Is the shorting bar removed?**	Yes No	GO to KP2. GO to KP4.
KP2 CHECK FOR MODIFICATION DECAL • Is there a modification decal attached to the vehicle indicating that the Octane Adjust shorting bar was removed?	Yes No	Testing complete. If vehicle has spark knock concern, GO to Section 2. GO to KP3.
KP3 CHECK FOR SERVICE CODE 57/341 • Replace Octane Adjust shorting bar. • Key off. • Activate self-test. • **Is service code 57/341 present?**	Yes No	GO to KP4. Testing complete. EEC system OK.
KP4 CHECK CONTINUITY OF OCTANE ADJUST CIRCUIT **NOTE: There should be continuity from OCT ADJ circuit thru the in-line connector and shorting bar to SIG RTN circuit.** • Key off. • Disconnect processor 60 pin connector. Inspect for damaged or pushed out pins, corrosion, loose wires, etc. Service as necessary. • Install breakout box, leave processor disconnected • Measure resistance between Test Pin 46 and OCT ADJ Test Pin at the breakout box (see schematic for appropriate OCT ADJ circuit test pin). • **Is the resistance less than 5 ohms?**	Yes No	REPLACE processor. REMOVE breakout box. RERUN Quick Test. SERVICE open OCT ADJ circuit or shorting bar or SIG RTN circuit. REMOVE breakout box. RERUN Quick Test.

Revised 5/91

Octane Adjust

Pinpoint Test **KP**

TEST STEP	RESULT	ACTION TO TAKE
KP5 CHECK FOR SERVICE CODE 11 • Start engine and idle vehicle at operating temperature. • Key off. • Activate self-test. • Key on, engine off. • **Is service code 11 or 111 present?**	Yes ▶ No ▶	GO to KP6. **For service code 57/341:** GO to KP1. **For all other codes:** RETURN to Quick Test.
KP6 VERIFY IN-LINE CONNECTOR SHORTING BAR IS INSTALLED • Key off. • Visually inspect Octane Adjust in-line connector. • **Is shorting bar installed?**	Yes ▶ No ▶	GO to KP8. GO to KP7.
KP7 CHECK FOR MODIFICATION DECAL • Is there a modification decal attached to the vehicle indicating that the Octane Adjust shorting bar was removed?	Yes ▶ No ▶	GO to KP10. REPLACE shorting bar. GO to Section 2 to address spark knock concern.
KP8 CHECK FOR TSB • Is there a Technical Service Bulletin (TSB) authorizing the removal of the Octane Adjust shorting bar?	Yes ▶ No ▶	GO to KP9. GO to Section 2 to address spark knock concern.
KP9 REMOVE SHORTING BAR • Remove shorting bar only if there is a TSB authorization. • Drive vehicle to verify spark knock. • **Is spark knock present?**	Yes ▶ No ▶	GO to KP10. Testing complete. EEC system OK.

Revised 5/91

Octane Adjust

Pinpoint Test **KP**

TEST STEP	RESULT	ACTION TO TAKE
KP10 CHECK OCTANE ADJUST CIRCUIT FOR A SHORT TO GROUND • Key off. • Breakout box installed, processor disconnected. • Measure resistance between OCT ADJ circuit at the in-line connector and Test Pin 40/60 at the breakout box. • **Is each resistance greater than 10,000 ohms?**	Yes ▶	GO to **KP11**.
	No ▶	SERVICE short circuit. REMOVE breakout box. If spark knock is still present, GO to Section 2.
KP11 CHECK PROCESSOR INTEGRITY • Key off. • Shorting bar removed because of TSB authorization. • Breakout box installed, processor connected. • Key on. • Measure voltage between Octane Adjust circuit and Test Pin 40/60 at the breakout box. • **Is voltage greater than 4.0 volts?**	Yes ▶	REMOVE breakout box. If spark knoock is still present, GO to Section 2.
	No ▶	REPLACE processor. REMOVE breakout box. If spark knock is still present, GO to Section 2.

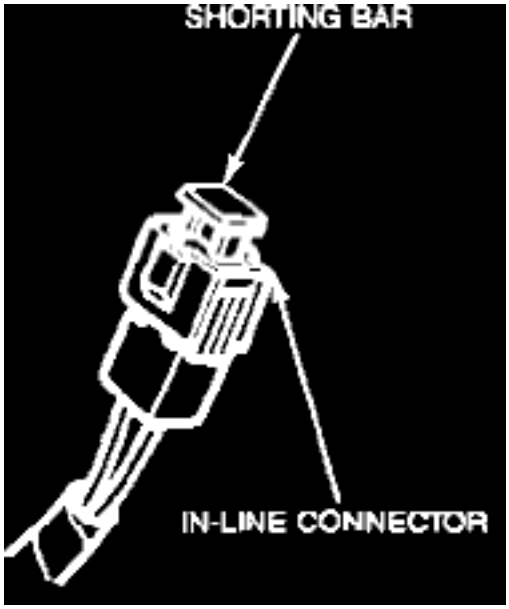
Ignition Timing Connector: Locations

Component Location

The SPOUT connector (SAW check connector C127) is located at the RH front of the engine compartment in front of the battery.



Ignition Timing Connector: Description and Operation

In-line Connector With Shorting Bar

The octane adjustment switch is used to retard the ignition timing three to four degrees. When the switch jumper is INSTALLED, the timing is normal. With the jumper REMOVED, the timing is retarded. This is done to allow for optimum spark advance for effective combustion of the air/fuel mixture.

Ignition Control Module: Customer Interest Engine - Loss of Power At High Engine Speeds

Article No. 92-3-8

01/29/92

LOSS OF POWER - 4.0L - AT HIGH ENGINE SPEEDS BETWEEN 3800 AND 4700 RPM - CANADIAN VEHICLES

LIGHT TRUCK: 1990-92 RANGER 1991-92 EXPLORER

ISSUE: A loss of power may occur at engine speeds between 3800 and 4700 RPM under wide open throttle. After several months use, this can be caused by an interaction between MMT (octane enhancer additive in Canadian fuel) contaminated spark plugs and the EDIS (Electronic Distributorless Ignition System) module. A check engine light concern may be present with Self-Test Codes 18 (212 three digit code) and 45 in continuous memory.

ACTION: If service is required, confirm the concern and, if necessary, replace the EDIS module and spark plugs. Refer to the following procedure for service details.

1. Confirm the customer concern by accelerating the vehicle at wide open throttle from 3000 RPM to 4700 RPM with the transmission in second gear.

^ If the vehicle exhibits a loss of power (caused by fuel shutoff of one of the fuel banks) in this RPM range, follow Steps 2 and 3.

^ Otherwise, follow the Powertrain Control/Emissions Diagnosis Manual's diagnostic procedures.

NOTE:

FUEL SHUTOFF (REV. LIMITER) AT 4850 RPM FOR AUTOMATICS AND 5200 RPM FOR MANUAL TRANSMISSIONS IS NORMAL AND SHOULD NOT BE CONFUSED WITH THIS CONCERN.

2. Replace all the spark plugs.

3. Replace the EDIS module (F1TZ-12KO72-B).

NOTE:

THIS MODULE WILL ELIMINATE THE PREMATURE FUEL SHUTOFF CONCERN. THE RED DEPOSITS ON THE SPARK PLUGS WILL STILL OCCUR AFTER TIME. THIS IS CONSIDERED NORMAL FOR THIS TYPE OF FUEL.

FORD: 1991-94 ESCORT 1992-94 CROWN VICTORIA 1993-94 TAURUS 1994 MUSTANG, THUNDERBIRD

LINCOLN-MERCURY: 1990-94 TOWN CAR 1991-94 TRACER 1992-94 GRAND MARQUIS 1993-94 MARK VIII 1994 COUGAR

LIGHT TRUCK: 1990-94 AEROSTAR, RANGER 1991-94 EXPLORER

ISSUE: Some vehicles may have a disconnect of the Ignition Control Module (ICM) connector or moisture buildup within the connector. This can cause hard to start/no start, rough idle, or "check engine light" illumination concerns. The improved gasket and connector retainer that are currently used in production are now available for service of prior model distributorless ignition systems.

ACTION: Install new Connector Sleeve Retainer Clip and a current production seal (gasket). The clip assembles in between the connector beams and the ICM which will prevent accidental disconnects. The new seal is a "solid silicone" gasket that provides improved resistance to moisture entry into the connector. Refer to the ICM Connector Harness Wire Service kit (F5CZ-14A411-AA) for service details (I.S. 6621).

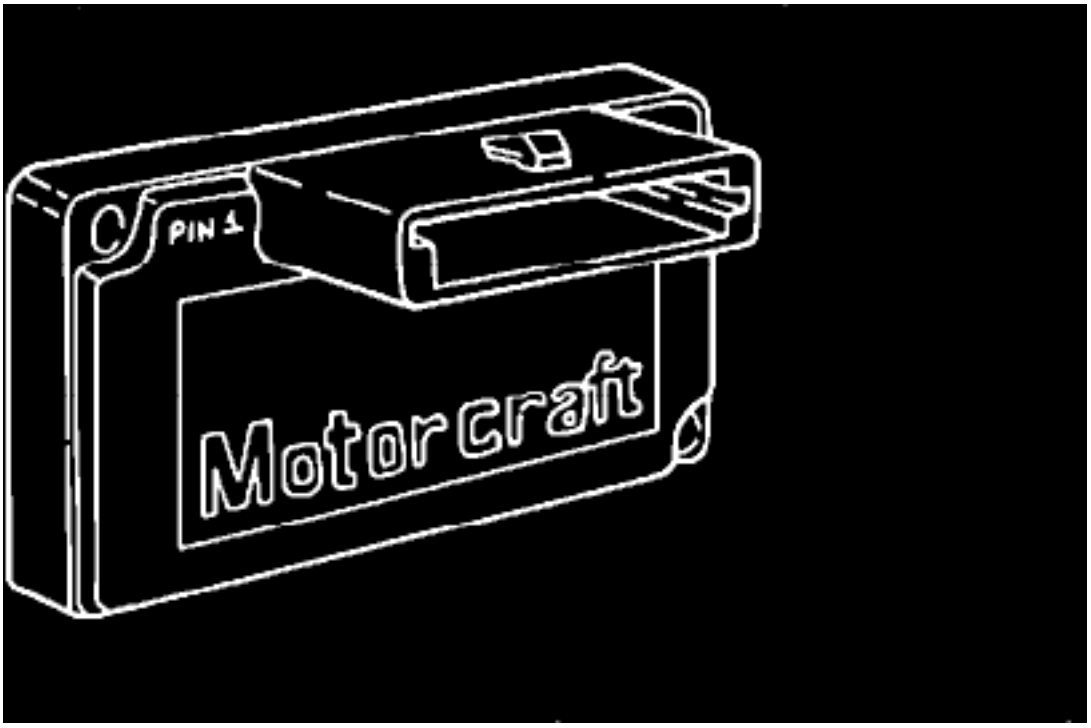
Electronic Distributorless Ignition System (EDIS) Module Connector



Ignition Control Module: Description and Operation

Module And Pin-Out

The EDIS module receives the Variable Reluctance Sensor (VRS) signal from the crankshaft sensor and the Spark Advance Word (SAW) signal from the EEC IV module. During normal operation, Profile Ignition Pickup (PIP) is sent to the EEC IV module from the EDIS module, providing base timing and RPM information. The VRS signal provides the EDIS module with the information required to synchronize the ignition coils for proper firing sequence. The Spark Angle Word (SAW) signal is a pulse width modulated signal and contains the optimum spark timing information. Spark angle is determined by the EDIS module using a zero excess dwell control routine.

Ignition Control Module: Service and Repair

REMOVAL:

Ignition Module

1. Disconnect both battery cables, then remove the battery from the vehicle. 2. Disconnect the electrical connector from the ignition module.

NOTE: To disconnect the module connector, push on the connector where it says PUSH, then slide the connector from the module.

3. Remove the ignition module retaining bolt and remove the module by sliding the assembly up until it is released from the teardrop shaped hole in

the sheet metal.

INSTALLATION:

1. Place the module on the sheet metal so the retaining rivet passes through the hole, then slide the module down into position. Install the retaining

bolt. Torque to 22-31 in lb (2.2-3.5 Nm).

2. Connect the electrical connector to the module. 3. Install the battery and cables.

Wire Color Code Identification

NOTE: Whenever a wire is labeled with two colors; the first color listed is the basic color of the wire, and the second color is the tracer marking of the wire. If the second color is followed by by a D, the tracer is dots. If the second color is followed by an H, the tracer is hash marks.

For example: BR/O is a brown wire with an orange stripe, R/Y D is a red wire with yellow dots and BK/W H is a black wire with white hash marks.

Wire Color Code Identification

NOTE: Whenever a wire is labeled with two colors; the first color listed is the basic color of the wire, and the second color is the tracer marking of the wire. If the second color is followed by by a D, the tracer is dots. If the second color is followed by an H, the tracer is hash marks.

For example: BR/O is a brown wire with an orange stripe, R/Y D is a red wire with yellow dots and BK/W H is a black wire with white hash marks.

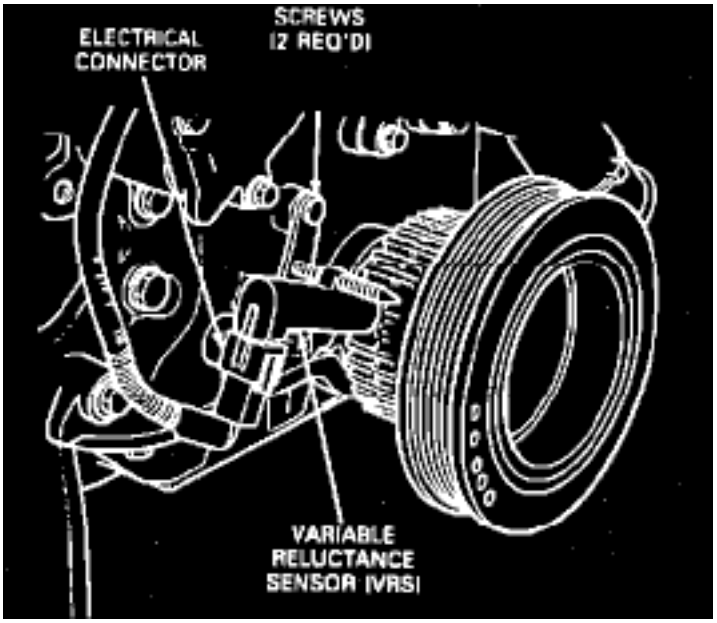
Crankshaft Position Sensor: Description and Operation

Crankshaft Timing Sensor

The crankshaft timing sensor is a variable reluctance type sensor. It is triggered by a 35 tooth trigger wheel tooth configuration machined into the rear of the crankshaft dampener. The signal generated by this sensor is called a Variable Reluctance Sensor (VRS) signal. The VRS signal provides the base timing and rpm information to the EDIS module. Base timing is set at 10° and is not adjustable.



Crankshaft Position Sensor: Service and Repair

Variable Reluctance (Crankshaft Position) Sensor

REMOVAL:

1. Disconnect the negative battery cable.

2. Disconnect the sensor electrical connector from the wiring harness.

3. Remove the Variable Reluctance (Crankshaft Position) Sensor mounting bolts and remove the sensor.

INSTALLATION:

1. Position the Variable Reluctance (Crankshaft Position) Sensor assembly on the engine.

2. Install the two sensor attaching bolts and tighten to specified torque. (SEE SPECIFICATIONS/MECHANICAL)

3. Route the sensor wiring harness and connect the electrical connector to the sensor.

4. Connect the negative battery cable.

11/24/93

^ LAMP - MALFUNCTION OF FOUR PIN LOW OIL LEVEL RELAY - VEHICLES BUILT AFTER 8/1/92 OR 1983-1993 VEHICLES THAT HAVE HAD SERVICE REPLACEMENT IGNITION SWITCHES AFTER 8/1/92

^ LAMPS - INSTRUMENT CLUSTER WARNING LIGHTS DIMLY LIT - VEHICLES BUILT AFTER 8/1/92 OR 1983-1993 VEHICLES THAT HAVE HAD SERVICE REPLACEMENT IGNITION SWITCHES AFTER 8/1/92

FORD: 1983 FAIRMONT 1983-89 CROWN VICTORIA, ESCORT 1983-93 MUSTANG, THUNDERBIRD 1983-94 PROBE 1984-86 LTD 1984-94 TEMPO

LINCOLN-MERCURY: 1983 LN7, ZEPHYR 1983-87 CONTINENTAL, LYNX 1983-89 GRAND MARQUIS, TOWN CAR 1983-93 COUGAR 1984-86 CAPRI, MARQUIS 1984-94 TOPAZ

LIGHT TRUCK: 1983-91 BRONCO 1983-93 ECONOLINE, F-150-350 SERIES, RANGER 1986-91 AEROSTAR 1991-93 EXPLORER

ISSUE: The instrument cluster warning light(s) may be dimly lit or there may be a malfunction of the four pin low oil relay on vehicles so equipped. This could be due to the ignition switch.

ACTION:

If the vehicle displays the subject symptoms and meets the following conditions, replace the ignition switch. Refer to the appropriate Car or Light Truck Service Manual (Section 13-04 for 1983-1990 Cars, Section 11-04 for 1991-1993 Cars and Section 13-05 for 1983-1990 Light Trucks, Section 11-05 for 1991-1993 Light Trucks) for removal and installation procedures. Refer to the Parts Block in this article for correct parts usage.

CONDITIONS

^ The vehicle has 14401 wiring attached to the P2 terminal of the ignition switch. Refer to the wiring schematic and/or Electrical And Vacuum Troubleshooting Manual (EVTM) for the concern vehicle.

Ignition Switch: Customer Interest Engine - Hard Start/No Start When Cold

Article No. 91-13-9

06/26/91

^ HARD START - 4.0L - COLD ENGINE

^ NO START - 4.0L - COLD ENGINE

^ IGNITION SWITCH BOUNCE - HARD OR NO START - 4.0L COLD ENGINE

LIGHT TRUCK: 1990-91 RANGER 1991 EXPLORER

ISSUE: A hard start or no start condition may occur when the engine is cold. The engine may not start without cycling the key to the OFF position and back to START. Ignition switch bounce (loss of electrical continuity between contacts) may cause the EDIS module to recycle several times or to lock-up and not allow a start at all.

ACTION: Install a new ignition switch containing synthetic lubricant which reduces the amount of bounce. Also, install a new wiring connector containing a new material that is compatible with the new synthetic lubricant. Refer to the following procedure for service details.

REMOVAL

1. Disconnect the battery power.

2. Remove the trim panel. Refer to the 1990-91 Ranger/Explorer Shop Manual, Section 11-04B, for removal procedure.

3. Turn the lock cylinder to the RUN position.

4. Remove the two (2) nuts on the ignition switch.

5. Separate the connector from ignition switch by gently prying on the ears of the connector and pulling apart firmly.

6. Disengage the terminals from the existing connector. Discard the connector.

Figure 1

7. Insert terminal into proper locations in new connector (F2TZ-14489-A), Figure 1.

INSTALLATION

1. Remove the spring clip from the new switch (F2TZ-11572-A). This clip keeps the switch in the correct position during shipment.

2. Press the new connector (F2TZ-14489-A) onto the terminals of the ignition switch. Be sure the tabs lock securely.

3. Locate the switch on the weld studs on the steering column.

NOTE: THE END OF THE ACTUATOR ROD MUST FIT IN THE HOLE ON THE SLIDER.

4. Install the nuts on the weld stud. Tighten to 4.45-7.24 N-m (39-64 lb.in.).

5. Connect the battery terminal.

6. Check the switch operation. If necessary, adjust it. Refer to the 1990-91 Aerostar, Explorer, Ranger Truck Shop Manual, Section 11-04B, for adjustment procedure.

7. Install the trim panel.

Spark Plug: Customer Interest Engine - Loss of Power At High Engine Speeds

Article No. 92-3-8

01/29/92

LOSS OF POWER - 4.0L - AT HIGH ENGINE SPEEDS BETWEEN 3800 AND 4700 RPM - CANADIAN VEHICLES

LIGHT TRUCK: 1990-92 RANGER 1991-92 EXPLORER

ISSUE: A loss of power may occur at engine speeds between 3800 and 4700 RPM under wide open throttle. After several months use, this can be caused by an interaction between MMT (octane enhancer additive in Canadian fuel) contaminated spark plugs and the EDIS (Electronic Distributorless Ignition System) module. A check engine light concern may be present with Self-Test Codes 18 (212 three digit code) and 45 in continuous memory.

ACTION: If service is required, confirm the concern and, if necessary, replace the EDIS module and spark plugs. Refer to the following procedure for service details.

1. Confirm the customer concern by accelerating the vehicle at wide open throttle from 3000 RPM to 4700 RPM with the transmission in second gear.

^ If the vehicle exhibits a loss of power (caused by fuel shutoff of one of the fuel banks) in this RPM range, follow Steps 2 and 3.

^ Otherwise, follow the Powertrain Control/Emissions Diagnosis Manual's diagnostic procedures.

NOTE:

FUEL SHUTOFF (REV. LIMITER) AT 4850 RPM FOR AUTOMATICS AND 5200 RPM FOR MANUAL TRANSMISSIONS IS NORMAL AND SHOULD NOT BE CONFUSED WITH THIS CONCERN.

2. Replace all the spark plugs.

3. Replace the EDIS module (F1TZ-12KO72-B).

NOTE:

THIS MODULE WILL ELIMINATE THE PREMATURE FUEL SHUTOFF CONCERN. THE RED DEPOSITS ON THE SPARK PLUGS WILL STILL OCCUR AFTER TIME. THIS IS CONSIDERED NORMAL FOR THIS TYPE OF FUEL.

Article No. 94-4-11

02/23/94

HEATER - OBJECTIONABLE AIRFLOW FROM PANEL REGISTERS DURING HEAVY ACCELERATION - NON A/C VEHICLES

LIGHT TRUCK: 1990-92 RANGER 1991-92 EXPLORER

This TSB article is being republished in its entirety to include 1992 Model vehicles.

ISSUE: Objectionable airflow from the heater system panel registers may occur when the system is in the OFF mode and the vehicle is under heavy acceleration. This condition is caused by movement of the fresh air door when the vacuum to the door actuator is lost during heavy acceleration.

ACTION: Installation of a vacuum hose/reservoir/check valve assembly will provide sufficient vacuum level to maintain proper operation of the heater system in the OFF mode. Refer to the following procedure for service details.

SERVICE PROCEDURE

1. Remove the blower assembly from the vehicle.

2. Drill two holes in the blower assembly, in a vertical position, to allow for installation of the vacuum reservoir. Refer to Figure 1.

3. Using two screws, mount the vacuum reservoir as shown in Figure 1.

4. Disconnect the existing vacuum check valve.

5. Remove the vacuum line which sourced the heater system check valve and attached to an engine vacuum port. Refer to Figure 1.

6. Discard the check valve and vacuum line.

7. Reinstall the blower assembly in the vehicle.

8. Route the new vacuum line and check valve (attached to the reservoir) as the original vacuum line was routed and attach to the original vacuum port.

9. Attach the vacuum line from the heater plenum chamber to the open port on the vacuum check valve.

10. Start the engine and verify proper operation of the Fresh Air/Off door.

LIGHT TRUCK: 1986-90 BRONCO II

1986-91 BRONCO, RANGER 1991 EXPLORER

ISSUE: The shift procedures into and out of LOW RANGE are revised for Ranger, Bronco and Explorer trucks built after 8/1/90 due to module changes. The new module will also be used to service prior model year trucks.

ACTION: If service is required on models built prior to 8/1/90, advise the customers of the following changes made to their vehicles.

Operation of the 1991 modules have been changed as follows:

To shift into 4 LOW: ^

Truck must be in 4x4 HIGH by previously pressing the 4x4 switch

^ Truck must be stopped (condition A)

^ The clutch must be depressed or the automatic transmission must be in neutral (condition B)

^ Then press LOW RANGE switch

To shift out of 4 LOW:

^ Truck must be stopped (condition A)

^ The clutch must be depressed or the automatic transmission must be in neutral (condition B)

^ Then press the LOW RANGE switch to shift back into 4x4 HIGH

^ Press the 4x4 HIGH switch to shift into 2 HIGH if desired

Previously, the module would respond to the LOW RANGE input from any mode (2H, 4H, 4L). If conditions A and B above are not met, the module would respond by flashing the 4 LOW indicator and wait until conditions A and B are met before completing the shift into or out of LOW RANGE. If LOW RANGE was selected while in 2 HIGH mode, the module would shift to 4 HIGH before flashing the indicator.

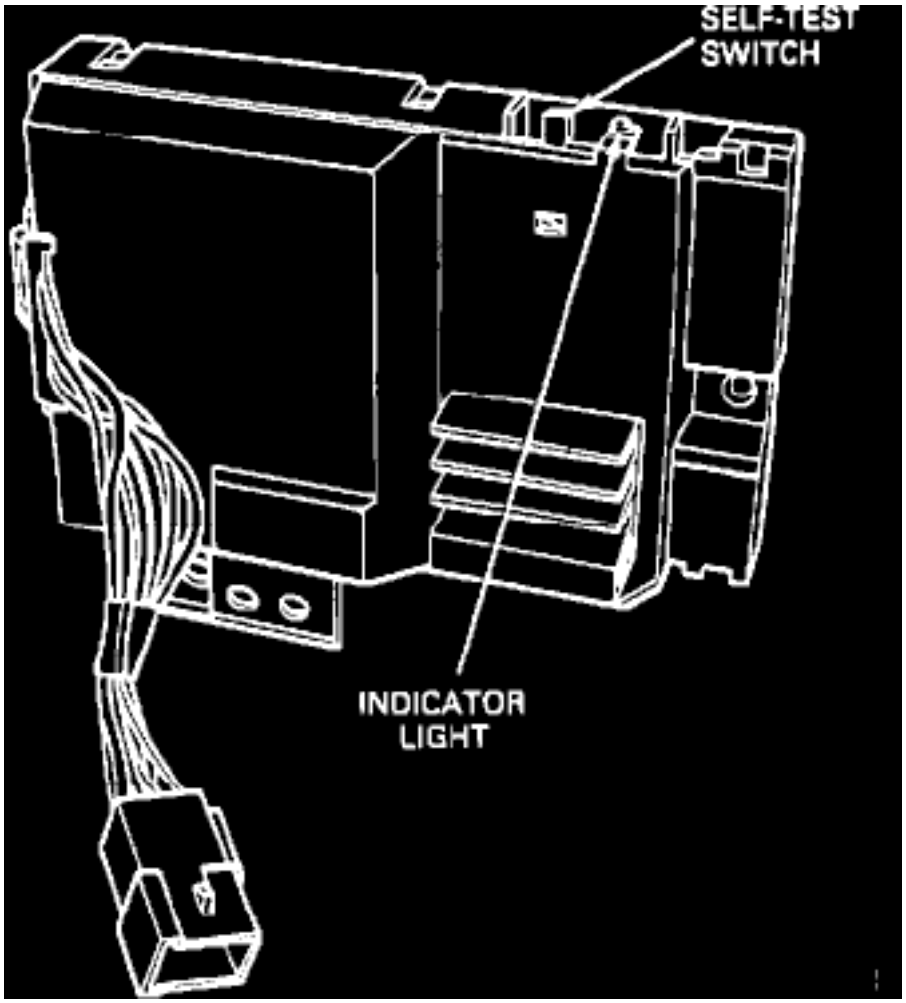
Electronic Shift Control Module: Description and Operation

The electronic control module conducts transfer case operation in response to inputs from the vehicle speed sensor, neutral start switch and clutch interlock switch and push-button actuation made by the operator.



Electronic Shift Control Module: Testing and Inspection

The electronic control module has a diagnostic capability of its internal circuitry. Self test procedure is as follows:

1. Disconnect five-wire and eight wire connectors from electronic control module.

2. Turn ignition switch to the RUN position.

3. Activate the self test switch and note result:

Control Module Self Test

NOTE: The self test switch and indicator light is located on the Electronic Control Module.

A FLASHING INDICATOR LAMP, (approximately one flash per second), indicates control module is functioning properly.

A STEADY INDICATOR LIGHT, indicates that control module is inoperative and must be replaced.

Transmission Temperature Sensor/Switch: Testing and Inspection

Pinpoint testing procedures for this component are located in the system level Testing and Inspection.

Band Apply Servo: Technical Service Bulletins A/T - A4LD Servo Cover Heat Shield

Article No. 94-6-16 Date: March 23, 1994

TRANSMISSION - A4LD-SERVO COVER HEAT SHIELD REQUIRED TO AVOID DAMAGING OVERDRIVE AND INTERMEDIATE SERVOS - VEHICLES WITH 4.0L ENGINE

LIGHT TRUCK: 1990-94 AEROSTAR, RANGER 1991-94 EXPLORER

ISSUE: Damage to overdrive and intermediate servos may occur if the servo heat shield is not reinstalled after servicing A4LD transmissions with 4.0L engines.

ACTION: When servicing A4LD transmissions with 4.0L engines that require servo cover heat shield removal, it is necessary that this heat shield be reinstalled to deflect heat generated by the catalytic converter away from the transmission. Failure to do so may result in premature failure of the overdrive, intermediate servos and transmission.

Band Apply Servo: Service and Repair Low/Reverse Servo - With A4LD

REMOVAL

1. Raise and support vehicle. 2. Loosen oil pan attaching bolts and allow transmission fluid to drain. 3. Remove oil pan attaching bolts and oil pan. 4. Remove oil filter screen and gasket. 5. Remove low-reverse servo cover retaining screws, then the cover, servo piston, spring, and gasket.

INSTALLATION

1. Reverse procedure to install. 2. Torque oil pan attaching bolts to 98-115 in lbs.

Band Apply Servo: Service and Repair Rear Servo

1. Disconnect battery ground cable.
2. Starting from rear of pan and working toward front, loosen bolts and allow fluid to drain.
3. Remove all pan attaching bolts and pan.
4. Remove oil filter screen and gasket.
5. Remove rear servo cover, piston, spring and gasket.
6. Reverse procedure to install.

ISSUE: A new service Center Support that uses a thrust bearing (# 3 and # 4) in place of thrust washers has been released. The procedure used in determining rear end play and selecting the new Number 4 Thrust Bearing has been revised.

ACTION: Use the Instruction Sheet packed with the new thrust bearing center supports to determine rear end play and the correct Number 4 Thrust Bearing.

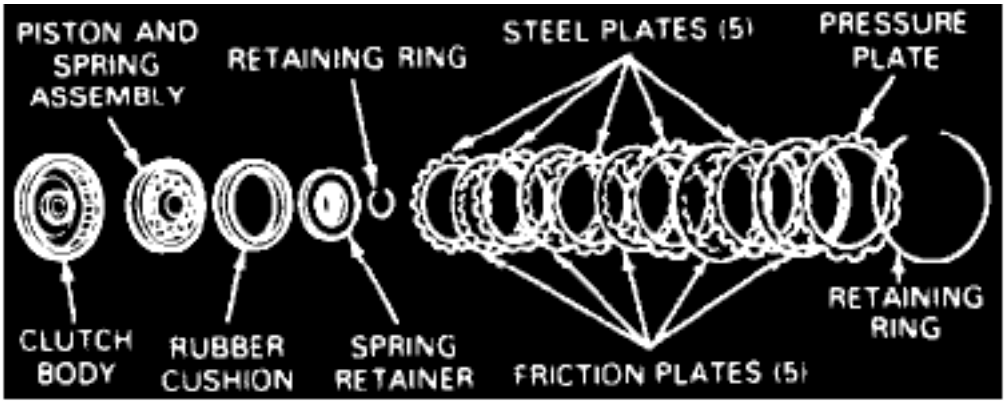
NOTE:

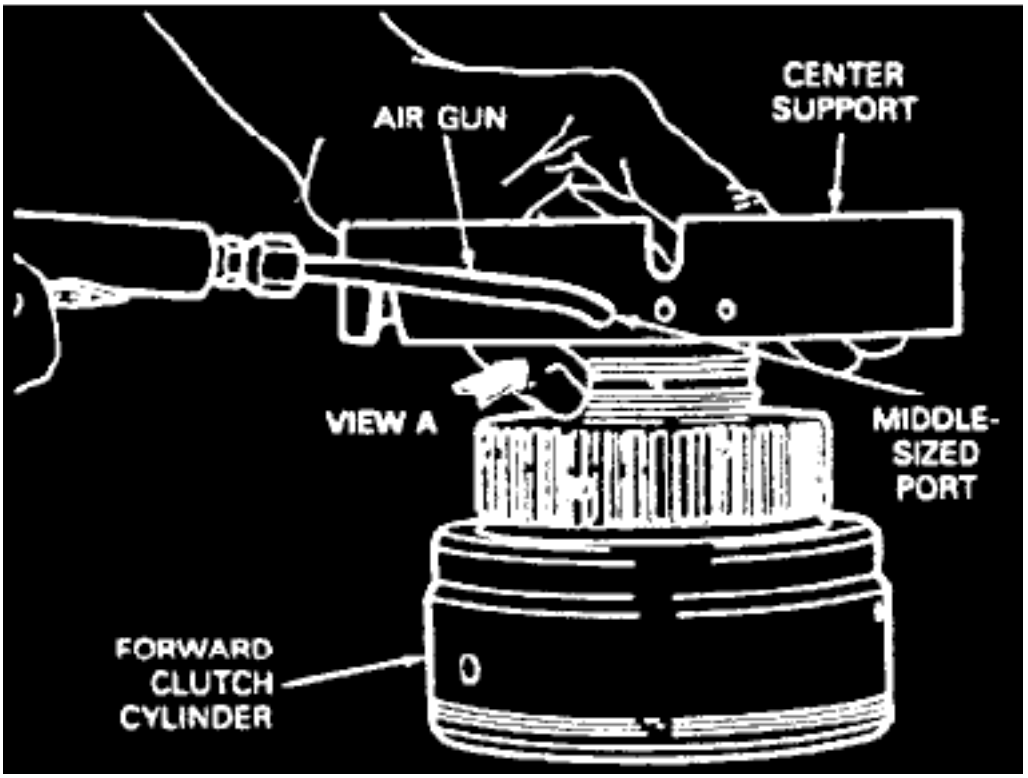
REFER TO THE LATEST VERSION SERVICE MANUAL PROCEDURE FOR DISASSEMBLY AND REASSEMBLY OF THE TRANSMISSION AS LISTED IN THE APPROPRIATE MODEL/YEAR SERVICE MANUAL.

OTHER APPLICABLE ARTICLES: NONE

WARRANTY STATUS: INFORMATION ONLY

OASIS CODES: 501000, 502000, 503000, 504000, 590000





Clutch: Service and Repair Forward Clutch

DISASSEMBLE

Exploded View Of Forward Clutch

1. Remove pressure plate retainer ring, then the plate pack. 2. Inspect steel clutch plates and clutch lining plates for wear, damage, or effects of overheating, replacing entire set if necessary.

NOTE: If new plates are to be used, immerse them in transmission fluid for 30 minutes before assembly.

Removing Forward Clutch Piston Or Air Testing Assembled Forward Clutch

3. Install center support on forward clutch cylinder, then apply no more than 20 psi air pressure to left port in center support to force piston assembly

from clutch cylinder.

Assemble

1. Install new seal rings on clutch piston. 2. Carefully install clutch piston into clutch body, a rubber cushion spring is used between the piston and steel plate. 3. Install compression spring and spring retainer, compress springs using clutch spring compressor and install retaining ring. 4. Install clutch plates beginning with a steel plate, then alternate friction and steel plates, there are five steel and five friction plates used. 5. Using feeler gauge, check clearance between retaining ring and pressure plate, pushing downward on plates while checking clearance. 6. If clearance is not 0.055-0.083 inch install corrective selective retaining ring. Retaining rings are available in thicknesses of 0.0539, 0.0681,

0.0819, and 0.0961 inch.

7. Install center support on forward clutch cylinder, then apply no more than 20 psi air pressure to left port in center support to check piston

application. Piston must apply when pressurized and release when air is removed.

Clutch: Service and Repair One-Way Clutch, A/T

ASSEMBLE

CAUTION: Models with 4.0L engines use a sprag type one-way clutch that should not be disassembled.

1. Remove snap ring using a screwdriver, then lift out cage with springs and bearing as an assembly. 2. Inspect inner and outer races for scores or damaged surfaces where rollers contact races. 3. Inspect rollers and springs for excessive wear or damage, then the spring and roller cage for bent or damaged spring retainers. 4. Install cage with springs, then insert bearing rollers one by one and install snap ring.

Clutch: Service and Repair Overdrive Clutch

WITH A4LD

DISASSEMBLE

Exploded View Of Overdrive Clutch

1. Remove pressure plate retainer ring, then the plate pack. 2. Inspect steel clutch plates and clutch lining plates for wear, damage, or effects of overheating, replacing entire set if necessary.

NOTE: If new plates are to be used, immerse them in transmission fluid for 30 minutes before assembly.

3. Using clutch spring compressor T65L-77515-A or equivalent, compress clutch compression springs, remove retaining ring, and carefully release

pressure on spring, then remove spring and compression spring retainer.

Removing Overdrive Clutch Piston Or Air Testing Assembled Overdrive Clutch

4. Apply no more than 20 psi air pressure to blow out clutch piston as shown in the Removing Overdrive Clutch Piston Or Air Testing Assembled

Overdrive Clutch image, using finger to close off opposite hole.

ASSEMBLE

1. Install new seal rings on clutch piston. 2. Carefully install clutch piston into clutch body. 3. Install compression spring and spring retainer, compress springs using clutch spring compressor and install retaining ring. 4. Install clutch plates beginning with a steel plate, then alternate friction and steel plates. 5. Install pressure plate and secure with retaining ring. 6. Using feeler gauge, check clearance between retaining ring and pressure plate, pushing downward on plates while checking clearance. 7. If clearance is not 0.039-0.067 inch on 1988 models or 0.055-0.083 inch on 1989-1991 models, install corrective Selective retaining ring.

Retaining rings are available in thicknesses of 0.0539, 0.0681, 0.0819, and 0.0961 inch.

8. Block hole with finger to prevent air leakage, then ensure piston applies when pressurized and releases when air is stopped, as shown in the

Removing Overdrive Clutch Piston Or Air Testing Assembled Overdrive Clutch image.

Exploded View Of Reverse High Clutch

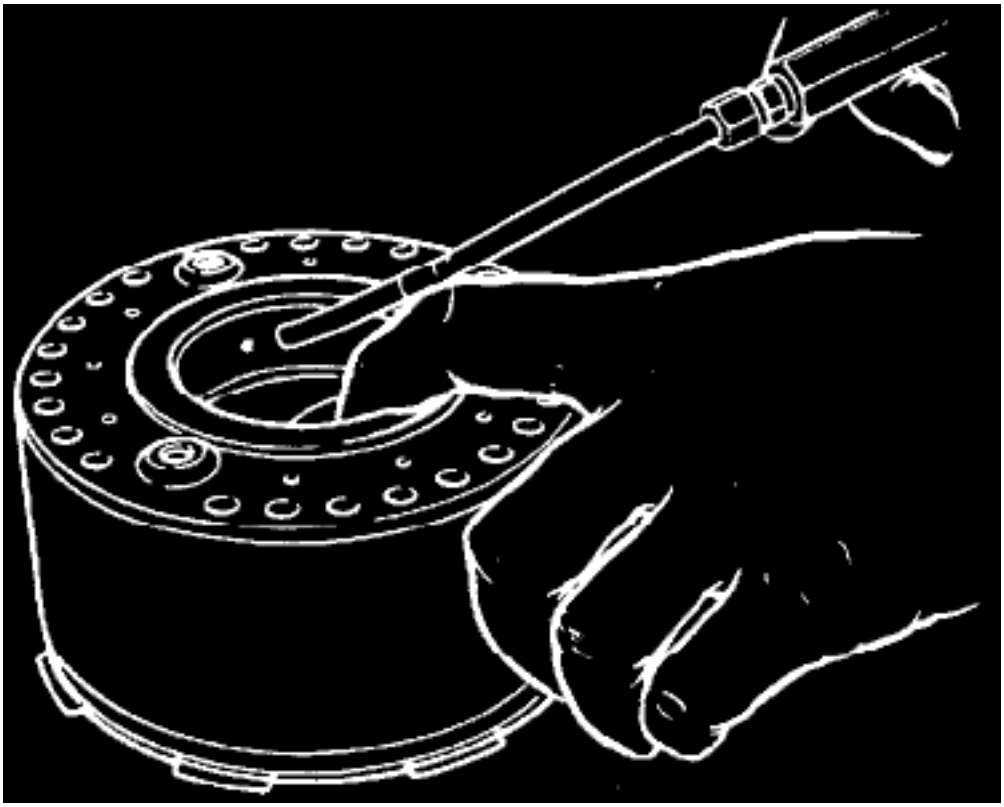
1. Remove pressure plate retainer ring, then the plate pack. 2. Inspect steel clutch plates and clutch lining plates for wear, damage, or effects of overheating, replacing entire set if necessary.

NOTE: If new plates are to be used, immerse them in transmission fluid for 30 minutes before assembly.

Removing Or Installing Reverse High Clutch Spring And Compression Spring Retainer

3. Using clutch spring compressor T65L-77515-A or equivalent, compress clutch compression springs, remove retaining ring, and carefully release

pressure on spring, then remove spring and compression spring retainer.



Removing Reverse/High Clutch Piston Or Air Testing Assembled Reverse/High Clutch

4. Apply no more than 20 psi air pressure to blow out clutch piston as shown in the Removing Reverse/High Clutch Piston Or Air Testing Assembled

Reverse/High Clutch image, using finger to close off opposite hole.

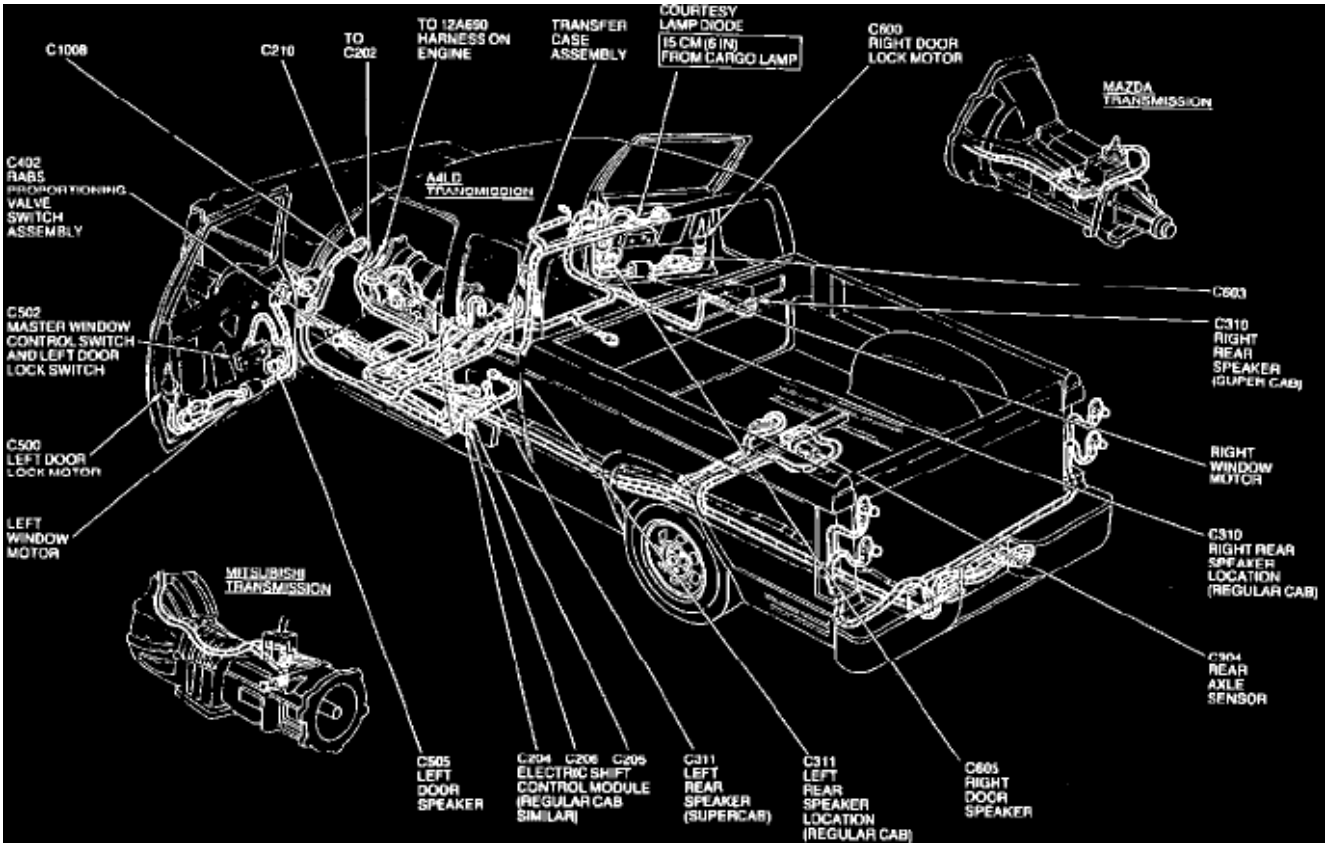
ASSEMBLE

1. Install new seal rings on clutch piston. 2. Carefully install clutch piston into clutch body. 3. Install compression spring and spring retainer, compress springs using clutch spring compressor and install retaining ring. 4. Install clutch plates beginning with a steel plate, then alternate friction and steel plates. 5. Install pressure plate and secure with retaining ring. 6. Using feeler gauge, check clearance between retaining ring and pressure plate, pushing downward on plates while checking clearance. 7. If clearance is not 0.051-0.079 inch, install corrective selective retaining ring. Retaining rings are available in thicknesses of 0.0539, 0.0681,

0.0819, and 0.0961 inch.

8. Block hole with finger to prevent air leakage, then ensure piston applies when pressurized and releases when air is stopped, as shown in the

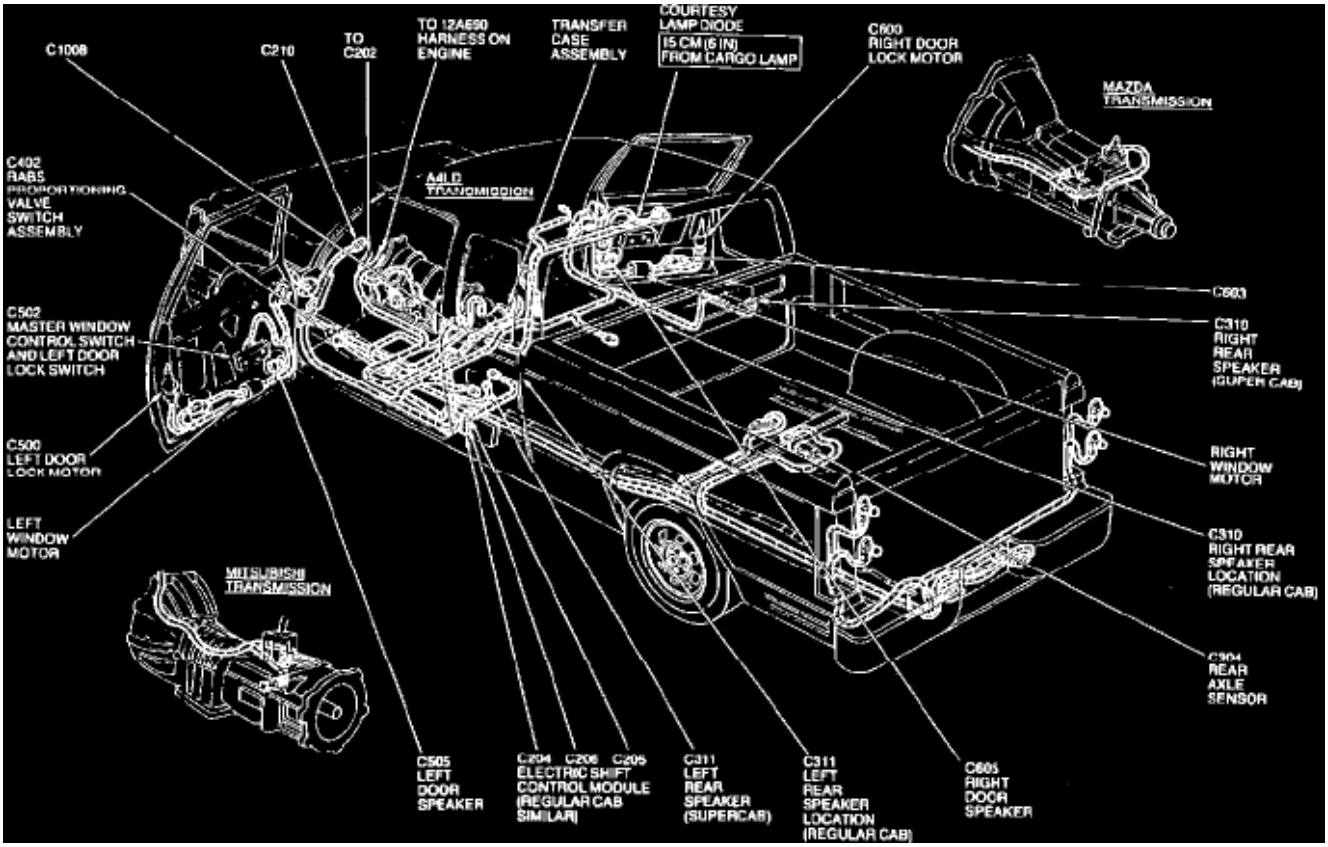
Removing Reverse/High Clutch Piston Or Air Testing Assembled Reverse/High Clutch image.



Control Module: Locations Regular Cab

Body Components

Lower LH Rear Corner Of Cab



Control Module: Locations Supercab

Body Components

Between Bottom Of LH ``B'' Pillar & Rear Of Cab

Extension Housing: Service and Repair

REMOVAL

1. Raise and support vehicle. 2. Install scribe marks on propeller shaft end yoke and rear axle companion flange, then remove propeller shaft. 3. Support transmission with suitable jack. 4. Remove speedometer cable from extension housing. 5. Remove bolts or nuts attaching rear support to crossmember. 6. Raise transmission slightly and remove rear support from extension housing. 7. Loosen extension housing attaching bolts and allow transmission to drain. 8. Remove bolts and the extension housing.

INSTALLATION

1. Reverse procedure to install, noting the following:

a. Use new extension housing gasket. b. Ensure parking pawl actuating rod is correctly seated in guide cup bore. c. Torque attaching bolts to 27-39 ft lbs.

Fluid - A/T: Technical Service Bulletins A/T - Mercon V ATF Usage

TSB 06-14-4

07/24/06

MERCON ATF IS BEING REPLACED BY MERCON V ATF AS A SERVICE FLUID.

MERKUR: 1985-1989 XR4TI

This article supersedes TSB 01-15-7 to update the vehicle application chart.

ISSUE MERCON(R) Automatic Transmission Fluid is being replaced by MERCON(R) V as a service fluid.

ACTION Beginning immediately all automatic transmission / transaxle applications requiring MERCON(R) can now be serviced using MERCON(R) V or MERCON(R) Automatic Transmission Fluid or dual usage fluids labeled MERCON(R) / MERCON(R) V. After July 1, 2007, MERCON(R) Automatic Transmission Fluid will no longer be manufactured, therefore, availability of this fluid will only continue for however long it takes to deplete what remains in inventory.

SERVICE PROCEDURE

AUTOMATIC TRANSMISSION FLUID CHART

Specific service fluids (listed to the right) are called for depending on the type of transmisson and the year the transmission was built. It is important to use the correct fluid, each fluid exhibits different properties and should be used only in the transmisson for which they were designed. The vehicle owner or rebuilder should use the type of fluid printed in the owners guide or on the automatic transmission fluid level indicator. Refer to your scheduled maintenance guide to determine the correct service interval. Failure to use the recommended fluid may affect transmisson performance and durability.

CAUTION:
DO NOT USE SUPPLEMENTAL TRANSMISSION FLUID ADDITIVES, TREATMENTS OR CLEANING AGENTS. The use of these materials may affect transmission operation and result in damage to internal transmission components.

CAUTION:
MERCON® SP, Motorcraft® Premium Automatic Transmission Fluid and Motorcraft® M5 ATF's are unique fluids and MUST be used in applications recommending that particular fluid. Use of any other fluid may cause reduced functionality or transmission damage.

CAUTION:
The functional characteristics of fluids for the CVT transmissions are very different than those of other ATF's. Use of a fluid other than Motorcraft® Continuously Variable Chain Type Transmission Fluid or one labeled as meeting MERCON® C may cause severe transmission damage.

FAILURE TO USE RECOMMENDED FLUID WILL AFFECT TRANSMISSION PERFORMANCE. REFER TO OWNERS MANUAL AND/OR FLUID LEVEL INDICATOR FOR PROPER FLUID TYPE.

V **MERCON® V**
- Part number XT-5-QM (Quarts) and XT-5-DM (55 Gallon Drum) Ford Specification is MERCON® V.

NOTE: AUTOMATIC TRANSMISSIONS REQUIRING MERCON® V SHOULD ONLY BE SERVICED WITH MERCON® V, OR FLUID FROM A CONTAINER THAT IS SPECIFIED AS A DUAL USAGE FLUID: MERCON®/MERCON®V.

SP **MERCON® SP**
- Part number XT-6-QSP (Quarts) and XT-6-DSP (55 Gallon Drum) Ford Specification is MERCON® SP.

CVT **CONTINUOUSLY VARIABLE CHAIN TYPE**
- Part number XT-7-QCFT (Quarts)

P **PREMIUM AUTOMATIC TRANSMISSION FLUID**
- Part number XT-8-QAW.

M5 **MAZDA SPECIFIC FLUID**
- Part number XT-9-QMM5.

V M **MERCON® - Part number XT-2-QDX (Quarts) and XT-2-DDX (55 Gallon Drum) or,**
MERCON® V - Part number XT-5-QM (Quarts) and XT-5-DM (55 Gallon Drum)
NOTE: AUTOMATIC TRANSMISSIONS REQUIRING MERCON® CAN NOW BE SERVICED WITH MERCON®, MERCON® V, CR, DUAL USAGE FLUIDS LABELED MERCON®/MERCON®V.

TB-8592-D

Figure 1

Service automatic transmissions requiring MERCON(R) with MERCON(R) V or MERCON(R) Automatic Transmission Fluid or dual usage fluids labeled MERCON(R) / MERCON(R) V

For proper fluid application on current and past model vehicles equipped with automatic transmissions I transaxles refer to the fluid usage chart. (Figure 1)

CAUTION

AUTOMATIC TRANSMISSIONS / TRANSAXLES THAT REQUIRE MERCON® V SHOULD STILL ONLY USE MERCON(R) V OR DUAL USAGE FLUID LABELED MERCON(R) / MERCON(R) V.

PART NUMBER	PART NAME
XT-2-QDX	MERCON® (Quart)
XT-2-DDX	MERCON® (55 Gal. Drum)
XT-5-QM	MERCON® V (Quart)
XT-5-DM	MERCON® V (55 Gal. Drum)

NOTE: The information in Technical Service Bulletins is intended for use by trained, professional technicians with the knowledge, tools, and equipment to do the job properly and safely. It informs these technicians of conditions that may occur on some vehicles, or provides information that could assist in proper vehicle service. The procedures should not be performed by "do-it-yourselfers". Do not assume that a condition described affects your car or truck. Contact a Ford, Lincoln, or Mercury dealership to determine whether the Bulletin applies to your vehicle.

CAUTION

MERCON(R) SP, MOTORCRAFT PREMIUM AUTOMATIC TRANSMISSION FLUID AND MOTORCRAFT M5 ATFS ARE UNIQUE FLUIDS AND MUST BE USED IN APPLICATIONS RECOMMENDING THAT PARTICULAR FLUID.

USE OF ANY OTHER FLUID MAY CAUSE REDUCED FUNCTIONALITY OR TRANSMISSION DAMAGE.

CAUTION

THE FUNCTIONAL CHARACTERISTICS OF FLUIDS FOR CVT TRANSMISSIONS ARE VERY DIFFERENT THAN THOSE OF OTHER AUTOMATIC TRANSMISSION FLUIDS (ATFS).

USE OF A FLUID OTHER THAN MOTORCRAFT CONTINUOUSLY VARIABLE CHAIN TYPE TRANSMISSION FLUID OR ONE LABELED AS MEETING MERCON(R) C WILL CAUSE FUNCTIONALITY CONCERNS AND INTERNAL TRANSMISSION DAMAGE.

CAUTION

DO NOT USE AUTOMATIC TRANSMISSION FLUID SUPPLEMENTS, ADDITIVES, TREATMENTS OR CLEANING AGENTS.

WARRANTY STATUS: Information Only

Disclaimer

Fluid - A/T: Specifications

TYPE MA

CAPACITY, Initial Refill*: C-6 (shallow pan) 5.0 qt (US)

With the engine at operating temperature, shift

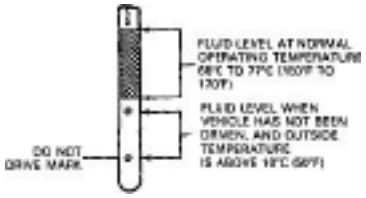
transmission through all gears. Check fluid level in PARK

and add fluid as needed

C-6 (deep pan) 6.0 qt (US)

E40D 8.5 qt (US)

Others 3.0 qt (US)



Fluid - A/T: Testing and Inspection Fluid Level Check

CHECKING OIL LEVEL

1. With transmission in Park, engine at curb idle RPM, foot brakes applied, and vehicle on a level surface, move transmission selector lever through

each range. Allow time in each range for transmission to engage, then return to Park and apply parking brake fully.

NOTE: If vehicle has been operated for an extended period at high speed, in city traffic during hot weather, or pulling a trailer, the vehicle should be turned off for about 30 minutes to allow the fluid to cool before checking.

NOTE: Vehicles equipped with 4X4 applications must have the 4X4 shift selector in any position other than neutral.

CAUTION: Your vehicle should not be driven if the fluid level is below the bottom hole on the dipstick and outside temperatures are above 10°C (50°F).

2. Clean all dirt from transmission dipstick cap. 3. Pull dipstick out of filler tube, wipe clean, and push dipstick back all the way into the filler tube, ensuring it is full seated. 4. Pull dipstick out of tube again and check fluid level as follows:

a. With transmission at operating temperature, 150° F-170° F, fluid level should be within the cross hatched area. b. With transmission at room temperature, 70° F-95° F, fluid should be between middle and top holes.

5. If it is necessary to add fluid, use only Dexron II or equivalent.

CAUTION: The use of fluid other than that specified could result in transmission malfunction and/or failure.

6. Install dipstick, ensuring it is fully seated in tube.

Adding Fluid

1. The fluid type is stamped on the dipstick. Before adding any fluid, be sure that the correct type will be used. 2. Add fluid in .25L (1/2 pint) increments through the filler tube to bring the level to the correct area on the dipstick. If an overfill occurs, excess

fluid should be removed.

Overfill can cause the fluid to foam and spill out through the transmission vent resulting in a transmission malfunction.

Undertill can result in transmission loss of engagement or slipping. This condition is most evident in cold weather or when the vehicle is parked or being driven on a hill.

If the transmission fluid level is checked when the fluid is at room temperature the dipstick could indicate that fluid should be added if the dipstick is misread. If fluid is added at this time, an overfill condition could result when the fluid reaches operating temperatures of 66° C-77°C (150°F-170°F) (dipstick hot to touch).

Fluid - A/T: Testing and Inspection Transaxle Fluid Cooler Flow Test

TRANSMISSION FLUID COOLER CHECK

1. Ensure linkage is properly adjusted and fluid level and control pressure are within specifications. 2. Remove transmission dipstick from filler tube and insert funnel in tube. 3. Raise and support vehicle. 4. Remove cooler return line from its fitting in the case, attach a hose to cooler return line and fasten free end of hose in funnel installed in filler tube. 5. Start engine and set idle at 1,000 RPM with transmission in Neutral. 6. Observe fluid flow at funnel. When flow is constant, it should be liberal. If there is not a liberal flow at 1,000 RPM in Neutral, low pump capacity,

main circuit system leakage, stuck converter charge relief valve, or cooler system restriction is indicated.

7. To separate transmission trouble from cooler system trouble, observe flow at transmission case converter-out fitting.

Fluid - A/T: Testing and Inspection Transmission Fluid Cooler Check

TRANSMISSION FLUID COOLER CHECK

1. Ensure linkage is properly adjusted and fluid level and control pressure are within specifications. 2. Remove transmission dipstick from filler tube and insert funnel in tube. 3. Raise and support vehicle. 4. Remove cooler return line from its fitting in the case, attach a hose to cooler return line and fasten free end of hose in funnel installed in filler tube. 5. Start engine and set idle at 1,000 RPM with transmission in Neutral. 6. Observe fluid flow at funnel. When flow is constant, it should be liberal. If there is not a liberal flow at 1,000 RPM in Neutral, low pump capacity,

main circuit system leakage, stuck converter charge relief valve, or cooler system restriction is indicated.

Fluid - A/T: Service and Repair

DRAIN AND REFILL

CAUTION: Normal maintenance and lubrication requirements do not necessitate periodic fluid changes. If a major failure has occurred in the transmission, it will have to be removed for service. At that time the converter, transmission cooler, and cooler lines must be flushed to remove any dirt. If vehicle accumulates 5,000 or more miles per month or is used in continuous stop and go service, change fluid every 30,000 miles as described.

NOTE: When filling a dry transmission and converter, approximate refill capacity is 9 quarts. Make final check using room temperature checking procedures. Procedures for partial drain and refill, due to in-vehicle service operation, are as follows:

1. Loosen pan attaching bolts and drain fluid. 2. Remove and thoroughly clean pan screen, discarding pan gasket. 3. Place new gasket on pan and install pan on transmission. 4. Add 3 quarts of fluid to transmission through filler tube. 5. Check fluid level following room temperature checking procedures.

ISSUE: Torque converter replacement guidelines and torque converter/transmission (or transaxle) cooling-system cleaning procedures are now available to reduce repeat repairs.

ACTION: Refer to the following guideline to properly diagnose and service torque converters and to properly clean the torque converter and transmission cooling system using forward flushing/backflushing. For diagnosis, service and cleaning, refer to to the appropriate model/year Service Manual, Sections 07-01, 07-02, 03-03, 307-01, 307-02, or 303-03.

OTHER APPLICABLE ARTICLES: NONE

WARRANTY STATUS: INFORMATION ONLY

OASIS CODES: 501000, 502000, 503000, 504000

Diagnostic Procedure

Prior to torque converter replacement, all diagnostic procedures must be followed. This is to prevent the unnecessary replacement of good torque converters. Only after a complete diagnostic evaluation can the decision be made to replace the torque converter.

The normal diagnostic procedure is as follows:

1. Preliminary inspection.

2. Know and understand the customers concern.

3. Verify the concern:

- Perform the Torque Converter Clutch Operation Test

4. Perform diagnostic procedures:

a. Run On-Board Diagnostics

- Repair all non-transmission-related Diagnostic

Trouble Codes (DTCs) first.

- Repair all transmission DTCs.

- Rerun On-Board Diagnostic to verify repair.

b. Perform Line Pressure Test

c. Perform Stall Speed Test

d. Diagnosis by Symptom Routines - Use the index to locate the appropriate routine that best describes the symptom(s). The routine will list all possible components that may cause or contribute to the symptom. Check each component listed, diagnose and service as required, before servicing the torque converter.

Replacement

The torque converter must be replaced if one or more of the following statements are true:

^ A torque converter malfunction has been determined based on completed diagnostic procedures

^ A converter stud(s), impeller hub or bushing is damaged

^ If there is discoloration of the torque converter (due to overheating)

^ The torque converter is found to be out of specification when performing the following checks (as applicable):

1. Torque Converter One-way Clutch Check

2. End Play Check

3. Stator-to-Turbine Interference Check

4. Converter Leakage Check

5. Stator-to-Impeller Interference Check

^ If there is evidence of transmission assembly or fluid contamination due to the following failure modes:

Torque converter Replacement Policy Failure Modes Major metallic failure

Multiple clutches or clutch plate failures

Sufficient component wear which results in metallic contamination

Torque Converter & Transmission Cooling System Cleaning

REQUIRED TOOLS	
Tool Number	Description
014-00028	Rotunda Converter/Oil Cooler Cleaner
014-00752	Rotunda Oil Cooler Flusher Kit
T77L-7902-R	Converter Clutch Holding Tool
T76L-7902-C	Converter Clutch Torquing Tool
TOOL-4210-C	Dial Indicator With Bracketry
T80L-7902-A	End Play Checking Tool
014-R1075	Torque Converter Leak Check Tool And Gasket
007-00500	New Generation Star (NGS) Tester
007-00085D	Rotunda Transmission Tester Kit - includes all cables and overlays required for transmission/transaxle diagnosis. Refer to the Service Manual for the correct cable/overlay combination to use. Individual cables/overlays and the tester may be ordered separately from Rotunda.

When the torque converter is replaced, the following actions must take place:

1. All cooler lines must be thoroughly cleaned by Back and Forward Flushing using Service Manual procedure.

2. All coolers (in-tank and auxiliary) must be thoroughly cleaned by Back and Forward Flushing using Service Manual procedure.

3. All Cooler By-Pass Valves (CBV), it equipped, must be removed and thoroughly cleaned using Service Manual procedures. Replace rubber coated sealing washers prior to reinstalling CBV. Replace CBV if damaged or plugged.

4. Perform Transmission Cooler Flow Test - If the Transmission Cooling System fails the Flow Test, the coolers, CBVs or lines must be replaced. If the coolers are to be replaced, use only factory approved service parts.

If the torque converter is not being replaced, the following actions must take place:

1. The torque convener must be thoroughly cleaned:

a. Torque converters with drain plugs can be cleaned using the Rotunda Torque Converter Cleaner Follow the instructions included with the equipment.

b. Torque converters without drain plugs can be cleaned by hand. Partially fill the converter using clean transmission fluid (as recommended for the particular transmission). Hand agitate the converter and then thoroughly drain the fluid. Refill with new fluid, specified for the transmission, and reinstall.

2. All cooler lines must be thoroughly cleaned by Back and Forward Flushing using Service Manual procedure.

3. All coolers (in-tank and auxiliary) must be thoroughly cleaned by Back and Forward Flushing using Service Manual procedure.

4. All Cooler By-Pass Valves (CBV), if equipped, must be removed and thoroughly cleaned using Service Manual procedures. Replace rubber coated sealing washers prior to reinstalling CBV. Replace CBV if damaged or plugged.

5. Perform Transmission Cooler Flow Test - If the Transmission Cooling System fails the Flow Test, the coolers, CBVs or lines must be replaced. If the coolers are to be replaced, use only factory approved service parts.

LIGHT TRUCK: 1985-90 BRONCO II 1985-97 RANGER 1987-97 AEROSTAR 1991-97 EXPLORER

ISSUE: Some vehicles may experience excessive torque converter slippage, torque converter not engaging, or Diagnostic Trouble Code (DTC) 628 or P0741 stored in memory. This may be caused by damage to the fluid pump support seal and/or to the groove on the pump where the seal is located.

ACTION: Inspect the fluid pump seal for damage. Refer to the following Service Procedure for details.

SERVICE PROCEDURE

1. Follow normal diagnostic procedures as listed in the appropriate Service Manual.

2. Inspect the fluid pump support for damage. If damaged, also inspect the fluid pump support seal groove on the pump.

3. If the groove is damaged, replace the pump.

4. If the groove is not damaged, replace the fluid pump support seal with a redesigned Seal (F77Z-7L323-AA). Refer to Figure 1.

5. Do not replace the torque converter unless it is damaged or fails the criteria listed in the appropriate Service Manual and/or refer to TSB 96-26-12.

Governor: Testing and Inspection

GOVERNOR TEST

NOTE: The governor can be checked at the same time as the Control Pressure Test is performed and in the same manner.

1. Raise and support rear of vehicle, then disconnect and plug the vacuum line to the vacuum diaphragm unit. 2. Connect the line from the distributor tester to the vacuum diaphragm unit and install automatic transmission tester.

CAUTION: Never exceed 60 MPH speedometer speed.

3. Place transmission in D2, with no load on engine, and apply 10 inches of vacuum to vacuum diaphragm unit. 4. Increase speed slowly and watch speedometer, noting speed at which control pressure cutback occurs. It should occur between 8 and 12 mph. 5. Decrease vacuum at vacuum diaphragm to 0.0-2.0 inches. Control pressure cutback should occur between 10 and 14 mph.

NOTE: After each test, move selector to N and run engine at 1,000 RPM to cool transmission.

6. The governor is good if cutback occurs within specifications. If cutback does not occur within specifications, check shift speed to verify that it is

the governor and not a stuck cutback valve, then repair or replace governor as necessary.

Governor: Service and Repair Removal and Installation

REMOVAL

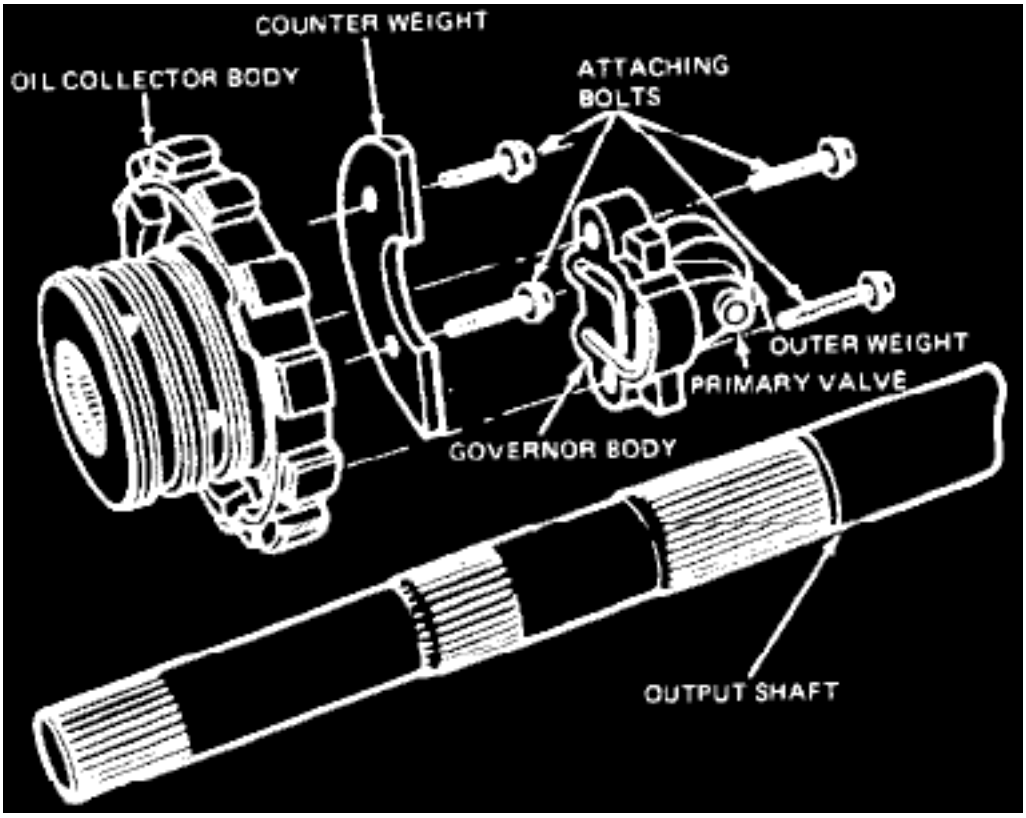
NOTE: Refer to Technical Service Bulletins (TSB) for governor seal ring replacement information.

1. Remove extension housing. 2. Remove governor body to oil collector body attaching bolts. 3. Remove governor body, valve, spring, and weight from collector body.

NOTE: Components are not retained once governor body to oil collector body attaching bolts have been removed. It is therefore necessary to hold the governor body and components while removing or installing.

INSTALLATION

1. Reverse procedure to install.



Governor: Service and Repair Disassembly and Assembly

DISASSEMBLE

NOTE: Refer to Technical Service Bulletins (TSB) for governor seal ring replacement information.

Exploded View Of Oil Collector And Governor Bodies

1. Remove governor body to oil collector body attaching bolts.

NOTE: When governor body attaching bolts are removed, the governor components are no longer retained in position to the governor body. Care must be taken not to drop the governor body and components when the attaching bolts are removed.

2. Remove governor components from governor body. 3. Remove counterweight. 4. Clean all parts, replacing any that are worn or damaged.

ASSEMBLE

1. Assemble outer weight spring and primary valve in governor body. 2. Assemble governor body and counterweight to oil collector body.

Recall - A/T A4LD Park Pawl Spring Update

RECALL NUMBER 91S41-S1

Date May, 1992

PARTS AVAILABILITY At Dealers By as Req'd 0% of Parts Direct Shipped to Dealers At PDC By Now Date in Owner Letter June, 1992

PLEASE PROVIDE COPIES OF THIS BULLETIN TO THE PARTS MANAGER AND TO THE SERVICE MANAGER

TO: All Ford Dealers

Reference: Safety Recall Bulletin 91S41, dated February 21, 1992

Subject: Safety Recall 91S41 Supplement # 1 - Additional Units

The purpose of this bulletin is to advise you that some additional trucks have been added to the population of the referenced recall. According to our records, the additional involved vehicle(s) shown on the enclosed listing have been delivered to your dealership.

NOTIFICATION OF OWNERS

Vehicle owners whose names and addresses are shown on the enclosed listing are being notified by First: Class Mail. If the owner of any vehicle cannot be contacted or does not make an appointment to have his vehicle corrected, advise your FPSD District Office of the owner's name and address so that we can handle further notification.

AFFECTED VEHICLES

All 1990 Bronco II and 1991 Rangers with standard A4LD transmissions. Certain 1989 Aerostars built from July 21, 1989 through end of 1989 model year with 1990 model Western Region (California, Oregon, Washington, Alaska and Hawaii) A4LD transmissions.

NOTE: Approximately 2,300 1990 model year transmissions were installed in late built 1989 Aerostars. For 1989 Aerostar vehicles, dealers need to check the model year of the transmission on the identification tag.

If the transmission model is 90GT-XXX, perform the recall.

If the transmission model is 89GT-XXX, the vehicle does NOT require the modification.

Two copies of a listing identifying affected dealers and involved vehicles in your district are enclosed with this mailing.

Please inform district personnel of these additional units in the recall. If you have any questions, call the FPSD Safety Recall Office.

June, 1992

Mr. John Sample 123 Main Street Anywhere, USA 12345

This notice is sent to you in accordance with the requirements of the National Traffic and Motor Vehicle Safety Act.

Ford Motor Company has determined that a defect which relates to motor vehicle safety exists in certain 1990 Bronco II, 1991 Rangers and 1989 Aerostars equipped with an automatic transmission.

Safety Defect

WARNING: The automatic transmission park mechanism sometimes may not prevent your vehicle from freely rolling even if the transmission shift lever is firmly placed in the "PARK" position.

WARNING IF YOU PARK YOUR VEHICLE WITHOUT SETTING THE PARKING BRAKE, IT COULD ROLL FREELY CREATING THE POSSIBILITY OF A CRASH OR PERSONAL INJURY.

The automatic transmission park mechanism sometimes may not hold your vehicle in a parked position. Parking on a slope such as a driveway, inclined parking lot or any non-level parking area without firmly setting the parking brake, may result in your vehicle freely rolling down the incline or slope without warning.

Repairs At no cost to you, your dealer will inspect your vehicle and, if necessary, replace the park pawl spring in the transmission and install a spring on the transmission shift cable.

How long will it take? The time needed to repair your vehicle is less than three hours. However, due to service scheduling times, your dealer may need your vehicle for one full working day.

Call your dealer Call your dealer without delay. Ask for a service date and whether parts are in stock.

If your dealer does not have the parts in stock, they can be ordered before scheduling your service date. Parts would be expected to arrive in approximately one week.

When you bring your vehicle in, give the dealer this letter.

If you misplace this letter, your dealer will still do the work, free of charge.

Changed address or sold the vehicle? If you have, please fill out enclosed prepaid postcard and mail it to us.

If the dealer doesn't make the repair promptly and without charge, you may contact the Ford Customer Assistance Center, 300 Renaissance Center, P.O. Box 43360, Detroit, MI., 48234. You also may send a complaint to the Administrator, National Highway Traffic Safety Administration, 400 Seventh Street, SW, Washington, DC 20590 or call the toll free Auto Safety Hotline 1-800-424-9393 (Washington DC area residents may call 366-0123).

We regret the inconvenience this service may cause you, but we want you to have the work done for your safety and satisfaction with your Ford-built vehicle.

Dealer Letter

June, 1992

To: All NAAO Export Sales North American Ford Product Dealers in U.S. Federalized Markets and Involved Dealers in Non-Federalized Locations

All NAAO Export Sales District Offices All Affiliated Ford Motor Companies - Service Managers

Subject: Safety Recall 91S41 Supplement # 1 - Additional Units

AFFECTED VEHICLES All 1990 Bronco II and 1991 Rangers with standard A4LD transmissions. Certain 1989 Aerostars built from July 21, 1989 through the end of 1989 model year with 1990 model Western Region (California, Oregon, Washington, Alaska and Hawaii) A4LD transmissions.

Enclosed are copies of FPSD's Safety Recall 91S41-S1 bulletin applicable to the above stated North American Ford-built vehicles. A sample copy of NAAO Export Sales' owner notification letter is included. If your dealership/location is involved, the applicable VIN listing is included. If not, use the bulletin as information only.

Please note that some details in the enclosed bulletin such as parts ordering and claim submission procedures are applicable to U.S. dealers only. Therefore, please observe the following administrative procedures:

1. Parts Order

Order the parts directly from FPSD-IDO, Windsor, Canada, using conventional parts ordering procedures. Parts will be reimbursed by submission of recall claim Form(s) 1864.

2. Reimbursement

Only the Form 1864 will be accepted for reimbursement under this Recall. Upon completion of the required service, the Form 1864 must be completely filled out and signed by authorized dealer personnel. Dealers having Direct Warranty Entry (DWE) are to use that method of claims submission.

PLEASE ENSURE THAT COPIES OF THIS RECALL ANNOUNCEMENT ARE ROUTED TO YOUR PARTS AND SERVICE PERSONNEL

June, 1992 Serial Number: 91S41

This notice is sent to you in accordance with the requirements of the U.S. National Traffic and Motor Vehicle Safety Act.

Ford Motor Company has determined that a defect which relates to motor vehicle safety exists in certain 1990 Bronco II, 1991 Rangers and 1989 Aerostars equipped with an automatic transmission.

Safety Defect The automatic transmission park mechanism sometimes may not prevent your vehicle from freely rolling even if the transmission shift lever is firmly placed in the "PARK" position.

If the dealer does not make the repair promptly and without charge, please fill out section 3 of the prepaid postcard and mail it to us. You also may send a complaint to the Administrator, National Highway Traffic Safety Administration, 400 Seventh Street, SW, Washington, DC 20590 or call the toll free Auto Safety Hotline 800-424-9393.

We regret the inconvenience this service may cause you, but we want you to have the work done for your safety and satisfaction with your Ford-built vehicle.

Parking Pawl: Recalls Recall 91V189000: Park Pawl Defect

WHEN THE AUTOMATIC TRANSMISSION SHIFT LEVER IS PLACED IN THE PARK POSITION, THE PARK PAWL DOES NOT ALWAYS ABUT OR ENGAGE THE PARK GEAR. DRIVER MAY BELIEVE THE VEHICLE IS SAFELY ENGAGED IN PARK WHEN THE GEAR IS NOT TRULY ENGAGED. THIS CAN LEAD TO THE VEHICLE JUMPING OUT OF GEAR UNINTENTIONALLY, VEHICLE ROLLAWAY WHEN PARKED ON A SLOPED SURFACE, AND INADVERTENT MOTION WHEN THE VEHICLE IS STARTED. ALL OF THESE CONDITIONS CAN RESULT IN A VEHICLE ACCIDENT. REPAIR THE TRANSMISSION WITH A NEW PARK PAWL.

SYSTEM: TRANSMISSION.

VEHICLE DESCRIPTION: PICKUP TRUCKS, VANS, AND MULTI-PURPOSE VEHICLES EQUIPPED WITH A 4LD AUTOMATIC TRANSMISSIONS.

If the transmission model is 89GT-XXX, the vehicle does NOT require the modification.

Two copies of a listing identifying affected dealers and involved vehicles in your district are enclosed with this mailing.

Please inform district personnel of these additional units in the recall. If you have any questions, call the FPSD Safety Recall Office.

June, 1992

Mr. John Sample 123 Main Street Anywhere, USA 12345

This notice is sent to you in accordance with the requirements of the National Traffic and Motor Vehicle Safety Act.

Ford Motor Company has determined that a defect which relates to motor vehicle safety exists in certain 1990 Bronco II, 1991 Rangers and 1989 Aerostars equipped with an automatic transmission.

Safety Defect

WARNING: The automatic transmission park mechanism sometimes may not prevent your vehicle from freely rolling even if the transmission shift lever is firmly placed in the "PARK" position.

WARNING IF YOU PARK YOUR VEHICLE WITHOUT SETTING THE PARKING BRAKE, IT COULD ROLL FREELY CREATING THE POSSIBILITY OF A CRASH OR PERSONAL INJURY.

The automatic transmission park mechanism sometimes may not hold your vehicle in a parked position. Parking on a slope such as a driveway, inclined parking lot or any non-level parking area without firmly setting the parking brake, may result in your vehicle freely rolling down the incline or slope without warning.

Repairs At no cost to you, your dealer will inspect your vehicle and, if necessary, replace the park pawl spring in the transmission and install a spring on the transmission shift cable.

How long will it take? The time needed to repair your vehicle is less than three hours. However, due to service scheduling times, your dealer may need your vehicle for one full working day.

Call your dealer Call your dealer without delay. Ask for a service date and whether parts are in stock.

If your dealer does not have the parts in stock, they can be ordered before scheduling your service date. Parts would be expected to arrive in approximately one week.

When you bring your vehicle in, give the dealer this letter.

If you misplace this letter, your dealer will still do the work, free of charge.

Changed address or sold the vehicle? If you have, please fill out enclosed prepaid postcard and mail it to us.

If the dealer doesn't make the repair promptly and without charge, you may contact the Ford Customer Assistance Center, 300 Renaissance Center, P.O. Box 43360, Detroit, MI., 48234. You also may send a complaint to the Administrator, National Highway Traffic Safety Administration, 400 Seventh Street, SW, Washington, DC 20590 or call the toll free Auto Safety Hotline 1-800-424-9393 (Washington DC area residents may call 366-0123).

We regret the inconvenience this service may cause you, but we want you to have the work done for your safety and satisfaction with your Ford-built vehicle.

Dealer Letter

June, 1992

To: All NAAO Export Sales North American Ford Product Dealers in U.S. Federalized Markets and Involved Dealers in Non-Federalized Locations

All NAAO Export Sales District Offices All Affiliated Ford Motor Companies - Service Managers

Subject: Safety Recall 91S41 Supplement # 1 - Additional Units

AFFECTED VEHICLES All 1990 Bronco II and 1991 Rangers with standard A4LD transmissions. Certain 1989 Aerostars built from July 21, 1989 through the end of 1989 model year with 1990 model Western Region (California, Oregon, Washington, Alaska and Hawaii) A4LD transmissions.

Enclosed are copies of FPSD's Safety Recall 91S41-S1 bulletin applicable to the above stated North American Ford-built vehicles. A sample copy of NAAO Export Sales' owner notification letter is included. If your dealership/location is involved, the applicable VIN listing is included. If not, use the bulletin as information only.

Please note that some details in the enclosed bulletin such as parts ordering and claim submission procedures are applicable to U.S. dealers only. Therefore, please observe the following administrative procedures:

1. Parts Order

Order the parts directly from FPSD-IDO, Windsor, Canada, using conventional parts ordering procedures. Parts will be reimbursed by submission of recall claim Form(s) 1864.

2. Reimbursement

Only the Form 1864 will be accepted for reimbursement under this Recall. Upon completion of the required service, the Form 1864 must be completely filled out and signed by authorized dealer personnel. Dealers having Direct Warranty Entry (DWE) are to use that method of claims submission.

PLEASE ENSURE THAT COPIES OF THIS RECALL ANNOUNCEMENT ARE ROUTED TO YOUR PARTS AND SERVICE PERSONNEL

June, 1992 Serial Number: 91S41

This notice is sent to you in accordance with the requirements of the U.S. National Traffic and Motor Vehicle Safety Act.

Ford Motor Company has determined that a defect which relates to motor vehicle safety exists in certain 1990 Bronco II, 1991 Rangers and 1989 Aerostars equipped with an automatic transmission.

Safety Defect The automatic transmission park mechanism sometimes may not prevent your vehicle from freely rolling even if the transmission shift lever is firmly placed in the "PARK" position.

WARNING IF YOU PARK YOUR VEHICLE WITHOUT SETTING THE PARKING BRAKE, IT COULD ROLL FREELY CREATING THE POSSIBILITY OF A CRASH OR PERSONAL INJURY.

The automatic transmission park mechanism sometimes may not hold your vehicle in a parked position. Parking on a slope such as a driveway, inclined parking lot or any non-level parking area without firmly setting the parking brake, may result in your vehicle freely rolling down the incline or slope without warning.

Repairs At no cost to you, your dealer will inspect your vehicle and, if necessary replace the park pawl spring in the transmission and install a spring on the transmission shift cable.

Call Your Dealer Call your dealer without delay. Ask for a service date and if parts are in stock. If your dealer does not have the parts in stock, they can be ordered before scheduling your service date.

When you bring your car in, give the dealer the enclosed form. If you misplace the form, your dealer will still do the work, free of charge.

Changed Address or Sold the Vehicle? If you have, please fill out Section 1 of the prepaid postcard and mail it to us.

If the dealer does not make the repair promptly and without charge, please fill out section 3 of the prepaid postcard and mail it to us. You also may send a complaint to the Administrator, National Highway Traffic Safety Administration, 400 Seventh Street, SW, Washington, DC 20590 or call the toll free Auto Safety Hotline 800-424-9393.

We regret the inconvenience this service may cause you, but we want you to have the work done for your safety and satisfaction with your Ford-built vehicle.

Parking Pawl: All Technical Service Bulletins Recall 91V189000: Park Pawl Defect

WHEN THE AUTOMATIC TRANSMISSION SHIFT LEVER IS PLACED IN THE PARK POSITION, THE PARK PAWL DOES NOT ALWAYS ABUT OR ENGAGE THE PARK GEAR. DRIVER MAY BELIEVE THE VEHICLE IS SAFELY ENGAGED IN PARK WHEN THE GEAR IS NOT TRULY ENGAGED. THIS CAN LEAD TO THE VEHICLE JUMPING OUT OF GEAR UNINTENTIONALLY, VEHICLE ROLLAWAY WHEN PARKED ON A SLOPED SURFACE, AND INADVERTENT MOTION WHEN THE VEHICLE IS STARTED. ALL OF THESE CONDITIONS CAN RESULT IN A VEHICLE ACCIDENT. REPAIR THE TRANSMISSION WITH A NEW PARK PAWL.

SYSTEM: TRANSMISSION.

VEHICLE DESCRIPTION: PICKUP TRUCKS, VANS, AND MULTI-PURPOSE VEHICLES EQUIPPED WITH A 4LD AUTOMATIC TRANSMISSIONS.

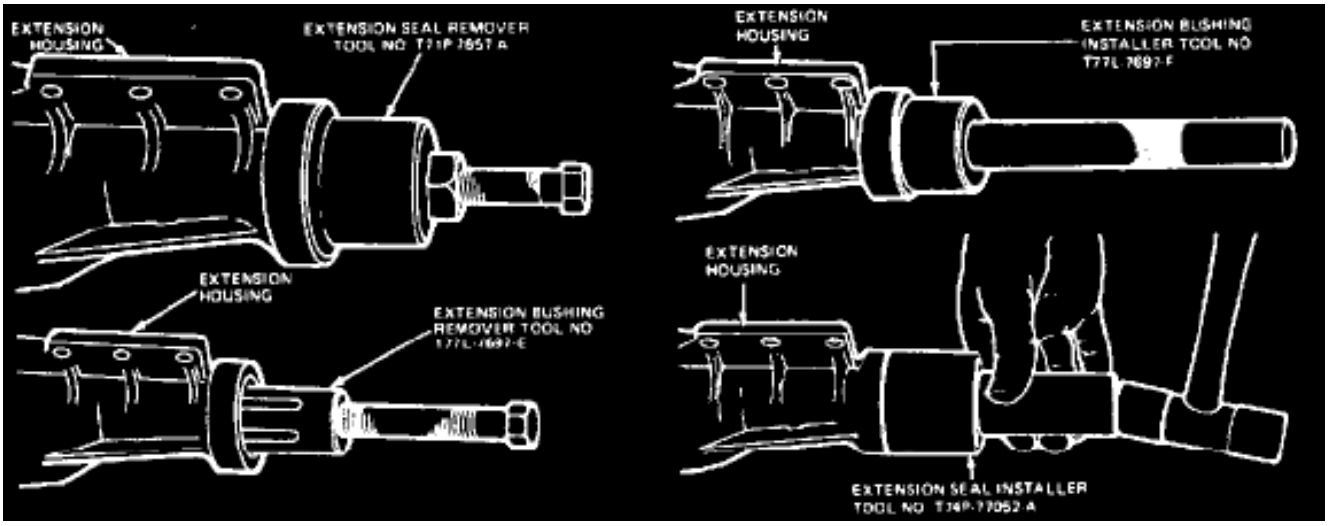
Control Module: Locations Supercab

Body Components

Between Bottom Of LH ``B'' Pillar & Rear Of Cab



Seals and Gaskets: Service and Repair

REMOVAL

1. Raise and support vehicle. 2. Install scribe marks on propeller shaft end yoke and rear axle companion flange, then remove propeller shaft.

Replacing Extension Housing Rear Seal And Bushing

3. Using extension housing seal remover tool No. T71P-7657-A or equivalent, remove oil seal. 4. Using extension housing bushing remover tool No. T77L-7697-E or equivalent, remove extension housing bushing.

INSTALLATION

1. Using extension housing bushing replacer tool No. T77L-7697-F or equivalent, install new extension housing bushing. 2. Inspect sealing surface of universal joint yoke for scoring, replacing yoke as necessary. 3. Inspect counterbore of housing for burrs, removing as necessary. 4. Using extension housing seal replacer tool No. T74P-77052-A or equivalent, install new oil seal. Coat inside diameter at end of rubber boot

portion of seal and the front universal joint spline with suitable lubricant.

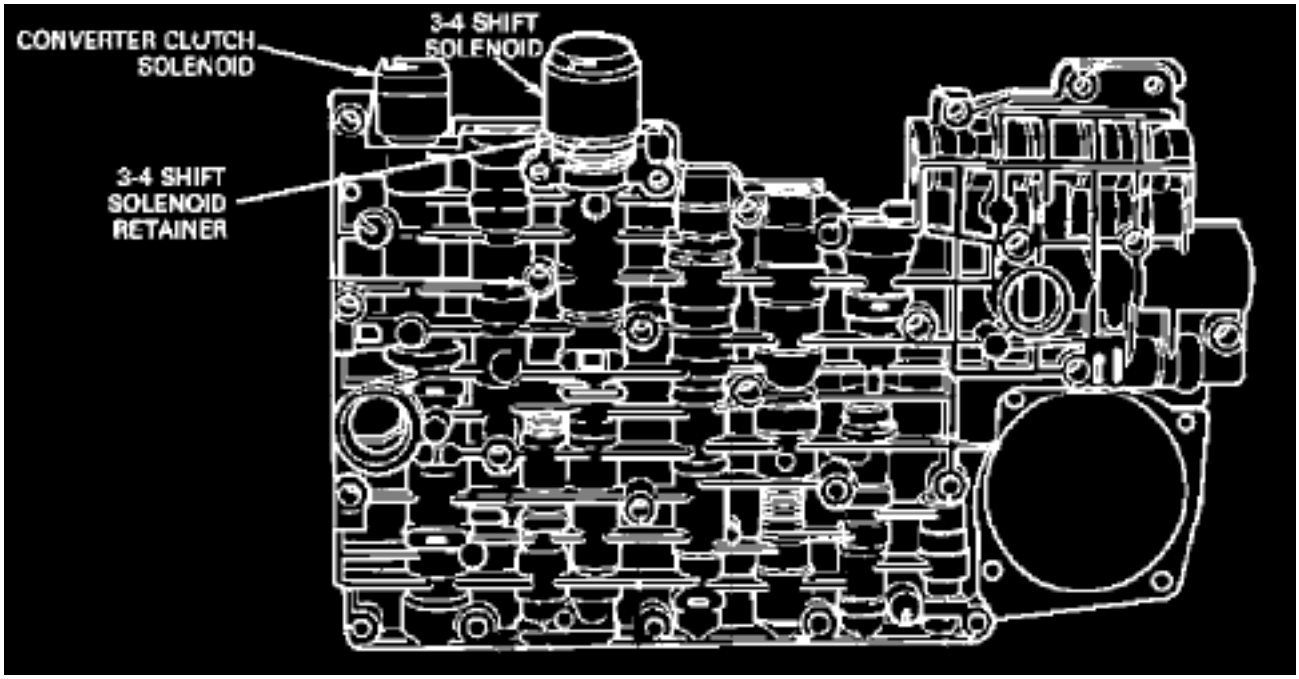
5. Install propeller shaft, aligning scribe marks, then lower vehicle and check transmission fluid level, adding fluid as necessary.

Transmission Temperature Sensor/Switch: Testing and Inspection

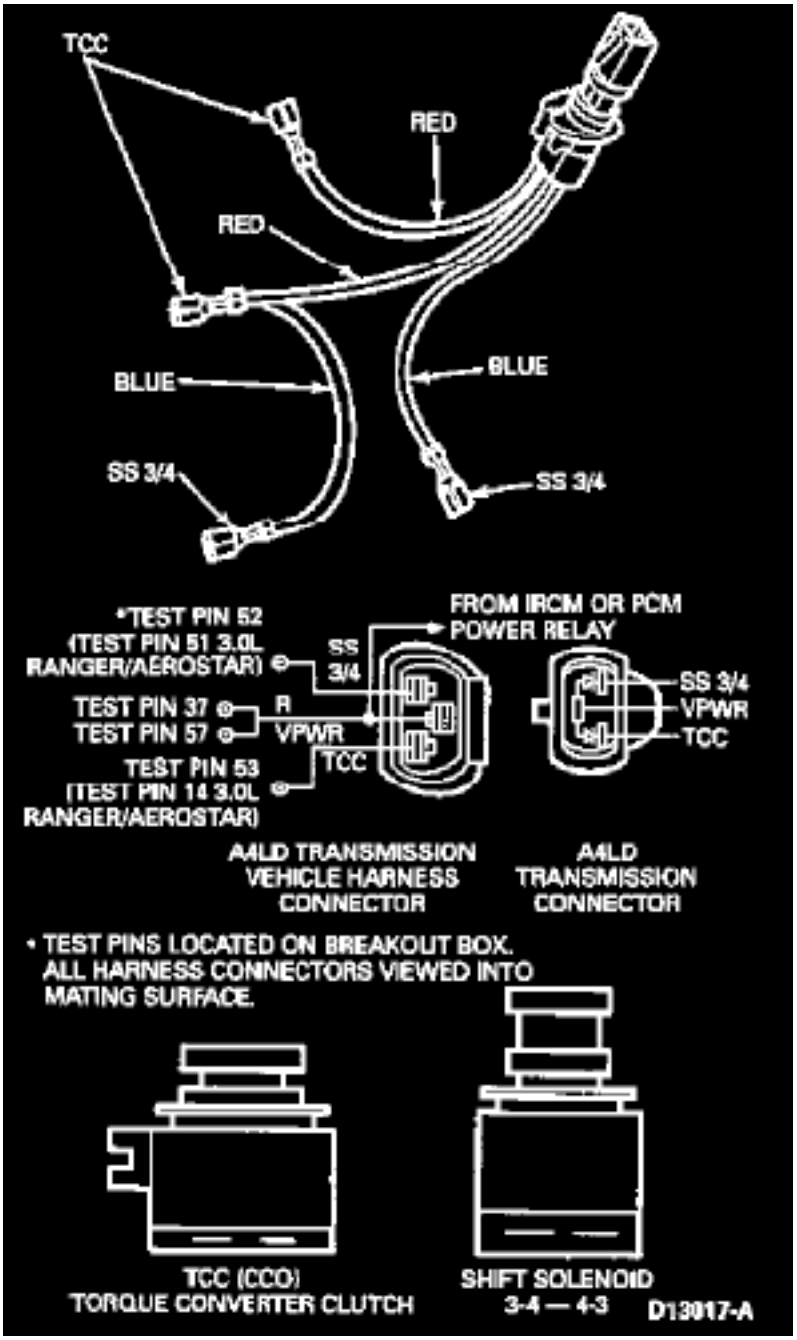
Pinpoint testing procedures for this component are located in the system level Testing and Inspection.

CONDITION	POSSIBLE CAUSE	ACTION
• Shift Lock allows shifting out of park with ignition in RUN and brake pedal not depressed.	• No power to Shift Lock Actuator.	• Check Fuse 1. • With Ignition Switch in RUN, check for battery voltage on 298 (P/O) wire at Shift Lock Actuator.
	• Open ground.	• Check continuity of 57 (BK) wire to ground G200.
	• Inoperative solenoid/cable assembly.	• With solenoid energized, check cable at shifter for no play. • With solenoid deenergized, check cable at shifter for free play.
• Shift Lock does not allow shifting with ignition in RUN and brake pedal depressed.	• Inoperative Stop Lamp Switch.	• Check for battery voltage on 10 (LG/R) wire at Stop Lamp Switch. • Connect a jumper wire across the Stop Lamp Switch with the Ignition Switch in RUN. If Actuator unlocks, replace Stop Lamp Switch. If Actuator remains locked, check continuity of 810 (R/LG) wire from Stop Lamp Switch to Shift Lock Actuator.
	• Inoperative solenoid/cable assembly.	• With solenoid energized, check cable at shifter for no play. • With solenoid deenergized, check cable at shifter for free play.

Troubleshooting Hints



CONVERTER CLUTCH SOLENOID
3-4 SHIFT SOLENOID
3-4 SHIFT SOLENOID RETAINER



Shift Solenoid: Description and Operation

Shift Solenoid 3-4 (SS 3-4)

The 3-4 shift solenoid is used to control the 3-4/4-3 shift valve.

Transmission Function: Used to shift from third gear to fourth gear, and fourth gear to third gear.

Shifter A/T: Description and Operation

SELECTOR SHIFT PATTERNS

NOTE: The A4LD uses a seven position, Select Shift control. It is linked to the manual lever on the transmission to select the desired operating position.

1. In the (Park) position the transmission is in neutral. The output shaft is locked to the case by engaging a parking pawl within the paring gear. The

engine can be started in this selector position. This is the only position in which the ignition key can be removed.

2. In the R (Reverse) position the transmission is in reverse at a reduced ratio. 3. In the N (Neutral) position the transmission is in neutral but the output shaft is not locked to the case. The engine can be started, and the parking

brake applied, since the rear wheels are free to turn.

4. The OD (Overdrive) position is the normal driving position. Selection of this position provides all automatic shifts including the application and

release of the converter clutch. The transmission may also be shifted manually between all forward ranges.

5. The D (Drive) position provides all automatic shifts, including the application and release of the converter clutch, except the shift into overdrive.

This position can be used when overdrive is not wanted such as hilly/mountainous terrain or trailer towing.

6. The 2 (Manual Second) position provides only 2nd gear operation regardless of vehicle speed. It is useful for start-up on slippery surfaces or to

provide engine braking on downgrades.

7. The Manual Low) position, when Selected at start-up, provides only 1st gear operation. Selection of this position at higher speeds results in a

downshift to second gear. An automatic downshift to low will occur only after vehicle speed decreases to approximately 30 mph, dependent on axle ratio and tire size. Once in low, the transmission will stay in low until the selector lever is moved to another position.

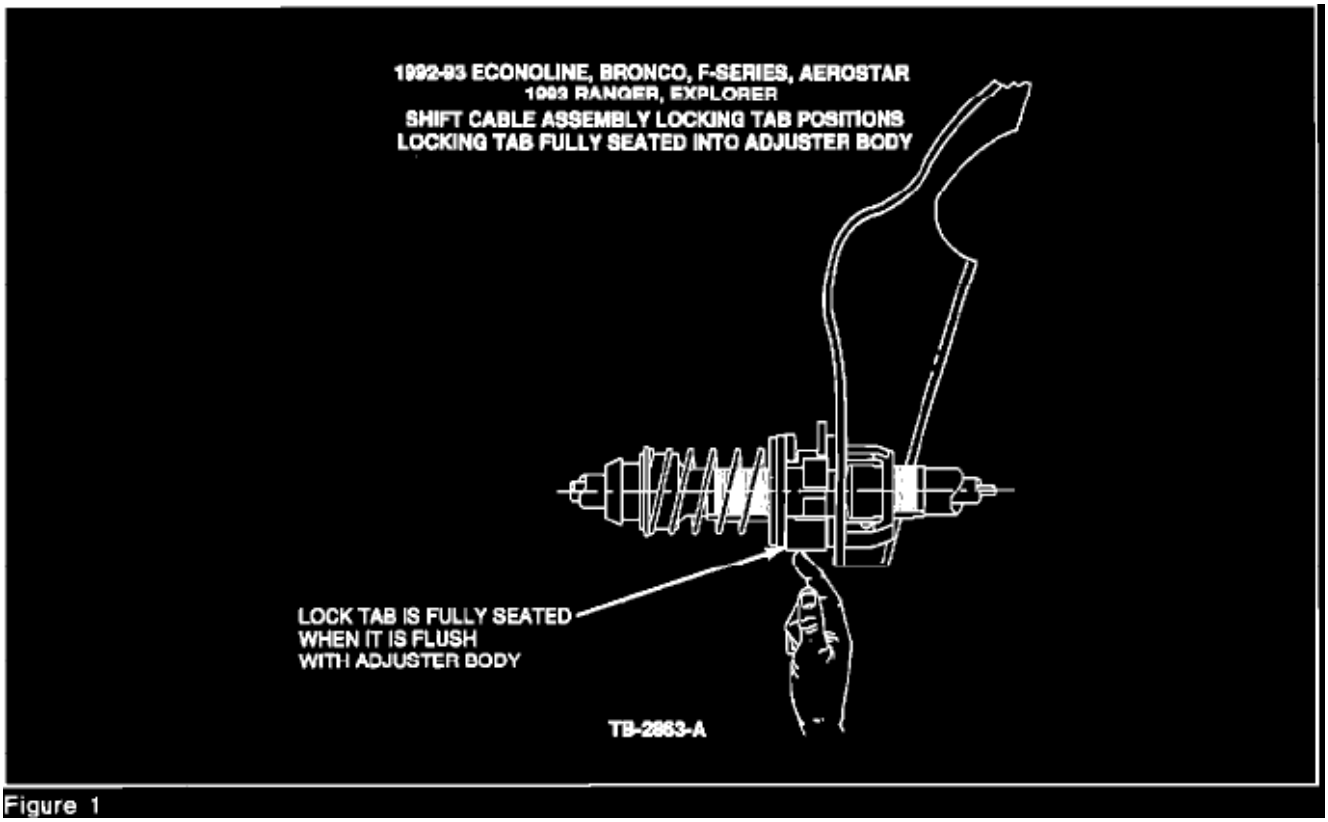


Figure 1

Shift Cable: Customer Interest A/T - Shift Selector Indicates Incorrect Gear

Article No. 93-5-14

March 3, 1993

TRANSMISSION - SHIFT LEVER PRNDL POSITION MAY NOT MATCH THE TRANSMISSION GEAR

LIGHT TRUCK: 1989-90 BRONCO II 1989-93 RANGER 1991-93 EXPLORER 1992-93 AEROSTAR, BRONCO, ECONOLINE, F-150-350 SERIES, F-47

This TSB article is being republished in its entirety to include other transmissions in addition to the A4LD.

ISSUE: The position of the shift lever, shown on the PRNDL, may not always show the proper gear in the transmission. This could be caused by the transmission control cable assembly locking tab not being fully seated or secure in the cable body.

ACTION:

Inspect the position of the shift lever on the PRNDL. If it appears to be misadjusted, check the locking tab to be sure that it is fully seated in the cable body, Figure 1. The locking tab is available as a service part. It is not necessary to replace the shift cable assembly. Refer to the following procedure for service, details.

If the locking tab is not seated flush with the cable adjustor body, proceed as follows:

1. Remove the tab from the adjustor body with a pair of pliers.

NOTE:

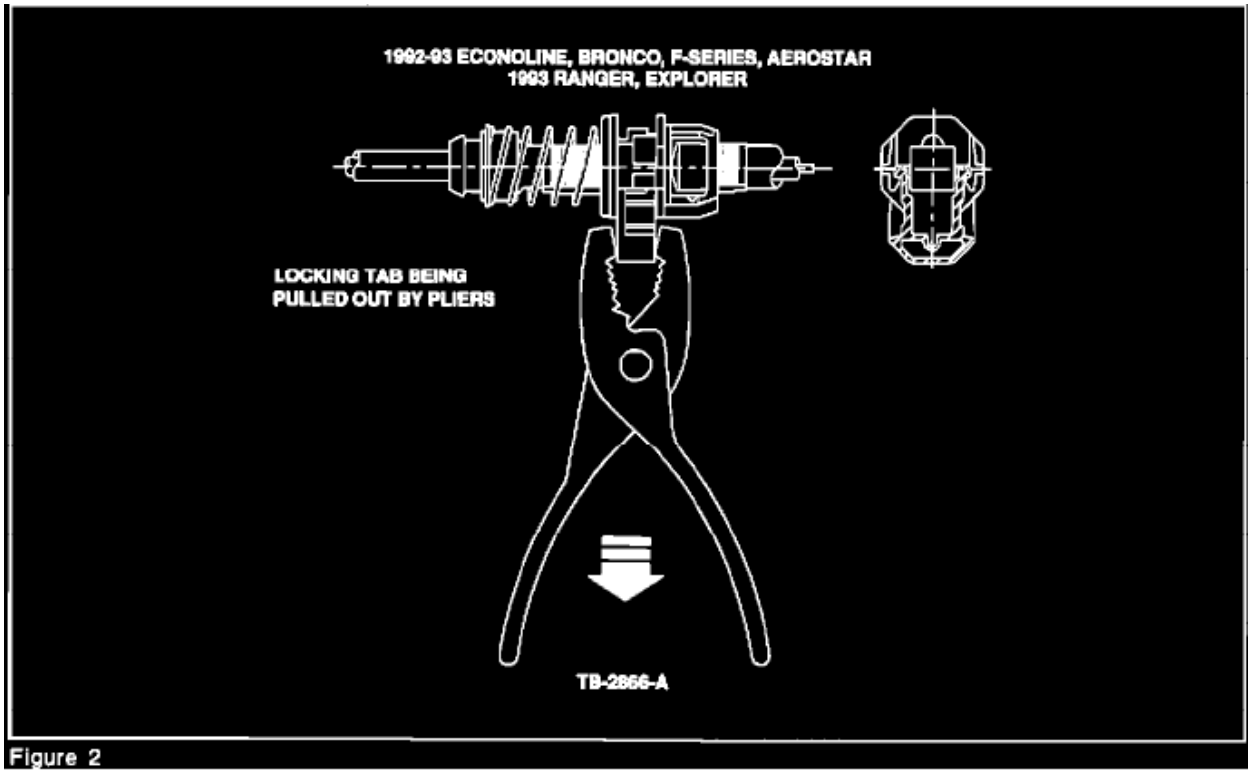

Figure 2

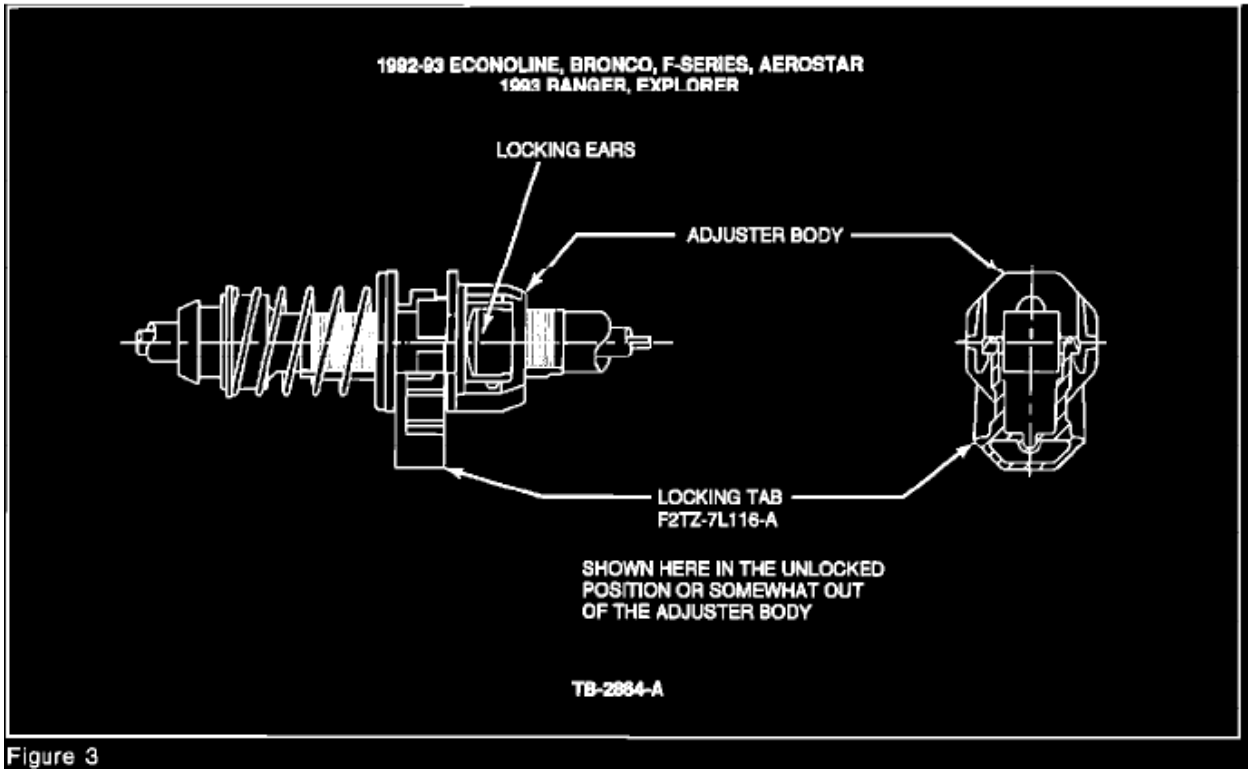

Figure 3

TO PREVENT REMOVING THE CABLE BODY FROM THE TRANSMISSION BRACKET, HOLD THE CABLE WITH THE OTHER HAND WHILE PULLING OUT THE TAB. APPLY A FORCE OF

ABOUT 15 TO 20 LBS., REFER TO FIGURE 2.

2. Replace the existing locking tab with a new locking tab. Refer to the Parts Block for correct parts usage.

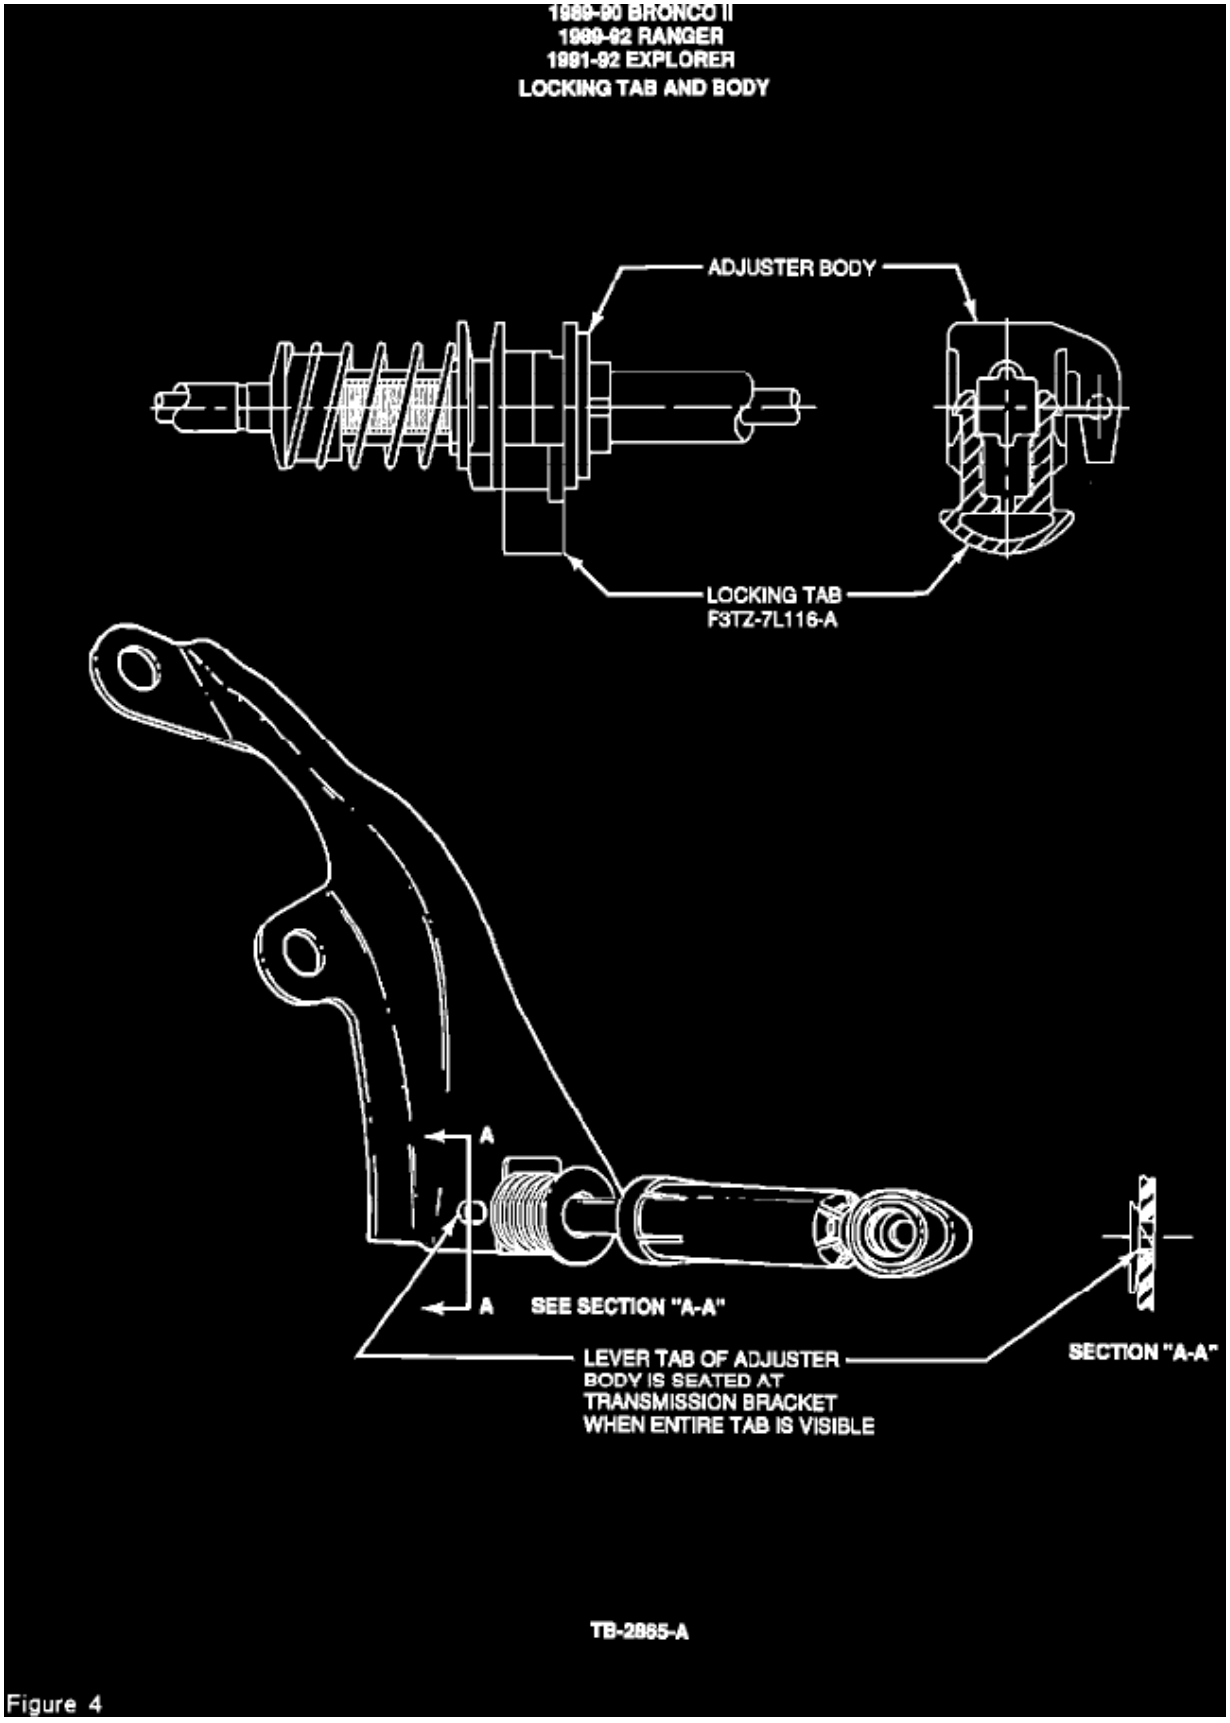

Figure 4

3. Push the new lock tab into the cable adjustor only half way, Figures 3 and 4.

4. Adjust the shift system according to the service manual before fully seating the new locking tab.

NOTE: BE SURE THE CABLE BODY IS SECURE IN THE TRANSMISSION BRACKET AFTER SERVICE IS COMPLETE. SEE FIGURE 4.

CAUTION: IF THE LOCKING TAB WAS NOT FULLY SEATED, IT MAY HAVE TAKEN A PERMANENT SET. THEREFORE, DO NOT REUSE THE LOCKING TAB.

Shift Cable: Adjustments

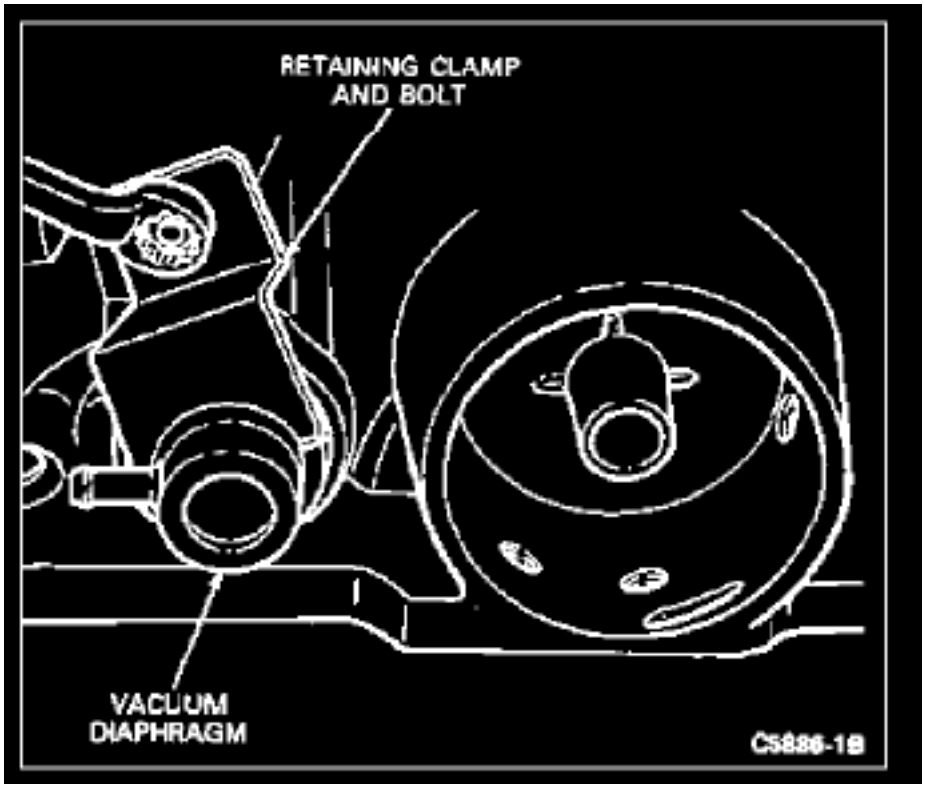
KICKDOWN CABLE ADJUST

NOTE: The kickdown cable is self-adjusting.

1. The cable automatically adjusts to proper length after installation by depressing accelerator pedal to floor. 2. If the kickdown cable requires readjustment after installation, reset the cable by depressing the D-flat while pulling the conduit back from cable

body.

3. The cable will automatically readjust to the proper length when accelerator pedal is depressed to the floor.



Shift Modulator: Service and Repair

Vacuum Diaphragm

Removal and Installation

1. On 4.0L and 2.9L 4x4 vehicles, remove nut from studded bolt and remove heat shield from studded bolt and clips on frame.

2. Disconnect hose from vacuum diaphragm.

3. Remove bolt or studded bolt and remove clamp.Do not pry or bend clamp. Pull vacuum diaphragm from transmission case.

4. Remove the vacuum diaphragm control rod from transmission case.

5. Install vacuum diaphragm control rod in transmission case.

6. Push vacuum diaphragm into case and secure with retaining clamp and bolt or studded bolt. Tighten bolt to 9-12 N-m (80-106 in-lb). On 2.9L

and 4.0L 4x4 vehicles, tighten studded bolt to 8-11 N-m 70-98 in-lb).

7. Install vacuum diaphragm hose to vacuum diaphragm.

8. Install heat shield on studded bolt and push retaining clips on pan rail. Tighten nut on studded bolt to 8-11 N-m (70-98 in-lb).

Throttle Valve Cable/Linkage: Adjustments

The kickdown cable is self-adjusting and automatically adjusts to a tolerance range of 1 inch during normal operation. However, if the cable requires readjustment, depress the semi-circular metal tab on the self-adjuster, while pulling the cable toward the front of vehicle. The cable will now automatically adjust to proper length during kickdown operation.

ISSUE: A new torque converter leak test tool has been released. The current leak test tool has been discontinued by the manufacturer. The new tool will be available to all dealers in 1997.

ACTION: When using the new leak test tool, a new procedure must be followed. Refer to the following Service Procedure and/or the 1997 Service/Workshop Manuals when using the new leak test tool.

NEW TOOL NUMBER

Description Tool Number

Torque converter Leak Test Tool and Gasket 014-R1075

SERVICE PROCEDURE

1. Clean the outside surface of the torque converter.

CAUTION:

BE CAREFUL NOT TO DAMAGE THE CONVERTER HUB FINISH WHEN INSTALLING THE TOOL.

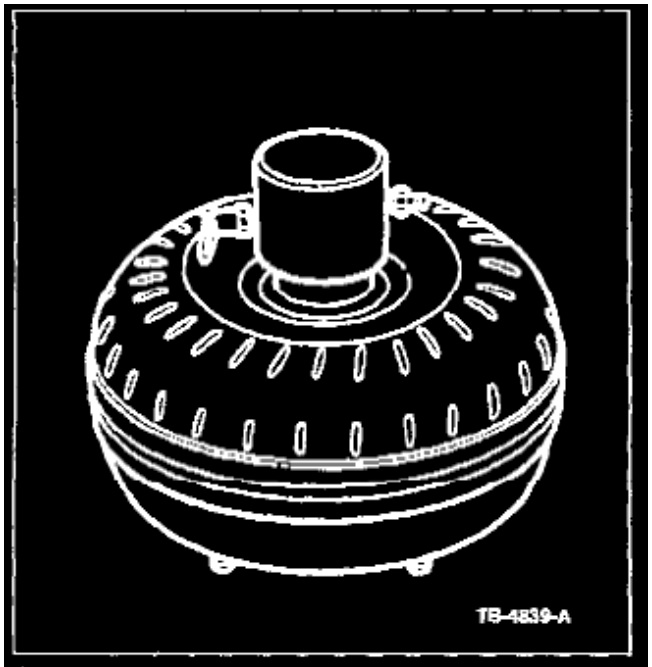

Figure 1

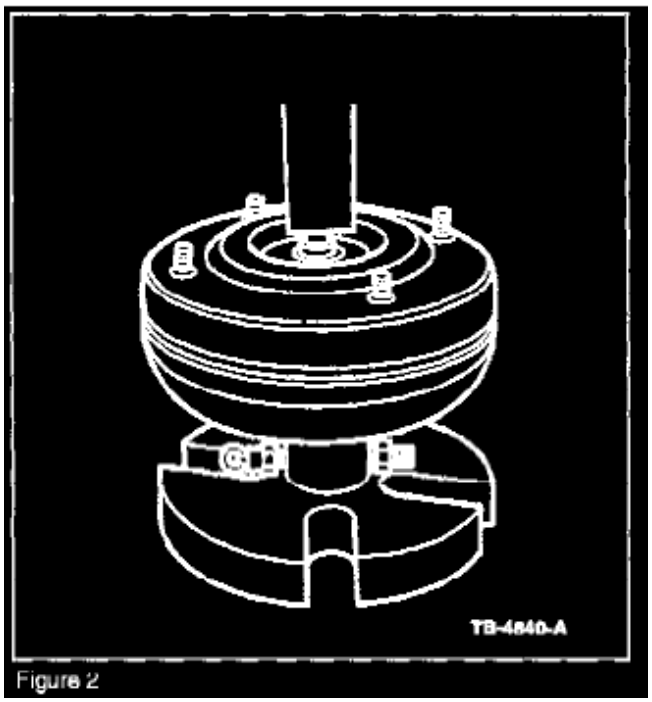

Figure 2

2. Install the Torque Converter Leak Test Tool and Gasket (O14-R1075) into the converter hub. Figure 1.

WARNING:

ALWAYS USE PROPER SAFETY PROCEDURES WHILE USING PRESS.

CAUTION:

DO NOT DAMAGE THE CONVERTER BY APPLYING EXCESSIVE FORCE FROM THE PRESS. USE ONLY ENOUGH FORCE TO SEAL TOOL INTO THE CONVERTER.

3. Place the torque converter with the tool installed into press and apply enough force to seal tool into the converter. Figure 2.

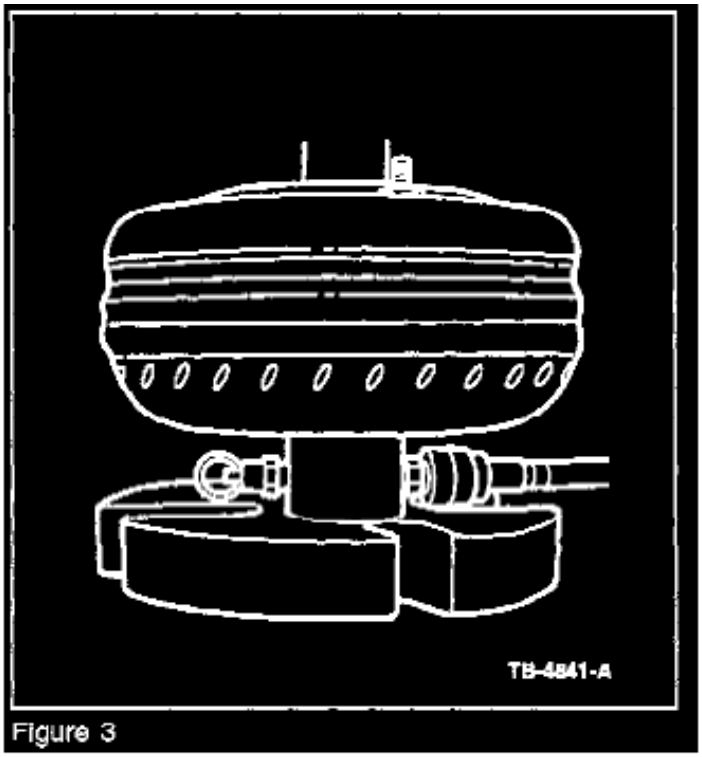

Figure 3

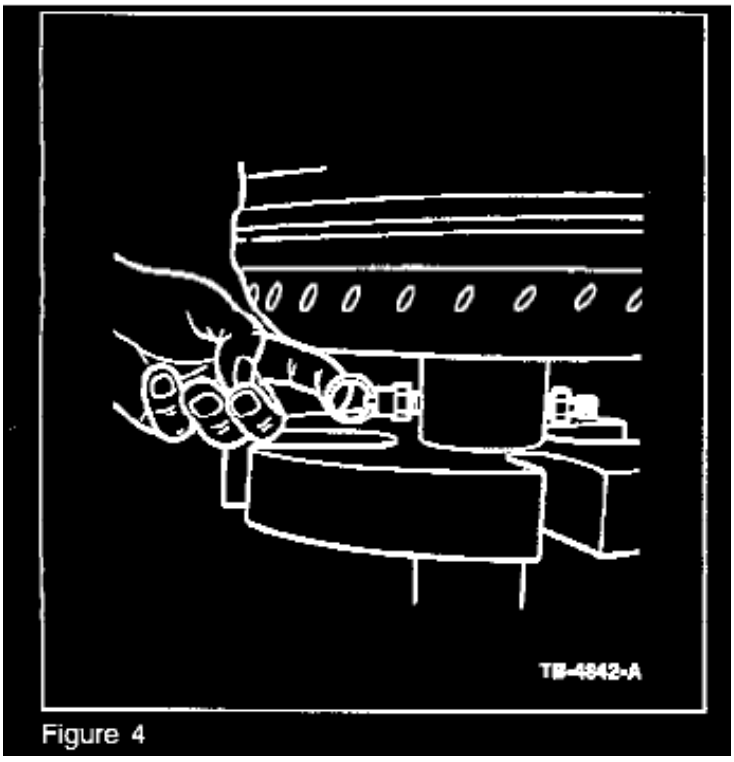

Figure 4

4. Using clean, dry shop air only, apply air pressure of 552 kPa (80 psi) maximum to the valve on the tool. Refer to Figure 3.

5. With air pressure applied to the valve, inspect for any air leaks at the studs, seams and pilot hub. A soap bubble solution may be applied around those areas to aid in diagnosis. If any leaks are present, replace the converter.

6. Disconnect the air line and release the air pressure from the tool by pulling on the release ring and then slowly releasing the press. Refer to Figure 4.

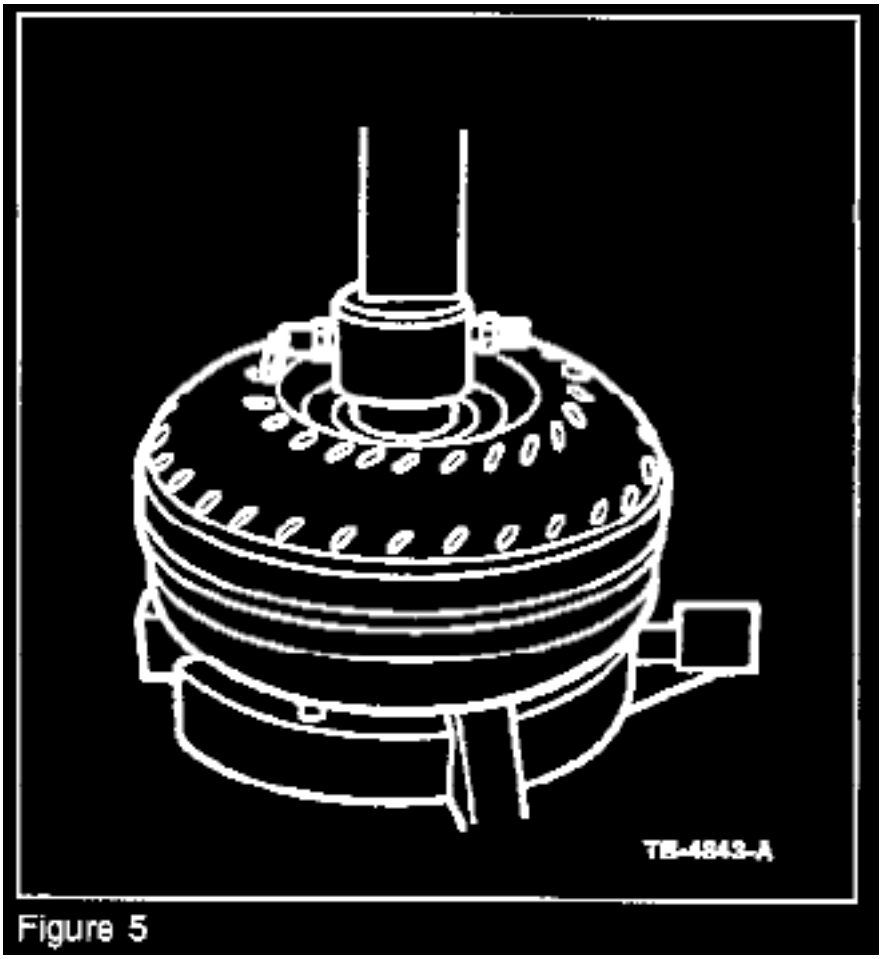

Figure 5

7. Turn the torque converter and tool upside down and reinstall into the press. Repeat Steps 2-6 to check for leaks on the opposite side. Refer to Figure 5.

Diagnostic Procedure

Prior to torque converter replacement, all diagnostic procedures must be followed. This is to prevent the unnecessary replacement of good torque converters. Only after a complete diagnostic evaluation can the decision be made to replace the torque converter.

The normal diagnostic procedure is as follows:

1. Preliminary inspection.

2. Know and understand the customers concern.

3. Verify the concern:

- Perform the Torque Converter Clutch Operation Test

4. Perform diagnostic procedures:

a. Run On-Board Diagnostics

- Repair all non-transmission-related Diagnostic

Trouble Codes (DTCs) first.

- Repair all transmission DTCs.

- Rerun On-Board Diagnostic to verify repair.

b. Perform Line Pressure Test

c. Perform Stall Speed Test

d. Diagnosis by Symptom Routines - Use the index to locate the appropriate routine that best describes the symptom(s). The routine will list all possible components that may cause or contribute to the symptom. Check each component listed, diagnose and service as required, before servicing the torque converter.

Replacement

The torque converter must be replaced if one or more of the following statements are true:

^ A torque converter malfunction has been determined based on completed diagnostic procedures

^ A converter stud(s), impeller hub or bushing is damaged

^ If there is discoloration of the torque converter (due to overheating)

^ The torque converter is found to be out of specification when performing the following checks (as applicable):

1. Torque Converter One-way Clutch Check

2. End Play Check

3. Stator-to-Turbine Interference Check

4. Converter Leakage Check

5. Stator-to-Impeller Interference Check

^ If there is evidence of transmission assembly or fluid contamination due to the following failure modes:

Torque converter Replacement Policy Failure Modes Major metallic failure

Multiple clutches or clutch plate failures

Sufficient component wear which results in metallic contamination

Torque Converter & Transmission Cooling System Cleaning

REQUIRED TOOLS	
Tool Number	Description
014-00028	Rotunda Converter/Oil Cooler Cleaner
014-00752	Rotunda Oil Cooler Flusher Kit
T77L-7902-R	Converter Clutch Holding Tool
T76L-7902-C	Converter Clutch Torquing Tool
TOOL-4210-C	Dial Indicator With Bracketry
T80L-7902-A	End Play Checking Tool
014-R1075	Torque Converter Leak Check Tool And Gasket
007-00500	New Generation Star (NGS) Tester
007-00095D	Rotunda Transmission Tester Kit - includes all cables and overlays required for transmission/transaxle diagnosis. Refer to the Service Manual for the correct cable/overlay combination to use. Individual cables/overlays and the tester may be ordered separately from Rotunda.

When the torque converter is replaced, the following actions must take place:

1. All cooler lines must be thoroughly cleaned by Back and Forward Flushing using Service Manual procedure.

2. All coolers (in-tank and auxiliary) must be thoroughly cleaned by Back and Forward Flushing using Service Manual procedure.

3. All Cooler By-Pass Valves (CBV), it equipped, must be removed and thoroughly cleaned using Service Manual procedures. Replace rubber coated sealing washers prior to reinstalling CBV. Replace CBV if damaged or plugged.

4. Perform Transmission Cooler Flow Test - If the Transmission Cooling System fails the Flow Test, the coolers, CBVs or lines must be replaced. If the coolers are to be replaced, use only factory approved service parts.

If the torque converter is not being replaced, the following actions must take place:

1. The torque convener must be thoroughly cleaned:

a. Torque converters with drain plugs can be cleaned using the Rotunda Torque Converter Cleaner Follow the instructions included with the equipment.

b. Torque converters without drain plugs can be cleaned by hand. Partially fill the converter using clean transmission fluid (as recommended for the particular transmission). Hand agitate the

converter and then thoroughly drain the fluid. Refill with new fluid, specified for the transmission, and reinstall.

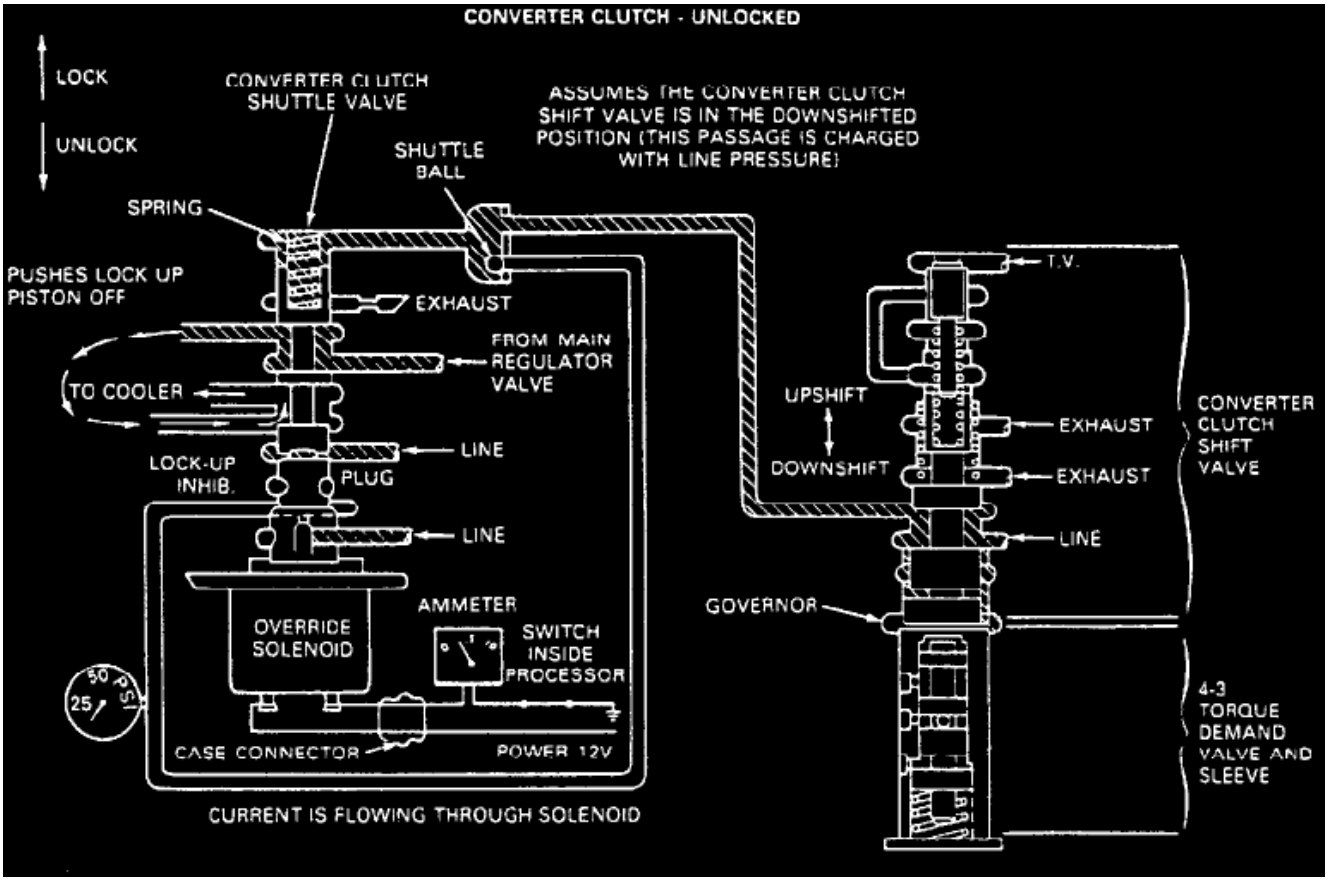
2. All cooler lines must be thoroughly cleaned by Back and Forward Flushing using Service Manual procedure.

3. All coolers (in-tank and auxiliary) must be thoroughly cleaned by Back and Forward Flushing using Service Manual procedure.

4. All Cooler By-Pass Valves (CBV), if equipped, must be removed and thoroughly cleaned using Service Manual procedures. Replace rubber coated sealing washers prior to reinstalling CBV. Replace CBV if damaged or plugged.

5. Perform Transmission Cooler Flow Test - If the Transmission Cooling System fails the Flow Test, the coolers, CBVs or lines must be replaced. If the coolers are to be replaced, use only factory approved service parts.

Required Tools



Torque Converter: Description and Operation

DESCRIPTION The torque converter provides fluid coupling and torque multiplication and acts as a shock absorber. It couples the engine to the gear train as a fluid coupling or fluid clutch, providing hydraulic drive or coupling between engine and gear train. In certain operating conditions, it multiplies torque, providing extra reduction to match engine output to the driveshaft. It also absorbs the shock of gear shifting in the drive train.

CONSTRUCTION The A4LD 10-1/4 inch converter resembles other converters, but has a hydraulic piston plate added. This feature changes the hydraulic coupling to a more efficient mechanical coupling.

OPERATION

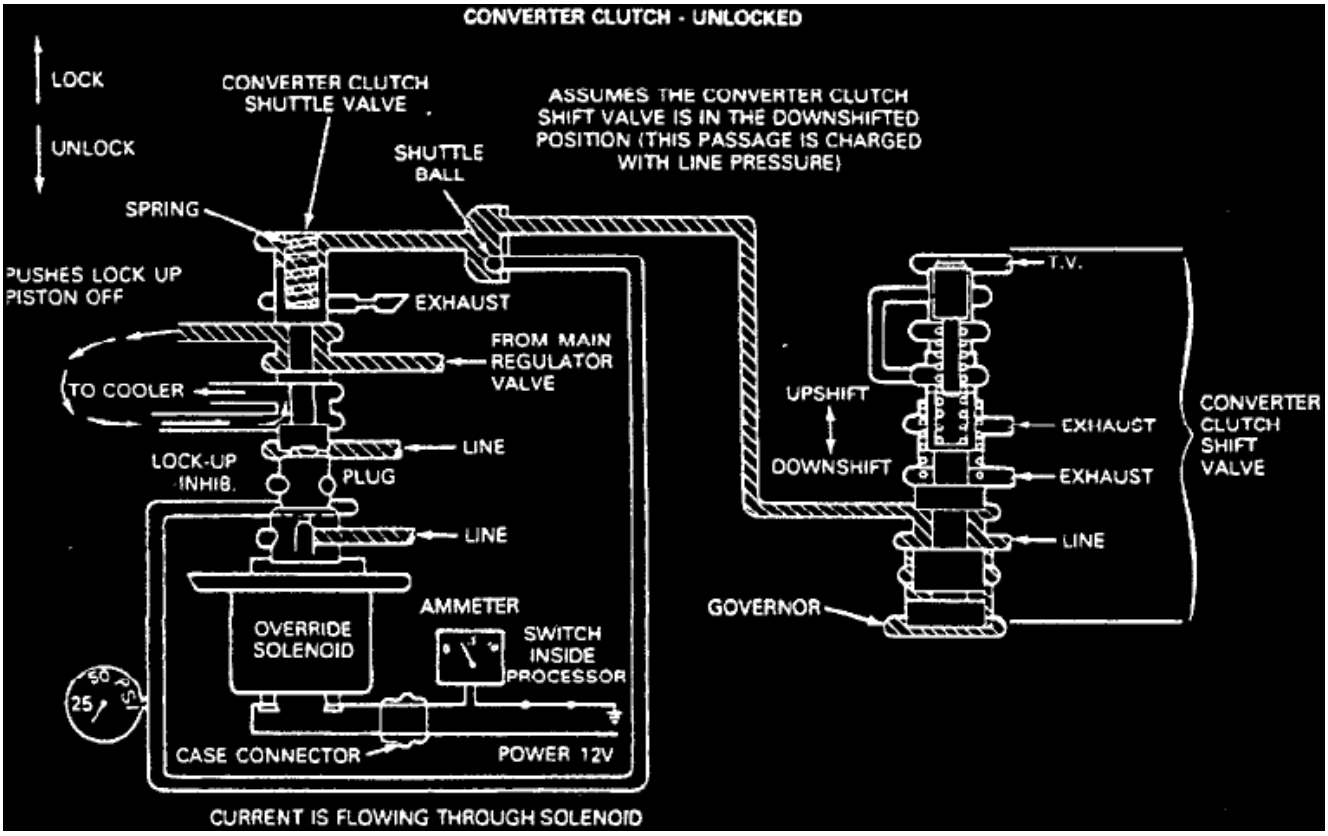
1. Converter clutch application is based on both engine speed and vehicle speed by combined transmission hydraulics and on-board computer

electronic controls. When this clutch engages there is a mechanical connection between the engine and rear wheels. This feature is provided to improve both driveline efficiency and fuel economy. Whenever the clutch is engaged, the vehicle may respond in ways similar to driving with a manual transmission. This is normal and should not be considered as adverse or indicating need for servicing.

2. Converter clutch engagements and disengagements are scheduled hydraulically but can be overridden electronically. The converter clutch is

inhibited from engaging when engine coolant temperature is below 128° F or above 24O° F, during heavy brake application, at closed throttle, during heavy or wide open throttle acceleration, during quick tip-ins or tip-outs, or when actual engine speed is below a certain value at lower vacuums. During these modes, no current flows through the solenoid.

Hydraulics With Converter Clutch Unlocked, 1988 Thunderbird And 1988-1989 Mustang



Hydraulics with converter clutch unlocked, (1988-1990 Bronco II, 1988-1991 Aerostar And Ranger, 1990-1991 Mustang, And 1991 Explorer)

3. When the converter clutch shuttle valve is resting on the plug, line pressure is directed through the shuttle valve and to the torque converter in a

flow path that pushes the lockup piston off. When line pressure on the spring end of the converter clutch shuttle valve is exhausted, line pressure on the plug end of the valve forces the valve to move and compress the spring. Governor pressure acting on the converter clutch shift valve has not yet moved the valve to the upshifted position. Line pressure is therefore acting on the spring end of the converter clutch shuttle valve. The torque converter is therefore unlocked.

4. As vehicle speed increases, governor pressure increases and the converter clutch shift valve moves to the upshifted position. Oil on the spring end

of the converter clutch shuttle valve now drains to exhaust at the converter clutch shift valve. Line pressure is now directed through the shuttle valve to the converter in a flow path that pushes the piston on.

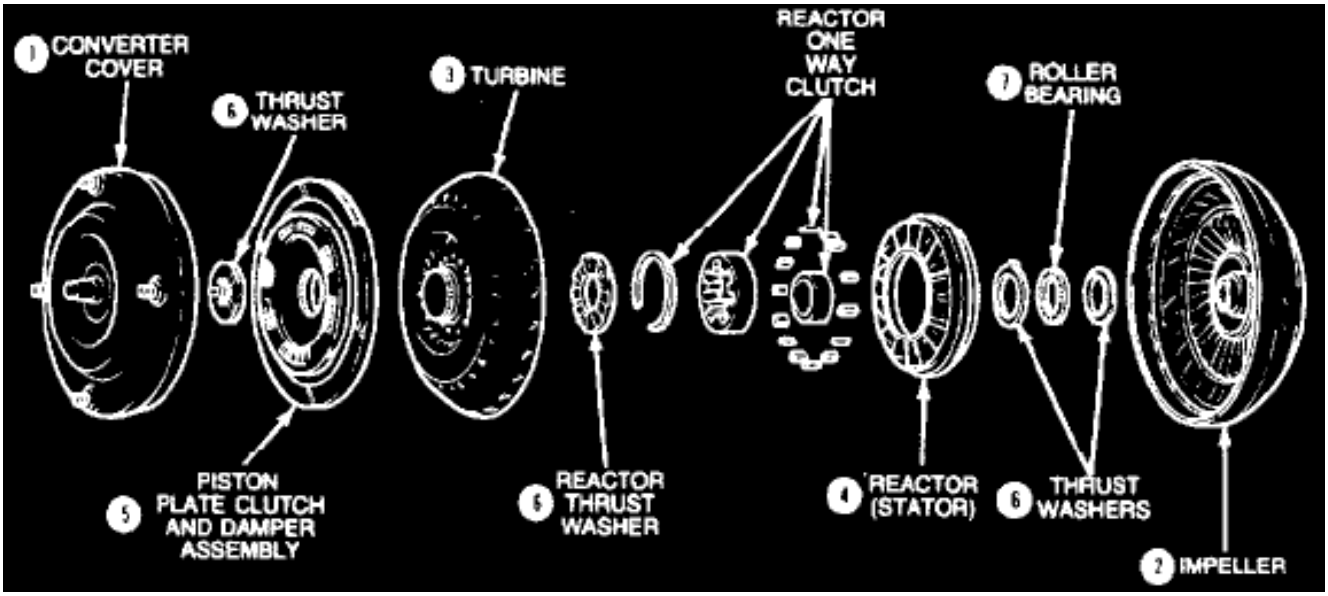
5. If the brakes are now applied, or the vehicle is operated in any of the other inhibit modes, current will not flow through the solenoid.

Hydraulics With Converter Clutch Unlocked But Electronically Inhibited, (1988 Thunderbird And 1988-1989 Mustang)

Hydraulics With Converter Clutch Unlocked But Electronically Inhibited, (1988-1990 Bronco II, 1988-1991 Aerostar And Ranger, 1990-1991 Mustang, And 1991 Explorer)

6. With no current to the solenoid, line pressure can flow through the solenoid valving and enter the lockup inhibition passage. Line pressure in the

inhibition passage forces the shuttle ball to take its position. The shuttle valve moves against the plug and the converter unlocks. Since this is a hybrid system, it will often be necessary to check both the hydraulic and electronic portions of the system.



Component Functions

Exploded View Of Locking Torque Converter

1 The converter cover (1) is bolted to the engine flywheel and is driven at engine speed. It has a hub that pivots in the crankshaft. Thus the cover transmits engine power into the converter.

2. The impeller (2) is the pumping member for fluid coupling and torque multiplication. It is welded to and driven by the cover. Its rear hub

drives the transmission oil pump.

3. The turbine (3) is the driven member of the converter. It is driven by fluid from the impeller and is splined to the input shaft. 4. The reactor (4), also called the stator, causes hydraulic reaction during torque multiplication. It includes a one-way clutch to hold it

stationary only when reaction is required.

5. The piston plate clutch and damper assembly (5) has friction material on the outer portion of the plate and a spring cushioned damper

assembly. It transmits engine power to the turbine from the converter cover.

6. The thrust washers (6) and roller bearing (7) provide bearing surfaces for the converter components that turn against each other.

Torque Multiplication

1. Torque multiplication occurs from stall (engine turning but turbine stopped) up to engagement of the converter clutch. 2. The impeller is driven at engine speed. Fluid is supplied from the valve body to the spaces between the vanes. Centrifugal force causes the

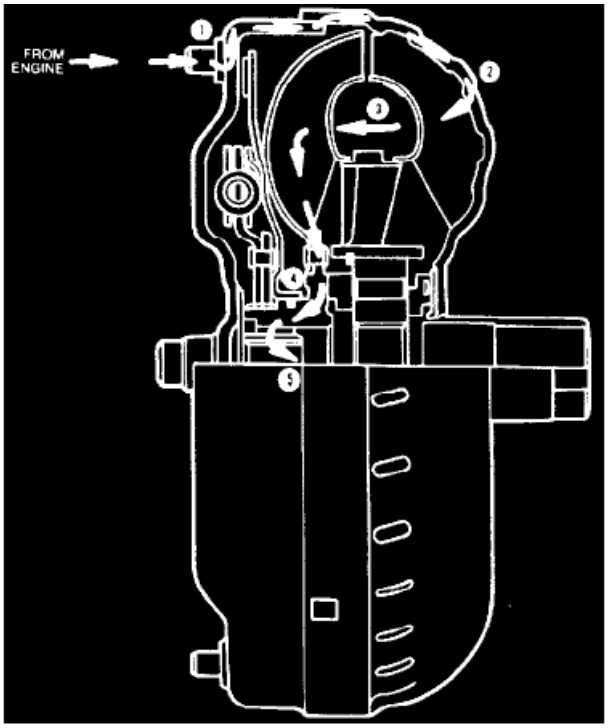
fluid to be set in motion and forced out of the openings around the inner ring. The fluid is directed toward the turbine vanes. Striking the turbine vanes, the fluid causes it to turn in the same direction as the impeller. The fluid flows around the turbines' inner ring and is directed to the reactor. The

reactor is held stationary by its one-way clutch. Its vanes direct the fluid back to the impeller in a direction that assists the impeller. The impeller again accelerates the fluid and returns it to the turbine with increased energy.

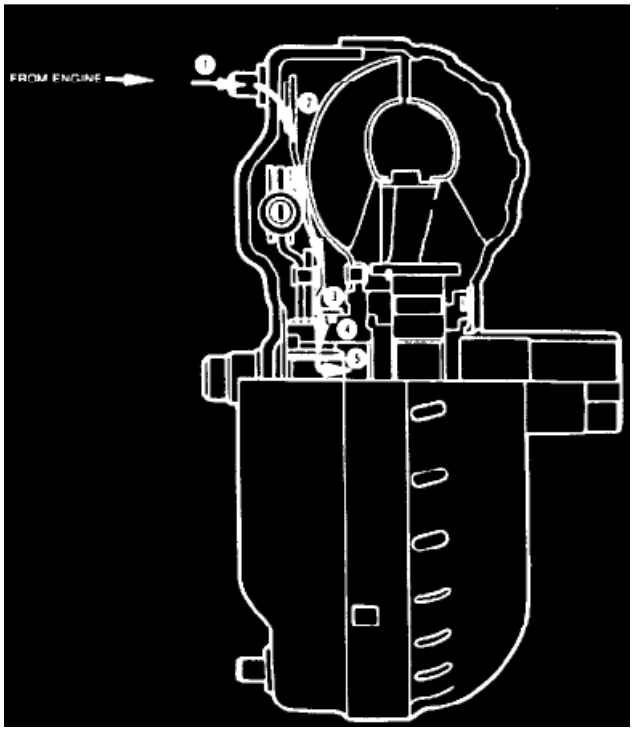
3. Torque multiplication comes from a reduced turbine speed and reuse of the velocity of the fluid returning from the reactor to the impeller.

As turbine speed increases in relation to the impeller, there is less energy in the returning fluid, and therefore less torque multiplication.

Operation And Power Flow



FROM ENGINE



FROM ENGINE

Torque Converter Power Flow With Hydraulic Input

1. Power flow through the torque converter when the clutch is not active is as shown in the Torque Converter Power Flow With Hydraulic

Input image. The engine drives the converter cover (1).

2. The converter cover drives the impeller (2). 3. The impeller drives the turbine hydraulically (3). 4. The turbine drives the input shaft (4). 5. The input shaft transmits power into the gear train (5).

Torque Converter Power Flow With Mechanical Input

6. Power flow through the torque converter when piston plate clutch is engaged is as shown in the Torque Converter Power Flow With

Mechanical Input image. The clutch is engaged when hydraulic pressure from the valve body is applied to the clutch plate from the turbine side of the plate.

7. The engine drives the converter cover (1). 8. The converter cover drives the piston plate clutch (2). 9. The clutch drives the turbine (3).

10. The turbine drives the input shaft (4). 11. The input shaft transmits power into the gear train (5).

Torque Converter: Testing and Inspection

TORQUE CONVERTER CLUTCH TEST

NOTE: This test should be performed on the road. If performed on the hoist the technician may not feel the torque converter clutch solenoid engage.

NOTE: The torque converter clutch solenoid is labeled "CCO" on the transmission tester overlay.

CAUTION: Do not depress torque converter clutch switch with transmission in gear and the vehicle at a stop. Damage to torque converter clutch may result.

NOTE: Engine coolant temperature must be above 128° and below 240° F. This temperature can be obtained after approximately 15 minutes of highway driving. Since most converter clutch shifts are difficult to feel, a tachometer and/or vacuum gauge must be connected to engine.

1. Accelerate vehicle to 88km/h (55 mph) and allow vehicle to upshift into third gear. Hold speed steady and depress the torque converter clutch

switch. Does the torque converter (7902) engage? Does the engine rpm drop? Did the torque converter clutch solenoid activate/deactivate?

ISSUE: Torque converter replacement guidelines and torque converter/transmission (or transaxle) cooling-system cleaning procedures are now available to reduce repeat repairs.

ACTION: Refer to the following guideline to properly diagnose and service torque converters and to properly clean the torque converter and transmission cooling system using forward flushing/backflushing. For diagnosis, service and cleaning, refer to to the appropriate model/year Service Manual, Sections 07-01, 07-02, 03-03, 307-01, 307-02, or 303-03.

Diagnostic Procedure

Prior to torque converter replacement, all diagnostic procedures must be followed. This is to prevent the unnecessary replacement of good torque converters. Only after a complete diagnostic evaluation can the decision be made to replace the torque converter.

The normal diagnostic procedure is as follows:

1. Preliminary inspection.

2. Know and understand the customers concern.

3. Verify the concern:

- Perform the Torque Converter Clutch Operation Test

4. Perform diagnostic procedures:

a. Run On-Board Diagnostics

- Repair all non-transmission-related Diagnostic

Trouble Codes (DTCs) first.

- Repair all transmission DTCs.

- Rerun On-Board Diagnostic to verify repair.

b. Perform Line Pressure Test

c. Perform Stall Speed Test

d. Diagnosis by Symptom Routines - Use the index to locate the appropriate routine that best describes the symptom(s). The routine will list all possible components that may cause or contribute to the symptom. Check each component listed, diagnose and service as required, before servicing the torque converter.

Replacement

The torque converter must be replaced if one or more of the following statements are true:

^ A torque converter malfunction has been determined based on completed diagnostic procedures

^ A converter stud(s), impeller hub or bushing is damaged

^ If there is discoloration of the torque converter (due to overheating)

^ The torque converter is found to be out of specification when performing the following checks (as applicable):

1. Torque Converter One-way Clutch Check

2. End Play Check

3. Stator-to-Turbine Interference Check

4. Converter Leakage Check

5. Stator-to-Impeller Interference Check

^ If there is evidence of transmission assembly or fluid contamination due to the following failure modes:

Torque converter Replacement Policy Failure Modes Major metallic failure

Multiple clutches or clutch plate failures

Sufficient component wear which results in metallic contamination

Torque Converter & Transmission Cooling System Cleaning

REQUIRED TOOLS	
Tool Number	Description
014-00028	Rotunda Converter/Oil Cooler Cleaner
014-00752	Rotunda Oil Cooler Flusher Kit
T77L-7902-R	Converter Clutch Holding Tool
T76L-7902-C	Converter Clutch Torquing Tool
TOOL-4210-C	Dial Indicator With Bracketry
T80L-7902-A	End Play Checking Tool
014-R1075	Torque Converter Leak Check Tool And Gasket
007-00500	New Generation Star (NGS) Tester
007-00085D	Rotunda Transmission Tester Kit - includes all cables and overlays required for transmission/transaxle diagnosis. Refer to the Service Manual for the correct cable/overlay combination to use. Individual cables/overlays and the tester may be ordered separately from Rotunda.

When the torque converter is replaced, the following actions must take place:

1. All cooler lines must be thoroughly cleaned by Back and Forward Flushing using Service Manual procedure.

2. All coolers (in-tank and auxiliary) must be thoroughly cleaned by Back and Forward Flushing using Service Manual procedure.

3. All Cooler By-Pass Valves (CBV), it equipped, must be removed and thoroughly cleaned using Service Manual procedures. Replace rubber coated sealing washers prior to reinstalling CBV. Replace CBV if damaged or plugged.

4. Perform Transmission Cooler Flow Test - If the Transmission Cooling System fails the Flow Test, the coolers, CBVs or lines must be replaced. If the coolers are to be replaced, use only factory approved service parts.

If the torque converter is not being replaced, the following actions must take place:

1. The torque convener must be thoroughly cleaned:

a. Torque converters with drain plugs can be cleaned using the Rotunda Torque Converter Cleaner Follow the instructions included with the equipment.

b. Torque converters without drain plugs can be cleaned by hand. Partially fill the converter using clean transmission fluid (as recommended for the particular transmission). Hand agitate the converter and then thoroughly drain the fluid. Refill with new fluid, specified for the transmission, and reinstall.

2. All cooler lines must be thoroughly cleaned by Back and Forward Flushing using Service Manual procedure.

3. All coolers (in-tank and auxiliary) must be thoroughly cleaned by Back and Forward Flushing using Service Manual procedure.

4. All Cooler By-Pass Valves (CBV), if equipped, must be removed and thoroughly cleaned using Service Manual procedures. Replace rubber coated sealing washers prior to reinstalling CBV. Replace CBV if damaged or plugged.

5. Perform Transmission Cooler Flow Test - If the Transmission Cooling System fails the Flow Test, the coolers, CBVs or lines must be replaced. If the coolers are to be replaced, use only factory approved service parts.

Required Tools

Transmission Cooler: Testing and Inspection

TRANSMISSION FLUID COOLER CHECK

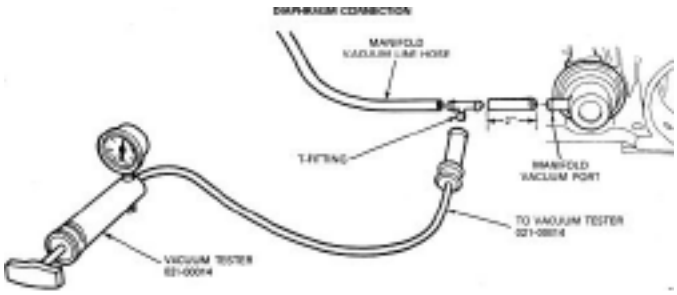
1. Ensure linkage is properly adjusted and fluid level and control pressure are within specifications. 2. Remove transmission dipstick from filler tube and insert funnel in tube. 3. Raise and support vehicle. 4. Remove cooler return line from its fitting in the case, attach a hose to cooler return line and fasten free end of hose in funnel installed in filler tube. 5. Start engine and set idle at 1,000 RPM with transmission in Neutral. 6. Observe fluid flow at funnel. When flow is constant, it should be liberal. If there is not a liberal flow at 1,000 RPM in Neutral, low pump capacity,

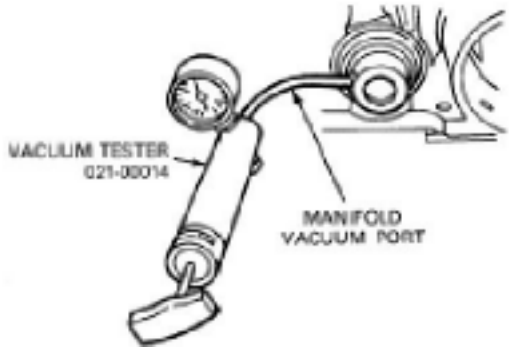
main circuit system leakage, stuck converter charge relief valve, or cooler system restriction is indicated.

7. To separate transmission trouble from cooler system trouble, observe flow at transmission case converter-out fitting.

Transmission Temperature Sensor/Switch: Testing and Inspection

Pinpoint testing procedures for this component are located in the system level Testing and Inspection.





Vacuum Diaphragm: Testing and Inspection

OFF VEHICLE TEST

1. Remove unit from transmission and, using suitable vacuum tester, adjust tester until vacuum gauge reads 18 inches with end of vacuum hose

blocked off.

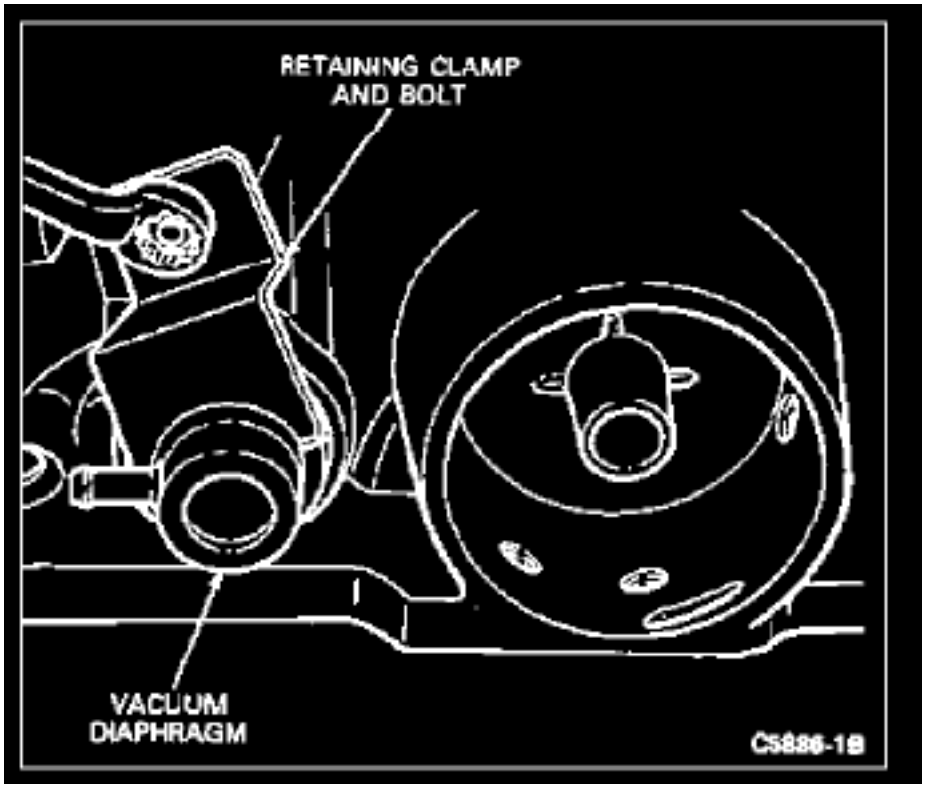
2. Connect vacuum hose to manifold vacuum port. 3. If gauge still reads 18 inches, vacuum unit diaphragm is not leaking. 4. A second leakage check can be made as the hose is removed from the transmission vacuum unit. 5. Hold a finger over the end of the vacuum control rod. 6. When the hose is removed the internal spring of the vacuum unit should push the control rod outward. 7. If the vacuum diaphragm needs replacing, install a new unit that has been released for service.

ON VEHICLE TEST

1. Start the vacuum pump and set the regulator knob so that the vacuum gauge reads 18 inches with the end of the vacuum hose blocked off, then

connect the vacuum hose to the diaphragm unit.

2. If the gauge still reads 18 inches, the vacuum diaphragm unit is not leaking.



Vacuum Diaphragm: Service and Repair

Vacuum Diaphragm

Removal and Installation

1. On 4.0L and 2.9L 4x4 vehicles, remove nut from studded bolt and remove heat shield from studded bolt and clips on frame.

2. Disconnect hose from vacuum diaphragm.

3. Remove bolt or studded bolt and remove clamp.Do not pry or bend clamp. Pull vacuum diaphragm from transmission case.

4. Remove the vacuum diaphragm control rod from transmission case.

5. Install vacuum diaphragm control rod in transmission case.

6. Push vacuum diaphragm into case and secure with retaining clamp and bolt or studded bolt. Tighten bolt to 9-12 N-m (80-106 in-lb). On 2.9L

and 4.0L 4x4 vehicles, tighten studded bolt to 8-11 N-m 70-98 in-lb).

7. Install vacuum diaphragm hose to vacuum diaphragm.

8. Install heat shield on studded bolt and push retaining clips on pan rail. Tighten nut on studded bolt to 8-11 N-m (70-98 in-lb).

ISSUE: Some high altitude calibration units may exhibit a harsh 2-3 backout upshift during altitude operating conditions. This may be caused by the calibration of the 2-3 backout spring in bore 211 of the main control assembly.

Vacuum Tank: All Technical Service Bulletins Heater - Air Flow From Panel During Heavy Acceleration

Article No. 94-4-11

02/23/94

HEATER - OBJECTIONABLE AIRFLOW FROM PANEL REGISTERS DURING HEAVY ACCELERATION - NON A/C VEHICLES

LIGHT TRUCK: 1990-92 RANGER 1991-92 EXPLORER

This TSB article is being republished in its entirety to include 1992 Model vehicles.

ISSUE: Objectionable airflow from the heater system panel registers may occur when the system is in the OFF mode and the vehicle is under heavy acceleration. This condition is caused by movement of the fresh air door when the vacuum to the door actuator is lost during heavy acceleration.

ACTION: Installation of a vacuum hose/reservoir/check valve assembly will provide sufficient vacuum level to maintain proper operation of the heater system in the OFF mode. Refer to the following procedure for service details.

SERVICE PROCEDURE

1. Remove the blower assembly from the vehicle.

2. Drill two holes in the blower assembly, in a vertical position, to allow for installation of the vacuum reservoir. Refer to Figure 1.

3. Using two screws, mount the vacuum reservoir as shown in Figure 1.

4. Disconnect the existing vacuum check valve.

5. Remove the vacuum line which sourced the heater system check valve and attached to an engine vacuum port. Refer to Figure 1.

6. Discard the check valve and vacuum line.

7. Reinstall the blower assembly in the vehicle.

8. Route the new vacuum line and check valve (attached to the reservoir) as the original vacuum line was routed and attach to the original vacuum port.

9. Attach the vacuum line from the heater plenum chamber to the open port on the vacuum check valve.

10. Start the engine and verify proper operation of the Fresh Air/Off door.

Valve Body: Description and Operation

MAIN CONTROL VALVE BODY FUNCTION

Main Control Valve Body Component Identification

1. The intermediate servo accumulator (1) controls band capacity on 1-2 shift 2. The overdrive servo accumulator (2) controls overdrive band capacity on 3-4 upshifts. 3. The 3-4 backout valve (3) controls the rate at which overdrive servo release oil exhausts on 3-4 backout shifts. 4. The 3-2 high clutch release valve (4) controls the rate at which high clutch oil exhausts on higher speed 3-2 downshifts. 5. The 3-2 intermediate servo release valve (5) controls the rate at which intermediate servo release oil exhausts on higher speed 3-2 downshifts. 6. The 3-2 kickdown timing valve (6) sends intermediate servo release and high clutch oil to the torque demand valve during 3-2 downshifts at lower

speeds. At higher speed, this valve moves down and intermediate servo release and high clutch oil drains through the 3-2 intermediate servo release kickdown control and 3-2 high clutch kickdown control valves.

7. The 3-2 coast control valve (7) controls the rate at which intermediate servo release and high clutch oil exhaust on 3-2 coasting downshifts. 8. The throttle pressure booster valve (8) increases throttle pressure output for shift delay at lower engine manifold vacuum levels. 9. The 1-2 transition valve (9), along with the 2-3 backout valve, will prevent an intermediate to reverse band tie-up on a manual 1-2 shift.

10. The 2-3 backout valve (10) prevents tie-up if driver backs off accelerator during 2-3 upshift. 11. The engagement control valve (11) feeds the forward clutch through a small orifice at low Throttle Valve (TV) pressures, or through a larger

orifice at higher TV pressures.

12. The torque demand control valve (12) controls the rate at which high clutch and intermediate servo release oil exhausts at lower speed 3-2

downshifts.

13. The cut back valve (13) reduces control pressure as road speed increases. 14. The oil pressure regulator valve (14) regulates main control pressure. 15. The main oil pressure booster valve (15) increases or decreases main control pressure in relation to throttle pressure, and provides higher line

pressure in reverse.

16. The throttle downshift valve (16) reroutes line pressure to override the normal automatic upshift schedule and provide forced downshifts. 17. The manual control valve (17) moves with shift selector and directs control pressure to various passages to provide automatic function. 18. The 2-Low range coasting boost valve (18) boosts pressure in selector positions 1 and 2 at closed or nearly closed throttle. 19. The 1-2 shift valve (19) controls upshift from 1st to second and downshift from 2nd to 1st. 20. The D2 shift valve (20) is used in combination with the 1-2 shift valve to provide a 2nd gear start in 2 range. 21. The 2-3 shift valve (21) controls upshift from 2nd to high and downshift from high to 2nd. 22. The 2-3 throttle pressure modulator valve (22) provides a modulated pressure to the 2-3 shift valve at higher TV pressures. This modulated

pressure helps to delay 2-3 shifts at higher TV pressures.

23. The 4-3 torque demand valve (23) routes high clutch oil to the 3-4 shift valve at lower vacuums. This provides for a higher road speed 4-3 torque

demands at lower vacuum.

24. The converter clutch shift valve (24), along with the converter clutch shuttle valve and solenoid, controls converter clutch engagements and

disengagements.

25. The converter clutch throttle pressure modulator valve (25) sends a modulated pressure to the converter clutch shift valve at higher TV pressures.

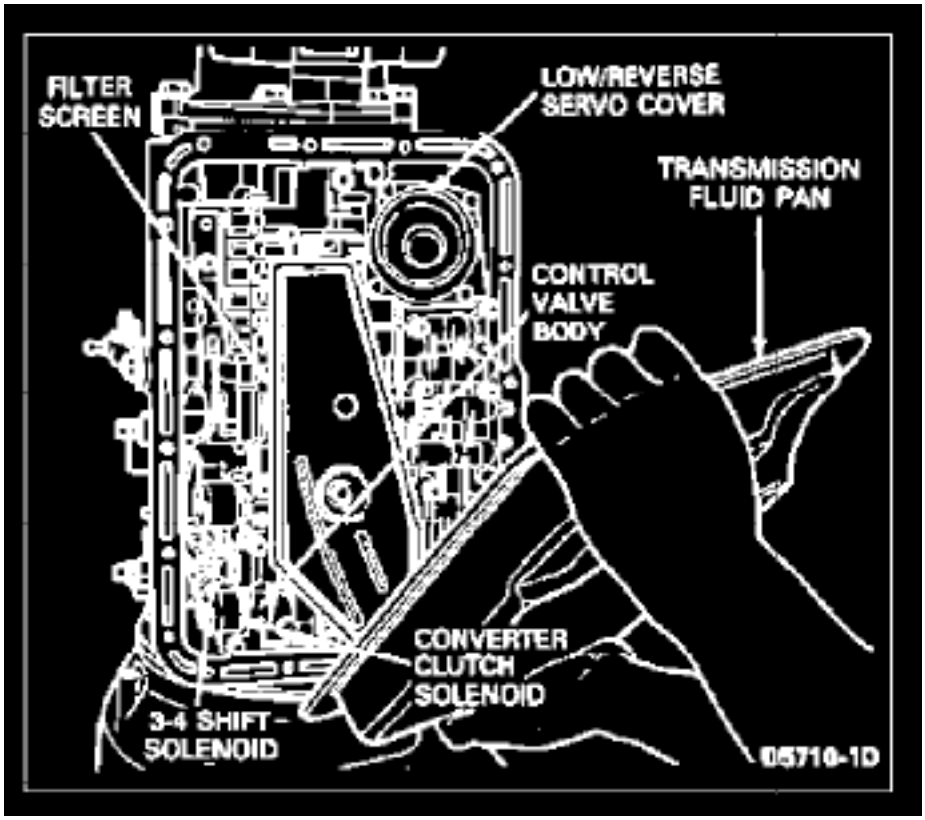
This modulated pressure helps to delay converter clutch upshifts at higher TV pressures.

26. The 3-4 shift valve (26) controls the scheduling for 3-4 upshifts and 4-3 downshifts. 27. The 3-4 throttle pressure modulator valve (27) provides a modulated pressure on the 3-4 shift valve at high TV pressures. This modulated pressure

helps to delay 3-4 upshifts at higher TV pressures.

28. The converter clutch shuttle valve (28), when bottomed against the plug, directs flow so the converter clutch will be disengaged. When the valve

compresses the spring, flow is directed so the converter clutch engages. The solenoid also controls the position of this valve.



Valve Body: Service and Repair Removal and Installation

Removal

1. Raise vehicle on a hoist so transmission and pan is accessible. Position suitable safety stands under vehicle.

2. Loosen pan attaching bolts and drain fluid from transmission. If the same fluid is to be used again, filter through a 100 mesh screen. Re-use fluid

only if it is in good condition.

3. Remove transmission fluid pan attaching bolts, pan and gasket.

4. Remove filter screen and O-rings.

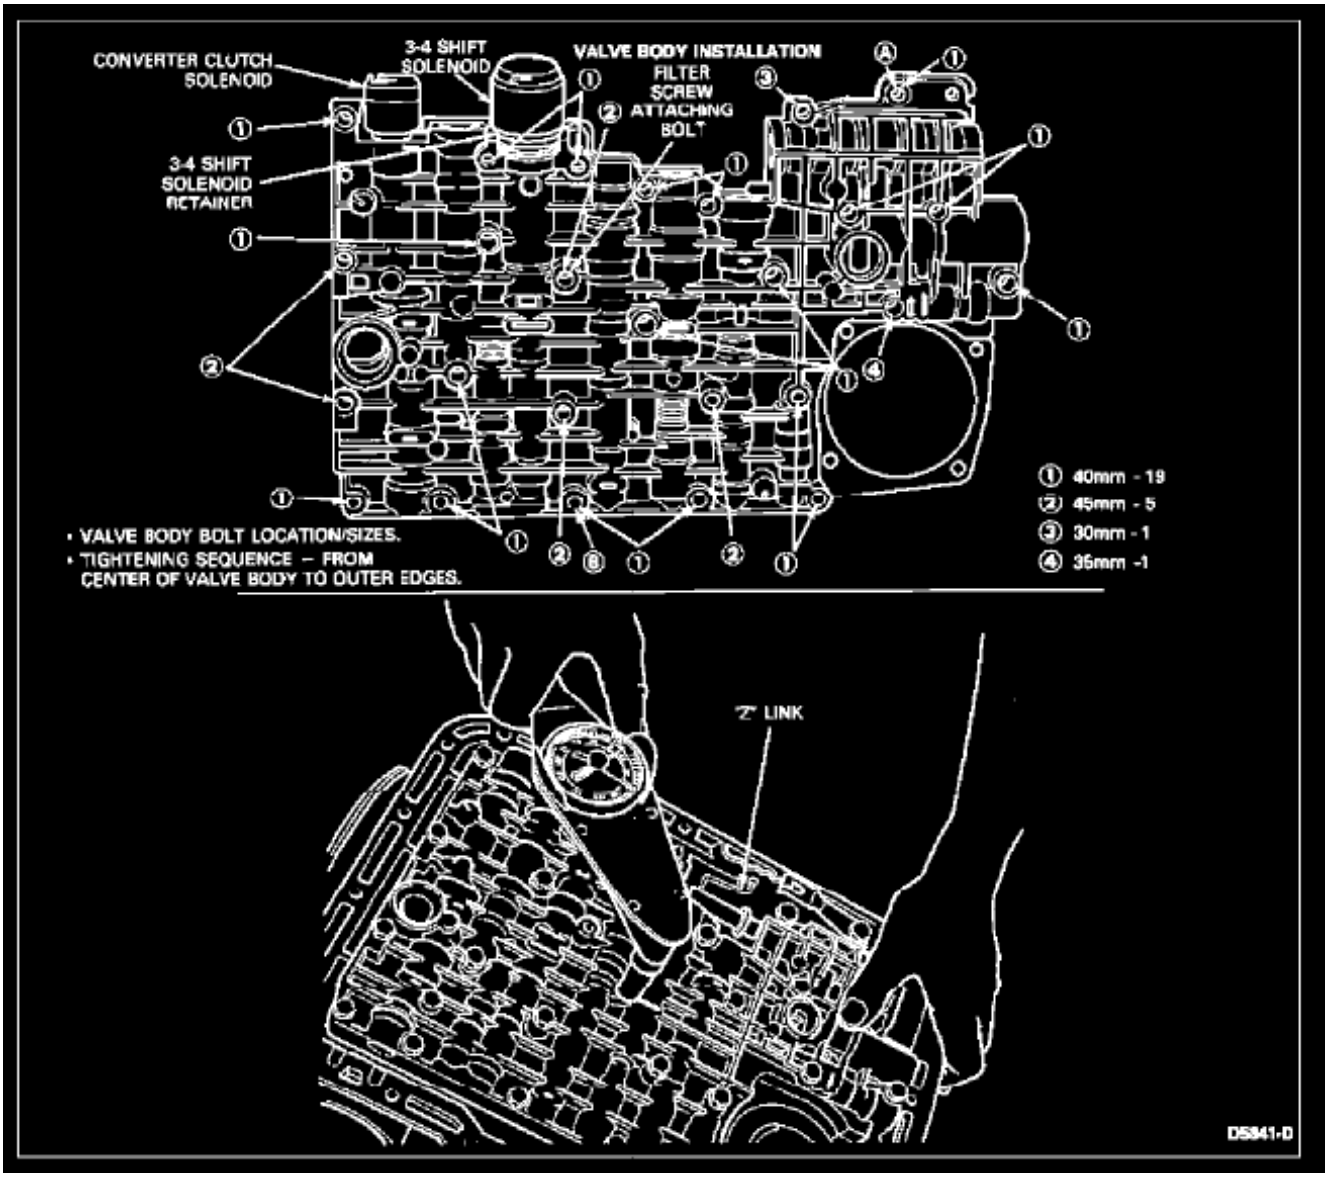
5. Remove low-reverse servo cover, piston, spring and gasket.

6. Disconnect two wires at the converter clutch solenoid and the two wires at the 3-4 shift solenoid.

7. Remove bolts from the control valve body. Note that the bolts are of different lengths and their locations are different from the bolt locations on

other automatic transmissions. Carefully ease the body from the case while unlocking and detaching the selector lever connecting rod.

Installation



1. Clean and inspect the valve body prior to installation as detailed in this section.

2. Attach and lock the selector lever connecting rod (Z-Link) to the manual valve and ease control body into the case.

CAUTION: Use care not to bend selector lever connecting rod (Z-Link).

3. Insert correct length bolts, finger-tight, in holes A and B to position control body to case.

4. Insert all remaining bolts and 3-4 shift solenoid retainer (correct length) except filter screen bolt and tighten to 8-11 N-m (71-97 in-lb).

NOTE: 3-4 shift solenoid retainer must be on outside of metal inner retainer.

5. Remove the bolt from hole A and install detent spring to bolt, then reassemble and tighten A and B locations to 8-11 N-m (71-97 in-lb).

6. Install low-reverse servo cover, piston, spring and gasket.

7. Connect the converter clutch solenoid wires.

8. Clean filter screen with solvent. Then install filter screen O-ring and filter screen.

9. Using a new gasket, install fluid pan. Tighten retaining bolts to 11-13 N-m (97-115 in-lb).

10. Remove safety stands and lower vehicle. Fill transmission with proper grade and quantity of fluid.

Pour in 2.8L (3 quarts) of fluid. Run engine and add fluid as required.

11. Operate vehicle and check for leaks.

Valve Body: Service and Repair Disassembly and Assembly

Main Control Valve Body Disassembly

1. Remove three Torx head screws retaining valve body separating plate and control valve body to case gasket to valve body.

2. Remove the valve body separating plate. This plate is not serviced separately.

Valve Body, Gasket, Separator Plate

3. Remove the main control to case gasket and separator to main control gasket. Replace with new main control to case gasket and separator to main

control gasket.

Main Control Valve Body

1. CAUTION: Make sure all holes in gasket line up with holes in separator plate.

Make sure all check balls, retainers, springs and valves are installed properly.

2. NOTE: Petroleum jelly can be used to hold gasket in place.

Install a new valve body-to-separator plate gasket.

3. Install the separator plate using two tapered punches at locations "E" to align gasket and separator plate-to-valve body. Install three Torx head

screws to retain separator plate and gasket to valve body. Tighten screw to 6-8 Nm (53-71 lb-in).

4. Remove alignment punches.

5. NOTE: Use petroleum jelly to hold the gasket in place.

Install and align (upper) separator plate to case gasket.

Clutch Disc: Service and Repair

REMOVAL

1. Disconnect clutch hydraulic system master cylinder from clutch pedal and dash panel. 2. Raise and support vehicle. 3. Remove starter motor from engine. 4. Remove hydraulic hose to slave cylinder retaining clip, then disconnect hose from save cylinder. Clean area around hose and slave cylinder to

prevent fluid contamination.

5. Disconnect the hydraulic coupling at transmission with coupling disconnect tool No. T88T-70522-A or equivalent by sliding the white plastic

sleeve toward slave cylinder and applying a slight tug on tube.

Transmission Rear Support

8. Remove nuts attaching transmission and insulator to No. 2 crossmember support. 9. Raise transmission slightly, then remove No. 2 crossmember support.

10. Lower transmission and clutch housing. 11. Mark assembled position of pressure plate and cover to the flywheel for installation. 12. Loosen pressure plate and cover attaching bolts evenly until pressure plate springs are completely expanded, then remove attaching bolts.

13. Remove pressure plate, cover assembly and clutch disc from flywheel. These parts can be removed through the opening in the bottom of the clutch

housing on models equipped with a dust cover.

14. Remove pilot bearing, if required.

INSTALLATION

1. Install pilot bearing, if removed. 2. Install clutch disc onto flywheel, then insert clutch alignment tool No. T74P-7137-K or equivalent into clutch pilot bearing hole. Ensure clutch

disc is properly aligned on flywheel.

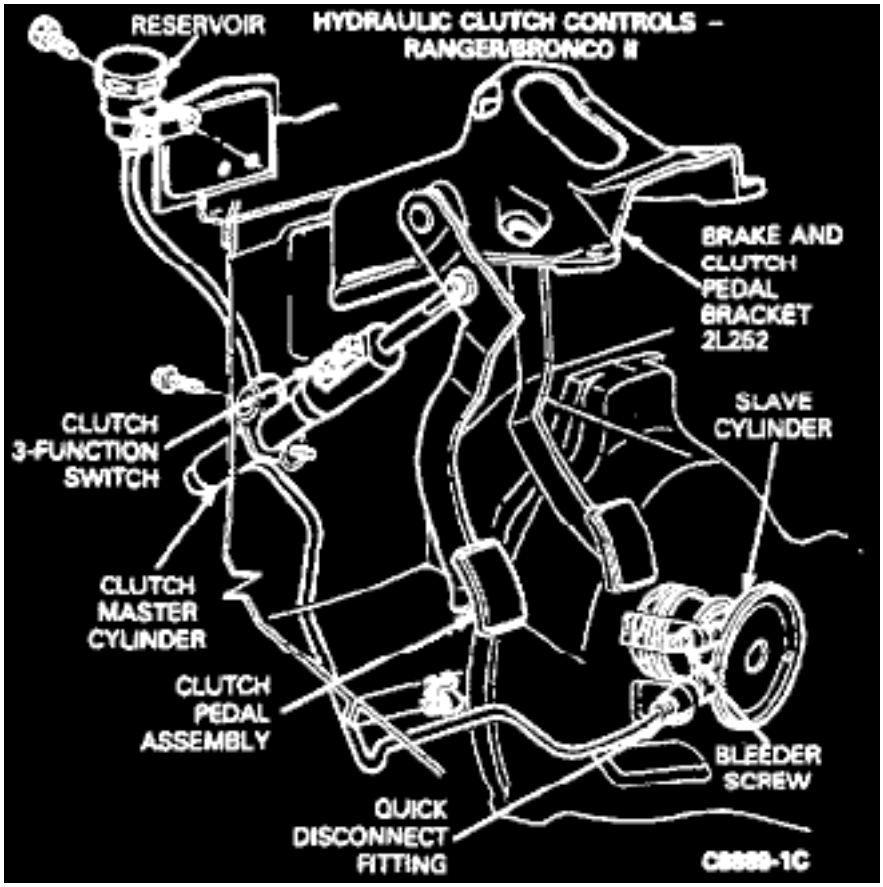
3. If installing original pressure plate and cover assembly, align marks made during removal and position pressure plate and cover assembly onto

flywheel.

4. Install pressure plate attaching bolts and torque bolts to 15-25 ft lbs. 5. Remove clutch disc alignment tool. 6. Raise transmission an clutch housing assembly into position, then install No. 2 crossmember support on to frame. 7. Lower transmission and insulator into crossmember support, and tighten attaching nuts. 8. Remove transmission jack. 9. Install driveshaft. Ensure marks made on driveshaft align properly with mark on companion flange. Torque attaching nuts and bolts to 70-95 ft lbs.

10. Install housing to engine block attaching bolts in correct position as removed. Torque attaching bolts to 28-38 ft lbs. 11. Install slave cylinder hydraulic hose, then the hose to slave cylinder retaining clip. 12. Install starter motor on to end line. 13. Lower vehicle and connect clutch hydraulic system master cylinder to the clutch pedal and to the dash panel assembly. Check clutch for proper

operation.



Clutch Master Cylinder: Service and Repair

Hydraulic Clutch Controls

CAUTION: Prior to any vehicle service that requires removal of the slave cylinder, (i.e.; transmission and clutch housing removal), the master cylinder push rod must be disconnected from the clutch pedal. If not disconnected, permanent damage to the master cylinder assembly will occur if the clutch pedal is depressed while the slave cylinder is disconnected.

REMOVAL

1. Disconnect the clutch master cylinder push rod from the clutch pedal by prying the retainer bushing and push rod off the pedal pin. 2. Remove the switch from the master cylinder assembly. 3. Remove the screw retaining the fluid reservoir to the cowl access cover. 4. Uncouple the tube from the slave cylinder, depress the white retainer bushing with T88T-70522-A, or equivalent, while pulling on the line. 5. Remove the bolts retaining the clutch master cylinder to the dash panel and remove the clutch master cylinder assembly.

INSTALLATION

1. Install the push rod through the hole in the engine compartment. Be sure it is located on the correct side of the clutch pedal. Place the master

cylinder assembly in position. Install the bolts and tighten to 11-16 Nm (8-12 ft-lb).

2. Insert the coupling end into the slave cylinder and install tube into clip(s).

NOTE: Minimal loss of fluid should occur during removal and installation, and bleeding should not normally be required unless the vehicle shows signs of lack of clutch reserve.

3. Position the fluid reservoir on the cowl access cover, and install the retaining screws. 4. Replace the retainer bushing in the clutch master cylinder push rod if worn or damaged. Install the retainer and push rod on the clutch pedal pin.

Be sure the bushing is oriented correctly (with the flange of the bushing against the pedal blade). Install the three function clutch interlock switch or clutch pedal position switch.

5. Bleed the system only if required.

Clutch Slave Cylinder: Customer Interest M/T Clutch Housing - Fluid Inside

Article No. 91-18-14 09/05/91

^ CLUTCH-SLAVE CYLINDER "LEAKS"- VEHICLES USED IN MUDDY OR DUSTY ENVIRONMENTS

^ LEAKS-CLUTCH SLAVE CYLINDER "LEAKS"- VEHICLES USED IN MUDDY OR DUSTY ENVIRONMENTS

LIGHT TRUCK: 1988-89 ECONOLINE 1988-91 AEROSTAR, BRONCO, F-150-350 SERIES, RANGER 1989-90 BRONCO II 1991 EXPLORER

ISSUE: Fluid detected inside the clutch housing may be caused by a leaking clutch slave cylinder. This may occur when vehicles are driven in severely muddy or dusty environments or when operated with extensive idle time. Vehicles include...

^ 1988-1991 Ranger, 1988-1990 Bronco II, 1988-1991 Aerostar and 1991 Explorer with manual transmissions.

^ 1988-1991 Bronco, F-150-350, and 1988-1989 Econoline with 5-Speed Manual Transmissions, except 7.3L Diesel and 7.5L engines.

ACTION: Replace the clutch slave cylinder if inspection confirms the cylinder is leaking. The new clutch slave cylinder contains a guide seal which improves durability and resistance to dirt entry. Refer to the following procedures for service details.

INSPECTION PROCEDURE:

1. If the vehicle is a Bronco or F-150, the repair will only involve 5 speed manual transmissions. Other vehicles described include all manual transmissions.

This slave cylinder is the internal "Concentric" and not the external style. Inspect vehicle to visually verify the style of slave cylinder installed.

2. Determine if the slave cylinder is leaking by checking for a fluid trace inside the bottom of the clutch housing.

REPAIR PROCEDURE

1. Remove the clutch slave cylinder. Refer to the appropriate Light Truck Shop Manual for service details.

2. Replace the clutch slave cylinder with a new slave cylinder (F1TZ-7A564-A). Refer to the appropriate Light Truck Shop Manual for service details.

Clutch Slave Cylinder: Service and Repair Bleeding Procedure

NOTE: On vehicles equipped with quick-connect clutch tube, the manufacturer recommends replacing the tube when ever hydraulic system service is necessary, because the quick-connect feature tends to trap air in the system and prevents complete bleeding of the system. The replacement tube does not include the quick-connect feature.

1. Clean area around fluid reservoir cap, then remove cap and fill reservoir with suitable DOT 3 brake fluid. 2. Loosen bleed screw on slave cylinder and wait until a steady stream of fluid is expelled, then tighten screw. 3. Depress clutch pedal to floor, wait 1-2 seconds, then release pedal as rapidly as possible. Repeat approximately 10 times. 4. Check fluid level in reservoir and fill as required. 5. Repeat steps 3 and 4, then reinstall reservoir cap. 6. Hold clutch pedal to floor, crack open bleed screw to allow any additional air to escape, then close screw and release clutch pedal. Check fluid

level and adjust as necessary.

7. Start engine, then depress clutch pedal and shift transmission into reverse gear. If gear clash occurs, repeat steps 3 through 6.

Clutch Slave Cylinder: Service and Repair Removal and Installation

Slave Cylinder Removal

REMOVAL

Clutch Coupling Tool T88T-70522-A

1. Using coupling disconnect tool No. T88T-70522-A or equivalent, disconnect hydraulic coupling at transmission by sliding white plastic sleeve

toward clutch slave cylinder while tugging on tube.

2. Remove transmission. 3. Remove clutch housing to transmission attaching bolts, then separate clutch housing from transmission. 4. Remove slave cylinder from transmission input shaft.

INSTALLATION

1. Reverse procedure to install, noting the following:

a. Position slave cylinder over transmission input shaft with bleed screw and coupling facing left side of transmission. b. Torque slave cylinder retaining bolts to 14-19 ft lbs. c. Bleed system if required.

M/T Clutch - Growling/Clicking Noise

Article No. 94-13-17

06/29/94

^ NOISE - "GROWL/CLICKING" - WHEN CLUTCH PEDAL IS DEPRESSED - 2.3L & 2.9L ENGINES

^ VIBRATION - CLUTCH PEDAL - 2.3L & 2.9L ENGINES

^ CLUTCH - "GROWL/CLICKING" NOISE WHEN PEDAL IS DEPRESSED - 2.3L & 2.9L ENGINES

LIGHT TRUCK: 1988-90 BRONCO II 1988-93 RANGER

This article is being republished in its entirety to add new procedures and parts for 1992/93 model year Ranger.

ISSUE: A "growling/clicking" noise may occur when the clutch pedal is depressed during shifting. The noise worsens with increasing engine speed. A vibration in the clutch pedal may also be felt. This condition is caused by engine vibrations being transmitted by the hydraulic line assembly.

ACTION: Inspect the vehicle and, if necessary, install a new hydraulic line service kit with a rubber damper section in the hydraulic line assembly. Refer to the following procedure for service details. Refer to Figure 1.

Parts Block

OASIS CODES: 506000, 702000

Inspection Procedure

INSPECTION PROCEDURE

1. Put the transmission in neutral.

2. Bring the engine speed to 3000 rpm or higher.

3. Press the clutch pedal slowly down and up.

4. If the audible growl is not present, try higher engine speeds and repeat Steps 1-3.

5. Listen to see if the growl occurs.

^ If it doesn't occur, the noise is not controlled strictly by the clutch pedal actuation. This "fix" is not appropriate and will not solve the concern.

^ If it does occur, proceed with the hydraulic line replacement procedure.

1992 and Prior Models - Hydraulic Line Replacement

HYDRAULIC LINE REPLACEMENT PROCEDURE - LOWER END (SLAVE CYLINDER END)

1. Raise the vehicle on a hoist.

2. If the vehicle is equipped with a metal clip connected to the floor flange, unclip the hydraulic line.

3. Uncouple the lower end of the hydraulic line from the slave cylinder using Clutch Coupling Tool T88T-70522-A.

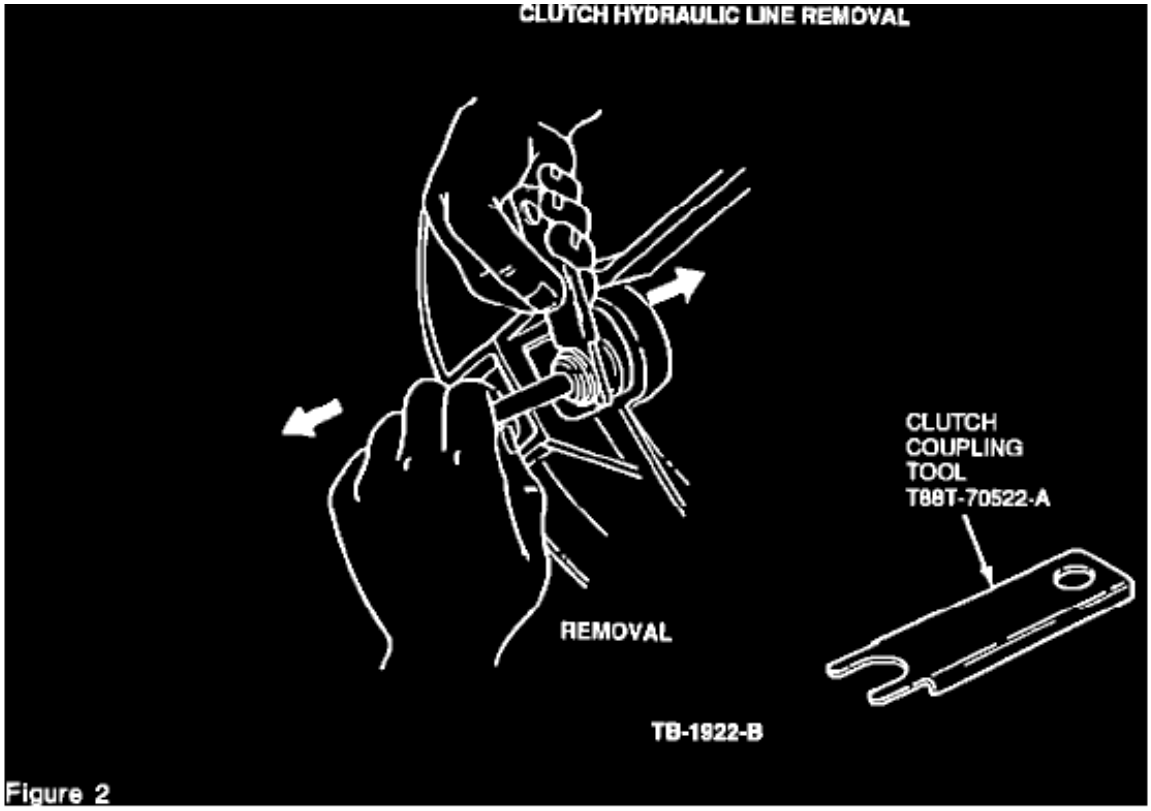

Figure 2

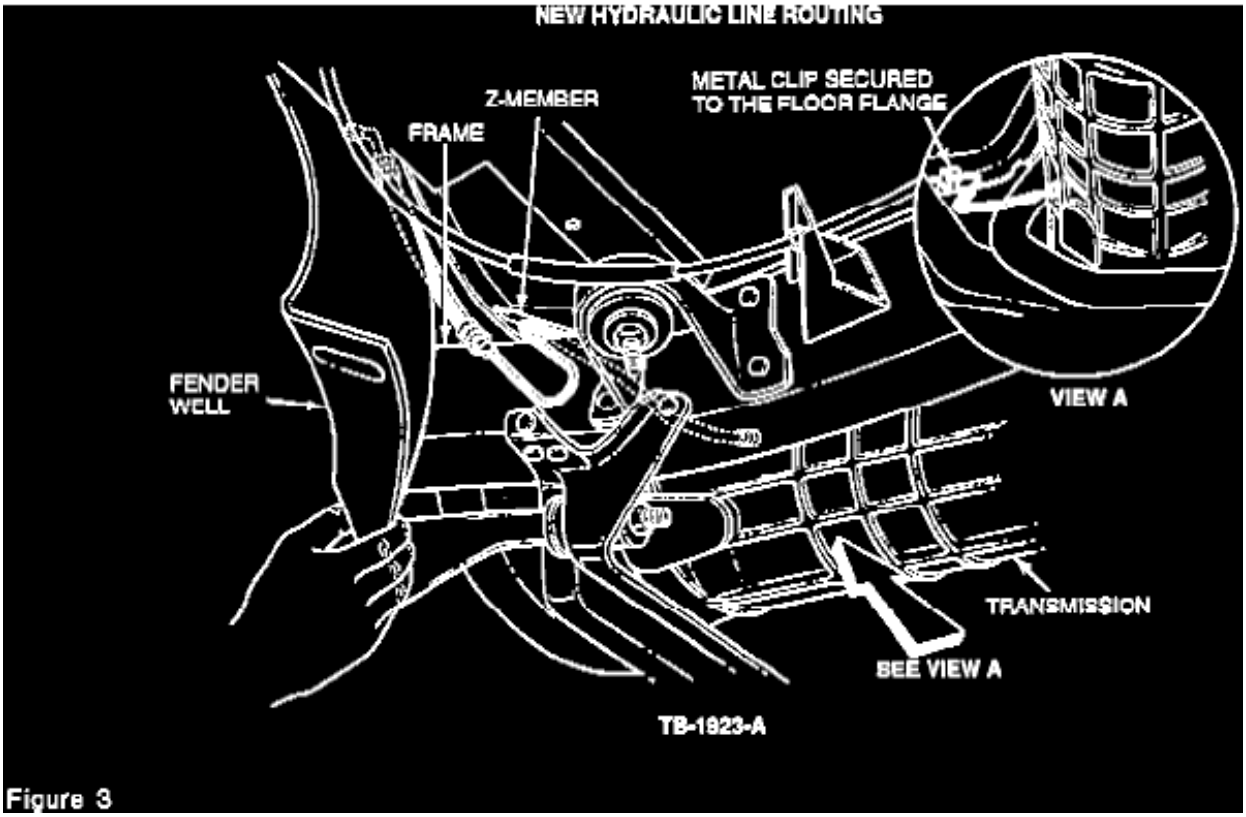

Figure 3

4. Slide the white plastic sleeve toward the slave cylinder while pulling the line away from the slave cylinder, Figure 2.

5. Route the new hydraulic line between the Z-member and frame as shown in Figure 3.

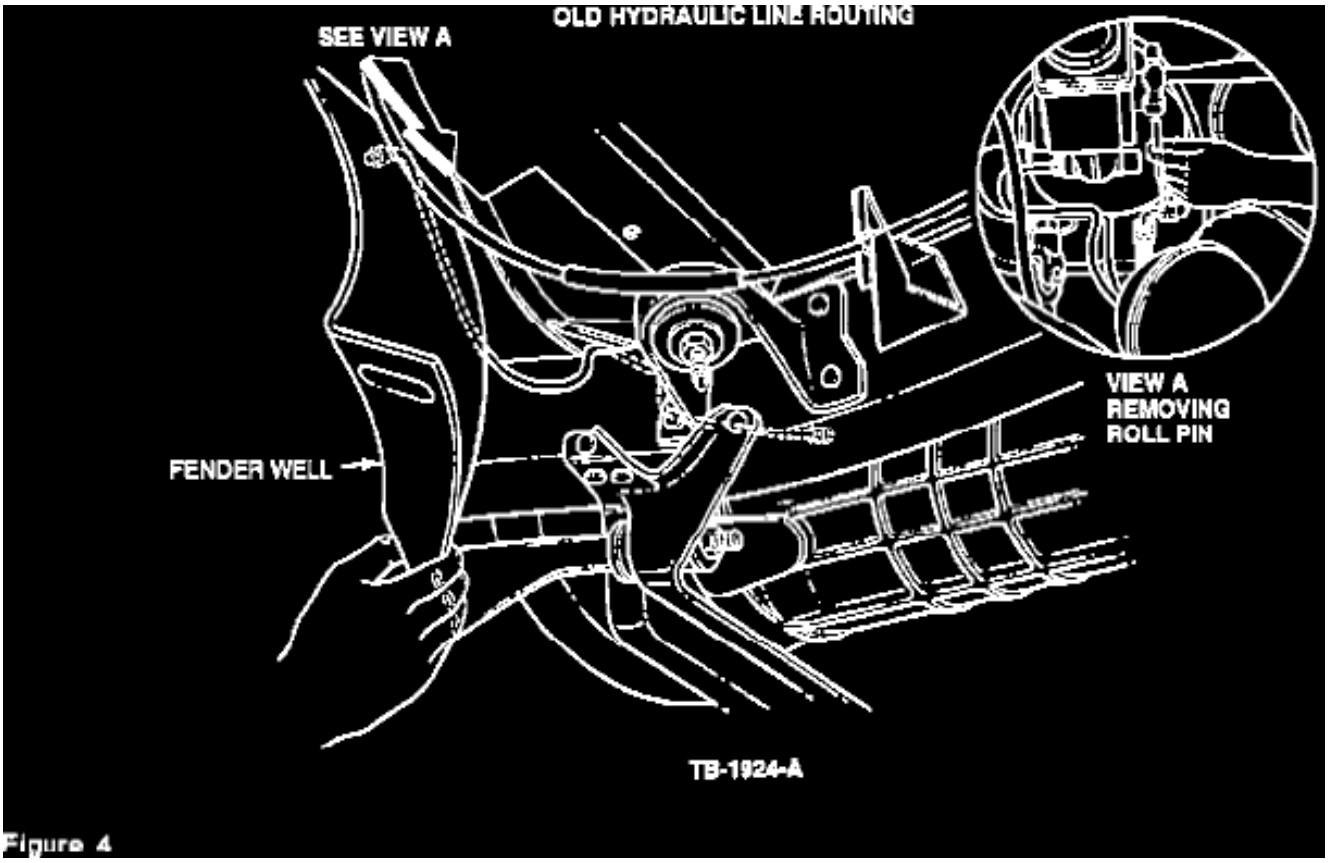

Figure 4

NOTE:

THIS ROUTING IS DIFFERENT THAN THE PRIOR HYDRAULIC LINE ROUTING WHICH IS SHOWN IN FIGURE 4 FOR REFERENCE.

6. Make sure that the heat shield is at the lower end of the hydraulic line (opposite end of rubber damper), Figure 3, View A.

7. Remove the red rubber protective cap from the lower end of the hydraulic line, a. Check to be sure that the O-ring is in place.

b. Insert the male coupling into the female coupling on the slave cylinder.

c. After the couplings are connected, pull on the line (away from the slave cylinder) to be sure that the connection is secure.

8. Connect the new hydraulic line to the metal retainer clip as follows:

a. If the vehicle is equipped with a metal retaining clip, the clip may be reused on the new hydraulic line. Secure the line to the metal retainer clip.

b. If the vehicle is not equipped with a retainer clip, use the new clip provided in the service kit. Insert the new clip to the floor flange and secure the line as shown in Figure 3, View A.

9. Lower the vehicle from the hoist.

HYDRAULIC LINE REPLACEMENT - UPPER END (MASTER CYLINDER END)

1. Raise the hood.

2. Remove and discard the roll pin.

a. Locate the roll pin on the clutch master cylinder, Figure 4, View A.

b. Use a fine punch and a hammer to knock the roll pin out of its hole.

3. Disconnect the hydraulic line from the clutch master cylinder.

a. Apply a slight tug on the hydraulic line away from the master cylinder outlet port.

b. Remove the hydraulic line from the vehicle.

4. Check to see that the O-ring is inside the clutch master cylinder outlet port.

^ If the existing O-ring is inside the clutch master cylinder outlet port, it may be reused.

^ If the O-ring is missing, install the new O-ring provided in the service kit.

5. Remove the plastic protective cover bag from the upper end of the new hydraulic line. Insert the hydraulic line into the clutch master cylinder outlet port.

6. Insert the new roll pin into the roll pin hole in the clutch master cylinder to retain the hydraulic line. Check to see that this connection is secured by pulling on the line away from the clutch master cylinder outlet port.

7. Bleed the clutch hydraulic system. Refer to the appropriate model year Ranger/Bronco II Shop Manual, Section 08-02, for bleeding procedure.

1993 Ranger With 2.3L - Hydraulic Line Replacement

HYDRAULIC LINE REPLACEMENT

1. Remove the clutch master cylinder, tube and reservoir assembly from vehicle. Refer to the 1993 Ranger Service Manual, Page 08-02-03.

2. Remove and discard the roll pin.

a. Locate the roll pin on the clutch master cylinder.

b. Use a fine punch and a hammer to knock the roll pin out of its hole.

3. Disconnect the hydraulic line from the clutch master cylinder. Apply a slight tug on the hydraulic line away from the master cylinder outlet port.

4. Check to see that the O-ring is inside the clutch master cylinder outlet port.

^ If the existing O-ring is inside the clutch master cylinder outlet port, it may be reused.

^ If the O-ring is missing, install the new O-ring provided in the service kit.

5. Remove the plastic protective cover bag from the upper end of the new hydraulic line. Insert the hydraulic line into the clutch master cylinder outlet port.

6. Insert the new roll pin into the roll pin hole in the clutch master cylinder to retain the hydraulic line. Check to see that this connection is secured by pulling on the line away from the clutch master cylinder outlet port.

7. Bleed system per the following bench bleed procedure.

Bench Bleed Procedure

BENCH BLEED PROCEDURE

1. Remove master cylinder, line and reservoir from vehicle and assemble with replacement parts required based on initial concern.

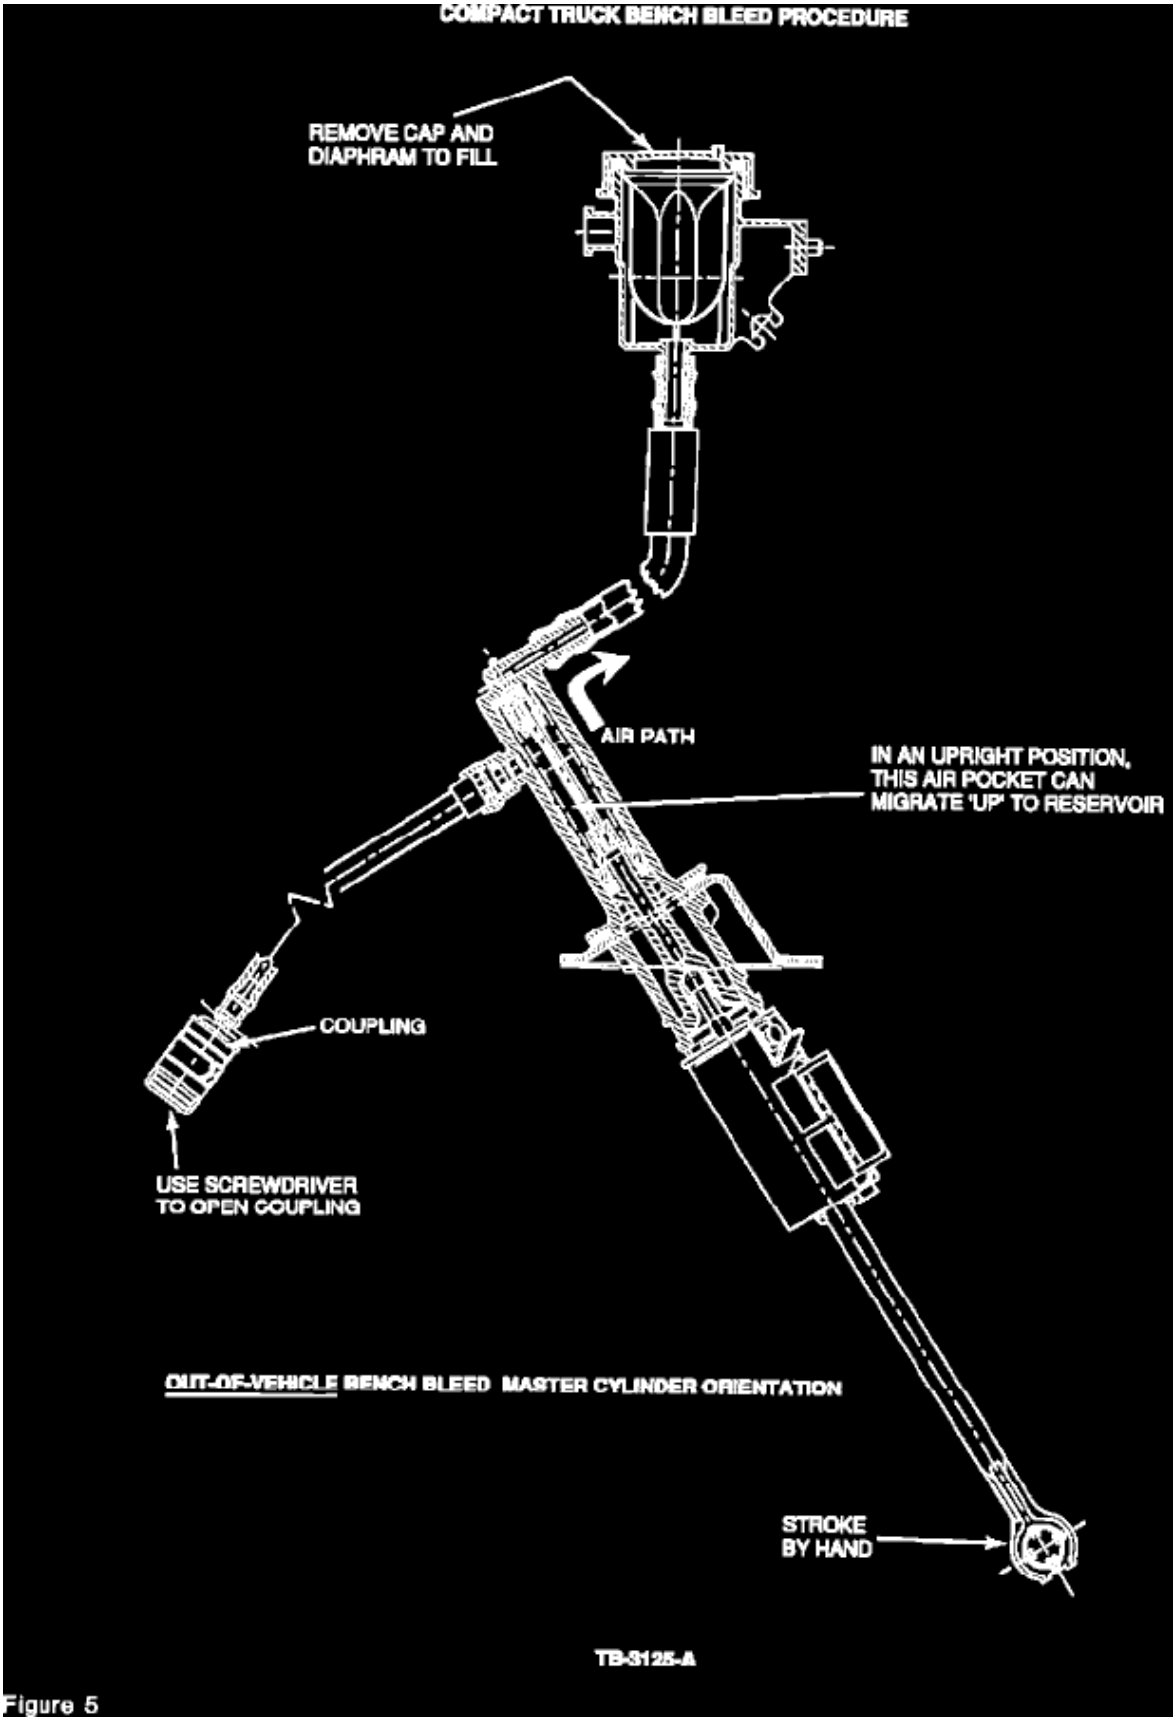

Figure 5

2. Hold the master cylinder vertically with the reservoir feed hose in the highest position on the body, Figure 5.

3. Fill the reservoir and extend above the master cylinder and assure the quick-connect on the clutch line is below the master cylinder. (Lightly clamp reservoir in a vise).

4. Using a small screwdriver, depress the internal mechanism of the male quick-connect coupling to open the valve, Figure 5.

5. Stroke and hold master cylinder pushrod.

6. Close quick-connect valve.

7. Release master cylinder pushrod.

8. Fill reservoir.

9. Repeat Steps 4 through 8 four more times.

10. With the master cylinder still being held with the outlet tube and reservoir feed tube ends high, quick-connect closed and the reservoir full, proceed as follows:

a. Push the pushrod into the body several times quickly to expel any remaining air.

b. If it is a remote reservoir, pinch the supply hose with your fingers two or three times to help move air into reservoir.

11. When the movement of the pushrod is .1601, (4 mm) or less when stroked in Step 10, reinstall the master cylinder into the vehicle and couple it to the slave cylinder per 1993 Ranger Service Manual Procedure, Page 08-02-03.

Final Inspection

1. Confirm that the audible growl is no longer present.

2. Inspect the vehicle for leaks and proper clutch operation.

^ If the hydraulic system leaks, check for a missing O-ring and any loose connections at either end of the hydraulic line.

^ If the clutch pedal feels effortless, actuate the clutch pedal several times at full stroke.

^ If the pedal still feels effortless, then the hydraulic system is probably not fully bled. Therefore, rebleed the hydraulic system.

1992 and Prior Models - Hydraulic Line Replacement

HYDRAULIC LINE REPLACEMENT PROCEDURE - LOWER END (SLAVE CYLINDER END)

1. Raise the vehicle on a hoist.

2. If the vehicle is equipped with a metal clip connected to the floor flange, unclip the hydraulic line.

3. Uncouple the lower end of the hydraulic line from the slave cylinder using Clutch Coupling Tool T88T-70522-A.

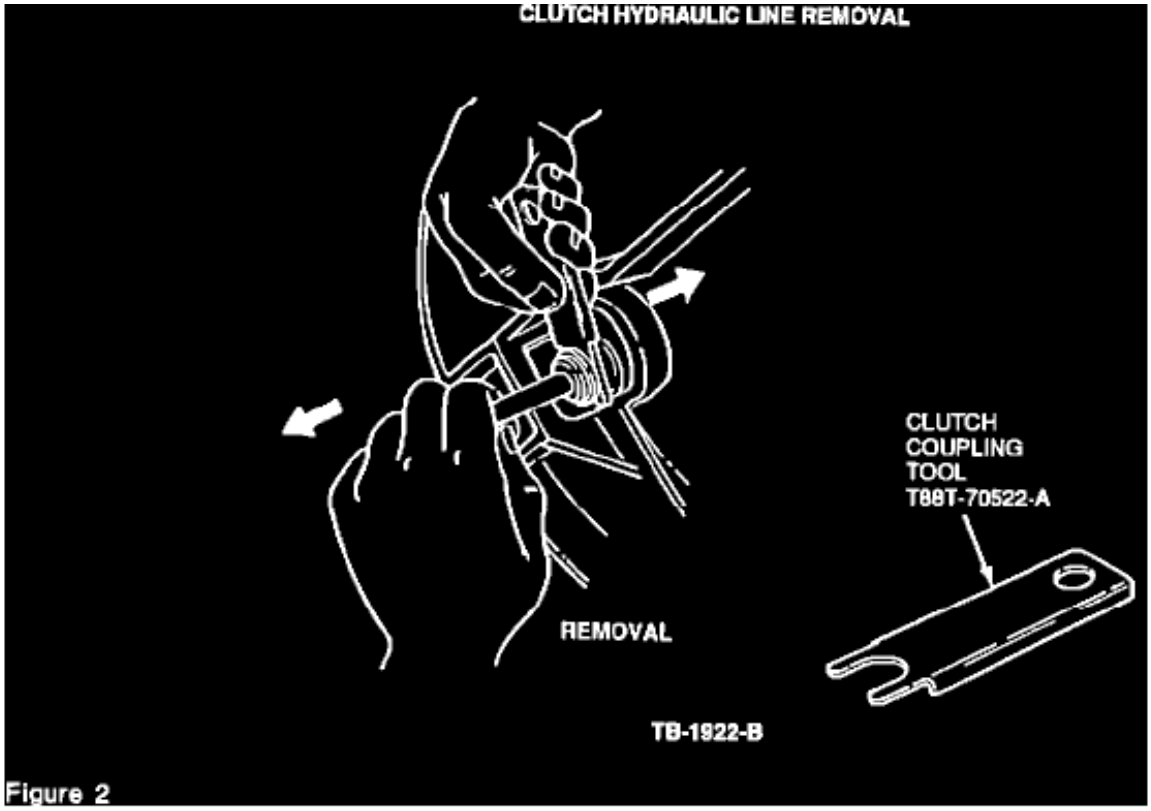

Figure 2

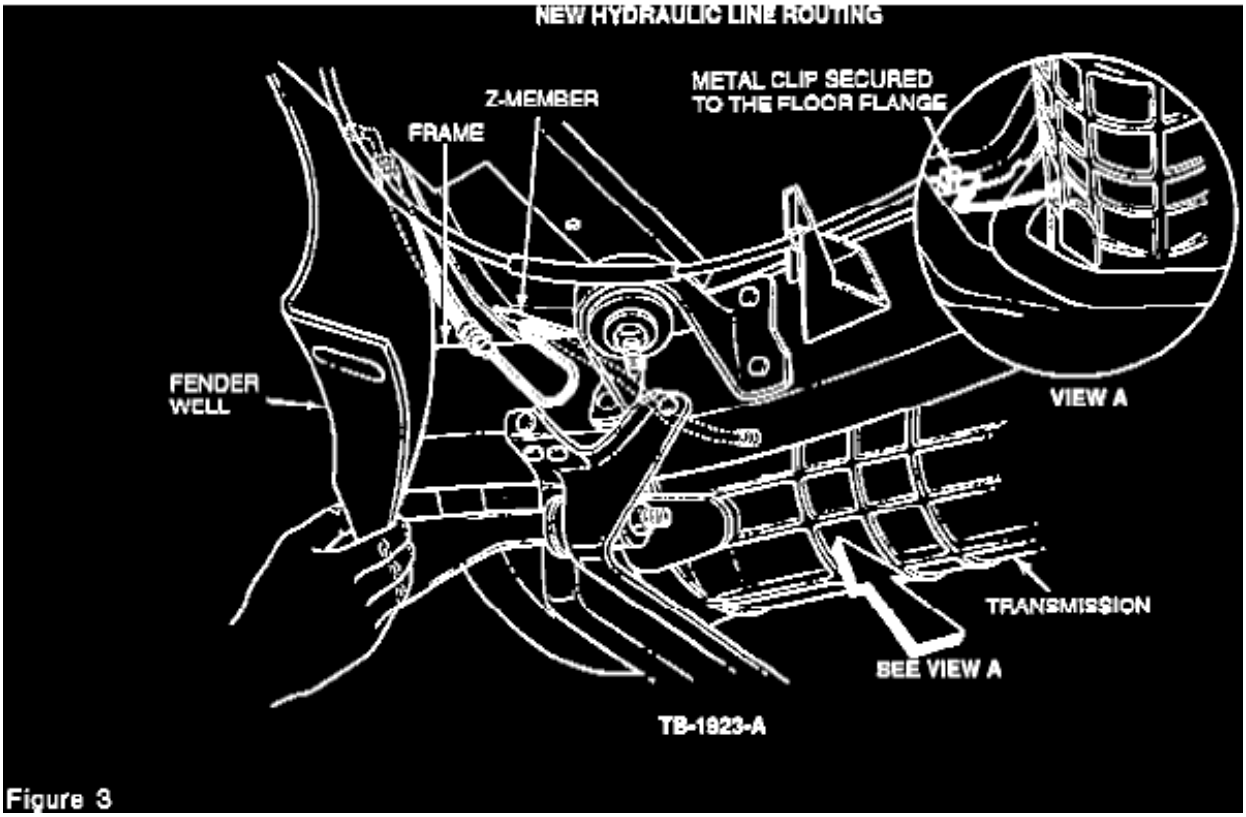

Figure 3

4. Slide the white plastic sleeve toward the slave cylinder while pulling the line away from the slave cylinder, Figure 2.

5. Route the new hydraulic line between the Z-member and frame as shown in Figure 3.

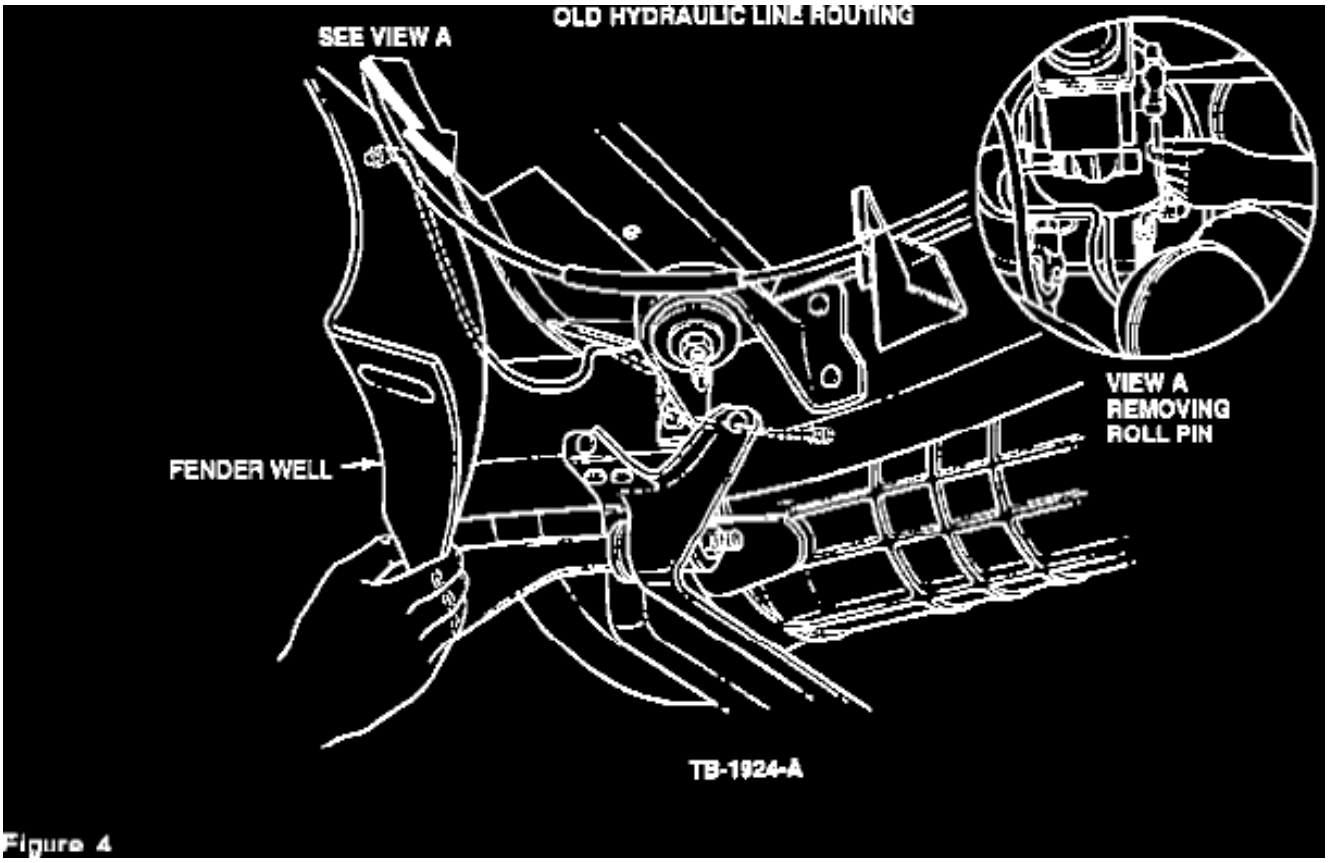

Figure 4

NOTE:

THIS ROUTING IS DIFFERENT THAN THE PRIOR HYDRAULIC LINE ROUTING WHICH IS SHOWN IN FIGURE 4 FOR REFERENCE.

6. Make sure that the heat shield is at the lower end of the hydraulic line (opposite end of rubber damper), Figure 3, View A.

7. Remove the red rubber protective cap from the lower end of the hydraulic line, a. Check to be sure that the O-ring is in place.

b. Insert the male coupling into the female coupling on the slave cylinder.

c. After the couplings are connected, pull on the line (away from the slave cylinder) to be sure that the connection is secure.

8. Connect the new hydraulic line to the metal retainer clip as follows:

a. If the vehicle is equipped with a metal retaining clip, the clip may be reused on the new hydraulic line. Secure the line to the metal retainer clip.

b. If the vehicle is not equipped with a retainer clip, use the new clip provided in the service kit. Insert the new clip to the floor flange and secure the line as shown in Figure 3, View A.

9. Lower the vehicle from the hoist.

HYDRAULIC LINE REPLACEMENT - UPPER END (MASTER CYLINDER END)

1. Raise the hood.

2. Remove and discard the roll pin.

a. Locate the roll pin on the clutch master cylinder, Figure 4, View A.

b. Use a fine punch and a hammer to knock the roll pin out of its hole.

3. Disconnect the hydraulic line from the clutch master cylinder.

a. Apply a slight tug on the hydraulic line away from the master cylinder outlet port.

b. Remove the hydraulic line from the vehicle.

4. Check to see that the O-ring is inside the clutch master cylinder outlet port.

^ If the existing O-ring is inside the clutch master cylinder outlet port, it may be reused.

^ If the O-ring is missing, install the new O-ring provided in the service kit.

5. Remove the plastic protective cover bag from the upper end of the new hydraulic line. Insert the hydraulic line into the clutch master cylinder outlet port.

6. Insert the new roll pin into the roll pin hole in the clutch master cylinder to retain the hydraulic line. Check to see that this connection is secured by pulling on the line away from the clutch master cylinder outlet port.

7. Bleed the clutch hydraulic system. Refer to the appropriate model year Ranger/Bronco II Shop Manual, Section 08-02, for bleeding procedure.

1993 Ranger With 2.3L - Hydraulic Line Replacement

HYDRAULIC LINE REPLACEMENT

1. Remove the clutch master cylinder, tube and reservoir assembly from vehicle. Refer to the 1993 Ranger Service Manual, Page 08-02-03.

2. Remove and discard the roll pin.

a. Locate the roll pin on the clutch master cylinder.

b. Use a fine punch and a hammer to knock the roll pin out of its hole.

3. Disconnect the hydraulic line from the clutch master cylinder. Apply a slight tug on the hydraulic line away from the master cylinder outlet port.

4. Check to see that the O-ring is inside the clutch master cylinder outlet port.

^ If the existing O-ring is inside the clutch master cylinder outlet port, it may be reused.

^ If the O-ring is missing, install the new O-ring provided in the service kit.

5. Remove the plastic protective cover bag from the upper end of the new hydraulic line. Insert the hydraulic line into the clutch master cylinder outlet port.

6. Insert the new roll pin into the roll pin hole in the clutch master cylinder to retain the hydraulic line. Check to see that this connection is secured by pulling on the line away from the clutch master cylinder outlet port.

7. Bleed system per the following bench bleed procedure.

Bench Bleed Procedure

BENCH BLEED PROCEDURE

1. Remove master cylinder, line and reservoir from vehicle and assemble with replacement parts required based on initial concern.

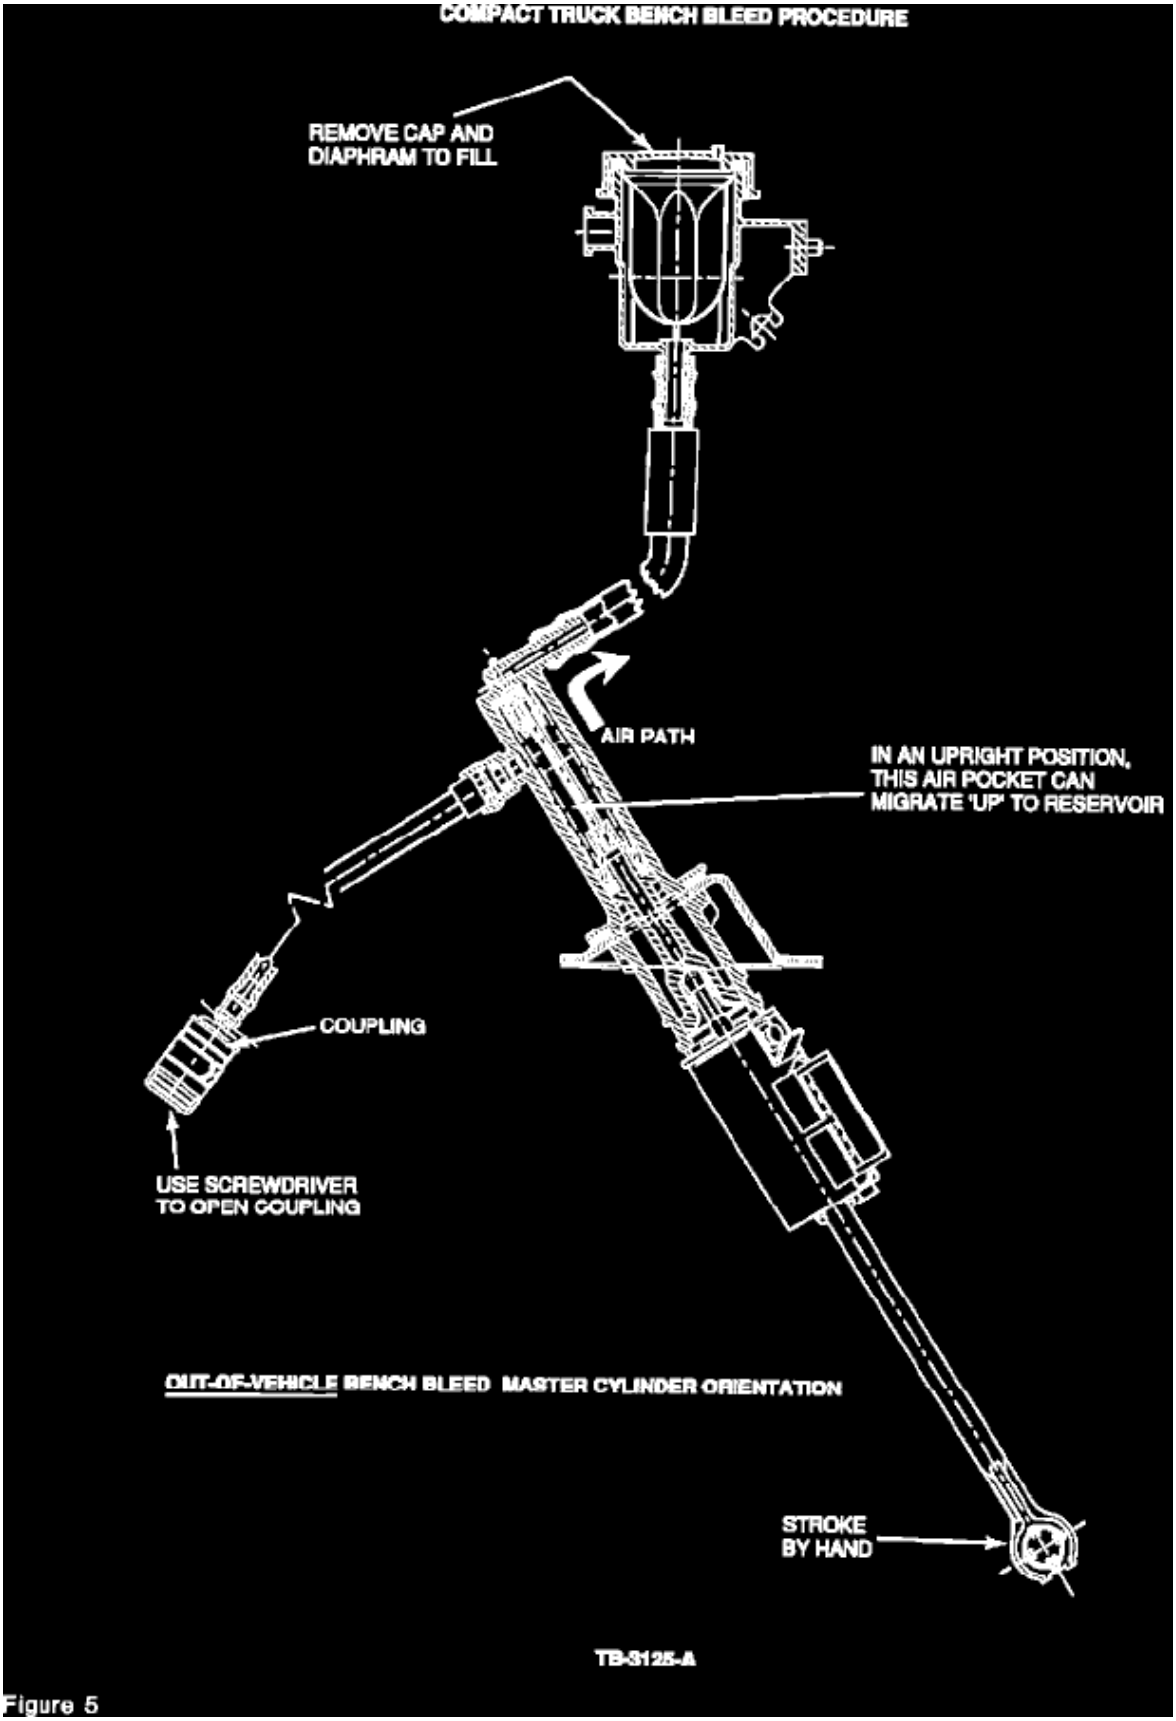

Figure 5

2. Hold the master cylinder vertically with the reservoir feed hose in the highest position on the body, Figure 5.

3. Fill the reservoir and extend above the master cylinder and assure the quick-connect on the clutch line is below the master cylinder. (Lightly clamp reservoir in a vise).

4. Using a small screwdriver, depress the internal mechanism of the male quick-connect coupling to open the valve, Figure 5.

5. Stroke and hold master cylinder pushrod.

6. Close quick-connect valve.

7. Release master cylinder pushrod.

8. Fill reservoir.

9. Repeat Steps 4 through 8 four more times.

10. With the master cylinder still being held with the outlet tube and reservoir feed tube ends high, quick-connect closed and the reservoir full, proceed as follows:

a. Push the pushrod into the body several times quickly to expel any remaining air.

b. If it is a remote reservoir, pinch the supply hose with your fingers two or three times to help move air into reservoir.

11. When the movement of the pushrod is .1601, (4 mm) or less when stroked in Step 10, reinstall the master cylinder into the vehicle and couple it to the slave cylinder per 1993 Ranger Service Manual Procedure, Page 08-02-03.

Final Inspection

1. Confirm that the audible growl is no longer present.

2. Inspect the vehicle for leaks and proper clutch operation.

^ If the hydraulic system leaks, check for a missing O-ring and any loose connections at either end of the hydraulic line.

^ If the clutch pedal feels effortless, actuate the clutch pedal several times at full stroke.

^ If the pedal still feels effortless, then the hydraulic system is probably not fully bled. Therefore, rebleed the hydraulic system.

Hydraulic Hose: Tools and Equipment

Clutch Line Fork

AST tool# 8008

Used for the R and R of the hydraulic clutch line from the internally mounted slave cylinder. This tool is applicable to the following Ford vehicles with manual transmissions: 1989 and later Ford Aerostar, Bronco II, Explorer, F150 and Ranger.

- For R and R of Hydraulic Clutch Lines

- Applicable to Ford Models with Manual Transmissions

- Steel Construction

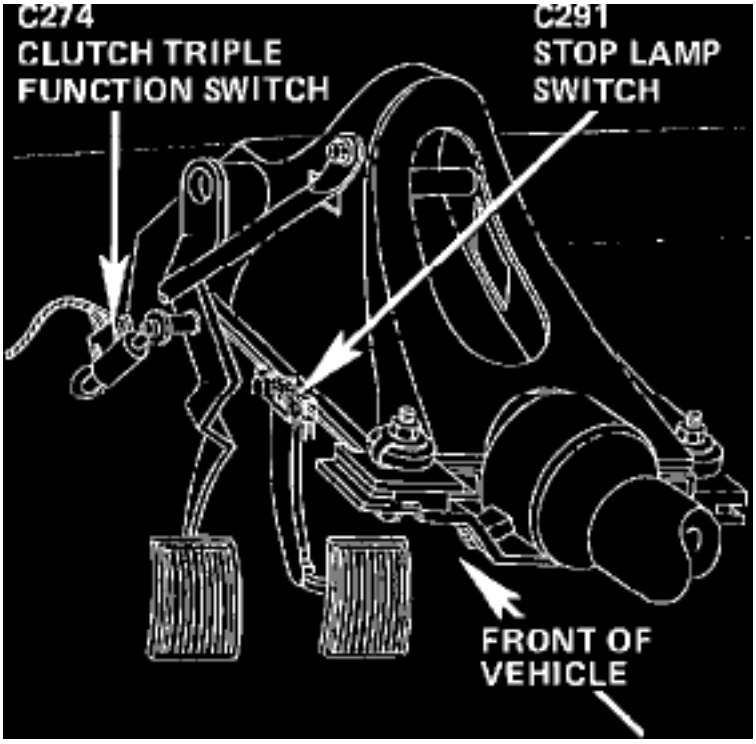
- Black-Oxide Finish

Contact AST for pricing.

Assenmacher Specialty Tools 1-800-525-2943

Clutch Pedal Assembly: Adjustments

These models are equipped with a hydraulic clutch system. No clutch linkage or pedal travel adjustments are required, since these adjustments are automatically taken up by the system.



Brake And Clutch Switches

Clutch Pedal Position Switch: Testing and Inspection

This switch functions magnetically. Do not use magnetized tools near this switch.

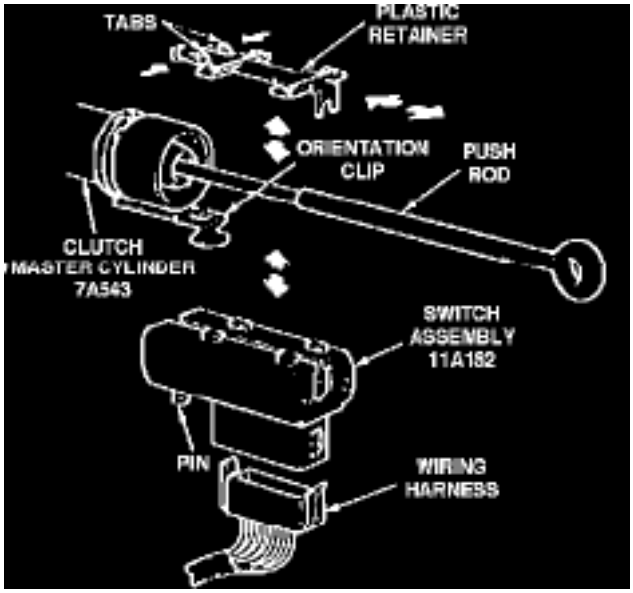
1. If the switch is open when the clutch pedal is released, speed control will not operate. This must be corrected before making any other tests. Use only a multimeter of 5000 ohm/volt rating or higher when performing the clutch switch test.

2. On all except 1990-91 Aerostar, Bronco II, Explorer and Ranger and 1992 Bronco & F150-350 models, disconnect switch pigtail connector from speed control harness connector and connect an ohmmeter to the two switch connector terminals.

3. On all 1990-91 Aerostar, Bronco II, Explorer and Ranger and 1992 Bronco & F150-350 models, connect suitable ohmmeter between two middle switch connector terminals.

4. On all models, with clutch pedal in the fully released position, the resistance should be less than 5 ohms. With clutch pedal fully depressed, the circuit should be open.

5. If switch does not function as described, remove and replace switch.



Clutch Pedal Position Switch: Service and Repair

Fig. 8 Clutch Interlock 3-way Switch

REMOVAL

1. Disconnect electrical connector from switch located on clutch master cylinder push rod, Fig. 8.

2. Pull orientation clip away from switch to separate pin, then rotate switch to expose plastic retainer.

3. Push tabs together to allow retainer to slide rearward and separate from switch.

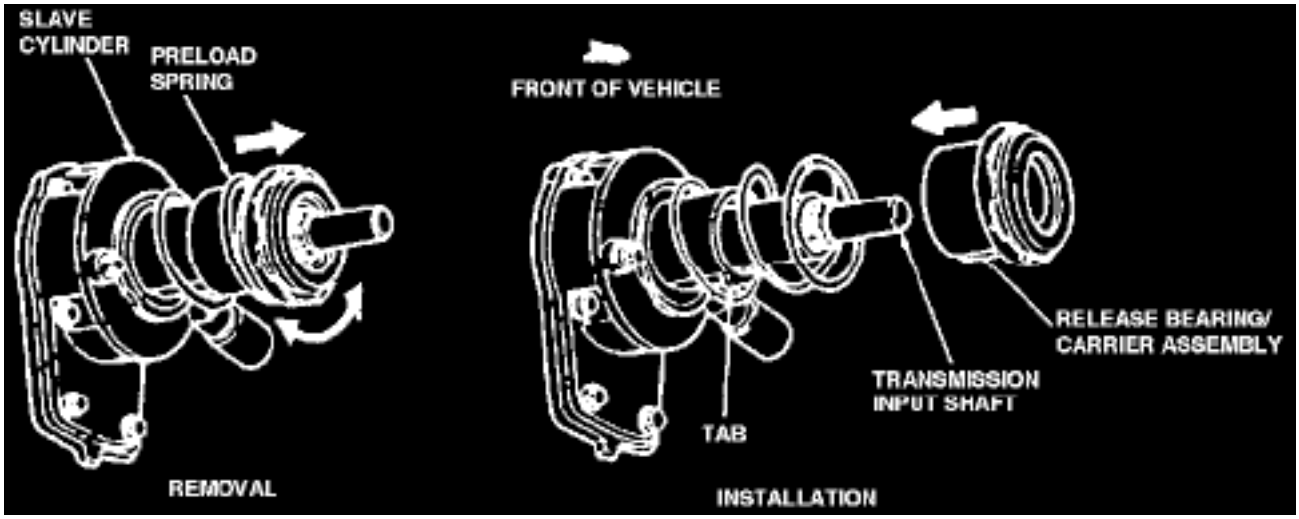
4. Remove switch from push rod.

INSTALLATION

1. Install switch onto master cylinder push rod, ensuring that switch is properly seated.

2. Install plastic retainer, then rotate switch into position and attach orientation clip.

3. Connect electrical connector.



Clutch Release Bearing: Service and Repair

Clutch Slave Cylinder

Removal

1. Remove transmission. 2. TWIST the release bearing and carrier assembly until resistance is felt. Turning the assembly further will allow the preload spring to push the

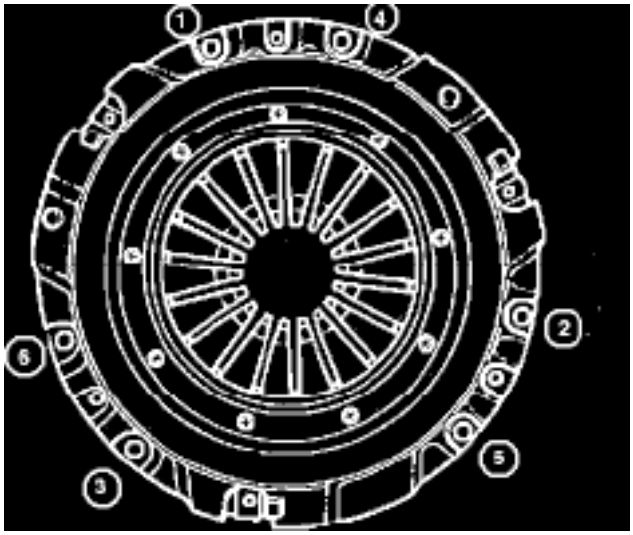
bearing assembly off the slave cylinder.

Installation

NOTE: Prior to installation, lubricate the bore of the bearing and bearing carrier with Premium Long-Life Grease or equivalent.

CAUTION: DO NOT use Petroleum base lubricants.

1. Install the release bearing assembly to the clutch slave cylinder by pushing into place. 2. Install transmission.



Pressure Plate: Service and Repair

1. Disconnect battery ground cable from battery. 2. Disconnect clutch hydraulic system master cylinder push rod from the clutch pedal. 3. Raise and support vehicle, then position safety stands under vehicle. 4. Remove starter motor from engine. 5. Using Coupling Disconnect Tool No. T88T-70522-A or equivalent, disconnect the hydraulic coupling at the transmission. 6. Remove transmission. 7. Mark the assembled position of the pressure plate and the cover to the flywheel (if original components are to be reinstalled). 8. Loosen the pressure plate retaining bolts evenly until the pressure plate diaphragm spring is expanded. 9. Remove bolts, pressure plate and clutch disc from the flywheel.

10. Using Puller tool No. T58L-101-B or equivalent, remove pilot bearing. If required. 11. Coat the pilot bore in the crankshaft with a small amount of Premium Long Life Grease part No. XG-1-C or equivalent. 12. Using Clutch Driver Tool No. T71P-7137-H or equivalent, install the pilot bearing with the seal facing the transmission. 13. Clean the pressure plate and flywheel surfaces with a commercial alcohol base solvent to ensure that surfaces are free from any oil film. 14. Install clutch disc onto flywheel, then insert clutch alignment tool No. T74P-7137-K or equivalent into clutch pilot bearing hole. Ensure clutch

disc is properly aligned on flywheel.

15. If installing original pressure plate and cover assembly, align marks made during removal and position pressure plate and cover assembly onto

flywheel.

16. Install pressure plate attaching bolts, then tighten bolts evenly one or two turns at a time until seated.

Pressure Plate Tightening Sequence

17. Torque retaining bolts to 15-24 ft. lbs in the sequence shown in example. 18. Remove clutch disc alignment tool. 19. Install transmission.

NOTE: Reuse the aluminum washers under the retaining bolts to prevent galvanic corrosion (2.9L/V6-179 engine only).

20. Connect the hydraulic line to the slave cylinder by pushing the male coupling into the female coupling on the slave cylinder. 21. Connect the master cylinder push rod to clutch pedal, then connect battery ground cable.

NOTE: On vehicles equipped with EEC, some abnormal drive conditions may occur while the EEC processor relearns its adaptive strategy. The vehicle may need to be driven 10 miles or more to relearn that strategy.

22. Bleed the clutch system (only if required).

Carrier Bearings: Testing and Inspection Bearing Cups

Check bearing cups for rings, galling or erratic wear patterns. The bearing cups must be solidly seated. Check by attempting to insert .0015 inch feeler gauge between cups and bottoms of bores.

Carrier Bearings: Testing and Inspection Cone & Roller Assemblies

When operated in the cups, the cone and roller assemblies must turn without any roughness. Examine roller ends for wear.

Carrier Bearings: Testing and Inspection Differential Bearing Adjusters

Test fit of bearing adjusters in their threads with bearing caps installed. Ensure that bearing caps are on sides that they were machined to fit. The faces of the adjusters that contact the bearing cups must be smooth and square. Examine threads in carrier if their fit is not proper and replace any adjuster with a damaged face or threads.

Carrier Bearings: Adjustments

1. Remove adjusting nut locks and loosen differential bearing cap bolts, then torque cap bolts to approximately 20 ft. lbs. Left adjusting nut is on ring gear side of carrier and right adjusting nut is on pinion side.

2. Loosen right nut until it is away from cup and tighten left nut until ring gear is just forced into position with zero backlash, then rotate pinion several revolutions to ensure that no binding is evident.

3. Check right nut to ensure that it is still loose, then install dial indicator.

4. Tighten right nut until it just contacts bearing cup, then set dial indicator to zero and apply pressure to bearings by tightening right nut until indicator reads .008-.012 inch.

5. Turn pinion gear several times in each direction to seat bearings in cups and ensure that no binding is evident, then torque bearing caps to specifications.

6. Measure backlash on several teeth around ring gear.

7. If backlash varies by more than .004 inch between any two teeth, loosen one adjusting nut and tighten opposite nut an equal amount to move ring gear away from or toward pinion. Tightening left nut moves ring gear into pinion to decrease backlash while tightening right nut moves ring gear away. When moving adjusting nuts, final movement should always be made in a tightening direction. Assuming left nut had to be loosened one notch, loosen nut two notches, then tighten one notch.

8. Ensure that case spread remains within specifications.

9. Perform teeth pattern check. If backlash is correct and gross pattern error results, recheck pinion shim selection.

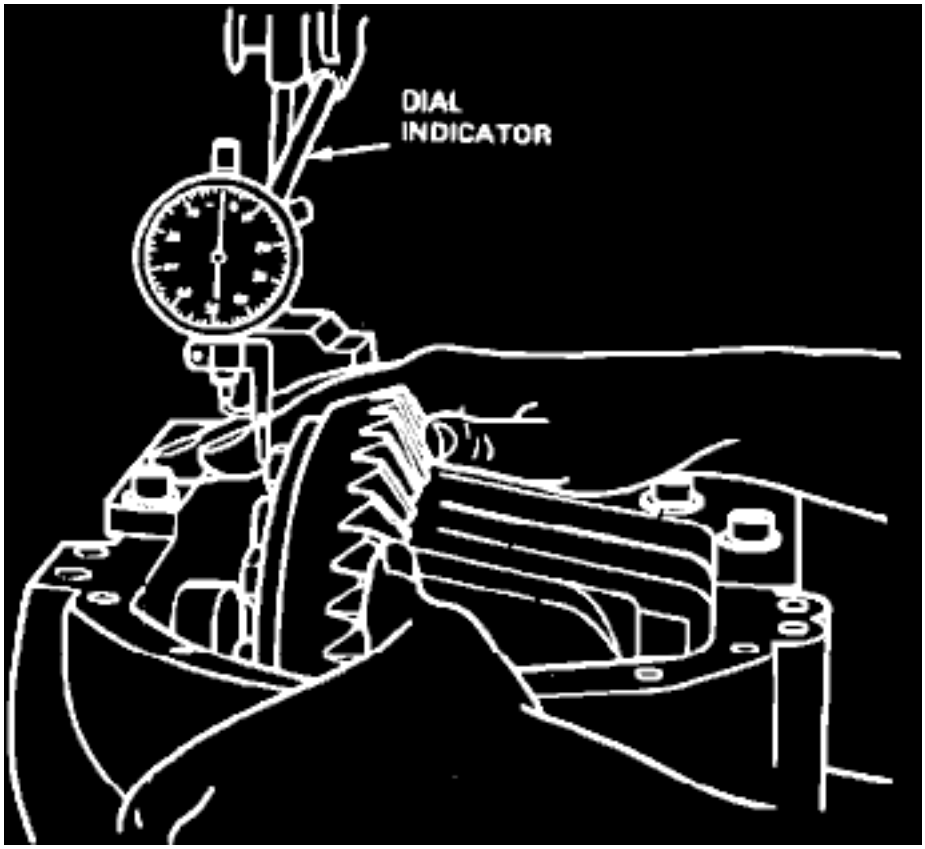
Carrier Side Gears: Testing and Inspection

Examine drive pinion and ring gear teeth for scoring or signs of excessive wear. Worn gears cannot be rebuilt to correct a noisy condition. Gear scoring and flaking are the result of excessive shock loading or the use of improper lubricant. Scored gears cannot be reused.

Examine teeth and thrust surfaces of differential gears. Wear on hub of differential side gears may cause a chucking noise known as chuckle, when the vehicle is operated at low speeds. Wear of splines, thrust surfaces or thrust washers may contribute to excessive drive line backlash.

Differential Case: Testing and Inspection

Ensure that hubs where bearings mount are smooth. Check fit of differential gears in the counterbores. Carefully examine thrust washers, which may be damaged when bearings are removed. If differential bearing assemblies do not seat firmly on hubs, failure is certain. Ensure that mating surfaces of the two parts of case and the face of the ring gear attaching flange are smooth and free from nicks and burrs.



Differential Case: Adjustments

Fig. 4 Total Differential Case Endplay Check

1. Attach ring gear to differential case using new bolts, then torque bolts alternately and evenly to specifications.

2. Clean trunnions on differential and install bearings onto differential case. Remove all burrs and nicks from hubs so bearings rotate freely.

3. Place differential case into carrier (without pinion). Differential case should move freely in carrier assembly. Position a suitable dial indicator against differential case flanges. Locate tip of indicator on flat surface of one ring gear bolt, Fig. 4. Force differential case toward dial indicator as far as possible and zero dial indicator with force still applied. Dial indicator should have a minimum of .200 inch travel on models except 35-IFS or .350 inch on model 35-IFS. Force differential case away from dial indicator as far as it will go. Repeat this procedure until same reading is obtained. Record dial indicator reading as measurement ``A'' on a worksheet for calculating ring gear backlash and differential bearing preload shims. This reading indicates amount of shims needed behind differential side bearings to take up total clearance between differential bearing cup and carrier. This reading will be used during ``Pinion & Ring Gear Backlash'' described under ``Carrier Assembly.''

4. Remove differential case from carrier. Do not remove differential case bearings at this time.

Differential Case: Service and Repair Model 28-2, 28-IFS & 35 IFS

Disassembly

1. Place differential case in a suitable vise, then drive out lockpin that retains pinion mate shaft to case.

2. Remove pinion mate shaft using a suitable drift, then rotate pinion mate gears and side gears until pinion mate gears turn to opening of case.

3. Remove pinion mate gears and spherical washers behind gears, then lift out side gears and thrust washers.

4. Inspect all parts and machined surfaces of case. If excessive wear is visible on all parts, it is suggested that complete differential case assembly be replaced. If any one of gears is to be replaced, the gears must be replaced as a set.

Assembly

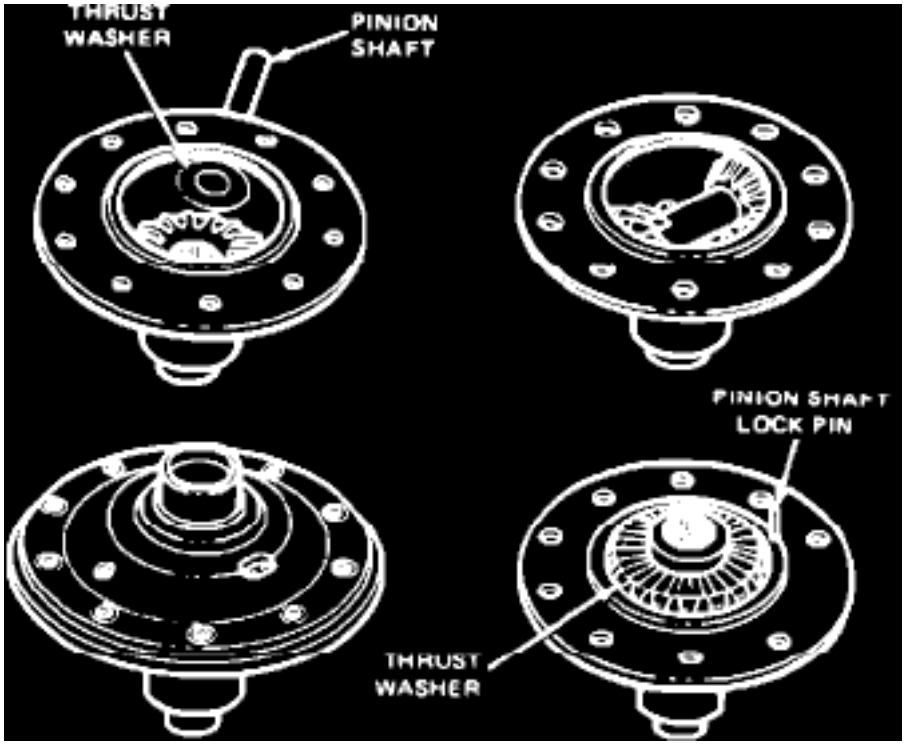
1. Apply a suitable multi-purpose long-life lubricant to side gear thrust washers, hub, thrust face of side gears, pinion mate gears and spherical washers.

2. Hold side gears in place in case, then install pinion mate gears and spherical washers.

3. Rotate side gears and pinion mate gears until holes in washers and pinion mate gears align with holes in case.

4. Insert pinion mate shaft into case, ensuring lockpin hole in shaft aligns with lockpin holes in case.

5. Insert lockpin, then peen some metal of case over pin to lock it into place.



Differential Case: Service and Repair Standard Differential

Fig. 10 Assembling Differential Case

1. Place side gear thrust washer and side gear in differential case bore, Fig. 10. Liberally lubricate all differential components with suitable lubricant during assembly.

2. Using soft faced hammer, drive differential pinion shaft into case only far enough to retain pinion thrust washer and pinion gear.

3. Place second differential pinion and thrust washer in position and drive pinion shaft into place, carefully aligning pinion shaft lockpin holes.

4. Place second side gear and thrust washer in position and install pinion shaft lockpin and the cover on differential case then insert axle shaft spline in side gear spline to check for free rotation of differential gears.

5. Using suitable solvent, clean tapped holes in ring gear.

6. Insert two 7/16 N.F. bolts two inches long through differential case flange and thread them three or four turns into ring gear as a guide for aligning ring gear bolts, then press or tap ring gear into position. If new bolts show a green or yellow coating of at least 1/2 inch on threaded area, use as is. If bolts are not coated, apply small amount of suitable sealant to threads. Torque bolts to specifications. Never install used bolts.

7. If differential bearings were removed, press them on using Bearing Cone Installation tool No. T57L-4221-A2 or equivalent.

8. Wipe thin coating of suitable lubricant on carrier differential bearing bores, then place cups on bearings and set differential case assembly in carrier.

9. Assemble differential case and ring gear assembly in carrier so that marked tooth on drive pinion indexes between marked teeth on ring gear.

10. Slide assembly along bores until a slight amount of backlash is felt between gear teeth.

11. Set adjusting nuts in bores so that they just contact bearing cups, engaging nuts approximately the same number of threads on both sides.

12. Carefully position differential bearing caps on carrier, matching alignment marks.

13. Ensure that adjuster nuts are properly threaded in cap and carrier and that they turn freely, then install bearing caps and alternately torque them to specifications.

14. If adjusting nuts do not turn freely as cap bolts are tightened, remove differential bearing caps and inspect for damaged threads or incorrectly positioned caps.

15. Adjust backlash and differential bearing preload.

0.023-0.027	0.025	0.025			

(1) With clutch hub, shims and clutch plates compressed 10-15 ft. lb.
(2) Service shims are available in 0.010 inch and 0.005 inch thicknesses.

Differential Case: Service and Repair Traction-LOC Differential

When new clutch plates are used, soak plates in suitable hypoid lubricant for approximately 30 minutes before installation. Lubricate all parts with suitable hypoid lubricant during assembly.

1. Mount differential case in suitable vise and place side gear thrust washer and side gear in counterbore of case.

2. Install differential pinion thrust washers and place pinion gears on side gear, aligning holes in washers and gears with holes in case.

3. Install center block so that shaft holes are aligned with holes in pinion gears and case.

4. Using brass drift, drive in long differential pinion shaft from outside of case, aligning lockpin holes in shaft with lockpin holes in case.

5. Position center block so that long shaft is driven through rough side and short shaft is driven through machined side.

6. Using suitable drift, install shaft lockpins, ensuring that differential pinion and side gears move freely.

7. Place four preload pins in holes provided in center block.

8. Position preload plate over four springs, ensuring that springs are properly seated. The preload plate straddles the center block over its narrower machined width.

9. Mount differential cover in suitable vise.

10. Insert shims .050 inch total thickness, in cover cavity.

11. Install composite plate on back side of clutch hub with friction material against hub, then install, in order, a friction plate, steel plate, friction plate, steel plate, friction plate and steel plate.

12. Place clutch hub with clutch plates into clutch gear cavities in differential cover, ensuring that splines on last friction plate are engaged on hub.

13. Obtain locally a 5/8 inch by 2 1/2 inch or 9/16 inch by 2 1/2 inch bolt, nut, and two 1 1/2 inch O.D. flat washers approximately 1/8 inch in thickness. Install flat washer on bolt and place bolt through clutch hub. Hold bolt in place and turn cover over. Plate flat washer and bolt and install nut, torquing nut to 10-15 ft. lbs. while ensuring that washers remain centered.

SFig. 11 Shim Pack Thickness Chart

14. Place shim template tool in clutch hub. Some clearance should be observed between shim tool and cover to case mating surface. Determine exact amount of clearance using feeler gauge. The shim pack thickness chart, Fig. 11, will indicate correct amount of shims to subtract from .050 inch shims originally installed.

15. Remove bolt, nut and flat washers. Remove clutch hub and clutch plates as necessary to alter shim thickness.

16. Install selected shims in cover cavity, then reinstall components as described in steps 11 and 12.

17. Install four steel clutch ear guides and side gears.

18. Place both assemblies in press and press two halves together, then install two Allen head or Phillips head screws and tighten evenly until tight.

19. Install ring gear and ring gear bolts and washers. Torque bolts evenly and alternately across diameter of ring gear to specifications.

20. Using currently released locker tools, check torque required to rotate one side gear while other is held stationary. The initial breakaway torque may exceed 250 ft. lbs. The rotating torque required to keep the side gear turning with new clutch plates is 100-250 ft. lbs. With reused clutch plates, the minimum torque required is 40 ft. lbs. (Torque may fluctuate 10-40 ft. lbs.)

Differential Clutch: Customer Interest Differential - Chatter On Turns

Article No. 96-12-9

06/03/96

^ NOISE - "CHATTER" DURING TIGHT TURNS OR TURNS AFTER AN EXTENDED PERIOD OF HIGHWAY DRIVING - TRACTION-LOK DIFFERENTIAL - 7.5 AND 8.8 INCH RING GEAR REAR AXLES

^ AXLE - NEW SERVICE KIT AVAILABLE FOR TRACTION-LOK DIFFERENTIAL - 7.5 AND 8.8 INCH RING GEAR

^ AXLE - TRACTION-LOK DIFFERENTIAL - 7.5 AND 8.8 INCH RING GEAR - "CHATTER" NOISE DURING TIGHT TURNS OR TURNS AFTER AN EXTENDED PERIOD OF HIGHWAY DRIVING

FORD: 1989-96 CROWN VICTORIA, MUSTANG, THUNDERBIRD

LINCOLN-MERCURY: 1989-96 COUGAR, GRAND MARQUIS, TOWN CAR

LIGHT TRUCK: 1989-96 AEROSTAR, BRONCO, E-150, RANGER 1989-97 F-150 1991-96 EXPLORER

ISSUE: A "chatter" noise can be felt and/or heard during tight turns or turns after an extended period of highway driving. This is due to insufficient specified friction modifier, or over-shimming of the clutch packs within Traction-Lok differentials.

ACTION: Install revised Clutch Pack Replacement Kit (F5ZZ-4947-BA for 7.5" ring gear and F5AZ-4947-BA for 8.8" ring gear), with improved friction material, in the differential after confirming the "chatter" concern with a road test of the vehicle. Refer to the Instruction Sheet within the kit for details.

NOTE:

THE CLUTCH PACK REPLACEMENT KIT INCLUDES SELECTED SHIMS. IT WILL NOT REQUIRE THE ORDERING OF INDIVIDUAL SHIMS BASED UPON TEARDOWN MEASUREMENTS.

REAR AXLE ASSEMBLY IDENTIFICATION

See metal Service Identification tag for rear axle ring gear size and differential type. The identification tag is attached to the rear axle cover by means of a cover bolt.

The Clutch Pack Replacement kit (F5ZZ-4947-BA) for the 7.5" ring gear traction-lok rear axle contains the following:

^ Two (2) Clutch Packs

^ One (1) Pinion Shaft Lockbolt

^ One (1) 4 oz. bottle of Friction Modifier

^ Two (2) Shims - 0.025" thick

^ Two (2) Shims - 0.030" thick

^ Two (2) Shims - 0.035" thick

^ Two (2) Shims - 0.040" thick

^ Two (2) Shims - 0.045" thick

^ One (1) Instruction Sheet (I.S. # 7145)

The Clutch Pack Replacement Kit (F5AZ-4947-BA) for the 8.8" ring gear traction-lok rear axle contains the following:

^ Two (2) Clutch Packs

Differential Axle Housing: Technical Service Bulletins Front Drive Axle - Identification Tags

Article No. 92-5-14

February 26, 1992

AXLE - FRONT DRIVE AXLE IDENTIFICATION TAGS - 4X4 MODELS

LIGHT TRUCK: 1985-90 BRONCO II 1985-92 BRONCO, F-150-350 SERIES, RANGER 1991-92 EXPLORER

ISSUE: The 1991 and prior model front drive axles had identification information in the following three (3) places...

^ It was on a metal tag attached to a carrier cover mounting bolt.

^ It was stamped into the left side axle arm (tube) front face inboard of the U-Joint.

^ It was on a paper tape tag wrapped around the axle arm (tube).

The 1992 model year axles use a glue-on label that replaces all three of the prior identification markings, Figure 1. The new label is on the rear face of the right hand arm (tube).

ACTION: Since this glue-on label, Figure 1, is the only identification, be sure that the information on the label is recorded in a retrievable place before any service actions are taken which will damage/destroy or remove the label.

Differential Axle Housing: Service and Repair

1. Raise vehicle and support at rear frame members.
2. Remove rear wheels and brake drums.
3. Drain rear axle lubricant by removing housing cover.
4. Remove axle shafts.
5. Remove 4 retaining nuts from each backing plate and wire the plates aside.
6. Disconnect rear axle housing vent.
7. Disconnect brake line from retaining clips on axle housing.
8. Remove hydraulic brake T-fitting from axle housing.
9. Mark driveshaft and axle flange for assembly reference, then disconnect shaft from flange.
10. Support axle with a suitable jack, then remove U-bolt nuts, U-bolts and plates.
11. Disconnect lower shock absorber studs from axle housing mounting brackets.
12. Lower axle housing and remove from vehicle.
13. Reverse procedure to install.

Pinion Bearing: Testing and Inspection Bearing Cups

Check bearing cups for rings, galling or erratic wear patterns. The bearing cups must be solidly seated. Check by attempting to insert .0015 inch feeler gauge between cups and bottoms of bores.

Pinion Bearing: Testing and Inspection Cone & Roller Assemblies

When operated in the cups, the cone and roller assemblies must turn without any roughness. Examine roller ends for wear.

Pinion Bearing: Adjustments

1. Install pinion into carrier, then a new collapsible spacer.

2. Install outer pinion bearing and thrust washer or oil slinger.

3. Coat drive pinion oil seal with suitable hypoid gear lubricant or equivalent, then install drive pinion oil seal using suitable oil seal replacer. After installation, ensure garter spring did not pop out. If garter spring pops out, remove and replace seal.

4. On model 28-IFS, install yoke using Companion Flange Replacer tool No. T83T-4851-A or equivalent, then install washer and nut. Torque nut to 175 ft. lbs.

5. Place an inch pound torque wrench on pinion nut and check pinion rotational torque. Rotational torque should be 15-35 inch lbs.

6. If reading is less than 15 inch lbs., tighten pinion nut in small increments until rotational torque specification is obtained. Do not torque nut to more than 225 ft. lbs, or collapsible spacer will be compressed too far.

7. If reading is greater than 35 inch lbs., collapsible spacer has been compressed too far and must be removed and replaced with a new spacer.

8. On model 28-2, install companion flange using Companion Flange Replacer tool No. T83T-4851-A or equivalent, then install washer and nut and torque to 140 ft. lbs.

9. Place an inch-pound torque wrench on pinion nut and check pinion rotational torque. Rotational torque should be 15-35 inch lbs.

10. If reading is less than 15 inch lbs., tighten pinion nut in small increments until rotational torque specification is obtained. Do not torque nut to more than 275 ft. lbs, or collapsible spacer will be compressed too far.

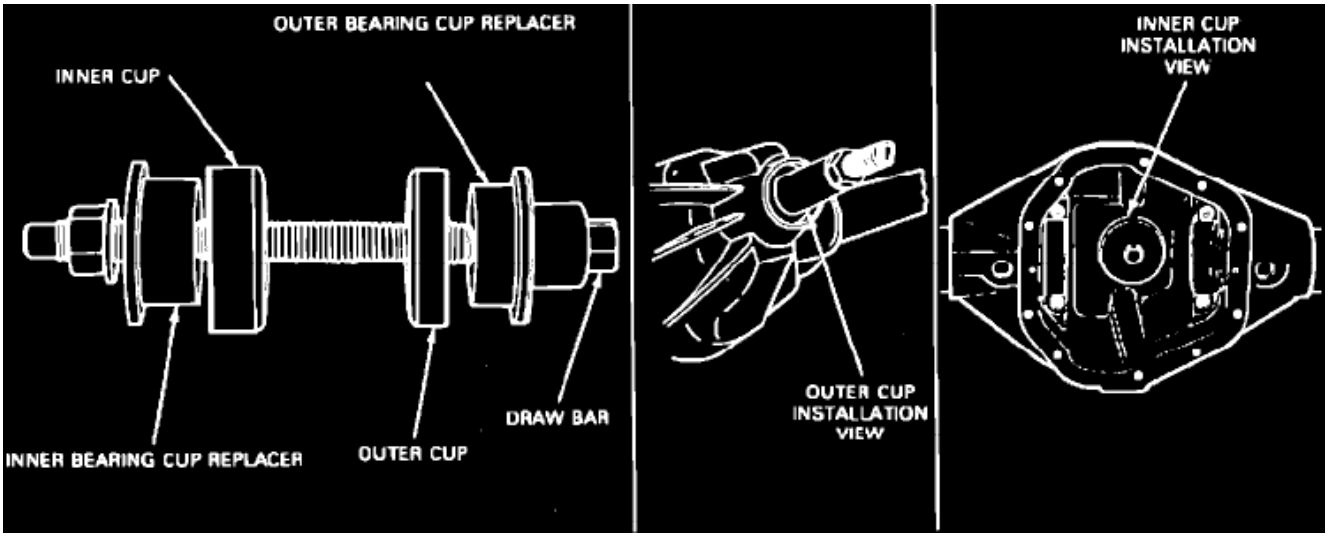
11. If reading is greater than 35 inch lbs., collapsible spacer has been compressed too far and must be removed and replaced with a new spacer.

12. On model 35-IFS, install yoke using Companion Flange Replacer tool No. T85T-4851-AH or equivalent, then install washer and nut and torque to 200 ft. lbs.

13. Place an inch-pound torque wrench on pinion nut and check pinion rotational torque. Rotational torque should be 15-25 inch lbs.

14. If reading is less than 15 inch lbs., tighten pinion nut in small increments until rotational torque specification is obtained. Do not torque nut to more than 350 ft. lbs, or collapsible spacer will be compressed too far.

15. If reading is greater than 25 inch lbs., collapsible spacer has been compressed too far and must be removed and replaced with a new spacer.



Pinion Bearing: Service and Repair Pinion Bearing Cup Installation

Fig. 11 Inner And Outer Pinion Cup Installation Tools

1. Place inner and outer pinion bearing cups into carrier bore.

2. Place suitable inner and outer bearing cup replacer tools on their respective cups, Fig. 11.

3. Install a suitable threaded draw bar into replacer tools and tighten drawbar to install cups in their bores.

Pinion Bearing: Service and Repair Pinion Bearing Cups

Do not remove drive pinion bearing cups from the retainer unless cups are worn or damaged.

1. Using suitable puller, remove bearing cups.

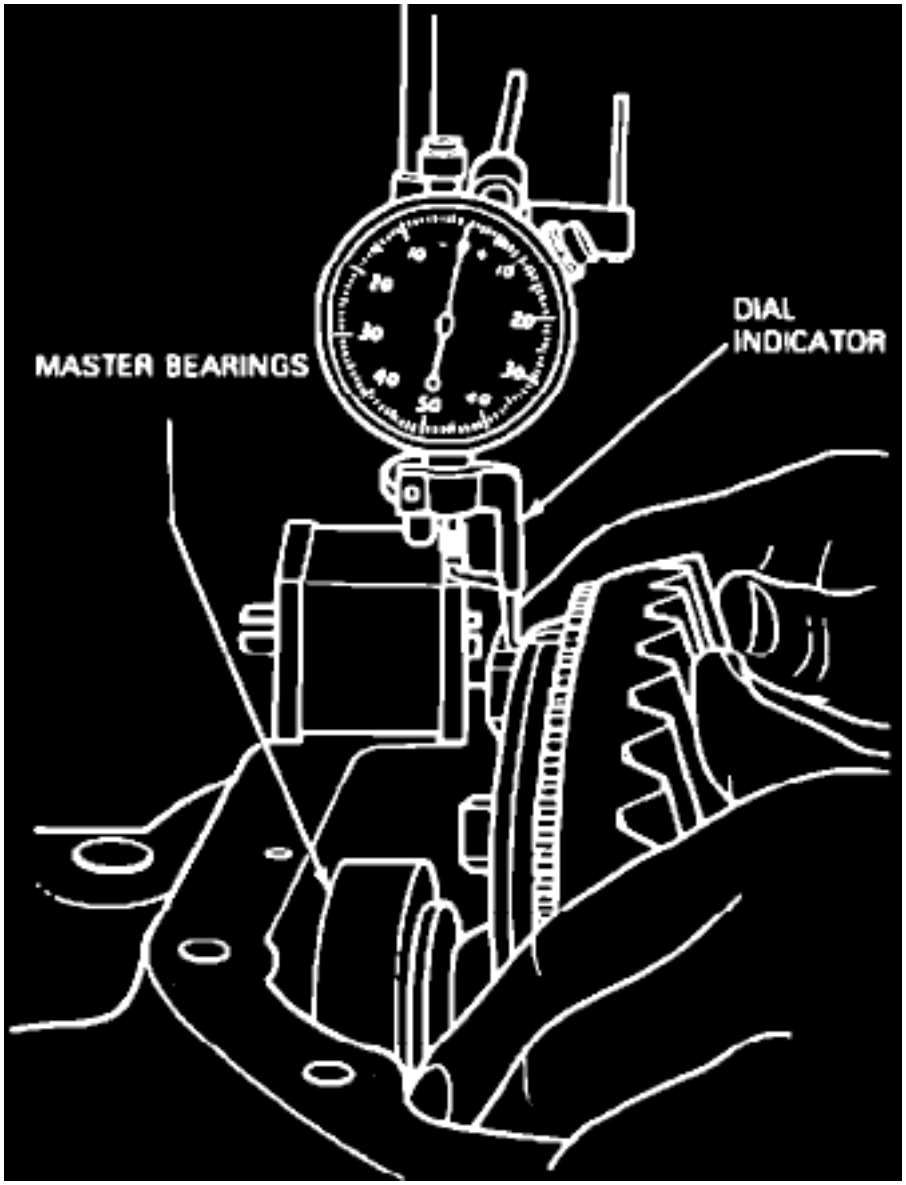
2. Using Bearing Cup Installation tool No. T71P-4616-A or equivalent, install new bearing cups.

3. Check seating of cups by attempting to insert a .0015 inch feeler gauge between cup and bottom of bore. Cone and roller assemblies should be replaced whenever cups are replaced.

Pinion Gear: Testing and Inspection

Examine drive pinion and ring gear teeth for scoring or signs of excessive wear. Worn gears cannot be rebuilt to correct a noisy condition. Gear scoring and flaking are the result of excessive shock loading or the use of improper lubricant. Scored gears cannot be reused.

Examine teeth and thrust surfaces of differential gears. Wear on hub of differential side gears may cause a chucking noise known as chuckle, when the vehicle is operated at low speeds. Wear of splines, thrust surfaces or thrust washers may contribute to excessive drive line backlash.



Pinion Gear: Adjustments Backlash

Fig. 7 Total Differential Case Endplay Check

1. Place differential case into position in carrier (differential case bearings should still be installed).

2. Force differential case away from drive pinion gear, until it is completely seated against cross bore face of carrier. Position a dial indicator so indicator tip rests on a ring gear bolt head, Fig. 7. Zero dial indicator.

3. Force ring gear against pinion gear. Rock ring gear slightly to ensure gear teeth are in contact, then force ring gear away from pinion gear, ensuring dial indicator returns to zero. Repeat this procedure until dial indicator reading is the same. This reading should be recorded as measurement ``B'' and reveals amount of shims necessary between differential case and differential bearing on ring gear side.

4. Assemble shim pack for ring gear side to measurement ``B.''

5. Subtract measurement ``B'' from measurement ``A'' obtained in step 3 under ``Total Differential Case Endplay'' as previously described to obtain measurement ``C.'' Measurement ``C'' equals amount of shims required between differential case and bearing on side opposite of ring gear.

6. Assemble shim pack for side opposite of ring gear to measurement ``C'' plus (+) .015 inch.

7. Remove differential case from carrier, then the bearings from case.

8. Place required amount of shims on hub of ring gear side of differential case, then install bearing and drive bearing onto hub using a suitable differential side bearing replacer.

9. Place required amount of shims on hub of differential case opposite of ring gear side, then install bearing. Place a suitable step plate on ring gear side bearing to protect bearing, then drive bearing opposite of ring gear side onto hub using differential side bearing replacer.

10. Install differential bearing cups onto bearings.

11. Mount Spreader tool No. TOOL-4000-E and Spreader Adapter tool No. T80T-4000-B or their equivalents onto carrier assembly.

12. Position a dial indicator onto carrier, then spread housing. Do not spread housing more than .015 inch.

13. Install differential case into carrier. If necessary, use a rawhide or plastic hammer to seat case in carrier bore. With partial and non-hunting/partial ring gear and pinion sets, align marks on ring gear and drive pinion, if applicable. Use care not to nick teeth of ring gear or pinion.

14. Remove spreader and dial indicator.

15. Install bearing caps and bolts, ensuring letters or numbers stamped on caps correspond in both position and direction with letters or numbers stamped into carrier, then torque bolts to specifications.

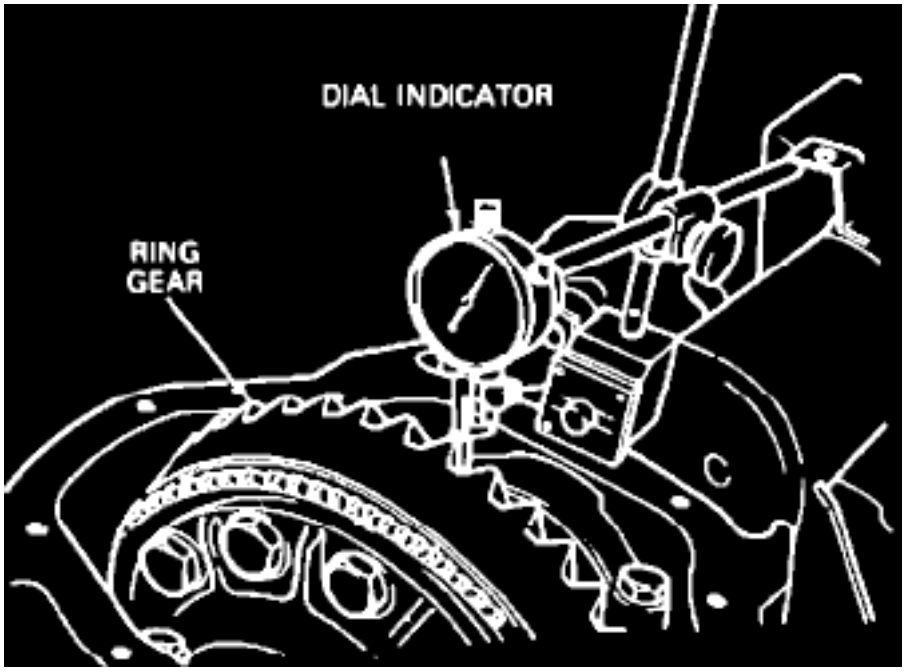


Fig. 16 Ring And Pinion Backlash Check

16. Install dial indicator on case, Fig. 16.

17. Check ring gear and pinion backlash at three equally spaced points on ring gear. Back lash tolerance is .005-.009 inch and cannot vary more than .003 inch between the three points.

18. If backlash is high, ring gear must be moved closer to pinion by moving shims to ring gear side from opposite side.

19. If backlash is low, ring gear must be moved away from pinion by moving shims from ring gear side to opposite side.

20. Install new cover gasket and cover plate, then the mounting bolts and torque to specifications.

Pinion Gear: Adjustments Backlash & Differential Bearing Preload Adjustment

1. Remove adjusting nut locks and loosen differential bearing cap bolts, then torque cap bolts to approximately 20 ft. lbs. Left adjusting nut is on ring gear side of carrier and right adjusting nut is on pinion side.

2. Loosen right nut until it is away from cup and tighten left nut until ring gear is just forced into position with zero backlash, then rotate pinion several revolutions to ensure that no binding is evident.

3. Check right nut to ensure that it is still loose, then install dial indicator.

4. Tighten right nut until it just contacts bearing cup, then set dial indicator to zero and apply pressure to bearings by tightening right nut until indicator reads .008-.012 inch.

5. Turn pinion gear several times in each direction to seat bearings in cups and ensure that no binding is evident, then torque bearing caps to specifications.

6. Measure backlash on several teeth around ring gear.

7. If backlash varies by more than .004 inch between any two teeth, loosen one adjusting nut and tighten opposite nut an equal amount to move ring gear away from or toward pinion. Tightening left nut moves ring gear into pinion to decrease backlash while tightening right nut moves ring gear away. When moving adjusting nuts, final movement should always be made in a tightening direction. Assuming left nut had to be loosened one notch, loosen nut two notches, then tighten one notch.

8. Ensure that case spread remains within specifications.

9. Perform teeth pattern check. If backlash is correct and gross pattern error results, recheck pinion shim selection.

Fig. 12 Inner And Outer Pinion Cup Installation Tools

3. Install inner and outer pinion cups using suitable tools, Fig. 12. Prior to installing pinion bearing cups into aluminum or magnesium housings, apply Lubrikote type A-1040 CR graphite lubricant or equivalent to bearing cup bore to prevent metal particles from being picked up as cup is pressed into bore.

4. Place a new inner pinion bearing over proper aligning adapter and insert into pinion bearing retainer assembly. Place outer pinion bearing into bearing cup in carrier and assemble handle onto screw and hand tighten. Note 3/8 inch square drive in handle to be used for obtaining proper pinion bearing preload.

5. Center proper gauge tube into differential bearing bore, install bearing caps and torque to specifications. To preload bearings, torque handle to 20-40 inch lbs.

6. Using suitable feeler gauges, select thickest feeler gauge that will enter between gauge tube and gauge block. Insert feeler gauge directly along gauge block to ensure a correct reading. Feeler gauge fit between gauge tube and gauge block should be a slight drag-type feeling.

7. After correct feeler gauge feel is obtained, obtain oil slinger of same thickness as feeler gauge, provided new pinion gear is marked with a zero (0). If new pinion gear is marked with a plus (+) reading, the plus (+) amount stamped on pinion gear must be subtracted from thickness dimension obtained in step 6. If new pinion gear is marked with a minus (-) reading, the minus (-) amount stamped on pinion gear must be added to thickness dimension obtained in step 6. Also, you must use exact same new inner pinion bearing that was used to obtain this dimension.

Fig. 13 Pressing Bearing Onto Drive Pinion

8. Measure oil slinger with a micrometer to verify size, then place oil slinger onto pinion and press bearing on as shown in Fig. 13.

9. Lubricate ends of outer pinion bearing rollers with a suitable high-temperature lubricant.

Fig. 3 Removing Pinion Shaft Nut

1. Remove drive pinion shaft nut, Fig. 3.

Fig. 4 Removing Companion Flange

2. Remove companion flange from drive pinion shaft, Fig. 4.

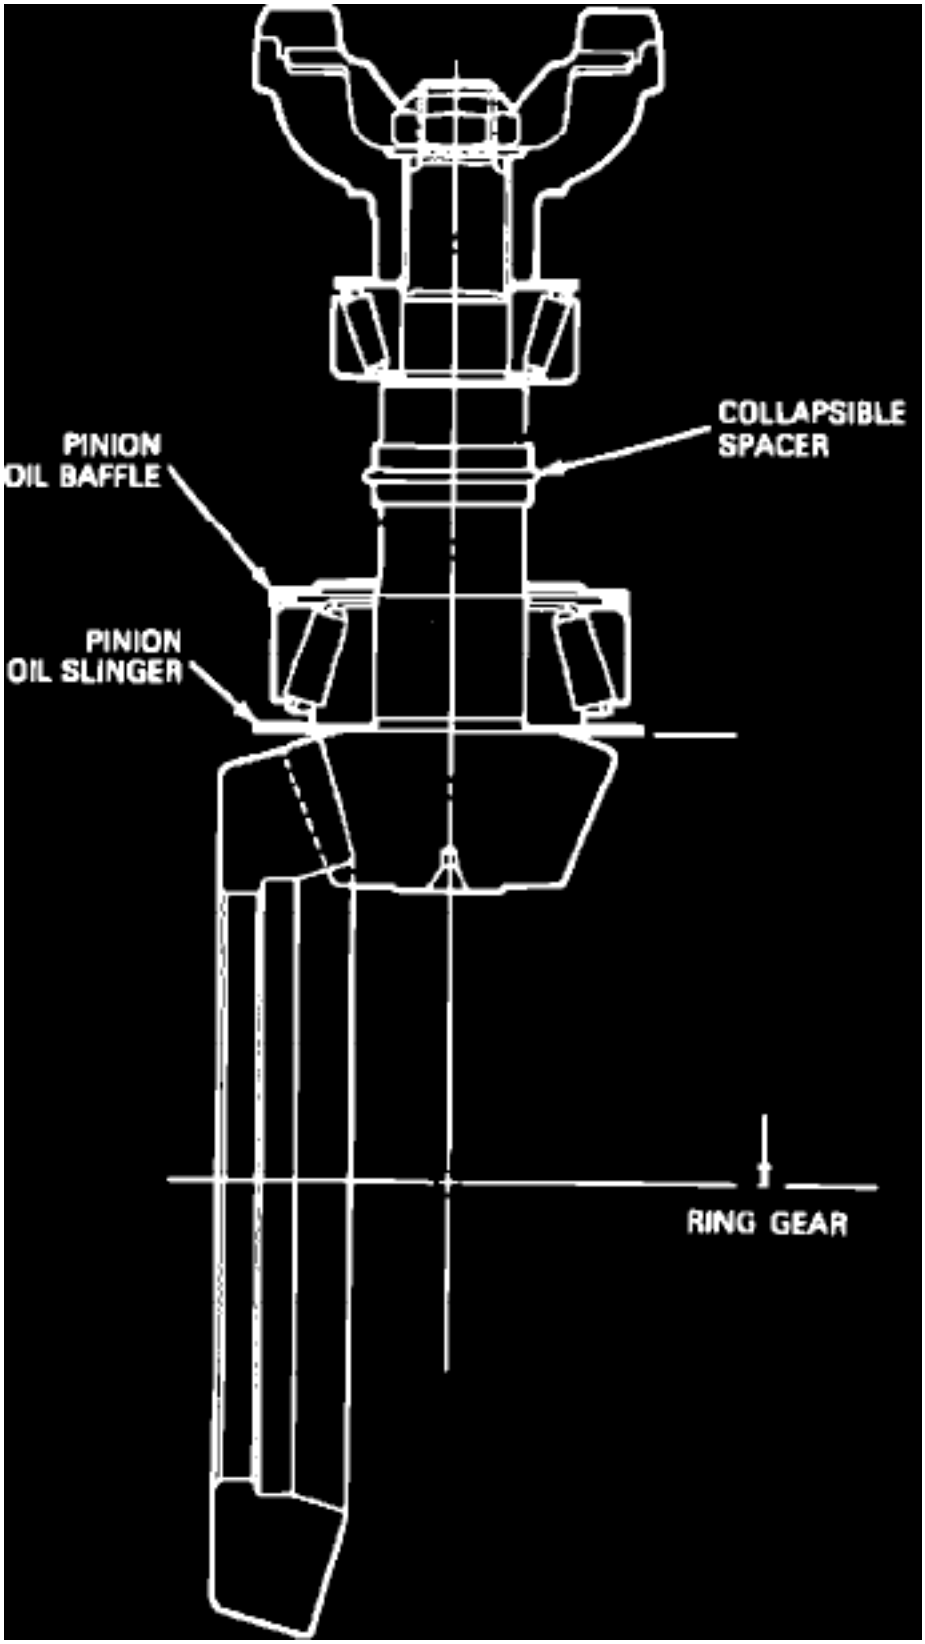
3. Using suitable puller, remove pinion seal.

4. Remove the pinion, bearing, and retainer assembly from carrier housing. Extreme care must be taken not to damage mounting surfaces of retainer and carrier.

5. Place protective sleeve on pinion pilot bearing surface and press drive pinion shaft out of pinion retainer.

6. Using Pinion Bearing Cone Removal tool No. T71P-4621-B or equivalent, press pinion shaft out of pinion rear bearing cone.

7. Clean and inspect all parts.



COLLAPSIBLE SPACER
PINION OIL BAFFLE
PINION OIL SLINGER
RING GEAR

Pinion Gear: Service and Repair Drive Pinion Installation

Two separate adjustments affect drive pinion and ring gear tooth contact: pinion depth and pinion to ring gear backlash.

Fig. 5 Drive Pinion Installation

Pinion depth is controlled by a selective thickness oil slinger located between drive pinion head and inner pinion bearing cone and an oil baffle located between inner bearing cup and carrier bore, Fig. 5.

Pinion to ring gear backlash is controlled by preload shims on model 28-IFS and 28-2 or a selective spacer on model 35-IFS, located between the differential bearing cup and carrier.

During pinion depth adjustment, the size of the selected thickness of oil slinger and baffle controls pinion position. Increasing oil slinger thickness moves pinion toward ring gear (-). Decreasing oil slinger thickness moves pinion away from ring gear (+).

Fig. 6 Ring And Pinion Identification

On the button of each drive pinion is marked a plus (+), a minus (-) or a zero (0), Fig. 6. These markings indicate the position for each gear set. The position is determined by thickness of baffle between inner pinion bearing cup and carrier bearing bore and thickness of selective oil slinger between pinion head and and inner pinion bearing. Any pinion depth change is made by changing

thickness of selective oil slinger.

If the original gear set is being re-used, measure original baffle and selective slinger and replace with exact same size, if necessary.

Fig. 7 Drive Pinion Adjusting Shim Thickness Chart

Fig. 8 Drive Pinion Adjusting Shim Thickness Chart (Metric)

If a new gear set is being used, notice the plus (+), minus (-) or zero (0) etchings on both original and new drive pinion and adjust thickness of new selective oil oil slinger according to charts in Figs. 7 and 8.

Pinion Gear: Service and Repair Pilot Bearing

1. Using suitable tool, drive out pilot bearing.

2. Using suitable tool, drive in new bearing until it is bottomed.

3. Using suitable tool, install new pilot bearing retainer, concave side up.

.025	.015	.013	.027		
.024	.016	.012	.028		

Fig. 6 Using Pinion Depth Guage Tool

2. Install gauge block on threaded shaft and tighten securely, Fig. 6 (1).

3. Place assembly and rear drive pinion bearing into pinion bearing retainer assembly, then install front pinion bearing and screw handle onto threaded shaft, tapered end into front pinion bearing, Fig. 6 (1) and (2). Flat end of handle has 3/8 inch hole cut in it so that an inch pound torque wrench may be used to obtain proper pinion bearing preload.

4. Install pinion bearing retainer assembly into carrier, less shim, torquing attaching bolts to specifications.

5. Rotate gauge block so that it rests against pilot boss, Fig. 6 (3).

6. Using feeler gauge, measure distance between gauge block and gauge tube, Fig. 6 (4). Insert blade directly along gauge block top to ensure a correct reading. Fit should be a slight drag-type feeling.

7. Select proper shim according to feeler gauge reading, Fig. 6.

Ring Gear: Testing and Inspection Gears

Examine drive pinion and ring gear teeth for scoring or signs of excessive wear. Worn gears cannot be rebuilt to correct a noisy condition. Gear scoring and flaking are the result of excessive shock loading or the use of improper lubricant. Scored gears cannot be reused.

Examine teeth and thrust surfaces of differential gears. Wear on hub of differential side gears may cause a chucking noise known as chuckle, when the vehicle is operated at low speeds. Wear of splines, thrust surfaces or thrust washers may contribute to excessive drive line backlash.

Ring Gear: Testing and Inspection Runout

Models equipped with anti-lock brakes incorporate a multi-tooth exciter ring which is pressed on the differential case located behind the ring gear assembly. Do not remove exciter ring to measure ring gear runout. A space is provided between the exciter ring and ring gear to measure ring gear runout.

If ring gear runout during disassembly exceeded specifications, the condition may be caused by a warped gear, or distorted or damaged case or foreign matter trapped between differential case halves or under ring gears.

To determine cause of excessive runout, assemble differential case without ring gear, then check as described below.

Install case in differential carrier without ring gear attached. Install bearing caps and adjuster nuts and tighten cap bolts to specifications. Tighten adjuster nuts to center differential side bearing. Mount a dial indicator and check runout of case flange and ring gear pilot. If runout at either point is excessive, install a new differential case. If runout is within specification, the ring gear is out of specification. When performing this check on a locking differential case the four compression springs within the case should be temporarily removed. This will prevent a false runout reading due to distortion caused by the springs forcing the case apart.

Ring Gear: Adjustments Backlash & Differential Bearing Preload Adjustment

1. Remove adjusting nut locks and loosen differential bearing cap bolts, then torque cap bolts to approximately 20 ft. lbs. Left adjusting nut is on ring gear side of carrier and right adjusting nut is on pinion side.

2. Loosen right nut until it is away from cup and tighten left nut until ring gear is just forced into position with zero backlash, then rotate pinion several revolutions to ensure that no binding is evident.

3. Check right nut to ensure that it is still loose, then install dial indicator.

4. Tighten right nut until it just contacts bearing cup, then set dial indicator to zero and apply pressure to bearings by tightening right nut until indicator reads .008-.012 inch.

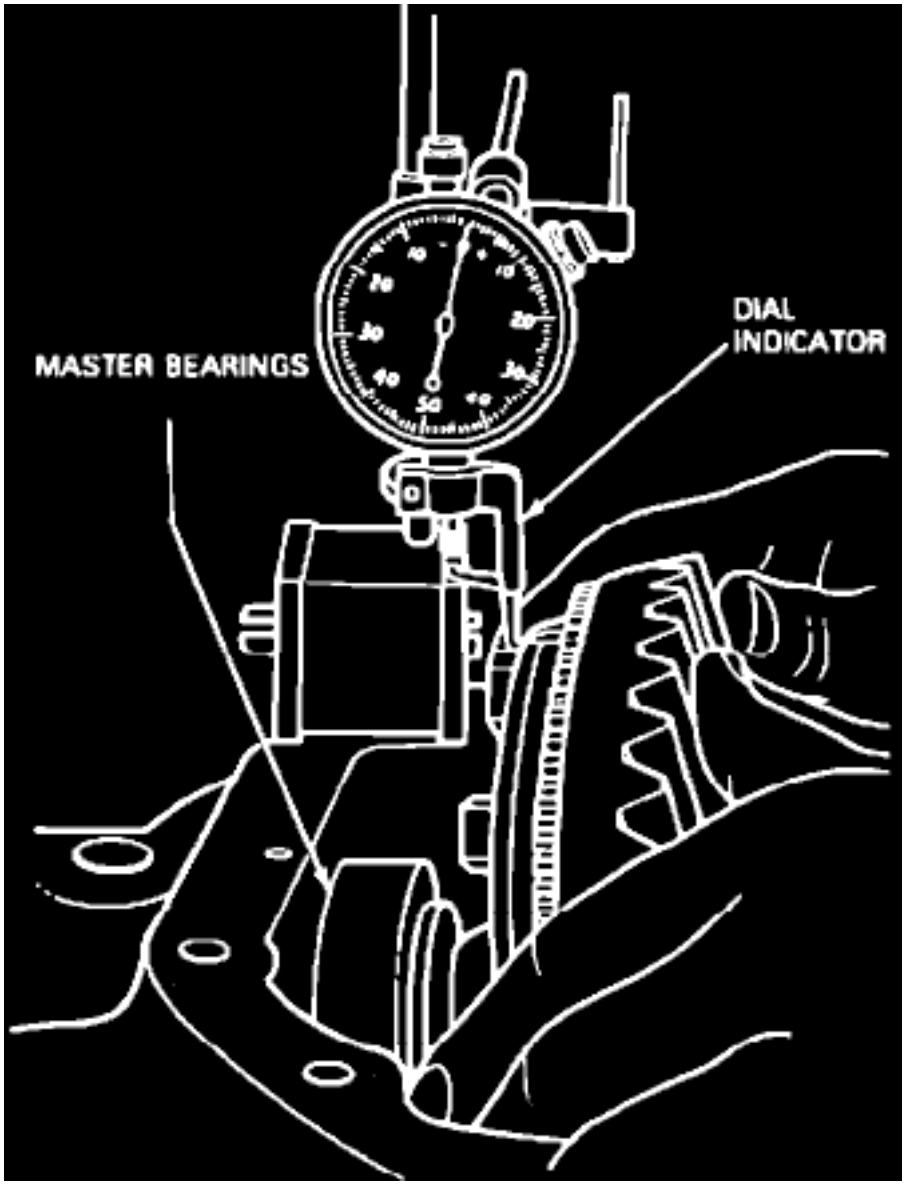
5. Turn pinion gear several times in each direction to seat bearings in cups and ensure that no binding is evident, then torque bearing caps to specifications.

6. Measure backlash on several teeth around ring gear.

7. If backlash varies by more than .004 inch between any two teeth, loosen one adjusting nut and tighten opposite nut an equal amount to move ring gear away from or toward pinion. Tightening left nut moves ring gear into pinion to decrease backlash while tightening right nut moves ring gear away. When moving adjusting nuts, final movement should always be made in a tightening direction. Assuming left nut had to be loosened one notch, loosen nut two notches, then tighten one notch.

8. Ensure that case spread remains within specifications.

9. Perform teeth pattern check. If backlash is correct and gross pattern error results, recheck pinion shim selection.



Ring Gear: Adjustments Pinion & Ring Gear Backlash

Fig. 7 Total Differential Case Endplay Check

1. Place differential case into position in carrier (differential case bearings should still be installed).

2. Force differential case away from drive pinion gear, until it is completely seated against cross bore face of carrier. Position a dial indicator so indicator tip rests on a ring gear bolt head, Fig. 7. Zero dial indicator.

3. Force ring gear against pinion gear. Rock ring gear slightly to ensure gear teeth are in contact, then force ring gear away from pinion gear, ensuring dial indicator returns to zero. Repeat this procedure until dial indicator reading is the same. This reading should be recorded as measurement ``B'' and reveals amount of shims necessary between differential case and differential bearing on ring gear side.

4. Assemble shim pack for ring gear side to measurement ``B.''

5. Subtract measurement ``B'' from measurement ``A'' obtained in step 3 under ``Total Differential Case Endplay'' as previously described to obtain measurement ``C.'' Measurement ``C'' equals amount of shims required between differential case and bearing on side opposite of ring gear.

6. Assemble shim pack for side opposite of ring gear to measurement ``C'' plus (+) .015 inch.

7. Remove differential case from carrier, then the bearings from case.

8. Place required amount of shims on hub of ring gear side of differential case, then install bearing and drive bearing onto hub using a suitable differential side bearing replacer.

9. Place required amount of shims on hub of differential case opposite of ring gear side, then install bearing. Place a suitable step plate on ring gear side bearing to protect bearing, then drive bearing opposite of ring gear side onto hub using differential side bearing replacer.

10. Install differential bearing cups onto bearings.

11. Mount Spreader tool No. TOOL-4000-E and Spreader Adapter tool No. T80T-4000-B or their equivalents onto carrier assembly.

12. Position a dial indicator onto carrier, then spread housing. Do not spread housing more than .015 inch.

13. Install differential case into carrier. If necessary, use a rawhide or plastic hammer to seat case in carrier bore. With partial and non-hunting/partial ring gear and pinion sets, align marks on ring gear and drive pinion, if applicable. Use care not to nick teeth of ring gear or pinion.

14. Remove spreader and dial indicator.

15. Install bearing caps and bolts, ensuring letters or numbers stamped on caps correspond in both position and direction with letters or numbers stamped into carrier, then torque bolts to specifications.

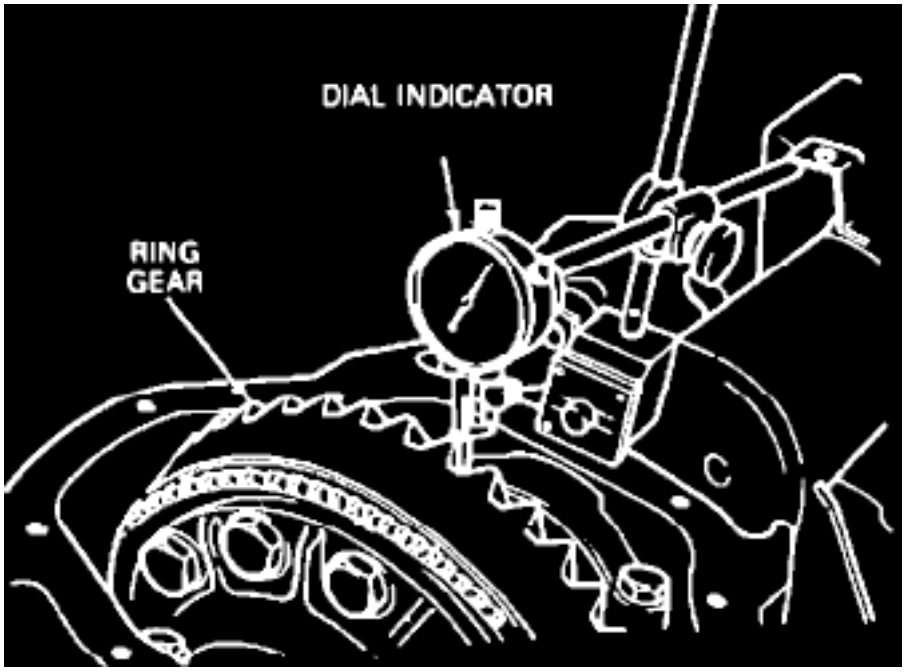


Fig. 16 Ring And Pinion Backlash Check

16. Install dial indicator on case, Fig. 16.

17. Check ring gear and pinion backlash at three equally spaced points on ring gear. Back lash tolerance is .005-.009 inch and cannot vary more than .003 inch between the three points.

18. If backlash is high, ring gear must be moved closer to pinion by moving shims to ring gear side from opposite side.

19. If backlash is low, ring gear must be moved away from pinion by moving shims from ring gear side to opposite side.

20. Install new cover gasket and cover plate, then the mounting bolts and torque to specifications.

PINION OIL SLINGER
RING GEAR

Ring Gear: Service and Repair

Two separate adjustments affect drive pinion and ring gear tooth contact: pinion depth and pinion to ring gear backlash.

Fig. 5 Drive Pinion Installation

Pinion depth is controlled by a selective thickness oil slinger located between drive pinion head and inner pinion bearing cone and an oil baffle located between inner bearing cup and carrier bore, Fig. 5.

Pinion to ring gear backlash is controlled by preload shims on model 28-IFS and 28-2 or a selective spacer on model 35-IFS, located between the differential bearing cup and carrier.

During pinion depth adjustment, the size of the selected thickness of oil slinger and baffle controls pinion position. Increasing oil slinger thickness moves pinion toward ring gear (-). Decreasing oil slinger thickness moves pinion away from ring gear (+).

Fig. 6 Ring And Pinion Identification

On the button of each drive pinion is marked a plus (+), a minus (-) or a zero (0), Fig. 6. These markings indicate the position for each gear set. The position is determined by thickness of baffle between inner pinion bearing cup and carrier bearing bore and thickness of selective oil slinger between pinion head and and inner pinion bearing. Any pinion depth change is made by changing

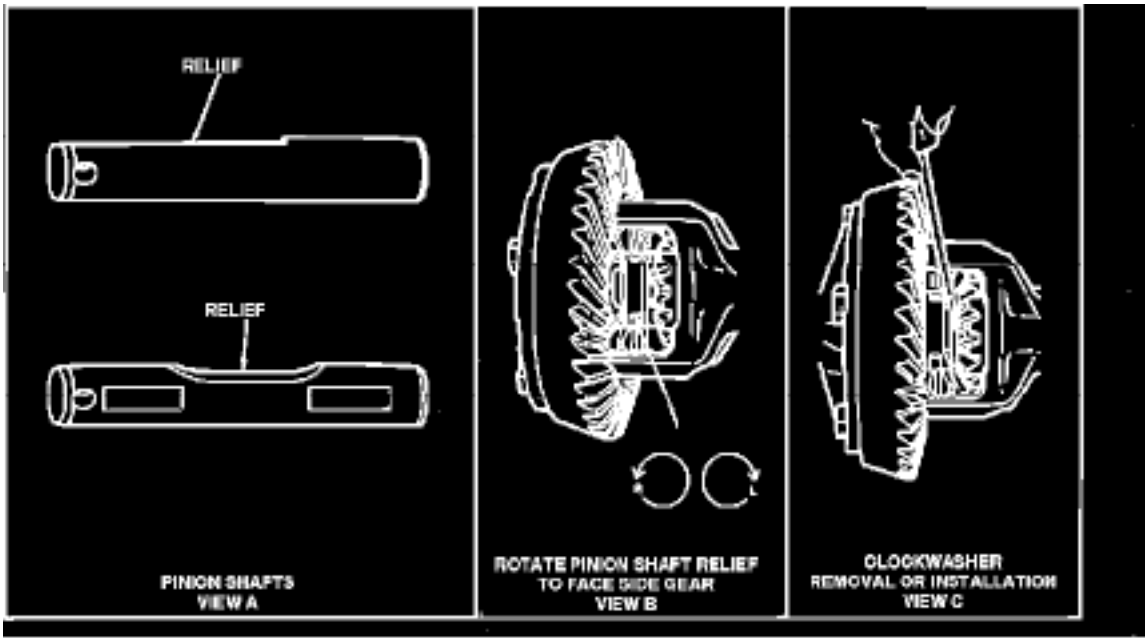
thickness of selective oil slinger.

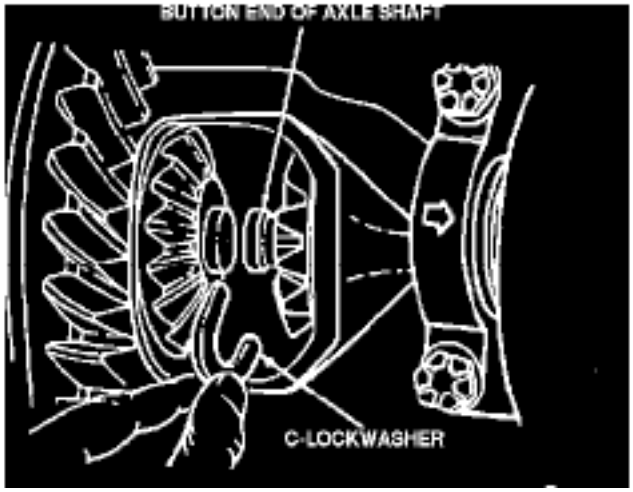
If the original gear set is being re-used, measure original baffle and selective slinger and replace with exact same size, if necessary.

Fig. 7 Drive Pinion Adjusting Shim Thickness Chart

Fig. 8 Drive Pinion Adjusting Shim Thickness Chart (Metric)

If a new gear set is being used, notice the plus (+), minus (-) or zero (0) etchings on both original and new drive pinion and adjust thickness of new selective oil oil slinger according to charts in Figs. 7 and 8.





Axle Bearing: Service and Repair

Fig. 1 Axle Shaft Removal. 3.73:1 or 4.10:1 Ratio Axle

Fig. 2 Axle Shaft Removal. Except 3.73:1 or 4.10:1 Ratio Axle

1. Raise and support vehicle.

2. Remove rear wheels and brake drums.

3. Drain rear axle lubricant by removing housing cover.

4. On models with 3.73:1 or 4.10:1 ratio axle, remove axle shafts as follows:

a. Remove pinion shaft lock bolt, then rotate pinion shaft until relief in shaft faces either side gear, Fig. 1, and remove C-lockwasher from axle

shaft.

b. Rotate pinion shaft 1/2 turn until relief faces opposite side gear and remove C-lockwasher from axle shafts. c. Carefully slide shafts out of housing.

5. On all models except those with 3.73:1 or 4.10:1 ratio axle, remove axle shafts as follows:

a. Remove differential pinion shaft lock bolt and the shaft. b. Push axle shafts inward toward center of vehicle and remove C-lockwashers from shafts, Fig. 2. c. Carefully slide axle shafts out of housing.

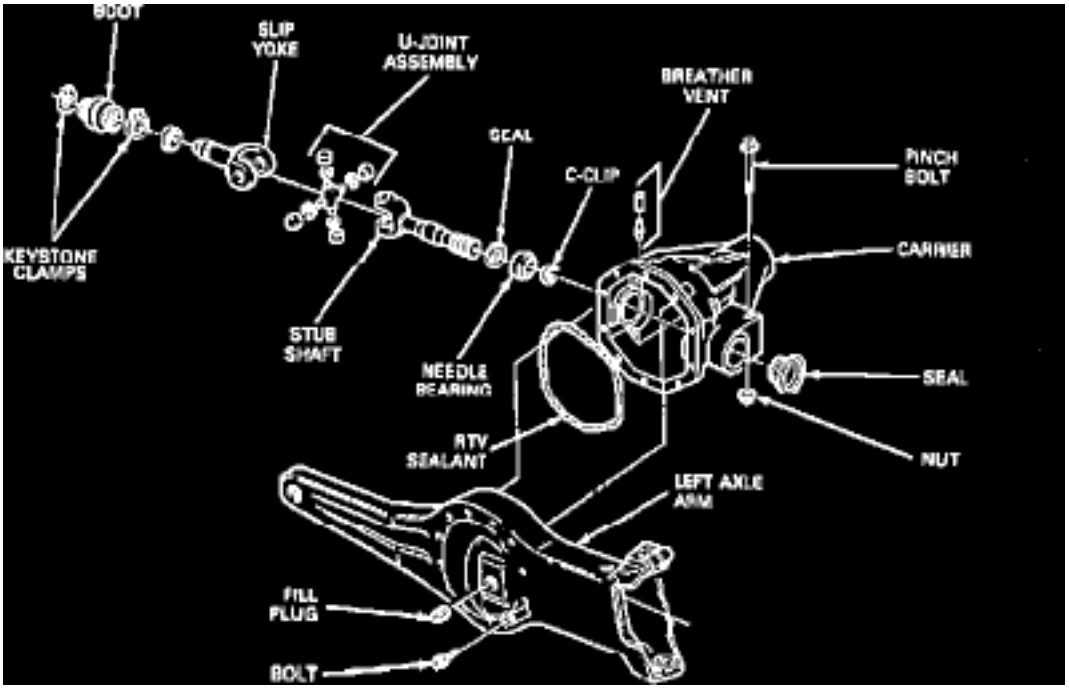
6. On all models, remove seal and bearing using a suitable hook-type puller.

7. Reverse procedure to install, noting the following:

a. Apply suitable grease between lips of axle shaft seal. b. Install bearing using axle tube bearing replacer tool No. T78P-1225-A, and install seal and using axle tube seal replacer tool No.

T78P-1177-A or equivalent.

c. Torque pinion shaft lock bolt to 15-22 ft. lbs. d. Torque differential housing cover bolts to 25-35 ft. lbs., except the ratio tag bolt which is torqued to 15-24 ft. lbs.



Axle Shaft: Service and Repair Right Hand Slip Yoke and Stub Shaft Assembly (4WD)

Fig. 2 Exploded View Of Right Slip Yoke & Stub Shaft

1. Disconnect driveshaft from yoke. Position driveshaft aside so it will not interfere with carrier removal.

2. Remove both spindles, Fig. 2, then the left and right shaft and U-joint assemblies as described previously.

3. Support carrier using a suitable jack, then remove carrier to support arm attaching bolts.

4. Separate carrier from support arm, then drain lubricant and remove carrier from vehicle.

5. Install carrier in suitable holding fixture, then rotate slip yoke and shaft assembly until open end of snap ring is exposed.

6. Remove snap ring, then the slip yoke and shaft assembly from carrier.

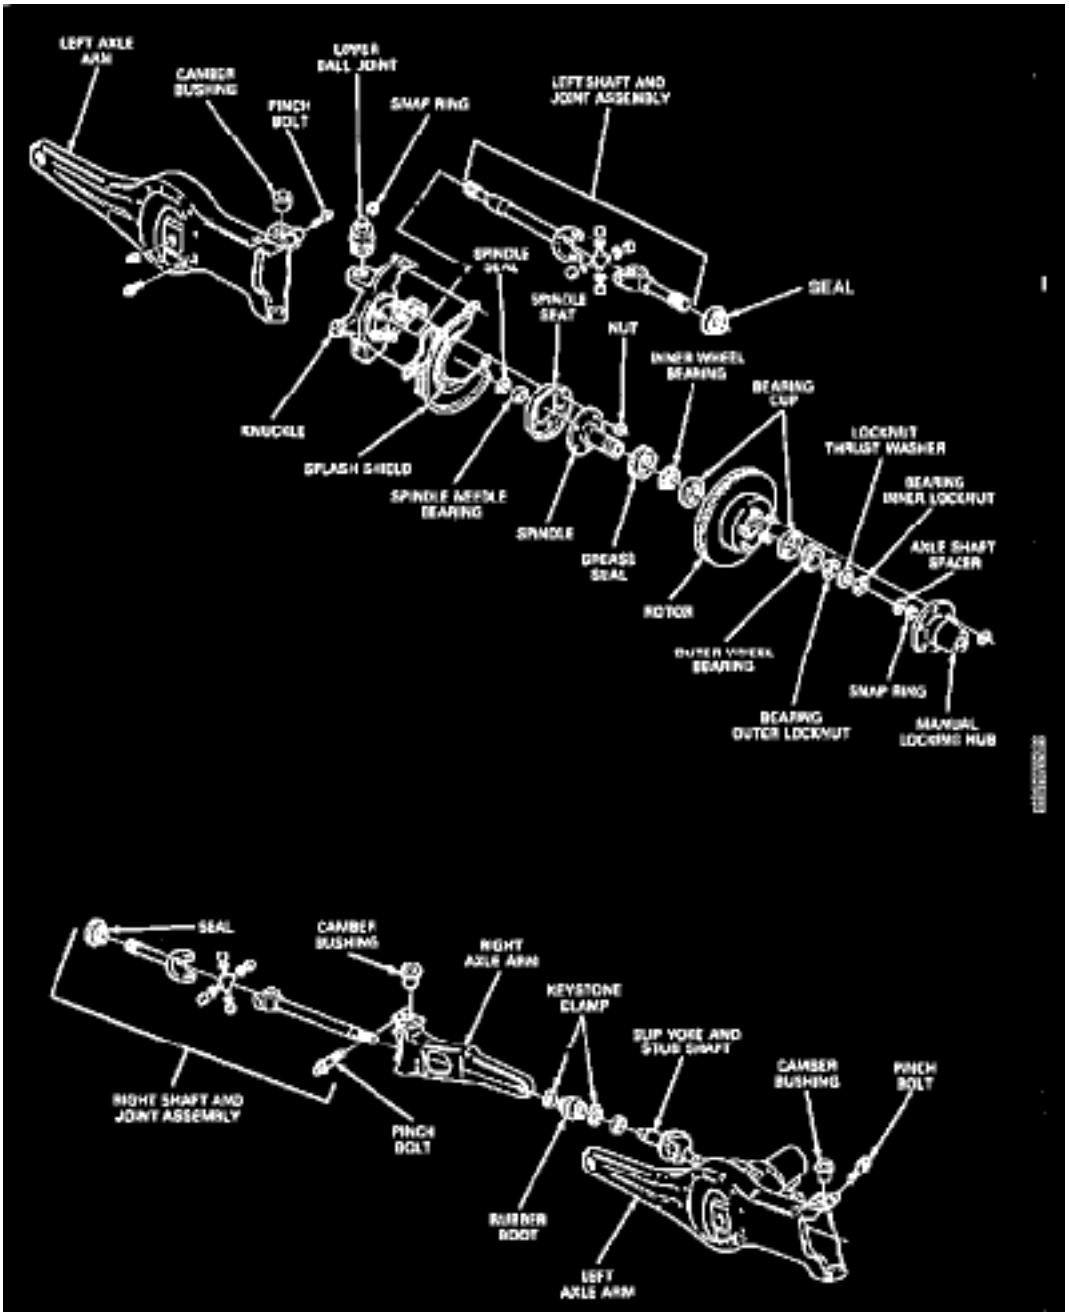
7. On 1987-89 models, remove oil seal and caged needle bearings simultaneously from carrier using tools No. T50T-100-A and D880L-100-A or equivalent. Discard seal and bearings.

8.

On 1990-92 models, using slide hammer tool No. T50T-100-A and seal puller tool Tool No. 1175-AC or equivalents, remove passenger side oil seal, then driver side oil seal. Using slide hammer tool No. T50T-100-A and axle bearing remover tool No. T90T-1225-A or equivalent, remove caged needle bearings.

9. On all models, reverse procedure to install, noting the following:

a. Clean mating surfaces of carrier and support arm. Apply a narrow bead of RTV sealant to mating surfaces. b. Install carrier attaching bolts hand tight, then tighten in a clockwise or counterclockwise pattern to specifications.



Axle Shaft: Service and Repair Spindle, Shaft and Joint (4WD)

Fig. 1 Exploded View Of Spindle, Shaft & Joint Assembly

1. Raise and support vehicle. Remove front wheels.

2. Remove disc brake caliper, hub locks, wheel bearings and locknuts, then the hub, rotor and outer wheel bearing cone, Fig. 1.

3. Remove and discard grease seal from rotor using slide hammer tool No. T50T-100-A and grease seal remover tool No. 1175-AC or equivalents.

4. Using bearing cup puller tool No. D78P-1225-B or equivalent, remove inner wheel bearing, then the inner and outer bearing cups.

5. Remove spindle to steering knuckle attaching nuts, then break spindle loose from knuckle and remove splash shield.

6. Remove shaft and joint assembly from right side of vehicle by pulling assembly out of carrier.

7. Remove and discard clamp from shaft and joint assembly and the stub shaft on right side of carrier. Slide rubber boot onto stub shaft, then pull shaft and joint assembly from stub shaft splines.

8. Install spindle, on second step, in suitable soft jawed vise.

9. Remove oil seal and needle bearing from spindle using bearing remover tool No. T50T-100-A and grease seal remover tool No. 1175-AC, or equivalent. Remove oil seal from shaft, if necessary.

10. Reverse procedure to install. Tighten spindle to steering knuckle attaching nuts to specifications.

Wheel Bearing: Specifications

TORQUE SPECIFICATIONS

Bearing Inner Locknut - Manual Locking Hub* Torque Limits - ..... 47 Nm (35 ft lb)

Bearing Outer Locknut - Manual Locking Hub Torque Limits - ..... 203 Nm (150 ft lb)

Bearing Nut - Automatic Locknut Hub* Torque Limits - ..... 47 Nm (35 ft lb)

Wheel Lug Nuts** Torque Limits - ..... 135 Nm (100 ft lb)

NOTES:

* After tightening to specified torque, back off the nut 1/4 turn (90°). After backing off the nut, retighten to 1.8 Nm (16 in lb)

** Torque specifications are for clean, dry bolt and nut threads. Never use oil or grease on studs or nuts.

Wheel Bearing: Adjustments With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

1. Raise the vehicle and install safety stands. 2. Remove the wheel lugnuts and the wheel and tire assembly. 3. Remove the retainer washers from the lugnut studs. Remove the automatic locking hub assembly from the spindle. 4. Remove the snap ring from the end of the spindle shaft.

Axle Shaft Spacer

5. Remove the axle shaft spacer. 6. Pull cam assembly off the wheel bearing adjusting nut and remove the two plastic thrust spacers from the adjusting nut.

CAUTION: Do not pry on the plastic cam or thrust spacers during removal. Prying may damage the cam or spacers.

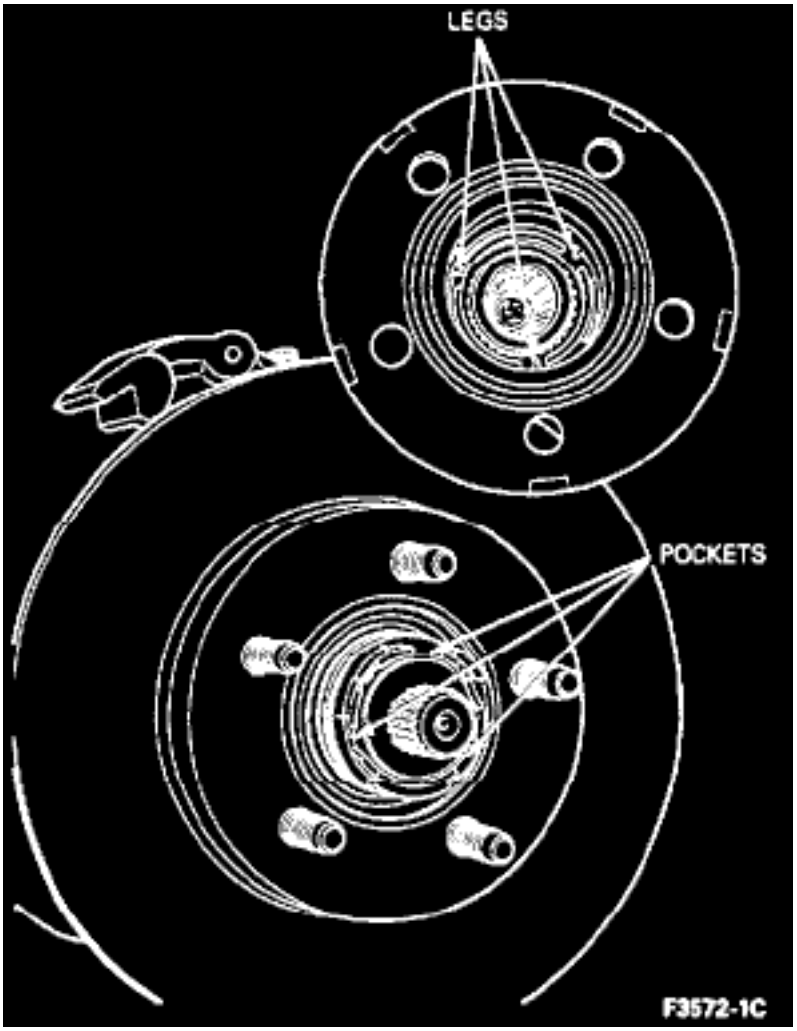
Cam Assembly And Locking Key

7. Using a magnet, remove the locking key.

NOTICE: If required, rotate the adjusting nut slightly to relieve pressure against the locking key, before the key can be removed.

CAUTION: To prevent damage to the spindle threads, look into the spindle keyway under the adjusting nut and remove the separate locking key before removing the adjusting nut.

8. Loosen the wheel bearing adjusting nut from the spindle using a 2-3/8 inch hex locknut wrench.



9. While rotating the hub and rotor assembly, tighten the wheel bearing adjusting nut to 47 Nm (35 ft lb) to seat the bearings. Spin the rotor and back

off the nut one-quarter turn (90 degrees).

10. Retighten the adjusting nut to 1.8 Nm (16 in lb) using a torque wrench. 11. Make sure the final end play of the wheel on the spindle is 0.00-0.08mm (0.000-0.003 inch). 12. Align the closest lug in the wheel bearing adjusting nut with the center of the spindle keyway slot. Advance the nut to the next lug if required.

Install the separate locking key in the spindle keyway under the adjusting nut.

WARNING: Extreme care must be taken when aligning the spindle nut adjustment lug with the center of the spindle keyway slot to prevent damage to the separate locking key. the wheel and tire assembly may come off while the vehicle is in motion if the key is damaged.

13. Install the two thrust spacers and push or press the cam assembly onto the locknut by lining up the key in the fixed cam with the spindle keyway.

CAUTION: Extreme care must be taken when aligning the fixed cam key with the spindle keyway to prevent damage to the fixed cam.

14. Install the axle shaft spacer. 15. Clip the snap ring onto the end of the spindle shaft.

Automatic Locking Hub Installation

16. Install the automatic locking hub assembly over the spindle. Align three hub assembly legs with three pockets in cam assembly. Install the retainer

washers.

17. Install the wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb).

ISSUE: The use of a power impact wrench to install wheel nuts provides minimal torque control. Undertightening may allow the lug nuts to loosen, and can result in the wheel separating from the vehicle. Overtightening of wheel nuts may cause brake rotor distortion that could result in a brake shudder. Overtightening may cause distortion of the wheel. This can result in a change in the diameter of the center (axle) hole and make it difficult to remove from the axle it is mounted on or difficult or impossible to install on another axle with a smaller center hole diameter.

ACTION: Use a manual torque wrench to tighten wheel nuts. Refer to the approriate Shop Manual for specific torque values.

Wheel Hub: Service and Repair Removal

With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

1. Raise the vehicle and install safety stands. 2. Remove the wheel lugnuts and the wheel and tire assembly. 3. Remove the brake caliper and secure to the underbody to prevent damage to the brake hose. It is not necessary to disconnect the hose from the

caliper. Do not let the caliper hang with its weight on the brake hose or the hose may become stretched, twisted or ruptured.

4. Remove the retainer washers from the lugnut studs. Remove the automatic locking hub assembly from the spindle. 5. Remove the snap ring from the end of the spindle shaft.

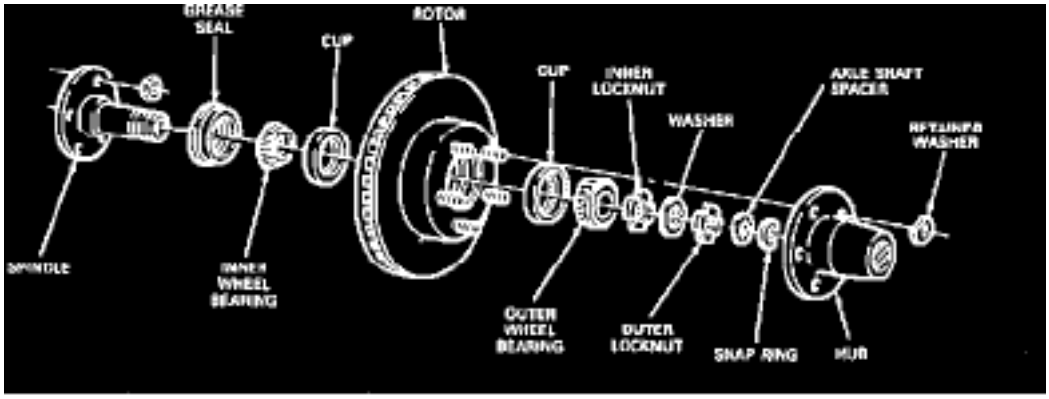
Axle Shaft Spacer

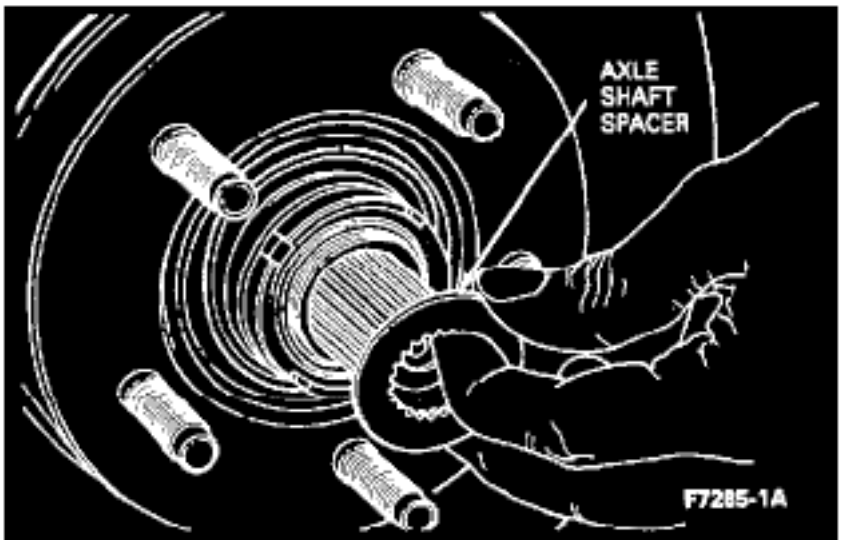
6. Remove the axle shaft spacer. 7. Pull cam assembly off the wheel bearing adjusting nut and remove the two plastic thrust spacers from the adjusting nut.

CAUTION: Do not pry on the plastic cam or thrust spacers during removal. Prying may damage the cam or spacers.

Cam Assembly And Locking Key

8. Using a magnet, remove the locking key.





NOTICE: If required, rotate the adjusting nut slightly to relieve pressure against the locking key, before the key can be removed.

CAUTION: To prevent damage to the spindle threads, look into the spindle keyway under the adjusting nut and remove the separate locking key before removing the adjusting nut.

9. Remove the wheel bearing adjusting nut from the spindle using a 2-3/8 inch Hex Locknut Wrench.

10. Remove the inner locknut and slide hub/rotor off spindle being careful to catch the outer wheel bearing.

With Manual Locking Hubs

Fig. 5 Manual Locking Hub

1. Raise the vehicle until the tire clears the floor and remove the wheel and tire assembly. 2. Remove the brake caliper and secure to the underbody to prevent damage to the brake hose. It is not necessary to disconnect the hose from the

caliper.

CAUTION: Do not let the caliper hang with its weight on the brake hose or the hose may become stretched, twisted or ruptured.

3. Remove the retainer washers from the lugnut studs and the manual locking hub assembly from the spindle. 4. Remove the snap ring from the end of the spindle shaft.

Axle Shaft Spacer

5. Remove the axle shaft spacer.

Wheel Hub: Service and Repair Installation

With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

CAUTION: Wheel bearing lubricant is a lithium-base grease. Sodium-base grease is not compatible with lithium-base grease and should not be intermixed. Therefore, do not lubricate front wheel bearings without first identifying the type of original wheel bearing lubricant. Usage of incompatible bearing lubricants may result in premature lubricant breakdown.

Installing Bearing Cups (Typical)

1. If inner or outer bearing cups were removed, install replacement inner and outer bearing cups in the hub with the appropriate bearing cup replacer

tool. Be sure to seat the cups properly in the hub. The cups will be properly seated when they are fully bottomed. Replace grease retainers. Polish grease retainer journal on spindle with 400 grit sandpaper. Clean with clean cloth.

2. Pack the inside of the hub with lithium-base grease or equivalent. Fill the hub until the grease is flush with the inside diameters of both bearing

cups. Pack the bearing cones and rollers with wheel bearing grease. Use a bearing packer for this operation. If a packer is not available, work as much lubricant as possible between the rollers and cages. Lubricate the cone surfaces with grease.

Installing Grease Seal (Typical)

3. Place the inner bearing in the inner cup and install the new grease seal. Be sure that the seal is fully seated. 4. Install the hub/rotor on the wheel spindle. Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads. 5. Place the outer bearing in the outer cup. 6. Install the wheel bearing adjustment nut. 7. While rotating the hub and rotor assembly, tighten the wheel bearing adjusting nut to 47 Nm (35 ft lb) to seat the bearings. Spin the rotor and back

off the nut one-quarter turn (90 degrees).

8. Retighten the adjusting nut to 1.8 Nm (16 in lb) using a torque wrench. 9. Make sure the final end play of the wheel on the spindle is 0.00-0.08 mm (0.000-0.003 in). the maximum torque to rotate the hub is 2.8 Nm (25 in

lb).

10. Align the closest lug in the wheel bearing adjusting nut with the center of the spindle keyway slot. Advance the nut to the next lug if required.

Install the separate locking key in the spindle keyway under the adjusting nut.

WARNING: Extreme care must be taken when aligning the spindle nut adjustment lug with the center of the spindle keyway slot to prevent damage to the separate locking key. The wheel and tire assembly may come off while the vehicle is in motion if the key is damaged.

11. Install the two thrust spacers and push or press the cam assembly onto the locknut by lining up the key in the fixed cam with the spindle keyway.

CAUTION: Extreme care must be taken when aligning the fixed cam key with the spindle keyway to prevent damage to the fixed cam.

12. Install the axle shaft spacer. 13. Clip the snap ring onto the end of the spindle shaft. 14. Install the automatic locking hub assembly over the spindle. Align three hub assembly legs with three pockets in cam assembly. Install the retainer

washers.

15. Install the caliper. 16. Install the wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb).

With Manual Locking Hubs

Installing Grease Seal (Typical)

3. Place the inner bearing in the inner cup and install the new grease seal. Be sure that the seal is fully seated. 4. Install the hub/rotor on the wheel spindle. Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads. 5. Place the outer bearing in the outer cup. 6. Install the inner locknut. 7. Tighten the inner locknut to 47 Nm (35 ft lb) while turning the rotor in the opposite direction to seat bearings. 8. Spin the rotor and back off the inner locknut one-quarter turn. Retighten the inner locknut to 1.8 Nm (16 in lb). 9. Install the lockwasher on the spindle.

NOTICE: If necessary, tighten inner locknut slightly to align the locknut pin with lockwasher hole.

10. Install the outer wheel bearing locknut using locknut wrench. Tighten locknut to 203 Nm (150 ft lb). 11. Check the end play of the wheel and tire assembly on the spindle. Final end play should be 0.00-0.08 mm (0.000-0.003 in). The maximum torque

to rotate the hub is 2.8 Nm (25 in lb).

12. Install the axle shaft spacer. 13. Clip the snap ring onto the end of the spindle shaft.

14. Install the manual hub assembly over the spindle. Install the retainer washers. 15. Install caliper. 16. Install wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb). 17. Lower vehicle. 18. Check brakes for proper operation.

WARNING: Before moving vehicle, pump brake pedal several times to be sure it is firm. Do not move vehicle until a firm pedal is obtained.

Wheel Hub (Locking): Customer Interest Front Hub - (4WD) Noise or Failure

Article No. 91-18-12 09/05/91

^ NOISE-"RATCHETING" SOUND FROM HUBLOCKBRONCO II BUILT AFTER 10/1/89, RANGER BUILT BETWEEN 10/1/89 AND 3/31/91, EXPLORER BUILT UNTIL 3/31/91

^ AXLE-FRONT-AUTOMATIC LOCKING HUBS-ENGAGEMENT OF FRONT DRIVELINE DELAYED OR NO COUPLING OF FRONT WHEELS-BRONCO II BUILT AFTER 10/1/89, RANGER BUILT BETWEEN 10/1/89 AND 3/31/91, EXPLORER BUILT UNTIL 3/31/91

LIGHT TRUCK: 1990 BRONCO II 1990-91 RANGER 1991 EXPLORER

This TSB article is being republished in its entirety to note that the wheel bearing retaining nut is included with the front automatic locking hub assembly.

ISSUE: Engagement of the front driveline on 4x4 models of the subject vehicles with Shift-On-The-Fly and Dana 35 axles may exhibit delayed or no coupling of the front wheels. Both of these conditions may result in a hublock ratcheting noise and sometimes may result in structural damage to the hublock. These concerns are caused by the failure of the transfer case to provide synchronization of the drivetrain during cold weather.

ACTION: Test drive the vehicle to determine if the driveline exhibits delayed or no coupling of the front wheels. If so, use the following procedure to service the vehicle.

NOTE: THESE ACTIONS SHOULD PROVIDE SHIFT-ON-FLY CAPABILITY TO 55 MPH (89 KM/H) AT TEMPERATURES ABOVE 32~F (0~C) AND 45 MPH (72 KM/H) WITH TEMPERATURES FROM 32~F (0~C) TO AS LOW AS -20~F (-29~C).

FRONT AUTOMATIC LOCKING HUB

1. Remove the left and right front automatic locking hubs and camming assemblies and replace with new assemblies (FOTZ-3B396-B). Refer to the appropriate Light Truck Shop Manual, Section 04-01D, for service details.

2. Inspect the wheel bearing retaining nut for damage and presence of foreign material which would diminish wheel bearing life.

3. Replace the wheel bearing retaining nut if damaged. This nut is included with the front automatic locking hub assembly.

FRONT AXLE LUBRICANT

1. Determine if the vehicle was built prior to 12/15/90.

2. If the vehicle was built prior to 12/15/90, replace the front axle lubricant with new lubricant (F1TZ-19580-A).

a. Extract the old lubricant using a suction gun.

NOTE: BREAKING THE CARRIER SEAL IS NOT A RECOMMENDED METHOD OF EXTRACTING THE LUBRICANT.

b. Refill the front axle with 56 ounces of lubricant (F1TZ-19580-A) using a suction gun.

TRANSFER CASE

1. Remove the following old transfer case parts and replace them with the following new parts. Refer to the appropriate Light Truck Shop Manual, Section 07-07E, for service details.

^ Clutch Coil Assembly (F1TZ-7G361-B)

^ Clutch Housing (F1TZ-7G362-A)

^ Lock-Up Collar (F1TZ-7106-B)

^ Lock-Up Fork (FOTZ-7289-A) - (Green paint mark by part number)

^ Return Spring (F1TZ-7219-A)

^ Sleeve Spring (E6TZ-7D126-A)

2. Install the sleeve spring (E6TZ-7D126-A) into the bore of the 7106 lock-up collar large end first.

Wheel Hub (Locking): All Technical Service Bulletins Automatic Hublock - Diagnosis/Service Tips

Article No. 95-5-18

03/13/95

^ LOCK HUBS - 4WD - AUTOMATIC HUBLOCK INFORMATION - SERVICE TIPS

^ FOUR-WHEEL DRIVE (4WD) - AUTOMATIC LOCK HUB DIAGNOSIS

LIGHT TRUCK: 1983-90 BRONCO II 1983-95 RANGER 1991-94 EXPLORER

ISSUE: 4X4 system diagnosis can be difficult at times due to system complexities.

ACTION:

For general system operation and diagnosis: Refer to TSB Article No. 92-1-8.

For specific automatic lock hub diagnosis and service: Refer to this article.

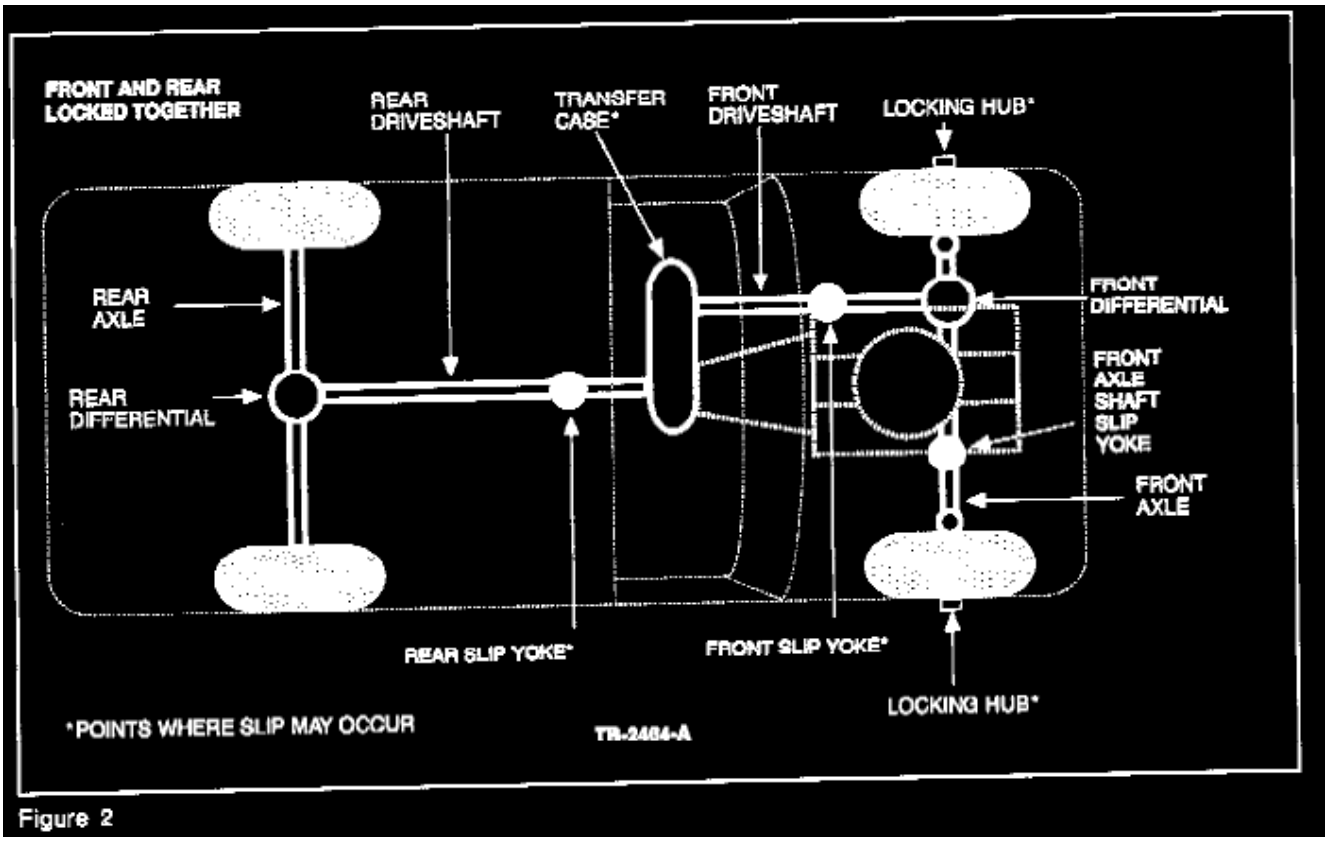

Figure 2

HUBLOCK DIAGNOSTICS

WHEEL END CONTAMINATION:

^ All compact vehicle hublocks have an O-ring seal between the hublock and wheel hub to prevent contamination. Whenever the hublock is removed, the 0-ring seal should be checked for damage.

^ If contamination is found in the wheel end, the path must be determined and corrected. Path possibilities are through the hublock seal, the wheel

bearing seals or the axle spindle seals.

WHEEL END NOISE (BUZZING) IN 4X2, AFTER UNLOCKING HUBS, SHORTLY AFTER FOUR-WHEEL DRIVE USAGE:

^ Noise concerns in two-wheel drive shortly after shifting from four-wheel drive and unlocking hubs, can occur if one of the hublocks fails to disengage. As the vehicle moves forward, the one (1) hublock that has failed to disengage will rotate its axle shaft through the differential and attempt to rotate the other axle shaft in the opposite direction. This is called differential motoring torque. As this torque attempts to turn the other axle shaft through the differential gears, that shaft's hublock will attempt to engage which will result in a ratcheting or buzzing noise.

^ This type of noise concern is usually found on axles that have incorrect front axle differential lubricant or very few 4X4 miles on them.

^ Verify that the front axle differential lubricant is F1TZ-19580-A. If incorrect lubricant is detected, extract the old lubricant using a suction gun.

NOTE:

BREAKING THE CARRIER SEAL IS NOT A RECOMMENDED METHOD OF EXTRACTING THE LUBRICANT.

1. Refill the front axle with 56 oz (1.66 L) of lubricant F1TZ-19580-A using a suction gun.

2. As the front axle accumulates 100-200 miles (161-322 km) of locked hublock operation, the axle will break-in, thus reducing the amount of differential motoring torque significantly.

3. If a front axle requires breaking in, refer to the Front Axle Break-In Procedure in this article.

4. If the front axle has been broken-in and the differential lubricant is F1TZ-19580-A, however, a wheel end noise (buzzing) in 4X2 is still experienced shortly after four-wheel drive usage. It is advised that the hublock which is not ratcheting be replaced as it is not disengaging correctly. When this condition occurs on any 4X4 Ranger, Explorer, or Bronco II, built from 10/89 through model year 1993, it is advised that both hublocks be replaced as the ratcheting hub is likely to become damaged.

FRONT AXLE BREAK-IN PROCEDURE:

^ To break-in the front axle, engage four-wheel drive and then shift out of it without disengaging the hublocks.

^ Thereafter, continue to drive the vehicle with locked hublocks until 100-200 miles (161-322 km) are accumulated. This will break-in the axle. Should the vehicle be backed up during this time

period, the hublocks will disengage and will have to be locked again by repeating the engagement procedure.

WHEEL END NOISE (RATCHETING) IN 4X2 AND HUBS UNLOCKED:

^ This condition could occur during turns or when the suspension is stroked. It is more prevalent in cold weather, with new front axles. It is usually caused by high motoring torque at the axle shafts or by incorrect axle lubrication.

^ Verify that axle lubrication is F1TZ-19580-A. If the front axle is not broken-in, 100-200 4X4 miles (161-322 km), proceed to do so following the outlined front axle break-in procedure in the Hublock Diagnostics section of this TSB article.

WHEEL END NOISE (BUZZING) WHILE ENGAGING 4X4 (TOUCH DRIVE) WHILE MOVING:

^ Refer to TSB Article No. 91-15-10.

POPPING/BANGING SOUND WHILE IN 4X4:

^ If the system slips under load, find what has broken or is slipping. To locate where slip is taking place, put marks at various possible slip points (Figure 1). Test drive the vehicle, then check to see if marks at different points are still in the same relationship to each other. This will help you determine where the slippage is taking place or where to look for broken parts, if any.

^ On vehicles with automatic hubs, find a place where you can do your test, mark the components, then drive without backing up. Stop and check the marks to see if they are in the same relationship to each other. If you back up before checking your marks, the hubs may reindex and not reveal the problem.

^ Reindex component should be serviced.

INSTALLATION PROCEDURE

1. Remove old hublock; remove key from bearing retainer nut and then remove nut.

2. If replacing a manual hublock with an automatic hublock, also remove the three-piece wheel bearing nut assembly.

3. Remove the new wheel bearing retaining nut from the cam assembly and install on the threaded spindle.

4. Using Hex Locknut Wrench (T70T-4252-B), torque the wheel bearing retainer nut to 47 N-m (35 lb.ft.) while rotating the wheel assembly. Back nut off 1/4 turn and retighten to 1.8 N-m (16 lb.in.) of torque.

5. Align scallop of the wheel bearing retaining nut with the center of the spindle keyway by advancing the nut clockwise.

6. Install the retaining key into the spindle keyway. With the garter spring inboard, align the key on the cam assembly with the keyway on the spindle.

7. Firmly press the cam assembly on the wheel bearing retaining nut.

CAUTION:

DO NOT PACK THE HUBLOCK WITH GREASE. TOO MUCH GREASE WILL CAUSE IMPROPER HUBLOCK OPERATION AND MAY DAMAGE THE HUBLOCK.

8. For Ranger and Bronco II, model years 1983-90 (through build date 10/4/89), using the DANA 28 Axle, install the thrust washer set onto the axle:

a. First, the plain steel washer.

b. Second, the needle bearing.

c. Last, the spline washer.

9. For model years 1990-94 (begin build date 10/5/89), DANA 35 Axle, install the one-piece spline washer. Install the "C" clip into the axle groove. It may be necessary to push the axle outboard from the inboard side of the knuckle.

10. For 1995 Ranger, install the thrust washer onto the axle:

a. First, the plain steel thrust washer.

b. Second, the plastic unsplined thrust washer.

AUTOMATIC HUBLOCK IDENTIFICATION CHART				
AUTOMATIC HUBLOCK MODEL TYPE	DATE CODE DESCRIPTION	EXAMPLE	PRODUCTION DATE	HUBLOCK BODY COLOR
M350A	Three (3) alphanumeric characters, or in some cases, no code	AB2 or no code	10/89	Argent
M350B	Six (6) numbers	920621	6/92	Argent
M350C	Backward letter "C" or the letter "C" followed by six (6) numbers	" " 931020 or C931021	8/93	Argent

c. Last, the steel spline thrust washer.

CAUTION:

ENSURE THE RETAINING RING OR "C" CLIP IS SEATED PROPERLY IN THE AXLE GROOVE FOR STEPS 8, 9, OR 10.

11. Check to ensure 0-ring seal on the flange face of the hublock body is not damaged and is properly positioned in its groove.

12. Install the hublock body assembly into the vehicle hub and rotor assembly. The hub may have to be rotated to line up the three (3) prongs of the cam follower (found internally to the hublock) with the cam assembly.

13. Install retainer flat nuts on wheel studs.

NOTE:

DO NOT FORCE THE HUBLOCK ASSEMBLY. IF THE BODY ASSEMBLY WILL NOT FIT, RECHECK THE ALIGNMENT OF ALL COMPONENTS. INSTALL SPEEDNUTS ON WHEEL LUGS TO RETAIN HUBLOCK. THEREAFTER, INSTALL THE WHEEL AND TORQUE THE LUG NUTS TO 136 N-m (100 LB.FT.) (FIGURE 2).

HISTORY AND TIMING

The Warn Automatic Hublock (Model M350) was used on the DANA 28 Axle (Bronco II and Ranger) from model years 1983-90 (through build date 10/4/89). The Warn Automatic Hublocks (Models M350A and M350B) were used on the DANA 35 Axle (Bronco II, Explorer and Ranger) for model years 1990-93 (begin build date 10/5/89). Starting with model year 1994 the Warn Automatic Hublock (Model M350C) used on the DANA 35 Axle (Explorer and Ranger) was introduced.

The Model M350 is black and Model M350A, M350B and M350C are argent (white silver) in color. The Model M350 can only be replaced by Model M350 service parts. The M350C service kits should be used as replacements for the following:

^ M350A hublocks released 10/89 as model year 1990 running change.

^ M350B hublocks released 4/92 as model year 1992 late running change.

^ M350C hublocks released 8/93 as model year 1994 Job 1 change.

When automatic hublock servicing is required for any Ranger, Explorer, or Bronco II built from 10/89 through model year 1993, it is advised that both hublocks be replaced.

NOTE:

IF AN M350A OR M350B HUBLOCK REQUIRES SERVICING, ALL THE HUBLOCK COMPONENTS MUST BE REMOVED AND REPLACED WITH SERVICE KIT F3TZ-3B396-B, WHICH ESSENTIALLY IS THE SERVICE KIT FOR THE M350C AUTOMATIC HUBLOCK. THE CAM ASSEMBLY OF THE M350A OR M35OB SHOULD NOT BE USED WITH AN M350C AUTOMATIC HUBLOCK BODY NOR SHOULD AN M350A OR M350B AUTOMATIC HUBLOCK BODY BE USED WITH AN M350C CAM ASSEMBLY.

For model year 1994 (and beyond) 4X4 Rangers or Explorers, replace automatic hublocks in accordance with the automatic hublock Service Manual procedure and additional diagnostics procedure outlined in this TSB.

IDENTIFYING AUTOMATIC HUBLOCK MODELS

A stamped code found on the rear of the automatic hublock flange face can be used to identify the automatic hublock type, in addition to the model year summary described above. Examples of the three (3) different codes which correlate to the automatic hublock model type are outlined in the chart:

PART NUMBER	PART NAME
E3TZ-1K105-B	Hublock Assembly
E3TZ-3N105-A	Nut And Bearing
E3TZ-1K106-B	Seal Kit
E5TZ-3B459-A	Key
E6TZ-3B477-A	Cam

PART NUMBER	PART NAME
F3TZ-3B396-B	Hublock - Automatic (Hublock Assembly, Wheel Retainer, Cam Assembly Key)
F3TZ-3N105-A	Hublock Nut/Key
F3TZ-1K106-A	Hublock Seal/Decal

THE ABOVE PART APPLICATION CHART IS FOR 1983-90 (THROUGH BUILD DATE 10/4/89) BRONCO II, RANGER, DANA 28 AXLE, HUBLOCK MODEL M350:

THE ABOVE PART APPLICATION CHART IS FOR:

^ 1990-95 Ranger (begin build date 10/5/89)

^ 1990 Bronco (begin build date 10/5/89 through end of production)

^ 1991-94 Explorer (through build date 11/18/94, DANA 35 Axle, Hublock Model M350C)

OTHER APPLICABLE ARTICLES: 92-1-8 WARRANTY STATUS: INFORMATION ONLY OASIS CODES: 508000, 509000, 590000

Wheel Hub (Locking): All Technical Service Bulletins Front Hub - (4WD) Noise or Failure

Article No. 91-18-12 09/05/91

^ NOISE-"RATCHETING" SOUND FROM HUBLOCKBRONCO II BUILT AFTER 10/1/89, RANGER BUILT BETWEEN 10/1/89 AND 3/31/91, EXPLORER BUILT UNTIL 3/31/91

^ AXLE-FRONT-AUTOMATIC LOCKING HUBS-ENGAGEMENT OF FRONT DRIVELINE DELAYED OR NO COUPLING OF FRONT WHEELS-BRONCO II BUILT AFTER 10/1/89, RANGER BUILT BETWEEN 10/1/89 AND 3/31/91, EXPLORER BUILT UNTIL 3/31/91

LIGHT TRUCK: 1990 BRONCO II 1990-91 RANGER 1991 EXPLORER

This TSB article is being republished in its entirety to note that the wheel bearing retaining nut is included with the front automatic locking hub assembly.

ISSUE: Engagement of the front driveline on 4x4 models of the subject vehicles with Shift-On-The-Fly and Dana 35 axles may exhibit delayed or no coupling of the front wheels. Both of these conditions may result in a hublock ratcheting noise and sometimes may result in structural damage to the hublock. These concerns are caused by the failure of the transfer case to provide synchronization of the drivetrain during cold weather.

ACTION: Test drive the vehicle to determine if the driveline exhibits delayed or no coupling of the front wheels. If so, use the following procedure to service the vehicle.

NOTE: THESE ACTIONS SHOULD PROVIDE SHIFT-ON-FLY CAPABILITY TO 55 MPH (89 KM/H) AT TEMPERATURES ABOVE 32~F (0~C) AND 45 MPH (72 KM/H) WITH TEMPERATURES FROM 32~F (0~C) TO AS LOW AS -20~F (-29~C).

FRONT AUTOMATIC LOCKING HUB

1. Remove the left and right front automatic locking hubs and camming assemblies and replace with new assemblies (FOTZ-3B396-B). Refer to the appropriate Light Truck Shop Manual, Section 04-01D, for service details.

2. Inspect the wheel bearing retaining nut for damage and presence of foreign material which would diminish wheel bearing life.

3. Replace the wheel bearing retaining nut if damaged. This nut is included with the front automatic locking hub assembly.

FRONT AXLE LUBRICANT

1. Determine if the vehicle was built prior to 12/15/90.

2. If the vehicle was built prior to 12/15/90, replace the front axle lubricant with new lubricant (F1TZ-19580-A).

a. Extract the old lubricant using a suction gun.

NOTE: BREAKING THE CARRIER SEAL IS NOT A RECOMMENDED METHOD OF EXTRACTING THE LUBRICANT.

b. Refill the front axle with 56 ounces of lubricant (F1TZ-19580-A) using a suction gun.

TRANSFER CASE

1. Remove the following old transfer case parts and replace them with the following new parts. Refer to the appropriate Light Truck Shop Manual, Section 07-07E, for service details.

^ Clutch Coil Assembly (F1TZ-7G361-B)

^ Clutch Housing (F1TZ-7G362-A)

^ Lock-Up Collar (F1TZ-7106-B)

^ Lock-Up Fork (FOTZ-7289-A) - (Green paint mark by part number)

^ Return Spring (F1TZ-7219-A)

^ Sleeve Spring (E6TZ-7D126-A)

2. Install the sleeve spring (E6TZ-7D126-A) into the bore of the 7106 lock-up collar large end first.

ISSUE: 4X4 system diagnosis can be difficult at times due to system complexities.

ACTION:

For general system operation and diagnosis: Refer to TSB Article No. 92-1-8.

For specific automatic lock hub diagnosis and service: Refer to this article.

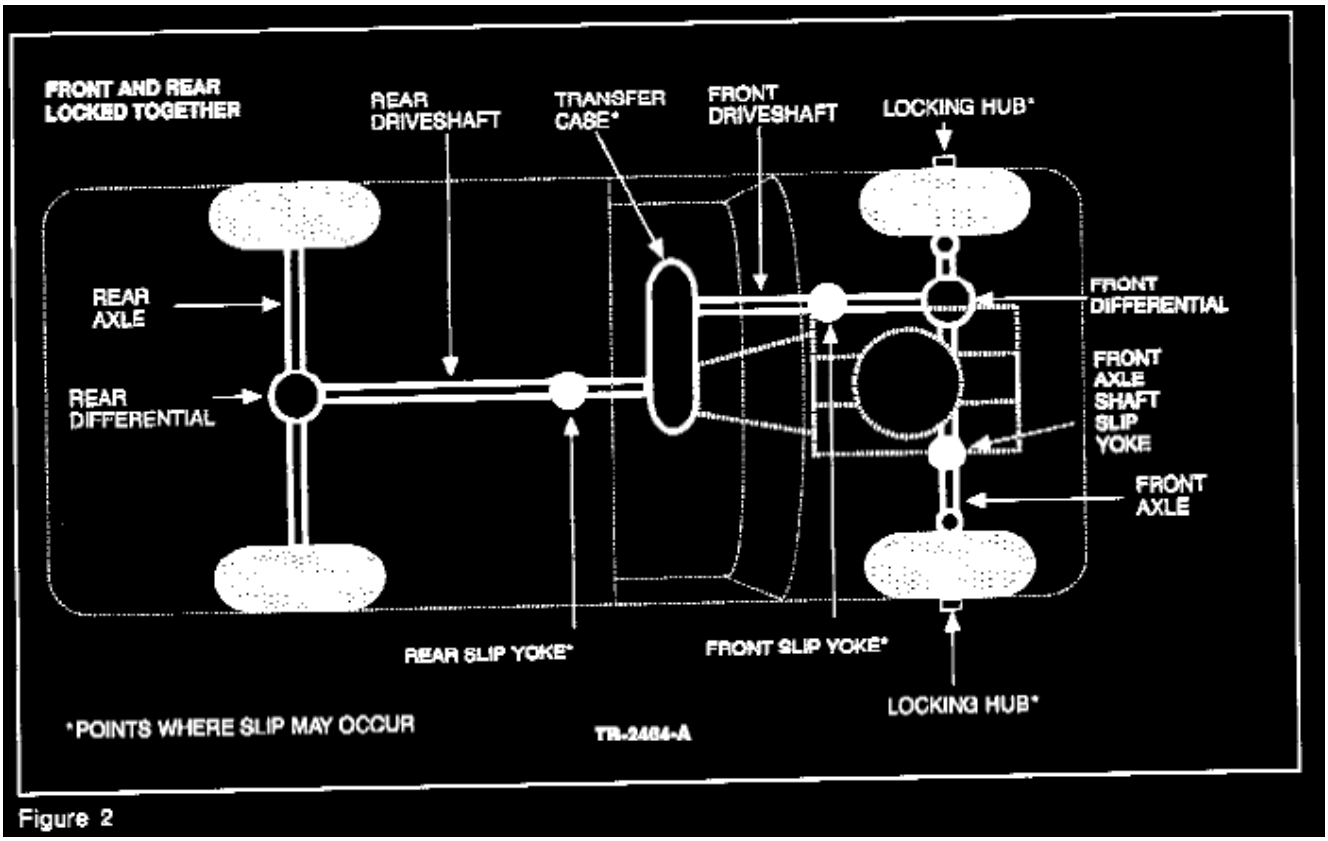

Figure 2

HUBLOCK DIAGNOSTICS

WHEEL END CONTAMINATION:

^ All compact vehicle hublocks have an O-ring seal between the hublock and wheel hub to prevent contamination. Whenever the hublock is removed, the 0-ring seal should be checked for damage.

^ If contamination is found in the wheel end, the path must be determined and corrected. Path possibilities are through the hublock seal, the wheel

bearing seals or the axle spindle seals.

WHEEL END NOISE (BUZZING) IN 4X2, AFTER UNLOCKING HUBS, SHORTLY AFTER FOUR-WHEEL DRIVE USAGE:

^ Noise concerns in two-wheel drive shortly after shifting from four-wheel drive and unlocking hubs, can occur if one of the hublocks fails to disengage. As the vehicle moves forward, the one (1) hublock that has failed to disengage will rotate its axle shaft through the differential and attempt to rotate the other axle shaft in the opposite direction. This is called differential motoring torque. As this torque attempts to turn the other axle shaft through the differential gears, that shaft's hublock will attempt to engage which will result in a ratcheting or buzzing noise.

^ This type of noise concern is usually found on axles that have incorrect front axle differential lubricant or very few 4X4 miles on them.

^ Verify that the front axle differential lubricant is F1TZ-19580-A. If incorrect lubricant is detected, extract the old lubricant using a suction gun.

NOTE:

BREAKING THE CARRIER SEAL IS NOT A RECOMMENDED METHOD OF EXTRACTING THE LUBRICANT.

1. Refill the front axle with 56 oz (1.66 L) of lubricant F1TZ-19580-A using a suction gun.

2. As the front axle accumulates 100-200 miles (161-322 km) of locked hublock operation, the axle will break-in, thus reducing the amount of differential motoring torque significantly.

3. If a front axle requires breaking in, refer to the Front Axle Break-In Procedure in this article.

4. If the front axle has been broken-in and the differential lubricant is F1TZ-19580-A, however, a wheel end noise (buzzing) in 4X2 is still experienced shortly after four-wheel drive usage. It is advised that the hublock which is not ratcheting be replaced as it is not disengaging correctly. When this condition occurs on any 4X4 Ranger, Explorer, or Bronco II, built from 10/89 through model year 1993, it is advised that both hublocks be replaced as the ratcheting hub is likely to become damaged.

FRONT AXLE BREAK-IN PROCEDURE:

^ To break-in the front axle, engage four-wheel drive and then shift out of it without disengaging the hublocks.

^ Thereafter, continue to drive the vehicle with locked hublocks until 100-200 miles (161-322 km) are accumulated. This will break-in the axle. Should the vehicle be backed up during this time

period, the hublocks will disengage and will have to be locked again by repeating the engagement procedure.

WHEEL END NOISE (RATCHETING) IN 4X2 AND HUBS UNLOCKED:

^ This condition could occur during turns or when the suspension is stroked. It is more prevalent in cold weather, with new front axles. It is usually caused by high motoring torque at the axle shafts or by incorrect axle lubrication.

^ Verify that axle lubrication is F1TZ-19580-A. If the front axle is not broken-in, 100-200 4X4 miles (161-322 km), proceed to do so following the outlined front axle break-in procedure in the Hublock Diagnostics section of this TSB article.

WHEEL END NOISE (BUZZING) WHILE ENGAGING 4X4 (TOUCH DRIVE) WHILE MOVING:

^ Refer to TSB Article No. 91-15-10.

POPPING/BANGING SOUND WHILE IN 4X4:

^ If the system slips under load, find what has broken or is slipping. To locate where slip is taking place, put marks at various possible slip points (Figure 1). Test drive the vehicle, then check to see if marks at different points are still in the same relationship to each other. This will help you determine where the slippage is taking place or where to look for broken parts, if any.

^ On vehicles with automatic hubs, find a place where you can do your test, mark the components, then drive without backing up. Stop and check the marks to see if they are in the same relationship to each other. If you back up before checking your marks, the hubs may reindex and not reveal the problem.

^ Reindex component should be serviced.

INSTALLATION PROCEDURE

1. Remove old hublock; remove key from bearing retainer nut and then remove nut.

2. If replacing a manual hublock with an automatic hublock, also remove the three-piece wheel bearing nut assembly.

3. Remove the new wheel bearing retaining nut from the cam assembly and install on the threaded spindle.

4. Using Hex Locknut Wrench (T70T-4252-B), torque the wheel bearing retainer nut to 47 N-m (35 lb.ft.) while rotating the wheel assembly. Back nut off 1/4 turn and retighten to 1.8 N-m (16 lb.in.) of torque.

5. Align scallop of the wheel bearing retaining nut with the center of the spindle keyway by advancing the nut clockwise.

6. Install the retaining key into the spindle keyway. With the garter spring inboard, align the key on the cam assembly with the keyway on the spindle.

7. Firmly press the cam assembly on the wheel bearing retaining nut.

CAUTION:

DO NOT PACK THE HUBLOCK WITH GREASE. TOO MUCH GREASE WILL CAUSE IMPROPER HUBLOCK OPERATION AND MAY DAMAGE THE HUBLOCK.

8. For Ranger and Bronco II, model years 1983-90 (through build date 10/4/89), using the DANA 28 Axle, install the thrust washer set onto the axle:

a. First, the plain steel washer.

b. Second, the needle bearing.

c. Last, the spline washer.

9. For model years 1990-94 (begin build date 10/5/89), DANA 35 Axle, install the one-piece spline washer. Install the "C" clip into the axle groove. It may be necessary to push the axle outboard from the inboard side of the knuckle.

10. For 1995 Ranger, install the thrust washer onto the axle:

a. First, the plain steel thrust washer.

b. Second, the plastic unsplined thrust washer.

AUTOMATIC HUBLOCK IDENTIFICATION CHART

AUTOMATIC HUBLOCK MODEL TYPE	DATE CODE DESCRIPTION	EXAMPLE	PRODUCTION DATE	HUBLOCK BODY COLOR
M350A	Three (3) alphanumeric characters, or in some cases, no code	AB2 or no code	10/89	Argent
M350B	Six (6) numbers	920621	6/92	Argent
M350C	Backward letter "C" or the letter "C" followed by six (6) numbers	" " 931020 or C931021	8/93	Argent

c. Last, the steel spline thrust washer.

CAUTION:

ENSURE THE RETAINING RING OR "C" CLIP IS SEATED PROPERLY IN THE AXLE GROOVE FOR STEPS 8, 9, OR 10.

11. Check to ensure 0-ring seal on the flange face of the hublock body is not damaged and is properly positioned in its groove.

12. Install the hublock body assembly into the vehicle hub and rotor assembly. The hub may have to be rotated to line up the three (3) prongs of the cam follower (found internally to the hublock) with the cam assembly.

13. Install retainer flat nuts on wheel studs.

NOTE:

DO NOT FORCE THE HUBLOCK ASSEMBLY. IF THE BODY ASSEMBLY WILL NOT FIT, RECHECK THE ALIGNMENT OF ALL COMPONENTS. INSTALL SPEEDNUTS ON WHEEL LUGS TO RETAIN HUBLOCK. THEREAFTER, INSTALL THE WHEEL AND TORQUE THE LUG NUTS TO 136 N-m (100 LB.FT.) (FIGURE 2).

HISTORY AND TIMING

The Warn Automatic Hublock (Model M350) was used on the DANA 28 Axle (Bronco II and Ranger) from model years 1983-90 (through build date 10/4/89). The Warn Automatic Hublocks (Models M350A and M350B) were used on the DANA 35 Axle (Bronco II, Explorer and Ranger) for model years 1990-93 (begin build date 10/5/89). Starting with model year 1994 the Warn Automatic Hublock (Model M350C) used on the DANA 35 Axle (Explorer and Ranger) was introduced.

The Model M350 is black and Model M350A, M350B and M350C are argent (white silver) in color. The Model M350 can only be replaced by Model M350 service parts. The M350C service kits should be used as replacements for the following:

^ M350A hublocks released 10/89 as model year 1990 running change.

^ M350B hublocks released 4/92 as model year 1992 late running change.

^ M350C hublocks released 8/93 as model year 1994 Job 1 change.

When automatic hublock servicing is required for any Ranger, Explorer, or Bronco II built from 10/89 through model year 1993, it is advised that both hublocks be replaced.

NOTE:

IF AN M350A OR M350B HUBLOCK REQUIRES SERVICING, ALL THE HUBLOCK COMPONENTS MUST BE REMOVED AND REPLACED WITH SERVICE KIT F3TZ-3B396-B, WHICH ESSENTIALLY IS THE SERVICE KIT FOR THE M350C AUTOMATIC HUBLOCK. THE CAM ASSEMBLY OF THE M350A OR M35OB SHOULD NOT BE USED WITH AN M350C AUTOMATIC HUBLOCK BODY NOR SHOULD AN M350A OR M350B AUTOMATIC HUBLOCK BODY BE USED WITH AN M350C CAM ASSEMBLY.

For model year 1994 (and beyond) 4X4 Rangers or Explorers, replace automatic hublocks in accordance with the automatic hublock Service Manual procedure and additional diagnostics procedure outlined in this TSB.

IDENTIFYING AUTOMATIC HUBLOCK MODELS

A stamped code found on the rear of the automatic hublock flange face can be used to identify the automatic hublock type, in addition to the model year summary described above. Examples of the three (3) different codes which correlate to the automatic hublock model type are outlined in the chart:

PART NUMBER	PART NAME
E3TZ-1K105-B	Hublock Assembly
E3TZ-3N105-A	Nut And Bearing
E3TZ-1K106-B	Seal Kit
E5TZ-3B459-A	Key
E6TZ-3B477-A	Cam

PART NUMBER	PART NAME
F3TZ-3B396-B	Hublock - Automatic (Hublock Assembly, Wheel Retainer, Cam Assembly Key)
F3TZ-3N105-A	Hublock Nut/Key
F3TZ-1K106-A	Hublock Seal/Decal

THE ABOVE PART APPLICATION CHART IS FOR 1983-90 (THROUGH BUILD DATE 10/4/89) BRONCO II, RANGER, DANA 28 AXLE, HUBLOCK MODEL M350:

THE ABOVE PART APPLICATION CHART IS FOR:

^ 1990-95 Ranger (begin build date 10/5/89)

^ 1990 Bronco (begin build date 10/5/89 through end of production)

^ 1991-94 Explorer (through build date 11/18/94, DANA 35 Axle, Hublock Model M350C)

Wheel Hub (Locking): Service and Repair Removal

With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

1. Raise the vehicle and install safety stands. 2. Remove the wheel lugnuts and the wheel and tire assembly. 3. Remove the brake caliper and secure to the underbody to prevent damage to the brake hose. It is not necessary to disconnect the hose from the

caliper. Do not let the caliper hang with its weight on the brake hose or the hose may become stretched, twisted or ruptured.

4. Remove the retainer washers from the lugnut studs. Remove the automatic locking hub assembly from the spindle. 5. Remove the snap ring from the end of the spindle shaft.

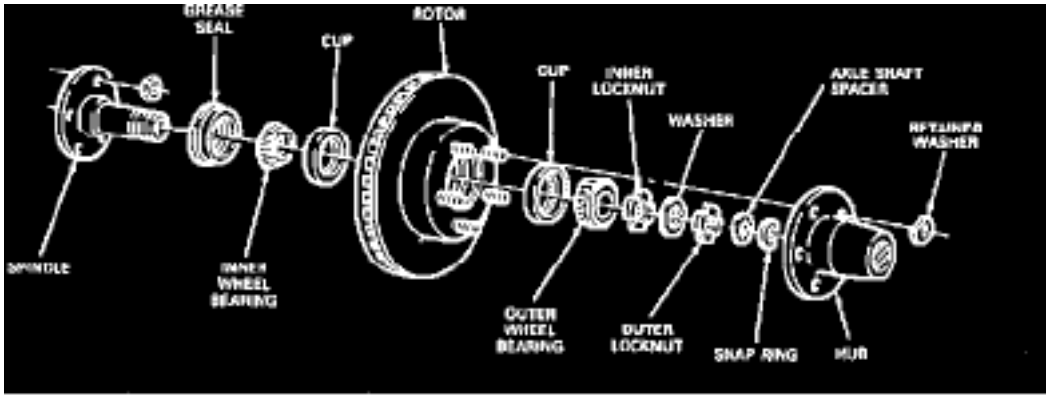
Axle Shaft Spacer

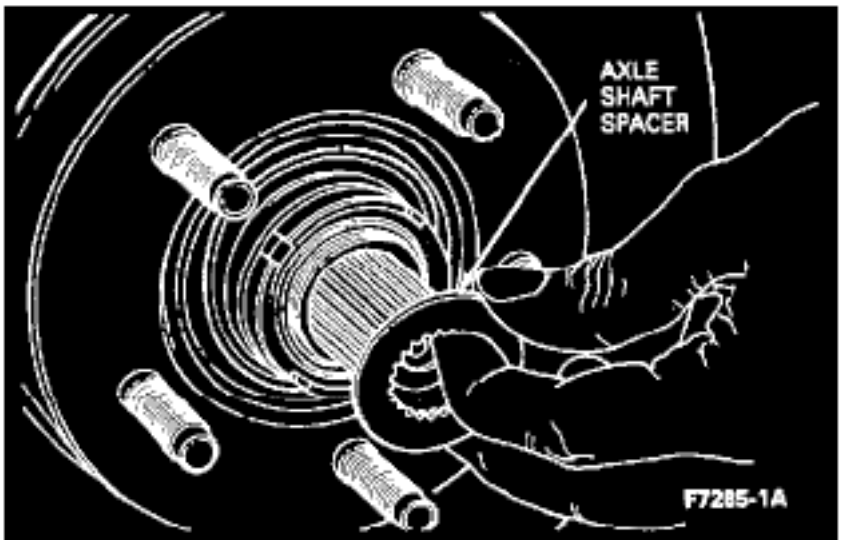
6. Remove the axle shaft spacer. 7. Pull cam assembly off the wheel bearing adjusting nut and remove the two plastic thrust spacers from the adjusting nut.

CAUTION: Do not pry on the plastic cam or thrust spacers during removal. Prying may damage the cam or spacers.

Cam Assembly And Locking Key

8. Using a magnet, remove the locking key.





NOTICE: If required, rotate the adjusting nut slightly to relieve pressure against the locking key, before the key can be removed.

CAUTION: To prevent damage to the spindle threads, look into the spindle keyway under the adjusting nut and remove the separate locking key before removing the adjusting nut.

9. Remove the wheel bearing adjusting nut from the spindle using a 2-3/8 inch Hex Locknut Wrench.

10. Remove the inner locknut and slide hub/rotor off spindle being careful to catch the outer wheel bearing.

With Manual Locking Hubs

Fig. 5 Manual Locking Hub

1. Raise the vehicle until the tire clears the floor and remove the wheel and tire assembly. 2. Remove the brake caliper and secure to the underbody to prevent damage to the brake hose. It is not necessary to disconnect the hose from the

caliper.

CAUTION: Do not let the caliper hang with its weight on the brake hose or the hose may become stretched, twisted or ruptured.

3. Remove the retainer washers from the lugnut studs and the manual locking hub assembly from the spindle. 4. Remove the snap ring from the end of the spindle shaft.

Axle Shaft Spacer

5. Remove the axle shaft spacer.

Wheel Hub (Locking): Service and Repair Installation

With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

CAUTION: Wheel bearing lubricant is a lithium-base grease. Sodium-base grease is not compatible with lithium-base grease and should not be intermixed. Therefore, do not lubricate front wheel bearings without first identifying the type of original wheel bearing lubricant. Usage of incompatible bearing lubricants may result in premature lubricant breakdown.

Installing Bearing Cups (Typical)

1. If inner or outer bearing cups were removed, install replacement inner and outer bearing cups in the hub with the appropriate bearing cup replacer

tool. Be sure to seat the cups properly in the hub. The cups will be properly seated when they are fully bottomed. Replace grease retainers. Polish grease retainer journal on spindle with 400 grit sandpaper. Clean with clean cloth.

2. Pack the inside of the hub with lithium-base grease or equivalent. Fill the hub until the grease is flush with the inside diameters of both bearing

cups. Pack the bearing cones and rollers with wheel bearing grease. Use a bearing packer for this operation. If a packer is not available, work as much lubricant as possible between the rollers and cages. Lubricate the cone surfaces with grease.

Installing Grease Seal (Typical)

3. Place the inner bearing in the inner cup and install the new grease seal. Be sure that the seal is fully seated. 4. Install the hub/rotor on the wheel spindle. Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads. 5. Place the outer bearing in the outer cup. 6. Install the wheel bearing adjustment nut. 7. While rotating the hub and rotor assembly, tighten the wheel bearing adjusting nut to 47 Nm (35 ft lb) to seat the bearings. Spin the rotor and back

off the nut one-quarter turn (90 degrees).

8. Retighten the adjusting nut to 1.8 Nm (16 in lb) using a torque wrench. 9. Make sure the final end play of the wheel on the spindle is 0.00-0.08 mm (0.000-0.003 in). the maximum torque to rotate the hub is 2.8 Nm (25 in

lb).

10. Align the closest lug in the wheel bearing adjusting nut with the center of the spindle keyway slot. Advance the nut to the next lug if required.

Install the separate locking key in the spindle keyway under the adjusting nut.

WARNING: Extreme care must be taken when aligning the spindle nut adjustment lug with the center of the spindle keyway slot to prevent damage to the separate locking key. The wheel and tire assembly may come off while the vehicle is in motion if the key is damaged.

11. Install the two thrust spacers and push or press the cam assembly onto the locknut by lining up the key in the fixed cam with the spindle keyway.

CAUTION: Extreme care must be taken when aligning the fixed cam key with the spindle keyway to prevent damage to the fixed cam.

12. Install the axle shaft spacer. 13. Clip the snap ring onto the end of the spindle shaft. 14. Install the automatic locking hub assembly over the spindle. Align three hub assembly legs with three pockets in cam assembly. Install the retainer

washers.

15. Install the caliper. 16. Install the wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb).

With Manual Locking Hubs

Fig. 5 Manual Locking Hub

CAUTION: Wheel bearing lubricant is a lithium-base grease. Sodium-base grease is not compatible with lithium-base grease and should not be intermixed. Therefore, do not lubricate front wheel bearings without first identifying the type of original wheel bearing lubricant. Usage of incompatible bearing lubricants may result in premature lubricant breakdown.

Installing Bearing Cups (Typical)

1. If inner or outer bearing cups were removed, install replacement inner and outer bearing cups in the hub with the appropriate bearing cup replacer

tool. Be sure to seat the cups properly in the hub. The cups will be properly seated when they are fully bottomed. Polish grease retainer journal on spindle with 400 grit sandpaper. Clean with clean cloth. Replace grease retainers.

2. Pack the inside of the hub with lithium-base grease or equivalent. Fill the hub until the grease is flush with the inside diameters of both bearing

cups. Pack the bearing cones and rollers with wheel bearing grease. Use a bearing packer for this operation. If a packer is not available, work as much lubricant as possible between the rollers and cages. Lubricate the cone surfaces with grease.

Installing Grease Seal (Typical)

3. Place the inner bearing in the inner cup and install the new grease seal. Be sure that the seal is fully seated. 4. Install the hub/rotor on the wheel spindle. Keep the hub centered on the spindle to prevent damage to the grease retainer or the spindle threads. 5. Place the outer bearing in the outer cup. 6. Install the inner locknut. 7. Tighten the inner locknut to 47 Nm (35 ft lb) while turning the rotor in the opposite direction to seat bearings. 8. Spin the rotor and back off the inner locknut one-quarter turn. Retighten the inner locknut to 1.8 Nm (16 in lb). 9. Install the lockwasher on the spindle.

NOTICE: If necessary, tighten inner locknut slightly to align the locknut pin with lockwasher hole.

10. Install the outer wheel bearing locknut using locknut wrench. Tighten locknut to 203 Nm (150 ft lb). 11. Check the end play of the wheel and tire assembly on the spindle. Final end play should be 0.00-0.08 mm (0.000-0.003 in). The maximum torque

to rotate the hub is 2.8 Nm (25 in lb).

12. Install the axle shaft spacer. 13. Clip the snap ring onto the end of the spindle shaft.

14. Install the manual hub assembly over the spindle. Install the retainer washers. 15. Install caliper. 16. Install wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb). 17. Lower vehicle. 18. Check brakes for proper operation.

WARNING: Before moving vehicle, pump brake pedal several times to be sure it is firm. Do not move vehicle until a firm pedal is obtained.

ACTION: Follow the Diagnostic Chart in this TSB article. Install revised design components as required to provide better isolation and improved driveline angles to resolve the concern. Refer to

the following Service Procedure for details.

NOTE:

THE SERVICE REPLACEMENT DRIVESHAFTS CONTAINED IN THIS TSB ARTICLE WILL NOT FIT VEHICLES EQUIPPED WITH A MITSUBISHI MANUAL TRANSMISSION. IF DRIVESHAFT REPLACEMENT IS REQUIRED ON MITSUBISHI EQUIPPED MODELS, REFER TO THE PARTS CATALOG FOR CORRECT APPLICATION.

Service Procedure

NOTE:

BEFORE DIAGNOSING A 4-WHEEL-DRIVE VEHICLE, MAKE SURE IT IS IN 2WD AND THE FRONT HUBS ARE UNLOCKED.

1. On smooth pavement, drive the vehicle at a constant speed and feel for the "float" condition:

a. This is the narrow, neutral range where the driveline can be said to "float" because neither accel nor decel forces are being applied to the driveline.

b. It is important to accurately identify vehicle behavior in "float" mode because the diagnostic routine to be used will depend on Noise/Vibration/Harshness (NVH) characteristics during float.

c. It may be necessary to drive the vehicle several minutes before the sensation can be clearly identified.

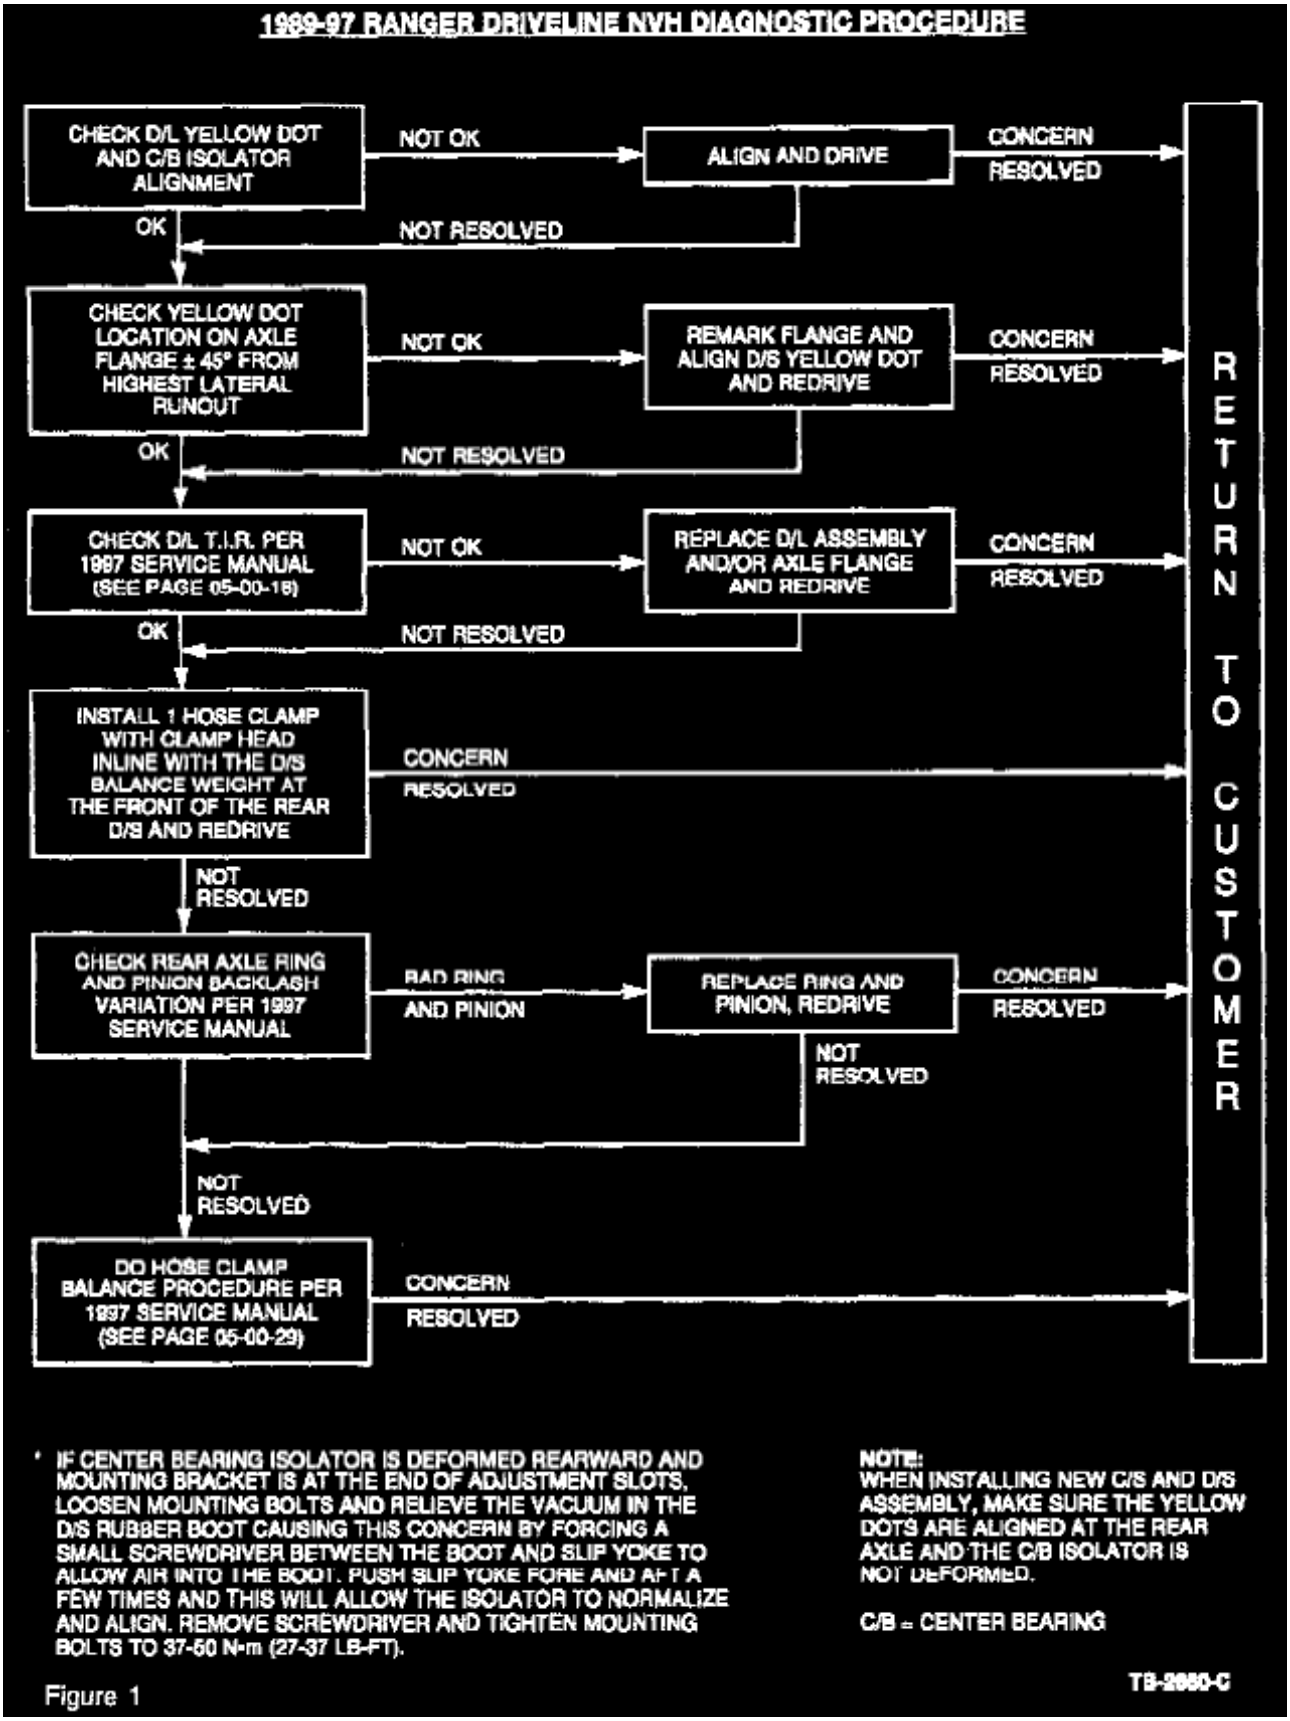

Figure 1

2. Perform the Driveline NVH Diagnostic Procedure shown in Figure 1 BEFORE replacing any components.

Vibration

Vibration, technically, is a high-frequency trembling, shaking or grounding condition, felt or heard, that is constant or variable in level and occurs during a portion of the total operating speed range. The types of vibrations that can be felt in the vehicle can be divided into three groups:

^ Vibrations of various unbalanced rotating parts of the vehicle

^ Body and frame vibrations excited by the powertrain, wind or road inputs

^ Tip-in moans or resonance vibrations from stressed engine or exhaust system mounts

If vibration is gone, check the front driveshaft, transfer case, front axle, or halfshafts for loose components. Refer to the 1997 Ranger Service Manual, Section 05-03B, for details.

NOTE:

DRIVING A 4-WHEEL-DRIVE VEHICLE WITH THE REAR DRIVESHAFT REMOVED FURTHER CONFIRMS ANY VIBRATION CONCERNS WITH THE FRONT DRIVE SYSTEM.

These vehicle vibrations can also be subdivided into those that occur at low speeds and those that are most noticeable at higher speeds. Since the dividing line between low and higher speed vibrations is not clear, there will be vibrations that overlap the two ranges.

Typical Low Speed Vibrations (less than 72 km/h (45 mph))

^ Exhaust vibration

^ Engine harshness

^ Driveline vibration due to improper driveline angles

^ Power steering pump disturbances

^ Air conditioner compressor or drive belt vibrations

^ Takeoff shudder (clutch or driveline problems)

^ Brake roughness or harshness

^ Driveline roughness

^ Clutch torsion vibration

^ Driveline slip-yoke or U-joints

Typical High Speed Vibrations (above than 72 km/h (45 mph))

^ Axle and companion flange runout or imbalance

^ Driveshaft imbalance

^ Excessive tire-wheel and drum assembly imbalance

^ Tire roughness due to high non-uniformity (force variation) or out-of-balance condition

^ Rear axle pinion gear pitch line runout

^ Excessive tire and wheel run out

^ Worn suspension components

^ Front end accessory vibrations

^ Exhaust vibration - Exhaust vibration is greatly reduced in Ranger exhaust systems de-coupled by a flexible coupling and mounted with blade and block hangers

Driveshaft Vibrates

1. Road test vehicle to determine critical vibration points. Note road speed, engine rpm and shift lever positions at which vibration occurs.

2. Stop vehicle and run engine with clutch depressed (automatic transmission in Neutral) through critical speed ranges determined in Step 1 of Driveshaft Vibrates.

3. If vibration is gone, the driveshaft must be balanced as described in the 1997 Ranger Service Manual, Page 05-00-29.

Component Test

Driveline Vibration

^ Driveline vibration exhibits a higher frequency and lower amplitude than does high-speed shake

^ Driveline vibration is directly related to the speed of the vehicle and is usually noticed at speeds of 72 km/h (45 mph) or higher

^ Driveline vibration can be perceived as a tremor in the floor pan or is heard as a rumble, hum or boom

^ Driveline vibration can exist in all drive modes, but may exhibit different symptoms depending upon whether the vehicle is accelerating, decelerating, floating or coasting. If the vibration is

particularly noticeable during acceleration or deceleration, especially at lower speeds, then driveline angle should be checked

^ Driveline vibration can be duplicated by supporting the axle upon a hoist or upon jackstands, though the brakes may need to be applied lightly in order to simulate road resistance. Refer to the 1997 Ranger Service Manual, Page 05-00-15, Steps 1-10

Driveshaft Runout and Balance

Vibration or shudder which is noticeable either on fast acceleration, when coasting, or when using the engine for braking, may be caused by the rear axle housing being loose on the rear suspension, improper tire balance, improper driveline installation, or driveline balance.

If driveshaft components are replaced and shaft vibration is encountered after installation, disconnect and remove the driveshaft. Rotate the rear axle companion flange 180 degrees; then, reconnect the driveshaft to the driveshaft slip-yoke and reinstall in vehicle. If the vibration persists, disconnect the driveshaft at the rear axle companion flange. Rotate the rear axle companion flange 180 degrees and reconnect the driveshaft to the rear axle companion flange.

If rotating the driveshaft 180 degrees does not eliminate vibration, the driveshaft may be balanced by referring to the 1997 Ranger Service Manual, Page 05-00-29, Steps 1-9, for details.

Slip-Yoke Spline

Vehicle noise and vibration can be caused by a seized driveshaft slip-yoke spline. The service resolution to minimize driveshaft slip-yoke spline contamination and ultimate seizure can be found in the 1997 Ranger Service Manual, Page 05-00-32, Steps 1-11.

Driveline Angularity

Driveline angularity is the angular relationship between the engine crankshaft, the driveshaft and the rear axle pinion. Factors determining driveline angularity include ride height (rear spring) and engine mounts.

Low speed vibration, less than 72 km/h (45 mph), especially when the vehicle is subjected to heavy acceleration or deceleration, is an indication of improper driveline angles. When these conditions exist, check the universal joints for proper seating, mounting and operation.

Center Bearing, Supercab 4X2 and 4X4

1. Unbolt the center bearing mount and spin the bearing. If bearing does not rotate freely it must be replaced.

2. Inspect the rubber insulator for evidence of hardening, cracking or deterioration before removing shaft. Replace if damaged. Refer to the 1997 Ranger Workshop Manual, Pages 05-01-14 and -15, for center bearing and rubber insulator service.

NOTE:

IF DRIVESHAFT AND COUPLING SHAFT ARE REMOVED, MAKE SURE THE YOKE IS REINSTALLED ON THE COUPLING SHAFT IN THE SAME ORIENTATION AS IT WAS ORIGINALLY INSTALLED. THE ORIENTATION IS CRITICAL SO THAT PROPER DRIVESHAFT BALANCE AND UNIVERSAL JOINT PHASING IS MAINTAINED. TORQUE THE ATTACHING NUT TO 136-163 N.m (100-120 LB-FT).

NOTE:

THE DRIVESHAFTS CONTAINED IN THIS TSB ARTICLE ARE THE MOST RECENT RELEASED FOR SERVICE. REFER TO OTHER TSB ARTICLES LISTED FOR 1993 AND PRIOR MODELS.

ACTION: Follow the Diagnostic Chart in this TSB article. Install revised design components as required to provide better isolation and improved driveline angles to resolve the concern. Refer to

the following Service Procedure for details.

NOTE:

THE SERVICE REPLACEMENT DRIVESHAFTS CONTAINED IN THIS TSB ARTICLE WILL NOT FIT VEHICLES EQUIPPED WITH A MITSUBISHI MANUAL TRANSMISSION. IF DRIVESHAFT REPLACEMENT IS REQUIRED ON MITSUBISHI EQUIPPED MODELS, REFER TO THE PARTS CATALOG FOR CORRECT APPLICATION.

Service Procedure

NOTE:

BEFORE DIAGNOSING A 4-WHEEL-DRIVE VEHICLE, MAKE SURE IT IS IN 2WD AND THE FRONT HUBS ARE UNLOCKED.

1. On smooth pavement, drive the vehicle at a constant speed and feel for the "float" condition:

a. This is the narrow, neutral range where the driveline can be said to "float" because neither accel nor decel forces are being applied to the driveline.

b. It is important to accurately identify vehicle behavior in "float" mode because the diagnostic routine to be used will depend on Noise/Vibration/Harshness (NVH) characteristics during float.

c. It may be necessary to drive the vehicle several minutes before the sensation can be clearly identified.

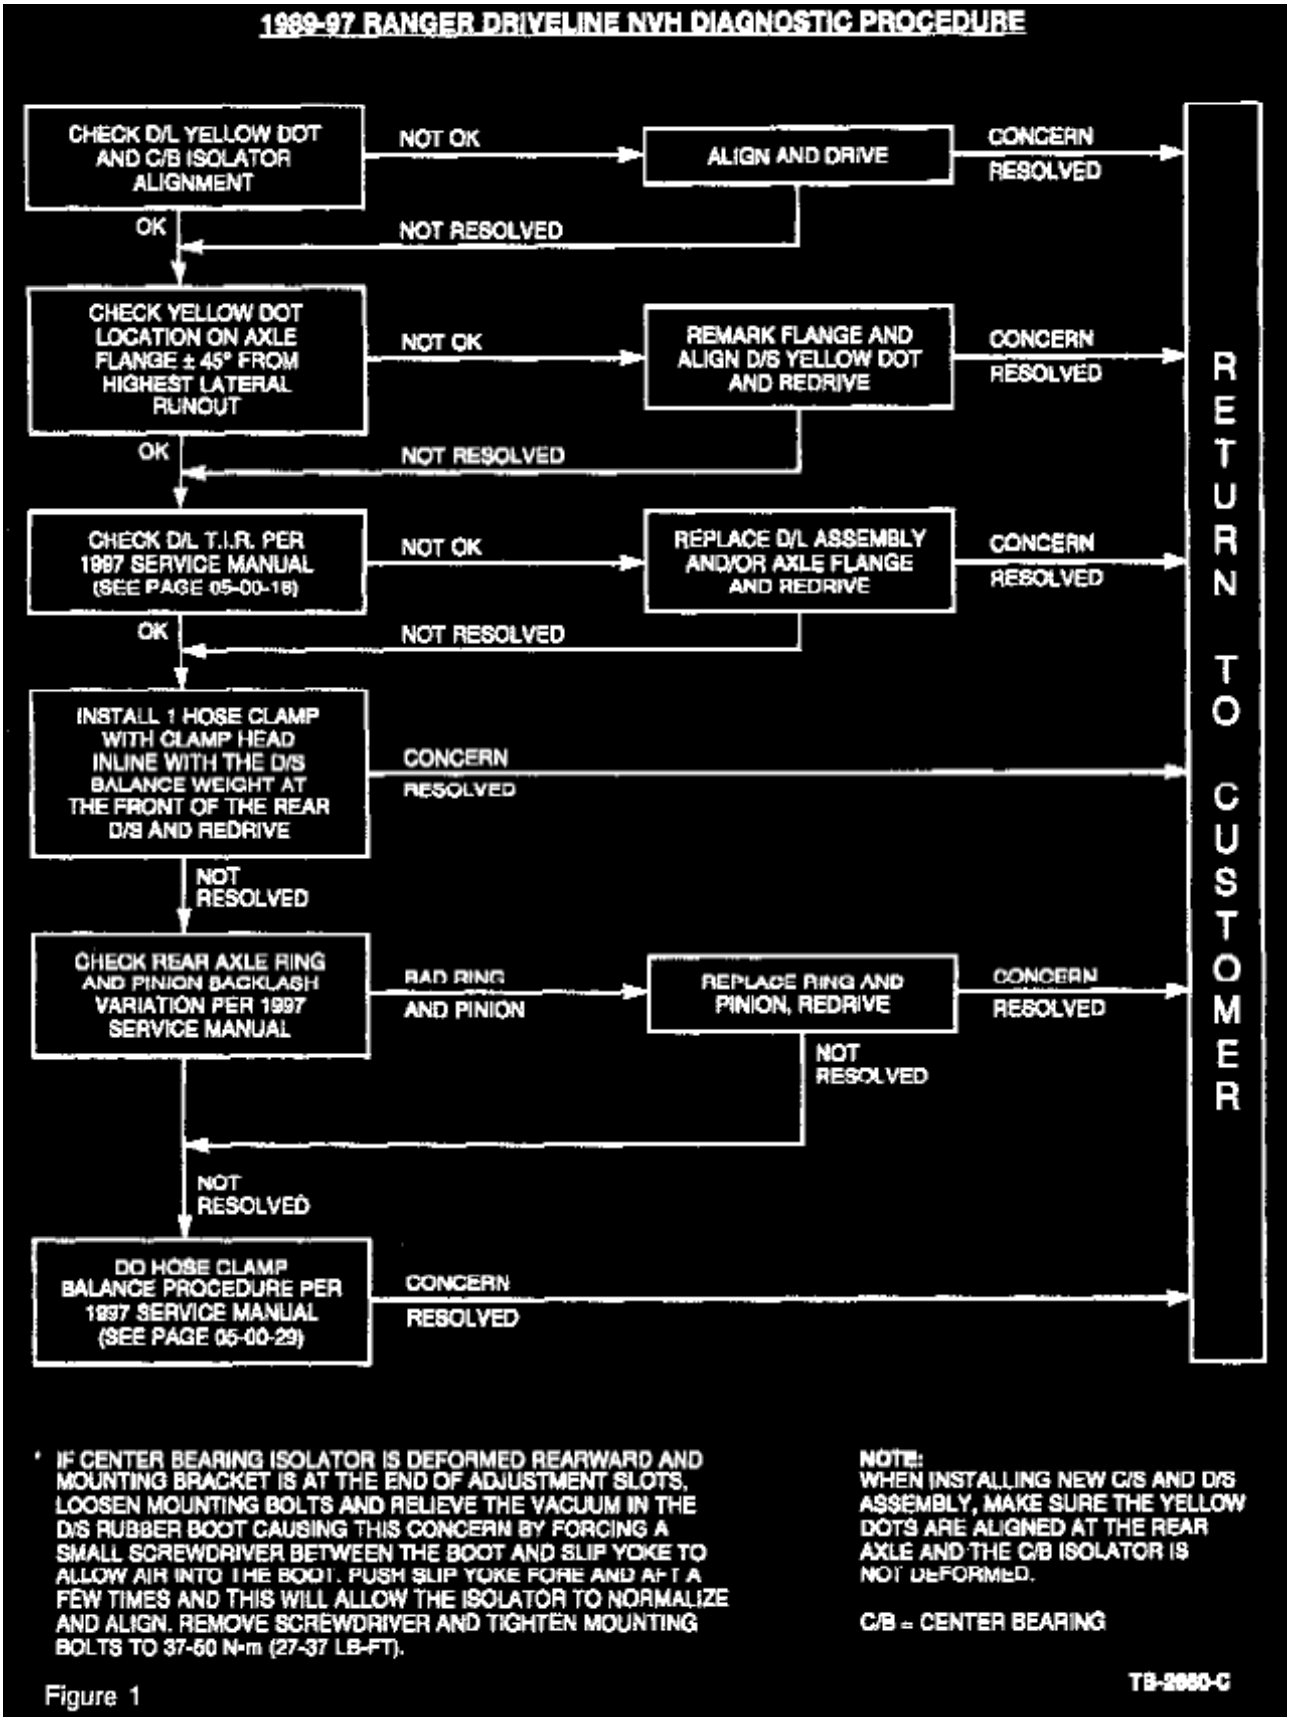

Figure 1

2. Perform the Driveline NVH Diagnostic Procedure shown in Figure 1 BEFORE replacing any components.

Vibration

Vibration, technically, is a high-frequency trembling, shaking or grounding condition, felt or heard, that is constant or variable in level and occurs during a portion of the total operating speed range. The types of vibrations that can be felt in the vehicle can be divided into three groups:

^ Vibrations of various unbalanced rotating parts of the vehicle

^ Body and frame vibrations excited by the powertrain, wind or road inputs

^ Tip-in moans or resonance vibrations from stressed engine or exhaust system mounts

If vibration is gone, check the front driveshaft, transfer case, front axle, or halfshafts for loose components. Refer to the 1997 Ranger Service Manual, Section 05-03B, for details.

NOTE:

DRIVING A 4-WHEEL-DRIVE VEHICLE WITH THE REAR DRIVESHAFT REMOVED FURTHER CONFIRMS ANY VIBRATION CONCERNS WITH THE FRONT DRIVE SYSTEM.

These vehicle vibrations can also be subdivided into those that occur at low speeds and those that are most noticeable at higher speeds. Since the dividing line between low and higher speed vibrations is not clear, there will be vibrations that overlap the two ranges.

Typical Low Speed Vibrations (less than 72 km/h (45 mph))

^ Exhaust vibration

^ Engine harshness

^ Driveline vibration due to improper driveline angles

^ Power steering pump disturbances

^ Air conditioner compressor or drive belt vibrations

^ Takeoff shudder (clutch or driveline problems)

^ Brake roughness or harshness

^ Driveline roughness

^ Clutch torsion vibration

^ Driveline slip-yoke or U-joints

Typical High Speed Vibrations (above than 72 km/h (45 mph))

^ Axle and companion flange runout or imbalance

^ Driveshaft imbalance

^ Excessive tire-wheel and drum assembly imbalance

^ Tire roughness due to high non-uniformity (force variation) or out-of-balance condition

^ Rear axle pinion gear pitch line runout

^ Excessive tire and wheel run out

^ Worn suspension components

^ Front end accessory vibrations

^ Exhaust vibration - Exhaust vibration is greatly reduced in Ranger exhaust systems de-coupled by a flexible coupling and mounted with blade and block hangers

Driveshaft Vibrates

1. Road test vehicle to determine critical vibration points. Note road speed, engine rpm and shift lever positions at which vibration occurs.

2. Stop vehicle and run engine with clutch depressed (automatic transmission in Neutral) through critical speed ranges determined in Step 1 of Driveshaft Vibrates.

3. If vibration is gone, the driveshaft must be balanced as described in the 1997 Ranger Service Manual, Page 05-00-29.

Component Test

Driveline Vibration

^ Driveline vibration exhibits a higher frequency and lower amplitude than does high-speed shake

^ Driveline vibration is directly related to the speed of the vehicle and is usually noticed at speeds of 72 km/h (45 mph) or higher

^ Driveline vibration can be perceived as a tremor in the floor pan or is heard as a rumble, hum or boom

^ Driveline vibration can exist in all drive modes, but may exhibit different symptoms depending upon whether the vehicle is accelerating, decelerating, floating or coasting. If the vibration is

particularly noticeable during acceleration or deceleration, especially at lower speeds, then driveline angle should be checked

^ Driveline vibration can be duplicated by supporting the axle upon a hoist or upon jackstands, though the brakes may need to be applied lightly in order to simulate road resistance. Refer to the 1997 Ranger Service Manual, Page 05-00-15, Steps 1-10

Driveshaft Runout and Balance

Vibration or shudder which is noticeable either on fast acceleration, when coasting, or when using the engine for braking, may be caused by the rear axle housing being loose on the rear suspension, improper tire balance, improper driveline installation, or driveline balance.

If driveshaft components are replaced and shaft vibration is encountered after installation, disconnect and remove the driveshaft. Rotate the rear axle companion flange 180 degrees; then, reconnect the driveshaft to the driveshaft slip-yoke and reinstall in vehicle. If the vibration persists, disconnect the driveshaft at the rear axle companion flange. Rotate the rear axle companion flange 180 degrees and reconnect the driveshaft to the rear axle companion flange.

If rotating the driveshaft 180 degrees does not eliminate vibration, the driveshaft may be balanced by referring to the 1997 Ranger Service Manual, Page 05-00-29, Steps 1-9, for details.

Slip-Yoke Spline

Vehicle noise and vibration can be caused by a seized driveshaft slip-yoke spline. The service resolution to minimize driveshaft slip-yoke spline contamination and ultimate seizure can be found in the 1997 Ranger Service Manual, Page 05-00-32, Steps 1-11.

Driveline Angularity

Driveline angularity is the angular relationship between the engine crankshaft, the driveshaft and the rear axle pinion. Factors determining driveline angularity include ride height (rear spring) and engine mounts.

Low speed vibration, less than 72 km/h (45 mph), especially when the vehicle is subjected to heavy acceleration or deceleration, is an indication of improper driveline angles. When these conditions exist, check the universal joints for proper seating, mounting and operation.

Center Bearing, Supercab 4X2 and 4X4

1. Unbolt the center bearing mount and spin the bearing. If bearing does not rotate freely it must be replaced.

2. Inspect the rubber insulator for evidence of hardening, cracking or deterioration before removing shaft. Replace if damaged. Refer to the 1997 Ranger Workshop Manual, Pages 05-01-14 and -15, for center bearing and rubber insulator service.

NOTE:

IF DRIVESHAFT AND COUPLING SHAFT ARE REMOVED, MAKE SURE THE YOKE IS REINSTALLED ON THE COUPLING SHAFT IN THE SAME ORIENTATION AS IT WAS ORIGINALLY INSTALLED. THE ORIENTATION IS CRITICAL SO THAT PROPER DRIVESHAFT BALANCE AND UNIVERSAL JOINT PHASING IS MAINTAINED. TORQUE THE ATTACHING NUT TO 136-163 N.m (100-120 LB-FT).

NOTE:

THE DRIVESHAFTS CONTAINED IN THIS TSB ARTICLE ARE THE MOST RECENT RELEASED FOR SERVICE. REFER TO OTHER TSB ARTICLES LISTED FOR 1993 AND PRIOR MODELS.

Propeller Shaft: Service and Repair

1. Remove nuts and U-bolts securing front driveshaft to front drive axle.

2. Remove U-joint assembly from axle yoke, then slide the splined yoke assembly out of transfer case front output shaft and remove driveshaft assembly.

3. Reverse procedure to install. Tighten attaching nuts to specifications.

LIGHT TRUCK: 1990-96 BRONCO 1990-97 AEROSTAR, ECONOLINE, F SUPER DUTY, F-150-350 SERIES, RANGER 1991-97 EXPLORER 1997 EXPEDITION, MOUNTAINEER

ISSUE: Available U-joints for driveshaft service are not always identifiable through model application charts. Some customers may request greaseable U-joints as a personal preference.

ACTION: Refer to the following Service Information for availability of U-joint with grease fittings.

SERVICE INFORMATION

TO IDENTIFY U-JOINT BY MEASUREMENT:

1. Remove the old U-joint.

2. Measure U-joint using the following measuring procedure.

a. Remove bearing cups.

b. Remove excess grease from bottom of bearing cups and trunnions.

c. Remove seals from bearing cups and trunnions.

d. Reinstall bearing cups on trunnions.

e. Measure as follows, permitting a tolerance of 10.005" at Dimension "G" in Figure 1 with Dimension "D" and "E" at 10.003".

Outside Snap Ring Style (Figure 1)

A) Measure "G" dimension and record.

B) Measure "D" dimension and record.

C) Measure "E" dimension and record,

3. Identify U-joint part number using reference dimensions in the Light Truck Cross Reference Chart found at the end of this TSB article.

TO IDENTIFY GREASEABLE U-JOINT FOR SERVICE:

For customers who demand greaseable U-joints due to their specific vehicle duty cycle, refer to Light Truck Cross Reference Chart found at the end of this TSB article.

Greaseable U-joints are typically recommended only for vehicles which operate 100% of the time in a high grit environment (e.g., coal mines).

NOTE:

GREASEABLE U-JOINTS DO NOT CONTAIN END PLAY THRUST WASHERS AND MAY CAUSE NOISE/VIBRATION/HARSHNESS (NVH) CONCERNS ON CERTAIN APPLICATIONS.

Universal Joint: Service and Repair Constant Velocity Type

Fig. 7 Constant Velosity Joint

The CV type joint, Fig. 7, incorporates an outer bearing retainer and flange, spring, cap, circlip, inner bearing assembly and a wire ring. The inner bearing assembly incorporates a bearing cage, six ball bearings and an inner race.

DISASSEMBLY

1. Remove clamp retaining shroud to outer bearing race and flange assembly.

Fig. 8 Removing Shroud

2. Remove shroud taking care not to damage dust boot or outer bearing race and flange assembly, Fig. 8. It may be necessary to tap shroud using a plastic hammer.

Fig. 9 Positioning Dust Boot

3. Peel dust boot upward, Fig. 9, and away from outer bearing race and flange assembly.

4. Using a suitable screwdriver, remove wire ring that retains the inner race to outer race.

Fig. 10 Removing Inner Race from Outer Race

5. Remove inner race and shaft assembly from outer race and flange assembly, Fig. 10, then cap and spring from inside the outer retainer.

6. Using suitable snap ring pliers, remove circlip retaining the inner race assembly to shaft, then inner race assembly. Discard circlip.

7. If necessary, remove clamp retaining boot to shaft, then boot.

8. Using a suitable screwdriver, pry ball bearings from cage. Do not scratch or damage cage, race or ball bearings.

9. Rotate inner race to align it with cage windows, then remove inner race through wider end of cage.

ASSEMBLY

Individual components are not available for service. Therefore, if inspection determines component replacement, the entire CV joint must be replaced as an assembly.

1. Install inner bearing race in bearing cage with counterbore facing large end of cage.

2. Push race to top of cage, then rotate race until ball slots are aligned with windows. This will lock race to top of cage.

3. Install ball bearings.

4. If removed, install dust boot on shaft using a new clamp.

5. Install inner bearing assembly on shaft, then the circlip.

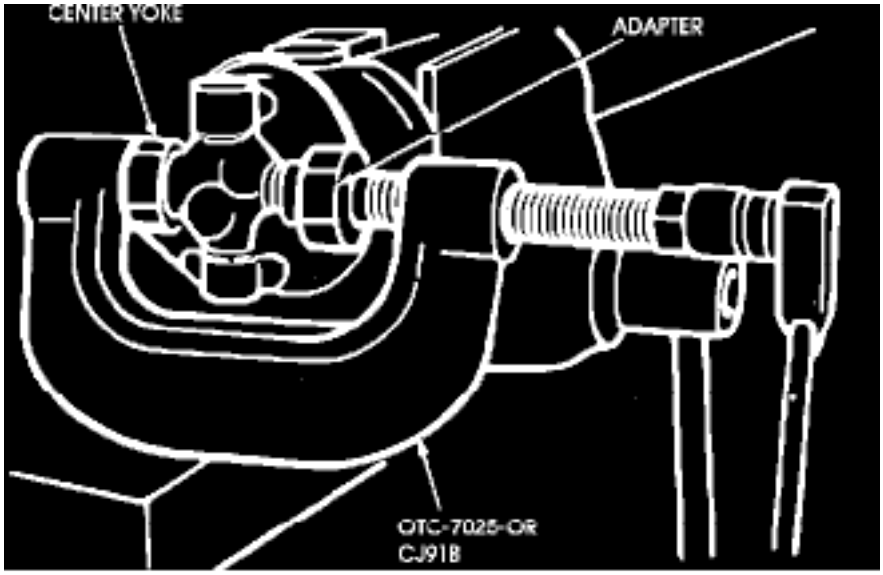
6. Install spring and cap in outer bearing retainer and flange, then fill outer bearing retainer with suitable grease.

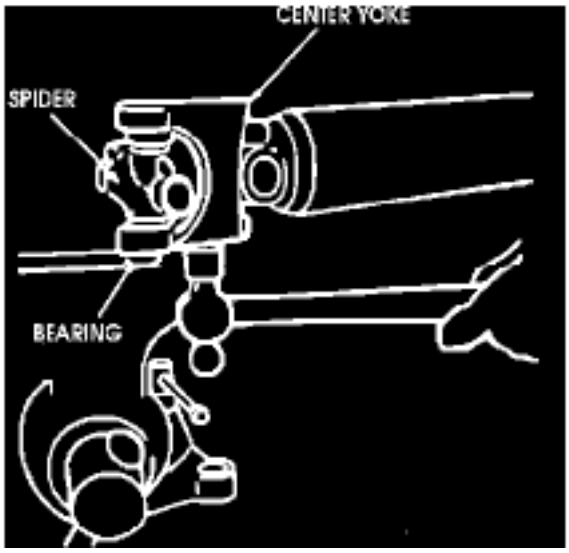
7. Install inner race and shaft assembly in the outer bearing retainer and flange, then push inner race down and install wire ring.

8. Fill top of outer bearing retainer with suitable grease. Remove excess grease from external surfaces.

9. Pull dust boot over retainer until boot is seated in groove. Insert a suitable screwdriver blade between boot and outer bearing retainer to allow trapped air to escape from boot.

10. Install shroud over boot and retainer, then clamp in position.





Universal Joint: Service and Repair Cross & Roller Type

With Replacement Tool

Disassembly

1. Place driveshaft in a vise using care to avoid damaging it.

2. Remove bearing retaining snap rings. Some universal joints use injected nylon retainers in place of snap rings. During servicing, the snap rings supplied with the replacement universal joint assembly must be used.

Fig. 4 Removing Bearing Caps Using Tool And Adapter

Fig. 5 Removing Bearing Cap By Holding In A Vice And Striking Center Yoke With Hammer

3. Position tool on shaft and press bearing out of yoke, Fig. 4. If bearing cannot be pressed all the way out, remove it using vise grips or channel lock pliers or position driveshaft as shown and strike center yoke with hammer, Fig. 5. Mark yoke and shaft to make sure they will be reassembled in their same relative positions.

4. Reposition tool so that it presses on the spider in order to press other bearing from opposite side of flange.

5. If used, remove flange from spider.

Assembly

1. Start new bearing into yoke, then position spider into yoke and press bearing until it is 1/4 inch below surface.

2. Remove tool and install a new snap ring.

3. Start new bearing in opposite side of yoke, then install tool and press on bearing until opposite bearing contacts snap ring.

4. Remove tool and install remaining snap ring.

Without Replacement Tool

Disassembly

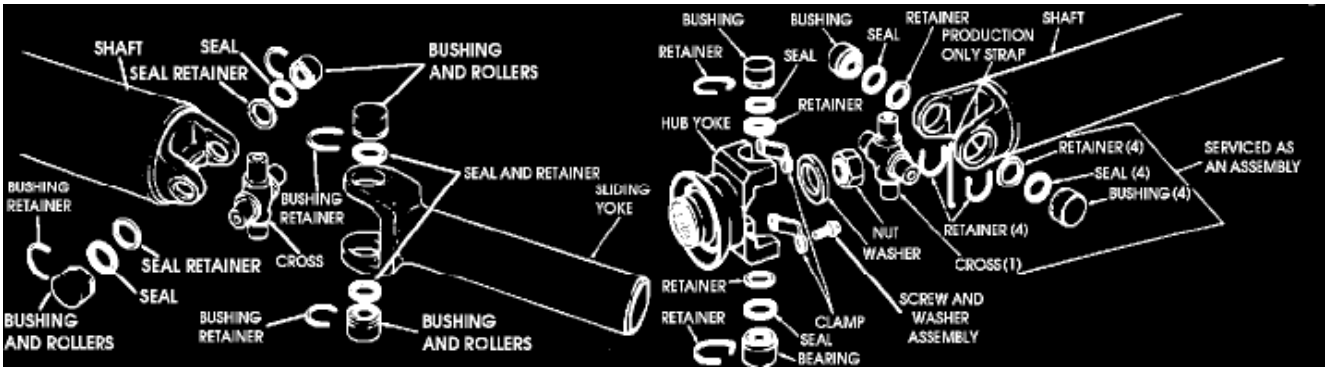


Fig. 3 Cross And Roller Type Universal Joint

1. Remove snap rings (or retainer plates) that retain bearings in yoke and driveshaft Fig. 3

2. Place U-joint in a vise.

3. Select a wrench socket with an outside diameter slightly smaller than the U-joint bearings. Select another wrench socket with an inside diameter slightly larger than the U-joint bearings.

4. Place the sockets at opposite bearings in the yoke so that the smaller socket becomes a bearing pusher and the larger socket becomes a bearing receiver when the vise jaws come together. Close vise jaws until both bearings are free of yoke and remove bearings from the cross or spider.

5. If bearings will not come all the way out, close vise until bearing in receiver socket protrudes from yoke as much as possible without using excessive force. Then remove from vise and place that portion of bearing which protrudes from yoke between vise jaws. Tighten vise to hold bearing and drive yoke off with a soft hammer.

6. To remove opposite bearing from yoke, replace in vise with pusher socket on exposed cross journal with receiver socket over bearing cup. Then tighten vise jaws to press bearing back through yoke into receiving socket.

7. Remove yoke from driveshaft and again place protruding portion of bearing between vise jaws. Then tighten vise to hold bearing while driving yoke off bearing with soft hammer.

8. Turn spider or cross 1/4 turn and use the same procedure to press bearings out of driveshaft.

Assembly

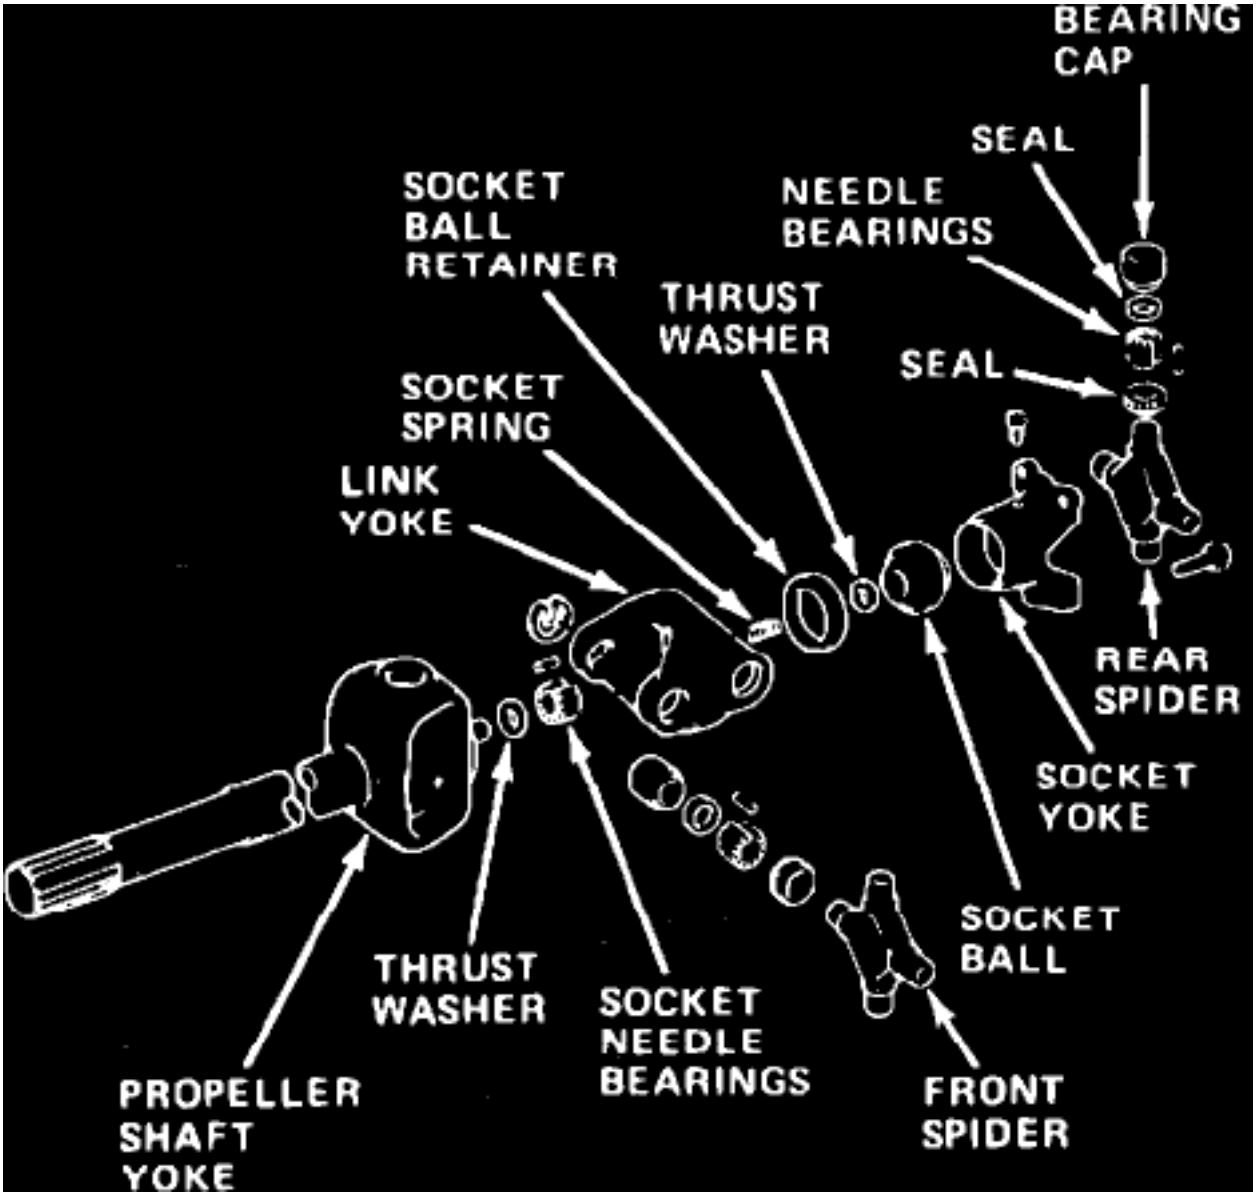
1. If old parts are to be reassembled, pack bearing cups with universal joint grease. Do not fill cups completely or use excessive amounts as over-lubrication may damage seals during reassembly. Use new seals.

2. If new parts are being installed, check new bearings for adequate grease before assembling.

3. With the pusher (smaller) socket, press one bearing part way into driveshaft. Position spider into the partially installed bearing. Place second bearing into driveshaft. Fasten driveshaft in vise so that bearings are in contact with faces of vise jaws. Some spiders are provided with locating lugs which must face toward driveshaft when installed.

4. Press bearings all the way into position and install snap rings or retainer plates.

5. Install bearings in yoke in same manner. When installation is completed, check U-joint for binding or roughness. If free movement is impeded, correct the condition before installation in vehicle.



Universal Joint: Service and Repair Disassembly and Assembly

Fig. 9 Double cardan universal joint exploded view

The double cardan type joint, Fig. 9, incorporates two universal joints, a centering socket yoke, and center yoke at one end of the shaft. A single universal joint is used at the other end.

DISASSEMBLY

1. Remove all bearing cap retainers.

2. Mark bearing caps, spiders, propeller shaft yoke, link yoke and socket yoke for assembly alignment reference, Fig. 9.

3. Remove bearing caps attaching from spider to propeller shaft yoke as follows:

a. Use a 5/8 inch socket to drive the bearing cap and a 11/16 inch socket to receive the opposite bearing cap as it is driven out. b. Place 5/8 inch socket on one bearing cap and 11/16 inch socket on opposite bearing. c. Position assembly in vise so vise jaws bear directly against sockets. d. Tighten vise to press first bearing cap out of link yoke. e. Loosen vise, reposition sockets and press opposite bearing cap out of link yoke.

4. Disengage propeller shaft yoke from link yoke.

5. Remove bearing caps attaching front spider to propeller shaft as described in step 3 above.

6. Remove front spider from yoke.

7. Remove bearing caps attaching rear spider to link yoke as outlined in step 3 above and remove spider and socket yoke from link yoke.

8. Clean all parts in solvent and wipe dry. Inspect assembly for damage or wear. If any component is worn or damaged, the entire assembly must be replaced.

ASSEMBLY

When assembling universal joint, make sure to align spiders and yokes according to marks made during disassembly.

1. Lubricate all bearings and contact surfaces with lithium base chassis grease.

2. Install bearing caps on yoke ends of rear spider and secure caps with tape, Fig. 9.

3. Assemble socket yoke and rear spider.

4. Position rear spider in link yoke and install bearing caps. Press caps into yoke using 5/8 inch socket until bearing cap retainer grooves are exposed.

5. Install rear spider-to-link yoke bearing cap retainers.

6. Position front spider in propeller shaft yoke and install bearing caps. Press caps into yoke using a 5/8 inch socket until bearing cap retainer grooves are exposed.

7. Install front spider-to-propeller shaft yoke bearing cap retainers.

8. Install thrust washer and socket spring in ball socket bearing bore, if removed.

9. Install thrust washer on ball socket bearing boss (located on propeller shaft yoke), if removed.

10. Align ball socket bearing boss on propeller shaft yoke with ball socket bearing bore and insert boss into bore.

11. Align front spider with link yoke bearing cap bores and install bearing caps. Press caps into yoke using a 5/8 inch socket until bearing cap retainer grooves are exposed.

12. Install front spider-to-link yoke bearing cap retainers.

Universal Joint: Service and Repair Service Notes

Fig. 1 Production Type Universal Joint Which Use Nylon Injection Rings In Place Of Snap Rings

Fig. 2 Service Type Universal Joint (Internal Snap Ring Type)

Before disassembling any universal joint, examine the assembly carefully and note the position of the grease fitting (if used). Also, be sure to mark the yokes with relation to the propeller shaft so they may be reassembled in the same relative position. Failure to observe these precautions may produce rough vehicle operation which results in rapid wear and failure of parts, and place an unbalanced load on transmission, engine and rear axle.

When universal joints are disassembled for lubrication or inspection, and the old parts are to be reinstalled, special care must be exercised to avoid damage to universal joint spider or cross and bearing cups. Some driveshafts use an injected nylon retainer on the universal joint bearings. When service is necessary, pressing the bearings out will sheer the nylon retainer, Fig. 1. Replacement with the conventional steel snap ring type is then necessary, Fig. 2.

Flex Plate: Customer Interest Engine - Noise/Vibration/No Crank/No A/T Engagement

Article No. 02-14-2

07/22/02

^ ENGINE - 4.0L OHV - POSSIBLE CRACKED FLEXPLATE - NOISE OR VIBRATION - VEHICLES EQUIPPED WITH AUTOMATIC TRANSMISSION ONLY

^ ENGINE - NO CRANK - POSSIBLE CRACKED FLEXPLATE - NOISE OR VIBRATION - VEHICLES EQUIPPED WITH 4.0L ENGINE AND AUTOMATIC TRANSMISSION ONLY

^ NOISE - NOISE DURING CRANKING - POSSIBLE CRACKED FLEXPLATE - VEHICLES EQUIPPED WITH 4.0L OHV ENGINE AND AUTOMATIC TRANSMISSION ONLY

^ TRANSMISSION - A4LD - 4R55E - NO FORWARD OF REVERSE ENGAGEMENT - POSSIBLE CRACKED FLEXPLATE - VEHICLES EQUIPPED WITH 4.0L OHV ENGINE ONLY

FORD: 1991-1996 AEROSTAR, EXPLORER, RANGER

ISSUE

Some vehicles equipped with an automatic transmission and a 4.0L OHV engine may exhibit a noise/vibration, no drive, unusual noise during cranking or a no crank condition. This may be caused by a crack in the flexplate.

ACTION

Verify that one of the conditions exists. if the condition is verified and the flexplate has been isolated as the cause, replace the flexplate with revised

PART NUMBER	PART NAME
F1TZ-6375-BA	Flexplate

Service Part F1TZ-6375-BA (Figure 1). Refer to the following Service Procedure for details.

SERVICE PROCEDURE

NOTE

THIS ARTICLE DOES NOT APPLY TO ANY OTHER CONDITIONS OR COMPONENTS THAT MAY CAUSE SIMILAR SYMPTOMS AND IS ONLY WRITTEN TO COVER THESE SPECIFIC CONDITIONS.

1. Verify that one of the conditions exist; noise/vibration, no drive, unusual noise during cranking 6r a no crank condition.

2. Verify that the starter operates properly. If not, service as necessary, then recheck if one of the other conditions still exist.

3. If the one of the conditions still exist and the flexplate has been. isolated as the cause, the flexplate will have to be replaced with revised part F1TZ-6375-BA (Figure 1).

4. Following the procedures listed in the appropriate year Workshop Manual, Engine Section 03, In-Vehicle Service, Flywheel, replace the Automatic Transmission Flexplate.

5. After completing the replacement procedure, check the transmission fluid level and adjust if necessary to the proper level.

6. Verify service.

1. Verify that one of the conditions exist; noise/vibration, no drive, unusual noise during cranking 6r a no crank condition.

2. Verify that the starter operates properly. If not, service as necessary, then recheck if one of the other conditions still exist.

3. If the one of the conditions still exist and the flexplate has been. isolated as the cause, the flexplate will have to be replaced with revised part F1TZ-6375-BA (Figure 1).

4. Following the procedures listed in the appropriate year Workshop Manual, Engine Section 03, In-Vehicle Service, Flywheel, replace the Automatic Transmission Flexplate.

5. After completing the replacement procedure, check the transmission fluid level and adjust if necessary to the proper level.

6. Verify service.

Bell Housing: Customer Interest M/T Clutch Housing - Fluid Inside

Article No. 91-18-14 09/05/91

^ CLUTCH-SLAVE CYLINDER "LEAKS"- VEHICLES USED IN MUDDY OR DUSTY ENVIRONMENTS

^ LEAKS-CLUTCH SLAVE CYLINDER "LEAKS"- VEHICLES USED IN MUDDY OR DUSTY ENVIRONMENTS

LIGHT TRUCK: 1988-89 ECONOLINE 1988-91 AEROSTAR, BRONCO, F-150-350 SERIES, RANGER 1989-90 BRONCO II 1991 EXPLORER

ISSUE: Fluid detected inside the clutch housing may be caused by a leaking clutch slave cylinder. This may occur when vehicles are driven in severely muddy or dusty environments or when operated with extensive idle time. Vehicles include...

^ 1988-1991 Ranger, 1988-1990 Bronco II, 1988-1991 Aerostar and 1991 Explorer with manual transmissions.

^ 1988-1991 Bronco, F-150-350, and 1988-1989 Econoline with 5-Speed Manual Transmissions, except 7.3L Diesel and 7.5L engines.

ACTION: Replace the clutch slave cylinder if inspection confirms the cylinder is leaking. The new clutch slave cylinder contains a guide seal which improves durability and resistance to dirt entry. Refer to the following procedures for service details.

INSPECTION PROCEDURE:

1. If the vehicle is a Bronco or F-150, the repair will only involve 5 speed manual transmissions. Other vehicles described include all manual transmissions.

This slave cylinder is the internal "Concentric" and not the external style. Inspect vehicle to visually verify the style of slave cylinder installed.

2. Determine if the slave cylinder is leaking by checking for a fluid trace inside the bottom of the clutch housing.

REPAIR PROCEDURE

1. Remove the clutch slave cylinder. Refer to the appropriate Light Truck Shop Manual for service details.

2. Replace the clutch slave cylinder with a new slave cylinder (F1TZ-7A564-A). Refer to the appropriate Light Truck Shop Manual for service details.

LIGHT TRUCK: 1983-91 BRONCO 1983-93 ECONOLINE, F-150-350 SERIES, RANGER 1986-91 AEROSTAR 1991-93 EXPLORER

ISSUE: The instrument cluster warning light(s) may be dimly lit or there may be a malfunction of the four pin low oil relay on vehicles so equipped. This could be due to the ignition switch.

ACTION:

If the vehicle displays the subject symptoms and meets the following conditions, replace the ignition switch. Refer to the appropriate Car or Light Truck Service Manual (Section 13-04 for 1983-1990 Cars, Section 11-04 for 1991-1993 Cars and Section 13-05 for 1983-1990 Light Trucks, Section 11-05 for 1991-1993 Light Trucks) for removal and installation procedures. Refer to the Parts Block in this article for correct parts usage.

CONDITIONS

^ The vehicle has 14401 wiring attached to the P2 terminal of the ignition switch. Refer to the wiring schematic and/or Electrical And Vacuum Troubleshooting Manual (EVTM) for the concern vehicle.

Ignition Switch: All Technical Service Bulletins Engine - Hard Start/No Start When Cold

Article No. 91-13-9

06/26/91

^ HARD START - 4.0L - COLD ENGINE

^ NO START - 4.0L - COLD ENGINE

^ IGNITION SWITCH BOUNCE - HARD OR NO START - 4.0L COLD ENGINE

LIGHT TRUCK: 1990-91 RANGER 1991 EXPLORER

ISSUE: A hard start or no start condition may occur when the engine is cold. The engine may not start without cycling the key to the OFF position and back to START. Ignition switch bounce (loss of electrical continuity between contacts) may cause the EDIS module to recycle several times or to lock-up and not allow a start at all.

ACTION: Install a new ignition switch containing synthetic lubricant which reduces the amount of bounce. Also, install a new wiring connector containing a new material that is compatible with the new synthetic lubricant. Refer to the following procedure for service details.

REMOVAL

1. Disconnect the battery power.

2. Remove the trim panel. Refer to the 1990-91 Ranger/Explorer Shop Manual, Section 11-04B, for removal procedure.

3. Turn the lock cylinder to the RUN position.

4. Remove the two (2) nuts on the ignition switch.

5. Separate the connector from ignition switch by gently prying on the ears of the connector and pulling apart firmly.

6. Disengage the terminals from the existing connector. Discard the connector.

Figure 1

7. Insert terminal into proper locations in new connector (F2TZ-14489-A), Figure 1.

INSTALLATION

1. Remove the spring clip from the new switch (F2TZ-11572-A). This clip keeps the switch in the correct position during shipment.

2. Press the new connector (F2TZ-14489-A) onto the terminals of the ignition switch. Be sure the tabs lock securely.

3. Locate the switch on the weld studs on the steering column.

NOTE: THE END OF THE ACTUATOR ROD MUST FIT IN THE HOLE ON THE SLIDER.

4. Install the nuts on the weld stud. Tighten to 4.45-7.24 N-m (39-64 lb.in.).

5. Connect the battery terminal.

6. Check the switch operation. If necessary, adjust it. Refer to the 1990-91 Aerostar, Explorer, Ranger Truck Shop Manual, Section 11-04B, for adjustment procedure.

7. Install the trim panel.

5. Remove spring pins retaining shift forks to shift rails, then discard spring pins. 6. Ensure 5th/reverse shift rail is in full forward position, then remove spring pin from end of 5th/reverse rail.

Cross-Sectional View Of Shift Rail Assembly

7. Remove three rubber plugs blocking shift rod service bores. To prevent component loss when performing the following procedures, cover lock

balls, friction device and spring seats with a suitable clean cloth held firmly in place.

WARNING: Ensure to wear safety glasses during shift rail removal.

8. Remove 5th/reverse shift rail from top cover through service bore. If necessary, insert a 5/16 inch drift punch through spring pin bore and gently

rock shift rail from side to side while maintaining rearward pressure.

9. Remove 3rd/4th shift rail from top cover through service bore. If necessary, insert a suitable drift through spring pin bore and gently rock shift rail

from side to side while maintaining rearward pressure.

Removing 5th/Reverse Cam Lockout Plate

10. Remove 5th/reverse cam lockout plate retaining bolts, then the 5th/reverse cam lockout plate.

ASSEMBLY

1. Place top cover in a suitable holding fixture. 2. Position 5th/reverse cam lockout plate to top cover. Install 5th/reverse cam lockout plate retaining bolts, then torque to 6-7 ft lbs. 3. Position 3rd/4th shift rail into top cover through service bore. If necessary, insert a 5/16 inch drift punch through spring pin bore and gently rock

shift rail from side to side while maintaining forward pressure.

4. Engage 3rd/4th shift fork with shift rail, then position detent ball and spring into top cover spring seats. 5. Compress detent ball and spring assembly, then push shift rail into position over detent ball. 6. Position friction device and spring into top cover spring seats. 7. Compress friction device and spring assembly, then push shift rail into position over friction device. 8. Install 3rd/4th shift fork to shift rail retaining spring. 9. Position 1st/2nd shift rail into top cover through service bore. If necessary, insert a 5/16 inch drift punch through spring pin bore and gently rock

shift rail from side to side while maintaining forward pressure.

10. Engage 1st/2nd shift fork with shift rail, then position detent ball and spring into top cover spring seats. 11. Compress detent ball and spring assembly, then push shift rail into position over detent ball. 12. Position friction device and spring into top cover spring seats. 13. Compress friction device and spring assembly, then push shift rail into position over friction device. 14. Install 1st/2nd shift fork to shift rail retaining spring. 15. Position 5th/reverse shift rail into top cover through service bore. If necessary, insert a 5/16 inch drift punch through spring pin bore and gently

rock shift rail from side to side while maintaining forward pressure.

16. Engage 5th/reverse shift fork with shift rail, then position detent ball and spring into spring seats. 17. Compress detent ball and spring assembly, then push shift rail into position over detent ball. 18. Install shift rail to top cover spring pins, then the 5th/reverse shift fork to shift rail retaining spring pin. 19. Install rubber plugs into service bores. 20. Insert interlock pins into 1st/2nd and 3rd/4th shift rails. Ensure large and small interlock pins are installed into their original positions.

NOTE: Improper installation of interlock pins will prevent activation of neutral switch and/or back-up lamp switch.

21. Apply a suitable sealant to back-up lamp switch and neutral switch threads. Install switches in top cover, then torque to 18-26 ft lbs. 22. Position lower shift lever and dust cover assembly into top cover, then install three retaining screws and tighten.

Countershaft: Testing and Inspection

Installing Countershaft Front Bearing Inner Race

4. Install countershaft front bearing inner race, using bearing replacer tool No. T53T-4621-B or equivalent.

Extension Housing: Testing and Inspection

Check extension housing for cracks. Ensure machined mating surfaces are free from burrs, nicks or any other damage. If necessary, replace oil seal after extension housing has been installed onto transmission.

NOTE: Extension housing rear bushing cannot be serviced. If service is required, replace as a unit.

Fluid - M/T: Technical Service Bulletins M/T - Mercon(R) V ATF Usage Information

TSB 06-26-1

01/08/07

MERCON ATF IS BEING REPLACED BY MERCON V AS A SERVICE FLUID FOR SOME MANUAL TRANSMISSIONS

FORD: 1981-2003 Escort 1984-1995 Thunderbird 1985-2007 Mustang 1985-1996 Bronco 1985-2007 Ranger 1986-1997 Aerostar 1991-2004 Explorer 1995-2007 F-150 1996-2007 F-Super Duty 2001-2003 Explorer Sport Trac, Explorer Sport

LINCOLN: 2001-2002 Lincoln LS

MERCURY: 1984-1995 Cougar 1987-1999 Tracer

ISSUE MERCON(R) Automatic Transmission Fluid is being replaced by MERCON(R) V as the service fluid for manual transmissions originally requiring MERCON(R).

ACTION Beginning immediately all manual transmission applications requiring MERCON(R) can now be serviced using MERCON(R) V or MERCON(R) Automatic Transmission Fluid or dual usage fluids labeled MERCON(R) / MERCON(R) V. After July 1, 2007, MERCON(R) Automatic Transmission Fluid will no longer be manufactured, therefore, availability of this fluid will continue until remaining inventory has been depleted.

- Part number XT-75W90-QGL. Ford specification WSS-M2C203-A1.
TB-8705-C

Figure 1

Service manual transmissions requiring MERCON(R) with MERCON(R) V or MERCON(R) Automatic Transmission Fluid or dual usage fluids labeled MERCON/MERCON(R) V. For proper fluid application on current and past model manual transmissions refer to the fluid usage chart. (Figure 1)

WARNING

FULL SYNTHETIC MANUAL TRANSMISSION FLUID (XT-M5-QS), SAE 75W-90 API GL-4 GEAR OIL (XY-75W90-QGL) AND SAE 75W-90 PREMIUM SYNTHETIC TRANSAXLE LUBRICANT (XT-75W90-QGT) ARE UNIQUE FLUIDS AND MUST BE USED IN APPLICATIONS RECOMMENDING THAT PARTICULAR FLUID.

USE OF ANY OTHER FLUID MAY CAUSE REDUCED FUNCTIONALITY OR DAMAGE.

PART NUMBER	PART NAME
XT-2-QDX	MERCON® (Quart)
XT-5-QM	MERCON® V (Quart)
XT-2-DDX	MERCON® (55 Gallon Drum)
XT-5-DM	MERCON® V (55 Gallon Drum)

NOTE: The information in Technical Service Bulletins is intended for use by trained, professional technicians with the knowledge, tools, and equipment to do the job properly and safely. It informs these technicians of conditions that may occur on some vehicles, or provides information that could assist in proper vehicle service. The procedures should not be performed by "do-it-yourselfers". Do not assume that a condition described affects your car or truck. Contact a Ford, Lincoln, or Mercury dealership to determine whether the Bulletin applies to your vehicle.

Mazda M5OD 5-SPD O/D M/T

The Mazda M5OD 5-SPD O/D M/T uses ATF as shown. The Mitsubishi 5-SPD M/T uses gear oil, for more information on the Mitsubishi 5-SPD M/T, refer to 1991 Ranger 4x4 with 2.9L engine.

Synchronizer Hub: Customer Interest M/T - Crunching Shifting From 2nd to 3rd Gear

Article No. 91-18-11 09/05/91

^ NOISE-INTERMITTENT "CRUNCHING" WHEN SHIFTING FROM 2ND TO 3RD-VEHICLES WITH M50D (MAZDA R1 AND R2) TRANSMISSION

^ TRANSMISSION-M50D (MAZDA R1 AND R2)- INTERMITTENT "CRUNCHING" NOISE WHEN SHIFTING FROM 2ND TO 3RD

LIGHT TRUCK: 1988-89 ECONOLINE 1988-90 BRONCO II 1988-91 AEROSTAR, BRONCO, F-150, RANGER 1991 EXPLORER

ISSUE: A slight intermittent "crunch" or grinding noise may be heard when shifting from 2nd to 3rd. This is caused by improper synchronizer engagement.

ACTION: Install a new synchronizer service kit. Refer to the Parts Block for correct parts usage and the following procedure for service details.

INSPECTION

1. Drive the vehicle to warm the transmission oil temperature to about 125~F (52~C). This can usually be done after driving about 10 miles at highway speed when the outside temperature is above freezing.

2. On a smooth road surface, accelerate the vehicle from a stop to 3rd gear at normal shift speeds as defined in the owners guide.

3. If a slight "crunch" is heard or grinding sensation is felt in the shift lever when shifting from 2nd to 3rd, proceed with the following synchronizer kit installation procedure.

SYNCHRONIZER KIT INSTALLATION

1. Remove the transmission from the vehicle. Refer to the appropriate Light Truck Shop Manual, Section 07-03A, for removal procedure.

2. Remove the 1st/2nd and 3rd/4th clutch hub and sleeve assembly along with the corresponding synchronizer ring.

3. Install all parts from the appropriate synchronizer kit. The kits contain new 1, 2, 3, and 4 synchronizer rings, a new 3/4 synchronizer sleeve and an instruction sheet. The original 1/2 clutch hub sleeve assembly and 3/4 clutch hub must be reused.

4. Put a label on the transmission showing it was updated per TSB 91-18-11 and to refer to this TSB before servicing.

NOTE: THE NEW 3RD GEAR SYNCHRONIZER RING AND 3/4 SYNCHRONIZER SLEEVE ARE UNIQUE FROM THE ORIGINAL COMPONENTS. THE NEW COMPONENTS MUST BE INSTALLED AS A SET IN THE PROPER POSITION. FAILURE TO DO SO WILL RESULT IN THE INABILITY TO SHIFT THE TRANSMISSION INTO ONE OF THE GEARS. note>

Synchronizer Ring: Customer Interest M/T - M50D Hard Shift Condition

Article No. 91-10-15

5/15/91

TRANSMISSION - M50D - HARD SHIFT TO REVERSE OR FIFTH GEAR

LIGHT TRUCK: 1988-89 ECONOLINE 1988-90 BRONCO II 1988-91 AEROSTAR, BRONCO, F-150, F-250, RANGER 1991 EXPLORER

ISSUE: The 5-R synchronizer sliding sleeve clutching teeth may wear on the reverse side. This may cause a hard to engage or partial engagement of fifth or reverse gear and could result in the transmission jumping out of gear. If the wear is allowed to continue, it may become difficult or impossible to engage 1-2-3 or 4th gear.

ACTION: Inspect the 5-R synchronizer sliding sleeve for wear and replace if excessive wear is found. Refer to the following procedure for service details.

INSPECTION PROCEDURE:

1. Remove necessary components so that the transmission extension housing can be removed without removing the entire transmission. Refer to the

Light Truck Shop Manual Section 07-03A for service details.

NOTE: COMPACT VEHICLES MAY REQUIRE REMOVAL OF TRANSMISSION

2. Remove the transmission extension housing.

3. Inspect the 5-R synchronizer sliding sleeve for wear of the reverse clutching teeth.

REPAIR PROCEDURE

1. If wear is observed, remove speedometer drive gear (4 x 2 only).

2. Remove the top cover (if repairing on the bench).

3. Carefully remove the main shaft and counter shaft locking nuts.

4. Remove and replace the following transmission parts. Refer to the Light Truck Shop Manual for service procedures.

^ 5th Counter Shaft Gear

^ 5-R Synchronizer, hub and ring assembly

NOTE: INSTALL WITH THE DOT ON THE SYNCHRONIZER SLEEVE FACING REVERSE GEAR.

^ Reverse counter shaft gear

^ 5-R Counter Lever

^ 5-R Shift fork and rod

NOTE: USE THE SPRING AND BALL FROM THE EXISTING ASSEMBLY.

^ Replace the idler shaft in the reverse idler gear assembly (R1 only).

NOTE: THERE ARE EXTRA ADJUSTING SHIMS PROVIDED IN CASE IT IS NECESSARY TO RESET THE 5-R SYNCHRONIZER HUB AND CONTROL REVERSE GEAR END PLAYS TO SPECIFICATION. USE THE NEW MAIN SHAFT AND COUNTER SHAFT LOCKING NUTS UPON ASSEMBLY.

CAUTION: USE ALL THE PARTS CONTAINED IN THE SERVICE KIT INCLUDING THE COUNTER REVERSE LEVER. ALTHOUGH THE

NEW LEVER LOOKS THE SAME AS THE ONE CONTAINED IN THE TRANSMISSION, CONTACT ANGLES ARE SLIGHTLY DIFFERENT TO INSURE PROPER TIMING AND

ENGAGEMENT.

^ TRANSMISSION-M50D (MAZDA R1 AND R2)- INTERMITTENT "CRUNCHING" NOISE WHEN SHIFTING FROM 2ND TO 3RD

LIGHT TRUCK: 1988-89 ECONOLINE 1988-90 BRONCO II 1988-91 AEROSTAR, BRONCO, F-150, RANGER 1991 EXPLORER

ISSUE: A slight intermittent "crunch" or grinding noise may be heard when shifting from 2nd to 3rd. This is caused by improper synchronizer engagement.

ACTION: Install a new synchronizer service kit. Refer to the Parts Block for correct parts usage and the following procedure for service details.

INSPECTION

1. Drive the vehicle to warm the transmission oil temperature to about 125~F (52~C). This can usually be done after driving about 10 miles at highway speed when the outside temperature is above freezing.

2. On a smooth road surface, accelerate the vehicle from a stop to 3rd gear at normal shift speeds as defined in the owners guide.

3. If a slight "crunch" is heard or grinding sensation is felt in the shift lever when shifting from 2nd to 3rd, proceed with the following synchronizer kit installation procedure.

SYNCHRONIZER KIT INSTALLATION

1. Remove the transmission from the vehicle. Refer to the appropriate Light Truck Shop Manual, Section 07-03A, for removal procedure.

2. Remove the 1st/2nd and 3rd/4th clutch hub and sleeve assembly along with the corresponding synchronizer ring.

3. Install all parts from the appropriate synchronizer kit. The kits contain new 1, 2, 3, and 4 synchronizer rings, a new 3/4 synchronizer sleeve and an instruction sheet. The original 1/2 clutch hub sleeve assembly and 3/4 clutch hub must be reused.

4. Put a label on the transmission showing it was updated per TSB 91-18-11 and to refer to this TSB before servicing.

NOTE: THE NEW 3RD GEAR SYNCHRONIZER RING AND 3/4 SYNCHRONIZER SLEEVE ARE UNIQUE FROM THE ORIGINAL COMPONENTS. THE NEW COMPONENTS MUST BE INSTALLED AS A SET IN THE PROPER POSITION. FAILURE TO DO SO WILL RESULT IN THE INABILITY TO SHIFT THE TRANSMISSION INTO ONE OF THE GEARS. note>

BASIC PART NO. CONDITION CODE

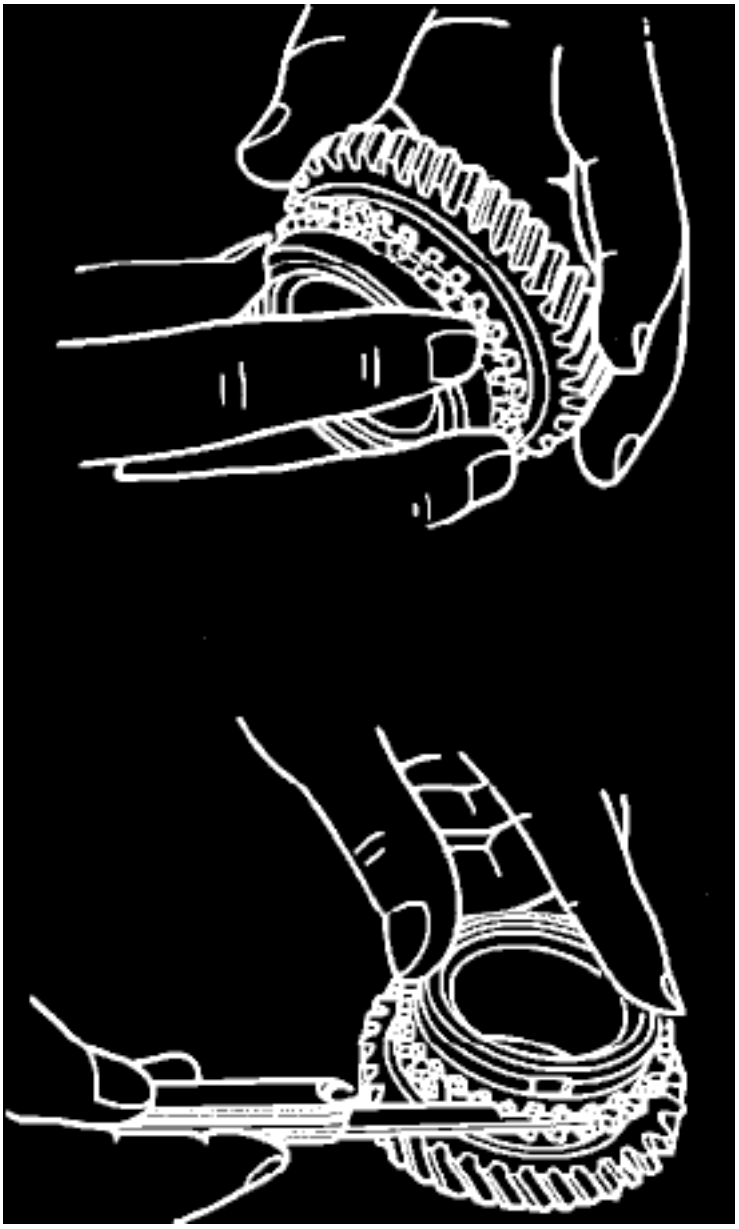
7124 30

OASIS CODES: 505000



Synchronizer Ring: Testing and Inspection

1. Inspect gear teeth on synchronizer ring. If evidence of chipping or excessively worn teeth are present, replace component.

Checking Synchronizer Ring

2. Check synchronizer ring for wear by assembling synchronizer ring to gear cone. 3. Measure clearance between side faces of synchronizer ring and gear using a suitable feeler gauge. If clearance is less than 0.031 inch, replace

synchronizer ring or gear.

NOTE: 1st/2nd, 3rd/4th and 5th/reverse synchronizer to gear clearance specifications are the same.

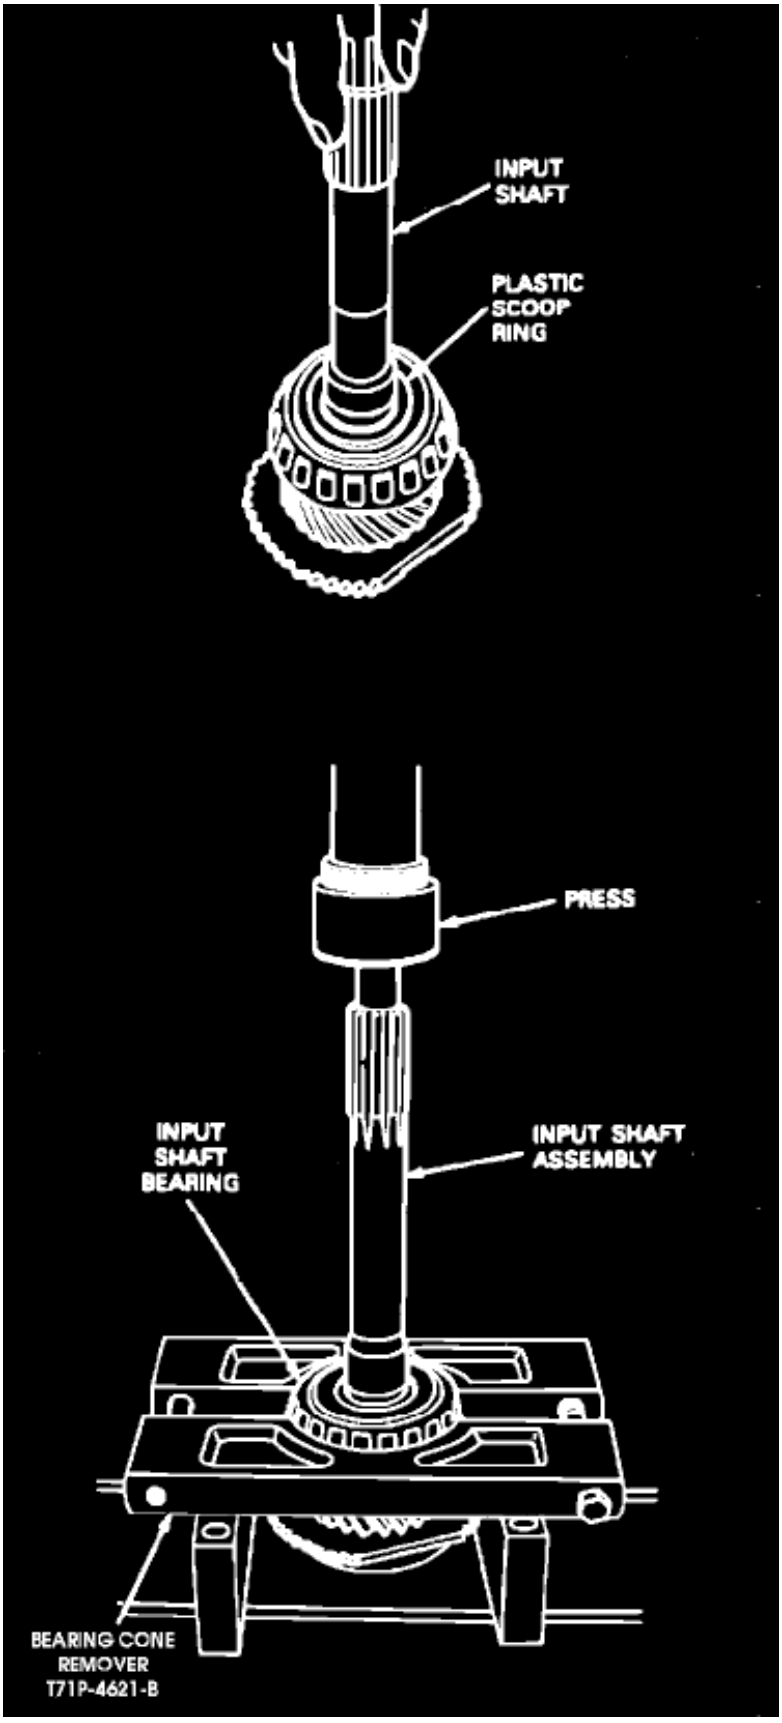
4. Check for proper contact between inner surface of synchronizer ring and cone surface of gear by applying a thin coat of Prussian blue or

equivalent to surface of cone, then fitting it into ring. If contact pattern is poor, correct by applying compound and lapping surfaces together.

5. Ensure clutch sleeve slides easily onto clutch hub. 6. Check synchronizer inserts (keys), inner surface of clutch sleeve, then the insert groove on clutch hub from wear. 7. Check synchronizer insert spring for tension.

Input Shaft: Testing and Inspection

Check input shaft for spline damage. If needle bearing surface in bore of bearing is worn or rough or if cone surface is damaged, replace input shaft.



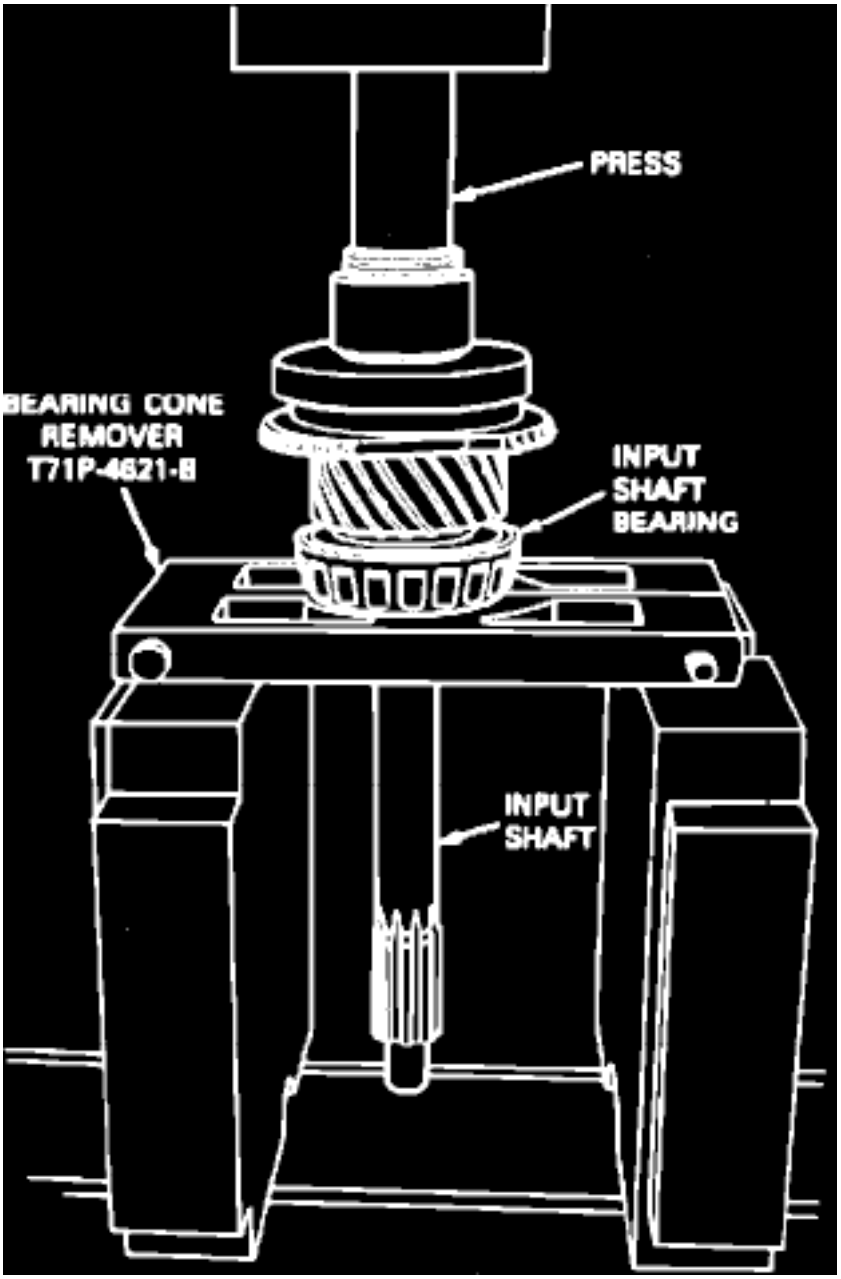
INPUT SHAFT
PLASTIC SCOOP RING
PRESS
INPUT SHAFT BEARING
INPUT SHAFT ASSEMBLY
BEARING CONE REMOVER T71P-4621-B

Input Shaft: Service and Repair

1. Remove and discard plastic scoop ring.

Disassembling Input Shaft

2. Press tapered roller bearing from input shaft using bearing remover tool No. T71P-4621-B or equivalent and a suitable press.



Installing Input Shaft Bearing

3. Install input shaft tapered roller bearing, using bearing cone installer tool No. T88T-7025-B or equivalent. 4. Install new plastic scoop ring onto input shaft, then manually rotate ring clockwise to ensure input shaft oil holes are properly aligned with scoop

ring and a click is heard.

Output Shaft: Testing and Inspection

1. Check output shaft runout by placing output shaft in V-blocks. 2. Mount a suitable dial indicator next to shaft, then measure runout at several points along shaft. 3. Total output shaft runout should not exceed 0.002 inch.

Output Shaft: Service and Repair

DISASSEMBLY

Positioning output Shaft For Component Replacement

1. Position output shaft front flange, then remove pilot bearing, snap ring, needle bearing and front spacer.

Output Shaft Components

2. Position front (short side of flange) of output shaft facing upward, then lift off clutch hub and sleeve assembly (3rd/4th), synchronizer ring (3rd)

and needle bearing as an assembly.

8. SLEEVE – 1ST GEAR
9. CENTER BEARING – INNER

Removing Output Shaft Components

3. Position output shaft with rear end facing upward on a suitable press. 4. Press off center bearing, 1st gear sleeve, 1st gear, needle bearing, 1st/2nd clutch hub and sleeve assembly, 1st/2nd synchronizer rings, 2nd gear

and needle bearing as an assembly.

ASSEMBLY

Output Shaft Components

1. Position output shaft with long side of flange facing upward, then position output shaft components to facilitate installation. 2. Assemble 2nd gear needle bearing, 2nd gear, 2nd gear synchronizer ring, 1st/2nd clutch hub and sleeve assembly, 1st gear synchronizer ring, 1st

gear needle bearing, 1st gear, 1st gear sleeve and center bearing onto shaft.

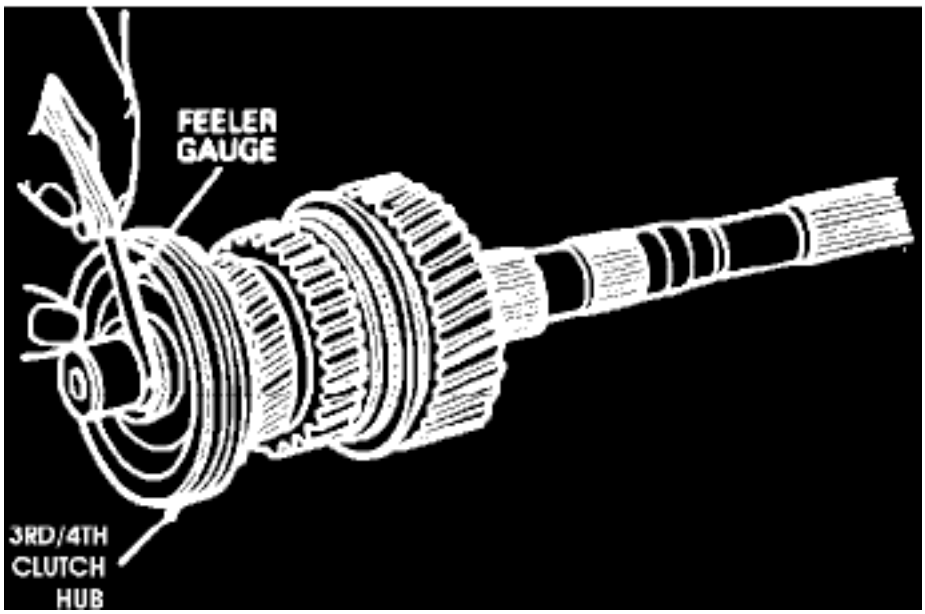
3RD GEAR SIDE



FEELER GAUGE
3RD/4TH CLUTCH HUB

NOTE: When installing 1st/2nd clutch hub and sleeve, ensure smaller width of sleeve is facing front side of 2nd gear.

3. Press components onto shaft, using tools bearing replacer No. T53T-4621-B and bearing plate T75L-1165-B or equivalent and a suitable press. 4. Ensure center bearing race is installed into transmission case, then install center bearing onto output shaft. 5. Position output shaft with short side of shaft facing upward on a suitable press, then install 3rd gear needle bearing, 3rd gear, and 3rd gear

synchronizer ring.

6. Install 3rd/4th clutch hub and sleeve as follows:

a. Mate clutch hub synchronizer key groove with reference mark on clutch hub sleeve. b. Ensure mark is facing rearward.

Installing 3rd/4th Clutch Hub

c. Install longer flange on clutch hub sleeve toward 3rd gear. Front and rear sides of clutch are similar except for reference mark on one side.

7. Install in order, spacer, needle bearing with rollers upward, retaining ring, then the pilot roller bearing. 8. Install original retaining ring.

Measuring Clutch Hub.

9. Check clutch hub endplay, using a suitable feeler gauge.

Reverse Gear Shaft: Service and Repair

Cross-Sectional View Of Reverse Idler Gear Shaft

1. Remove retaining ring, spacer, idle gear, needle bearings and thrust washer from reverse idler gear shaft. 2. Install thrust washer onto reverse idler gear shaft. Ensure tab on thrust washer mates with groove on reverse idler shaft to prevent rotation of thrust

washer.

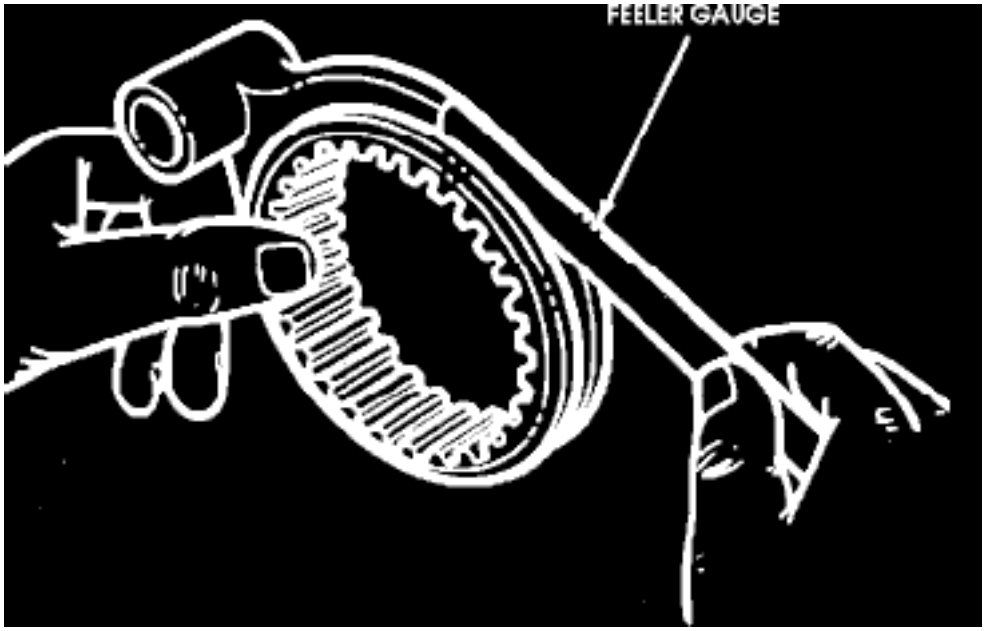
3. Install needle bearings, idler gear and spacer. 4. Install original retaining ring onto reverse idler gear shaft, then insert a suitable feeler gauge between retaining ring and reverse idler gear to

measure endplay.

Reverse Idler Gear Selective Retaining Ring Chart

5. Endplay should be 0.0039-0.0078 inch (0.1-0.2mm). If endplay is not as specified, select a suitable retaining ring from chart that will bring

endplay to within specifications.



Shift Fork: Testing and Inspection

Checking Shift Fork Hub Sleeve

1. Check contact surface of shift fork and clutch hub sleeve for evidence of wear or damage. Measure from shift fork to clutch hub sleeve. Clearance

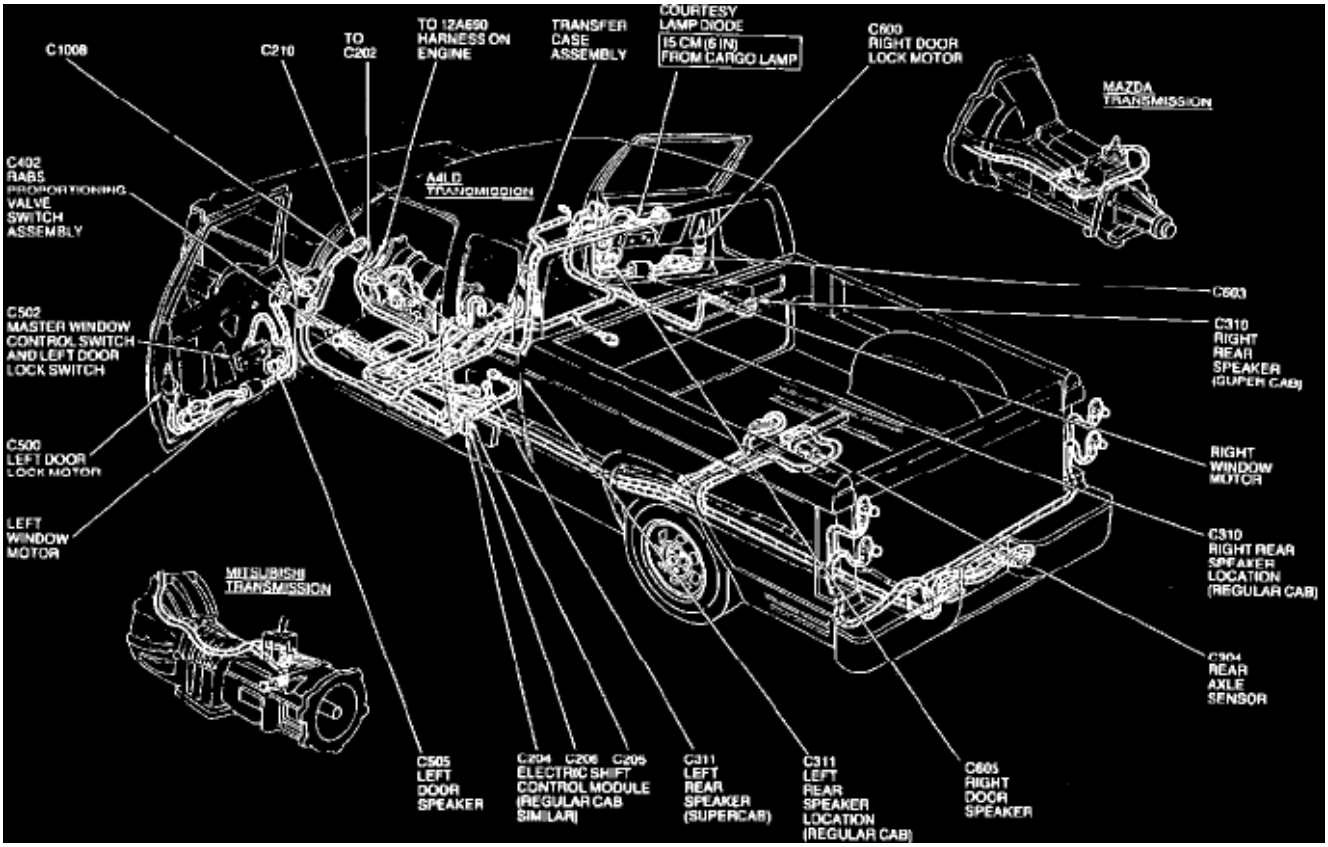
should be 0.031 inch.

2. Check operation of clutch hub sleeve while assembled to hub. 3. Position clutch hub sleeve horizontally, then lift hub approximately 3/4 of the way off the sleeve and release. Hub should slide downward into

sleeve on its own. If necessary to push hub into sleeve, service as necessary.

Speedometer Gear, M/T: Testing and Inspection

Check speedometer drive and driven gear shafts for wear or damage. Check O-ring and oil seals for weakness or damage.



Control Module: Locations Regular Cab

Body Components

Electronic Shift Control Module: Technical Service Bulletins Transfer Case - Revised Shift Procedures

Article No. 90-18-10

^ ELECTRONIC SHIFT MODULE (4X4) - MODIFIED OPERATION

^ TRANSFER CASE - 4X4 ELECTRONIC SHIFT MODULE - REVISED OPERATION PROCEDURE

LIGHT TRUCK: 1986-90 BRONCO II

1986-91 BRONCO, RANGER 1991 EXPLORER

ISSUE: The shift procedures into and out of LOW RANGE are revised for Ranger, Bronco and Explorer trucks built after 8/1/90 due to module changes. The new module will also be used to service prior model year trucks.

ACTION: If service is required on models built prior to 8/1/90, advise the customers of the following changes made to their vehicles.

Operation of the 1991 modules have been changed as follows:

To shift into 4 LOW: ^

Truck must be in 4x4 HIGH by previously pressing the 4x4 switch

^ Truck must be stopped (condition A)

^ The clutch must be depressed or the automatic transmission must be in neutral (condition B)

^ Then press LOW RANGE switch

To shift out of 4 LOW:

^ Truck must be stopped (condition A)

^ The clutch must be depressed or the automatic transmission must be in neutral (condition B)

^ Then press the LOW RANGE switch to shift back into 4x4 HIGH

^ Press the 4x4 HIGH switch to shift into 2 HIGH if desired

Previously, the module would respond to the LOW RANGE input from any mode (2H, 4H, 4L). If conditions A and B above are not met, the module would respond by flashing the 4 LOW indicator and wait until conditions A and B are met before completing the shift into or out of LOW RANGE. If LOW RANGE was selected while in 2 HIGH mode, the module would shift to 4 HIGH before flashing the indicator.

4 X 4 Indicator Switch: Locations

Body Components

Top Front Of Transfer Case

4 X 4 Indicator Switch: Description and Operation

The shift position sensor is an integral component of the electronic shift motor. The sensor inputs shift position of the transfer case to the electronic control module.

Electronic Shift Control Module: Technical Service Bulletins Transfer Case - Revised Shift Procedures

Article No. 90-18-10

^ ELECTRONIC SHIFT MODULE (4X4) - MODIFIED OPERATION

^ TRANSFER CASE - 4X4 ELECTRONIC SHIFT MODULE - REVISED OPERATION PROCEDURE

LIGHT TRUCK: 1986-90 BRONCO II

1986-91 BRONCO, RANGER 1991 EXPLORER

ISSUE: The shift procedures into and out of LOW RANGE are revised for Ranger, Bronco and Explorer trucks built after 8/1/90 due to module changes. The new module will also be used to service prior model year trucks.

ACTION: If service is required on models built prior to 8/1/90, advise the customers of the following changes made to their vehicles.

Operation of the 1991 modules have been changed as follows:

To shift into 4 LOW: ^

Truck must be in 4x4 HIGH by previously pressing the 4x4 switch

^ Truck must be stopped (condition A)

^ The clutch must be depressed or the automatic transmission must be in neutral (condition B)

^ Then press LOW RANGE switch

To shift out of 4 LOW:

^ Truck must be stopped (condition A)

^ The clutch must be depressed or the automatic transmission must be in neutral (condition B)

^ Then press the LOW RANGE switch to shift back into 4x4 HIGH

^ Press the 4x4 HIGH switch to shift into 2 HIGH if desired

Previously, the module would respond to the LOW RANGE input from any mode (2H, 4H, 4L). If conditions A and B above are not met, the module would respond by flashing the 4 LOW indicator and wait until conditions A and B are met before completing the shift into or out of LOW RANGE. If LOW RANGE was selected while in 2 HIGH mode, the module would shift to 4 HIGH before flashing the indicator.

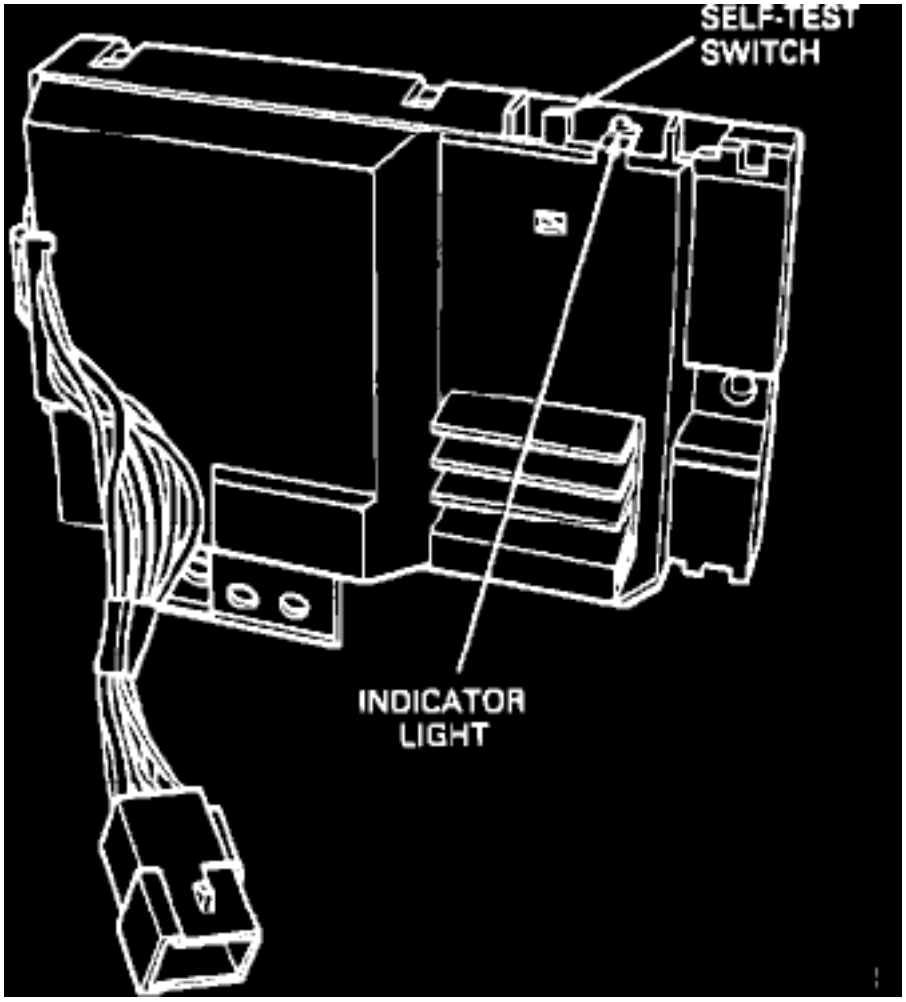
Electronic Shift Control Module: Description and Operation

The electronic control module conducts transfer case operation in response to inputs from the vehicle speed sensor, neutral start switch and clutch interlock switch and push-button actuation made by the operator.



Electronic Shift Control Module: Testing and Inspection

The electronic control module has a diagnostic capability of its internal circuitry. Self test procedure is as follows:

1. Disconnect five-wire and eight wire connectors from electronic control module.

2. Turn ignition switch to the RUN position.

3. Activate the self test switch and note result:

Control Module Self Test

NOTE: The self test switch and indicator light is located on the Electronic Control Module.

A FLASHING INDICATOR LAMP, (approximately one flash per second), indicates control module is functioning properly.

A STEADY INDICATOR LIGHT, indicates that control module is inoperative and must be replaced.

Body Components

Top Front Of Transfer Case

4 X 4 Indicator Switch: Description and Operation

The shift position sensor is an integral component of the electronic shift motor. The sensor inputs shift position of the transfer case to the electronic control module.

Speed Sensor: Description and Operation

The speed sensor information to the electronic control module verifies the proper speed to allow range shifts (in or out of 4-Low) to occur.

Shift Fork: Customer Interest Transfer Case - Unable to Disengage 4WD Into 2WD

Article No. 91-20-17

10/02/91

TRANSFER CASE - 4X4 - UNABLE TO DISENGAGE

LIGHT TRUCK: 1990-91 RANGER 1991 EXPLORER

ISSUE: The vehicle may remain in 4 Wheel Drive after the transfer case has been shifted back into 2WD. This may occur because of uneven tire wear, the front axle hubs not disengaging, or the return spring force not being sufficient to move the lock-up fork back to the 2WD position.

ACTION: Inspect the vehicle tires for wear and, if necessary, replace the return spring, sleeve spring and lock-up fork in the transfer case.

INITIAL CHECKS

1. Rotate the tires and check for evidence of an uneven wear band or spots.

2. Set the tire pressure as specified on the safety compliance certification label.

3. Confirm that the tires are matched in design, size and manufacture.

4. Confirm by hand rotation that the front axle automatic and manual locking hubs are disengaging correctly.

NOTE: IF THE VEHICLE WAS PREVIOUSLY REPAIRED PER TSB 91-15-10, THE TRANSFER CASE WAS UPDATED WITH THE PARTS

INCLUDED IN THIS TSB. IF THE UPDATED TRANSFER CASE STILL WILL NOT DISENGAGE AFTER FOLLOWING THE INITIAL CHECKS, THEN THE CAUSE COULD BE THAT THE DRIVER IS NOT ALLOWING SUFFICIENT TIME FOR THE 4WD SYSTEM TO DISENGAGE.

VERIFICATION

Drive the vehicle. If the transfer case still will not disengage after performing the initial checks, proceed as follows:

1. Shift the vehicle with lever operated or electric shift transfer case to 4WD high.

2. Hand rotate the front axle manual locking hubs to the lock position, if so equipped.

3. Drive the vehicle slowly in a tight turn on dry hard pavement until you feel the front wheel power hop/skip which indicates that the 4WD system is engaged.

4. Drive the vehicle on a frame hoist...

a. Shift the automatic or manual transmission to neutral.

b. Shift the transfer case to 2WD.

c. Turn the ignition key to the OFF position.

5. Raise the vehicle on the frame hoist, making sure all tires are free to rotate.

6. Using gloves, hand rotate the rear driveshaft while viewing the front driveshaft for rotation.

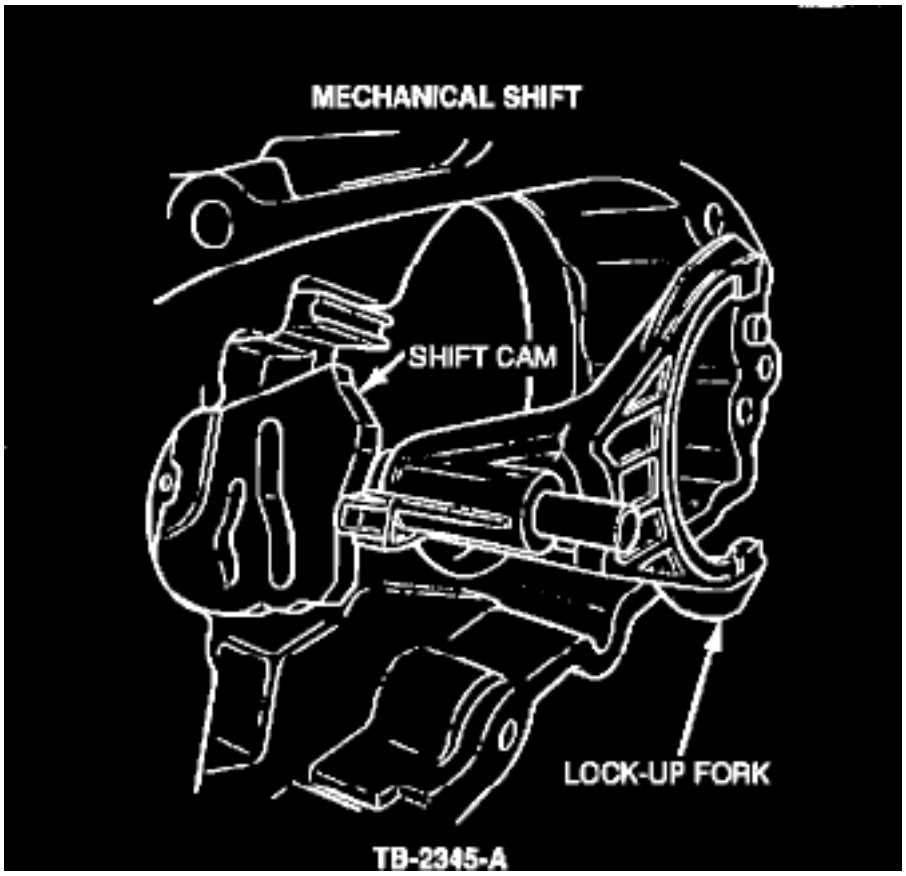
^ If the front driveshaft does not rotate, this indicates that the transfer case has disengaged and is functioning correctly.

^ If the front driveshaft rotates while turning the rear driveshaft, this indicates that the transfer case has not disengaged and must be repaired.

7. Before starting the repair, repeat the above procedure a second time to confirm that the transfer case will not disengage.

ELECTRIC SHIFT TRANSFER CASE

If the above procedure is not conclusive, for an electric shift transfer case system, proceed as follows:



1. Remove the 7K470 speed sensor/wiring harness bracket and 7F293 speed sensor assembly from the transfer case.

2. With the use of a light and looking into the speed sensor opening...

a. Locate the white or black 7289 lock-up fork.

b. Using a straight tool, push it forward toward the front of the vehicle.

^ If the lock-up fork does not move, this indicates that the lock-up assembly has moved back to the 2WD position and the transfer case is functioning correctly.

^ If the lock-up fork moves about 3/8" (9.525 mm), this indicates that the lock-up assembly remained in the 4WD position or did not disengage and must be repaired.

TRANSFER CASE REPAIR

Refer to the 1991 Ranger and Explorer Service Manual, Sections 07-07E and 07-07D, for procedures to remove and dissemble the transfer case. Install and reassemble the following components:

^ One (1) Return Spring (F1TZ-7219-A)

^ One (1) Sleeve Spring (E6TZ-7D126-A), with large end installed first into bore of 7106 lock-up collar.

^ One (1) Lock-Up Fork (F1TZ-7289-D, bone white color).

Figure 1

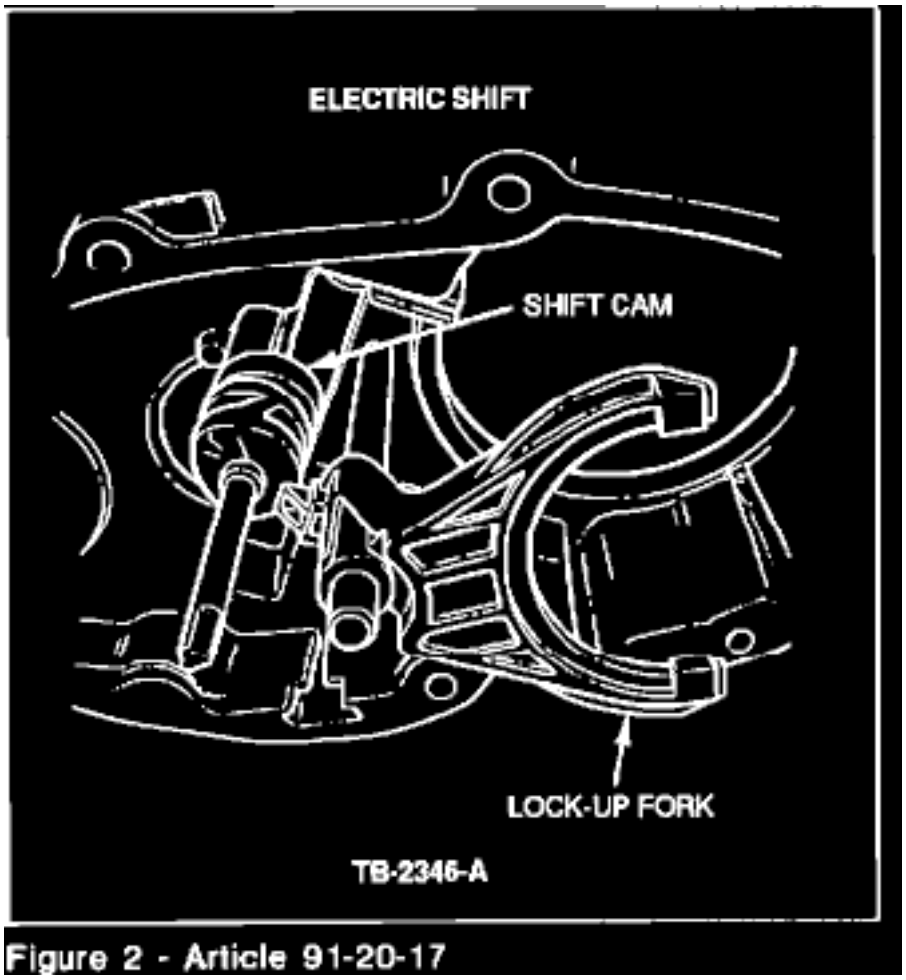


Figure 2 - Article 91-20-17

Figure 2

NOTE: WHEN INSTALLING THE 7289 LOCK-UP FORK, MAKE SURE THAT THE 7235 LOCK-UP FORK ROLLER BUSHING IS

POSITIONED ON THE TOP OR END SURFACE OF THE 7F063 SHIFT CAM AND NOT INTO AN INSIDE CAM TRACK, FIGURES 1 AND 2.

Reinstall the transfer case in the vehicle and check for shift function including engagement and disengagement.

Shift Lever: Adjustments

Fig. 5 Shift Linkage Adjustment

1. Raise shift boot to expose cam plate, loosen bolts A and B, Fig. 5, approximately two turns, then place shift lever in 4L position.

2. Move cam plate rearward until bottom corner of neutral lug just contacts forward right edge of shift lever (Point C), Fig. 5.

3. With cam plate positioned as outlined above, torque bolt A to 70-90 ft. lbs., then bolt B to 31-42 ft. lbs.

4. Place shift lever in all shift positions and check for positive engagement.

5. Check clearance between shift lever and cam plate with shift lever positioned in 2H, 4H and 4L positions as shown, Fig. 5. Clearance should not exceed .130 inch. If clearance exceeds specification, repeat adjustment

Shift Lever: Service and Repair

Removal of the shift ball is necessary only if the shift ball, boot, or lever is being replaced. If not, remove the ball, boot and lever as an assembly.

1. Remove plastic insert from shift ball, then warm ball to approximately 140-180°F and knock ball off lever with a hammer and a block of wood.

2. Remove rubber boot and pan cover, then disconnect vent hose from control lever.

3. Unscrew shift lever from control lever, then remove shifter to extension housing retaining bolt and the shoulder bolt. Remove control lever and bushings.

4. Reverse procedure to install. Note the following:

a. Torque shifter to extension housing retaining bolt to 31-42 ft. lbs. and shoulder bolt to 70-90 ft. lbs. The shifter retaining bolt must be

tightened before the shoulder bolt.

b. Torque shift lever to 27-37 ft. lbs. c. Install vent assembly so the white marking on housing is in line with notch in shifter. Position upper end of vent hose inside shift lever bolts. d. Install shift ball to the end of knurl on upper part of shift lever.

Speed Sensor: Description and Operation

The speed sensor information to the electronic control module verifies the proper speed to allow range shifts (in or out of 4-Low) to occur.

Electronic Shift Control Module: Technical Service Bulletins Transfer Case - Revised Shift Procedures

Article No. 90-18-10

^ ELECTRONIC SHIFT MODULE (4X4) - MODIFIED OPERATION

^ TRANSFER CASE - 4X4 ELECTRONIC SHIFT MODULE - REVISED OPERATION PROCEDURE

LIGHT TRUCK: 1986-90 BRONCO II

1986-91 BRONCO, RANGER 1991 EXPLORER

ISSUE: The shift procedures into and out of LOW RANGE are revised for Ranger, Bronco and Explorer trucks built after 8/1/90 due to module changes. The new module will also be used to service prior model year trucks.

ACTION: If service is required on models built prior to 8/1/90, advise the customers of the following changes made to their vehicles.

Operation of the 1991 modules have been changed as follows:

To shift into 4 LOW: ^

Truck must be in 4x4 HIGH by previously pressing the 4x4 switch

^ Truck must be stopped (condition A)

^ The clutch must be depressed or the automatic transmission must be in neutral (condition B)

^ Then press LOW RANGE switch

To shift out of 4 LOW:

^ Truck must be stopped (condition A)

^ The clutch must be depressed or the automatic transmission must be in neutral (condition B)

^ Then press the LOW RANGE switch to shift back into 4x4 HIGH

^ Press the 4x4 HIGH switch to shift into 2 HIGH if desired

Previously, the module would respond to the LOW RANGE input from any mode (2H, 4H, 4L). If conditions A and B above are not met, the module would respond by flashing the 4 LOW indicator and wait until conditions A and B are met before completing the shift into or out of LOW RANGE. If LOW RANGE was selected while in 2 HIGH mode, the module would shift to 4 HIGH before flashing the indicator.

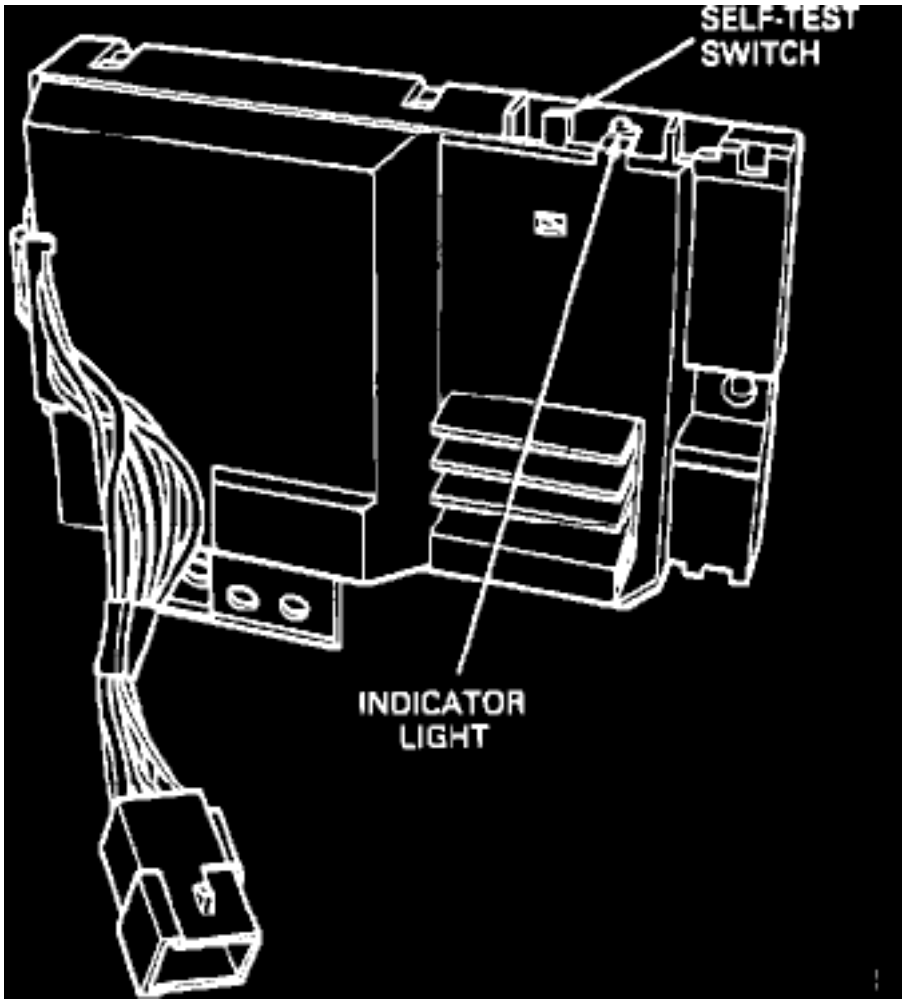
Electronic Shift Control Module: Description and Operation

The electronic control module conducts transfer case operation in response to inputs from the vehicle speed sensor, neutral start switch and clutch interlock switch and push-button actuation made by the operator.



Electronic Shift Control Module: Testing and Inspection

The electronic control module has a diagnostic capability of its internal circuitry. Self test procedure is as follows:

1. Disconnect five-wire and eight wire connectors from electronic control module.

2. Turn ignition switch to the RUN position.

3. Activate the self test switch and note result:

Control Module Self Test

NOTE: The self test switch and indicator light is located on the Electronic Control Module.

A FLASHING INDICATOR LAMP, (approximately one flash per second), indicates control module is functioning properly.

A STEADY INDICATOR LIGHT, indicates that control module is inoperative and must be replaced.

Transmission Temperature Sensor/Switch: Testing and Inspection

Pinpoint testing procedures for this component are located in the system level Testing and Inspection.

Electronic Brake Control Module: Technical Service Bulletins Antilock Brakes - Service Tips

Article No. 93-15-16

07/21/93

^ BRAKES - REAR ANTI-LOCK BRAKE SYSTEM (RABS) - ADVERSE BRAKING CHARACTERISTICS - RABS WARNING LIGHT NOT ON, MAY OCCUR WHEN INCORRECT RABS MODULE IS INSTALLED - SERVICE TIP

^ BRAKES - REAR ANTI-LOCK BRAKE SYSTEM (RABS) - INCORRECT (RABS I) ELECTRONIC CONTROL UNIT INSTALLED IN RABS II EQUIPPED VEHICLES - SERVICE TIP

LIGHT TRUCK: 1987-90 BRONCO II 1987-92 BRONCO 1987-93 F-150 1989-93 RANGER 1990-93 AEROSTAR, E SERIES 1991-92 EXPLORER

ISSUE: Adverse braking characteristics and failure of the RABS light to indicate a RABS failure may be caused by improper servicing of RABS II equipped vehicles with RABS I electronic control units.

ACTION:

When replacing a RABS electronic control unit, refer to the following RABS Module Chart for correct parts usage.

RABS II modules have been designed with Keep Alive Memory and are to be used to service all prior year RABS I systems, except for 1987 and 1988 Bronco II vehicles.

SERVICE PARTS RETURN OF BRAKE COMPUTER MODULE

LIGHT TRUCK: 1987-93 F-150-350 SERIES 1989-93 BRONCO, RANGER 1990-93 AEROSTAR 1991-92 EXPLORER

ISSUE: The subject Module - Brake Computer (E7TZ-2C018-A, F2UZ-2C018-A, F2TZ-2C018-A, FOUZ-2C018-A and E99Z-2C018-A) are being replaced by different part numbers. They should be withdrawn from your inventory and returned to your facing PDC within 30 days of this TSB.

ACTION: Remove and return the obsolete parts from your dealership's inventory.

1. Return obsolete parts (Noted above) to your facing PDC using the least expensive transportation.

2. If claim is processed electronically via DOES II use return code "GB"; otherwise, complete a separate paper claim form FPS-340 using return code "J".

3. In the Remarks Section write "Returned per TSB 93-17-13".

LIMITS

^ The returns must be received within 30 days from the date of this TSB.

^ Returns are restricted to the subject parts.

^ The parts returned must have been purchased from FPSD in accordance with Policy and Procedure Bulletin 4000.

CREDIT

Credit for parts and prepaid freight costs will be issued.

NOTE: REPLACEMENT STOCK IS AVAILABLE FOR ORDERING IMMEDIATELY.

Electronic Brake Control Module: Locations

I/P Components

Behind Center Of I/P, LH Side Of Ashtray

Electronic Brake Control Module: Service and Repair

1. Disconnect battery ground cable.

2. Disconnect wiring harness from RABS module.

3. On Bronco, Bronco II, F-Series, Ranger and Explorer models, remove module to instrument panel retaining screws behind center of instrument panel.

4. On Aerostar models, remove module to instrument panel anti-skid plate retaining screws on lefthand side of engine cover under instrument panel.

5.

On E-Series models, remove parking brake actuator assembly as follows: a.

Loosen adjusting nut at equalizer.

b. From inside engine compartment, remove nuts attaching actuator assembly to cowl.

c. From under instrument panel, remove one bolt attaching actuator assembly to lower flange of instrument panel.

d. Remove parking brake cable from actuator assembly by compressing conduit end fitting prongs using a 1/2 inch box wrench.

e. Remove actuator assembly.

6. On Aerostar and E-Series models, remove two module attaching screws, then the module.

7. On all models, reverse procedure to install, then check system for proper operation.

Hydraulic Control Assembly - Antilock Brakes: Service and Repair

1. Disconnect and plug brake lines from valve.

2. Disconnect wiring harness, then remove valve attaching nuts and valve from frame rail.

3. Position new valve onto frame rail, then install and torque attaching nuts to 30-40 inch lbs on Aerostar models, 11-14 ft. lbs. on Bronco II, Explorer and Ranger models, 19-24 ft. lbs. on E-Series models or 12-17 ft. lbs. on Bronco and F-Series models.

4. Reconnect wiring harness and brake lines, torque brake lines to valve, 1/2 20 threaded fitting to 10-17 ft. lbs., 7/16 24 threaded fitting to 10-15 ft. lbs. and 3/8 24 threaded fitting to 10-15 ft. lbs.

5. Perform system brake bleeding procedures as required.

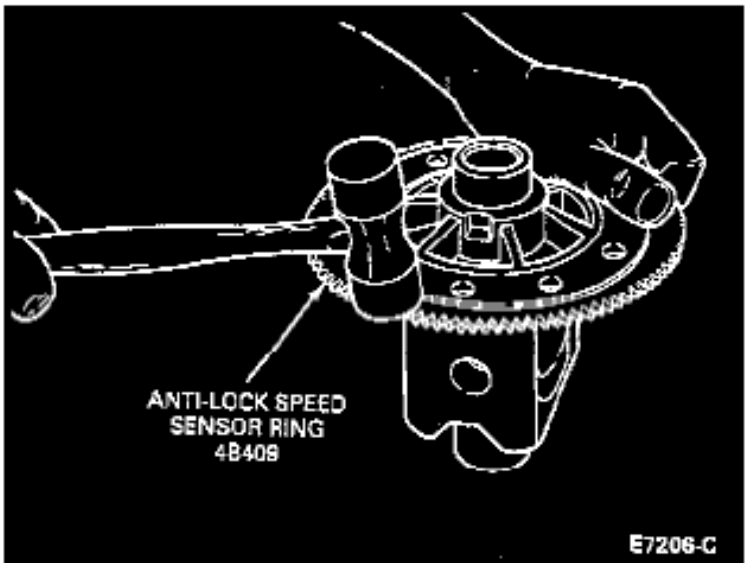
PART OF 4209
GE0976-A



ANTI-LOCK SPEED
SENSOR RING
4B409
E7206-C

Wheel Speed Sensor: Service and Repair Toothed Ring

NOTE: To service the speed sensor ring, the differential case must be removed from the axle housing.

REMOVAL

1. Remove the bolts retaining the ring gear to the differential case. Remove the ring gear by striking at alternate holes around the gear.

CAUTION: Extreme care should be taken not to scratch, dent, chip or otherwise cause damage to anti-lock brake sensor ring teeth while handling or during assembly.

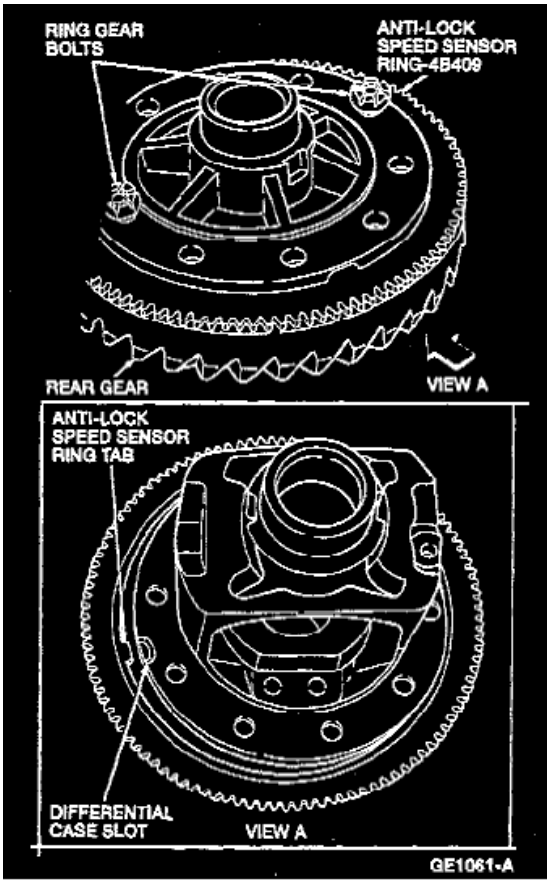
NOTE:

^ Before removing ring gear inspect it and determine if ring runout check is necessary.

^ Do not remove anti-lock speed sensor ring unless replacement is required. It does not have to be removed for ring gear replacement.

2. If replacement is required remove the anti-lock brake sensor ring by tapping with a soft-faced hammer. Discard the anti-lock speed sensor ring.

CAUTION: The anti-lock speed sensor ring must be discarded upon removal. If removed, a new anti-lock brake sensor ring must be installed.



RING GEAR BOLTS

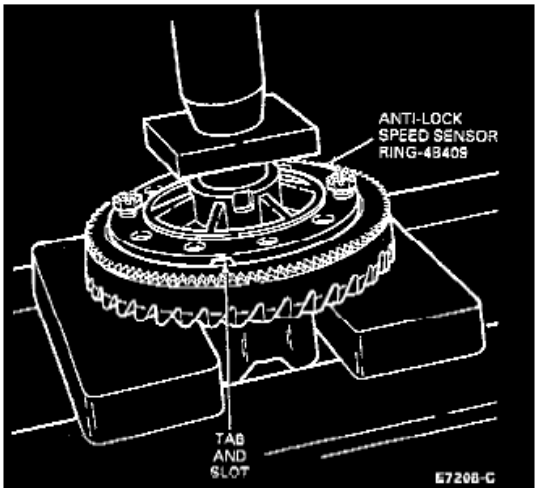
REAR GEAR
VIEW A
ANTI-LOCK SPEED SENSOR RING TAB
DIFFERENTIAL CASE SLOT
VIEW A
GE1061-A



ANTI-LOCK SPEED SENSOR RING-4B409
TAB AND SLOT
E7208-C

INSTALLATION

1. Position the ring gear and anti-lock speed sensor ring on the differential case. The tab on the anti-lock speed sensor ring must be aligned with the

slot in the differential case as shown. Start two ring gear retaining bolts through the differential case into the ring gear to make sure case-to-ring gear bolt hole alignment is achieved.

CAUTION:

^ Extreme care should be taken not to scratch, dent, chip or otherwise cause damage to anti-lock speed sensor ring teeth while handling or during assembly.

^ The tab on the anti-lock speed sensor ring must be aligned with the slot in the differential case.

2. Press the ring gear and anti-lock speed sensor ring on the differential case using the ring gear as a pilot.

3. Coat the threads of the ring gear retaining bolts with Stud and Bearing Mount EOAZ-19554-BA or equivalent meeting Ford specification

WSK-M2G349-A1. Install the bolts and alternately and evenly tighten to 95-115 Nm (70-85 ft. lbs.).

Wheel Speed Sensor: Service and Repair Wheel Speed Sensor

REMOVAL

1. At the rear axle housing pull the wiring harness connector from the speed sensor. 2. Remove the speed sensor hold down bolt and remove the speed sensor from the rear axle housing.

INSTALLATION

1. Clean the rear axle housing mounting surface. Use care to prevent dirt from entering the rear axle housing. 2. Inspect and clean the magnetized sensor pole piece to make sure that it is free from loose metal particles which could cause erratico■ system

operation. Inspect the speed sensor O-ring for damage and replace if necessary.

3. Lightly lubricate the speed sensor O-ring with motor oil, align the bolt hole, and install.

NOTE: Do not apply force to the plastic sensor connector. The sensor flange should slide to the mounting surface. This will make sure the air gap setting is between 0.127-1.143 mm (0.005-0.045 inches).

4. Install the speed sensor hold-down bolt and tighten to 34-40 Nm (25-29 ft. lbs.). 5. Push the connector on the speed sensor.

Brake Bleeding: Service and Repair Manual Bleeding

Bleed the primary and secondary hydraulic brake systems separately.

NOTICE: Do not allow the reservoir to run dry during the bleeding operation. Keep the master cylinder reservoirs filled with the specified brake fluid. Never reuse the fluid that has been drained from the hydraulic system.

1. Loosen the master cylinder to hydraulic line nut. 2. Wrap a shop cloth around the tubing below the fitting to absorb escaping brake fluid. 3. Push the brake pedal down slowly by hand to the floor of the cab. This will force air trapped in the master cylinder to escape at the fitting. 4. Hold the pedal down and tighten the fitting. Release the brake pedal.

NOTICE: Do not release the brake pedal until the fitting is tightened or air will re-enter the master cylinder.

5. Repeat this procedure until air ceases to excape at the fitting and the brake pedal is firm. 6. Place a box wrench on the bleeder fitting on the Rear Antilock Brake System (RABS) valve. Attach a rubber drain tube to the bleeder fitting

making sure the end of the tube fits snugly around the bleeder fitting.

7. Submerge the free end of the tube in a container partially filled with clean brake fluid. Loosen the bleeder fitting approximately three-quarters of a

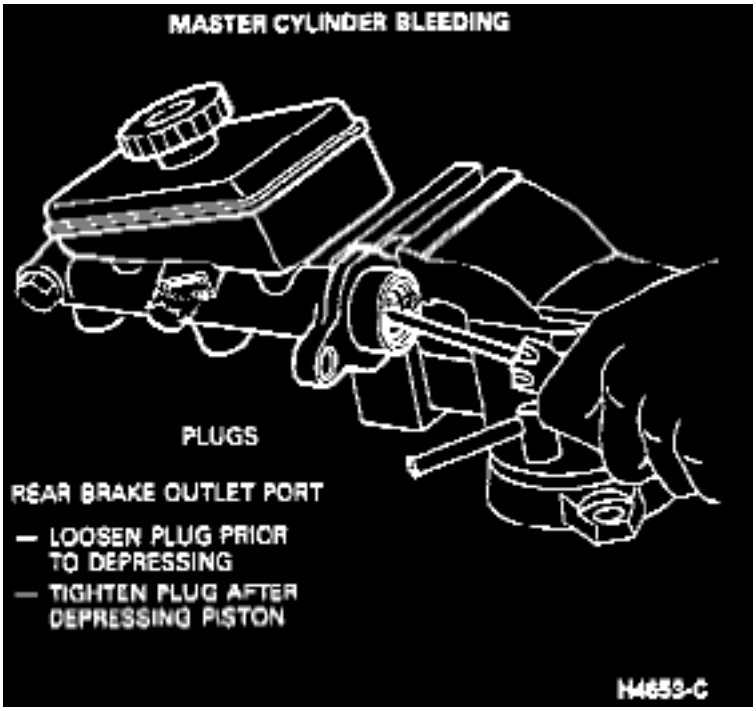
turn.

8. Slowly press the brake pedal all the way down. Close the bleeder fitting, and return the pedal to the fully released position. Repeat this operation

until air bubbles no longer appear at the submerged end of the bleeder tube.

9. When the fluid is completely free of air bubbles, close the bleeder fitting and remove the bleeder tube.

10. Repeat this procedure at the RR, LR, RF and LF wheels. 11. When the bleeding procedure is complete, fill the master cylinder to the maximum level line of the master cylinder reservoir.



Brake Bleeding: Service and Repair Master Cylinder Bleeding

Bench Bleeding Master Cylinder

1. Support the master cylinder body in a vise, and fill both fluid reservoirs with heavy duty DOT 3 brake fluid. 2. Install plugs in the front and rear brake outlet ports. Bleed the rear brake outlet system first. 3. Loosen the plug in the rear brake outlet port. Depress the primary piston slowly to force the air out of the master cylinder. Tighten plug while

piston is depressed or air will enter the master cylinder.

4. Repeat this procedure until air ceases to exit at the outlet port. 5. Repeat steps 3 and 4 for the front brake outlet port with the rear brake outlet plugged. 6. Tighten the plugs and try to depress the piston. Depressing the piston should be harder after all air is expelled. 7. Install the cover and diaphragm assembly making sure the cover retainer is tightened securely. Remove the plugs.

For additional information see Bench Bleeding Notes.

Brake Bleeding: Service and Repair Pressure Bleeding

Be sure the bleeder tank contains enough of the specified brake fluid to complete the bleeding operation. Charge the tank with approximately 69-206 kPa (10-30 psi). Never exceed 345 kPa (50 psi). Never use brake fluid that has been drained from the hydraulic system. Bleed the longest lines first.

1. Clean all dirt from the master cylinder reservoir cap. 2. Remove the master cylinder reservoir cap and fill the master cylinder reservoir with the specified brake fluid. Install the pressure bleeder adapter

tool on the master cylinder, and attach the bleeder tank hose to the fitting on the adapter.

NOTE: Master cylinder pressure bleeder adapter tools are available from the manufacturers of pressure bleeding equipment. Follow the manufacturer's instructions when installing the adapter.

3. Place a 3/8 inch box wrench on the bleeder fitting on the right rear brake wheel cylinder. Attach a bleeder tube snugly to the bleeder fitting. 4. Open the valve on the bleeder tank and admit pressurized brake fluid to the master cylinder reservoir. 5. Submerge the free end of the tube in a container partially filled with clean brake fluid, and loosen the bleeder fitting. 6. When air bubbles no longer appear in the fluid at the submerged end of the bleeder tube, close the bleeder fitting and remove the tube. 7. Repeat Steps 3 through 6 at the opposite wheel cylinder. On front brakes, bleed the right front caliper first. 8. When the bleeding operation is completed, close the bleeder tank valve and remove the tank hose from the adapter fitting. 9. Remove the pressure bleeder adapter tool. Fill the master cylinder reservoirs with the specified brake fluid to within 3 mm (1/8 in) from the top of

the filler neck. Install the master cylinder cover.

Brake Caliper: Customer Interest Brakes - Sticking/Binding/Grabbing

Article No. 93-11-7

05/26/93

BRAKES - STICK/BIND/GRAB - FRONT CALIPER PINS CORRODED

LIGHT TRUCK: 1987-90 BRONCO II 1987-92 AEROSTAR, BRONCO, ECONOLINE, F-150-350 SERIES, RANGER 1988-92 F SUPER DUTY 1991-92 EXPLORER

This TSB article is being republished in its entirety to include F Super Duty vehicles.

ISSUE: Sticking, binding or grabbing of the brakes may be caused by brake caliper slide pins that are corroded. The corrosion does not allow the brake caliper assembly to move freely.

ACTION: Install the new improved caliper pins that are corrosion resistant. Refer to the following Service Procedure for service details.

SERVICE PROCEDURE

1. Remove the caliper and pins. Refer to the applicable Light Truck Service Manual for service details.

NOTE: IF PADS ARE DAMAGED OR WORN, PAD REPLACEMENT IS REQUIRED.

2. Clean the upper and lower knuckle pin grooves, upper and lower knuckle inner pad grooves, and the upper and lower caliper pin grooves with a wire brush or portable wire wheel.

WARNING: USE SAFETY GLASSES AND AN AIR RESPIRATOR WHEN CLEANING THE GROOVES.

3. Apply a light coat of lubricant (D7AZ-19590-A) to the upper and lower knuckle inner pad grooves and upper and lower caliper pin grooves.

CAUTION: LUBRICANT SHOULD NOT BE USED ON ROTORS, LININGS OR CALIPER PISTON BOOTS.

4. Re-assemble the caliper using the new pins, (F2TZ-2C150-A) for all vehicles except F Super Duty. Use new pins (F2TZ-2C150-B) for F Super Duty vehicles.

NOTE: NORMAL BRAKE MAINTENANCE REQUIREMENTS LISTED IN THE OWNER MANUAL SHOULD BE PERFORMED EVERY 15,000 MILES.

Brake Caliper: Customer Interest Front Brakes - Popping or Clunking Noise

Article No. 92-14-7

07/01/92

^ BRAKES - FRONT DISC - "POPPING" OR "CLUNKING" SOUND DURING BRAKING

^ NOISE - "POPPING" OR "CLUNKING" SOUND WHEN BRAKING

^ VIBRATION THROUGH FLOOR BOARD WHEN BRAKING

LIGHT TRUCK: 1989-90 BRONCO II 1989-92 AEROSTAR, RANGER 1991-92 EXPLORER

See TSB # 93-20-11 for additional information.

ISSUE: A "popping" or "clunking" noise and a floor board vibration may occur during braking. The noise and/or vibration may be caused by the front brake caliper suddenly springing away from the caliper abutment and returning.

ACTION: Check and adjust the brake pads and caliper knuckle clearance by using the following service procedure.

1. Road test to confirm that the "popping" or "clunking" noise occurs only during braking at the initial part of the stop.

2. Raise the front of the vehicle.

a. Remove the front wheels.

b. Remove the pins from the caliper.

3. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails.

NOTE:

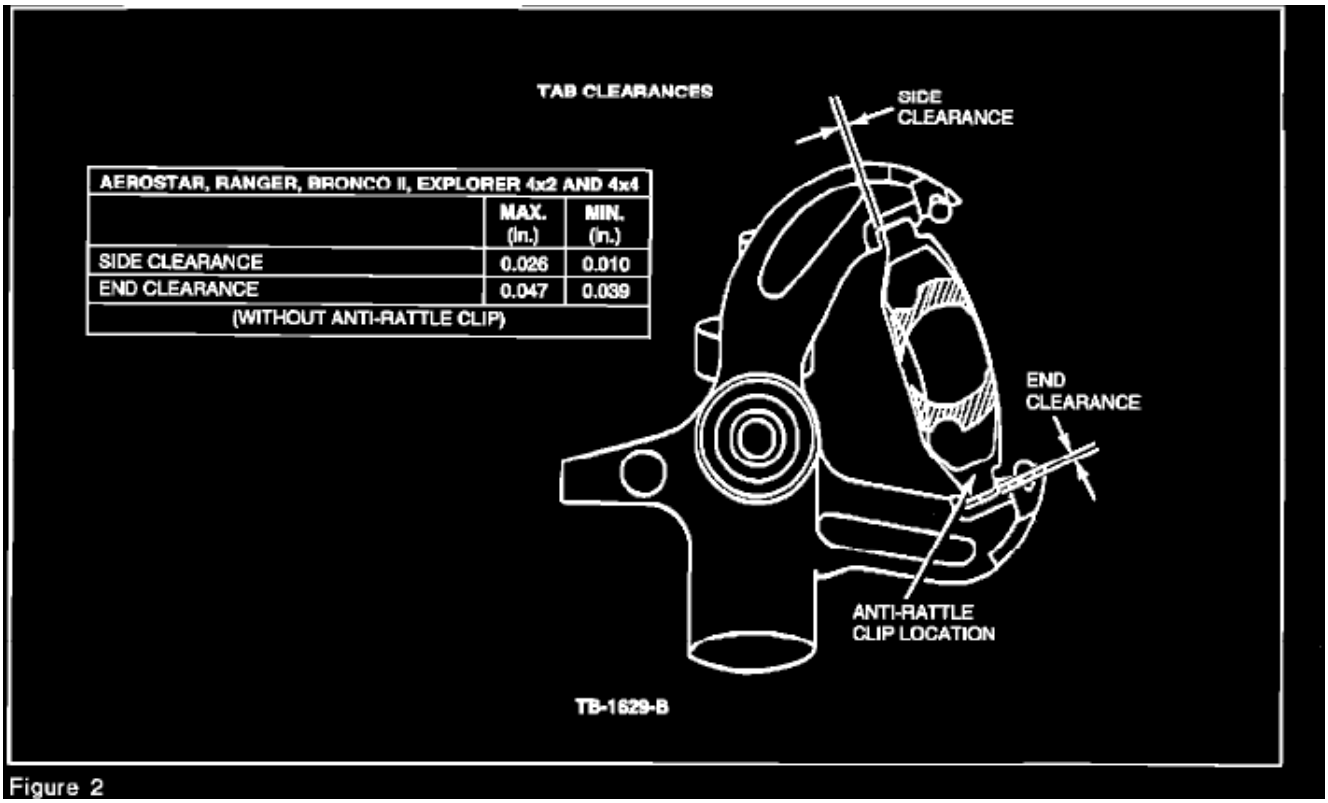

Figure 2

THE CLEARANCE SHOULD BE A MINIMUM OF .015" (.381 MM).

a. If the caliper clearance is less than .015" (.381 mm) on either caliper, replace the caliper and repeat the measurements.

b. If the caliper clearance is less than .015" (.381 mm) on both calipers, replace both calipers and recheck clearance.

c. If the caliper clearance is still less than .015" (.381 mm) on both calipers, replace both spindles (4X2) or knuckles (4X4) and recheck clearance.

NOTE: CHECK THE CLEARANCE OF THE NEW KNUCKLE BEFORE INSTALLATION.

4. After measuring the caliper/knuckle for proper clearance, remove both calipers and brake pad assemblies. Refer to the appropriate Light Truck Service Manual, Section 06-03, for the removal procedure.

5. Replace the caliper piston (FOTZ-2196-A). Refer to the appropriate Light Truck Service Manual, Section 06-03, for the replacement procedure.

6. Install the new lining kit (FO9Z-2001-A).

a. Check the side and end clearances with a feeler gauge.

b. Refer to Figure 2 for clearance dimensions.

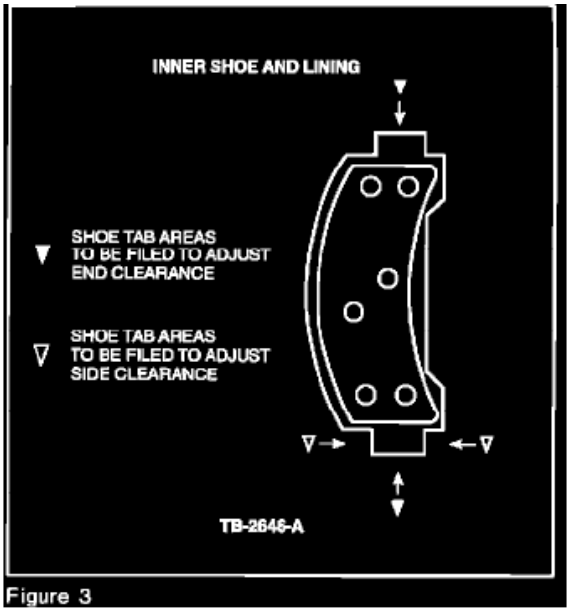

Figure 3

E8TZ-3131-A	Arm Assembly, LH (4X4 Bronco II)	B

7. If the lining clearance is not to the required dimensions, file the shoe tab. Remove equal amounts from both sides and ends, Figure 3.

WARNING: USE SAFETY GLASSES WHEN FILING THE BACKING PLATES.

CAUTION: DO NOT GRIND. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

8. Assemble the brakes and caliper pins (E8TZ-2C150-B). Lubricate the caliper pins with disc brake lubricant (D7AZ-19590-A). Refer to the appropriate Light Truck Service Manual, Section 06-03, for assembling details.

9. Apply a light coat of disc brake lubricant (D7AZ-19590-A) to the inner knuckle top and bottom pad groove. Also apply a light coat of disc brake lubricant (D7AZ-19590-A) to the caliper rails.

CAUTION: PREVENT LUBRICANT FROM STICKING TO ROTORS, LININGS OR CALIPER PISTON BOOTS.

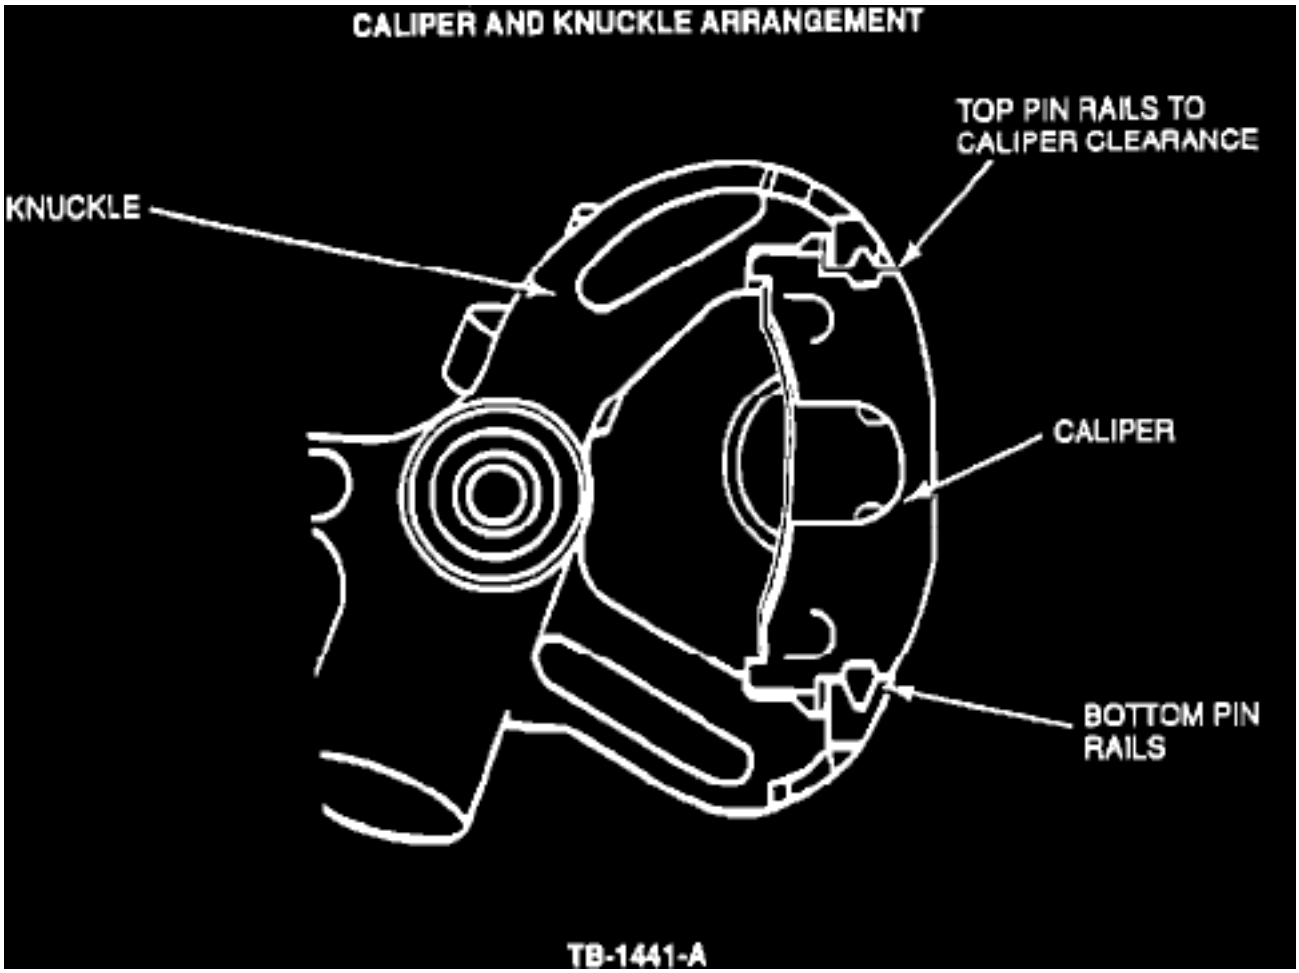
WARRANTY STATUS AND OPERATION DESCRIPTION



Technical Service Bulletin # 9097 Date: 900427

Steering/Suspension - Pull/Drift Diagnostic Procedure

^ BRAKES - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

^ STEERING - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

Article No. 90-9-7

LIGHT TRUCK: 1988-90 BRONCO II, RANGER 1991 EXPLORER

ISSUE: A comprehensive, pull and drift diagnostic procedure has been developed to assist techicians with truck service.

ACTION: Use the following service procedure to resolve drift and pull concerns.

This is the same basic procedure as published in TSB 90-7-16 for the 1988-90 Bronco and F-150, 4x4 models. However, you should note that there are some differences such as replacing radius arm bushings instead of installing a radius arm bracket kit, etc.

Proceed with the Pull and Drift Diagnostic Procedure if the pull or drift is not significantly reduced or where there is a case of steady state drift (no braking).

A Diagnostic Check List has been provided at the end of this article to use with this procedure.

NOTE: THIS TSB ARTICLE SHOULD BE READ COMPLETELY BEFORE PERFORMING DIAGNOSTICS OR REPAIRS.

Service Procedure

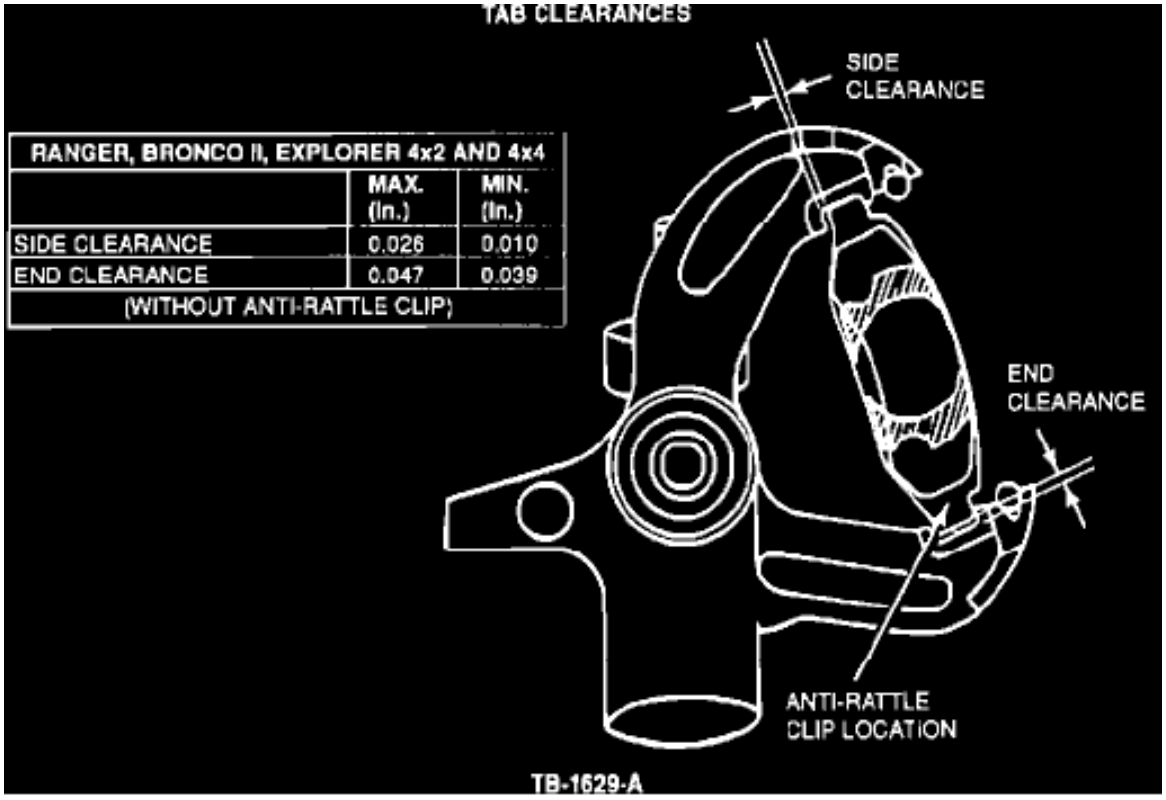
Figure 1

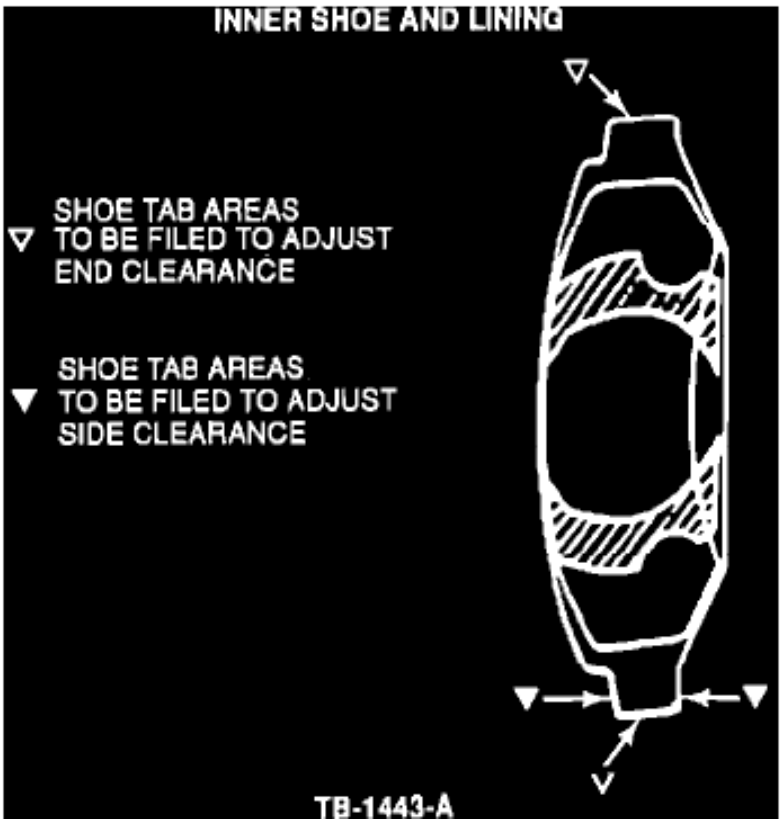
1. Check and adjust brake pad clearances and caliper knuckle clearances as follows:

a. Remove the pins from the caliper.

b. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails.

Clearance should be a minimum of .015 ".





c. If the clearance is insufficient, replace the caliper and measure again. If clearance concern still exists, replace the knuckle.

NOTE: CHECK THE CLEARANCE ON THE NEW KNUCKLE BEFORE INSTALLATION.

d. After measuring the caliper/knuckle for proper clearances, remove both calipers and inner pad assemblies.

e. Remove the anti-rattle clip from the inner pad.

Figure 2

Figure 3

f. Re-install pad and check the side and end clearances with a feeler gauge. (See Figure 2 for clearance dimensions.)

g. If the pad clearances are within specification, refer to Service Procedure Step 2 - "Caliper Groove Lubrication". If the pad clearances are not to the

required dimensions, file the steel backing plate.

WARNING: USE SAFETY GLASSES WHEN FILING STEEL BACKING PLATES

h. File material, removing equal amounts from both sides or ends. (See Figure 3.)

CAUTION: DO NOT GRIND. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

i. Check the tab clearances and install anti-rattle clip on the lower pad tab, Figure

2.

2. Apply a light coat of lubricant (D7AZ-19590-A) to the inner knuckle top and bottom pad groove and caliper rails. CAUTION:

MAKE SURE THE LUBRICANT DOES NOT GET ON THE ROTORS, LININGS, OR ON THE CALIPER PISTON BOOTS.

3. Replace the right and left side arm bushings with new bushings (FITZ-3B203-A). Refer to the appropriate Light Truck Shop Manual, Section 04-OIC

for service details.

NOTE: THE EXPLORER IS ALREADY EQUIPPED WITH THE NEW RADIUS ARM BUSHINGS.

Pull Drift Diagnostic Procedure

The Pull Drift Diagnostic Procedure should be used if the pull or drift is not significantly reduced with the service procedure or in cases of a steady state drift (no braking).

Test drive the truck with the customer to understand his/her pull or drift concern. Many customers will call a clear vision concern a pull or drift because the steering wheel is not straight.

Pull or drifts come from various sources, each with a particular set of symptoms. Careful road test evaluation usually will pinpoint which cause (or causes) are present.

The Road Test

It is important to test drive the truck with the customer to UNDERSTAND HIS OR HER CONCERN.

Complete the road test before beginning any repairs since you may have multiple causes that need to be identified.

^ The road test should be done on a flat, straight road and should be done in both directions to account for wind.

^ Tire pressure should be checked and adjusted, if necessary.

^ A second person in the truck during the road test is helpful. Unless otherwise directed, the second person must remain in the front RH passenger location.

^ On trucks with automatic locking hubs, it is necessary to drive (20) feet forward and then backwards to unlock the hubs.

ROAD TEST	RESULT	ACTION
Maintain a steady speed of 50-55 mph (80-89 km/h). **DO NOT BRAKE**	Is there a steady state pull? If no, go to the next step.	**See Diagnostic Procedure 1.** Tire mismatch or tire pressure concern
While stopped, have second person move to the left hand rear passenger location. Maintaining 50-55 mph (80-89 km/h).	Any change in pull? If no change, go to next step.	**See Diagnostic Procedure 2** Caster split
Make sure front hubs are unlocked (if equipped*). Accelerate the truck - decelerate the truck using **engine braking only.**	Any changes in the pull? Does it pull one way on acceleration and another way on deceleration? If no, go to next step.	**See Diagnostic Procedure 3.** Possible limited slip rear axle and tire circumference
Maintain a steady speed of 50-55 mph (80-89 km/h). Put the vehicle in neutral and shut off the engine.	Does the pull go away? If no, go to the next step.	**See Diagnostic Procedure 4.** Steering gear valve off center
Stop the truck along the highway. Rotate the wheel full left. Proceed with road test.	Does the pull get better or worse? Stop the truck; rotate the wheel full right. Does the pull change - better or worse? If no, go to next step.	**See Diagnostic Procedure 5.** Possible Rubber Ball Socket (RBS) memory steer
In a safe clear area, while firmly holding the steering wheel, apply the brakes moderately hard, but not to the point of engaging RABS.	Does the trucks heading change during brake application? If no, go to next step.	**See Diagnostic Procedure 6.** Possible brake imbalance.
Disconnect the fluid level sensor (disable RABS). Brake the truck from 50 mph (80 km/h).	Does the vehicle pull with A/L disconnected? If no, go to next step.	**See Diagnostic Procedure 6** Possible inadequate rear brake application
Brake the truck hard, to the point of lock-up (RABS disabled).	Do both rears lock? Do both wheels lock at the same time?	**See Diagnostic Procedure 6** Possible unequal rear brake application

NOTE: IT IS POSSIBLE THAT THE TRUCK MAY HAVE MULTIPLE SYMPTOMS. A ROAD TEST/CAUSE CHART FOLLOWS.

NOTE: RECONNECT THE FLUID LEVEL SENSOR AFTER ROAD TEST

Diagnostic Procedure # 1 - Tire Mismatch

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the diagnostic procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to RPO (regular production option) list and set tire psi to the correct value.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only.

Set tire pressure to value on the certification label.

1. Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Tire Pull - Swap the front tires from side to side and road test. If the concern is not corrected, continue with next step.

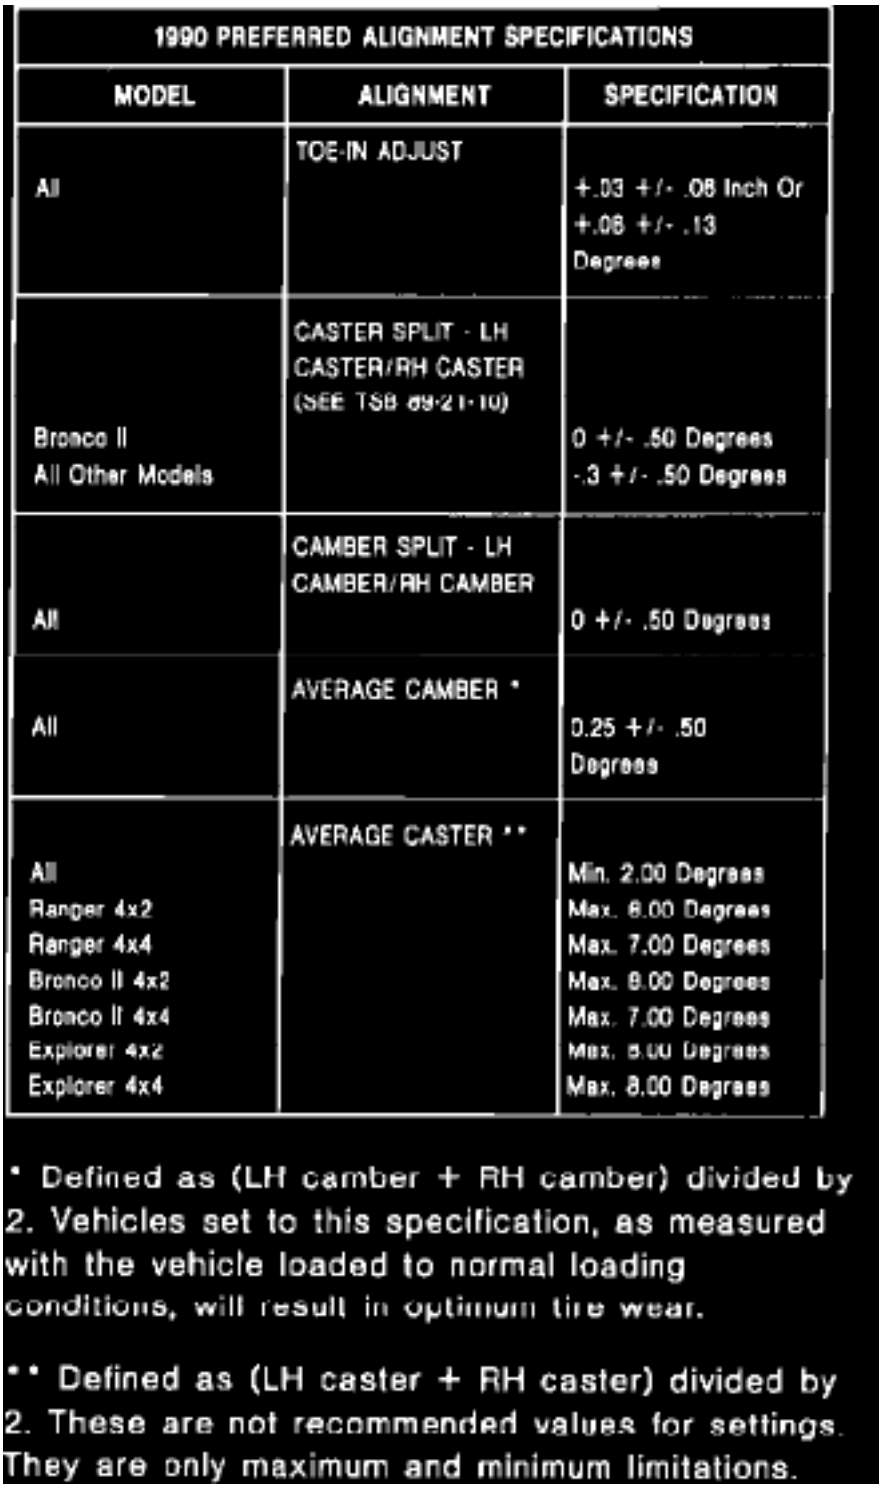
3. Tire Pull - Swap rear tires from side to side and road test. If the concern is not corrected, continue with next step.

4. Tire Pull - Swap front tires from front to rear. Set the tire pressure to the required pressure for the new front and rear positions, then road test.

NOTE: ON REAR LIMITED SLIP AXLE (FRONT HUB UNLOCKED) DRIFT CONCERNS, IT MAY BE NECESSARY TO MEASURE TIRE

CIRCUMFERENCE AND PLACE A MATCHED SET OF TIRES ON THE REAR AXLE.

Diagnostic Procedure # 2 - Alignment



1990 PREFERRED ALIGNMENT SPECIFICATIONS

MODEL	ALIGNMENT	SPECIFICATION
All	TOE-IN ADJUST	+.03 +/- .08 Inch Or +.08 +/- .13 Degrees
Bronco II All Other Models	CASTER SPLIT - LH CASTER/RH CASTER (SEE TSB 89-21-10)	0 +/- .50 Degrees -.3 +/- .50 Degrees
All	CAMBER SPLIT - LH CAMBER/RH CAMBER	0 +/- .50 Degrees
All	AVERAGE CAMBER *	0.25 +/- .50 Degrees
All Ranger 4x2 Ranger 4x4 Bronco II 4x2 Bronco II 4x4 Explorer 4x2 Explorer 4x4	AVERAGE CASTER **	Min. 2.00 Degrees Max. 8.00 Degrees Max. 7.00 Degrees Max. 8.00 Degrees Max. 7.00 Degrees Max. 8.00 Degrees Max. 8.00 Degrees

* Defined as (LH camber + RH camber) divided by 2. Vehicles set to this specification, as measured with the vehicle loaded to normal loading conditions, will result in optimum tire wear.

** Defined as (LH caster + RH caster) divided by 2. These are not recommended values for settings. They are only maximum and minimum limitations.

Wheel Alignment - Measure the front wheel alignment. For out of specification vehicles, align to the "1990 Preferred Alignment Specifications" stated in this article.

^ Spin the front tires to be sure that the front hubs are unlocked, if hubs are unlocked, the axle shaft will not rotate with the wheels.

^ Do not adjust wheel alignment to correct for brake pull if the vehicle does not have pull during non-brake applications.

^ Set the tire pressure to the specification on the certification label.

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the diagnostic procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to HPO (regular production option) list and set tire pressure to the correct value.

^ IF THE TIRES AND WHEELS DO NOT MATCH CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only.

Drive vehicle after alignment is performed. ^

Vehicles which exceed the maximum average caster value shown above may result in shimmy concerns.

^ Vehicles operated below the minimum average caster value shown can result in wander and poor steering returnability concerns.

If the vehicle is not within these minimum and maximum average caster values, or if the vehicle has experienced any of these listed steering/handling concerns, the average caster should be set in accordance with ride height/caster chart in the Shop Manual.

Diagnostic Procedure # 3 - Tires

1. Spin the front tires to be sure that the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Measure tire circumference of all four tires; put the two closest circumference tires on the rear axle. Tire pressure must be equal on all tires.

Diagnostic Procedure # 4 - Steering Gear Valve Off Center

Rotary Valve Centering Check: To confirm that you are looking at a steering gear valve concern, lift the front wheels off the ground.

^ The truck should be raised so that there is no interference with the steering linkage.

^ The front wheels should also spin freely.

With the wheels in a straight ahead position, start the engine and observe any steering wheel or linkage movement when the engine is started. If any movement is observed, continue with the rotary valve centering check.

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Install a 0-13,789 kPa (0-2000 psi) pressure-gauge (Tool D79L-33610-A, Power Steering Analyzer) in the pressure line between the power steering

pump outlet port 1 and the integral steering gear inlet port. Make sure the valve on the gauge is fully open.

3. Check the fluid level in the reservoir. Add Premimum Power Steering Fluid - E6AZ-19582-AA (ESW-M2C33-F) or equivalent, if necessary.

4. Start the engine and turn the steering wheel from stop-to-stop to bring the steering lubricant to normal operating temperature. Turn off the engine and

re-check the fluid level. Add Premium Power Steering Fluid - E6AZ-19582-AA (ESW-M2C33-F) or equivalent, if necessary.

5. With the engine running at approximately 1000 rpm and the steering wheel centered, attach an lb.in. torque wrench to the steering wheel nut. Apply

sufficient torque in each direction to get a gauge reading of 1723 kPa (250 psi).

6. The torque wrench readings should be the same in both directions at 1723 kPa (250 psi). If the difference between the readings exceeds 6 lb.in. (0.68

N-m), remove the steering gear and replace the shaft and control assembly.

7. Remove the pressure gauge installed in Step 2.

Diagnostic Procedure # 5 - Rbs Linkage

If the RBS linkage is determined to have wind up or memory steer, replace RBS linkage with greasable steel linkage.

NOTE: ALL SERVICE PART STEERING LINKAGE IS THE GREASABLE STEEL SOCKET TYPE.

Diagnostic Procedure # 6 - Brake Imbalance

Spin the front tires make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Check for front wheel rotational drag with warm/hot brakes.

a. Make a series of 10 stops from speeds of 30 mph (48 km/h).

b. Make the 10 stops with no more than 30 second intervals between stops. This generally will induce a maximum pull if there is a drift/pull

concern.

c. Raise the front end of the truck so that both tires are off the ground.

d. Rotate the front wheels by hand.

NOTE: FOR ALL 4 WHEEL DRIVE TRUCKS, MAKE SURE THE HUBS ARE DISENGAGED.

Both tires should rotate about the same amount, with little brake drag occurring. Some brake drag will naturally be present for each size of truck.

3. If the truck has excess brake drag, proceed as follows:

a. Open the bleed screw on the affected wheel to check for residual pressure in the brake lines. If there is a squirt of brake fluid out the bleeder

screw and the drag is reduced or eliminated, the master cylinder may not be allowing the brake fluid to return to the reservoir.

b. Check the master cylinder push rod adjustment. Refer to the appropriate Light Truck Shop Manual, Section 06-06 for service details.

c. Check the brake pedal to determine if it is fully returning.

4. Remove both calipers and check piston retraction using a "C" clamp and wooden block. The piston should easily move back into the bore under the

force of the clamp. Re-build or replace as needed.

5. If Steps 1 through 4 have not determined the concern, swap rotors and linings from side to side.

NOTE: SHOE TAB CLEARANCES SHOULD BE CHECKED AND MODIFIED IF NEEDED. SEE FIGURE 2.

6. Test drive the vehicle with 10 or more stops from 40 mph before evaluating for brake drift. If there is no change in drift while braking, it may be

assumed the concern is not the result of the front brakes.

7. Check the rear brakes. Remove the rear wheels and brake drums.

a. Check for contaminates (i.e., grease, axle lube, leaking brake fluid, etc.).

b. Check for broken components, frozen parking brake cables and improperly installed parts.

c. Check the cage diameter using the Brake Shoe Adjustment Gauge (D81L-1103-A). If either side is out of specification, check for proper

function of the adjusting mechanism and repair or replace as required.

d. Check the rear wheel cylinders by the following method.

^ Replace one of the brake drums.

^ Have another person apply the brakes and watch for movement of one of the brake shoes on the other wheel.

^ Re-apply the brakes while holding in place the shoe that moved. The opposite shoe should now move. If no movement is observed, repair or replace the wheel cylinder.

^ Re-install the drum and repeat the procedure for the other rear brake.

8. If the condition still exists, swap rear shoes from side to side and drive the truck. If the drift is significantly reduced, replace the rear linings. If the

drift/pull is not significantly reduced, go to Service Procedure # 7.

Diagnostic Procedure # 7 - Miscellaneous

Check for loose, damaged or excessively worn parts. Visually inspect the front suspension for loose or worn components (i.e., ball joints, radius arm bushings, radius arm attachments at the axle and frame, alignment adjusters, steering linkage, etc.). Repair or replace as required.

Diagnostic Check List

NOTE: THE FOLLOWING CHECK LIST SHOULD BE COMPLETED AFTER EACH STEP OF THE DIAGNOSTIC WHERE APPLICABLE.

SERVICE PROCEDURE

1. Checking clearances.

_ Caliper to knuckle clearance.

_ Inner shoe side and end clearance.

2. Lubrication of components.

_ Lubrication of the caliper rails and inner knuckle pad grooves.

3. Radius arm bushings.

_ Replacement of right and left side radius arm bushings.

DIAGNOSTIC PROCEDURE:

1. Tire mismatch.

_ Unlocked hubs check.

_ Front tires swapped side to side.

_ Rear tires swapped side to side.

_ Front to rear tire swap.

2. Alignment.

_ Unlocked hubs check.

_ Toe changed to _.

_ Caster changed and split is _.

_ Camber changed and split is _.

3. Tire circumference.

_ Unlocked hubs check.

_ Tire circumference checked and two closest circumference tires swapped to rear axle.

4. Steering gear valve.

_ Unlocked hubs check.

_ Install pressure gauge.

_ Check fluid level with engine off and on.

_ Apply torque to the steering wheel nut and check gauge readings.

_ Replaced the shaft and control assembly.

_ Removed the pressure gauge.

5. RABS linkage.

_ Replaced the RBS linkage.

6. Brake imbalance.

_ Unlocked hubs check.

_ Front wheel rotational drag check.

_ Master cylinder check.

_ Piston retraction check.

_ Rotors and linings swapped from side to side.

_ Rear brakes checked.

_ Rear drums and shoes swapped from side to side.

7. Miscellaneous.

_ Check for loose, damaged or worn parts.

05/26/93

BRAKES - STICK/BIND/GRAB - FRONT CALIPER PINS CORRODED

LIGHT TRUCK: 1987-90 BRONCO II 1987-92 AEROSTAR, BRONCO, ECONOLINE, F-150-350 SERIES, RANGER 1988-92 F SUPER DUTY 1991-92 EXPLORER

This TSB article is being republished in its entirety to include F Super Duty vehicles.

ISSUE: Sticking, binding or grabbing of the brakes may be caused by brake caliper slide pins that are corroded. The corrosion does not allow the brake caliper assembly to move freely.

ACTION: Install the new improved caliper pins that are corrosion resistant. Refer to the following Service Procedure for service details.

SERVICE PROCEDURE

1. Remove the caliper and pins. Refer to the applicable Light Truck Service Manual for service details.

NOTE: IF PADS ARE DAMAGED OR WORN, PAD REPLACEMENT IS REQUIRED.

2. Clean the upper and lower knuckle pin grooves, upper and lower knuckle inner pad grooves, and the upper and lower caliper pin grooves with a wire brush or portable wire wheel.

WARNING: USE SAFETY GLASSES AND AN AIR RESPIRATOR WHEN CLEANING THE GROOVES.

3. Apply a light coat of lubricant (D7AZ-19590-A) to the upper and lower knuckle inner pad grooves and upper and lower caliper pin grooves.

CAUTION: LUBRICANT SHOULD NOT BE USED ON ROTORS, LININGS OR CALIPER PISTON BOOTS.

4. Re-assemble the caliper using the new pins, (F2TZ-2C150-A) for all vehicles except F Super Duty. Use new pins (F2TZ-2C150-B) for F Super Duty vehicles.

NOTE: NORMAL BRAKE MAINTENANCE REQUIREMENTS LISTED IN THE OWNER MANUAL SHOULD BE PERFORMED EVERY 15,000 MILES.

Brake Caliper: All Technical Service Bulletins Front Brakes - Popping or Clunking Noise

Article No. 92-14-7

07/01/92

^ BRAKES - FRONT DISC - "POPPING" OR "CLUNKING" SOUND DURING BRAKING

^ NOISE - "POPPING" OR "CLUNKING" SOUND WHEN BRAKING

^ VIBRATION THROUGH FLOOR BOARD WHEN BRAKING

LIGHT TRUCK: 1989-90 BRONCO II 1989-92 AEROSTAR, RANGER 1991-92 EXPLORER

See TSB # 93-20-11 for additional information.

ISSUE: A "popping" or "clunking" noise and a floor board vibration may occur during braking. The noise and/or vibration may be caused by the front brake caliper suddenly springing away from the caliper abutment and returning.

ACTION: Check and adjust the brake pads and caliper knuckle clearance by using the following service procedure.

1. Road test to confirm that the "popping" or "clunking" noise occurs only during braking at the initial part of the stop.

2. Raise the front of the vehicle.

a. Remove the front wheels.

b. Remove the pins from the caliper.

3. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails.

NOTE:

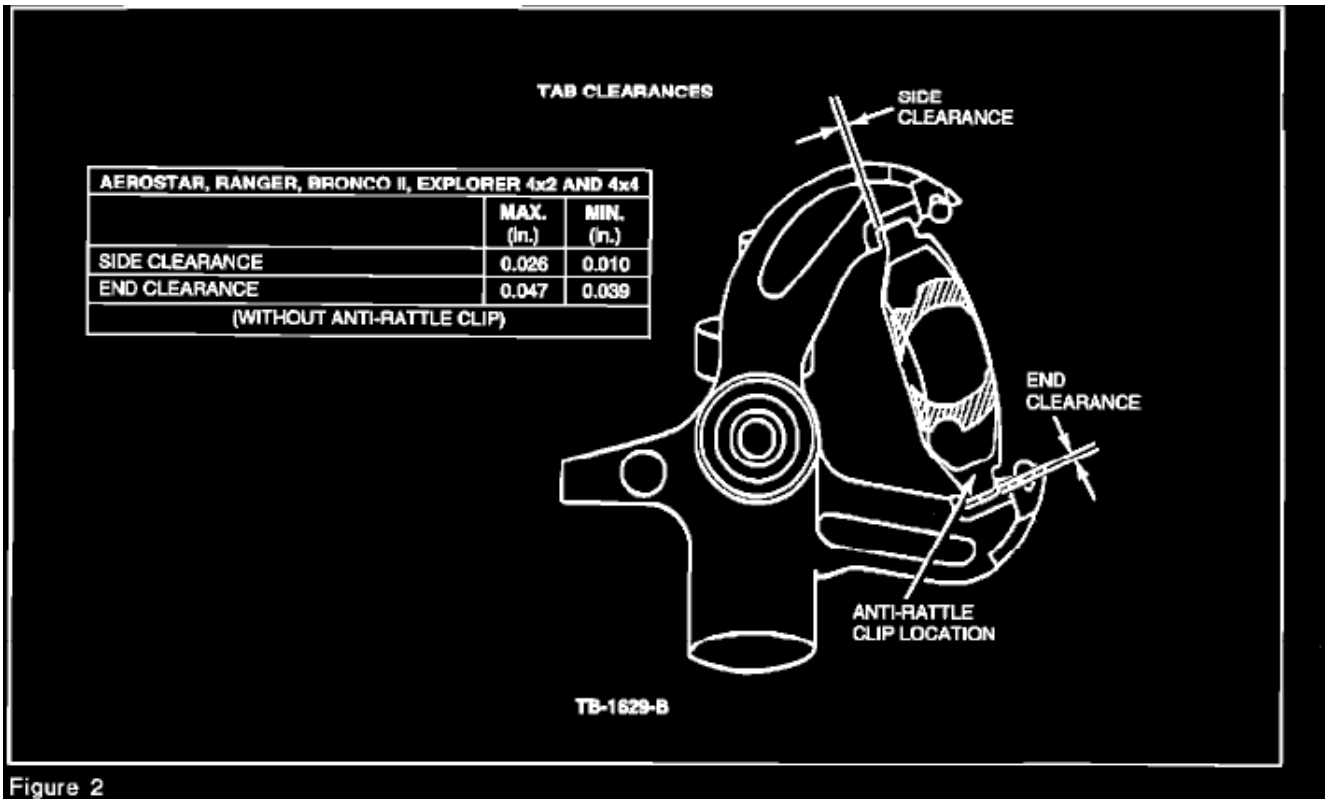

Figure 2

THE CLEARANCE SHOULD BE A MINIMUM OF .015" (.381 MM).

a. If the caliper clearance is less than .015" (.381 mm) on either caliper, replace the caliper and repeat the measurements.

b. If the caliper clearance is less than .015" (.381 mm) on both calipers, replace both calipers and recheck clearance.

c. If the caliper clearance is still less than .015" (.381 mm) on both calipers, replace both spindles (4X2) or knuckles (4X4) and recheck clearance.

NOTE: CHECK THE CLEARANCE OF THE NEW KNUCKLE BEFORE INSTALLATION.

4. After measuring the caliper/knuckle for proper clearance, remove both calipers and brake pad assemblies. Refer to the appropriate Light Truck Service Manual, Section 06-03, for the removal procedure.

5. Replace the caliper piston (FOTZ-2196-A). Refer to the appropriate Light Truck Service Manual, Section 06-03, for the replacement procedure.

6. Install the new lining kit (FO9Z-2001-A).

a. Check the side and end clearances with a feeler gauge.

b. Refer to Figure 2 for clearance dimensions.

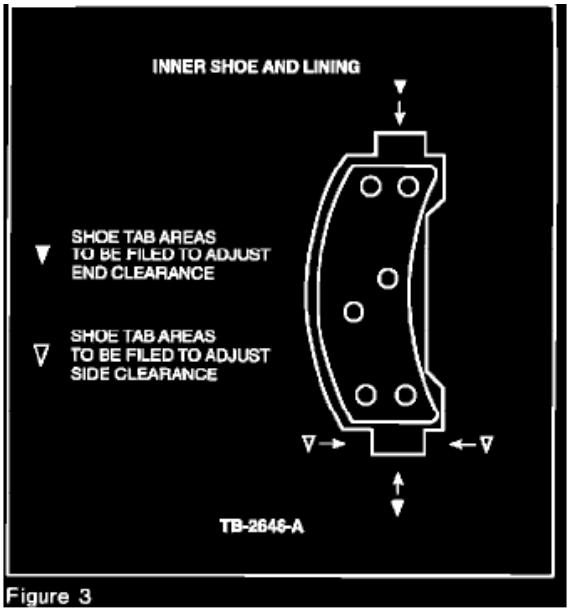

Figure 3

E8TZ-3131-A	Arm Assembly, LH (4X4 Bronco II)	B

7. If the lining clearance is not to the required dimensions, file the shoe tab. Remove equal amounts from both sides and ends, Figure 3.

WARNING: USE SAFETY GLASSES WHEN FILING THE BACKING PLATES.

CAUTION: DO NOT GRIND. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

8. Assemble the brakes and caliper pins (E8TZ-2C150-B). Lubricate the caliper pins with disc brake lubricant (D7AZ-19590-A). Refer to the appropriate Light Truck Service Manual, Section 06-03, for assembling details.

9. Apply a light coat of disc brake lubricant (D7AZ-19590-A) to the inner knuckle top and bottom pad groove. Also apply a light coat of disc brake lubricant (D7AZ-19590-A) to the caliper rails.

CAUTION: PREVENT LUBRICANT FROM STICKING TO ROTORS, LININGS OR CALIPER PISTON BOOTS.

Technical Service Bulletin # 9097 Date: 900427

Steering/Suspension - Pull/Drift Diagnostic Procedure

^ BRAKES - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

^ STEERING - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

Article No. 90-9-7

LIGHT TRUCK: 1988-90 BRONCO II, RANGER 1991 EXPLORER

ISSUE: A comprehensive, pull and drift diagnostic procedure has been developed to assist techicians with truck service.

ACTION: Use the following service procedure to resolve drift and pull concerns.

This is the same basic procedure as published in TSB 90-7-16 for the 1988-90 Bronco and F-150, 4x4 models. However, you should note that there are some differences such as replacing radius arm bushings instead of installing a radius arm bracket kit, etc.

Proceed with the Pull and Drift Diagnostic Procedure if the pull or drift is not significantly reduced or where there is a case of steady state drift (no braking).

A Diagnostic Check List has been provided at the end of this article to use with this procedure.

NOTE: THIS TSB ARTICLE SHOULD BE READ COMPLETELY BEFORE PERFORMING DIAGNOSTICS OR REPAIRS.

Service Procedure

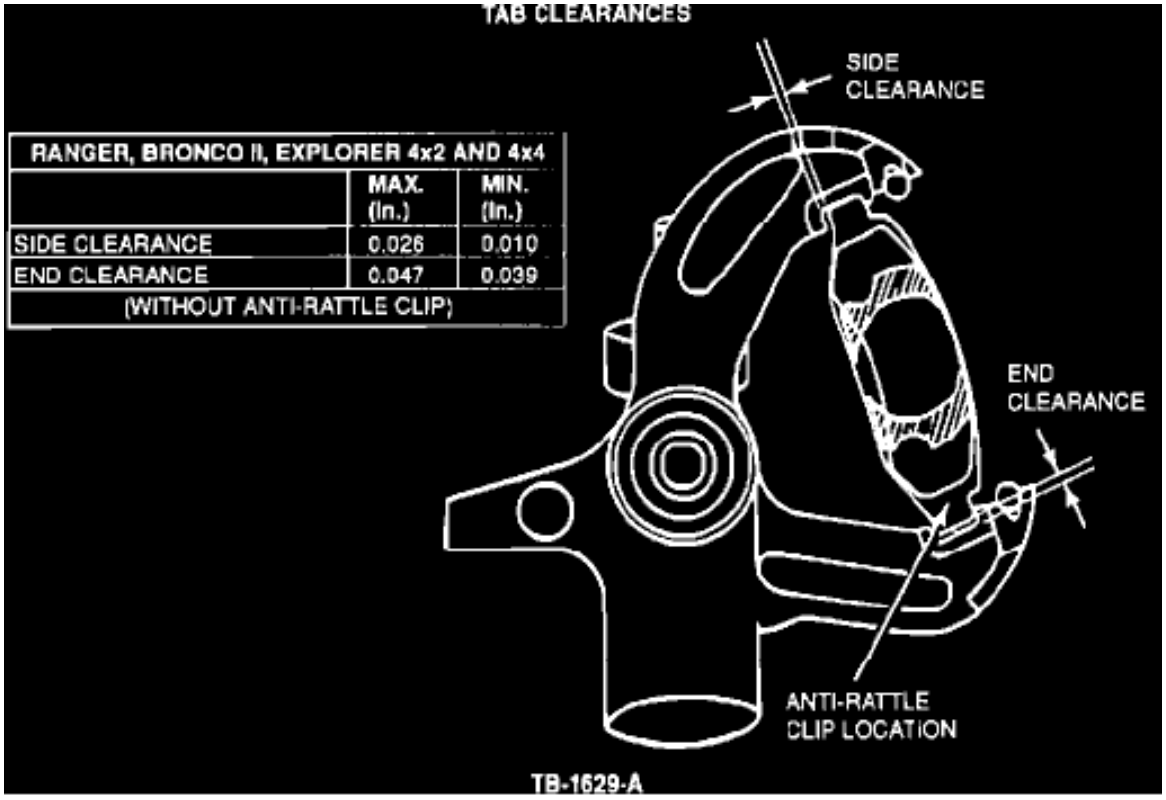
Figure 1

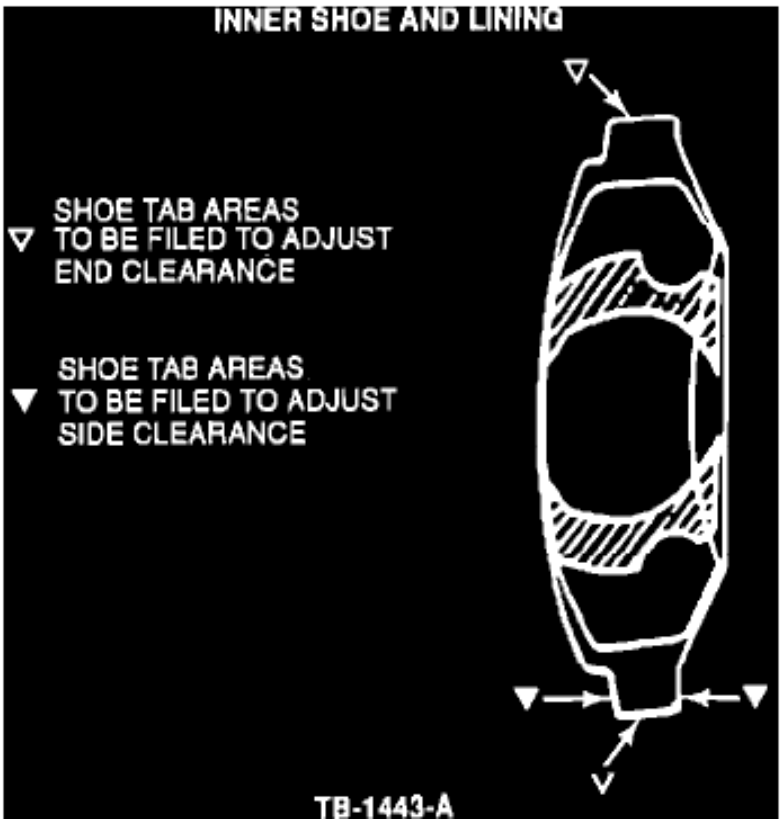
1. Check and adjust brake pad clearances and caliper knuckle clearances as follows:

a. Remove the pins from the caliper.

b. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails.

Clearance should be a minimum of .015 ".





c. If the clearance is insufficient, replace the caliper and measure again. If clearance concern still exists, replace the knuckle.

NOTE: CHECK THE CLEARANCE ON THE NEW KNUCKLE BEFORE INSTALLATION.

d. After measuring the caliper/knuckle for proper clearances, remove both calipers and inner pad assemblies.

e. Remove the anti-rattle clip from the inner pad.

Figure 2

Figure 3

f. Re-install pad and check the side and end clearances with a feeler gauge. (See Figure 2 for clearance dimensions.)

g. If the pad clearances are within specification, refer to Service Procedure Step 2 - "Caliper Groove Lubrication". If the pad clearances are not to the

required dimensions, file the steel backing plate.

WARNING: USE SAFETY GLASSES WHEN FILING STEEL BACKING PLATES

h. File material, removing equal amounts from both sides or ends. (See Figure 3.)

CAUTION: DO NOT GRIND. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

i. Check the tab clearances and install anti-rattle clip on the lower pad tab, Figure

2.

2. Apply a light coat of lubricant (D7AZ-19590-A) to the inner knuckle top and bottom pad groove and caliper rails. CAUTION:

MAKE SURE THE LUBRICANT DOES NOT GET ON THE ROTORS, LININGS, OR ON THE CALIPER PISTON BOOTS.

3. Replace the right and left side arm bushings with new bushings (FITZ-3B203-A). Refer to the appropriate Light Truck Shop Manual, Section 04-OIC

for service details.

NOTE: THE EXPLORER IS ALREADY EQUIPPED WITH THE NEW RADIUS ARM BUSHINGS.

Pull Drift Diagnostic Procedure

The Pull Drift Diagnostic Procedure should be used if the pull or drift is not significantly reduced with the service procedure or in cases of a steady state drift (no braking).

Test drive the truck with the customer to understand his/her pull or drift concern. Many customers will call a clear vision concern a pull or drift because the steering wheel is not straight.

Pull or drifts come from various sources, each with a particular set of symptoms. Careful road test evaluation usually will pinpoint which cause (or causes) are present.

The Road Test

It is important to test drive the truck with the customer to UNDERSTAND HIS OR HER CONCERN.

Complete the road test before beginning any repairs since you may have multiple causes that need to be identified.

^ The road test should be done on a flat, straight road and should be done in both directions to account for wind.

^ Tire pressure should be checked and adjusted, if necessary.

^ A second person in the truck during the road test is helpful. Unless otherwise directed, the second person must remain in the front RH passenger location.

^ On trucks with automatic locking hubs, it is necessary to drive (20) feet forward and then backwards to unlock the hubs.

ROAD TEST	RESULT	ACTION
Maintain a steady speed of 50-55 mph (80-89 km/h). **DO NOT BRAKE**	Is there a steady state pull? If no, go to the next step.	**See Diagnostic Procedure 1.** Tire mismatch or tire pressure concern
While stopped, have second person move to the left hand rear passenger location. Maintaining 50-55 mph (80-89 km/h).	Any change in pull? If no change, go to next step.	**See Diagnostic Procedure 2** Caster split
Make sure front hubs are unlocked (if equipped*). Accelerate the truck - decelerate the truck using **engine braking only.**	Any changes in the pull? Does it pull one way on acceleration and another way on deceleration? If no, go to next step.	**See Diagnostic Procedure 3.** Possible limited slip rear axle and tire circumference
Maintain a steady speed of 50-55 mph (80-89 km/h). Put the vehicle in neutral and shut off the engine.	Does the pull go away? If no, go to the next step.	**See Diagnostic Procedure 4.** Steering gear valve off center
Stop the truck along the highway. Rotate the wheel full left. Proceed with road test.	Does the pull get better or worse? Stop the truck; rotate the wheel full right. Does the pull change - better or worse? If no, go to next step.	**See Diagnostic Procedure 5.** Possible Rubber Ball Socket (RBS) memory steer
In a safe clear area, while firmly holding the steering wheel, apply the brakes moderately hard, but not to the point of engaging RABS.	Does the trucks heading change during brake application? If no, go to next step.	**See Diagnostic Procedure 6.** Possible brake imbalance.
Disconnect the fluid level sensor (disable RABS). Brake the truck from 50 mph (80 km/h).	Does the vehicle pull with A/L disconnected? If no, go to next step.	**See Diagnostic Procedure 6** Possible inadequate rear brake application
Brake the truck hard, to the point of lock-up (RABS disabled).	Do both rears lock? Do both wheels lock at the same time?	**See Diagnostic Procedure 6** Possible unequal rear brake application

NOTE: IT IS POSSIBLE THAT THE TRUCK MAY HAVE MULTIPLE SYMPTOMS. A ROAD TEST/CAUSE CHART FOLLOWS.

NOTE: RECONNECT THE FLUID LEVEL SENSOR AFTER ROAD TEST

Diagnostic Procedure # 1 - Tire Mismatch

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the diagnostic procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to RPO (regular production option) list and set tire psi to the correct value.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only.

Set tire pressure to value on the certification label.

1. Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Tire Pull - Swap the front tires from side to side and road test. If the concern is not corrected, continue with next step.

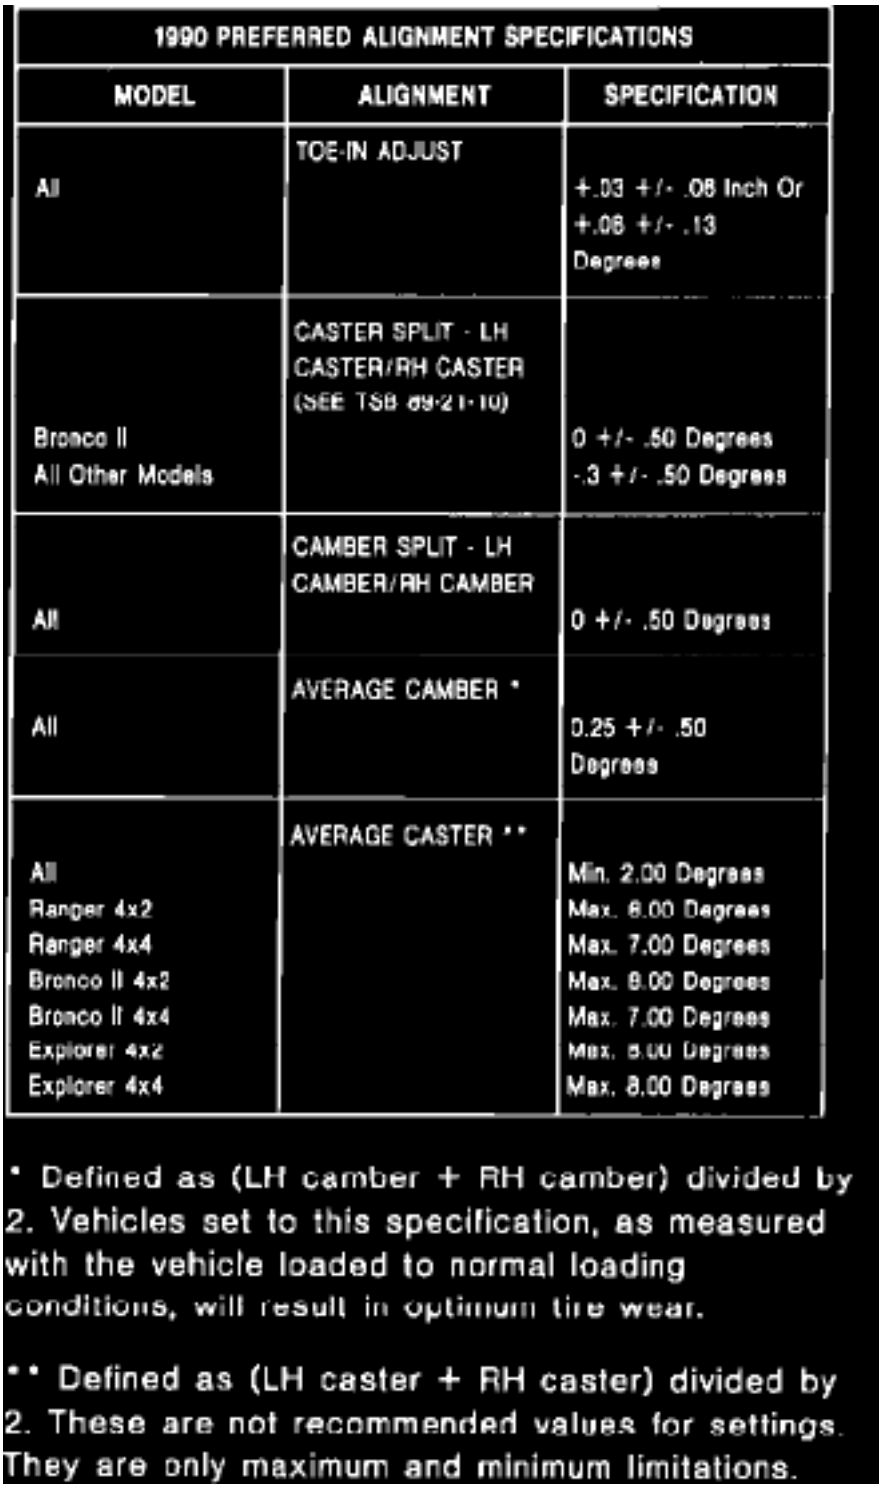
3. Tire Pull - Swap rear tires from side to side and road test. If the concern is not corrected, continue with next step.

4. Tire Pull - Swap front tires from front to rear. Set the tire pressure to the required pressure for the new front and rear positions, then road test.

NOTE: ON REAR LIMITED SLIP AXLE (FRONT HUB UNLOCKED) DRIFT CONCERNS, IT MAY BE NECESSARY TO MEASURE TIRE

CIRCUMFERENCE AND PLACE A MATCHED SET OF TIRES ON THE REAR AXLE.

Diagnostic Procedure # 2 - Alignment



1990 PREFERRED ALIGNMENT SPECIFICATIONS		
MODEL	ALIGNMENT	SPECIFICATION
All	TOE-IN ADJUST	+.03 +/- .08 Inch Or +.08 +/- .13 Degrees
Bronco II All Other Models	CASTER SPLIT - LH CASTER/RH CASTER (SEE TSB 89-21-10)	0 +/- .50 Degrees -.3 +/- .50 Degrees
All	CAMBER SPLIT - LH CAMBER/RH CAMBER	0 +/- .50 Degrees
All	AVERAGE CAMBER *	0.25 +/- .50 Degrees
All Ranger 4x2 Ranger 4x4 Bronco II 4x2 Bronco II 4x4 Explorer 4x2 Explorer 4x4	AVERAGE CASTER **	Min. 2.00 Degrees Max. 8.00 Degrees Max. 7.00 Degrees Max. 8.00 Degrees Max. 7.00 Degrees Max. 8.00 Degrees Max. 8.00 Degrees

* Defined as (LH camber + RH camber) divided by 2. Vehicles set to this specification, as measured with the vehicle loaded to normal loading conditions, will result in optimum tire wear.

** Defined as (LH caster + RH caster) divided by 2. These are not recommended values for settings. They are only maximum and minimum limitations.

Wheel Alignment - Measure the front wheel alignment. For out of specification vehicles, align to the "1990 Preferred Alignment Specifications" stated in this article.

^ Spin the front tires to be sure that the front hubs are unlocked, if hubs are unlocked, the axle shaft will not rotate with the wheels.

^ Do not adjust wheel alignment to correct for brake pull if the vehicle does not have pull during non-brake applications.

^ Set the tire pressure to the specification on the certification label.

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the diagnostic procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to HPO (regular production option) list and set tire pressure to the correct value.

^ IF THE TIRES AND WHEELS DO NOT MATCH CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only.

Drive vehicle after alignment is performed. ^

Vehicles which exceed the maximum average caster value shown above may result in shimmy concerns.

^ Vehicles operated below the minimum average caster value shown can result in wander and poor steering returnability concerns.

If the vehicle is not within these minimum and maximum average caster values, or if the vehicle has experienced any of these listed steering/handling concerns, the average caster should be set in accordance with ride height/caster chart in the Shop Manual.

Diagnostic Procedure # 3 - Tires

1. Spin the front tires to be sure that the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Measure tire circumference of all four tires; put the two closest circumference tires on the rear axle. Tire pressure must be equal on all tires.

Diagnostic Procedure # 4 - Steering Gear Valve Off Center

Rotary Valve Centering Check: To confirm that you are looking at a steering gear valve concern, lift the front wheels off the ground.

^ The truck should be raised so that there is no interference with the steering linkage.

^ The front wheels should also spin freely.

With the wheels in a straight ahead position, start the engine and observe any steering wheel or linkage movement when the engine is started. If any movement is observed, continue with the rotary valve centering check.

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Install a 0-13,789 kPa (0-2000 psi) pressure-gauge (Tool D79L-33610-A, Power Steering Analyzer) in the pressure line between the power steering

pump outlet port 1 and the integral steering gear inlet port. Make sure the valve on the gauge is fully open.

3. Check the fluid level in the reservoir. Add Premimum Power Steering Fluid - E6AZ-19582-AA (ESW-M2C33-F) or equivalent, if necessary.

4. Start the engine and turn the steering wheel from stop-to-stop to bring the steering lubricant to normal operating temperature. Turn off the engine and

re-check the fluid level. Add Premium Power Steering Fluid - E6AZ-19582-AA (ESW-M2C33-F) or equivalent, if necessary.

5. With the engine running at approximately 1000 rpm and the steering wheel centered, attach an lb.in. torque wrench to the steering wheel nut. Apply

sufficient torque in each direction to get a gauge reading of 1723 kPa (250 psi).

6. The torque wrench readings should be the same in both directions at 1723 kPa (250 psi). If the difference between the readings exceeds 6 lb.in. (0.68

N-m), remove the steering gear and replace the shaft and control assembly.

7. Remove the pressure gauge installed in Step 2.

Diagnostic Procedure # 5 - Rbs Linkage

If the RBS linkage is determined to have wind up or memory steer, replace RBS linkage with greasable steel linkage.

NOTE: ALL SERVICE PART STEERING LINKAGE IS THE GREASABLE STEEL SOCKET TYPE.

Diagnostic Procedure # 6 - Brake Imbalance

Spin the front tires make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Check for front wheel rotational drag with warm/hot brakes.

a. Make a series of 10 stops from speeds of 30 mph (48 km/h).

b. Make the 10 stops with no more than 30 second intervals between stops. This generally will induce a maximum pull if there is a drift/pull

concern.

c. Raise the front end of the truck so that both tires are off the ground.

d. Rotate the front wheels by hand.

NOTE: FOR ALL 4 WHEEL DRIVE TRUCKS, MAKE SURE THE HUBS ARE DISENGAGED.

Both tires should rotate about the same amount, with little brake drag occurring. Some brake drag will naturally be present for each size of truck.

3. If the truck has excess brake drag, proceed as follows:

a. Open the bleed screw on the affected wheel to check for residual pressure in the brake lines. If there is a squirt of brake fluid out the bleeder

screw and the drag is reduced or eliminated, the master cylinder may not be allowing the brake fluid to return to the reservoir.

b. Check the master cylinder push rod adjustment. Refer to the appropriate Light Truck Shop Manual, Section 06-06 for service details.

c. Check the brake pedal to determine if it is fully returning.

4. Remove both calipers and check piston retraction using a "C" clamp and wooden block. The piston should easily move back into the bore under the

force of the clamp. Re-build or replace as needed.

5. If Steps 1 through 4 have not determined the concern, swap rotors and linings from side to side.

NOTE: SHOE TAB CLEARANCES SHOULD BE CHECKED AND MODIFIED IF NEEDED. SEE FIGURE 2.

6. Test drive the vehicle with 10 or more stops from 40 mph before evaluating for brake drift. If there is no change in drift while braking, it may be

assumed the concern is not the result of the front brakes.

7. Check the rear brakes. Remove the rear wheels and brake drums.

a. Check for contaminates (i.e., grease, axle lube, leaking brake fluid, etc.).

b. Check for broken components, frozen parking brake cables and improperly installed parts.

c. Check the cage diameter using the Brake Shoe Adjustment Gauge (D81L-1103-A). If either side is out of specification, check for proper

function of the adjusting mechanism and repair or replace as required.

d. Check the rear wheel cylinders by the following method.

^ Replace one of the brake drums.

^ Have another person apply the brakes and watch for movement of one of the brake shoes on the other wheel.

^ Re-apply the brakes while holding in place the shoe that moved. The opposite shoe should now move. If no movement is observed, repair or replace the wheel cylinder.

^ Re-install the drum and repeat the procedure for the other rear brake.

8. If the condition still exists, swap rear shoes from side to side and drive the truck. If the drift is significantly reduced, replace the rear linings. If the

drift/pull is not significantly reduced, go to Service Procedure # 7.

Diagnostic Procedure # 7 - Miscellaneous

Check for loose, damaged or excessively worn parts. Visually inspect the front suspension for loose or worn components (i.e., ball joints, radius arm bushings, radius arm attachments at the axle and frame, alignment adjusters, steering linkage, etc.). Repair or replace as required.

Diagnostic Check List

NOTE: THE FOLLOWING CHECK LIST SHOULD BE COMPLETED AFTER EACH STEP OF THE DIAGNOSTIC WHERE APPLICABLE.

SERVICE PROCEDURE

1. Checking clearances.

_ Caliper to knuckle clearance.

_ Inner shoe side and end clearance.

2. Lubrication of components.

_ Lubrication of the caliper rails and inner knuckle pad grooves.

3. Radius arm bushings.

_ Replacement of right and left side radius arm bushings.

DIAGNOSTIC PROCEDURE:

1. Tire mismatch.

_ Unlocked hubs check.

_ Front tires swapped side to side.

_ Rear tires swapped side to side.

_ Front to rear tire swap.

2. Alignment.

_ Unlocked hubs check.

_ Toe changed to _.

_ Caster changed and split is _.

_ Camber changed and split is _.

3. Tire circumference.

_ Unlocked hubs check.

_ Tire circumference checked and two closest circumference tires swapped to rear axle.

4. Steering gear valve.

_ Unlocked hubs check.

_ Install pressure gauge.

_ Check fluid level with engine off and on.

_ Apply torque to the steering wheel nut and check gauge readings.

_ Replaced the shaft and control assembly.

_ Removed the pressure gauge.

5. RABS linkage.

_ Replaced the RBS linkage.

6. Brake imbalance.

_ Unlocked hubs check.

_ Front wheel rotational drag check.

_ Master cylinder check.

_ Piston retraction check.

_ Rotors and linings swapped from side to side.

_ Rear brakes checked.

_ Rear drums and shoes swapped from side to side.

7. Miscellaneous.

_ Check for loose, damaged or worn parts.

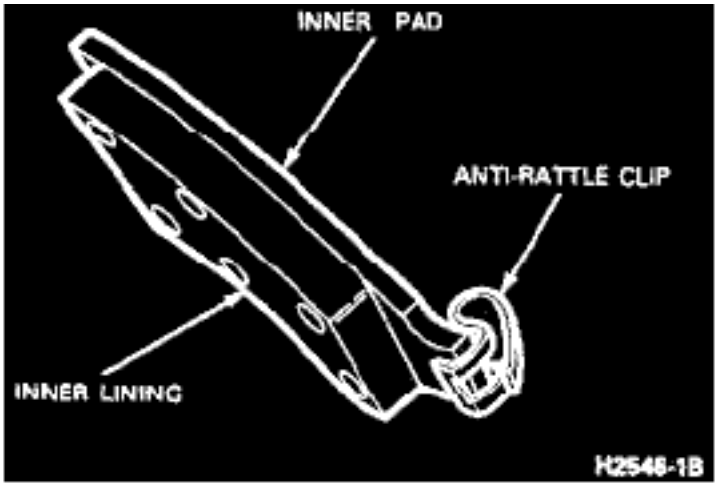
Brake Caliper: Description and Operation

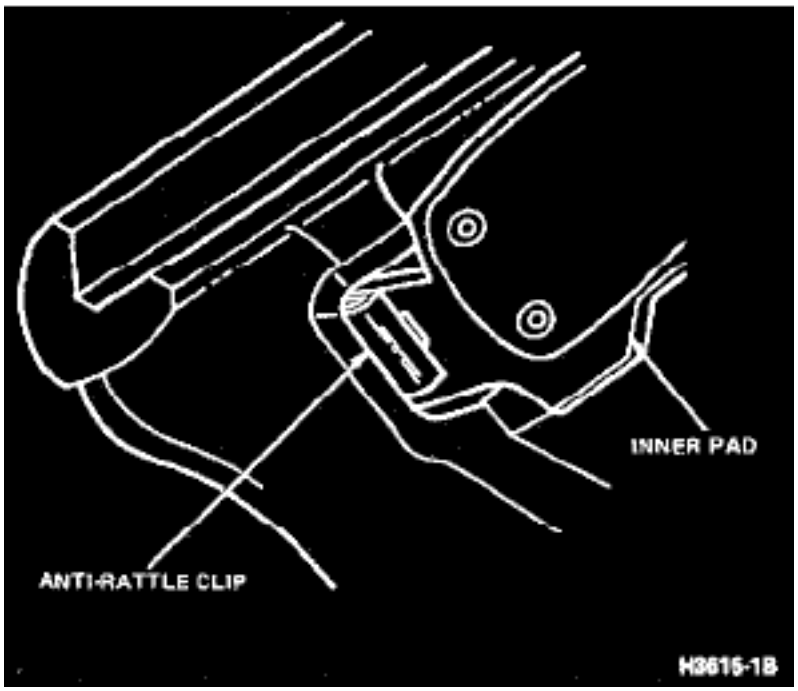
Caliper Assembly

Brake Caliper

The caliper assembly consists of a pin slider caliper housing, inner and outer pad and lining assemblies, and a single piston. The caliper assembly slides on two pins which also attach the caliper to the spindle.

The caliper housing contains a piston. The piston has a molded rubber dust boot on its outer end that is pressed into a cylinder bore groove to prevent cylinder contamination. There is also a rectangular section rubber piston seal located in the cylinder bore providing sealing between the cylinder and piston. This seal also causes the piston to retract once the brakes are released.





Brake Caliper: Service and Repair Inspection

For additional information see Installation Notes. See: Fundamentals and Basics

1. The caliper piston must be "bottomed out" when replacing pad and lining assemblies with new parts. "Bottom out" the caliper piston with an eight

inch c-clamp using a worn out inner pad or a block of wood to push against the piston. Never attempt to "bottom out" piston with outer pad installed.

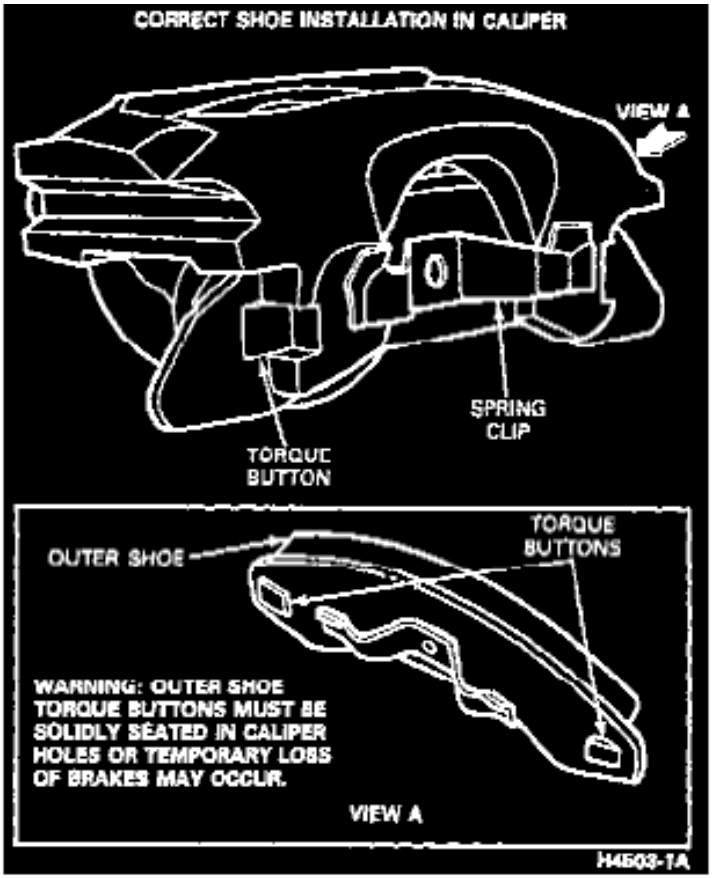
Installing Anti-Rattle Clip

2. Place a new anti-rattle clip on the lower end of the inner pad. Be sure the tabs on the clip are positioned properly and the clip is fully seated.

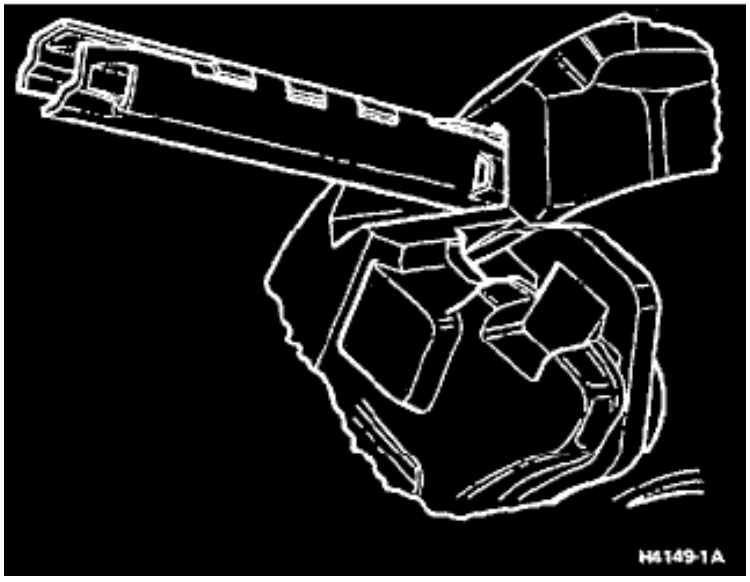
Installing Inner Shoe And Anti-Rattle Clip

3. Position the inner pad and anti-rattle clip in the pad abutment with the anti-rattle clip tab against the pad abutment and the loop-type spring away

from the rotor. Compress the anti-rattle clip and slide the upper end of the pad in position.



CORRECT SHOE INSTALLATION IN CALIPER
VIEW A
SPRING CLIP
TORQUE BUTTON
TORQUE BUTTONS
OUTER SHOE
WARNING: OUTER SHOE TORQUE BUTTONS MUST BE SOLIDLY SEATED IN CALIPER HOLES OR TEMPORARY LOSS OF BRAKES MAY OCCUR.
VIEW A
H4503-1A



H4149-1A

Outer Pad Installation

4. Install the outer pad, making sure the torque buttons on the pad are seated solidly in the matching holes in the caliper. 5. Install the caliper on the spindle, making sure the mounting surfaces are free of dirt and lubricate the caliper grooves with disc brake caliper

grease.

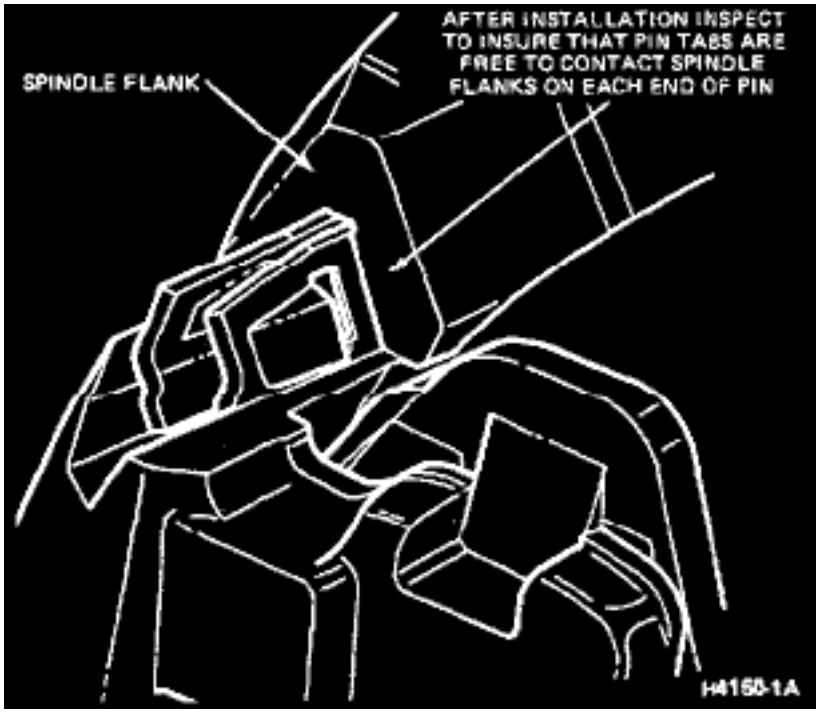
Caliper Pin Installation

6. Position pin with the pin retention tabs oriented adjacent to the spindle groove.

NOTE: Do not use the bolt and nut with the new pin.

7. Tap the pin on the outboard end with a hammer. Continue tapping the pin inward until the retention tabs on the sides of the pin contact the spindle

face. Repeat procedure for the lower pin.



Correct Caliper Pin Installation

CAUTION: During the installation procedure do not allow the tabs of the caliper pin to be tapped too far into the spindle groove. If this happens it will be necessary to tap the other end of the caliper pin until the tabs snap into place. The tabs on each end of the caliper pin must be free to catch on the spindle flanks.

8. If removed, install the brake hose to the caliper and perform brake bleeding procedures.

Lower the vehicle, check the brake fluid level and fill as necessary. Check brakes for proper operation.

WARNING: Before moving vehicle, pump brake pedal several times to be sure it is firm. Do not move vehicle until a firm pedal is obtained.

Brake Caliper: Service and Repair Rebuild

Caliper Assembly

NOTE: Do not use a screwdriver or any similar tool to pry piston into or out of the bore to prevent chipping or scuffing damage to the phenolic piston.

DISASSEMBLY

1. Remove the caliper assembly. Place a block of wood over the piston before applying air pressure to prevent damage to the piston.

Removing Piston

WARNING: Do not place fingers in front of piston in an attempt to catch or protect it when applying compressed air. This could result in serious injury.

2. Apply air pressure to the fluid port in the caliper with a rubber-tipped nozzle to remove the piston. If the piston is seized and cannot be forced

from the caliper, tap lightly around the piston while applying air pressure.

3. Remove the dust boot from the caliper assembly. 4. Remove the rubber piston seal from the cylinder and discard it.

CLEANING AND INSPECTION

^ Clean all metal parts with isopropyl alcohol or brake parts cleaner. Then, clean out and dry the grooves and passageways with compressed air. Make sure caliper bore and component parts are thoroughly clean.

^ Check the cylinder bore and piston for damage or excessive wear. Replace the piston if it shows signs of pitting, scoring or cracks.

ASSEMBLY

1. Apply a film of clean brake fluid to the new caliper piston seal, and install it in the cylinder bore. Be sure the seal does not become twisted but is

firmly seated in the groove.

2. Install a new dust boot by setting the flange squarely in the outer groove of the caliper bore. 3. Coat the piston with brake fluid, and install the piston in the cylinder bore. 4. Spread the dust boot over the piston as it is installed. Seat the dust boot in the piston groove. 5. Install the caliper.

Brake Caliper: Service and Repair Removal

For additional information see Removal Notes. See: Fundamentals and Basics

1. Use a clean siphon or suction hose to remove a portion of the fluid from the master cylinder. Discard the removed fluid.

CAUTION: System contamination may result if anything other than a clean device is used to remove fluid from master cylinder.

2. Raise the vehicle and install safety stands. Remove wheel and tire assembly.

Compressing Caliper

3. Use an eight-inch C-clamp to move the piston back into its bore as follows:

a. Place the head of the C-clamp against the caliper, and the screw end of the C-clamp against the outer pad below the spring clip.

CAUTION: Do not position C-clamp on the spring clip. Also, do not compress piston further than is required to disengage torque buttons from caliper. Damage to the spring clip will result. Replace pad if spring clip is bent or damaged.

CAUTION: Do not attempt to "bottom" the piston in the bore at this time. Use an old, worn out brake pad or block of wood and the C-clamp to bottom the piston once caliper is removed from rotor, and the pads are removed from the caliper.

b. Tighten the clamp until the torque buttons just clear the caliper (about 3 mm [1/8 in]). Remove the C-clamp.

CAUTION: Do not use a screwdriver or similar tool to pry piston away from the rotor.

4. Clean excess dirt from area around pin tabs. 5. Tap upper caliper pin towards inboard side until pin locking tabs touch the spindle face. 6. Insert a screwdriver into the slot provided behind the pin tabs on the inboard side of the pin.

Compressing Pin Tabs

7. Use needle nose pliers to compress the outboard end of the pin while prying at the same time with the screwdriver, until tabs slip into the spindle

groove.

8. Place one end of a punch (approximately 7/16 inch diameter) against the end of the caliper pin and drive the caliper pin out of the caliper slide

groove.

9. Repeat removal procedure for lower pin.

10. Remove the caliper from the rotor. If the caliper is to be removed for service, disconnect the brake hose from the caliper. If not, secure the caliper

with wire.

CAUTION: Do not let the caliper hang with its weight on the brake hose.

11. Compress the anti-rattle clip and remove the inner pad from the caliper.

Brake Caliper: Fundamentals and Basics Removal Notes

When Removing the Caliper, Remember...

- Prior to removing the calipers, remove/siphon brake fluid from master-cylinder until the reservoir is only 1/3 full.

- Brake fluid will remove paint and damage electrical connections. Use a drip pan and fender covers to protect the vehicle's finish and electrical system.

- Always replace all brake linings on an axle. Never replace only one wheel. Unequal lining thickness between wheels on the same axle will result in a strong steering pull when the brakes are applied.

- Work on one side at a time. If you forget how to reassemble the parts you can always use the other side as a model.

- When forcing the piston back into the caliper, open the bleeder valve first. Corrosion and other deposits accumulate inside of the caliper. If the bleeder valve is not opened when the piston is forced back into the caliper, these deposits will be forced back through the brake lines and into the master-cylinder.

-

When pushing the pistons back into the caliper with the bleeder screw open, a stream of brake fluid will be expelled from the bleeder screw for 2-3 feet. Use a drip pan and be careful not to "shoot" brake fluid onto the vehicle's finish. A cleaner method is to use a piece of clear plastic hose and a glass or plastic jar to catch the expelled fluid.

- Upon removal, Do Not allow the calipers to hang by the flexible brake hoses. The brake hoses can be damaged easily by this practice. These hoses are double walled, damage to the interior pressure hose will not be visible.

- Do not depress the brake pedal with either caliper removed from the rotor. The caliper pistons will be inadvertently expelled from the caliper. If this occurs rebuild or replace the caliper, do not attempt to insert the piston back into the caliper.

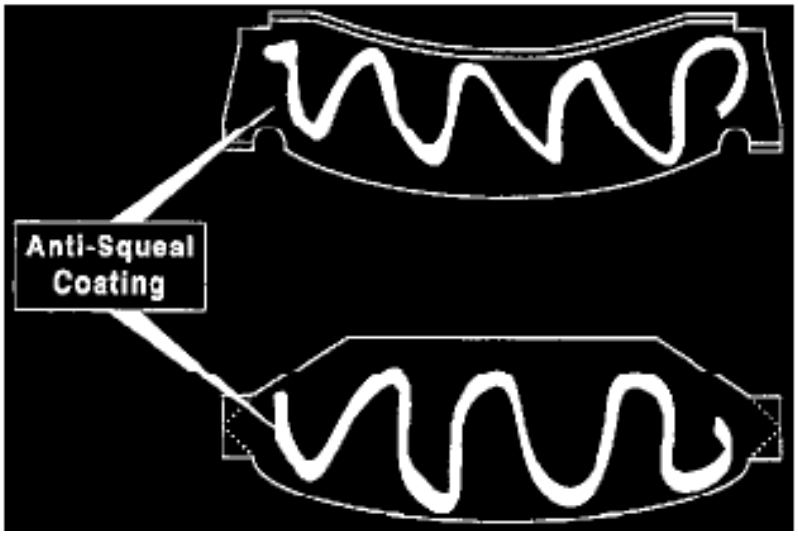
Caliper Slides On Frame



Anti-Squeal
Coating

Brake Caliper: Fundamentals and Basics Installation Notes

WHEN INSTALLING CALIPERS AND PADS, REMEMBER...

- Clean and lubricate caliper slide joint/pins with high temperature silicone grease:

Unlike drum brakes, disc brakes do not utilize a spring to withdraw the pads/linings when the brake pedal is released. Disc brakes rely on the elasticity of the piston seals, and the unrestricted movement of the caliper slide assemblies to release the brakes.

If the slide joints/pins are not cleaned and lubricated properly the disc brake linings will drag upon the release of the brake pedal. This will result in overheated brakes and premature brake wear.

Disc Brake Mechanical Force Diagram

NOTE: Floating calipers require free and unrestricted movement on the caliper mounting. Floating or sliding calipers have pistons only on one side of the rotor. The first part of the piston's travel forces the inner pad against the rotor, then further travel forces the movable part of the caliper to pull the outer pad against the rotor.

High temperature silicone lubricant must be used. Low temperature grease can melt and contaminate the pads and rotors, or can bake into a very hard substance which binds the slides. Petroleum based grease can cause the slide boots to soften and swell.

-

Work on one side at a time. If you forget how to reassemble the parts you can always use the other side as a model.

Anti-squeal Coating

- Apply an anti-squeal coating to the back side of the pads/linings. This coatings acts as an insulator to dampen high frequency vibrations that are generated during normal braking. These compounds are highly effective in preventing brake squeal.

- Many professional repair shops recommend always rebuilding or replacing the calipers when replacing the brake linings, because:

When the pistons are forced back into the calipers, the piston seals are dragged across any corrosion or abrasives that may be deposited on the inside of the caliper.

Damage to the seals may not be initially evident. As the new brake linings begin to wear, the piston is gradually withdrawn from the caliper.

This results in the piston seals again being dragged across the layer of corrosion and deposits.

Calipers which are not rebuilt or replaced have a higher probability of sticking or leaking.

- Check to ensure the bleeder screw is not frozen prior to reinstalling caliper. Freeing a stuck bleeder screw is much easier with the caliper removed from the vehicle.

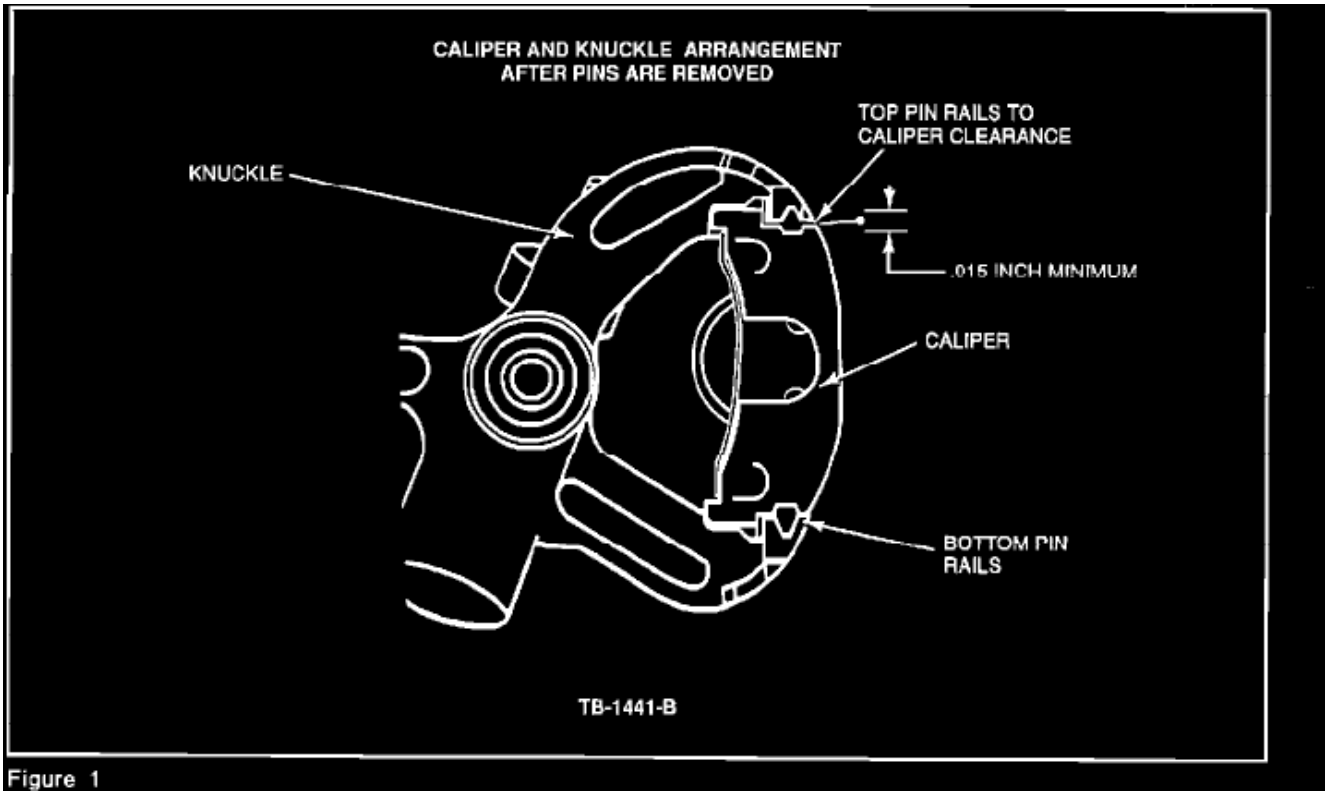


Figure 1

Brake Pad: Customer Interest Front Brakes - Popping or Clunking Noise

Article No. 92-14-7

07/01/92

^ BRAKES - FRONT DISC - "POPPING" OR "CLUNKING" SOUND DURING BRAKING

^ NOISE - "POPPING" OR "CLUNKING" SOUND WHEN BRAKING

^ VIBRATION THROUGH FLOOR BOARD WHEN BRAKING

LIGHT TRUCK: 1989-90 BRONCO II 1989-92 AEROSTAR, RANGER 1991-92 EXPLORER

See TSB # 93-20-11 for additional information.

ISSUE: A "popping" or "clunking" noise and a floor board vibration may occur during braking. The noise and/or vibration may be caused by the front brake caliper suddenly springing away from the caliper abutment and returning.

ACTION: Check and adjust the brake pads and caliper knuckle clearance by using the following service procedure.

1. Road test to confirm that the "popping" or "clunking" noise occurs only during braking at the initial part of the stop.

2. Raise the front of the vehicle.

a. Remove the front wheels.

b. Remove the pins from the caliper.

3. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails.

NOTE:

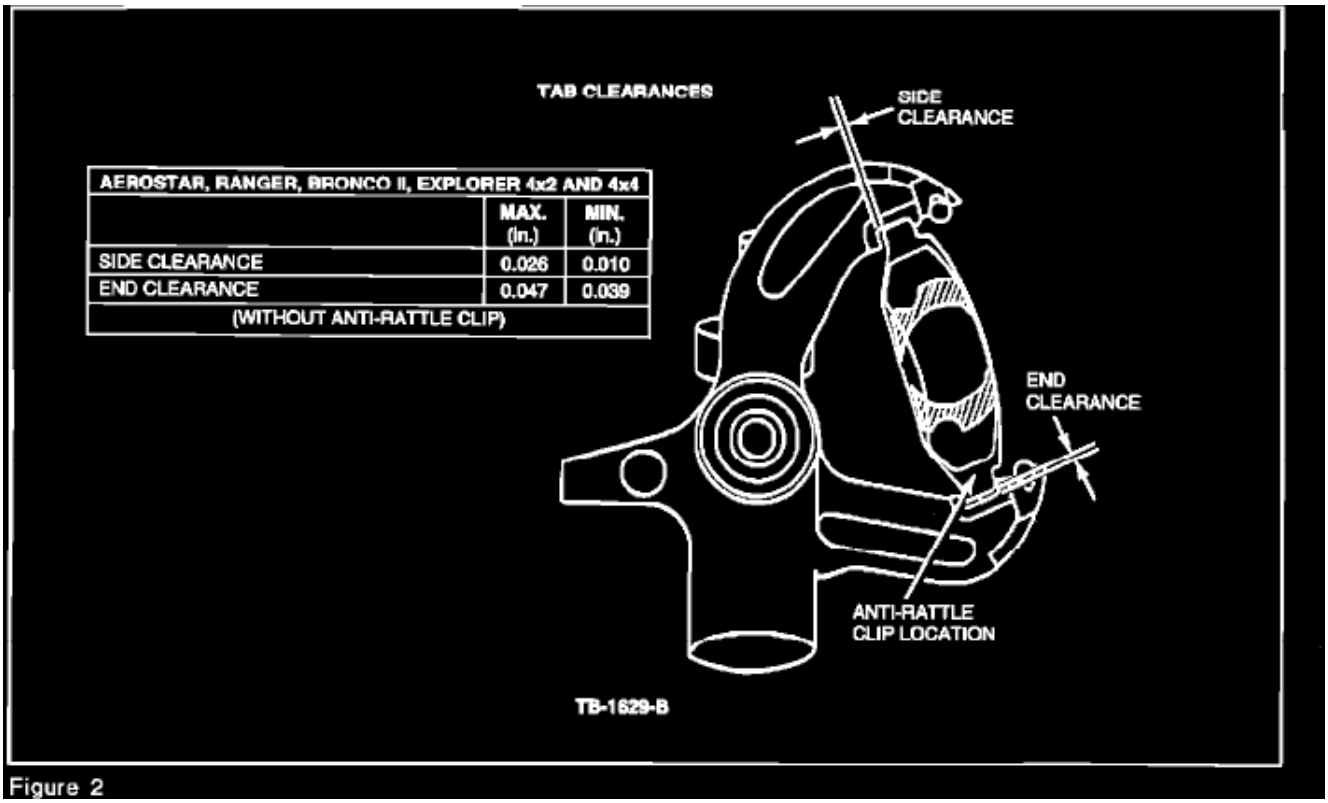

Figure 2

THE CLEARANCE SHOULD BE A MINIMUM OF .015" (.381 MM).

a. If the caliper clearance is less than .015" (.381 mm) on either caliper, replace the caliper and repeat the measurements.

b. If the caliper clearance is less than .015" (.381 mm) on both calipers, replace both calipers and recheck clearance.

c. If the caliper clearance is still less than .015" (.381 mm) on both calipers, replace both spindles (4X2) or knuckles (4X4) and recheck clearance.

NOTE: CHECK THE CLEARANCE OF THE NEW KNUCKLE BEFORE INSTALLATION.

4. After measuring the caliper/knuckle for proper clearance, remove both calipers and brake pad assemblies. Refer to the appropriate Light Truck Service Manual, Section 06-03, for the removal procedure.

5. Replace the caliper piston (FOTZ-2196-A). Refer to the appropriate Light Truck Service Manual, Section 06-03, for the replacement procedure.

6. Install the new lining kit (FO9Z-2001-A).

a. Check the side and end clearances with a feeler gauge.

b. Refer to Figure 2 for clearance dimensions.

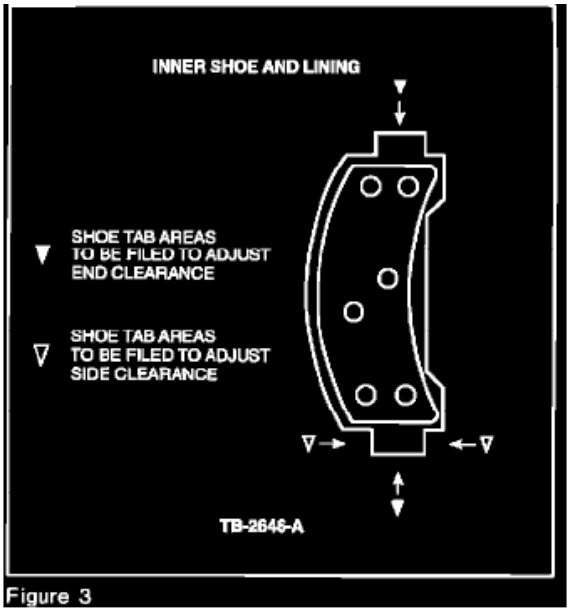

Figure 3

7. If the lining clearance is not to the required dimensions, file the shoe tab. Remove equal amounts from both sides and ends, Figure 3.

WARNING: USE SAFETY GLASSES WHEN FILING THE BACKING PLATES.

CAUTION: DO NOT GRIND. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

8. Assemble the brakes and caliper pins (E8TZ-2C150-B). Lubricate the caliper pins with disc brake lubricant (D7AZ-19590-A). Refer to the appropriate Light Truck Service Manual, Section 06-03, for assembling details.

9. Apply a light coat of disc brake lubricant (D7AZ-19590-A) to the inner knuckle top and bottom pad groove. Also apply a light coat of disc brake lubricant (D7AZ-19590-A) to the caliper rails.

CAUTION: PREVENT LUBRICANT FROM STICKING TO ROTORS, LININGS OR CALIPER PISTON BOOTS.

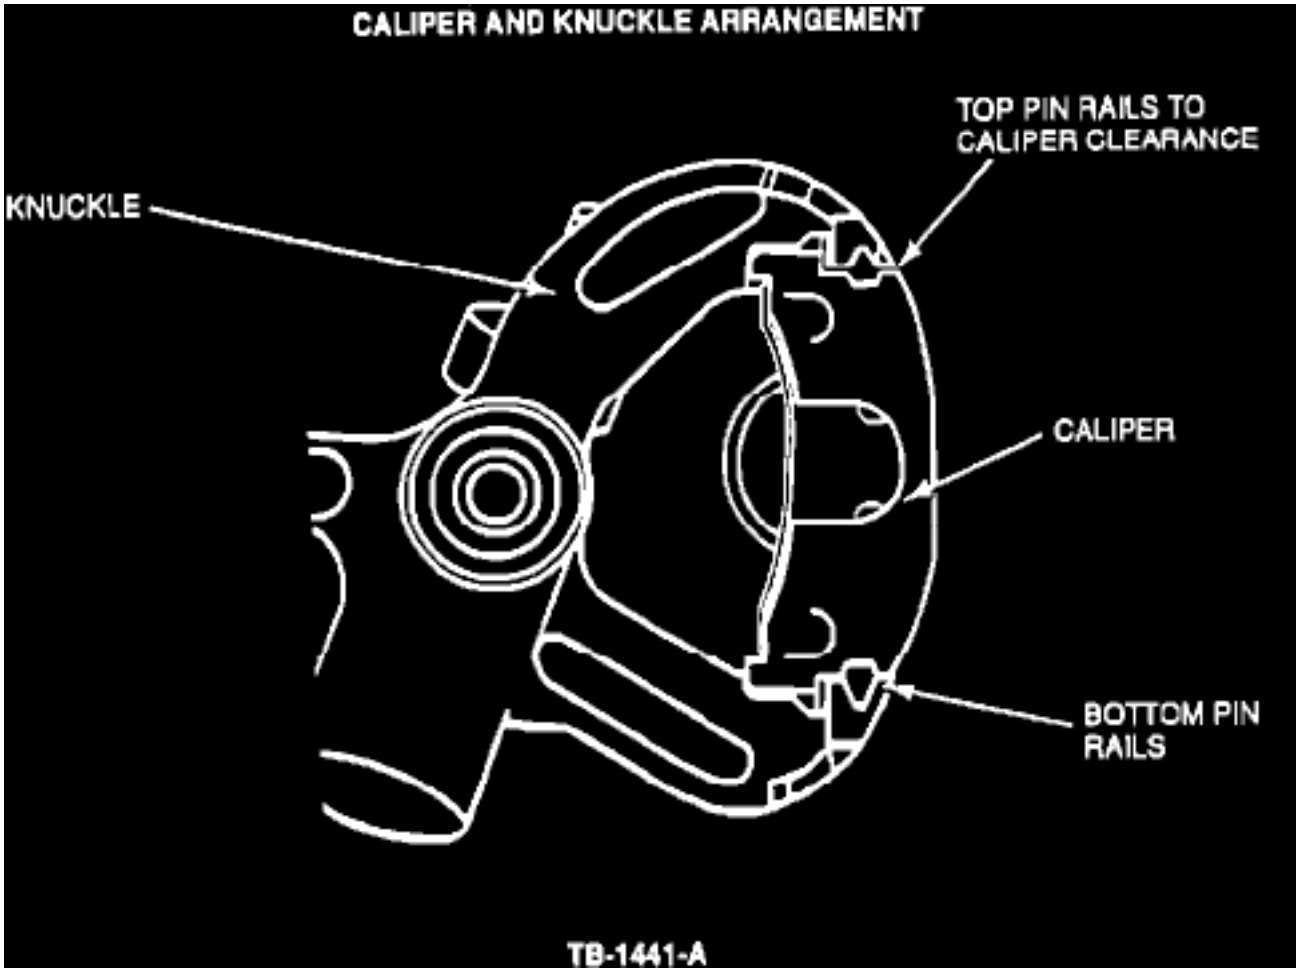
WARRANTY STATUS AND OPERATION DESCRIPTION



Technical Service Bulletin # 9097 Date: 900427

Steering/Suspension - Pull/Drift Diagnostic Procedure

^ BRAKES - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

^ STEERING - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

Article No. 90-9-7

LIGHT TRUCK: 1988-90 BRONCO II, RANGER 1991 EXPLORER

ISSUE: A comprehensive, pull and drift diagnostic procedure has been developed to assist techicians with truck service.

ACTION: Use the following service procedure to resolve drift and pull concerns.

This is the same basic procedure as published in TSB 90-7-16 for the 1988-90 Bronco and F-150, 4x4 models. However, you should note that there are some differences such as replacing radius arm bushings instead of installing a radius arm bracket kit, etc.

Proceed with the Pull and Drift Diagnostic Procedure if the pull or drift is not significantly reduced or where there is a case of steady state drift (no braking).

A Diagnostic Check List has been provided at the end of this article to use with this procedure.

NOTE: THIS TSB ARTICLE SHOULD BE READ COMPLETELY BEFORE PERFORMING DIAGNOSTICS OR REPAIRS.

Service Procedure

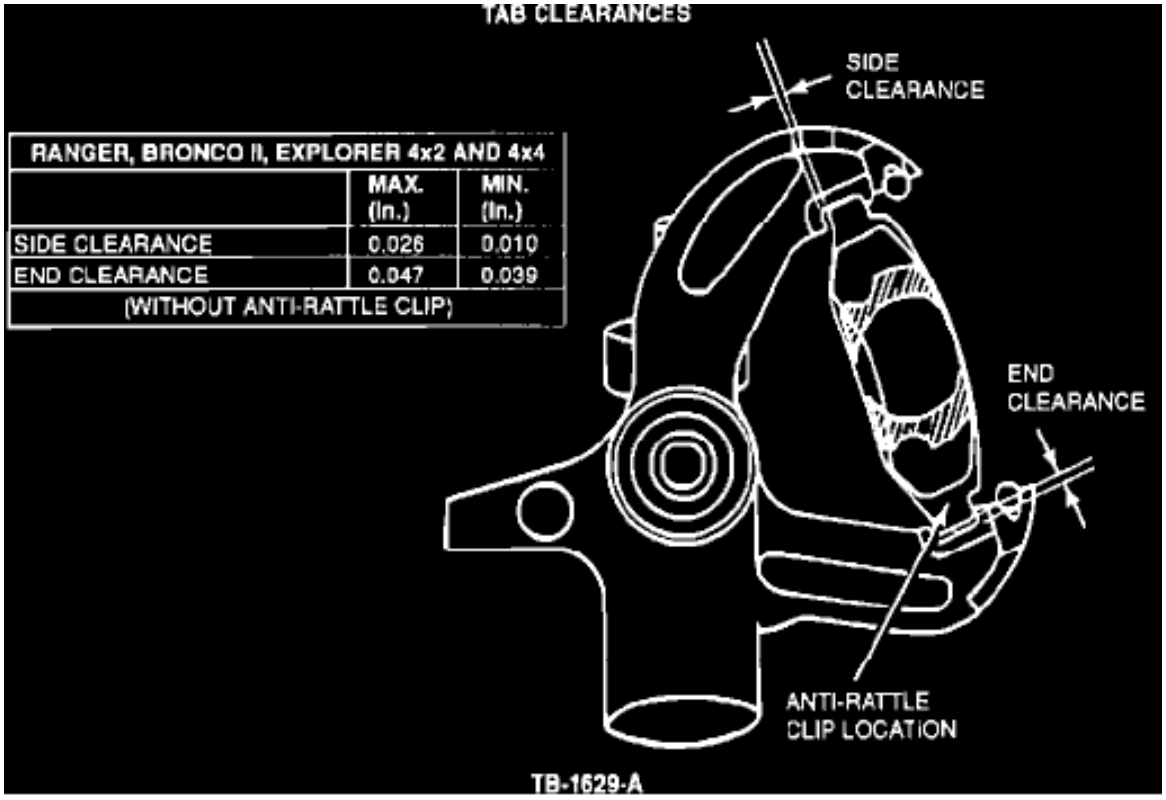
Figure 1

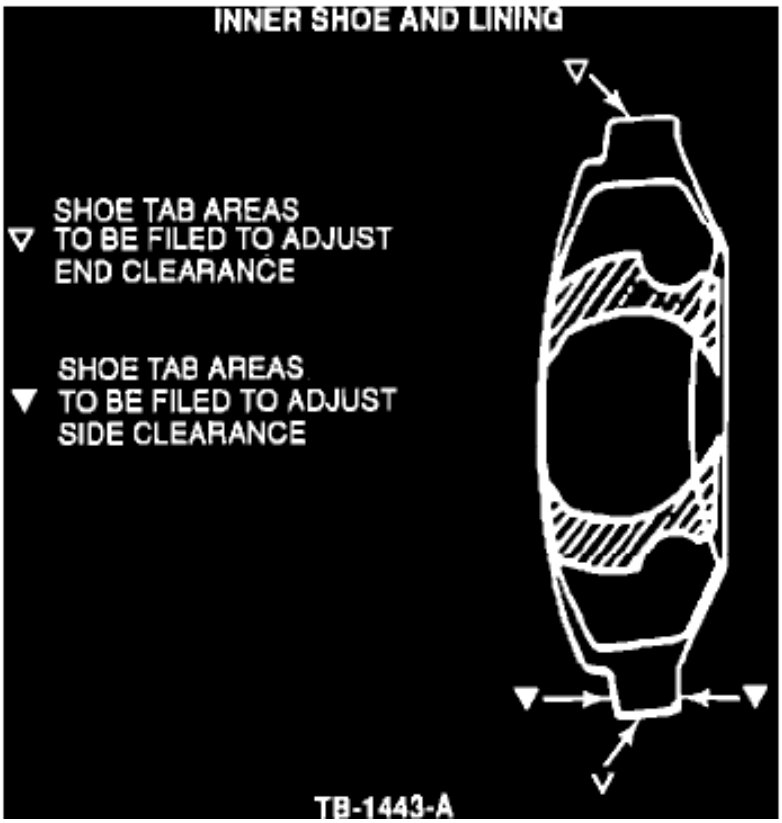
1. Check and adjust brake pad clearances and caliper knuckle clearances as follows:

a. Remove the pins from the caliper.

b. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails.

Clearance should be a minimum of .015 ".





c. If the clearance is insufficient, replace the caliper and measure again. If clearance concern still exists, replace the knuckle.

NOTE: CHECK THE CLEARANCE ON THE NEW KNUCKLE BEFORE INSTALLATION.

d. After measuring the caliper/knuckle for proper clearances, remove both calipers and inner pad assemblies.

e. Remove the anti-rattle clip from the inner pad.

Figure 2

Figure 3

f. Re-install pad and check the side and end clearances with a feeler gauge. (See Figure 2 for clearance dimensions.)

g. If the pad clearances are within specification, refer to Service Procedure Step 2 - "Caliper Groove Lubrication". If the pad clearances are not to the

required dimensions, file the steel backing plate.

WARNING: USE SAFETY GLASSES WHEN FILING STEEL BACKING PLATES

h. File material, removing equal amounts from both sides or ends. (See Figure 3.)

CAUTION: DO NOT GRIND. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

i. Check the tab clearances and install anti-rattle clip on the lower pad tab, Figure

2.

2. Apply a light coat of lubricant (D7AZ-19590-A) to the inner knuckle top and bottom pad groove and caliper rails. CAUTION:

MAKE SURE THE LUBRICANT DOES NOT GET ON THE ROTORS, LININGS, OR ON THE CALIPER PISTON BOOTS.

3. Replace the right and left side arm bushings with new bushings (FITZ-3B203-A). Refer to the appropriate Light Truck Shop Manual, Section 04-OIC

for service details.

NOTE: THE EXPLORER IS ALREADY EQUIPPED WITH THE NEW RADIUS ARM BUSHINGS.

Pull Drift Diagnostic Procedure

The Pull Drift Diagnostic Procedure should be used if the pull or drift is not significantly reduced with the service procedure or in cases of a steady state drift (no braking).

Test drive the truck with the customer to understand his/her pull or drift concern. Many customers will call a clear vision concern a pull or drift because the steering wheel is not straight.

Pull or drifts come from various sources, each with a particular set of symptoms. Careful road test evaluation usually will pinpoint which cause (or causes) are present.

The Road Test

It is important to test drive the truck with the customer to UNDERSTAND HIS OR HER CONCERN.

Complete the road test before beginning any repairs since you may have multiple causes that need to be identified.

^ The road test should be done on a flat, straight road and should be done in both directions to account for wind.

^ Tire pressure should be checked and adjusted, if necessary.

^ A second person in the truck during the road test is helpful. Unless otherwise directed, the second person must remain in the front RH passenger location.

^ On trucks with automatic locking hubs, it is necessary to drive (20) feet forward and then backwards to unlock the hubs.

ROAD TEST	RESULT	ACTION
Maintain a steady speed of 50-55 mph (80-89 km/h). **DO NOT BRAKE**	Is there a steady state pull? If no, go to the next step.	**See Diagnostic Procedure 1.** Tire mismatch or tire pressure concern
While stopped, have second person move to the left hand rear passenger location. Maintaining 50-55 mph (80-89 km/h).	Any change in pull? If no change, go to next step.	**See Diagnostic Procedure 2** Caster split
Make sure front hubs are unlocked (if equipped*). Accelerate the truck - decelerate the truck using **engine braking only.**	Any changes in the pull? Does it pull one way on acceleration and another way on deceleration? If no, go to next step.	**See Diagnostic Procedure 3.** Possible limited slip rear axle and tire circumference
Maintain a steady speed of 50-55 mph (80-89 km/h). Put the vehicle in neutral and shut off the engine.	Does the pull go away? If no, go to the next step.	**See Diagnostic Procedure 4.** Steering gear valve off center
Stop the truck along the highway. Rotate the wheel full left. Proceed with road test.	Does the pull get better or worse? Stop the truck; rotate the wheel full right. Does the pull change - better or worse? If no, go to next step.	**See Diagnostic Procedure 5.** Possible Rubber Ball Socket (RBS) memory steer
In a safe clear area, while firmly holding the steering wheel, apply the brakes moderately hard, but not to the point of engaging RABS.	Does the trucks heading change during brake application? If no, go to next step.	**See Diagnostic Procedure 6.** Possible brake imbalance.
Disconnect the fluid level sensor (disable RABS). Brake the truck from 50 mph (80 km/h).	Does the vehicle pull with A/L disconnected? If no, go to next step.	**See Diagnostic Procedure 6** Possible inadequate rear brake application
Brake the truck hard, to the point of lock-up (RABS disabled).	Do both rears lock? Do both wheels lock at the same time?	**See Diagnostic Procedure 6** Possible unequal rear brake application

NOTE: IT IS POSSIBLE THAT THE TRUCK MAY HAVE MULTIPLE SYMPTOMS. A ROAD TEST/CAUSE CHART FOLLOWS.

NOTE: RECONNECT THE FLUID LEVEL SENSOR AFTER ROAD TEST

Diagnostic Procedure # 1 - Tire Mismatch

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the diagnostic procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to RPO (regular production option) list and set tire psi to the correct value.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only.

Set tire pressure to value on the certification label.

1. Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Tire Pull - Swap the front tires from side to side and road test. If the concern is not corrected, continue with next step.

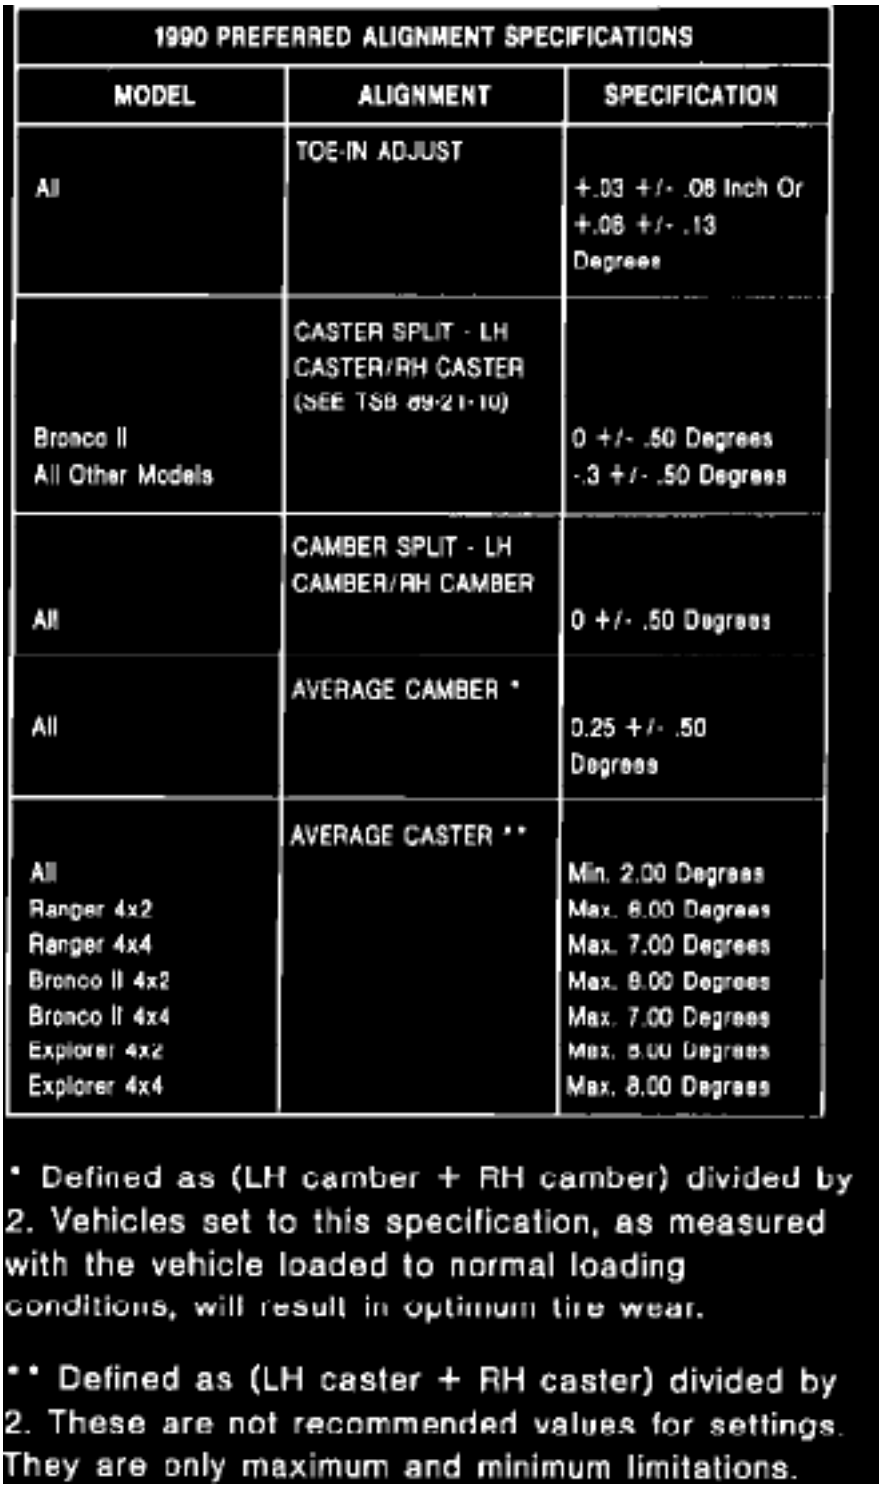
3. Tire Pull - Swap rear tires from side to side and road test. If the concern is not corrected, continue with next step.

4. Tire Pull - Swap front tires from front to rear. Set the tire pressure to the required pressure for the new front and rear positions, then road test.

NOTE: ON REAR LIMITED SLIP AXLE (FRONT HUB UNLOCKED) DRIFT CONCERNS, IT MAY BE NECESSARY TO MEASURE TIRE

CIRCUMFERENCE AND PLACE A MATCHED SET OF TIRES ON THE REAR AXLE.

Diagnostic Procedure # 2 - Alignment



1990 PREFERRED ALIGNMENT SPECIFICATIONS		
MODEL	ALIGNMENT	SPECIFICATION
All	TOE-IN ADJUST	+.03 +/- .08 Inch Or +.08 +/- .13 Degrees
Bronco II All Other Models	CASTER SPLIT - LH CASTER/RH CASTER (SEE TSB 89-21-10)	0 +/- .50 Degrees -.3 +/- .50 Degrees
All	CAMBER SPLIT - LH CAMBER/RH CAMBER	0 +/- .50 Degrees
All	AVERAGE CAMBER *	0.25 +/- .50 Degrees
All Ranger 4x2 Ranger 4x4 Bronco II 4x2 Bronco II 4x4 Explorer 4x2 Explorer 4x4	AVERAGE CASTER **	Min. 2.00 Degrees Max. 8.00 Degrees Max. 7.00 Degrees Max. 8.00 Degrees Max. 7.00 Degrees Max. 8.00 Degrees Max. 8.00 Degrees

* Defined as (LH camber + RH camber) divided by 2. Vehicles set to this specification, as measured with the vehicle loaded to normal loading conditions, will result in optimum tire wear.

** Defined as (LH caster + RH caster) divided by 2. These are not recommended values for settings. They are only maximum and minimum limitations.

Wheel Alignment - Measure the front wheel alignment. For out of specification vehicles, align to the "1990 Preferred Alignment Specifications" stated in this article.

^ Spin the front tires to be sure that the front hubs are unlocked, if hubs are unlocked, the axle shaft will not rotate with the wheels.

^ Do not adjust wheel alignment to correct for brake pull if the vehicle does not have pull during non-brake applications.

^ Set the tire pressure to the specification on the certification label.

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the diagnostic procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to HPO (regular production option) list and set tire pressure to the correct value.

^ IF THE TIRES AND WHEELS DO NOT MATCH CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only.

Drive vehicle after alignment is performed. ^

Vehicles which exceed the maximum average caster value shown above may result in shimmy concerns.

^ Vehicles operated below the minimum average caster value shown can result in wander and poor steering returnability concerns.

If the vehicle is not within these minimum and maximum average caster values, or if the vehicle has experienced any of these listed steering/handling concerns, the average caster should be set in accordance with ride height/caster chart in the Shop Manual.

Diagnostic Procedure # 3 - Tires

1. Spin the front tires to be sure that the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Measure tire circumference of all four tires; put the two closest circumference tires on the rear axle. Tire pressure must be equal on all tires.

Diagnostic Procedure # 4 - Steering Gear Valve Off Center

Rotary Valve Centering Check: To confirm that you are looking at a steering gear valve concern, lift the front wheels off the ground.

^ The truck should be raised so that there is no interference with the steering linkage.

^ The front wheels should also spin freely.

With the wheels in a straight ahead position, start the engine and observe any steering wheel or linkage movement when the engine is started. If any movement is observed, continue with the rotary valve centering check.

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Install a 0-13,789 kPa (0-2000 psi) pressure-gauge (Tool D79L-33610-A, Power Steering Analyzer) in the pressure line between the power steering

pump outlet port 1 and the integral steering gear inlet port. Make sure the valve on the gauge is fully open.

3. Check the fluid level in the reservoir. Add Premimum Power Steering Fluid - E6AZ-19582-AA (ESW-M2C33-F) or equivalent, if necessary.

4. Start the engine and turn the steering wheel from stop-to-stop to bring the steering lubricant to normal operating temperature. Turn off the engine and

re-check the fluid level. Add Premium Power Steering Fluid - E6AZ-19582-AA (ESW-M2C33-F) or equivalent, if necessary.

5. With the engine running at approximately 1000 rpm and the steering wheel centered, attach an lb.in. torque wrench to the steering wheel nut. Apply

sufficient torque in each direction to get a gauge reading of 1723 kPa (250 psi).

6. The torque wrench readings should be the same in both directions at 1723 kPa (250 psi). If the difference between the readings exceeds 6 lb.in. (0.68

N-m), remove the steering gear and replace the shaft and control assembly.

7. Remove the pressure gauge installed in Step 2.

Diagnostic Procedure # 5 - Rbs Linkage

If the RBS linkage is determined to have wind up or memory steer, replace RBS linkage with greasable steel linkage.

NOTE: ALL SERVICE PART STEERING LINKAGE IS THE GREASABLE STEEL SOCKET TYPE.

Diagnostic Procedure # 6 - Brake Imbalance

Spin the front tires make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Check for front wheel rotational drag with warm/hot brakes.

a. Make a series of 10 stops from speeds of 30 mph (48 km/h).

b. Make the 10 stops with no more than 30 second intervals between stops. This generally will induce a maximum pull if there is a drift/pull

concern.

c. Raise the front end of the truck so that both tires are off the ground.

d. Rotate the front wheels by hand.

NOTE: FOR ALL 4 WHEEL DRIVE TRUCKS, MAKE SURE THE HUBS ARE DISENGAGED.

Both tires should rotate about the same amount, with little brake drag occurring. Some brake drag will naturally be present for each size of truck.

3. If the truck has excess brake drag, proceed as follows:

a. Open the bleed screw on the affected wheel to check for residual pressure in the brake lines. If there is a squirt of brake fluid out the bleeder

screw and the drag is reduced or eliminated, the master cylinder may not be allowing the brake fluid to return to the reservoir.

b. Check the master cylinder push rod adjustment. Refer to the appropriate Light Truck Shop Manual, Section 06-06 for service details.

c. Check the brake pedal to determine if it is fully returning.

4. Remove both calipers and check piston retraction using a "C" clamp and wooden block. The piston should easily move back into the bore under the

force of the clamp. Re-build or replace as needed.

5. If Steps 1 through 4 have not determined the concern, swap rotors and linings from side to side.

NOTE: SHOE TAB CLEARANCES SHOULD BE CHECKED AND MODIFIED IF NEEDED. SEE FIGURE 2.

6. Test drive the vehicle with 10 or more stops from 40 mph before evaluating for brake drift. If there is no change in drift while braking, it may be

assumed the concern is not the result of the front brakes.

7. Check the rear brakes. Remove the rear wheels and brake drums.

a. Check for contaminates (i.e., grease, axle lube, leaking brake fluid, etc.).

b. Check for broken components, frozen parking brake cables and improperly installed parts.

c. Check the cage diameter using the Brake Shoe Adjustment Gauge (D81L-1103-A). If either side is out of specification, check for proper

function of the adjusting mechanism and repair or replace as required.

d. Check the rear wheel cylinders by the following method.

^ Replace one of the brake drums.

^ Have another person apply the brakes and watch for movement of one of the brake shoes on the other wheel.

^ Re-apply the brakes while holding in place the shoe that moved. The opposite shoe should now move. If no movement is observed, repair or replace the wheel cylinder.

^ Re-install the drum and repeat the procedure for the other rear brake.

8. If the condition still exists, swap rear shoes from side to side and drive the truck. If the drift is significantly reduced, replace the rear linings. If the

drift/pull is not significantly reduced, go to Service Procedure # 7.

Diagnostic Procedure # 7 - Miscellaneous

Check for loose, damaged or excessively worn parts. Visually inspect the front suspension for loose or worn components (i.e., ball joints, radius arm bushings, radius arm attachments at the axle and frame, alignment adjusters, steering linkage, etc.). Repair or replace as required.

Diagnostic Check List

NOTE: THE FOLLOWING CHECK LIST SHOULD BE COMPLETED AFTER EACH STEP OF THE DIAGNOSTIC WHERE APPLICABLE.

SERVICE PROCEDURE

1. Checking clearances.

_ Caliper to knuckle clearance.

_ Inner shoe side and end clearance.

2. Lubrication of components.

_ Lubrication of the caliper rails and inner knuckle pad grooves.

3. Radius arm bushings.

_ Replacement of right and left side radius arm bushings.

DIAGNOSTIC PROCEDURE:

1. Tire mismatch.

_ Unlocked hubs check.

_ Front tires swapped side to side.

_ Rear tires swapped side to side.

_ Front to rear tire swap.

2. Alignment.

_ Unlocked hubs check.

_ Toe changed to _.

_ Caster changed and split is _.

_ Camber changed and split is _.

3. Tire circumference.

_ Unlocked hubs check.

_ Tire circumference checked and two closest circumference tires swapped to rear axle.

4. Steering gear valve.

_ Unlocked hubs check.

_ Install pressure gauge.

_ Check fluid level with engine off and on.

_ Apply torque to the steering wheel nut and check gauge readings.

_ Replaced the shaft and control assembly.

_ Removed the pressure gauge.

5. RABS linkage.

_ Replaced the RBS linkage.

6. Brake imbalance.

_ Unlocked hubs check.

_ Front wheel rotational drag check.

_ Master cylinder check.

_ Piston retraction check.

_ Rotors and linings swapped from side to side.

_ Rear brakes checked.

_ Rear drums and shoes swapped from side to side.

7. Miscellaneous.

_ Check for loose, damaged or worn parts.

Brake Pad: All Technical Service Bulletins Front Brakes - Popping or Clunking Noise

Article No. 92-14-7

07/01/92

^ BRAKES - FRONT DISC - "POPPING" OR "CLUNKING" SOUND DURING BRAKING

^ NOISE - "POPPING" OR "CLUNKING" SOUND WHEN BRAKING

^ VIBRATION THROUGH FLOOR BOARD WHEN BRAKING

LIGHT TRUCK: 1989-90 BRONCO II 1989-92 AEROSTAR, RANGER 1991-92 EXPLORER

See TSB # 93-20-11 for additional information.

ISSUE: A "popping" or "clunking" noise and a floor board vibration may occur during braking. The noise and/or vibration may be caused by the front brake caliper suddenly springing away from the caliper abutment and returning.

ACTION: Check and adjust the brake pads and caliper knuckle clearance by using the following service procedure.

1. Road test to confirm that the "popping" or "clunking" noise occurs only during braking at the initial part of the stop.

2. Raise the front of the vehicle.

a. Remove the front wheels.

b. Remove the pins from the caliper.

3. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails.

NOTE:

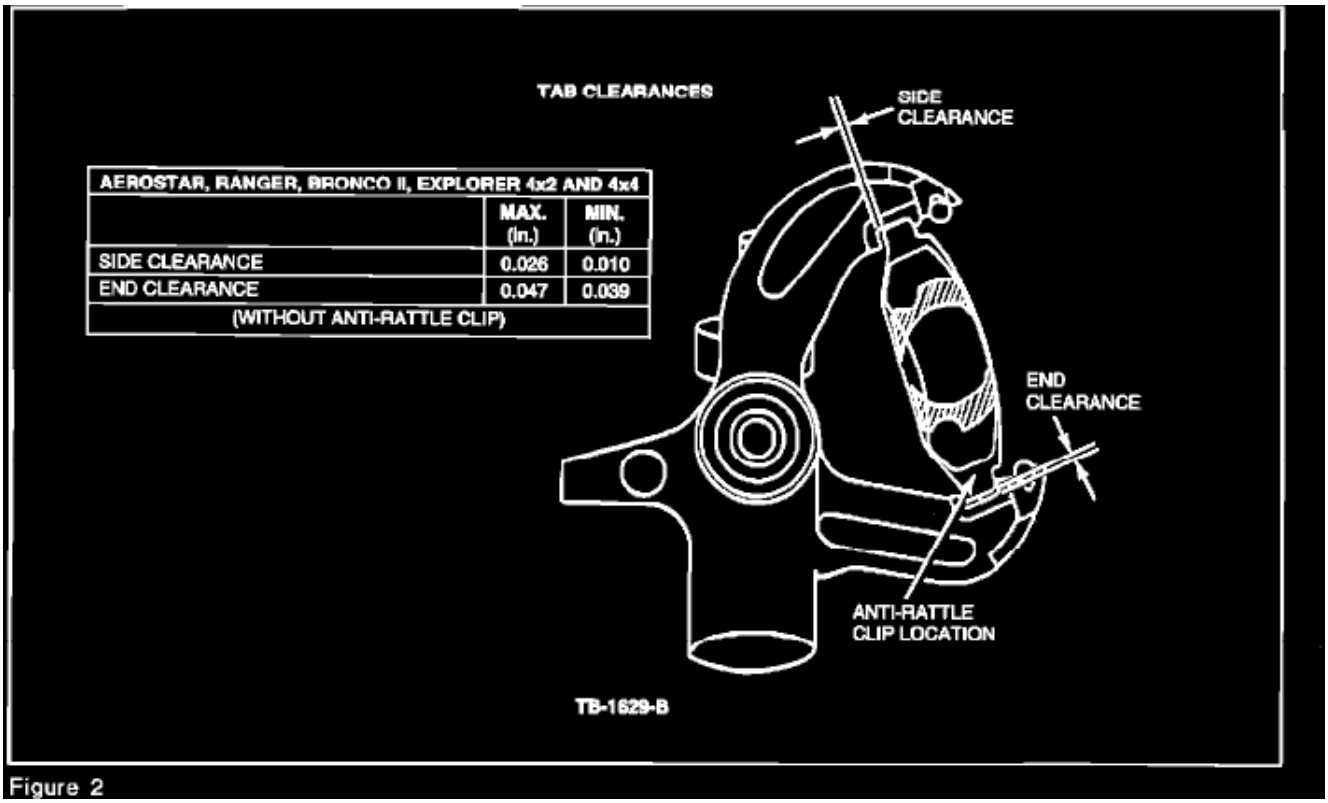

Figure 2

THE CLEARANCE SHOULD BE A MINIMUM OF .015" (.381 MM).

a. If the caliper clearance is less than .015" (.381 mm) on either caliper, replace the caliper and repeat the measurements.

b. If the caliper clearance is less than .015" (.381 mm) on both calipers, replace both calipers and recheck clearance.

c. If the caliper clearance is still less than .015" (.381 mm) on both calipers, replace both spindles (4X2) or knuckles (4X4) and recheck clearance.

NOTE: CHECK THE CLEARANCE OF THE NEW KNUCKLE BEFORE INSTALLATION.

4. After measuring the caliper/knuckle for proper clearance, remove both calipers and brake pad assemblies. Refer to the appropriate Light Truck Service Manual, Section 06-03, for the removal procedure.

5. Replace the caliper piston (FOTZ-2196-A). Refer to the appropriate Light Truck Service Manual, Section 06-03, for the replacement procedure.

6. Install the new lining kit (FO9Z-2001-A).

a. Check the side and end clearances with a feeler gauge.

b. Refer to Figure 2 for clearance dimensions.

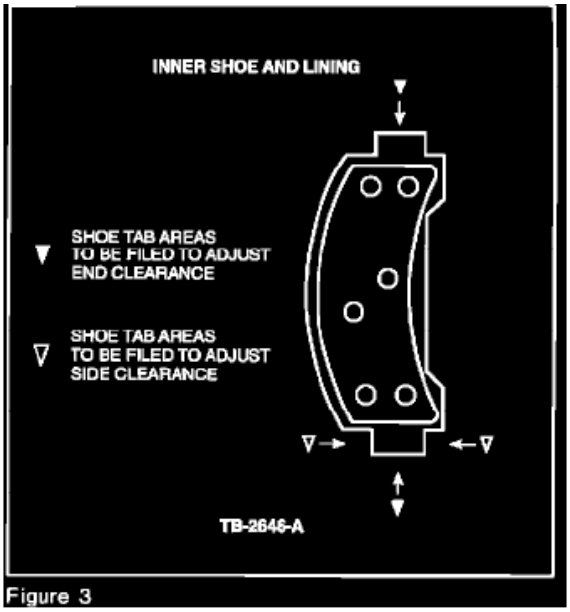

Figure 3

7. If the lining clearance is not to the required dimensions, file the shoe tab. Remove equal amounts from both sides and ends, Figure 3.

WARNING: USE SAFETY GLASSES WHEN FILING THE BACKING PLATES.

CAUTION: DO NOT GRIND. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

8. Assemble the brakes and caliper pins (E8TZ-2C150-B). Lubricate the caliper pins with disc brake lubricant (D7AZ-19590-A). Refer to the appropriate Light Truck Service Manual, Section 06-03, for assembling details.

9. Apply a light coat of disc brake lubricant (D7AZ-19590-A) to the inner knuckle top and bottom pad groove. Also apply a light coat of disc brake lubricant (D7AZ-19590-A) to the caliper rails.

CAUTION: PREVENT LUBRICANT FROM STICKING TO ROTORS, LININGS OR CALIPER PISTON BOOTS.

This TSB article is being republished in its entirety to expand the model and model year coverage.

ISSUE: Occasional or intermittent brake squeal may be cause by the brake friction material generating noise and heat in order to dissipate energy. This occasional or intermittent squeal may be a normal condition and requires no corrective action.

ACTION: If a customer is concerned about occasional or intermittent brake squeal, it should be explained that brake friction materials inherently generate noise and heat in order to dissipate energy. As a result, an occasional squeal condition may be normal, and could be affected by cold, heat, wetness, snow, salt, mud etc.

NOTE: THIS OCCASIONAL OR INTERMITTENT SQUEAL IS NOT A FUNCTIONAL PROBLEM AND DOES NOT INDICATE ANY LOSS OF BRAKE EFFECTIVENESS.

Steering/Suspension - Pull/Drift Diagnostic Procedure

^ BRAKES - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

^ STEERING - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

Article No. 90-9-7

LIGHT TRUCK: 1988-90 BRONCO II, RANGER 1991 EXPLORER

ISSUE: A comprehensive, pull and drift diagnostic procedure has been developed to assist techicians with truck service.

ACTION: Use the following service procedure to resolve drift and pull concerns.

This is the same basic procedure as published in TSB 90-7-16 for the 1988-90 Bronco and F-150, 4x4 models. However, you should note that there are some differences such as replacing radius arm bushings instead of installing a radius arm bracket kit, etc.

Proceed with the Pull and Drift Diagnostic Procedure if the pull or drift is not significantly reduced or where there is a case of steady state drift (no braking).

A Diagnostic Check List has been provided at the end of this article to use with this procedure.

NOTE: THIS TSB ARTICLE SHOULD BE READ COMPLETELY BEFORE PERFORMING DIAGNOSTICS OR REPAIRS.

Service Procedure

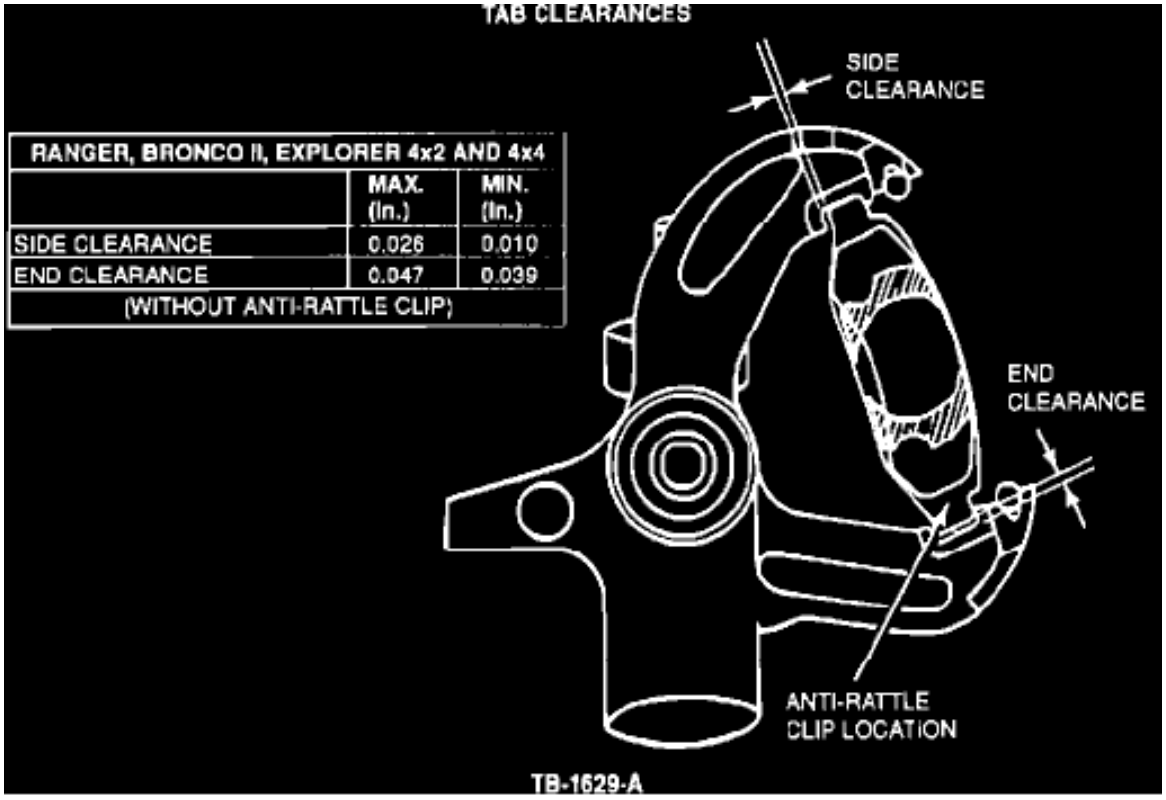
Figure 1

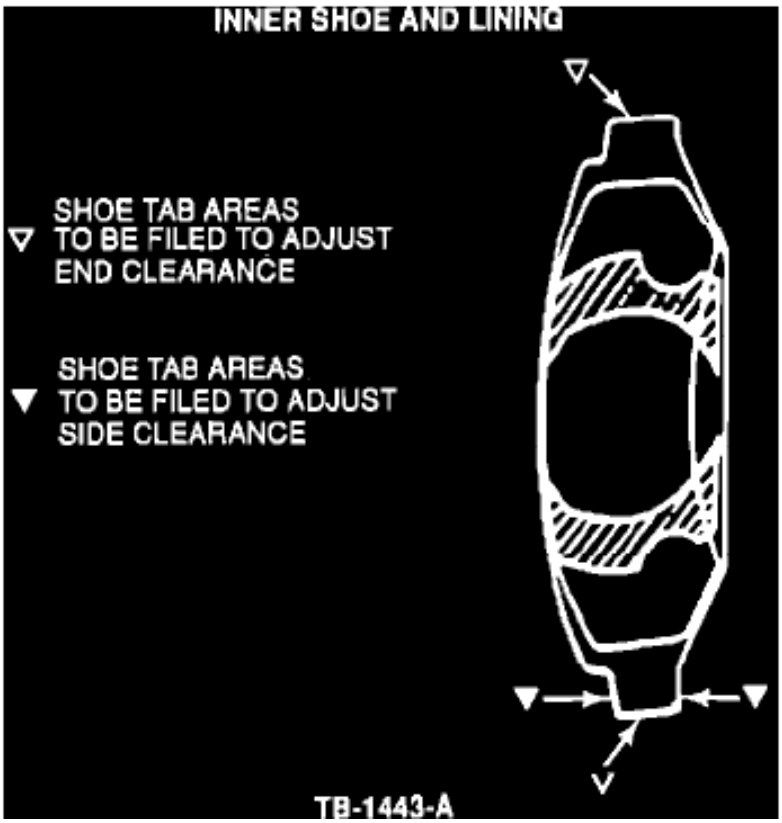
1. Check and adjust brake pad clearances and caliper knuckle clearances as follows:

a. Remove the pins from the caliper.

b. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails.

Clearance should be a minimum of .015 ".





c. If the clearance is insufficient, replace the caliper and measure again. If clearance concern still exists, replace the knuckle.

NOTE: CHECK THE CLEARANCE ON THE NEW KNUCKLE BEFORE INSTALLATION.

d. After measuring the caliper/knuckle for proper clearances, remove both calipers and inner pad assemblies.

e. Remove the anti-rattle clip from the inner pad.

Figure 2

Figure 3

f. Re-install pad and check the side and end clearances with a feeler gauge. (See Figure 2 for clearance dimensions.)

g. If the pad clearances are within specification, refer to Service Procedure Step 2 - "Caliper Groove Lubrication". If the pad clearances are not to the

required dimensions, file the steel backing plate.

WARNING: USE SAFETY GLASSES WHEN FILING STEEL BACKING PLATES

h. File material, removing equal amounts from both sides or ends. (See Figure 3.)

CAUTION: DO NOT GRIND. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

i. Check the tab clearances and install anti-rattle clip on the lower pad tab, Figure

2.

2. Apply a light coat of lubricant (D7AZ-19590-A) to the inner knuckle top and bottom pad groove and caliper rails. CAUTION:

MAKE SURE THE LUBRICANT DOES NOT GET ON THE ROTORS, LININGS, OR ON THE CALIPER PISTON BOOTS.

3. Replace the right and left side arm bushings with new bushings (FITZ-3B203-A). Refer to the appropriate Light Truck Shop Manual, Section 04-OIC

for service details.

NOTE: THE EXPLORER IS ALREADY EQUIPPED WITH THE NEW RADIUS ARM BUSHINGS.

Pull Drift Diagnostic Procedure

The Pull Drift Diagnostic Procedure should be used if the pull or drift is not significantly reduced with the service procedure or in cases of a steady state drift (no braking).

Test drive the truck with the customer to understand his/her pull or drift concern. Many customers will call a clear vision concern a pull or drift because the steering wheel is not straight.

Pull or drifts come from various sources, each with a particular set of symptoms. Careful road test evaluation usually will pinpoint which cause (or causes) are present.

The Road Test

It is important to test drive the truck with the customer to UNDERSTAND HIS OR HER CONCERN.

Complete the road test before beginning any repairs since you may have multiple causes that need to be identified.

^ The road test should be done on a flat, straight road and should be done in both directions to account for wind.

^ Tire pressure should be checked and adjusted, if necessary.

^ A second person in the truck during the road test is helpful. Unless otherwise directed, the second person must remain in the front RH passenger location.

^ On trucks with automatic locking hubs, it is necessary to drive (20) feet forward and then backwards to unlock the hubs.

ROAD TEST	RESULT	ACTION
Maintain a steady speed of 50-55 mph (80-89 km/h). **DO NOT BRAKE**	Is there a steady state pull? If no, go to the next step.	**See Diagnostic Procedure 1.** Tire mismatch or tire pressure concern
While stopped, have second person move to the left hand rear passenger location. Maintaining 50-55 mph (80-89 km/h).	Any change in pull? If no change, go to next step.	**See Diagnostic Procedure 2** Caster split
Make sure front hubs are unlocked (if equipped*). Accelerate the truck - decelerate the truck using **engine braking only.**	Any changes in the pull? Does it pull one way on acceleration and another way on deceleration? If no, go to next step.	**See Diagnostic Procedure 3.** Possible limited slip rear axle and tire circumference
Maintain a steady speed of 50-55 mph (80-89 km/h). Put the vehicle in neutral and shut off the engine.	Does the pull go away? If no, go to the next step.	**See Diagnostic Procedure 4.** Steering gear valve off center
Stop the truck along the highway. Rotate the wheel full left. Proceed with road test.	Does the pull get better or worse? Stop the truck; rotate the wheel full right. Does the pull change - better or worse? If no, go to next step.	**See Diagnostic Procedure 5.** Possible Rubber Ball Socket (RBS) memory steer
In a safe clear area, while firmly holding the steering wheel, apply the brakes moderately hard, but not to the point of engaging RABS.	Does the trucks heading change during brake application? If no, go to next step.	**See Diagnostic Procedure 6.** Possible brake imbalance.
Disconnect the fluid level sensor (disable RABS). Brake the truck from 50 mph (80 km/h).	Does the vehicle pull with A/L disconnected? If no, go to next step.	**See Diagnostic Procedure 6** Possible inadequate rear brake application
Brake the truck hard, to the point of lock-up (RABS disabled).	Do both rears lock? Do both wheels lock at the same time?	**See Diagnostic Procedure 6** Possible unequal rear brake application

NOTE: IT IS POSSIBLE THAT THE TRUCK MAY HAVE MULTIPLE SYMPTOMS. A ROAD TEST/CAUSE CHART FOLLOWS.

NOTE: RECONNECT THE FLUID LEVEL SENSOR AFTER ROAD TEST

Diagnostic Procedure # 1 - Tire Mismatch

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the diagnostic procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to RPO (regular production option) list and set tire psi to the correct value.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only.

Set tire pressure to value on the certification label.

1. Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Tire Pull - Swap the front tires from side to side and road test. If the concern is not corrected, continue with next step.

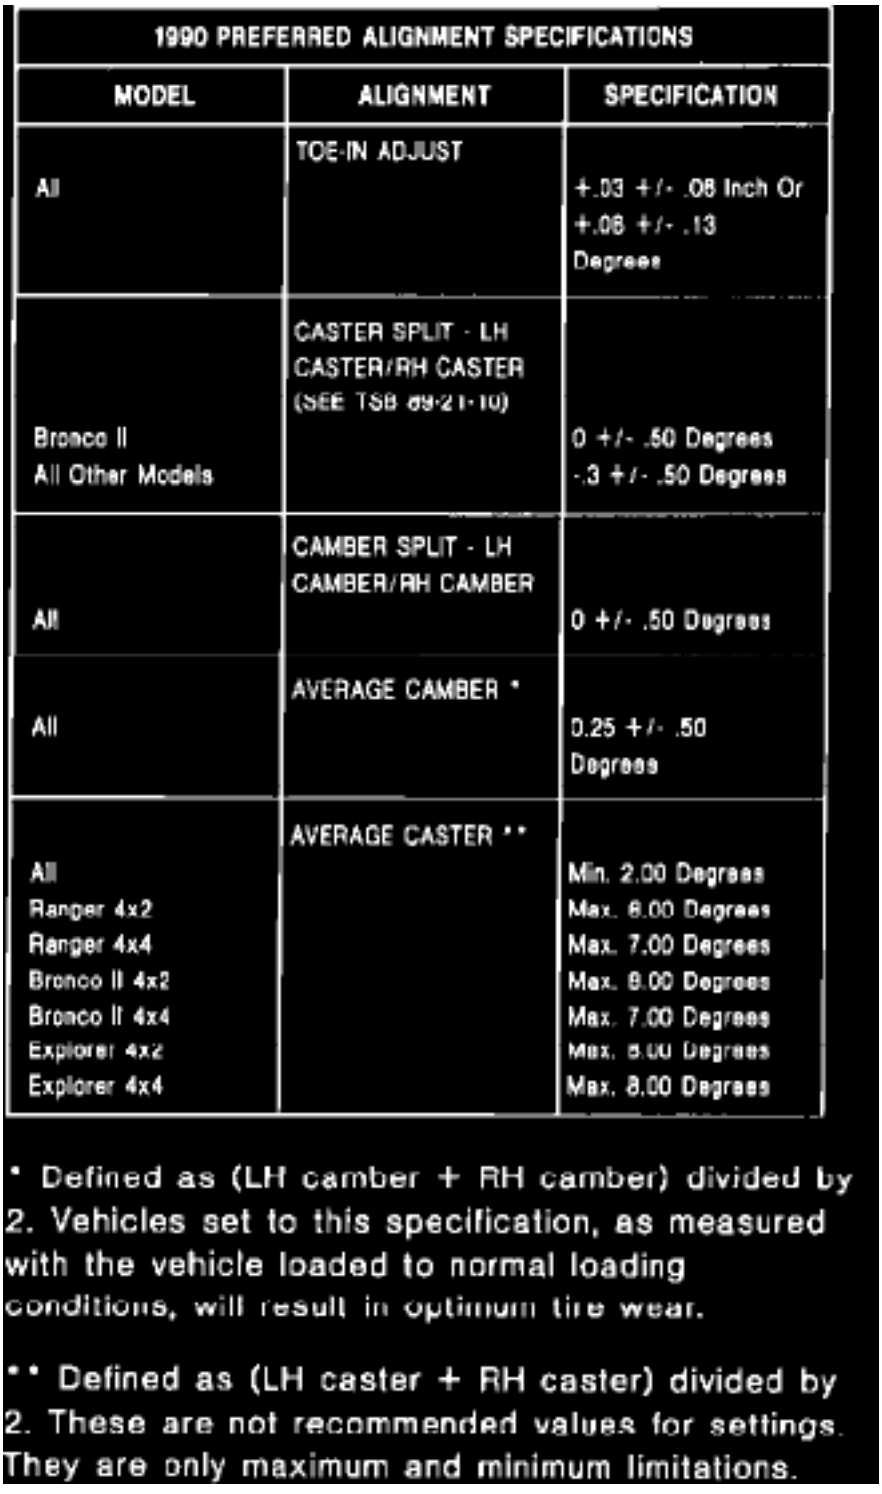
3. Tire Pull - Swap rear tires from side to side and road test. If the concern is not corrected, continue with next step.

4. Tire Pull - Swap front tires from front to rear. Set the tire pressure to the required pressure for the new front and rear positions, then road test.

NOTE: ON REAR LIMITED SLIP AXLE (FRONT HUB UNLOCKED) DRIFT CONCERNS, IT MAY BE NECESSARY TO MEASURE TIRE

CIRCUMFERENCE AND PLACE A MATCHED SET OF TIRES ON THE REAR AXLE.

Diagnostic Procedure # 2 - Alignment



1990 PREFERRED ALIGNMENT SPECIFICATIONS

MODEL	ALIGNMENT	SPECIFICATION
All	TOE-IN ADJUST	+.03 +/- .08 Inch Or +.08 +/- .13 Degrees
Bronco II All Other Models	CASTER SPLIT - LH CASTER/RH CASTER (SEE TSB 89-21-10)	0 +/- .50 Degrees -.3 +/- .50 Degrees
All	CAMBER SPLIT - LH CAMBER/RH CAMBER	0 +/- .50 Degrees
All	AVERAGE CAMBER *	0.25 +/- .50 Degrees
All Ranger 4x2 Ranger 4x4 Bronco II 4x2 Bronco II 4x4 Explorer 4x2 Explorer 4x4	AVERAGE CASTER **	Min. 2.00 Degrees Max. 8.00 Degrees Max. 7.00 Degrees Max. 8.00 Degrees Max. 7.00 Degrees Max. 8.00 Degrees Max. 8.00 Degrees

* Defined as (LH camber + RH camber) divided by 2. Vehicles set to this specification, as measured with the vehicle loaded to normal loading conditions, will result in optimum tire wear.

** Defined as (LH caster + RH caster) divided by 2. These are not recommended values for settings. They are only maximum and minimum limitations.

Wheel Alignment - Measure the front wheel alignment. For out of specification vehicles, align to the "1990 Preferred Alignment Specifications" stated in this article.

^ Spin the front tires to be sure that the front hubs are unlocked, if hubs are unlocked, the axle shaft will not rotate with the wheels.

^ Do not adjust wheel alignment to correct for brake pull if the vehicle does not have pull during non-brake applications.

^ Set the tire pressure to the specification on the certification label.

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the diagnostic procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to HPO (regular production option) list and set tire pressure to the correct value.

^ IF THE TIRES AND WHEELS DO NOT MATCH CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only.

Drive vehicle after alignment is performed. ^

Vehicles which exceed the maximum average caster value shown above may result in shimmy concerns.

^ Vehicles operated below the minimum average caster value shown can result in wander and poor steering returnability concerns.

If the vehicle is not within these minimum and maximum average caster values, or if the vehicle has experienced any of these listed steering/handling concerns, the average caster should be set in accordance with ride height/caster chart in the Shop Manual.

Diagnostic Procedure # 3 - Tires

1. Spin the front tires to be sure that the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Measure tire circumference of all four tires; put the two closest circumference tires on the rear axle. Tire pressure must be equal on all tires.

Diagnostic Procedure # 4 - Steering Gear Valve Off Center

Rotary Valve Centering Check: To confirm that you are looking at a steering gear valve concern, lift the front wheels off the ground.

^ The truck should be raised so that there is no interference with the steering linkage.

^ The front wheels should also spin freely.

With the wheels in a straight ahead position, start the engine and observe any steering wheel or linkage movement when the engine is started. If any movement is observed, continue with the rotary valve centering check.

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Install a 0-13,789 kPa (0-2000 psi) pressure-gauge (Tool D79L-33610-A, Power Steering Analyzer) in the pressure line between the power steering

pump outlet port 1 and the integral steering gear inlet port. Make sure the valve on the gauge is fully open.

3. Check the fluid level in the reservoir. Add Premimum Power Steering Fluid - E6AZ-19582-AA (ESW-M2C33-F) or equivalent, if necessary.

4. Start the engine and turn the steering wheel from stop-to-stop to bring the steering lubricant to normal operating temperature. Turn off the engine and

re-check the fluid level. Add Premium Power Steering Fluid - E6AZ-19582-AA (ESW-M2C33-F) or equivalent, if necessary.

5. With the engine running at approximately 1000 rpm and the steering wheel centered, attach an lb.in. torque wrench to the steering wheel nut. Apply

sufficient torque in each direction to get a gauge reading of 1723 kPa (250 psi).

6. The torque wrench readings should be the same in both directions at 1723 kPa (250 psi). If the difference between the readings exceeds 6 lb.in. (0.68

N-m), remove the steering gear and replace the shaft and control assembly.

7. Remove the pressure gauge installed in Step 2.

Diagnostic Procedure # 5 - Rbs Linkage

If the RBS linkage is determined to have wind up or memory steer, replace RBS linkage with greasable steel linkage.

NOTE: ALL SERVICE PART STEERING LINKAGE IS THE GREASABLE STEEL SOCKET TYPE.

Diagnostic Procedure # 6 - Brake Imbalance

Spin the front tires make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Check for front wheel rotational drag with warm/hot brakes.

a. Make a series of 10 stops from speeds of 30 mph (48 km/h).

b. Make the 10 stops with no more than 30 second intervals between stops. This generally will induce a maximum pull if there is a drift/pull

concern.

c. Raise the front end of the truck so that both tires are off the ground.

d. Rotate the front wheels by hand.

NOTE: FOR ALL 4 WHEEL DRIVE TRUCKS, MAKE SURE THE HUBS ARE DISENGAGED.

Both tires should rotate about the same amount, with little brake drag occurring. Some brake drag will naturally be present for each size of truck.

3. If the truck has excess brake drag, proceed as follows:

a. Open the bleed screw on the affected wheel to check for residual pressure in the brake lines. If there is a squirt of brake fluid out the bleeder

screw and the drag is reduced or eliminated, the master cylinder may not be allowing the brake fluid to return to the reservoir.

b. Check the master cylinder push rod adjustment. Refer to the appropriate Light Truck Shop Manual, Section 06-06 for service details.

c. Check the brake pedal to determine if it is fully returning.

4. Remove both calipers and check piston retraction using a "C" clamp and wooden block. The piston should easily move back into the bore under the

force of the clamp. Re-build or replace as needed.

5. If Steps 1 through 4 have not determined the concern, swap rotors and linings from side to side.

NOTE: SHOE TAB CLEARANCES SHOULD BE CHECKED AND MODIFIED IF NEEDED. SEE FIGURE 2.

6. Test drive the vehicle with 10 or more stops from 40 mph before evaluating for brake drift. If there is no change in drift while braking, it may be

assumed the concern is not the result of the front brakes.

7. Check the rear brakes. Remove the rear wheels and brake drums.

a. Check for contaminates (i.e., grease, axle lube, leaking brake fluid, etc.).

b. Check for broken components, frozen parking brake cables and improperly installed parts.

c. Check the cage diameter using the Brake Shoe Adjustment Gauge (D81L-1103-A). If either side is out of specification, check for proper

function of the adjusting mechanism and repair or replace as required.

d. Check the rear wheel cylinders by the following method.

^ Replace one of the brake drums.

^ Have another person apply the brakes and watch for movement of one of the brake shoes on the other wheel.

^ Re-apply the brakes while holding in place the shoe that moved. The opposite shoe should now move. If no movement is observed, repair or replace the wheel cylinder.

^ Re-install the drum and repeat the procedure for the other rear brake.

8. If the condition still exists, swap rear shoes from side to side and drive the truck. If the drift is significantly reduced, replace the rear linings. If the

drift/pull is not significantly reduced, go to Service Procedure # 7.

Diagnostic Procedure # 7 - Miscellaneous

Check for loose, damaged or excessively worn parts. Visually inspect the front suspension for loose or worn components (i.e., ball joints, radius arm bushings, radius arm attachments at the axle and frame, alignment adjusters, steering linkage, etc.). Repair or replace as required.

PART NUMBER PART NAME CLASS

E6AZ-19582-AA Steering Fluid V

D7AZ-19690-A Lubricant AW

F1TZ-3B203-A Radius Arm Bushings, 2 B

required

Diagnostic Check List

NOTE: THE FOLLOWING CHECK LIST SHOULD BE COMPLETED AFTER EACH STEP OF THE DIAGNOSTIC WHERE APPLICABLE.

SERVICE PROCEDURE

1. Checking clearances.

_ Caliper to knuckle clearance.

_ Inner shoe side and end clearance.

2. Lubrication of components.

_ Lubrication of the caliper rails and inner knuckle pad grooves.

3. Radius arm bushings.

_ Replacement of right and left side radius arm bushings.

DIAGNOSTIC PROCEDURE:

1. Tire mismatch.

_ Unlocked hubs check.

_ Front tires swapped side to side.

_ Rear tires swapped side to side.

_ Front to rear tire swap.

2. Alignment.

_ Unlocked hubs check.

_ Toe changed to _.

_ Caster changed and split is _.

_ Camber changed and split is _.

3. Tire circumference.

_ Unlocked hubs check.

_ Tire circumference checked and two closest circumference tires swapped to rear axle.

4. Steering gear valve.

_ Unlocked hubs check.

_ Install pressure gauge.

_ Check fluid level with engine off and on.

_ Apply torque to the steering wheel nut and check gauge readings.

_ Replaced the shaft and control assembly.

_ Removed the pressure gauge.

5. RABS linkage.

_ Replaced the RBS linkage.

6. Brake imbalance.

_ Unlocked hubs check.

_ Front wheel rotational drag check.

_ Master cylinder check.

_ Piston retraction check.

_ Rotors and linings swapped from side to side.

_ Rear brakes checked.

_ Rear drums and shoes swapped from side to side.

7. Miscellaneous.

_ Check for loose, damaged or worn parts.

This TSB article is being republished in its entirety to expand the model and model year coverage.

ISSUE: Occasional or intermittent brake squeal may be cause by the brake friction material generating noise and heat in order to dissipate energy. This occasional or intermittent squeal may be a normal condition and requires no corrective action.

ACTION: If a customer is concerned about occasional or intermittent brake squeal, it should be explained that brake friction materials inherently generate noise and heat in order to dissipate energy. As a result, an occasional squeal condition may be normal, and could be affected by cold, heat, wetness, snow, salt, mud etc.

NOTE: THIS OCCASIONAL OR INTERMITTENT SQUEAL IS NOT A FUNCTIONAL PROBLEM AND DOES NOT INDICATE ANY LOSS OF BRAKE EFFECTIVENESS.

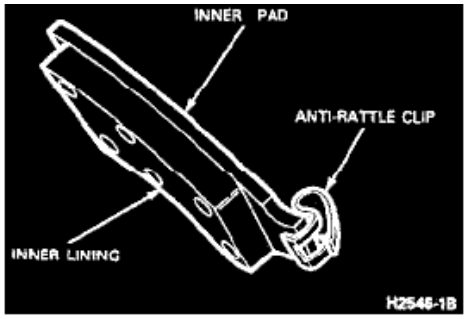
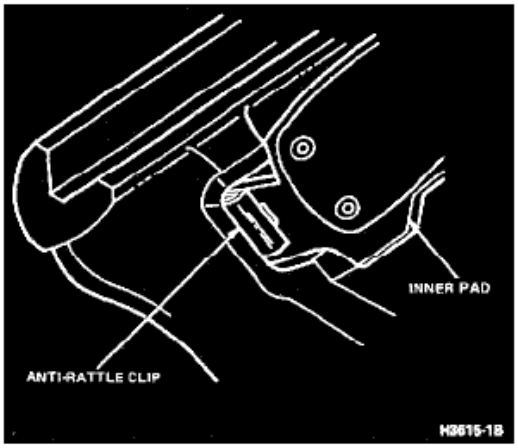
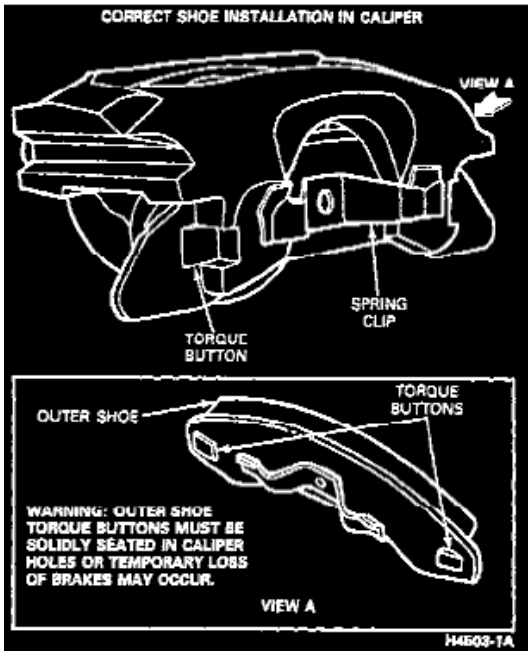
Ford Ranger 4wd Workshop Manual (V6-245 4.0L (1991))
Ford Workshop Manuals > Brakes and Traction Control > Disc Brake System > Brake Pad > Component Information > Service and Repair > Installation







Brake Pad: Service and Repair Installation

Installing Anti-Rattle Clip

1. Place a new anti-rattle clip on the lower end of the inner pad. Be sure the tabs on the clip are positioned properly and the clip is fully seated.

Installing Inner Shoe And Anti-Rattle Clip

2. Position the inner pad and anti-rattle clip in the pad abutment with the anti-rattle clip tab against the pad abutment and the loop-type spring away

from the rotor. Compress the anti-rattle clip and slide the upper end of the pad in position.

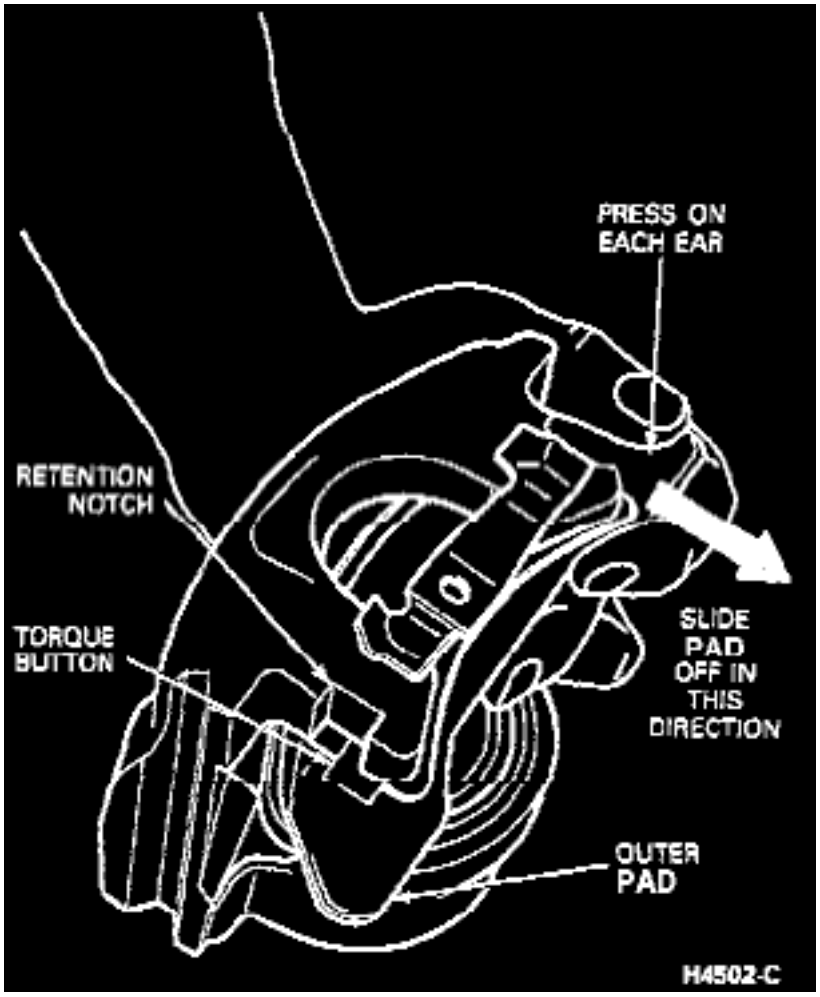
Outer Pad Installation

3. Install the outer pad, making sure the torque buttons on the pad are seated solidly in the matching holes in the caliper. 4. Install the caliper on the spindle, making sure the mounting surfaces are free of dirt and lubricate the caliper grooves with disc brake caliper

grease. See Caliper/Service and Repair See: Brake Caliper/Service and Repair

5. Install wheel and tire assembly. 6. Lower the vehicle, check the brake fluid level and fill as necessary. Check brakes for proper operation.

WARNING: Before moving vehicle, pump brake pedal several times to be sure it is firm. Do not move vehicle until a firm pedal is obtained.



Brake Pad: Service and Repair Removal

1. Remove tire and wheel assembly. 2. Remove caliper. See Caliper/Service and Repair See: Brake Caliper/Service and Repair 3. Compress the anti-rattle clip and remove the inner pad from the caliper.

Removing Outer Brake Pad

4. To remove the outer pad from the caliper, press each ear of the pad away from the caliper, slide the torque buttons out of the retention notches and

slide the pad off.

This TSB is being republished in its entirety to include the 1994 and 1995 model years.

ISSUE: On-vehicle caliper-mounted brake rotor machining equipment from Rotunda is now approved for warranty and service use. Brake roughness, pulsation and steering wheel nibble will occur when rotors wear unevenly (thickness variation). This article specifically addresses brake roughness, pulsation and steering wheel nibble resulting from disc brake rotor thickness variation induced by rotor runout.

ACTION: Use Rotunda On-Vehicle Brake Lathes 104-00129, 104-00130, 168-00004, or 168-00005 to service vehicles with brake roughness. This method is more effective because it allows machining of the rotor while it is still mounted on the vehicle. This improves the overall run-out of the assembly.

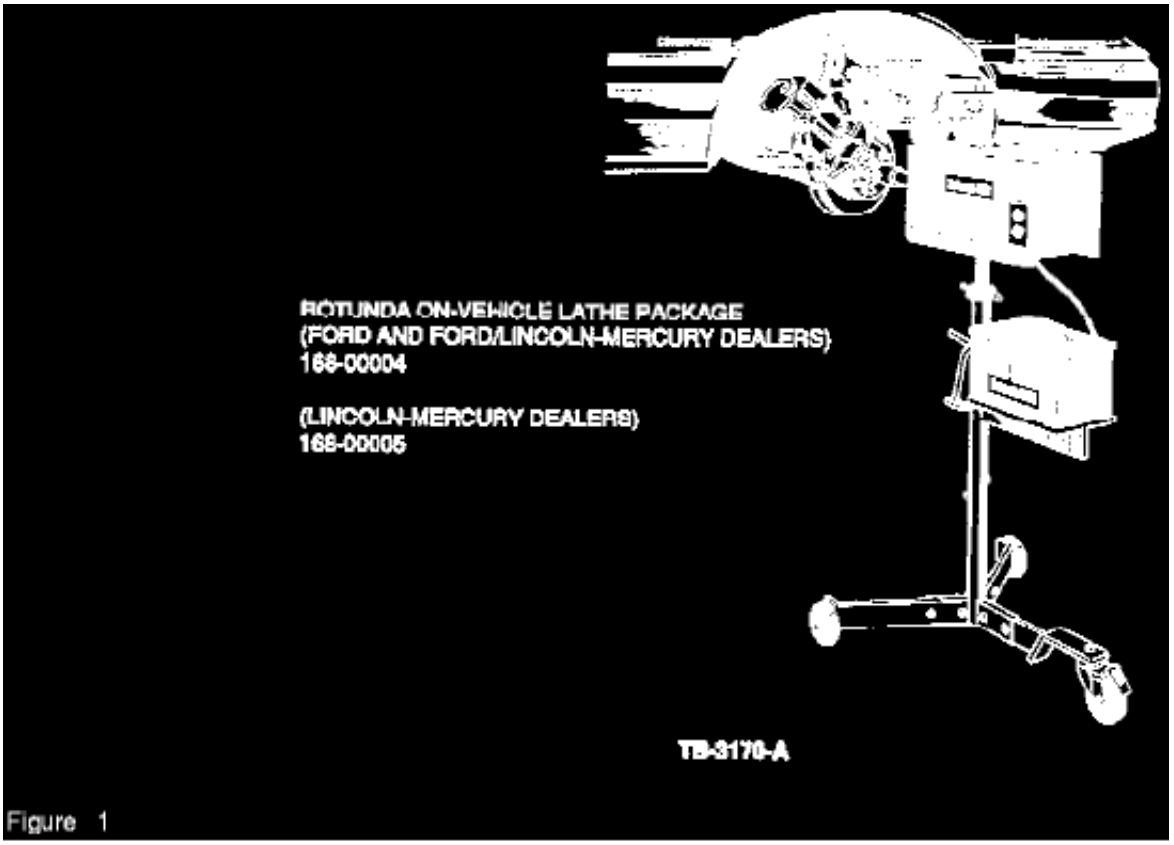

Figure 1

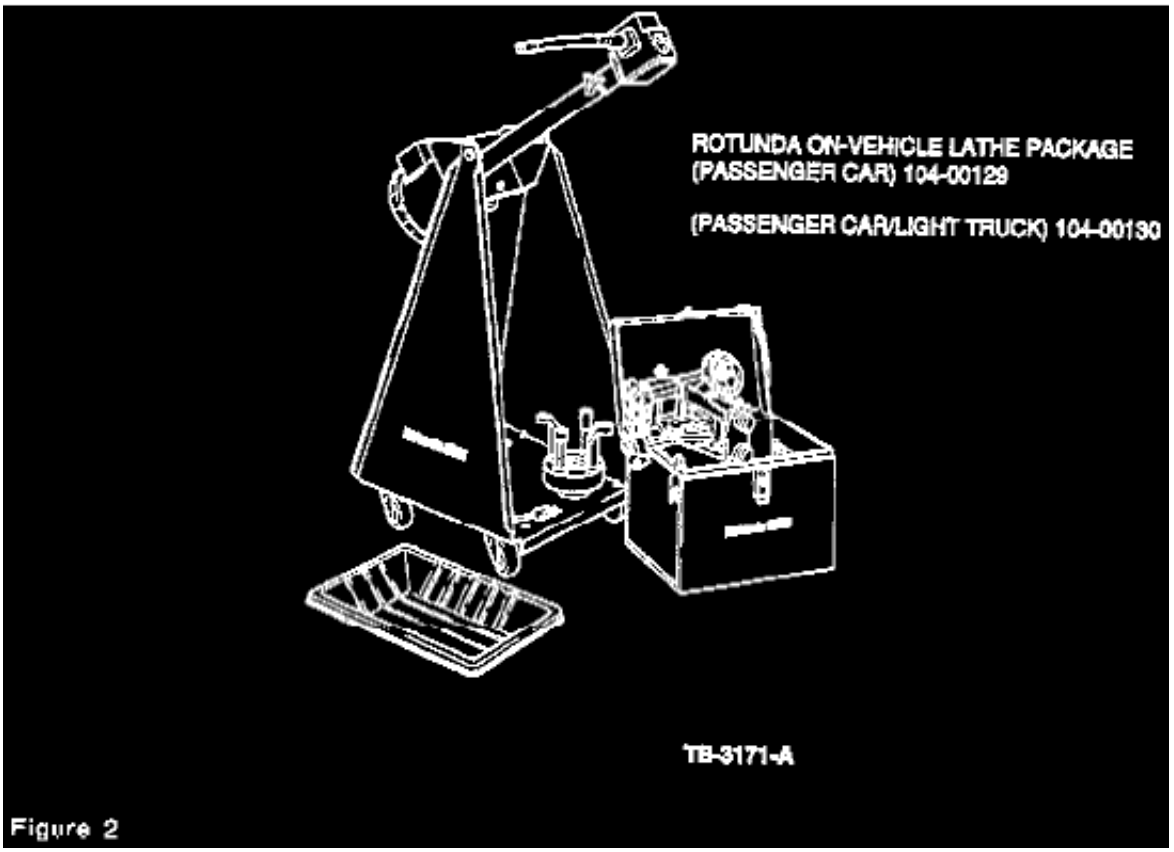

Figure 2

Rotunda on-vehicle caliper-mounted brake rotor machining equipment may correct runout if used according to the equipment manufacturer's instructions. Refer to Figures 1 and 2.

Machining the rotor with the use of a caliper-mounted brake lathe will be an eligible repair under warranty for the vehicles listed.

NOTE:

THERE MAY BE ADDITIONAL MANUFACTURERS OF SIMILAR EQUIPMENT. FORD DOES NOT ENDORSE, INDICATE ANY PREFERENCE FOR, OR ASSUME ANY RESPONSIBILITY FOR EQUIPMENT FROM THESE FIRMS, OR FOR ANY SUCH ITEMS WHICH MAY BE AVAILABLE FROM OTHER SOURCES.

NOTE:

DEALERS THAT HAVE APPROVED ON-VEHICLE BRAKE ROTOR MACHINING EQUIPMENT ARE REQUIRED TO RESURFACE BRAKE ROTORS UNDER THE BUMPER TO BUMPER COVERAGE PERIOD. IF A DEALER HAS THE ON-VEHICLE BRAKE ROTOR MACHINING EQUIPMENT, ROTOR REPLACEMENT WILL ONLY BE ALLOWED WHEN THE ROTOR IS BROKEN OR DOES NOT HAVE ENOUGH MATERIAL TO ALLOW TURNING. SUCH REPLACEMENTS MUST BE AUTHORIZED BY SERVICE MANAGEMENT.

NOTE:

EXCEPTIONS TO THE LAST STATEMENT ARE REAR ROTORS ON THE TOWN CAR, GRAND MARQUIS, CROWN VICTORIA, MUSTANG AND FRONT ROTORS ON F-350, F-47 AND F-53

HEAVY DUTY LIGHT TRUCKS. ON THESE VEHICLES, ROTORS CANNOT BE MACHINED. SERVICE MANAGEMENT AUTHORIZATION IS NOT REQUIRED FOR THESE EXCEPTIONS.

ISSUE: The use of a power impact wrench to install wheel nuts provides minimal torque control. Undertightening may allow the lug nuts to loosen, and can result in the wheel separating from the vehicle. Overtightening of wheel nuts may cause brake rotor distortion that could result in a brake shudder. Overtightening may cause distortion of the wheel. This can result in a change in the diameter of the center (axle) hole and make it difficult to remove from the axle it is mounted on or difficult or impossible to install on another axle with a smaller center hole diameter.

ACTION: Use a manual torque wrench to tighten wheel nuts. Refer to the approriate Shop Manual for specific torque values.

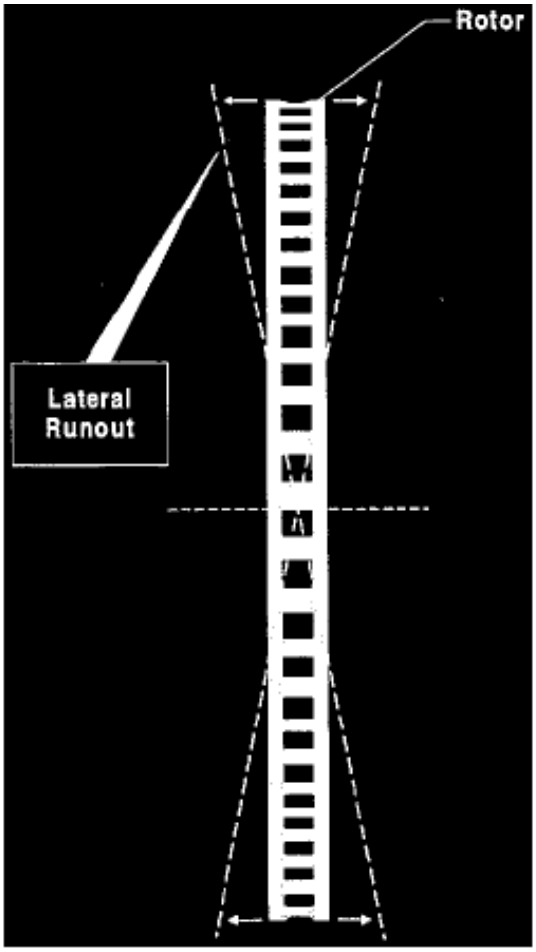
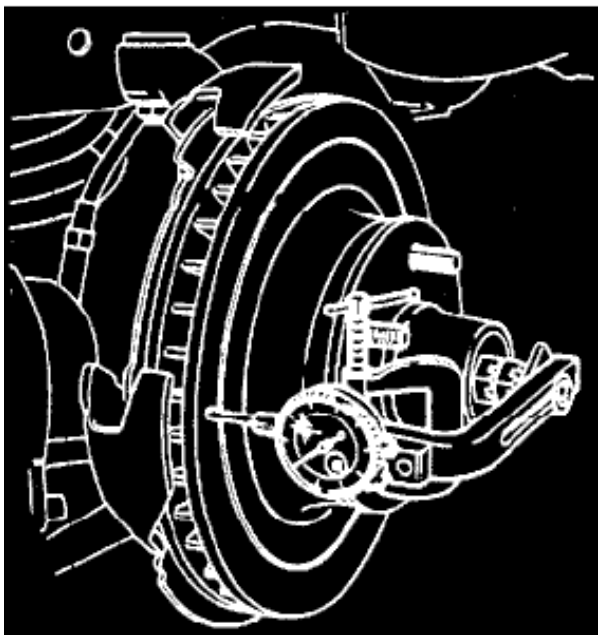
Brake Rotor/Disc: Specifications

Rotor Diameter 10.86 in

Minimum Thickness 0.81 in



Rotor
Lateral Runout



Brake Rotor/Disc: Testing and Inspection

PURPOSE

In the manufacturing of the brake rotor all the tolerances regarding surface finish, parallelism, and lateral runout are held very closely. The maintenance of these tolerances provide the surface necessary to prevent brake roughness.

Light scoring of the rotor surface not in excess of 0.38 mm (0.015-inch) in depth is normal. This condition does not affect the brake operation.

Some discoloration or wear of the disc surface is normal and does not require re-surfacing when linings are replaced.

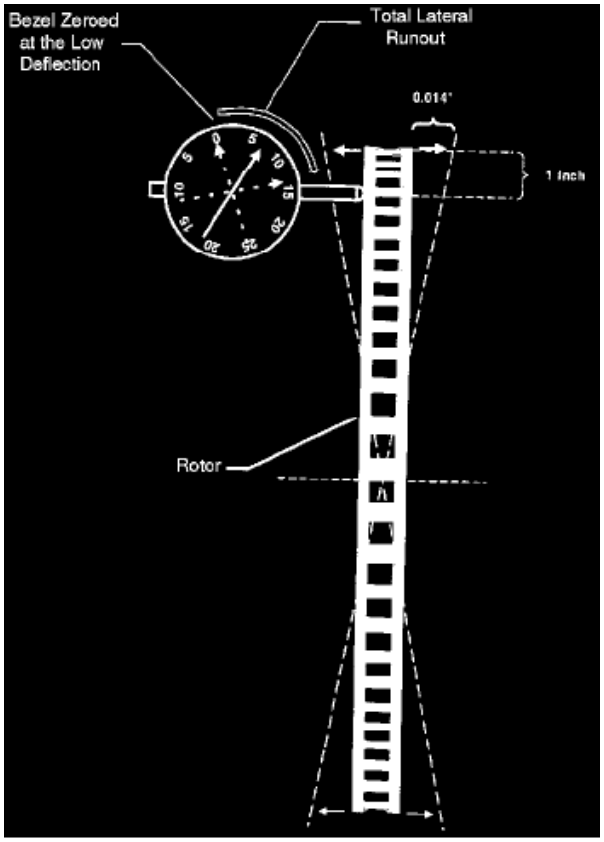
SPECIFICATIONS - See: Specifications

LATERAL RUNOUT

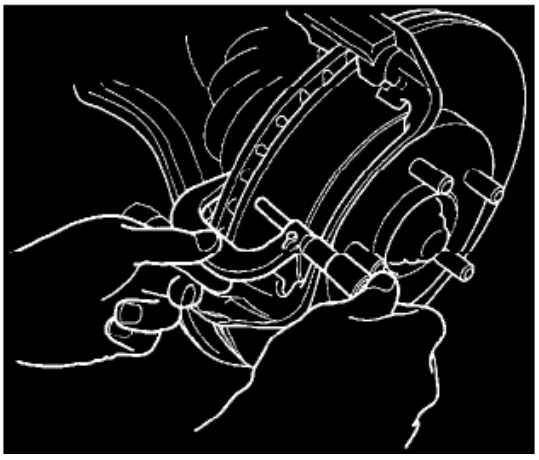
Lateral runout is the movement of the rotor from side to side as it rotates on the spindle. This could also be referred to as "rotor wobble".

This movement causes the brake pad and piston to be knocked back into it's bore. This results in additional pedal travel and a vibration during braking.

Checking Lateral Runout 1. Tighten the wheel bearings to eliminate all freeplay.



Bezel Zeroed at the Low Deflection
Total Lateral Runout
0.014"
1 inch
Rotor



2. Attach a dial indicator to a solid non-rotating portion of the hub assembly or suspension.

- The point of the styles must contact the rotor face about 25 mm (1-inch) from the rotor edge.

3. Move the rotor one complete rotation and observe the dial indicator.

4. Rotate the bezel on the dial indicator such that "0" is at the low deflection point. 5. Again rotate the rotor at least one complete turn and observe the needle deflection. Total needle deflection will equal lateral runout.

- The lateral runout should not exceed 0.254 mm (0.010 inch).

6. Readjust the wheel bearings.

MINIMUM THICKNESS

The thickness of a rotor is important for two reasons: 1. Rotors which are too thin are not able to properly absorb and release heat during heavy braking. This results in reduced braking capacity and

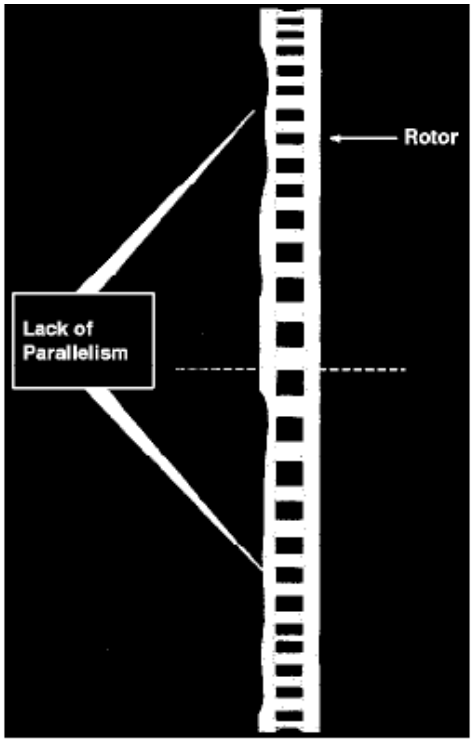
brake fade.

2. Rotors worn below minimum thickness in combination with worn pads/linings can result in the caliper piston extending too far becoming

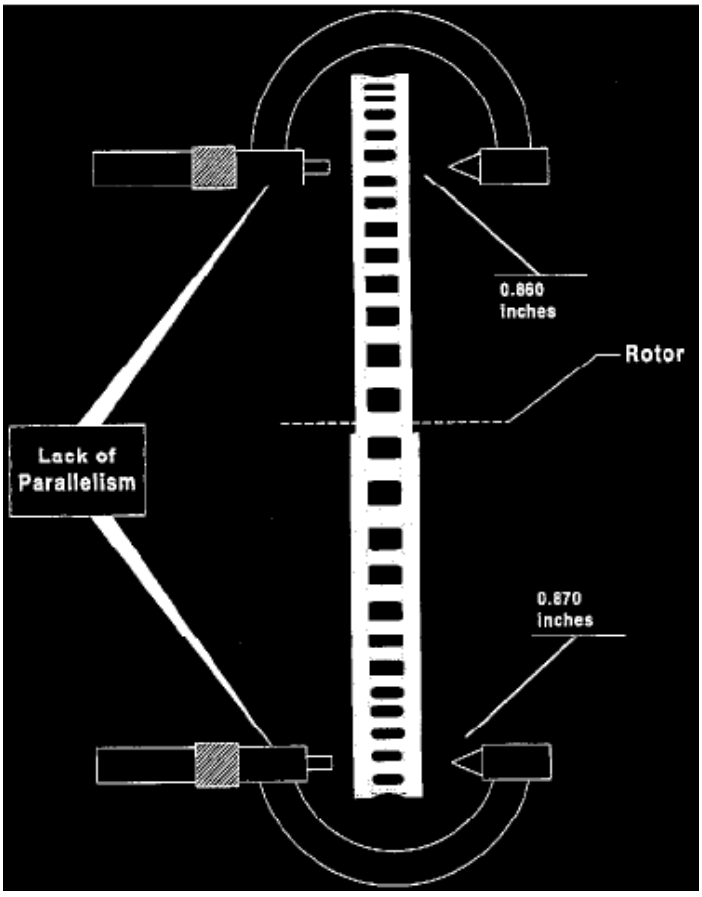
cocked or jammed.

Rotor thickness should be measured at the thinnest point on the rotor. Any rotor which is worn below its minimum thickness should be replaced.

For accurate measurements, it is best to remove the caliper to allow for complete access to the inboard side of the rotor.



Rotor
Lack of Parallelism



0.860 inches
Rotor
Lack of Parallelism
0.870 inches

For more information on how to use a disc brake micrometer see Fundamentals and Basics.

PARALLELISM

Parallelism is the measurement of the thickness of the rotor at 12 or more points around the circumference of the rotor. All measurements must be made at the same distance in from the edge of the rotor.

Lack Of Parallelism

Lack Of Parallelism

The rotor thickness must not vary more than 0.013 mm (0.0005-inch) from point to point.

MACHINING

Since accurate control of the rotor tolerances is necessary for proper performance of the disc brakes, machining of the rotor should be done only with precision equipment.

All brake rotors have a minimum thickness dimension cast into them. This dimension is the minimum wear dimension and not a refinish dimension. Do not use a brake rotor that will not meet the specifications, after refinishing. Replace with a new brake rotor.

NOTE: 1 inch = 25.4mm, so if your micrometer measures in inches and the specified thickness on the disc is in millimeters, convert millimeters to inches by dividing the specified number of millimeters by 25.4.

Example: Specification on disc is 17.8 mm. Dividing 17.8mm by 25.4mm/in = 17.8/25.4 = 0.70 inches.

Brake Rotor/Disc: Service and Repair With Automatic Locking Hubs

Fig. 6 Automatic Locking Hub

With Automatic Locking Hubs

1. Raise the vehicle and install safety stands. 2. Remove the wheel lugnuts and the wheel and tire assembly. 3. Remove the retainer washers from the lugnut studs. Remove the automatic locking hub assembly from the spindle. 4. Remove the snap ring from the end of the spindle shaft.

5. Remove the axle shaft spacer.

6. Being careful not to damage the plastic moving cam or thrust spacers, pull cam assembly off the wheel bearing adjusting nut and remove the two

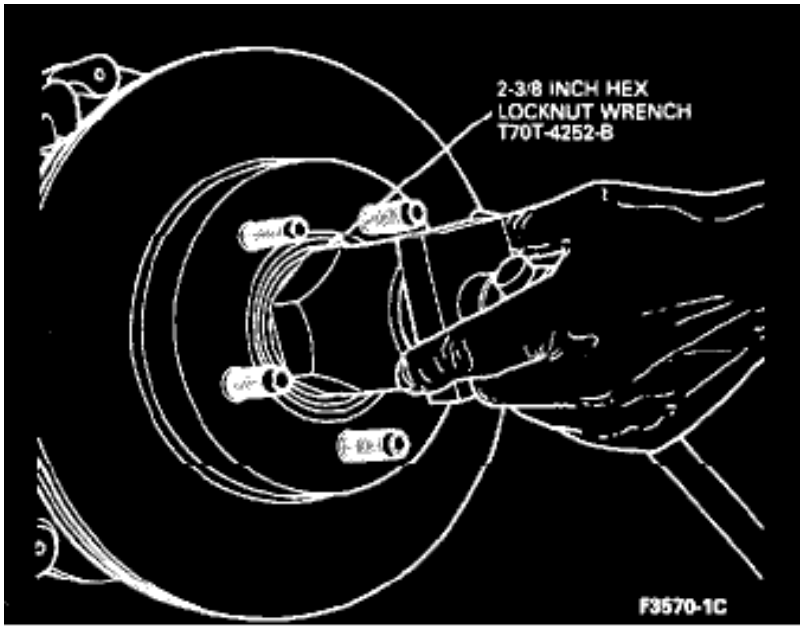
plastic thrust spacers from the adjusting nut.

CAUTION: Do not pry on the plastic cam or thrust spacers during removal. Prying may damage the cam or spacers.

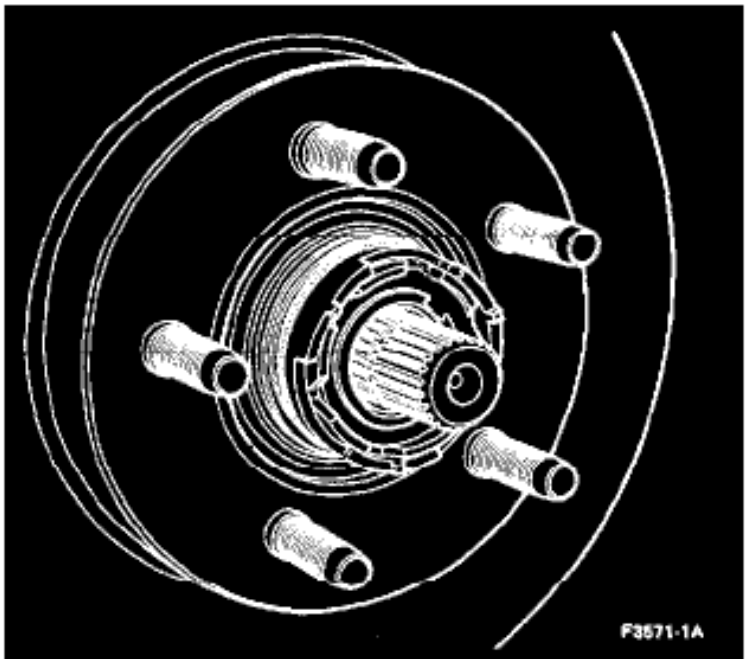
7. Using a magnet, remove the locking key.

NOTE: If required, rotate the adjusting nut slightly to relieve pressure against the locking key, before the key can be removed.

CAUTION: To prevent damage to the spindle threads, look into the spindle keyway under the adjusting nut and remove the separate locking key before removing the adjusting nut.



2-3/8 INCH HEX
LOCKNUT WRENCH
T70T-4252-B
F3570-1C



F3571-1A

8. Loosen the wheel bearing adjusting nut from the spindle using a 2-3/8 inch Hex Locknut Wrench T70T-4252-B or equivalent.

9. While rotating the hub and rotor assembly, tighten the wheel bearing adjusting nut to 47 Nm (35 ft lb) to seat the bearings. Spin the rotor and back

off the nut one-quarter turn (90 degrees).

10. Retighten the adjusting nut to 1.8 Nm (16 in lb) using a torque wrench. 11. Align the closest lug in the wheel bearing adjusting nut with the center of the spindle keyway slot. Advance the nut to the next lug if required.

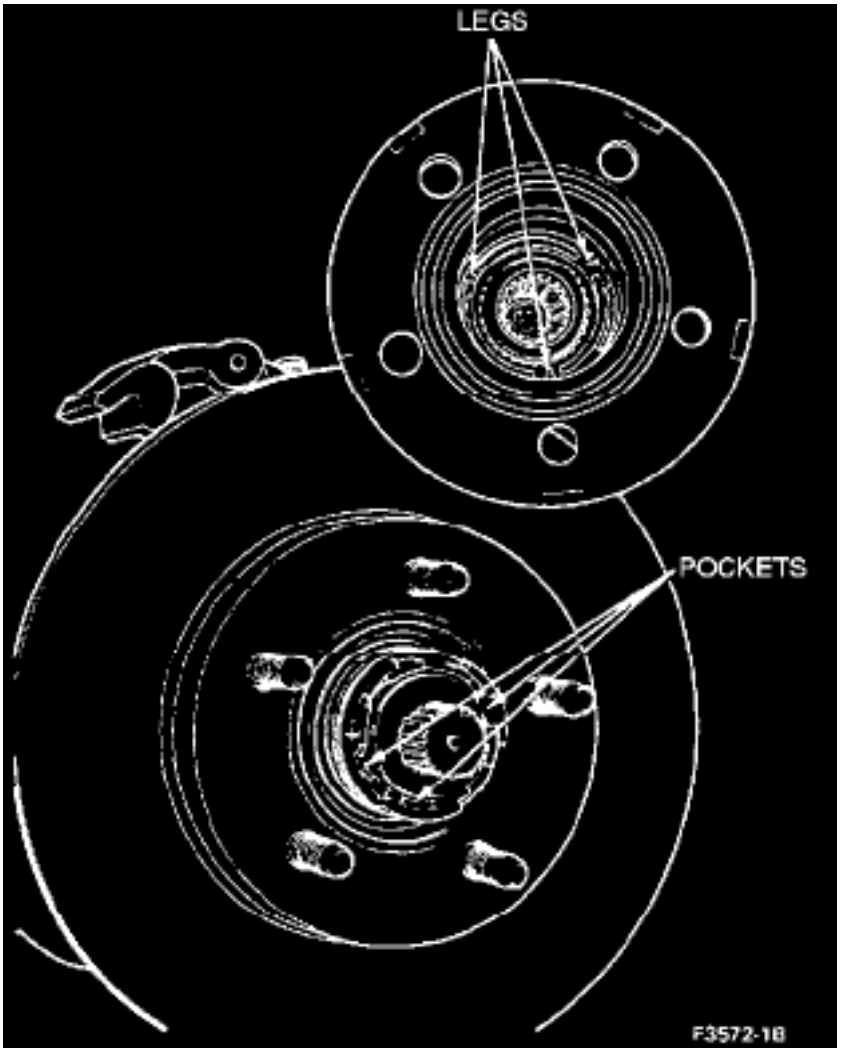
Install the separate locking key in the spindle keyway under the adjusting nut.

WARNING: Extreme care must be taken when aligning the spindle nut adjustment lug with the center of the spindle keyway slot to prevent damage to the separate locking key. The wheel and tire assembly may come off while the vehicle is in motion if the key is damaged.

12. Install the two thrust spacers and push or press the cam assembly onto the locknut by lining up the key in the fixed cam with the spindle keyway.

CAUTION: Extreme care must be taken when aligning the fixed cam key with the spindle keyway to prevent damage to the fixed cam.

13. Install the axle shaft spacer. 14. Clip the snap ring onto the end of the spindle shaft.



Automatic Locking Hub Installation

15. Install the automatic locking hub assembly over the spindle by lining up the three hub assembly legs with three pockets in cam assembly. Install

the retainer washers.

16. Install the wheel and tire assembly. Install and tighten lugnuts to 135 Nm (100 ft lb). 17. Make sure the final end play of the wheel on the spindle is 0.00-0.08 mm (0.000-0.003 inch). the maximum torque to rotate the hub is 2.8 Nm (25

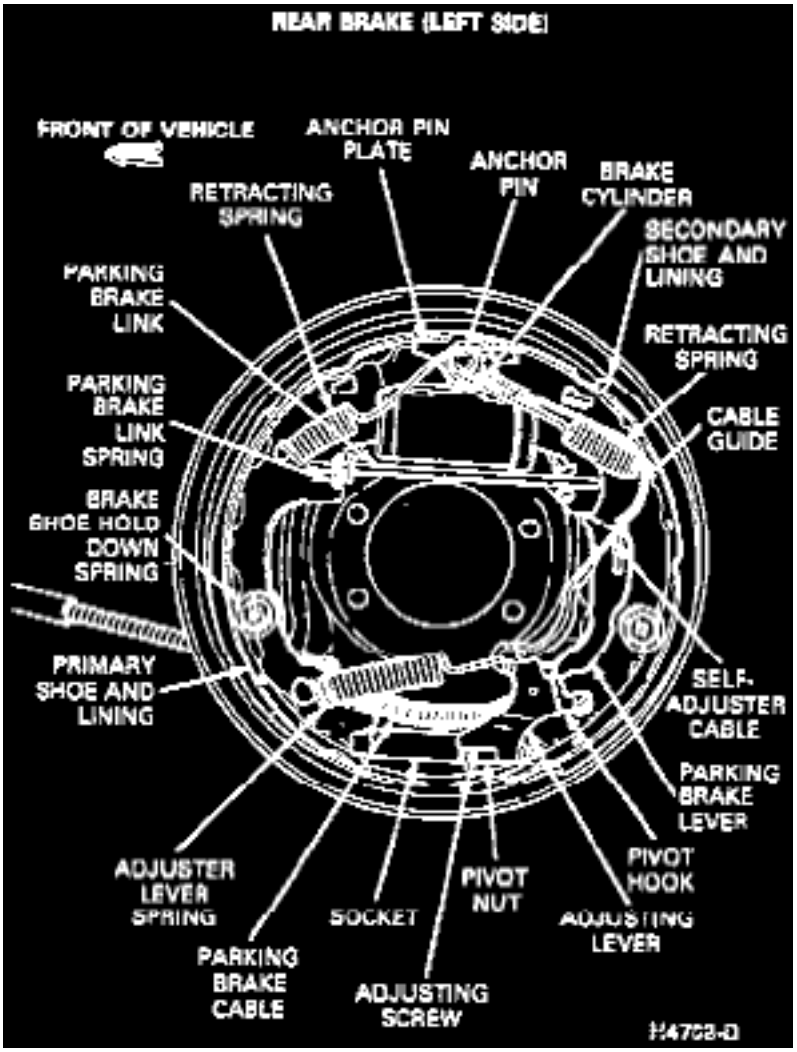
in lb).

Backing Plate: Specifications

Backing plate retaining nuts	34-47 Nm (25-35 ft lb)

Backing Plate: Testing and Inspection

Inspect backing plate shoe contact surface for grooves that may restrict shoe movement and cannot be removed by lightly sanding with emery cloth or other suitable abrasive. If backing plate exhibits above condition, it should be replaced. Also inspect for signs of cracks, warpage and excessive rust, indicating need for replacement.



Backing Plate: Service and Repair

Rear Brakes

REMOVE

1. Raise vehicle and position suitable safety stands under vehicle. 2. Remove the wheel and drum. Disconnect the brake line from the brake cylinder and plug line to prevent air from entering the system. 3. Remove the brake components. See: Brake Shoe/Service and Repair 4. Disconnect the parking brake lever from the cable. 5. Disconnect parking brake cable from backing plate by squeezing locking fingers together using a 9/16-inch flare nut wrench and pulling cable

through plate.

6. Remove the axle shaft.

CAUTION: When removing the axle shaft from the housing be careful not to damage the oil seal.

7. Remove the nuts retaining the backing plate to the housing and remove the backing plate.

INSTALL

1. Position the backing plate on the axle housing assembly. 2. Install the backing plate retaining nuts. Alternately and evenly tighten the nuts to 34-47 Nm (25-35 ft lb).

Backing Plate Lubrication Points

3. Apply a light coating of disc brake caliper slide grease to the ledge pads at the points where the brake shoes contact the backing plates. 4. Feed the parking brake cable through its hole in the backing plate and engage locking fingers. 5. Install the axle shaft. 6. Install the brake cylinder and brake shoes. Connect the parking brake cable to the lever. 7. Connect the brake line to the brake cylinder and install the brake drum and wheel. 8. Perform brake bleeding procedures. 9. Adjust the brake shoes.

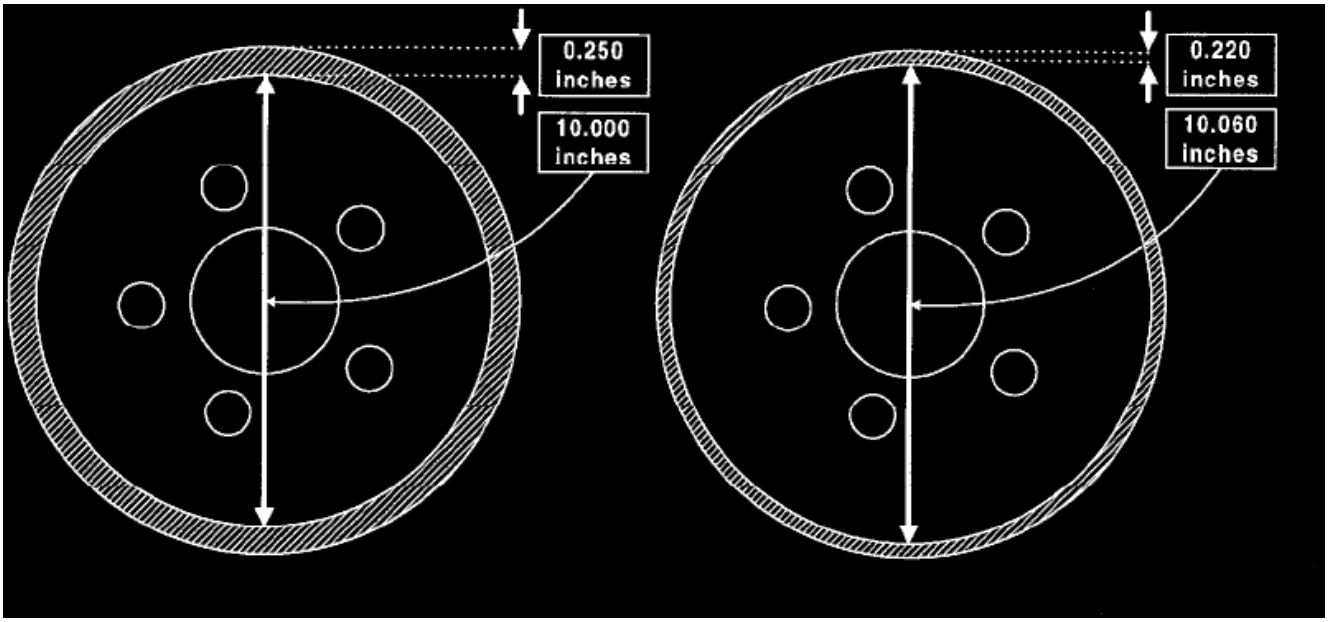
10. Lower vehicle.

Brake Drum: Specifications

Maximum Diameter To refinish the brake drum, refer to the maximum inside

diameter which is stamped on the outer surface of the brake

drum.



Brake Drum: Testing and Inspection

VISUAL INSPECTION

Inspect the drum for cracks. If any large, through-the-drum cracks are located the drum must be replaced.

NOTE: Cracks in drums are often difficult to locate. To quickly determine if a drum is cracked lightly drop the drum (from a height of 4-5 inches) onto a flat hard surface. A cracked drum will make a dull thud sound while a good drum will make a ringing sound.

Inspect for signs of overheating. An overheated drum will often be discolored (blue/gold), warped, or heat checked. Heat checks are small cracks in the drum friction surface. Heat checks can be removed by resurfacing.

NOTE: The cause of the overheating should be determined prior to replacing the shoes/linings or drums.

Inspect for scoring. Any grooves or scores in excess of 0.008 inches should be resurfaced.

SPECIFICATIONS - See: Specifications

MAXIMUM DIAMETER

Purpose

The thickness of the drum friction surface is directly proportional to the drums ability to absorb and release heat during braking. As the drum becomes thinner due to normal wear and resurfacing it looses its ability to absorb and release heat and is more prone to brake fade, distortion, and cracking.

As the drum wears the inside diameter of the drum increases. The amount of drum thickness lost to wear is equal to 1/2 the increase in diameter.

There are two specifications related to drum thickness.

How To Measure

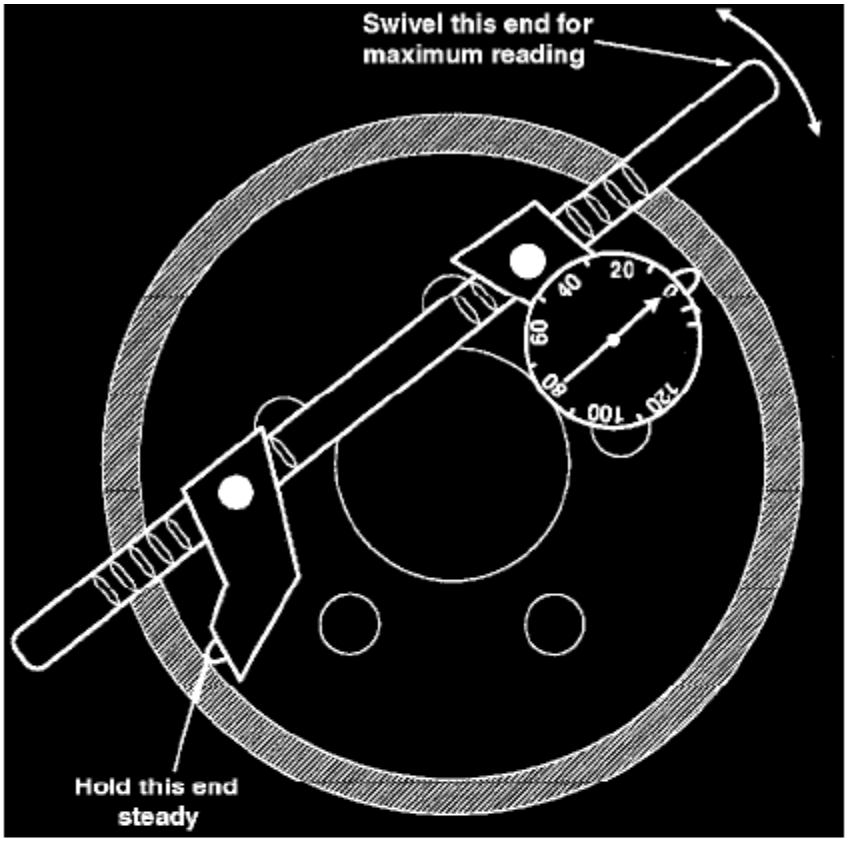
NOTE: For additional information on how to use a drum micrometer see Fundamentals and Basics.

- A drum micrometer is used to measure the drum diameter.

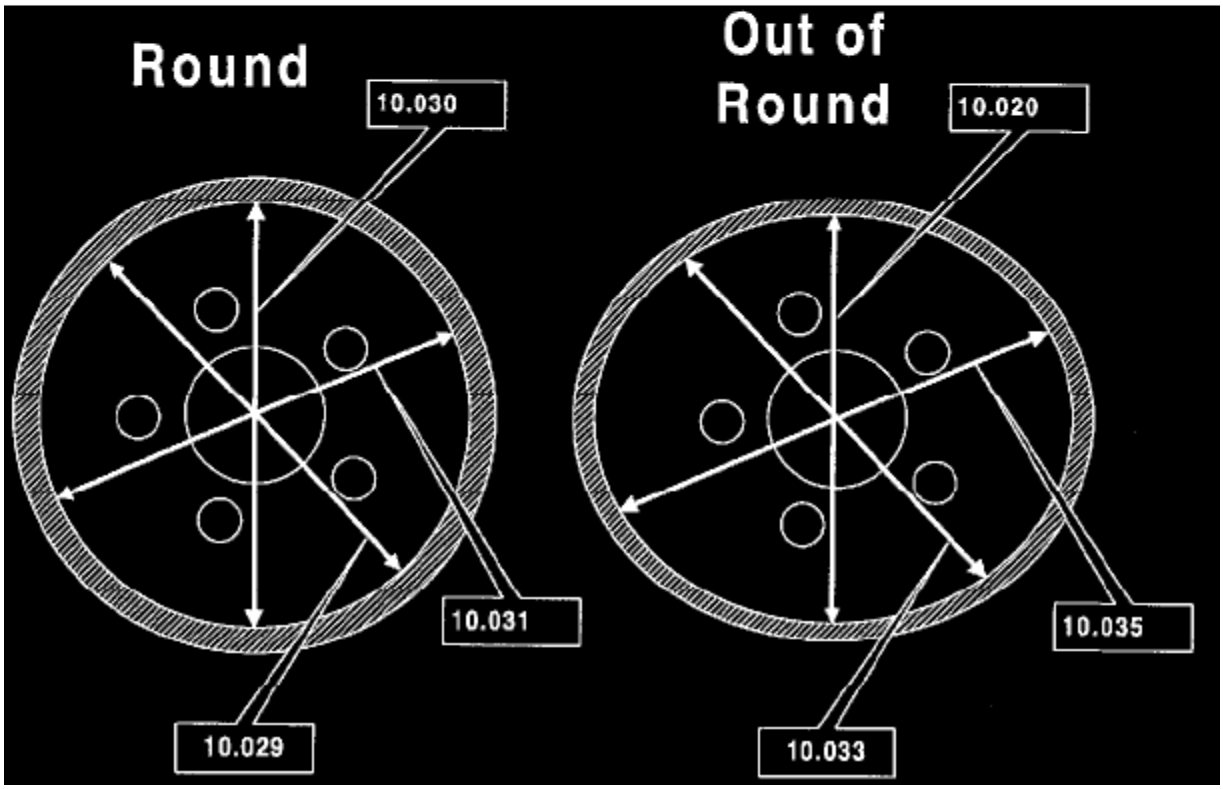
- The micrometer scale should be initially set to the original (new) thickness of the drum.

- The base of the micrometer should be placed in the deepest groove in the drum and held steady while the measuring point is swiveled to find the maximum diameter.

- The base and measuring point should be kept at the same depth in the drum.



Swivel this end for maximum reading
Hold this end steady



Round
10.030
10.031
10.029
Out of Round
10.020
10.035
10.033

Drum Micrometer

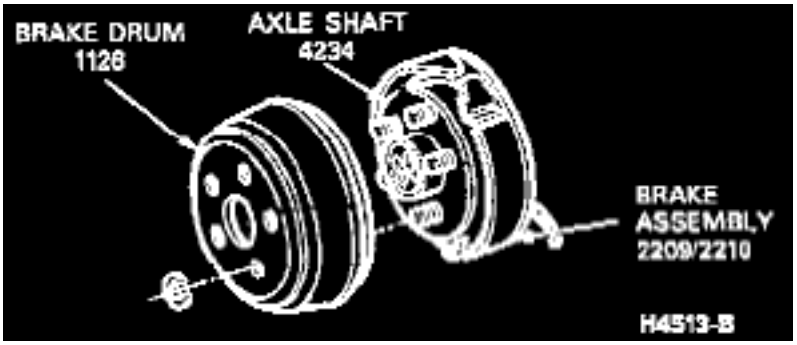
- The measurement should be repeated at 3 or more places around the circumference of the drum to determine if the drum is out of round. If the measurements differ by more than 0.004 inches the drum should be resurfaced.

NOTE: A drum which is out of round will cause a pedal pulsation to be felt upon braking.

- The measurement should also be repeated at various depths of the drum to check for a bellmouth condition. If the measurements differ by more than .004 inches the drum should be resurfaced.

NOTE: 1 inch = 25.4mm, so if your micrometer measures in inches and the specified thickness on the disc is in millimeters, convert millimeters to inches by dividing the specified number of millimeters by 25.4.

Example: Specification on disc is 17.8 mm. Dividing 17.8mm by 25.4mm/in = 17.8/25.4 = 0.70 inches.



Brake Drum: Service and Repair Installation

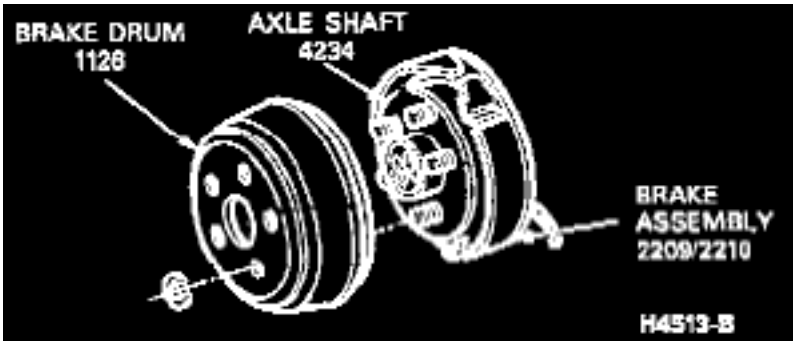
For additional information see Notes, Warnings, and Hints.

Brake Drum Removal/Installation

1. If brake shoes have been replaced or the adjusting screw has been moved the shoes should be adjusted. To do this use a suitable brake drum to

shoe gauge, measure brake drum inside diameter. Adjust brake shoes to dimension obtained on outside portion of gauge.

2. Install the brake drum. 3. Install the brake drum retaining nut. 4. Install the tire and wheel assembly 5. Lower vehicle.



Brake Drum: Service and Repair Removal

For additional information see Notes, Warnings, and Hints.

Brake Drum Removal/Installation

1. Raise and support vehicle. 2. Remove tire and wheel assembly. 3. Remove brake drum retaining nut. 4. Remove brake drum. If brake lining is dragging on brake drum, back off brake adjustment by rotating adjustment screw. If brake drum is rusted or

corroded to axle flange and cannot be removed, lightly tap axle flange to drum mounting surface with a suitable hammer.

Brake Shoe: Customer Interest Rear Brakes - Grab/Stick On First Few Applications

Article No. 98-5A-36

03/18/98

BRAKES - GRABBING AND/OR STICKING DURING FIRST FEW BRAKE APPLICATIONS AFTER A RAINFALL AND/OR WHEN BRAKES ARE COLD

LIGHT TRUCK: 1983-97 RANGER 1991-94 EXPLORER

ISSUE: A grabbing and/or sticking condition during the first few brake applications when the brakes are cold or in the morning after an overnight rain may occur on some vehicles. This may be caused by rear brake lining material that is sensitive to humidity.

ACTION: Install new design rear brake linings that are made from material that is less sensitive to humidity. Refer to the following Service Procedure for details.

SERVICE PROCEDURE

1. Remove the rear brake shoes. Refer to the appropriate Explorer/Ranger Service Manual, Section 06-02, for removal procedure.

2. Clean the brake assembly and drums.

3. Install new rear brake shoe and lining assemblies per the Parts Block. Refer to the Service Manual, Section 06-02, for installation procedure.

4. Adjust the brakes according to the Service Manual.

Brake Shoe: Testing and Inspection

INSPECT

Brake linings for: -

Excessive wear,

- Damage,

- Oil, grease or brake fluid contamination.

If any of the above conditions exists, brake linings should be replaced. Examine brake shoe webbing, for signs of overheating indicated by a slight blue color. If any component exhibits signs of overheating, replace hold-down and return springs with new ones.

NOTE: Do not attempt to replace only one set of brake shoes; they should be replaced as an axle set only to maintain equal braking forces.

Brake Shoe: Adjustments

OVERVIEW

The rear brake shoes adjust automatically when the vehicle is driven forward or reverse and the brakes are applied sharply several times. Manual adjustment is required only when brake shoes are replaced. When adjusting rear brakes, check parking brake cable for proper adjustment and that equalizer is operating freely.

WITH DRUMS REMOVED

1. With drums removed, clean areas where shoes contact backing plate, then apply suitable lubricant to these contact areas, ensuring that lubricant does not contaminate linings.

2. Using suitable brake shoe adjusting gauge, adjust gauge to inside diameter of brake drum.

Fig. 4 Checking Brake Lining Clearance

3. Reverse tool and adjust shoes until they contact gauge, ensuring that gauge is parallel to vehicle and at centerline of axle, Fig. 4. Holding automatic adjusting lever aside, rotate adjusting screw as necessary.

4. Install drums, wheels and retaining nuts, then complete adjustment by applying brakes several times while driving vehicle in reverse.

5. Check brake operation by making several stops in forward gear. Repeat step 4, if necessary.

WITH DRUMS INSTALLED

1. Raise and support rear of vehicle until the rear wheels clear the floor.

2. Remove cover from adjusting hole located at bottom of backing plate.

Brake Adjustment

3. Using a small screwdriver to hold adjusting lever away from star wheel, rotate adjusting screw star wheel until brake shoes are locked against drum, Fig. 5.

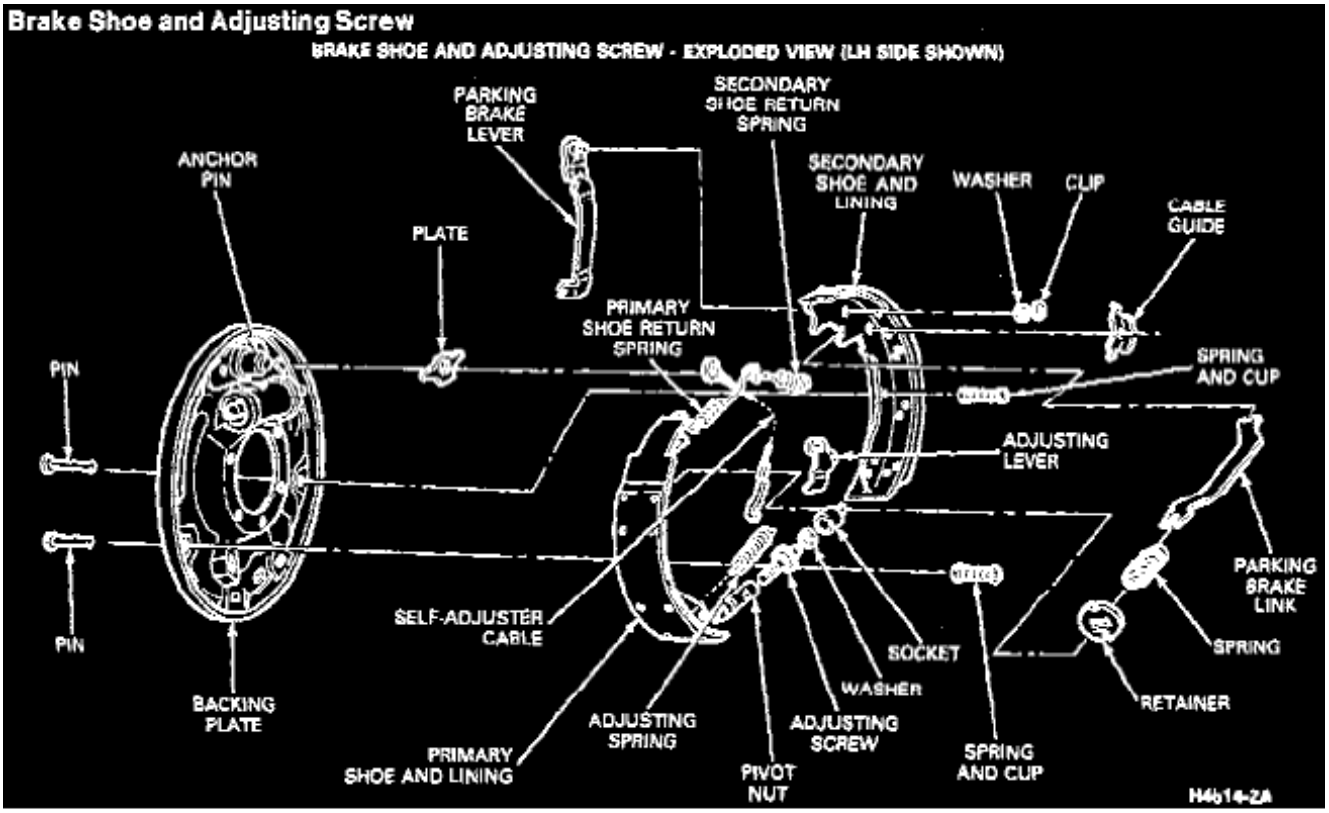
4. Back-off brake adjusting screw approximately 10 to 12 notches so that brake drum rotates freely without drag. If brake drum does not rotate freely, remove drum and clean and inspect drum brake components.

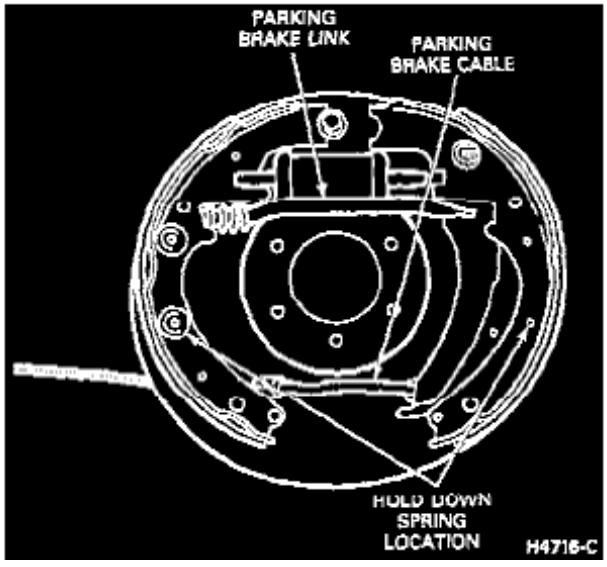
5. After adjusting both drum brakes install adjustment hole covers, lower vehicle and apply brakes several times to position brake shoes.

6. Road test vehicle to ensure brakes operate properly.

WARNING: Perform the road test only when the brakes will apply and the vehicle can be safely stopped.

Ford Ranger 4wd Workshop Manual (V6-245 4.0L (1991))
Ford Workshop Manuals > Brakes and Traction Control > Drum Brake System > Brake Shoe > Component Information > Service and Repair > Installation





Brake Shoe: Service and Repair Installation

For additional information see Notes, Warnings, and Hints.

Brake Components

1. Clean the ledge pads on the backing plate. Sand lightly to bare metal. 2. Apply a light coating of caliper slide grease at the points where the brake shoes touch the backing plate. 3. Before installing the rear brake shoes, assemble the parking brake lever on the secondary shoe and secure with the spring washer and retaining

clip.

Brake Assembly

4. Position the brake shoes on the backing plate, and install the hold-down spring pins, springs, and cups using a hold down spring tool. Install the

parking brake link, spring, and washer. Connect the parking brake cable to the parking brake lever.

NOTE: For additional information see Brake Spring Removal and Installation Notes.

Installing The Anchor Pin Plate

5. Install the anchor pin plate. if equipped. Place the cable anchor over the anchor pin with the crimped side toward the backing plate.

Installing Springs

6. Install the primary shoe-to-anchor spring using a brake spring removal/installation tool. 7. Install the cable guide on the secondary shoe web with the flanged holes fitted into the hole in the secondary shoe web. Thread the cable around

the cable guide groove.

NOTICE: Make sure the cable is positioned in this groove, and not between the guide and the shoe web.

8. Install the secondary shoe-to-anchor (long) spring.

NOTICE: Make sure the cable end is not cocked or binding on the anchor pin when installed. All parts should be flat on the anchor pin.

9. Remove the brake cylinder clamp.

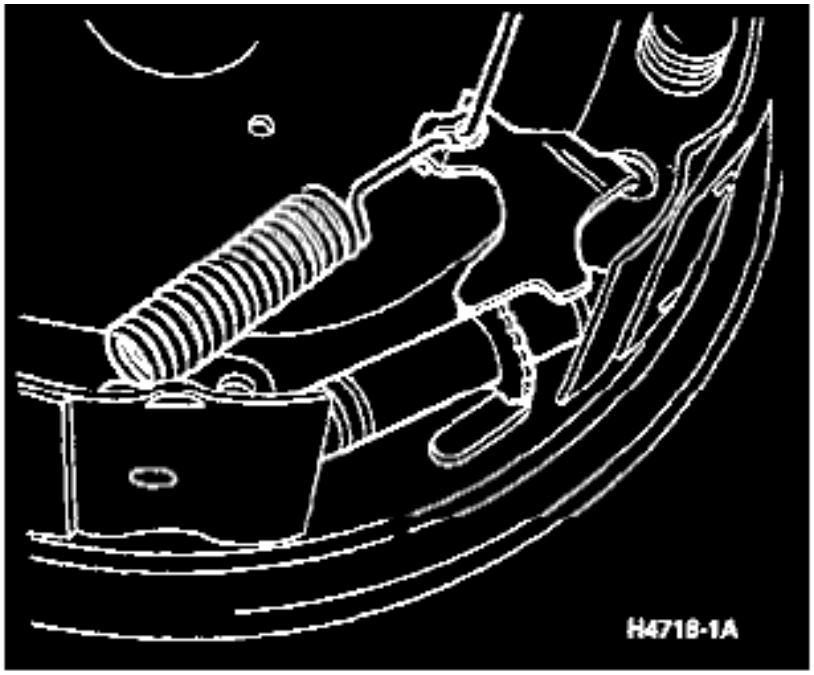
10. Apply a long-life grease to the threads and the socket end of the adjusting screw. Turn the adjusting screw into the adjusting pivot nut to the end of

the threads and then loosen it one-half turn.

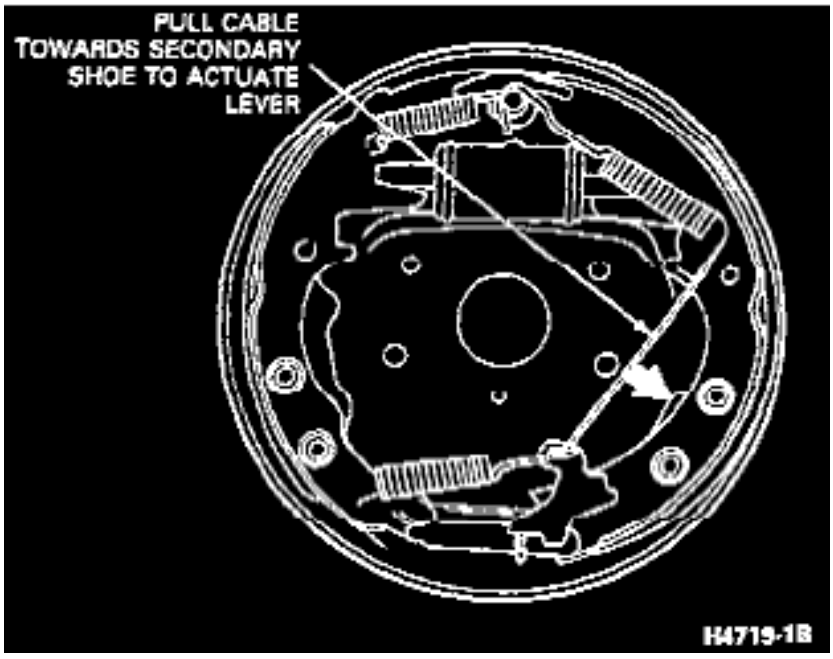
Adjusting Screw Identification

CAUTION: Install the adjusting screw assembly in the same location from which it was removed. Interchanging the brake shoe adjusting screw assemblies from one side of the vehicle to the other will cause the brake shoes to retract rather than expand each time the automatic adjusting mechanism is operated.

NOTICE: To prevent incorrect installation, the socket end of each adjusting screw is stamped with R or L to indicate their installation on the



H4718-1A



PULL CABLE TOWARDS SECONDARY SHOE TO ACTUATE LEVER
H4719-1B

right or left side of the vehicle. The adjusting pivot nuts can be distinguished by the number of lines machined around the body of the nut. Two lines indicate a right-hand nut; one line indicates a left-hand nut. Another way to identify adjusters is to check thread pitch. The right side adjuster has right-hand threads while the left side adjuster has left-hand threads. The adjuster will also increase in length when the lever is operated if properly installed.

Installing Adjusting Assembly

11. Place the adjusting socket on the screw and install the assembly between the shoe ends with the adjusting screw nearest the secondary shoe. 12. Hook the cable hook into the hole in the adjusting lever from the outboard plate side. The adjusting levers are also stamped with an R or L to

indicate their installation on the right or left hand brake assembly.

13. Place the hooked end of the adjuster spring in the large hole in the primary shoe web. Connect the loop end of the spring to the adjuster lever hole.

Checking Adjustment Lever Operation

14. Pull the adjuster lever, cable and automatic adjuster spring down toward the rear to engage the pivot hook in the large hole in the secondary shoe

web.

15. Check the action of the adjuster by pulling cable toward secondary shoe, activating lever. Lever should snap in behind the next tooth of adjuster.

Release cable to return adjuster lever to original position and the adjuster should turn one notch.

If pulling the cable does not produce the action described, or if lever action is sluggish instead of positive and sharp, check the position of the lever on the adjusting screw toothed wheel. The lever should contact the adjusting wheel one tooth above the center line of the adjusting screw. If the contact point is below this center line, the lever will not lock on the teeth in the adjusting screw wheel, and the screw will not be turned as the lever is actuated by the cable.

For additional information see Notes, Warnings, and Hints.

Brake Components - 10 Inch Drum

Brake Components - 9 Inch Drum

1. Remove the wheel and drum. 2. Inspect brake cylinder for signs of leaks or presence of rust by removing the boots and inspecting interior surfaces.

NOTICE: Water leaking into the cylinder past the boots will cause rust to form and may cause the cylinder to seize. If the boots are not removed, brake fluid leakage past the cups may go undetected because the boots may seal the fluid in the cylinder. If leaks are found, the brake cylinders must be removed and repaired or replaced.

Compressing The Brake Cylinder

3. If no leaks are found, install a brake cylinder clamp over the ends of the cylinder as shown. 4. Contract the shoes as follows:

a. Disengage the adjusting lever from the adjusting screw by pulling backward on the adjusting lever cable. b. Shorten the length of the adjuster by screwing the threaded rod in. This is done by moving the outward side of the adjusting screw upward until

the pivot nut is backed off as far as it will go.

Adjustment Lever Assembly

5. Pull the adjusting lever, cable and automatic adjuster spring down and toward the rear to unhook the pivot hook from the large hole in the

secondary shoe web.

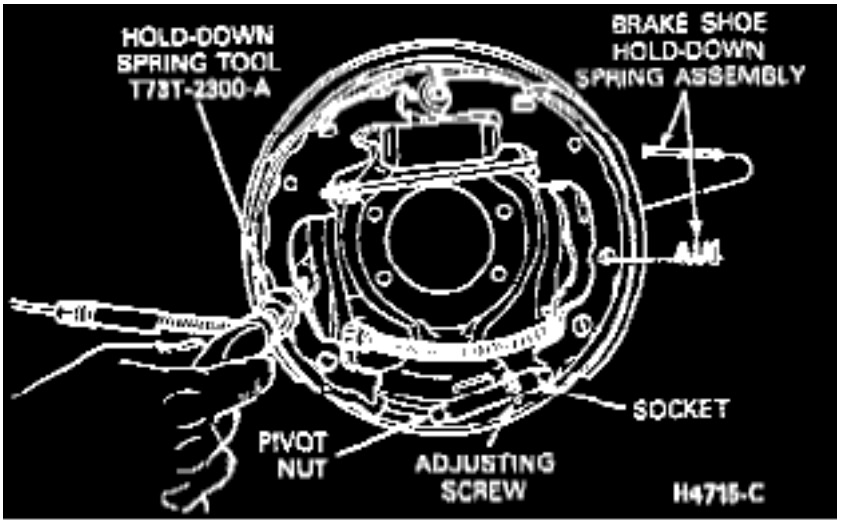
CAUTION: Do not pry the pivot hook out of the hole.

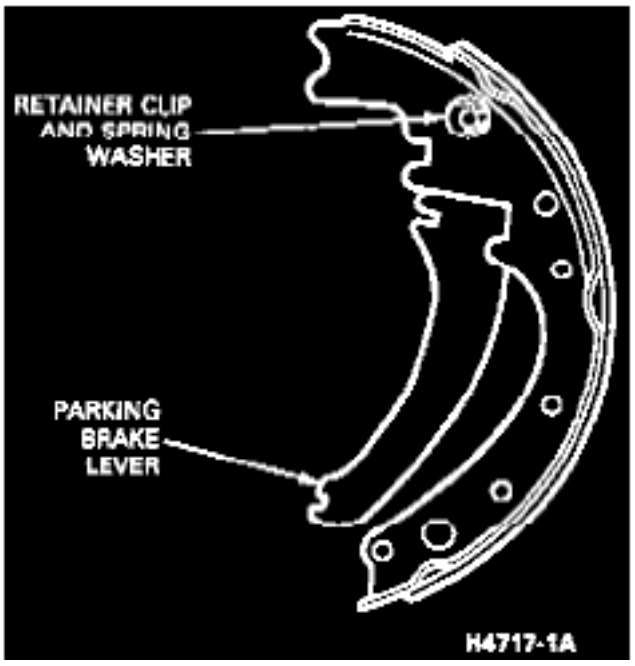
6. Remove the automatic adjuster spring and adjusting lever.

NOTICE: Note the color and position of each spring, they must be re-assembled in same position.

Removing/Installing Brake Springs

7. Remove the secondary shoe-to-anchor spring using a suitable brake spring removal / installation tool. Using the same tool, remove the primary





shoe-to-anchor spring and unhook the cable anchor. Remove the anchor pin plate (if equipped).

NOTE: For additional information see Brake Spring Removal and Installation Notes.

8. Remove the cable guide from the secondary shoe.

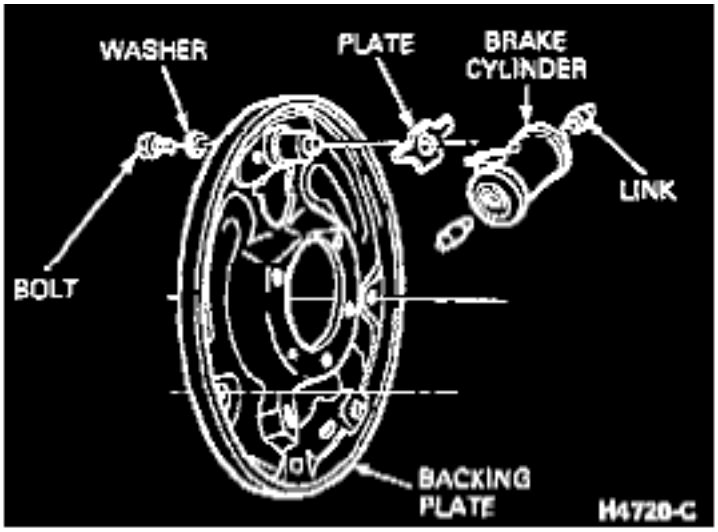
Removing/Installing Shoe Hold Down Springs

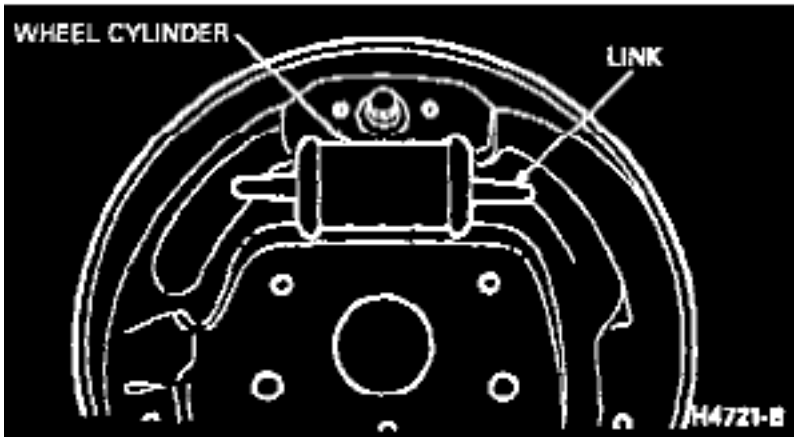
9. Remove the shoe hold-down springs using a hold down spring tool. Remove the shoes, adjusting screw, pivot nut, and socket.

10. Remove the parking brake link and spring. Disconnect the parking brake cable from the parking brake lever.

Park Brake Lever Assembly

11. Remove the brake secondary shoe. Remove the retainer clip and spring washer and remove the parking brake lever.





Wheel Cylinder: Service and Repair Removal

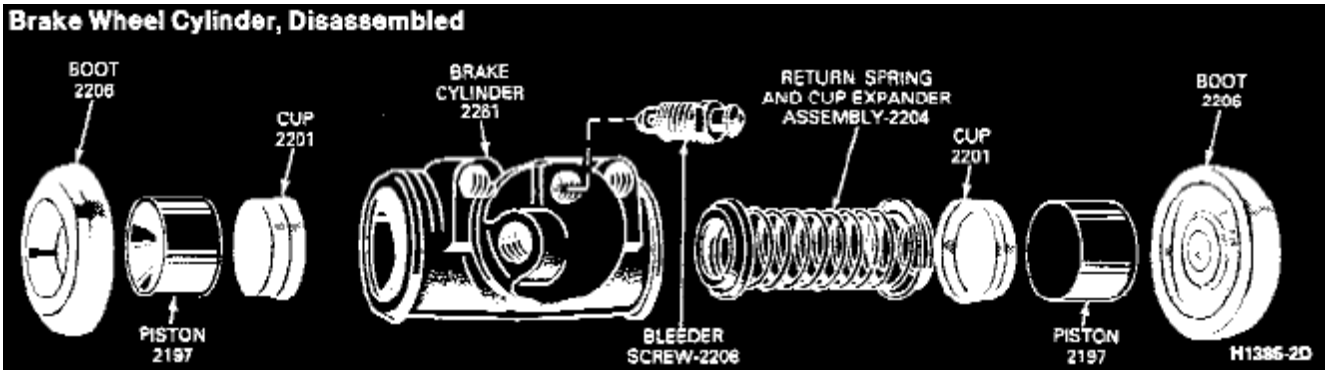
For additional information see Notes, Warnings, and Hints.

Wheel Cylinder And Backing Plate

1. Raise vehicle and position suitable safety stands under vehicle. Remove wheel and tire assembly. 2. Remove the drum, and brake shoes.

Wheel Cylinder Connecting Links

3. Remove the cylinder-to-shoe connecting links (if equipped). 4. Disconnect the brake line from the brake cylinder and plug line to prevent air from entering the system. 5. Remove the brake cylinder retaining bolts and lockwashers, and then remove the cylinder from the backing plate.



Wheel Cylinder: Service and Repair Rebuild

For additional information see Notes, Warnings, and Hints.

Wheel Cylinder Assembly

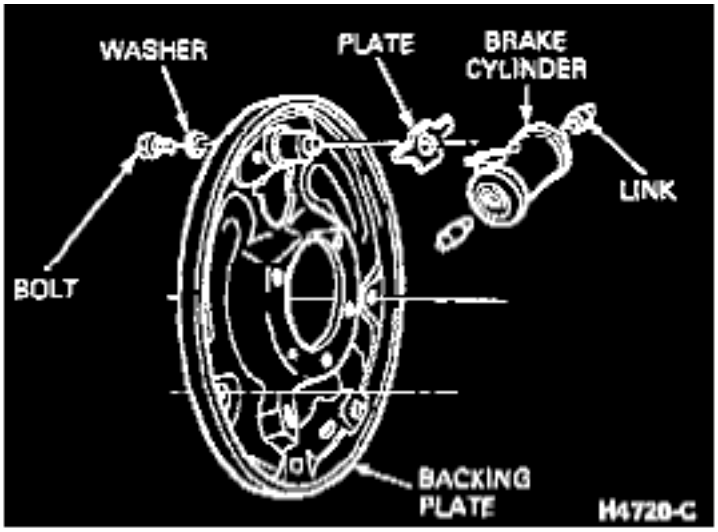
DISASSEMBLY

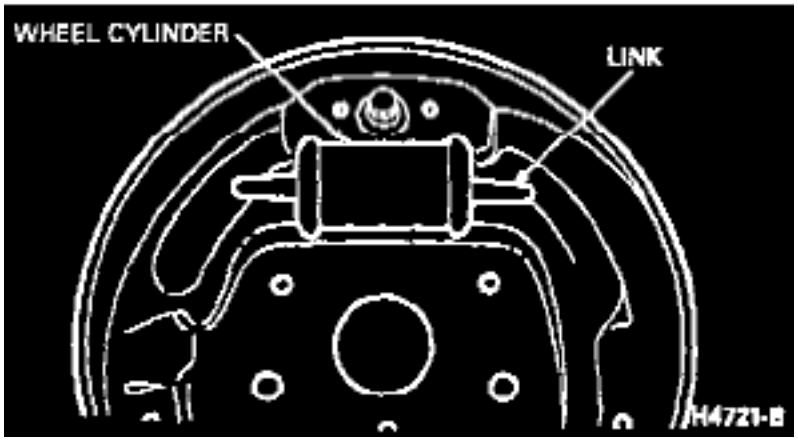
1. With the wheel cylinder removed, remove the rubber boots from the ends of the brake cylinder 2. Remove the pistons, cups, and piston return spring and cup expander assembly from the cylinder. 3. Remove the bleeder screw from the cylinder.

ASSEMBLY

1. Clean the wheel cylinder body with clean isopropyl alcohol or brake parts cleaner to remove any contamination. 2. Coat all brake cylinder parts with clean DOT 3 brake fluid. 3. Install the bleeder screw in the brake cylinder. 4. Place the piston return spring and piston expander assembly, cups, and pistons in the cylinder bore. 5. Clamp the brake cylinder pistons against the ends of the cylinder.

NOTICE: When using a brake cylinder repair kit, follow the instructions in the kit and use all of the parts provided.





Wheel Cylinder: Service and Repair Installation

For additional information see Notes, Warnings, and Hints.

Wheel Cylinder And Backing Plate

1. Place the brake cylinder on the backing plate and install the retaining bolts and lockwashers. 2. Connect the brake line to the brake cylinder.

Wheel Cylinder Connecting Links

3. Install the brake shoes and the connecting links (if equipped). 4. Install the drum. 5. Install the wheel and tire assembly. 6. Adjust the brakes and perform system brake bleeding procedures.

Brake Bleeding: Service and Repair Manual Bleeding

Bleed the primary and secondary hydraulic brake systems separately.

NOTICE: Do not allow the reservoir to run dry during the bleeding operation. Keep the master cylinder reservoirs filled with the specified brake fluid. Never reuse the fluid that has been drained from the hydraulic system.

1. Loosen the master cylinder to hydraulic line nut. 2. Wrap a shop cloth around the tubing below the fitting to absorb escaping brake fluid. 3. Push the brake pedal down slowly by hand to the floor of the cab. This will force air trapped in the master cylinder to escape at the fitting. 4. Hold the pedal down and tighten the fitting. Release the brake pedal.

NOTICE: Do not release the brake pedal until the fitting is tightened or air will re-enter the master cylinder.

5. Repeat this procedure until air ceases to excape at the fitting and the brake pedal is firm. 6. Place a box wrench on the bleeder fitting on the Rear Antilock Brake System (RABS) valve. Attach a rubber drain tube to the bleeder fitting

making sure the end of the tube fits snugly around the bleeder fitting.

7. Submerge the free end of the tube in a container partially filled with clean brake fluid. Loosen the bleeder fitting approximately three-quarters of a

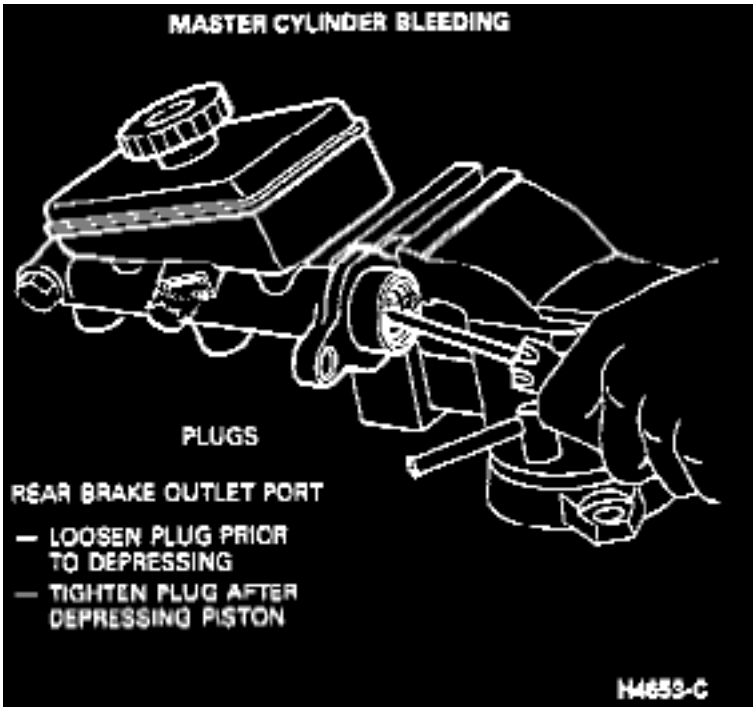
turn.

8. Slowly press the brake pedal all the way down. Close the bleeder fitting, and return the pedal to the fully released position. Repeat this operation

until air bubbles no longer appear at the submerged end of the bleeder tube.

9. When the fluid is completely free of air bubbles, close the bleeder fitting and remove the bleeder tube.

10. Repeat this procedure at the RR, LR, RF and LF wheels. 11. When the bleeding procedure is complete, fill the master cylinder to the maximum level line of the master cylinder reservoir.



Brake Bleeding: Service and Repair Master Cylinder Bleeding

Bench Bleeding Master Cylinder

1. Support the master cylinder body in a vise, and fill both fluid reservoirs with heavy duty DOT 3 brake fluid. 2. Install plugs in the front and rear brake outlet ports. Bleed the rear brake outlet system first. 3. Loosen the plug in the rear brake outlet port. Depress the primary piston slowly to force the air out of the master cylinder. Tighten plug while

piston is depressed or air will enter the master cylinder.

4. Repeat this procedure until air ceases to exit at the outlet port. 5. Repeat steps 3 and 4 for the front brake outlet port with the rear brake outlet plugged. 6. Tighten the plugs and try to depress the piston. Depressing the piston should be harder after all air is expelled. 7. Install the cover and diaphragm assembly making sure the cover retainer is tightened securely. Remove the plugs.

For additional information see Bench Bleeding Notes.

Brake Bleeding: Service and Repair Pressure Bleeding

Be sure the bleeder tank contains enough of the specified brake fluid to complete the bleeding operation. Charge the tank with approximately 69-206 kPa (10-30 psi). Never exceed 345 kPa (50 psi). Never use brake fluid that has been drained from the hydraulic system. Bleed the longest lines first.

1. Clean all dirt from the master cylinder reservoir cap. 2. Remove the master cylinder reservoir cap and fill the master cylinder reservoir with the specified brake fluid. Install the pressure bleeder adapter

tool on the master cylinder, and attach the bleeder tank hose to the fitting on the adapter.

NOTE: Master cylinder pressure bleeder adapter tools are available from the manufacturers of pressure bleeding equipment. Follow the manufacturer's instructions when installing the adapter.

3. Place a 3/8 inch box wrench on the bleeder fitting on the right rear brake wheel cylinder. Attach a bleeder tube snugly to the bleeder fitting. 4. Open the valve on the bleeder tank and admit pressurized brake fluid to the master cylinder reservoir. 5. Submerge the free end of the tube in a container partially filled with clean brake fluid, and loosen the bleeder fitting. 6. When air bubbles no longer appear in the fluid at the submerged end of the bleeder tube, close the bleeder fitting and remove the tube. 7. Repeat Steps 3 through 6 at the opposite wheel cylinder. On front brakes, bleed the right front caliper first. 8. When the bleeding operation is completed, close the bleeder tank valve and remove the tank hose from the adapter fitting. 9. Remove the pressure bleeder adapter tool. Fill the master cylinder reservoirs with the specified brake fluid to within 3 mm (1/8 in) from the top of

the filler neck. Install the master cylinder cover.

Brake Caliper: Customer Interest Brakes - Sticking/Binding/Grabbing

Article No. 93-11-7

05/26/93

BRAKES - STICK/BIND/GRAB - FRONT CALIPER PINS CORRODED

LIGHT TRUCK: 1987-90 BRONCO II 1987-92 AEROSTAR, BRONCO, ECONOLINE, F-150-350 SERIES, RANGER 1988-92 F SUPER DUTY 1991-92 EXPLORER

This TSB article is being republished in its entirety to include F Super Duty vehicles.

ISSUE: Sticking, binding or grabbing of the brakes may be caused by brake caliper slide pins that are corroded. The corrosion does not allow the brake caliper assembly to move freely.

ACTION: Install the new improved caliper pins that are corrosion resistant. Refer to the following Service Procedure for service details.

SERVICE PROCEDURE

1. Remove the caliper and pins. Refer to the applicable Light Truck Service Manual for service details.

NOTE: IF PADS ARE DAMAGED OR WORN, PAD REPLACEMENT IS REQUIRED.

2. Clean the upper and lower knuckle pin grooves, upper and lower knuckle inner pad grooves, and the upper and lower caliper pin grooves with a wire brush or portable wire wheel.

WARNING: USE SAFETY GLASSES AND AN AIR RESPIRATOR WHEN CLEANING THE GROOVES.

3. Apply a light coat of lubricant (D7AZ-19590-A) to the upper and lower knuckle inner pad grooves and upper and lower caliper pin grooves.

CAUTION: LUBRICANT SHOULD NOT BE USED ON ROTORS, LININGS OR CALIPER PISTON BOOTS.

4. Re-assemble the caliper using the new pins, (F2TZ-2C150-A) for all vehicles except F Super Duty. Use new pins (F2TZ-2C150-B) for F Super Duty vehicles.

NOTE: NORMAL BRAKE MAINTENANCE REQUIREMENTS LISTED IN THE OWNER MANUAL SHOULD BE PERFORMED EVERY 15,000 MILES.

Brake Caliper: Customer Interest Front Brakes - Popping or Clunking Noise

Article No. 92-14-7

07/01/92

^ BRAKES - FRONT DISC - "POPPING" OR "CLUNKING" SOUND DURING BRAKING

^ NOISE - "POPPING" OR "CLUNKING" SOUND WHEN BRAKING

^ VIBRATION THROUGH FLOOR BOARD WHEN BRAKING

LIGHT TRUCK: 1989-90 BRONCO II 1989-92 AEROSTAR, RANGER 1991-92 EXPLORER

See TSB # 93-20-11 for additional information.

ISSUE: A "popping" or "clunking" noise and a floor board vibration may occur during braking. The noise and/or vibration may be caused by the front brake caliper suddenly springing away from the caliper abutment and returning.

ACTION: Check and adjust the brake pads and caliper knuckle clearance by using the following service procedure.

1. Road test to confirm that the "popping" or "clunking" noise occurs only during braking at the initial part of the stop.

2. Raise the front of the vehicle.

a. Remove the front wheels.

b. Remove the pins from the caliper.

3. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails.

NOTE:

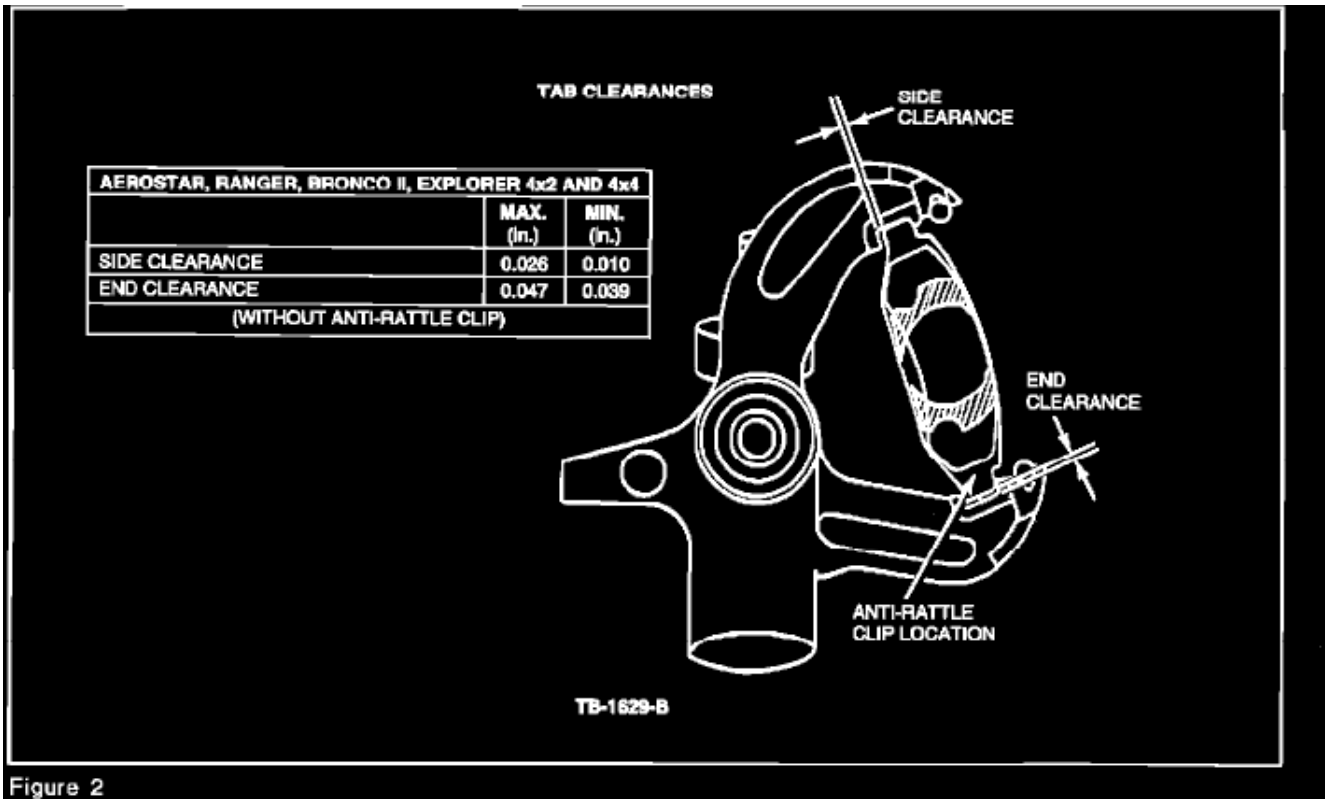

Figure 2

THE CLEARANCE SHOULD BE A MINIMUM OF .015" (.381 MM).

a. If the caliper clearance is less than .015" (.381 mm) on either caliper, replace the caliper and repeat the measurements.

b. If the caliper clearance is less than .015" (.381 mm) on both calipers, replace both calipers and recheck clearance.

c. If the caliper clearance is still less than .015" (.381 mm) on both calipers, replace both spindles (4X2) or knuckles (4X4) and recheck clearance.

NOTE: CHECK THE CLEARANCE OF THE NEW KNUCKLE BEFORE INSTALLATION.

4. After measuring the caliper/knuckle for proper clearance, remove both calipers and brake pad assemblies. Refer to the appropriate Light Truck Service Manual, Section 06-03, for the removal procedure.

5. Replace the caliper piston (FOTZ-2196-A). Refer to the appropriate Light Truck Service Manual, Section 06-03, for the replacement procedure.

6. Install the new lining kit (FO9Z-2001-A).

a. Check the side and end clearances with a feeler gauge.

b. Refer to Figure 2 for clearance dimensions.

E8TZ-3131-A	Arm Assembly, LH (4X4 Bronco II)	B

7. If the lining clearance is not to the required dimensions, file the shoe tab. Remove equal amounts from both sides and ends, Figure 3.

WARNING: USE SAFETY GLASSES WHEN FILING THE BACKING PLATES.

CAUTION: DO NOT GRIND. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

8. Assemble the brakes and caliper pins (E8TZ-2C150-B). Lubricate the caliper pins with disc brake lubricant (D7AZ-19590-A). Refer to the appropriate Light Truck Service Manual, Section 06-03, for assembling details.

9. Apply a light coat of disc brake lubricant (D7AZ-19590-A) to the inner knuckle top and bottom pad groove. Also apply a light coat of disc brake lubricant (D7AZ-19590-A) to the caliper rails.

CAUTION: PREVENT LUBRICANT FROM STICKING TO ROTORS, LININGS OR CALIPER PISTON BOOTS.

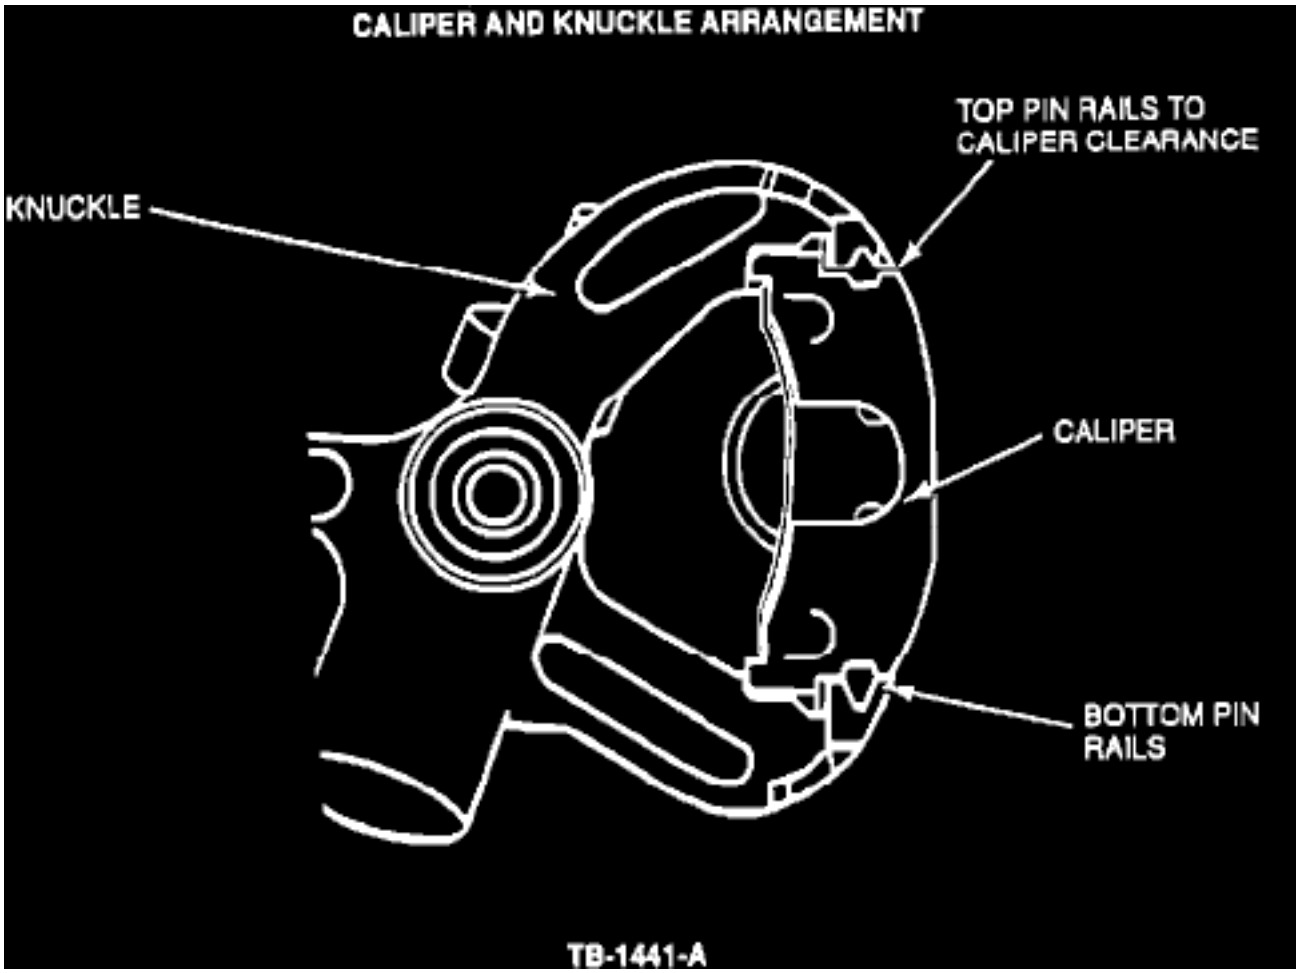
WARRANTY STATUS AND OPERATION DESCRIPTION



Technical Service Bulletin # 9097 Date: 900427

Steering/Suspension - Pull/Drift Diagnostic Procedure

^ BRAKES - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

^ STEERING - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

Article No. 90-9-7

LIGHT TRUCK: 1988-90 BRONCO II, RANGER 1991 EXPLORER

ISSUE: A comprehensive, pull and drift diagnostic procedure has been developed to assist techicians with truck service.

ACTION: Use the following service procedure to resolve drift and pull concerns.

This is the same basic procedure as published in TSB 90-7-16 for the 1988-90 Bronco and F-150, 4x4 models. However, you should note that there are some differences such as replacing radius arm bushings instead of installing a radius arm bracket kit, etc.

Proceed with the Pull and Drift Diagnostic Procedure if the pull or drift is not significantly reduced or where there is a case of steady state drift (no braking).

A Diagnostic Check List has been provided at the end of this article to use with this procedure.

NOTE: THIS TSB ARTICLE SHOULD BE READ COMPLETELY BEFORE PERFORMING DIAGNOSTICS OR REPAIRS.

Service Procedure

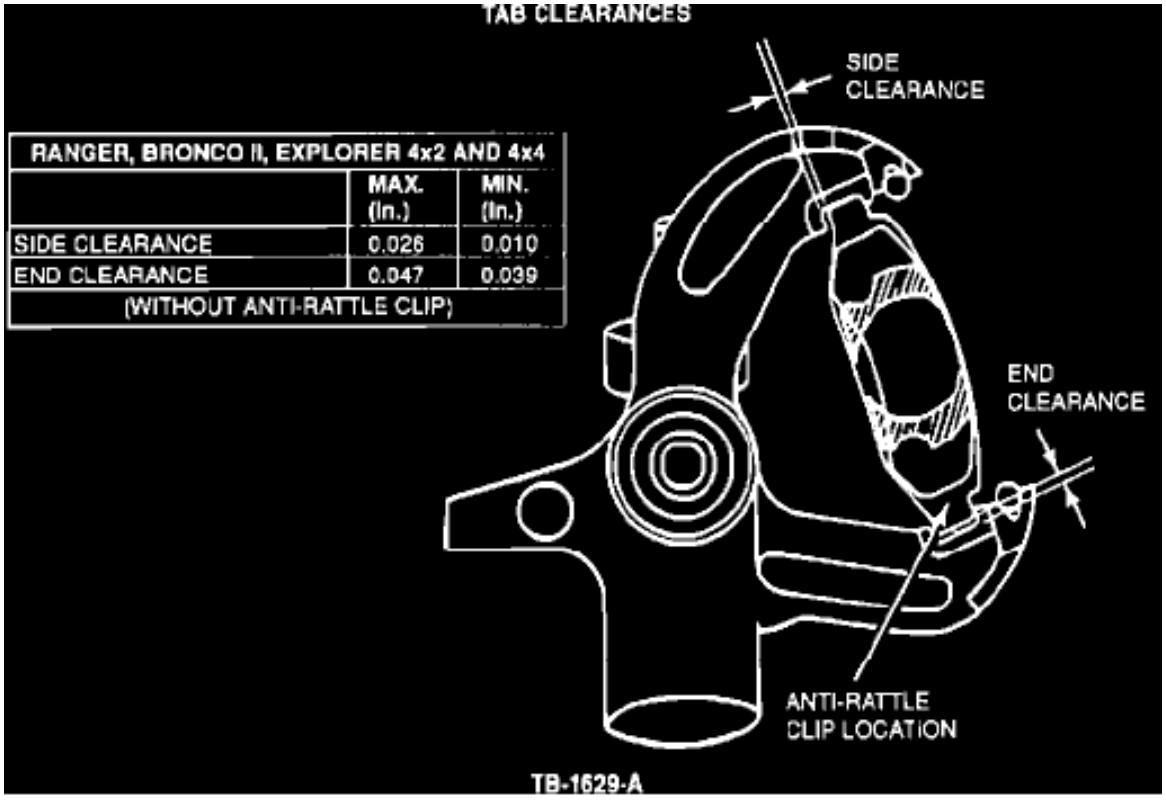
Figure 1

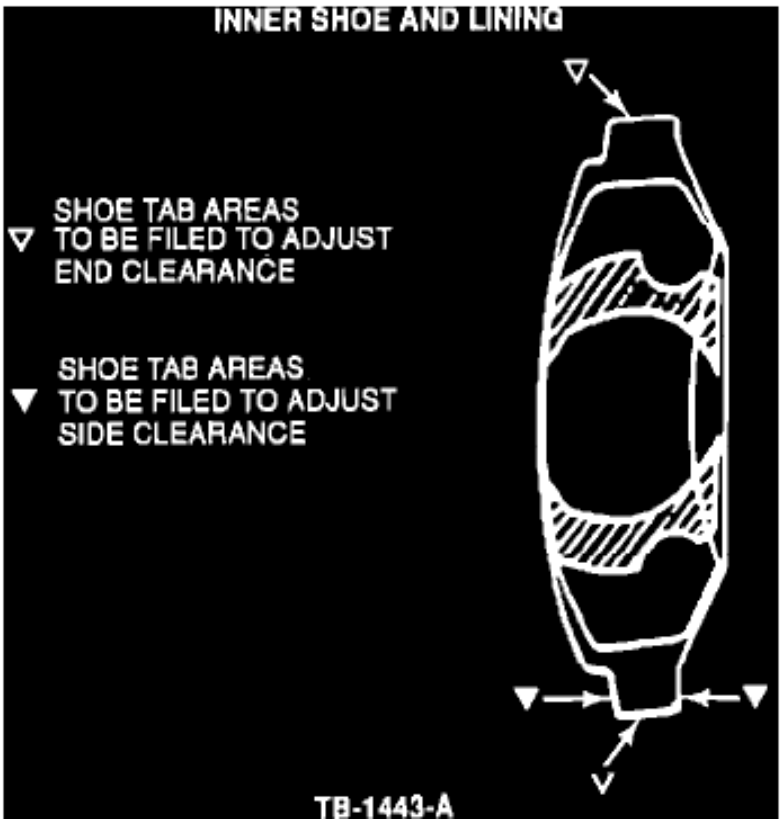
1. Check and adjust brake pad clearances and caliper knuckle clearances as follows:

a. Remove the pins from the caliper.

b. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails.

Clearance should be a minimum of .015 ".





c. If the clearance is insufficient, replace the caliper and measure again. If clearance concern still exists, replace the knuckle.

NOTE: CHECK THE CLEARANCE ON THE NEW KNUCKLE BEFORE INSTALLATION.

d. After measuring the caliper/knuckle for proper clearances, remove both calipers and inner pad assemblies.

e. Remove the anti-rattle clip from the inner pad.

Figure 2

Figure 3

f. Re-install pad and check the side and end clearances with a feeler gauge. (See Figure 2 for clearance dimensions.)

g. If the pad clearances are within specification, refer to Service Procedure Step 2 - "Caliper Groove Lubrication". If the pad clearances are not to the

required dimensions, file the steel backing plate.

WARNING: USE SAFETY GLASSES WHEN FILING STEEL BACKING PLATES

h. File material, removing equal amounts from both sides or ends. (See Figure 3.)

CAUTION: DO NOT GRIND. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

i. Check the tab clearances and install anti-rattle clip on the lower pad tab, Figure

2.

2. Apply a light coat of lubricant (D7AZ-19590-A) to the inner knuckle top and bottom pad groove and caliper rails. CAUTION:

MAKE SURE THE LUBRICANT DOES NOT GET ON THE ROTORS, LININGS, OR ON THE CALIPER PISTON BOOTS.

3. Replace the right and left side arm bushings with new bushings (FITZ-3B203-A). Refer to the appropriate Light Truck Shop Manual, Section 04-OIC

for service details.

NOTE: THE EXPLORER IS ALREADY EQUIPPED WITH THE NEW RADIUS ARM BUSHINGS.

Pull Drift Diagnostic Procedure

The Pull Drift Diagnostic Procedure should be used if the pull or drift is not significantly reduced with the service procedure or in cases of a steady state drift (no braking).

Test drive the truck with the customer to understand his/her pull or drift concern. Many customers will call a clear vision concern a pull or drift because the steering wheel is not straight.

Pull or drifts come from various sources, each with a particular set of symptoms. Careful road test evaluation usually will pinpoint which cause (or causes) are present.

The Road Test

It is important to test drive the truck with the customer to UNDERSTAND HIS OR HER CONCERN.

Complete the road test before beginning any repairs since you may have multiple causes that need to be identified.

^ The road test should be done on a flat, straight road and should be done in both directions to account for wind.

^ Tire pressure should be checked and adjusted, if necessary.

^ A second person in the truck during the road test is helpful. Unless otherwise directed, the second person must remain in the front RH passenger location.

^ On trucks with automatic locking hubs, it is necessary to drive (20) feet forward and then backwards to unlock the hubs.

ROAD TEST	RESULT	ACTION
Maintain a steady speed of 50-55 mph (80-89 km/h). DO NOT BRAKE	Is there a steady state pull? If no, go to the next step.	**See Diagnostic Procedure 1.** Tire mismatch or tire pressure concern
While stopped, have second person move to the left hand rear passenger location. Maintaining 50-55 mph (80-89 km/h).	Any change in pull? If no change, go to next step.	**See Diagnostic Procedure 2** Caster split
Make sure front hubs are unlocked (if equipped*). Accelerate the truck - decelerate the truck using **engine braking only.**	Any changes in the pull? Does it pull one way on acceleration and another way on deceleration? If no, go to next step.	**See Diagnostic Procedure 3.** Possible limited slip rear axle and tire circumference
Maintain a steady speed of 50-55 mph (80-89 km/h). Put the vehicle in neutral and shut off the engine.	Does the pull go away? If no, go to the next step.	**See Diagnostic Procedure 4.** Steering gear valve off center
Stop the truck along the highway. Rotate the wheel full left. Proceed with road test.	Does the pull get better or worse? Stop the truck; rotate the wheel full right. Does the pull change - better or worse? If no, go to next step.	**See Diagnostic Procedure 5.** Possible Rubber Ball Socket (RBS) memory steer
In a safe clear area, while firmly holding the steering wheel, apply the brakes moderately hard, but not to the point of engaging RABS.	Does the trucks heading change during brake application? If no, go to next step.	**See Diagnostic Procedure 6.** Possible brake imbalance.
Disconnect the fluid level sensor (disable RABS). Brake the truck from 50 mph (80 km/h).	Does the vehicle pull with A/L disconnected? If no, go to next step.	**See Diagnostic Procedure 6** Possible inadequate rear brake application
Brake the truck hard, to the point of lock-up (RABS disabled).	Do both rears lock? Do both wheels lock at the same time?	**See Diagnostic Procedure 6** Possible unequal rear brake application

NOTE: IT IS POSSIBLE THAT THE TRUCK MAY HAVE MULTIPLE SYMPTOMS. A ROAD TEST/CAUSE CHART FOLLOWS.

NOTE: RECONNECT THE FLUID LEVEL SENSOR AFTER ROAD TEST

Diagnostic Procedure # 1 - Tire Mismatch

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the diagnostic procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to RPO (regular production option) list and set tire psi to the correct value.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only.

Set tire pressure to value on the certification label.

1. Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Tire Pull - Swap the front tires from side to side and road test. If the concern is not corrected, continue with next step.

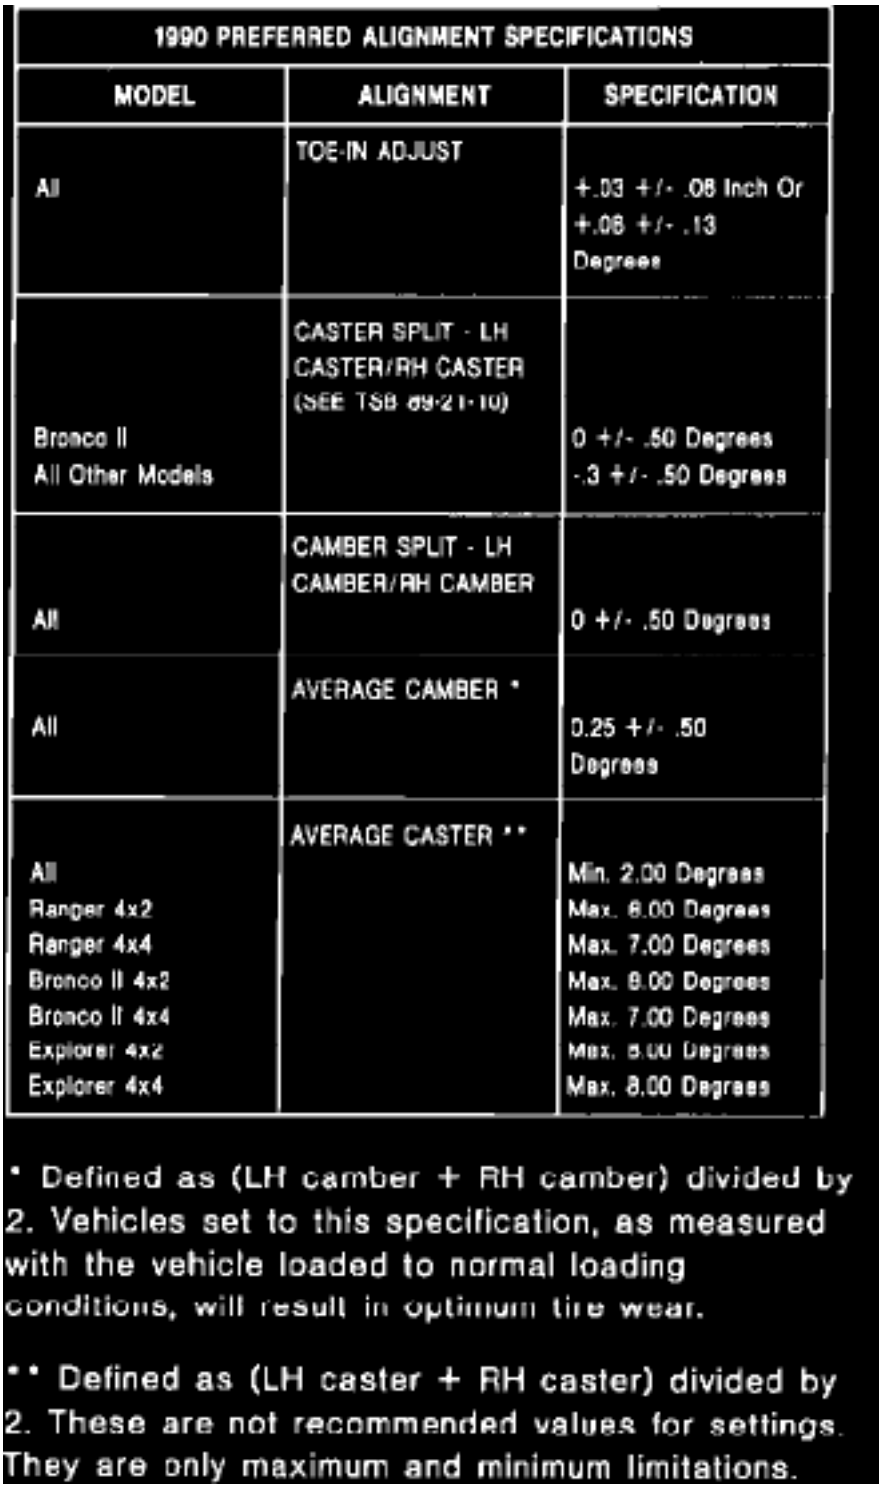
3. Tire Pull - Swap rear tires from side to side and road test. If the concern is not corrected, continue with next step.

4. Tire Pull - Swap front tires from front to rear. Set the tire pressure to the required pressure for the new front and rear positions, then road test.

NOTE: ON REAR LIMITED SLIP AXLE (FRONT HUB UNLOCKED) DRIFT CONCERNS, IT MAY BE NECESSARY TO MEASURE TIRE

CIRCUMFERENCE AND PLACE A MATCHED SET OF TIRES ON THE REAR AXLE.

Diagnostic Procedure # 2 - Alignment



1990 PREFERRED ALIGNMENT SPECIFICATIONS

MODEL	ALIGNMENT	SPECIFICATION
All	TOE-IN ADJUST	+.03 +/- .08 Inch Or +.08 +/- .13 Degrees
Bronco II All Other Models	CASTER SPLIT - LH CASTER/RH CASTER (SEE TSB 89-21-10)	0 +/- .50 Degrees -.3 +/- .50 Degrees
All	CAMBER SPLIT - LH CAMBER/RH CAMBER	0 +/- .50 Degrees
All	AVERAGE CAMBER *	0.25 +/- .50 Degrees
All Ranger 4x2 Ranger 4x4 Bronco II 4x2 Bronco II 4x4 Explorer 4x2 Explorer 4x4	AVERAGE CASTER **	Min. 2.00 Degrees Max. 8.00 Degrees Max. 7.00 Degrees Max. 8.00 Degrees Max. 7.00 Degrees Max. 8.00 Degrees Max. 8.00 Degrees

* Defined as (LH camber + RH camber) divided by 2. Vehicles set to this specification, as measured with the vehicle loaded to normal loading conditions, will result in optimum tire wear.

** Defined as (LH caster + RH caster) divided by 2. These are not recommended values for settings. They are only maximum and minimum limitations.

Wheel Alignment - Measure the front wheel alignment. For out of specification vehicles, align to the "1990 Preferred Alignment Specifications" stated in this article.

^ Spin the front tires to be sure that the front hubs are unlocked, if hubs are unlocked, the axle shaft will not rotate with the wheels.

^ Do not adjust wheel alignment to correct for brake pull if the vehicle does not have pull during non-brake applications.

^ Set the tire pressure to the specification on the certification label.

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the diagnostic procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to HPO (regular production option) list and set tire pressure to the correct value.

^ IF THE TIRES AND WHEELS DO NOT MATCH CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only.

Drive vehicle after alignment is performed. ^

Vehicles which exceed the maximum average caster value shown above may result in shimmy concerns.

^ Vehicles operated below the minimum average caster value shown can result in wander and poor steering returnability concerns.

If the vehicle is not within these minimum and maximum average caster values, or if the vehicle has experienced any of these listed steering/handling concerns, the average caster should be set in accordance with ride height/caster chart in the Shop Manual.

Diagnostic Procedure # 3 - Tires

1. Spin the front tires to be sure that the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Measure tire circumference of all four tires; put the two closest circumference tires on the rear axle. Tire pressure must be equal on all tires.

Diagnostic Procedure # 4 - Steering Gear Valve Off Center

Rotary Valve Centering Check: To confirm that you are looking at a steering gear valve concern, lift the front wheels off the ground.

^ The truck should be raised so that there is no interference with the steering linkage.

^ The front wheels should also spin freely.

With the wheels in a straight ahead position, start the engine and observe any steering wheel or linkage movement when the engine is started. If any movement is observed, continue with the rotary valve centering check.

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Install a 0-13,789 kPa (0-2000 psi) pressure-gauge (Tool D79L-33610-A, Power Steering Analyzer) in the pressure line between the power steering

pump outlet port 1 and the integral steering gear inlet port. Make sure the valve on the gauge is fully open.

3. Check the fluid level in the reservoir. Add Premimum Power Steering Fluid - E6AZ-19582-AA (ESW-M2C33-F) or equivalent, if necessary.

4. Start the engine and turn the steering wheel from stop-to-stop to bring the steering lubricant to normal operating temperature. Turn off the engine and

re-check the fluid level. Add Premium Power Steering Fluid - E6AZ-19582-AA (ESW-M2C33-F) or equivalent, if necessary.

5. With the engine running at approximately 1000 rpm and the steering wheel centered, attach an lb.in. torque wrench to the steering wheel nut. Apply

sufficient torque in each direction to get a gauge reading of 1723 kPa (250 psi).

6. The torque wrench readings should be the same in both directions at 1723 kPa (250 psi). If the difference between the readings exceeds 6 lb.in. (0.68

N-m), remove the steering gear and replace the shaft and control assembly.

7. Remove the pressure gauge installed in Step 2.

Diagnostic Procedure # 5 - Rbs Linkage

If the RBS linkage is determined to have wind up or memory steer, replace RBS linkage with greasable steel linkage.

NOTE: ALL SERVICE PART STEERING LINKAGE IS THE GREASABLE STEEL SOCKET TYPE.

Diagnostic Procedure # 6 - Brake Imbalance

Spin the front tires make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Check for front wheel rotational drag with warm/hot brakes.

a. Make a series of 10 stops from speeds of 30 mph (48 km/h).

b. Make the 10 stops with no more than 30 second intervals between stops. This generally will induce a maximum pull if there is a drift/pull

concern.

c. Raise the front end of the truck so that both tires are off the ground.

d. Rotate the front wheels by hand.

NOTE: FOR ALL 4 WHEEL DRIVE TRUCKS, MAKE SURE THE HUBS ARE DISENGAGED.

Both tires should rotate about the same amount, with little brake drag occurring. Some brake drag will naturally be present for each size of truck.

3. If the truck has excess brake drag, proceed as follows:

a. Open the bleed screw on the affected wheel to check for residual pressure in the brake lines. If there is a squirt of brake fluid out the bleeder

screw and the drag is reduced or eliminated, the master cylinder may not be allowing the brake fluid to return to the reservoir.

b. Check the master cylinder push rod adjustment. Refer to the appropriate Light Truck Shop Manual, Section 06-06 for service details.

c. Check the brake pedal to determine if it is fully returning.

4. Remove both calipers and check piston retraction using a "C" clamp and wooden block. The piston should easily move back into the bore under the

force of the clamp. Re-build or replace as needed.

5. If Steps 1 through 4 have not determined the concern, swap rotors and linings from side to side.

NOTE: SHOE TAB CLEARANCES SHOULD BE CHECKED AND MODIFIED IF NEEDED. SEE FIGURE 2.

6. Test drive the vehicle with 10 or more stops from 40 mph before evaluating for brake drift. If there is no change in drift while braking, it may be

assumed the concern is not the result of the front brakes.

7. Check the rear brakes. Remove the rear wheels and brake drums.

a. Check for contaminates (i.e., grease, axle lube, leaking brake fluid, etc.).

b. Check for broken components, frozen parking brake cables and improperly installed parts.

c. Check the cage diameter using the Brake Shoe Adjustment Gauge (D81L-1103-A). If either side is out of specification, check for proper

function of the adjusting mechanism and repair or replace as required.

d. Check the rear wheel cylinders by the following method.

^ Replace one of the brake drums.

^ Have another person apply the brakes and watch for movement of one of the brake shoes on the other wheel.

^ Re-apply the brakes while holding in place the shoe that moved. The opposite shoe should now move. If no movement is observed, repair or replace the wheel cylinder.

^ Re-install the drum and repeat the procedure for the other rear brake.

8. If the condition still exists, swap rear shoes from side to side and drive the truck. If the drift is significantly reduced, replace the rear linings. If the

drift/pull is not significantly reduced, go to Service Procedure # 7.

Diagnostic Procedure # 7 - Miscellaneous

Check for loose, damaged or excessively worn parts. Visually inspect the front suspension for loose or worn components (i.e., ball joints, radius arm bushings, radius arm attachments at the axle and frame, alignment adjusters, steering linkage, etc.). Repair or replace as required.

Diagnostic Check List

NOTE: THE FOLLOWING CHECK LIST SHOULD BE COMPLETED AFTER EACH STEP OF THE DIAGNOSTIC WHERE APPLICABLE.

SERVICE PROCEDURE

1. Checking clearances.

_ Caliper to knuckle clearance.

_ Inner shoe side and end clearance.

2. Lubrication of components.

_ Lubrication of the caliper rails and inner knuckle pad grooves.

3. Radius arm bushings.

_ Replacement of right and left side radius arm bushings.

DIAGNOSTIC PROCEDURE:

1. Tire mismatch.

_ Unlocked hubs check.

_ Front tires swapped side to side.

_ Rear tires swapped side to side.

_ Front to rear tire swap.

2. Alignment.

_ Unlocked hubs check.

_ Toe changed to _.

_ Caster changed and split is _.

_ Camber changed and split is _.

3. Tire circumference.

_ Unlocked hubs check.

_ Tire circumference checked and two closest circumference tires swapped to rear axle.

4. Steering gear valve.

_ Unlocked hubs check.

_ Install pressure gauge.

_ Check fluid level with engine off and on.

_ Apply torque to the steering wheel nut and check gauge readings.

_ Replaced the shaft and control assembly.

_ Removed the pressure gauge.

5. RABS linkage.

_ Replaced the RBS linkage.

6. Brake imbalance.

_ Unlocked hubs check.

_ Front wheel rotational drag check.

_ Master cylinder check.

_ Piston retraction check.

_ Rotors and linings swapped from side to side.

_ Rear brakes checked.

_ Rear drums and shoes swapped from side to side.

7. Miscellaneous.

_ Check for loose, damaged or worn parts.

LIGHT TRUCK: 1987-90 BRONCO II 1987-92 AEROSTAR, BRONCO, ECONOLINE, F-150-350 SERIES, RANGER 1988-92 F SUPER DUTY 1991-92 EXPLORER

This TSB article is being republished in its entirety to include F Super Duty vehicles.

ISSUE: Sticking, binding or grabbing of the brakes may be caused by brake caliper slide pins that are corroded. The corrosion does not allow the brake caliper assembly to move freely.

ACTION: Install the new improved caliper pins that are corrosion resistant. Refer to the following Service Procedure for service details.

SERVICE PROCEDURE

1. Remove the caliper and pins. Refer to the applicable Light Truck Service Manual for service details.

NOTE: IF PADS ARE DAMAGED OR WORN, PAD REPLACEMENT IS REQUIRED.

2. Clean the upper and lower knuckle pin grooves, upper and lower knuckle inner pad grooves, and the upper and lower caliper pin grooves with a wire brush or portable wire wheel.

WARNING: USE SAFETY GLASSES AND AN AIR RESPIRATOR WHEN CLEANING THE GROOVES.

3. Apply a light coat of lubricant (D7AZ-19590-A) to the upper and lower knuckle inner pad grooves and upper and lower caliper pin grooves.

CAUTION: LUBRICANT SHOULD NOT BE USED ON ROTORS, LININGS OR CALIPER PISTON BOOTS.

4. Re-assemble the caliper using the new pins, (F2TZ-2C150-A) for all vehicles except F Super Duty. Use new pins (F2TZ-2C150-B) for F Super Duty vehicles.

NOTE: NORMAL BRAKE MAINTENANCE REQUIREMENTS LISTED IN THE OWNER MANUAL SHOULD BE PERFORMED EVERY 15,000 MILES.

Brake Caliper: All Technical Service Bulletins Front Brakes - Popping or Clunking Noise

Article No. 92-14-7

07/01/92

^ BRAKES - FRONT DISC - "POPPING" OR "CLUNKING" SOUND DURING BRAKING

^ NOISE - "POPPING" OR "CLUNKING" SOUND WHEN BRAKING

^ VIBRATION THROUGH FLOOR BOARD WHEN BRAKING

LIGHT TRUCK: 1989-90 BRONCO II 1989-92 AEROSTAR, RANGER 1991-92 EXPLORER

See TSB # 93-20-11 for additional information.

ISSUE: A "popping" or "clunking" noise and a floor board vibration may occur during braking. The noise and/or vibration may be caused by the front brake caliper suddenly springing away from the caliper abutment and returning.

ACTION: Check and adjust the brake pads and caliper knuckle clearance by using the following service procedure.

1. Road test to confirm that the "popping" or "clunking" noise occurs only during braking at the initial part of the stop.

2. Raise the front of the vehicle.

a. Remove the front wheels.

b. Remove the pins from the caliper.

3. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails.

NOTE:

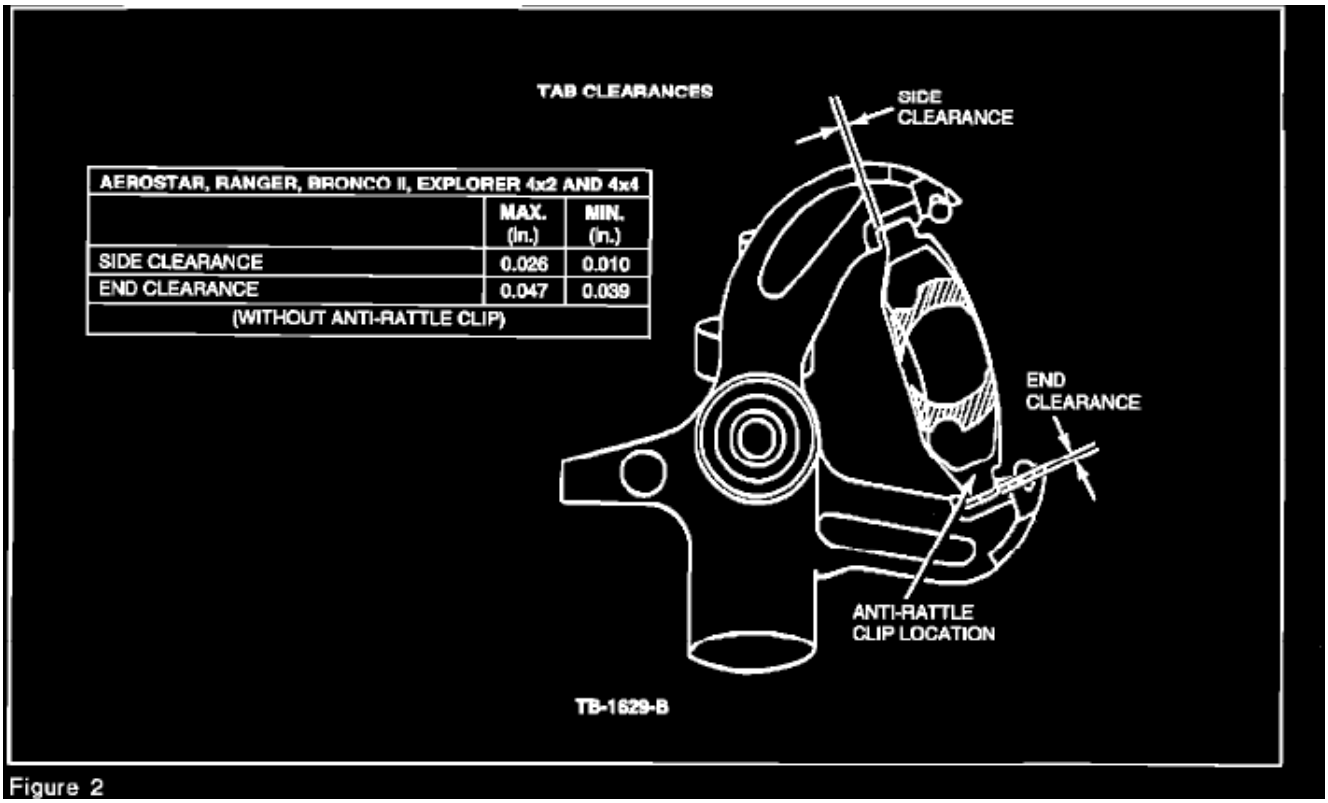

Figure 2

THE CLEARANCE SHOULD BE A MINIMUM OF .015" (.381 MM).

a. If the caliper clearance is less than .015" (.381 mm) on either caliper, replace the caliper and repeat the measurements.

b. If the caliper clearance is less than .015" (.381 mm) on both calipers, replace both calipers and recheck clearance.

c. If the caliper clearance is still less than .015" (.381 mm) on both calipers, replace both spindles (4X2) or knuckles (4X4) and recheck clearance.

NOTE: CHECK THE CLEARANCE OF THE NEW KNUCKLE BEFORE INSTALLATION.

4. After measuring the caliper/knuckle for proper clearance, remove both calipers and brake pad assemblies. Refer to the appropriate Light Truck Service Manual, Section 06-03, for the removal procedure.

5. Replace the caliper piston (FOTZ-2196-A). Refer to the appropriate Light Truck Service Manual, Section 06-03, for the replacement procedure.

6. Install the new lining kit (FO9Z-2001-A).

a. Check the side and end clearances with a feeler gauge.

b. Refer to Figure 2 for clearance dimensions.

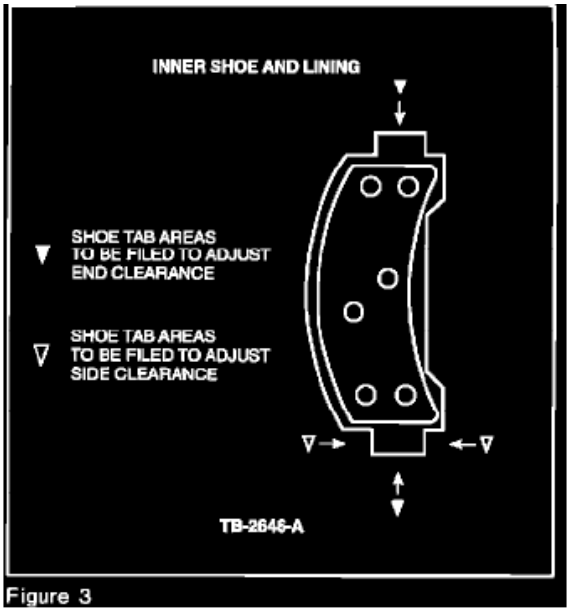

Figure 3

E8TZ-3131-A	Arm Assembly, LH (4X4 Bronco II)	B

7. If the lining clearance is not to the required dimensions, file the shoe tab. Remove equal amounts from both sides and ends, Figure 3.

WARNING: USE SAFETY GLASSES WHEN FILING THE BACKING PLATES.

CAUTION: DO NOT GRIND. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

8. Assemble the brakes and caliper pins (E8TZ-2C150-B). Lubricate the caliper pins with disc brake lubricant (D7AZ-19590-A). Refer to the appropriate Light Truck Service Manual, Section 06-03, for assembling details.

9. Apply a light coat of disc brake lubricant (D7AZ-19590-A) to the inner knuckle top and bottom pad groove. Also apply a light coat of disc brake lubricant (D7AZ-19590-A) to the caliper rails.

CAUTION: PREVENT LUBRICANT FROM STICKING TO ROTORS, LININGS OR CALIPER PISTON BOOTS.

Technical Service Bulletin # 9097 Date: 900427

Steering/Suspension - Pull/Drift Diagnostic Procedure

^ BRAKES - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

^ STEERING - PULL OR DRIFT - DIAGNOSTIC AND SERVICE PROCEDURE

Article No. 90-9-7

LIGHT TRUCK: 1988-90 BRONCO II, RANGER 1991 EXPLORER

ISSUE: A comprehensive, pull and drift diagnostic procedure has been developed to assist techicians with truck service.

ACTION: Use the following service procedure to resolve drift and pull concerns.

This is the same basic procedure as published in TSB 90-7-16 for the 1988-90 Bronco and F-150, 4x4 models. However, you should note that there are some differences such as replacing radius arm bushings instead of installing a radius arm bracket kit, etc.

Proceed with the Pull and Drift Diagnostic Procedure if the pull or drift is not significantly reduced or where there is a case of steady state drift (no braking).

A Diagnostic Check List has been provided at the end of this article to use with this procedure.

NOTE: THIS TSB ARTICLE SHOULD BE READ COMPLETELY BEFORE PERFORMING DIAGNOSTICS OR REPAIRS.

Service Procedure

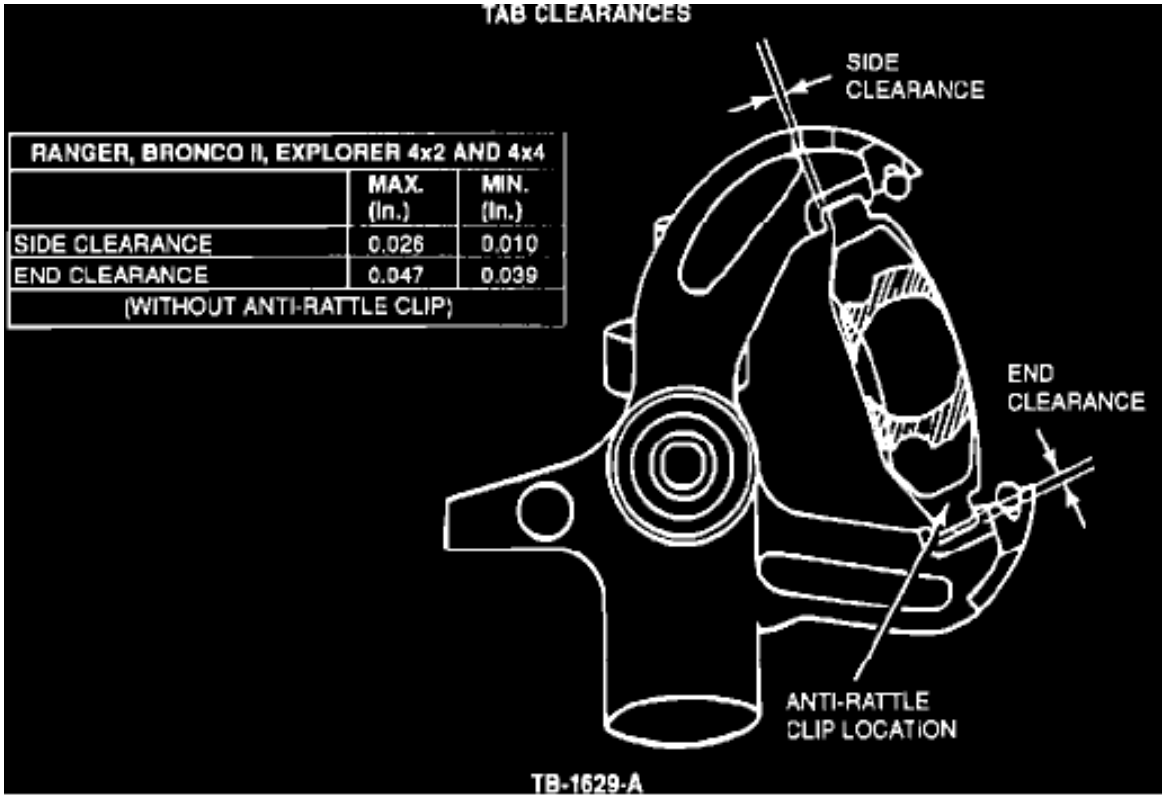
Figure 1

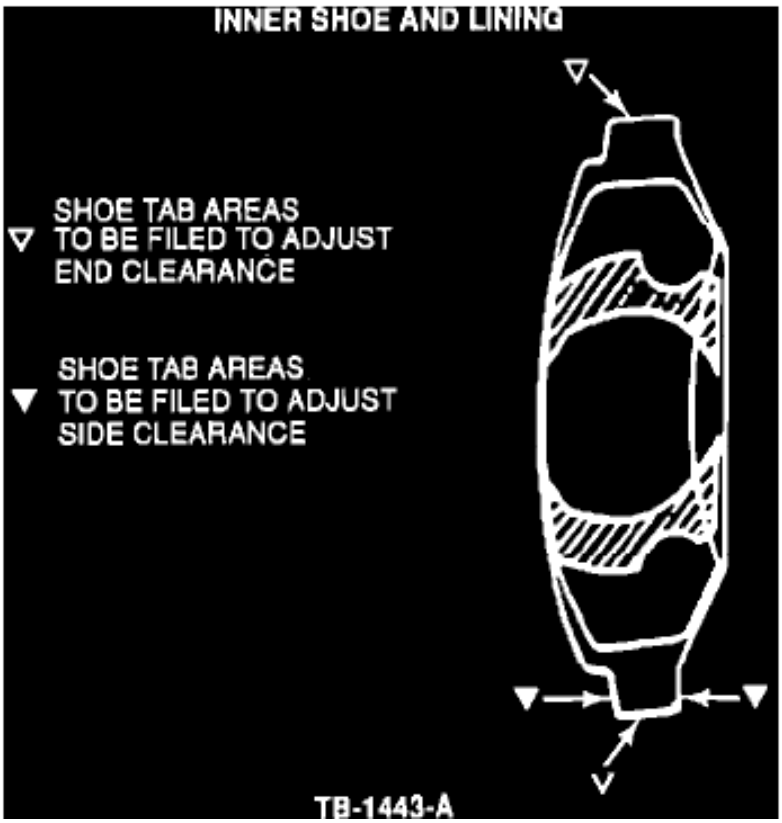
1. Check and adjust brake pad clearances and caliper knuckle clearances as follows:

a. Remove the pins from the caliper.

b. While holding the caliper in place against the bottom pin rails, Figure 1, measure the clearance between the caliper and the top pin rails.

Clearance should be a minimum of .015 ".





c. If the clearance is insufficient, replace the caliper and measure again. If clearance concern still exists, replace the knuckle.

NOTE: CHECK THE CLEARANCE ON THE NEW KNUCKLE BEFORE INSTALLATION.

d. After measuring the caliper/knuckle for proper clearances, remove both calipers and inner pad assemblies.

e. Remove the anti-rattle clip from the inner pad.

Figure 2

Figure 3

f. Re-install pad and check the side and end clearances with a feeler gauge. (See Figure 2 for clearance dimensions.)

g. If the pad clearances are within specification, refer to Service Procedure Step 2 - "Caliper Groove Lubrication". If the pad clearances are not to the

required dimensions, file the steel backing plate.

WARNING: USE SAFETY GLASSES WHEN FILING STEEL BACKING PLATES

h. File material, removing equal amounts from both sides or ends. (See Figure 3.)

CAUTION: DO NOT GRIND. IT IS POSSIBLE TO REMOVE TOO MUCH MATERIAL WHEN GRINDING.

i. Check the tab clearances and install anti-rattle clip on the lower pad tab, Figure

2.

2. Apply a light coat of lubricant (D7AZ-19590-A) to the inner knuckle top and bottom pad groove and caliper rails. CAUTION:

MAKE SURE THE LUBRICANT DOES NOT GET ON THE ROTORS, LININGS, OR ON THE CALIPER PISTON BOOTS.

3. Replace the right and left side arm bushings with new bushings (FITZ-3B203-A). Refer to the appropriate Light Truck Shop Manual, Section 04-OIC

for service details.

NOTE: THE EXPLORER IS ALREADY EQUIPPED WITH THE NEW RADIUS ARM BUSHINGS.

Pull Drift Diagnostic Procedure

The Pull Drift Diagnostic Procedure should be used if the pull or drift is not significantly reduced with the service procedure or in cases of a steady state drift (no braking).

Test drive the truck with the customer to understand his/her pull or drift concern. Many customers will call a clear vision concern a pull or drift because the steering wheel is not straight.

Pull or drifts come from various sources, each with a particular set of symptoms. Careful road test evaluation usually will pinpoint which cause (or causes) are present.

The Road Test

It is important to test drive the truck with the customer to UNDERSTAND HIS OR HER CONCERN.

Complete the road test before beginning any repairs since you may have multiple causes that need to be identified.

^ The road test should be done on a flat, straight road and should be done in both directions to account for wind.

^ Tire pressure should be checked and adjusted, if necessary.

^ A second person in the truck during the road test is helpful. Unless otherwise directed, the second person must remain in the front RH passenger location.

^ On trucks with automatic locking hubs, it is necessary to drive (20) feet forward and then backwards to unlock the hubs.

ROAD TEST	RESULT	ACTION
Maintain a steady speed of 50-55 mph (80-89 km/h). **DO NOT BRAKE**	Is there a steady state pull? If no, go to the next step.	**See Diagnostic Procedure 1.** Tire mismatch or tire pressure concern
While stopped, have second person move to the left hand rear passenger location. Maintaining 50-55 mph (80-89 km/h).	Any change in pull? If no change, go to next step.	**See Diagnostic Procedure 2** Caster split
Make sure front hubs are unlocked (if equipped*). Accelerate the truck - decelerate the truck using **engine braking only.**	Any changes in the pull? Does it pull one way on acceleration and another way on deceleration? If no, go to next step.	**See Diagnostic Procedure 3.** Possible limited slip rear axle and tire circumference
Maintain a steady speed of 50-55 mph (80-89 km/h). Put the vehicle in neutral and shut off the engine.	Does the pull go away? If no, go to the next step.	**See Diagnostic Procedure 4.** Steering gear valve off center
Stop the truck along the highway. Rotate the wheel full left. Proceed with road test.	Does the pull get better or worse? Stop the truck; rotate the wheel full right. Does the pull change - better or worse? If no, go to next step.	**See Diagnostic Procedure 5.** Possible Rubber Ball Socket (RBS) memory steer
In a safe clear area, while firmly holding the steering wheel, apply the brakes moderately hard, but not to the point of engaging RABS.	Does the trucks heading change during brake application? If no, go to next step.	**See Diagnostic Procedure 6.** Possible brake imbalance.
Disconnect the fluid level sensor (disable RABS). Brake the truck from 50 mph (80 km/h).	Does the vehicle pull with A/L disconnected? If no, go to next step.	**See Diagnostic Procedure 6** Possible inadequate rear brake application
Brake the truck hard, to the point of lock-up (RABS disabled).	Do both rears lock? Do both wheels lock at the same time?	**See Diagnostic Procedure 6** Possible unequal rear brake application

NOTE: IT IS POSSIBLE THAT THE TRUCK MAY HAVE MULTIPLE SYMPTOMS. A ROAD TEST/CAUSE CHART FOLLOWS.

NOTE: RECONNECT THE FLUID LEVEL SENSOR AFTER ROAD TEST

Diagnostic Procedure # 1 - Tire Mismatch

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the diagnostic procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to RPO (regular production option) list and set tire psi to the correct value.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only.

Set tire pressure to value on the certification label.

1. Spin the front tires to be sure that the front hubs are unlocked. If hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Tire Pull - Swap the front tires from side to side and road test. If the concern is not corrected, continue with next step.

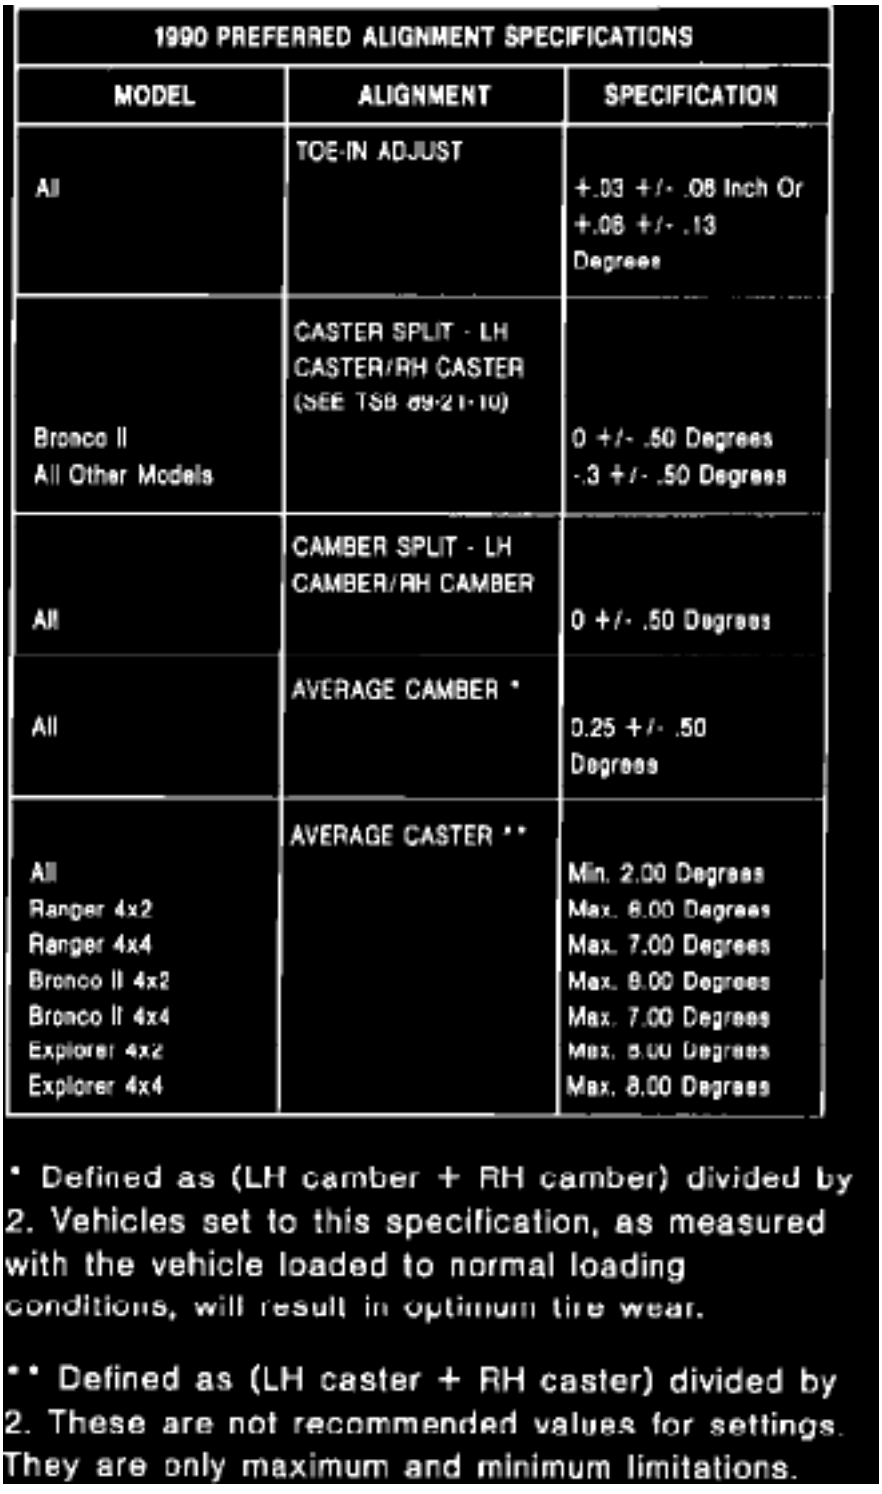
3. Tire Pull - Swap rear tires from side to side and road test. If the concern is not corrected, continue with next step.

4. Tire Pull - Swap front tires from front to rear. Set the tire pressure to the required pressure for the new front and rear positions, then road test.

NOTE: ON REAR LIMITED SLIP AXLE (FRONT HUB UNLOCKED) DRIFT CONCERNS, IT MAY BE NECESSARY TO MEASURE TIRE

CIRCUMFERENCE AND PLACE A MATCHED SET OF TIRES ON THE REAR AXLE.

Diagnostic Procedure # 2 - Alignment



1990 PREFERRED ALIGNMENT SPECIFICATIONS		
MODEL	ALIGNMENT	SPECIFICATION
All	TOE-IN ADJUST	+.03 +/- .08 Inch Or +.08 +/- .13 Degrees
Bronco II All Other Models	CASTER SPLIT - LH CASTER/RH CASTER (SEE TSB 89-21-10)	0 +/- .50 Degrees -.3 +/- .50 Degrees
All	CAMBER SPLIT - LH CAMBER/RH CAMBER	0 +/- .50 Degrees
All	AVERAGE CAMBER *	0.25 +/- .50 Degrees
All Ranger 4x2 Ranger 4x4 Bronco II 4x2 Bronco II 4x4 Explorer 4x2 Explorer 4x4	AVERAGE CASTER **	Min. 2.00 Degrees Max. 8.00 Degrees Max. 7.00 Degrees Max. 8.00 Degrees Max. 7.00 Degrees Max. 8.00 Degrees Max. 8.00 Degrees

* Defined as (LH camber + RH camber) divided by 2. Vehicles set to this specification, as measured with the vehicle loaded to normal loading conditions, will result in optimum tire wear.

** Defined as (LH caster + RH caster) divided by 2. These are not recommended values for settings. They are only maximum and minimum limitations.

Wheel Alignment - Measure the front wheel alignment. For out of specification vehicles, align to the "1990 Preferred Alignment Specifications" stated in this article.

^ Spin the front tires to be sure that the front hubs are unlocked, if hubs are unlocked, the axle shaft will not rotate with the wheels.

^ Do not adjust wheel alignment to correct for brake pull if the vehicle does not have pull during non-brake applications.

^ Set the tire pressure to the specification on the certification label.

Compare the installed tires and wheels to the certification label. If the tires and wheels match, continue with the diagnostic procedure.

^ IF THE TIRES AND WHEELS DO NOT MATCH THE CERTIFICATION LABEL, compare tires and wheels to HPO (regular production option) list and set tire pressure to the correct value.

^ IF THE TIRES AND WHEELS DO NOT MATCH CERTIFICATION LABEL OR RPO AVAILABILITY, swap known good tires and wheels (as called for by the certification label or RPO list) for the purposes of evaluation only.

Drive vehicle after alignment is performed. ^

Vehicles which exceed the maximum average caster value shown above may result in shimmy concerns.

^ Vehicles operated below the minimum average caster value shown can result in wander and poor steering returnability concerns.

If the vehicle is not within these minimum and maximum average caster values, or if the vehicle has experienced any of these listed steering/handling concerns, the average caster should be set in accordance with ride height/caster chart in the Shop Manual.

Diagnostic Procedure # 3 - Tires

1. Spin the front tires to be sure that the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Measure tire circumference of all four tires; put the two closest circumference tires on the rear axle. Tire pressure must be equal on all tires.

Diagnostic Procedure # 4 - Steering Gear Valve Off Center

Rotary Valve Centering Check: To confirm that you are looking at a steering gear valve concern, lift the front wheels off the ground.

^ The truck should be raised so that there is no interference with the steering linkage.

^ The front wheels should also spin freely.

With the wheels in a straight ahead position, start the engine and observe any steering wheel or linkage movement when the engine is started. If any movement is observed, continue with the rotary valve centering check.

1. Spin the front tires to make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Install a 0-13,789 kPa (0-2000 psi) pressure-gauge (Tool D79L-33610-A, Power Steering Analyzer) in the pressure line between the power steering

pump outlet port 1 and the integral steering gear inlet port. Make sure the valve on the gauge is fully open.

3. Check the fluid level in the reservoir. Add Premimum Power Steering Fluid - E6AZ-19582-AA (ESW-M2C33-F) or equivalent, if necessary.

4. Start the engine and turn the steering wheel from stop-to-stop to bring the steering lubricant to normal operating temperature. Turn off the engine and

re-check the fluid level. Add Premium Power Steering Fluid - E6AZ-19582-AA (ESW-M2C33-F) or equivalent, if necessary.

5. With the engine running at approximately 1000 rpm and the steering wheel centered, attach an lb.in. torque wrench to the steering wheel nut. Apply

sufficient torque in each direction to get a gauge reading of 1723 kPa (250 psi).

6. The torque wrench readings should be the same in both directions at 1723 kPa (250 psi). If the difference between the readings exceeds 6 lb.in. (0.68

N-m), remove the steering gear and replace the shaft and control assembly.

7. Remove the pressure gauge installed in Step 2.

Diagnostic Procedure # 5 - Rbs Linkage

If the RBS linkage is determined to have wind up or memory steer, replace RBS linkage with greasable steel linkage.

NOTE: ALL SERVICE PART STEERING LINKAGE IS THE GREASABLE STEEL SOCKET TYPE.

Diagnostic Procedure # 6 - Brake Imbalance

Spin the front tires make sure the front hubs are unlocked. If the hubs are unlocked, the axle shaft will not rotate with the wheels.

2. Check for front wheel rotational drag with warm/hot brakes.

a. Make a series of 10 stops from speeds of 30 mph (48 km/h).

b. Make the 10 stops with no more than 30 second intervals between stops. This generally will induce a maximum pull if there is a drift/pull

concern.

c. Raise the front end of the truck so that both tires are off the ground.

d. Rotate the front wheels by hand.

NOTE: FOR ALL 4 WHEEL DRIVE TRUCKS, MAKE SURE THE HUBS ARE DISENGAGED.

Both tires should rotate about the same amount, with little brake drag occurring. Some brake drag will naturally be present for each size of truck.

3. If the truck has excess brake drag, proceed as follows:

a. Open the bleed screw on the affected wheel to check for residual pressure in the brake lines. If there is a squirt of brake fluid out the bleeder

screw and the drag is reduced or eliminated, the master cylinder may not be allowing the brake fluid to return to the reservoir.

b. Check the master cylinder push rod adjustment. Refer to the appropriate Light Truck Shop Manual, Section 06-06 for service details.

c. Check the brake pedal to determine if it is fully returning.

4. Remove both calipers and check piston retraction using a "C" clamp and wooden block. The piston should easily move back into the bore under the

force of the clamp. Re-build or replace as needed.

5. If Steps 1 through 4 have not determined the concern, swap rotors and linings from side to side.

NOTE: SHOE TAB CLEARANCES SHOULD BE CHECKED AND MODIFIED IF NEEDED. SEE FIGURE 2.

6. Test drive the vehicle with 10 or more stops from 40 mph before evaluating for brake drift. If there is no change in drift while braking, it may be

assumed the concern is not the result of the front brakes.

7. Check the rear brakes. Remove the rear wheels and brake drums.

a. Check for contaminates (i.e., grease, axle lube, leaking brake fluid, etc.).

b. Check for broken components, frozen parking brake cables and improperly installed parts.

c. Check the cage diameter using the Brake Shoe Adjustment Gauge (D81L-1103-A). If either side is out of specification, check for proper

function of the adjusting mechanism and repair or replace as required.

d. Check the rear wheel cylinders by the following method.

^ Replace one of the brake drums.

^ Have another person apply the brakes and watch for movement of one of the brake shoes on the other wheel.

^ Re-apply the brakes while holding in place the shoe that moved. The opposite shoe should now move. If no movement is observed, repair or replace the wheel cylinder.

^ Re-install the drum and repeat the procedure for the other rear brake.

8. If the condition still exists, swap rear shoes from side to side and drive the truck. If the drift is significantly reduced, replace the rear linings. If the

drift/pull is not significantly reduced, go to Service Procedure # 7.

Diagnostic Procedure # 7 - Miscellaneous

Check for loose, damaged or excessively worn parts. Visually inspect the front suspension for loose or worn components (i.e., ball joints, radius arm bushings, radius arm attachments at the axle and frame, alignment adjusters, steering linkage, etc.). Repair or replace as required.

Diagnostic Check List

NOTE: THE FOLLOWING CHECK LIST SHOULD BE COMPLETED AFTER EACH STEP OF THE DIAGNOSTIC WHERE APPLICABLE.

SERVICE PROCEDURE

1. Checking clearances.

_ Caliper to knuckle clearance.

_ Inner shoe side and end clearance.

2. Lubrication of components.

_ Lubrication of the caliper rails and inner knuckle pad grooves.

3. Radius arm bushings.

_ Replacement of right and left side radius arm bushings.

DIAGNOSTIC PROCEDURE:

1. Tire mismatch.

_ Unlocked hubs check.

_ Front tires swapped side to side.

_ Rear tires swapped side to side.

_ Front to rear tire swap.

2. Alignment.

_ Unlocked hubs check.

_ Toe changed to _.

_ Caster changed and split is _.

_ Camber changed and split is _.

3. Tire circumference.

_ Unlocked hubs check.

_ Tire circumference checked and two closest circumference tires swapped to rear axle.

4. Steering gear valve.

_ Unlocked hubs check.

_ Install pressure gauge.

_ Check fluid level with engine off and on.

_ Apply torque to the steering wheel nut and check gauge readings.

_ Replaced the shaft and control assembly.

_ Removed the pressure gauge.

5. RABS linkage.

_ Replaced the RBS linkage.

6. Brake imbalance.

_ Unlocked hubs check.

_ Front wheel rotational drag check.

_ Master cylinder check.

_ Piston retraction check.

_ Rotors and linings swapped from side to side.

_ Rear brakes checked.

_ Rear drums and shoes swapped from side to side.

7. Miscellaneous.

_ Check for loose, damaged or worn parts.

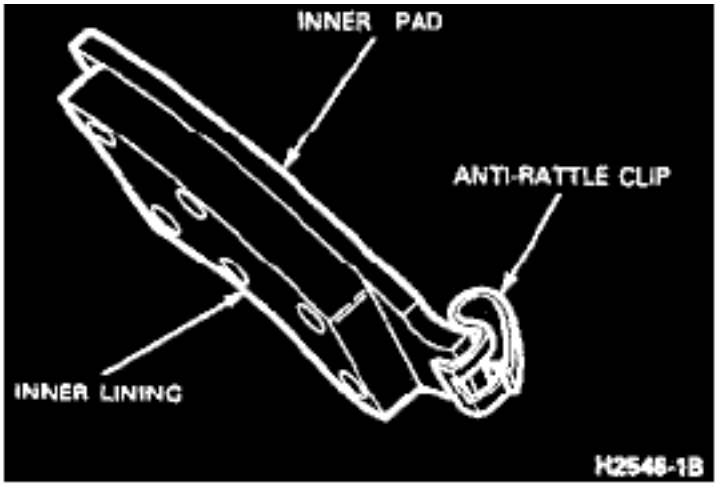
Brake Caliper: Description and Operation

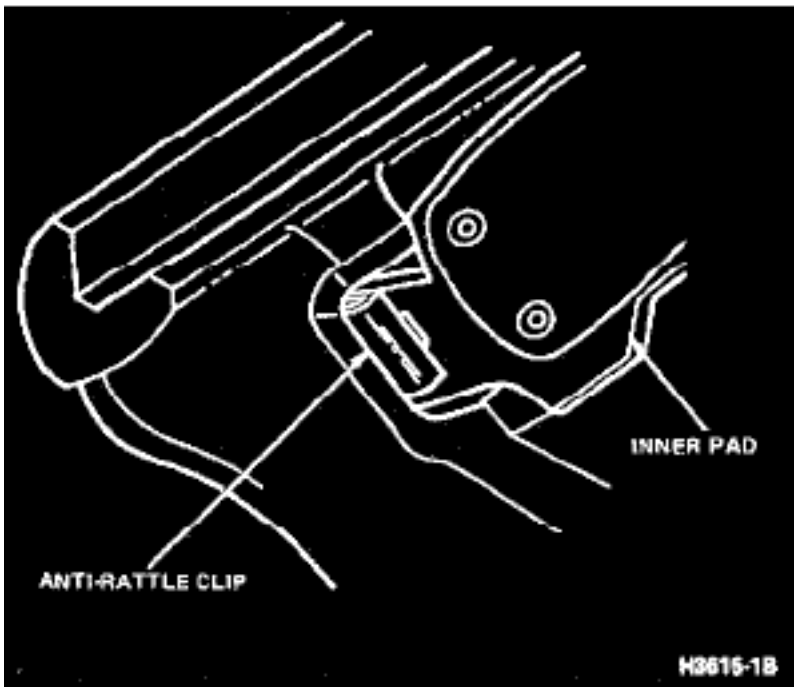
Caliper Assembly

Brake Caliper

The caliper assembly consists of a pin slider caliper housing, inner and outer pad and lining assemblies, and a single piston. The caliper assembly slides on two pins which also attach the caliper to the spindle.

The caliper housing contains a piston. The piston has a molded rubber dust boot on its outer end that is pressed into a cylinder bore groove to prevent cylinder contamination. There is also a rectangular section rubber piston seal located in the cylinder bore providing sealing between the cylinder and piston. This seal also causes the piston to retract once the brakes are released.





Brake Caliper: Service and Repair Inspection

For additional information see Installation Notes. See: Fundamentals and Basics

1. The caliper piston must be "bottomed out" when replacing pad and lining assemblies with new parts. "Bottom out" the caliper piston with an eight

inch c-clamp using a worn out inner pad or a block of wood to push against the piston. Never attempt to "bottom out" piston with outer pad installed.

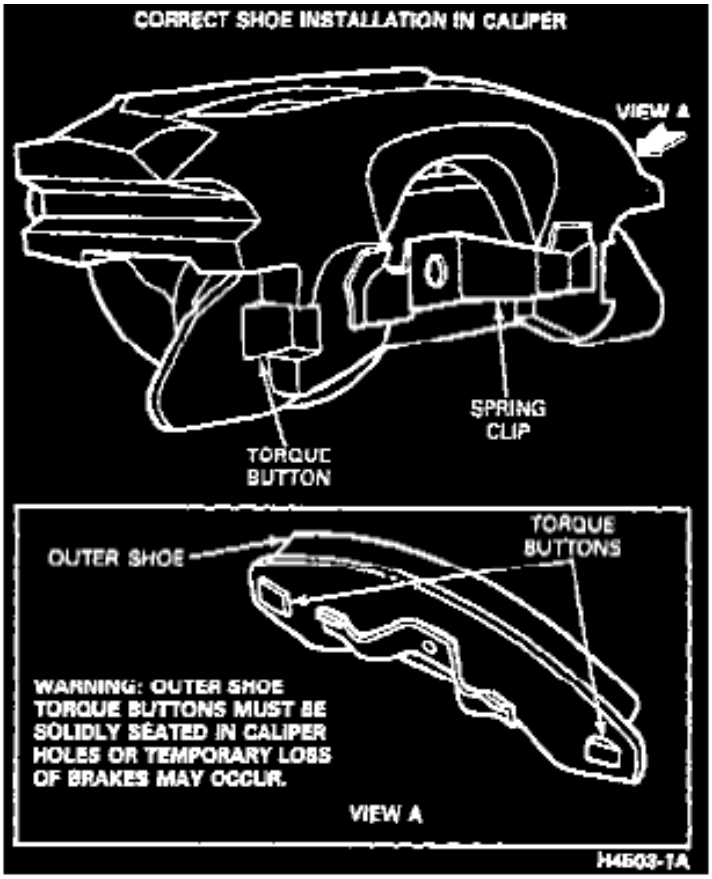
Installing Anti-Rattle Clip

2. Place a new anti-rattle clip on the lower end of the inner pad. Be sure the tabs on the clip are positioned properly and the clip is fully seated.

Installing Inner Shoe And Anti-Rattle Clip

3. Position the inner pad and anti-rattle clip in the pad abutment with the anti-rattle clip tab against the pad abutment and the loop-type spring away

from the rotor. Compress the anti-rattle clip and slide the upper end of the pad in position.



CORRECT SHOE INSTALLATION IN CALIPER
VIEW A
SPRING CLIP

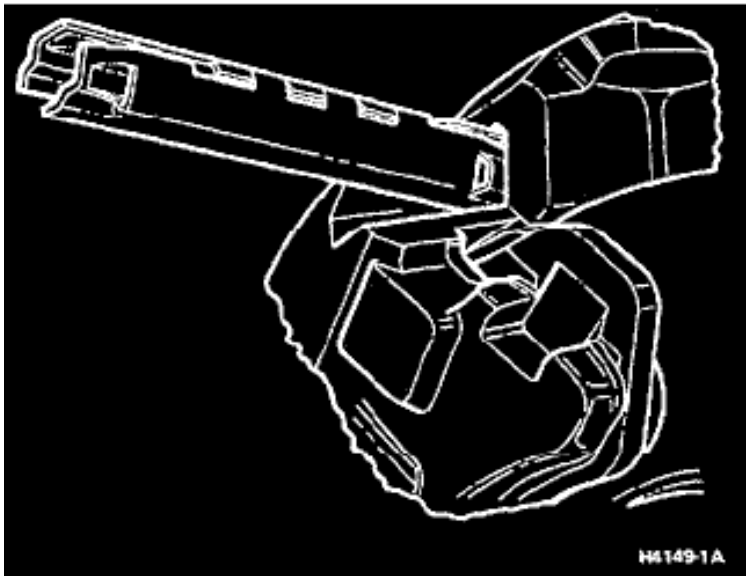
OUTER SHOE
WARNING: OUTER SHOE TORQUE BUTTONS MUST BE SOLIDLY SEATED IN CALIPER HOLES OR TEMPORARY LOSS OF BRAKES MAY OCCUR.
VIEW A
H4503-1A



H4149-1A

Outer Pad Installation

4. Install the outer pad, making sure the torque buttons on the pad are seated solidly in the matching holes in the caliper. 5. Install the caliper on the spindle, making sure the mounting surfaces are free of dirt and lubricate the caliper grooves with disc brake caliper

grease.

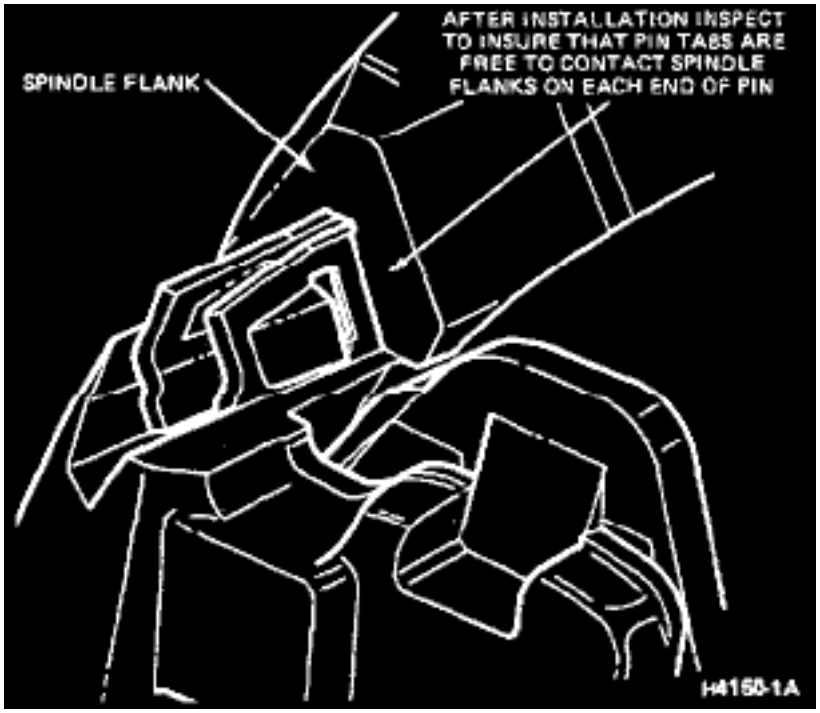
Caliper Pin Installation

6. Position pin with the pin retention tabs oriented adjacent to the spindle groove.

NOTE: Do not use the bolt and nut with the new pin.

7. Tap the pin on the outboard end with a hammer. Continue tapping the pin inward until the retention tabs on the sides of the pin contact the spindle

face. Repeat procedure for the lower pin.



Correct Caliper Pin Installation

CAUTION: During the installation procedure do not allow the tabs of the caliper pin to be tapped too far into the spindle groove. If this happens it will be necessary to tap the other end of the caliper pin until the tabs snap into place. The tabs on each end of the caliper pin must be free to catch on the spindle flanks.

8. If removed, install the brake hose to the caliper and perform brake bleeding procedures.

Lower the vehicle, check the brake fluid level and fill as necessary. Check brakes for proper operation.

WARNING: Before moving vehicle, pump brake pedal several times to be sure it is firm. Do not move vehicle until a firm pedal is obtained.

H4511-D

Brake Caliper: Service and Repair Rebuild

Caliper Assembly

NOTE: Do not use a screwdriver or any similar tool to pry piston into or out of the bore to prevent chipping or scuffing damage to the phenolic piston.

DISASSEMBLY

1. Remove the caliper assembly. Place a block of wood over the piston before applying air pressure to prevent damage to the piston.

Removing Piston

WARNING: Do not place fingers in front of piston in an attempt to catch or protect it when applying compressed air. This could result in serious injury.

2. Apply air pressure to the fluid port in the caliper with a rubber-tipped nozzle to remove the piston. If the piston is seized and cannot be forced

from the caliper, tap lightly around the piston while applying air pressure.

3. Remove the dust boot from the caliper assembly. 4. Remove the rubber piston seal from the cylinder and discard it.

CLEANING AND INSPECTION

^ Clean all metal parts with isopropyl alcohol or brake parts cleaner. Then, clean out and dry the grooves and passageways with compressed air. Make sure caliper bore and component parts are thoroughly clean.

^ Check the cylinder bore and piston for damage or excessive wear. Replace the piston if it shows signs of pitting, scoring or cracks.

ASSEMBLY

1. Apply a film of clean brake fluid to the new caliper piston seal, and install it in the cylinder bore. Be sure the seal does not become twisted but is

firmly seated in the groove.

2. Install a new dust boot by setting the flange squarely in the outer groove of the caliper bore. 3. Coat the piston with brake fluid, and install the piston in the cylinder bore. 4. Spread the dust boot over the piston as it is installed. Seat the dust boot in the piston groove. 5. Install the caliper.

Brake Caliper: Service and Repair Removal

For additional information see Removal Notes. See: Fundamentals and Basics

1. Use a clean siphon or suction hose to remove a portion of the fluid from the master cylinder. Discard the removed fluid.

CAUTION: System contamination may result if anything other than a clean device is used to remove fluid from master cylinder.

2. Raise the vehicle and install safety stands. Remove wheel and tire assembly.

Compressing Caliper

3. Use an eight-inch C-clamp to move the piston back into its bore as follows:

a. Place the head of the C-clamp against the caliper, and the screw end of the C-clamp against the outer pad below the spring clip.

CAUTION: Do not position C-clamp on the spring clip. Also, do not compress piston further than is required to disengage torque buttons from caliper. Damage to the spring clip will result. Replace pad if spring clip is bent or damaged.

CAUTION: Do not attempt to "bottom" the piston in the bore at this time. Use an old, worn out brake pad or block of wood and the C-clamp to bottom the piston once caliper is removed from rotor, and the pads are removed from the caliper.

b. Tighten the clamp until the torque buttons just clear the caliper (about 3 mm [1/8 in]). Remove the C-clamp.

CAUTION: Do not use a screwdriver or similar tool to pry piston away from the rotor.

4. Clean excess dirt from area around pin tabs. 5. Tap upper caliper pin towards inboard side until pin locking tabs touch the spindle face. 6. Insert a screwdriver into the slot provided behind the pin tabs on the inboard side of the pin.

Compressing Pin Tabs

7. Use needle nose pliers to compress the outboard end of the pin while prying at the same time with the screwdriver, until tabs slip into the spindle

groove.

8. Place one end of a punch (approximately 7/16 inch diameter) against the end of the caliper pin and drive the caliper pin out of the caliper slide

groove.

9. Repeat removal procedure for lower pin.

10. Remove the caliper from the rotor. If the caliper is to be removed for service, disconnect the brake hose from the caliper. If not, secure the caliper

with wire.

CAUTION: Do not let the caliper hang with its weight on the brake hose.

11. Compress the anti-rattle clip and remove the inner pad from the caliper.

Brake Caliper: Fundamentals and Basics Removal Notes

When Removing the Caliper, Remember...

- Prior to removing the calipers, remove/siphon brake fluid from master-cylinder until the reservoir is only 1/3 full.

- Brake fluid will remove paint and damage electrical connections. Use a drip pan and fender covers to protect the vehicle's finish and electrical system.

- Always replace all brake linings on an axle. Never replace only one wheel. Unequal lining thickness between wheels on the same axle will result in a strong steering pull when the brakes are applied.

- Work on one side at a time. If you forget how to reassemble the parts you can always use the other side as a model.

- When forcing the piston back into the caliper, open the bleeder valve first. Corrosion and other deposits accumulate inside of the caliper. If the bleeder valve is not opened when the piston is forced back into the caliper, these deposits will be forced back through the brake lines and into the master-cylinder.

-

When pushing the pistons back into the caliper with the bleeder screw open, a stream of brake fluid will be expelled from the bleeder screw for 2-3 feet. Use a drip pan and be careful not to "shoot" brake fluid onto the vehicle's finish. A cleaner method is to use a piece of clear plastic hose and a glass or plastic jar to catch the expelled fluid.

- Upon removal, Do Not allow the calipers to hang by the flexible brake hoses. The brake hoses can be damaged easily by this practice. These hoses are double walled, damage to the interior pressure hose will not be visible.

- Do not depress the brake pedal with either caliper removed from the rotor. The caliper pistons will be inadvertently expelled from the caliper. If this occurs rebuild or replace the caliper, do not attempt to insert the piston back into the caliper.

Anti-Squeal
Coating

Brake Caliper: Fundamentals and Basics Installation Notes

WHEN INSTALLING CALIPERS AND PADS, REMEMBER...

- Clean and lubricate caliper slide joint/pins with high temperature silicone grease:

Unlike drum brakes, disc brakes do not utilize a spring to withdraw the pads/linings when the brake pedal is released. Disc brakes rely on the elasticity of the piston seals, and the unrestricted movement of the caliper slide assemblies to release the brakes.

If the slide joints/pins are not cleaned and lubricated properly the disc brake linings will drag upon the release of the brake pedal. This will result in overheated brakes and premature brake wear.

Disc Brake Mechanical Force Diagram

NOTE: Floating calipers require free and unrestricted movement on the caliper mounting. Floating or sliding calipers have pistons only on one side of the rotor. The first part of the piston's travel forces the inner pad against the rotor, then further travel forces the movable part of the caliper to pull the outer pad against the rotor.

High temperature silicone lubricant must be used. Low temperature grease can melt and contaminate the pads and rotors, or can bake into a very hard substance which binds the slides. Petroleum based grease can cause the slide boots to soften and swell.

-

Work on one side at a time. If you forget how to reassemble the parts you can always use the other side as a model.

Anti-squeal Coating

- Apply an anti-squeal coating to the back side of the pads/linings. This coatings acts as an insulator to dampen high frequency vibrations that are generated during normal braking. These compounds are highly effective in preventing brake squeal.

- Many professional repair shops recommend always rebuilding or replacing the calipers when replacing the brake linings, because:

When the pistons are forced back into the calipers, the piston seals are dragged across any corrosion or abrasives that may be deposited on the inside of the caliper.

Damage to the seals may not be initially evident. As the new brake linings begin to wear, the piston is gradually withdrawn from the caliper.

This results in the piston seals again being dragged across the layer of corrosion and deposits.

Calipers which are not rebuilt or replaced have a higher probability of sticking or leaking.

- Check to ensure the bleeder screw is not frozen prior to reinstalling caliper. Freeing a stuck bleeder screw is much easier with the caliper removed from the vehicle.

Brake Hose/Line: Technical Service Bulletins Brake Hoses - Wet Appearance

Article No. 91-18-9 09/05/91

^ BRAKES-HYDRAULIC-RUBBER BRAKE HOSES ARE WET FROM SWEATING

^ BRAKES-HYDRAULIC-RUBBER HOSES-FLUID LEAK TESTING PROCEDURE

LIGHT TRUCK: 1985-90 BRONCO II 1985-92 BRONCO, ECONOLINE, F-150, F-250, F-350, RANGER 1986-92 AEROSTAR 1988-92 F SUPER DUTY, F-47, F-63, F-59 1991-92 EXPLORER

This TSB article is being republished in its entirety to include 1992 model vehicles.

ISSUE: The wet appearance of the outer cover of rubber brake hoses is called "sweating." This is a normal condition for neoprene rayon braid hose. The "sweating" condition is not evidence of a brake fluid leak and will not result in a loss of pressure in the system.

ACTION: No action is required for a normal "sweating" brake hose. However, to test for a hydraulic fluid leak, proceed as follows:

1. Check the brake fluid level in the master cylinder. If necessary, add brake fluid.

2. Wipe off the hose(s) in question with a clean cloth and an all purpose cleaner, then dry.

3. With the engine running, fully depress the brake twice and hold for two (2) minutes. ^

If the pedal goes down, check all of the connections for leaks and repair as required.

^ If the pedal goes down and no visible leaks are seen, then the master cylinder is leaking internally and must be replaced or rebuilt. Refer to the appropriate Light Truck or Medium/Heavy Truck Shop Manual, Section 6 or 12 (Light Truck) and Section 12 (Med./Hvy Truck) for service details.

Brake Proportioning/Combination Valve: Locations

Body Components

Below LH Side Of Vehicle, On LH Frame Rail

Brake Proportioning/Combination Valve: Description and Operation

This multi-function hydraulic control unit consists primarily of a pressure differential valve, brake lamp warning switch and a proportioning valve. A pressure differential shuttle and/or metering valve are also incorporated with some valve applications. The metering valve delays front disc brake effectiveness until the rear brake shoes contact the brake drums. The proportioning valve regulates rear hydraulic system pressure to prevent rear brake lock-up. The pressure differential valve senses hydraulic system pressure and will activate the brake lamp warning switch if a pressure loss occurs. The pressure differential shuttle bypass feature provides full rear brake application if front hydraulic system pressure is significantly reduced.

Hydraulic Control Assembly - Antilock Brakes: Service and Repair

1. Disconnect and plug brake lines from valve.

2. Disconnect wiring harness, then remove valve attaching nuts and valve from frame rail.

3. Position new valve onto frame rail, then install and torque attaching nuts to 30-40 inch lbs on Aerostar models, 11-14 ft. lbs. on Bronco II, Explorer and Ranger models, 19-24 ft. lbs. on E-Series models or 12-17 ft. lbs. on Bronco and F-Series models.

4. Reconnect wiring harness and brake lines, torque brake lines to valve, 1/2 20 threaded fitting to 10-17 ft. lbs., 7/16 24 threaded fitting to 10-15 ft. lbs. and 3/8 24 threaded fitting to 10-15 ft. lbs.

5. Perform system brake bleeding procedures as required.

ISSUE This TSB article is a diagnostic procedure to address vehicles that exhibit lean driveability symptoms and may or may not have any Diagnostic Trouble Codes (DTCs) stored in memory.

ACTION Follow the diagnostic procedures described in the following Service Tip. The revised diagnostic procedure is a more accurate means of diagnosing the symptoms.

SERVICE TIP

MASS AIR FLOW (MAF) DISCUSSION

MAF sensors can get contaminated from a variety of sources: dirt, oil, silicon, spider webs, potting compound from the sensor itself, etc. When a MAF sensor gets contaminated, it skews the transfer function such that the sensor over-estimates air flow at idle (causes the fuel system to go rich) and under-estimates air flow at high air flows (causes fuel system to go lean). This means Long Term Fuel Trims will learn lean (negative) corrections at idle and learn rich (positive) corrections at higher air flows.

If vehicle is driven at Wide Open Throttle (WOT) or high loads, the fuel system normally goes open loop rich to provide maximum power. If the MAF sensor is contaminated, the fuel system will actually be lean because of under-estimated air flow. During open loop fuel operation, the vehicle applies Long Term Fuel Trim corrections that have been learned during closed loop operation. These corrections are often lean corrections learned at lower air flows. This combination of under-estimated air flow and lean fuel trim corrections can result in spark knock/detonation and lack of power concerns at WOT and high loads.

One of the indicators for diagnosing this condition is barometric pressure. Barometric pressure (BARO) is inferred by the Powertrain Control Module (PCM) software at part throttle and WOT (there is no actual BARO sensor on MAF-equipped vehicles, except for the 3.8L Supercharged engine). At high air flows, a contaminated MAF sensor will under-estimate air flow coming into the engine, hence the PCM infers that the vehicle is operating at a higher altitude. The BARO reading is stored in Keep Alive Memory (KAM) after it is updated. Other indicators are Long Term Fuel Trim and MAF

voltage at idle.

NOTE

THE FOLLOWING PROCEDURE MAY ALSO BE USED TO DIAGNOSE VEHICLES THAT DO NOT HAVE FUEL SYSTEM/HO2S SENSOR DTCS.

Symptoms

^ Lack of Power

^ Spark Knock/Detonation

^ Buck/Jerk

^ Hesitation/Surge on Acceleration

^ Malfunction Indicator Lamp (MIL) Illuminated -

DTCs P0171, P0172, P0174, P0175 may be stored in memory

OBDII DTCs

^ P0171, P0174 (Fuel system lean, Bank 1 or 2)

^ P0172, P0175, (Fuel system rich, Bank 1 or 2)

^ P1130, P1131, P1132, (HO2S11 lack of switching, Bank 1)

^ P1150, P1151, P1152, (HO2S21 lack of switching, Bank 2)

OBDI DTCs

^ 181, 189 (Fuel system lean, Bank 1 or 2)

^ 179, 188 (Fuel system rich, Bank 1 or 2)

^ 171, 172, 173 (HO2S11 lack of switching, Bank 1)

^ 175, 176, 177 (HO2S21 lack of switching, Bank 2)

^ 184, 185 (MAF higher/lower than expected)

^ 186, 187 (Injector pulse width higher/lower than expected)

NOTE:

DO NOT DISCONNECT THE BATTERY. IT WILL ERASE KEEP ALIVE MEMORY AND RESET LONG TERM FUEL TRIM AND BARO TO THEIR STARTING/BASE VALUES. THE BARO PARAMETER IDENTIFICATION DISPLAY (PID) IS USED FOR THIS DIAGNOSTIC PROCEDURE. ALL OBDII APPLICATIONS HAVE THIS PID AVAILABLE. THERE ARE SOME OBDI VEHICLES THAT DO NOT HAVE THE BARO PID, FOR THESE VEHICLES OMIT THE BARO CHECK AND REFER ONLY TO STEPS 2, 3, AND 4 IN THE DIAGNOSTIC PROCEDURE.

BAROMETRIC PRESSURE REFERENCE

Barometric Pressure (in. Hg.)	Barometric Pressure (kPa)	BARO/MAP PID (Hz)	Altitude above sea level (ft)
3.5	11.8	89.3	
5	16.9	92.8	
10	33.8	104.6	
15	50.7	117.0	14,000
20	67.5	129.6	10,000
21	70.9	132.5	9,000
22	74.3	135.4	8,000
23	77.7	138.3	7,000
24	81.1	141.1	6,000
25	84.4	144.0	5,000
26	87.8	146.9	4,000
27	91.2	149.8	3,000
28	94.6	152.8	2,000
29	97.9	155.8	1,000
30	101.3	158.9	0 (sea level)
31	104.7	162.0	
31.875	107.7	164.7	

1. Look at the BARO PID. Refer to the Barometric Pressure Reference Chart in this article. At sea level, BARO should read about 159 Hz (29.91 in. Hg). As a reference, Denver, Colorado at 1524 meters (5000 ft.) altitude should be about 144 Hz (24.88 in.Hg). Normal learned BARO variability is up to +/- 6 Hz (+/- 2 in. Hg.). If BARO indicates a higher altitude than you are not at (7 or more Hz lower than expected), you may have MAF contamination. If available, Service Bay Diagnostic System (SBDS) has a Manifold Absolute Pressure (MAP) sensor that can be used as a barometric pressure reference. Use "MAP/BARO" test under "Powertrain," "Testers and Meters." Ignore the hookup screen. Connect GP2 to the reference MAP on the following screen.

NOTE

REMEMBER THAT MOST WEATHER SERVICES REPORT A LOCAL BAROMETRIC PRESSURE THAT HAS BEEN CORRECTED TO SEA LEVEL. THE BARO PID, ON THE OTHER HAND, REPORTS THE ACTUAL BAROMETRIC PRESSURE FOR THE ALTITUDE THE VEHICLE IS BEING OPERATED IN. LOCAL WEATHER CONDITIONS (HIGH AND LOW PRESSURE AREAS) WILL CHANGE THE LOCAL BAROMETRIC PRESSURE BY SEVERAL INCHES OF MERCURY (+/- 3 Hz, +/- 1 in. Hg.).

NOTE

BARO IS UPDATED ONLY WHEN THE VEHICLE IS AT HIGH THROTTLE OPENINGS. THEREFORE, A VEHICLE WHICH IS DRIVEN DOWN FROM A HIGHER ALTITUDE MAY NOT HAVE HAD AN OPPORTUNITY TO UPDATE THE BARO VALUE IN KAM. IF YOU ARE NOT CONFIDENT THAT BARO HAS BEEN UPDATED, PERFORM THREE OR FOUR HEAVY, SUSTAINED ACCELERATIONS AT GREATER THAN HALF-THROTTLE TO ALLOW BARO TO UPDATE.

2. On a fully warmed up engine, look at Long Term Fuel Trim at idle, in Neutral, A/C off, (LONGFT1 and/or LONGFT2 PIDs). If it is more negative than -12%, the fuel system has learned lean corrections which may be due to the MAF sensor over-estimating air flow at idle. Note that both Banks 1 and 2 will exhibit negative corrections for 2-bank system. If only one bank of a 2-bank system has negative corrections, the MAF sensor is probably not contaminated.

3. On a fully warmed up engine, look at MAF voltage at idle, in Neutral, A/C off (MAF V PID). If it's 30% greater than the nominal MAF V voltage listed in the Powertrain Control/Emissions Diagnosis (PC/ED) Diagnostic Value Reference Charts for your vehicle, or greater than 1.1 volts as a rough guide, the MAF sensor is over-estimating air flow at idle.

4. If at least tow of the previous three steps are true, proceed to disconnect the MAF sensor connector. This puts the vehicle into Failure Mode and Effects Management (FMEM). In FMEM mode, air flow is inferred by using rpm and throttle position instead of reading the MAF sensor. (In addition, the BARO value is reset to a base/unlearned value.) If the lean driveability symptoms go away, the MAF sensor is probably contaminated and should be replaced. If the lean driveability symptoms do not go away, go to the PC/ED Service Manual for the appropriate diagnostics.

NOTE

DUE TO INCREASINGLY STRINGENT EMISSION/OBDII REQUIREMENTS, IT IS POSSIBLE FOR SOME VEHICLES WITH MAF SENSOR CONTAMINATION TO SET FUEL SYSTEM DTCs AND ILLUMINATE THE MIL WITH NO DRIVEABILITY CONCERNS. DISCONNECTING THE MAF ON THESE VEHICLES WILL, THEREFORE, PRODUCE NO IMPROVEMENTS IN DRIVEABILITY. IN THESE CASES, IF THE BARO, LONGFT1, LONGFT2, AND MAF V PIDs INDICATE THAT THE MAF IS CONTAMINATED, PROCEED TO REPLACE THE MAF SENSOR.

After replacing the MAF sensor, disconnect the vehicle battery (5 minutes, minimum to reset KAM, or on newer vehicles, use the "KAM Reset" feature on the New Generation Star (NGS) Tester and verify that the lean driveability symptoms are gone.

OTHER APPLICABLE ARTICLES:: NONE WARRANTY STATUS: INFORMATION ONLY OASIS CODES: 206000, 610000, 610500, 610600, 610700, 611000, 611500, 612000, 612500, 614000, 614500, 614600, 698298

voltage at idle.

NOTE

THE FOLLOWING PROCEDURE MAY ALSO BE USED TO DIAGNOSE VEHICLES THAT DO NOT HAVE FUEL SYSTEM/HO2S SENSOR DTCS.

Symptoms

^ Lack of Power

^ Spark Knock/Detonation

^ Buck/Jerk

^ Hesitation/Surge on Acceleration

^ Malfunction Indicator Lamp (MIL) Illuminated -

DTCs P0171, P0172, P0174, P0175 may be stored in memory

OBDII DTCs

^ P0171, P0174 (Fuel system lean, Bank 1 or 2)

^ P0172, P0175, (Fuel system rich, Bank 1 or 2)

^ P1130, P1131, P1132, (HO2S11 lack of switching, Bank 1)

^ P1150, P1151, P1152, (HO2S21 lack of switching, Bank 2)

OBDI DTCs

^ 181, 189 (Fuel system lean, Bank 1 or 2)

^ 179, 188 (Fuel system rich, Bank 1 or 2)

^ 171, 172, 173 (HO2S11 lack of switching, Bank 1)

^ 175, 176, 177 (HO2S21 lack of switching, Bank 2)

^ 184, 185 (MAF higher/lower than expected)

^ 186, 187 (Injector pulse width higher/lower than expected)

NOTE:

DO NOT DISCONNECT THE BATTERY. IT WILL ERASE KEEP ALIVE MEMORY AND RESET LONG TERM FUEL TRIM AND BARO TO THEIR STARTING/BASE VALUES. THE BARO PARAMETER IDENTIFICATION DISPLAY (PID) IS USED FOR THIS DIAGNOSTIC PROCEDURE. ALL OBDII APPLICATIONS HAVE THIS PID AVAILABLE. THERE ARE SOME OBDI VEHICLES THAT DO NOT HAVE THE BARO PID, FOR THESE VEHICLES OMIT THE BARO CHECK AND REFER ONLY TO STEPS 2, 3, AND 4 IN THE DIAGNOSTIC PROCEDURE.

BAROMETRIC PRESSURE REFERENCE			
Barometric Pressure (in. Hg.)	Barometric Pressure (kPa)	BARO/MAP PID (Hz)	Altitude above sea level (ft)
3.5	11.8	89.3	
5	16.9	92.8	
10	33.8	104.6	
15	50.7	117.0	14,000
20	67.5	129.6	10,000
21	70.9	132.5	9,000
22	74.3	135.4	8,000
23	77.7	138.3	7,000
24	81.1	141.1	6,000
25	84.4	144.0	5,000
26	87.8	146.9	4,000
27	91.2	149.8	3,000
28	94.6	152.8	2,000
29	97.9	155.8	1,000
30	101.3	158.9	0 (sea level)
31	104.7	162.0	
31.875	107.7	164.7	

1. Look at the BARO PID. Refer to the Barometric Pressure Reference Chart in this article. At sea level, BARO should read about 159 Hz (29.91 in. Hg). As a reference, Denver, Colorado at 1524 meters (5000 ft.) altitude should be about 144 Hz (24.88 in.Hg). Normal learned BARO variability is up to +/- 6 Hz (+/- 2 in. Hg.). If BARO indicates a higher altitude than you are not at (7 or more Hz lower than expected), you may have MAF contamination. If available, Service Bay Diagnostic System (SBDS) has a Manifold Absolute Pressure (MAP) sensor that can be used as a barometric pressure reference. Use "MAP/BARO" test under "Powertrain," "Testers and Meters." Ignore the hookup screen. Connect GP2 to the reference MAP on the following screen.

NOTE

REMEMBER THAT MOST WEATHER SERVICES REPORT A LOCAL BAROMETRIC PRESSURE THAT HAS BEEN CORRECTED TO SEA LEVEL. THE BARO PID, ON THE OTHER HAND, REPORTS THE ACTUAL BAROMETRIC PRESSURE FOR THE ALTITUDE THE VEHICLE IS BEING OPERATED IN. LOCAL WEATHER CONDITIONS (HIGH AND LOW PRESSURE AREAS) WILL CHANGE THE LOCAL BAROMETRIC PRESSURE BY SEVERAL INCHES OF MERCURY (+/- 3 Hz, +/- 1 in. Hg.).

NOTE

BARO IS UPDATED ONLY WHEN THE VEHICLE IS AT HIGH THROTTLE OPENINGS. THEREFORE, A VEHICLE WHICH IS DRIVEN DOWN FROM A HIGHER ALTITUDE MAY NOT HAVE HAD AN OPPORTUNITY TO UPDATE THE BARO VALUE IN KAM. IF YOU ARE NOT CONFIDENT THAT BARO HAS BEEN UPDATED, PERFORM THREE OR FOUR HEAVY, SUSTAINED ACCELERATIONS AT GREATER THAN HALF-THROTTLE TO ALLOW BARO TO UPDATE.

2. On a fully warmed up engine, look at Long Term Fuel Trim at idle, in Neutral, A/C off, (LONGFT1 and/or LONGFT2 PIDs). If it is more negative than -12%, the fuel system has learned lean corrections which may be due to the MAF sensor over-estimating air flow at idle. Note that both Banks 1 and 2 will exhibit negative corrections for 2-bank system. If only one bank of a 2-bank system has negative corrections, the MAF sensor is probably not contaminated.

3. On a fully warmed up engine, look at MAF voltage at idle, in Neutral, A/C off (MAF V PID). If it's 30% greater than the nominal MAF V voltage listed in the Powertrain Control/Emissions Diagnosis (PC/ED) Diagnostic Value Reference Charts for your vehicle, or greater than 1.1 volts as a rough guide, the MAF sensor is over-estimating air flow at idle.

4. If at least tow of the previous three steps are true, proceed to disconnect the MAF sensor connector. This puts the vehicle into Failure Mode and Effects Management (FMEM). In FMEM mode, air flow is inferred by using rpm and throttle position instead of reading the MAF sensor. (In addition, the BARO value is reset to a base/unlearned value.) If the lean driveability symptoms go away, the MAF sensor is probably contaminated and should be replaced. If the lean driveability symptoms do not go away, go to the PC/ED Service Manual for the appropriate diagnostics.

NOTE

DUE TO INCREASINGLY STRINGENT EMISSION/OBDII REQUIREMENTS, IT IS POSSIBLE FOR SOME VEHICLES WITH MAF SENSOR CONTAMINATION TO SET FUEL SYSTEM DTCs AND ILLUMINATE THE MIL WITH NO DRIVEABILITY CONCERNS. DISCONNECTING THE MAF ON THESE VEHICLES WILL, THEREFORE, PRODUCE NO IMPROVEMENTS IN DRIVEABILITY. IN THESE CASES, IF THE BARO, LONGFT1, LONGFT2, AND MAF V PIDs INDICATE THAT THE MAF IS CONTAMINATED, PROCEED TO REPLACE THE MAF SENSOR.

After replacing the MAF sensor, disconnect the vehicle battery (5 minutes, minimum to reset KAM, or on newer vehicles, use the "KAM Reset" feature on the New Generation Star (NGS) Tester and verify that the lean driveability symptoms are gone.

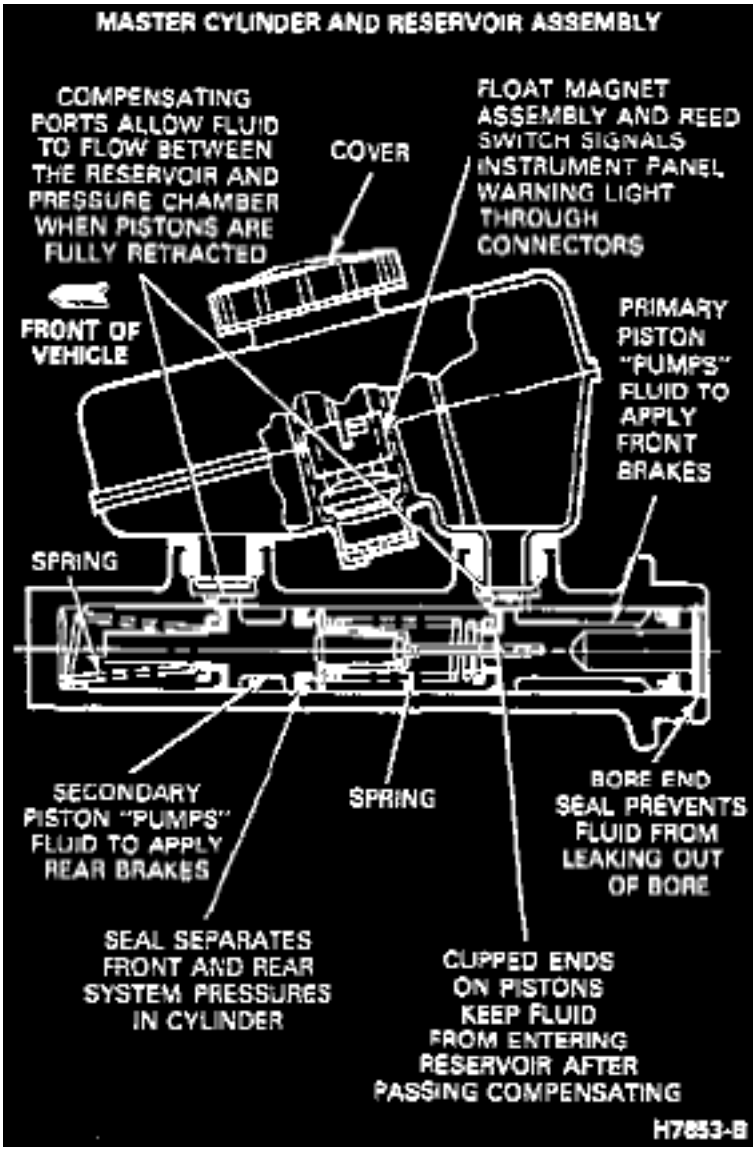
OTHER APPLICABLE ARTICLES:: NONE WARRANTY STATUS: INFORMATION ONLY OASIS CODES: 206000, 610000, 610500, 610600, 610700, 611000, 611500, 612000, 612500, 614000, 614500, 614600, 698298

Brake Master Cylinder: Specifications

Master cylinder retaining bolts	18-33 Nm (13-25 ft lb)

Brake Master Cylinder: Description and Operation Master Cylinder, ABS

The master cylinder consists primarily of a hydraulic cylinder, primary and secondary hydraulic pistons and a single or dual chamber fluid reservoir. The front brakes are connected to the primary outlet port(s) and are actuated by the primary piston assembly. The rear brakes are connected to the secondary outlet port and are actuated by the secondary piston assembly.



Brake Master Cylinder: Description and Operation Master Cylinder, Brakes

Master Cylinder

The dual master cylinder contains a double hydraulic cylinder with two fluid reservoirs as well as primary and secondary hydraulic pistons. The rear wheel brakes are connected to the secondary outlet port and are actuated by the secondary piston assembly. The front wheel brakes are connected to the primary outlet port(s), nearest the dash panel, and are actuated by the primary piston assembly.

Brake Master Cylinder: Testing and Inspection

INSPECTION

Inspect for Leakage

NOTE: The master-cylinder should be cleaned thoroughly prior to inspection (several days preferably). Spilled brake fluid can be easily confused with leakage.

Piston Seals -

Leakage around the piston seals will seep out from the end of the cylinder and leak down the outside of the brake booster.

- Inspect for signs of seepage or bubbled paint on the brake booster.

- If any leakage is detected the master-cylinder should be replaced or overhauled

Brake Line Fittings -

While someone is applying pressure to the brake pedal, inspect the brake line fittings on the master-cylinder for leakage.

- If the fittings are leaking they should be disassembled and inspected.

Reservoir to Cylinder Gasket -

Inspect the gasket for signs of leakage or hardening and cracking.

-

Overhaul or replace the master-cylinder if any leakage is indicated.

Inspect for Oil Contamination.

- Inspect the rubber gasket on the inside of the master-cylinder lid. If the gasket is swollen or bloated, the brake fluid is contaminated with oil.

- Siphon or scoop a small amount of brake fluid out of the master-cylinder and place into a styrofoam cup filled 2/3 of the way with water. Brake fluid will mix with the water while oil contaminants will float on the surface and dissolve the styrofoam.

NOTE: If any oil contamination is present ALL brake components containing rubber seals will need to be replaced or overhauled. This includes the master-cylinder, both front calipers, both rear wheel cylinders, and all flexible brake hoses.

Verify Hold-Down Bolts Are Tight

- While someone is applying and releasing pressure to the brake pedal, verify the the master-cylinder is tightly secured to the brake booster.

-

Retighten hold-down bolts if necessary.

Functional Checks

WARNING: Always bleed the entire brake system and verify the rear brakes are properly adjusted prior to diagnosing a master-cylinder as defective. For additional information on master-cylinder / brake pedal relationship see Fundamentals and Basics.

Check Related Systems -

Check for proper brake booster operation 1. With the engine "OFF", depress and release the brake pedal 4-5 times (this bleeds off the vacuum reserve in the booster). 2. Depress the brake pedal firmly and start the engine.

If the pedal goes down slightly the brake booster is assisting in brake operation. If the pedal does not go down slightly the brake booster is not assisting in brake operation and should be diagnosed for problems.

- Check and adjust rear brakes.

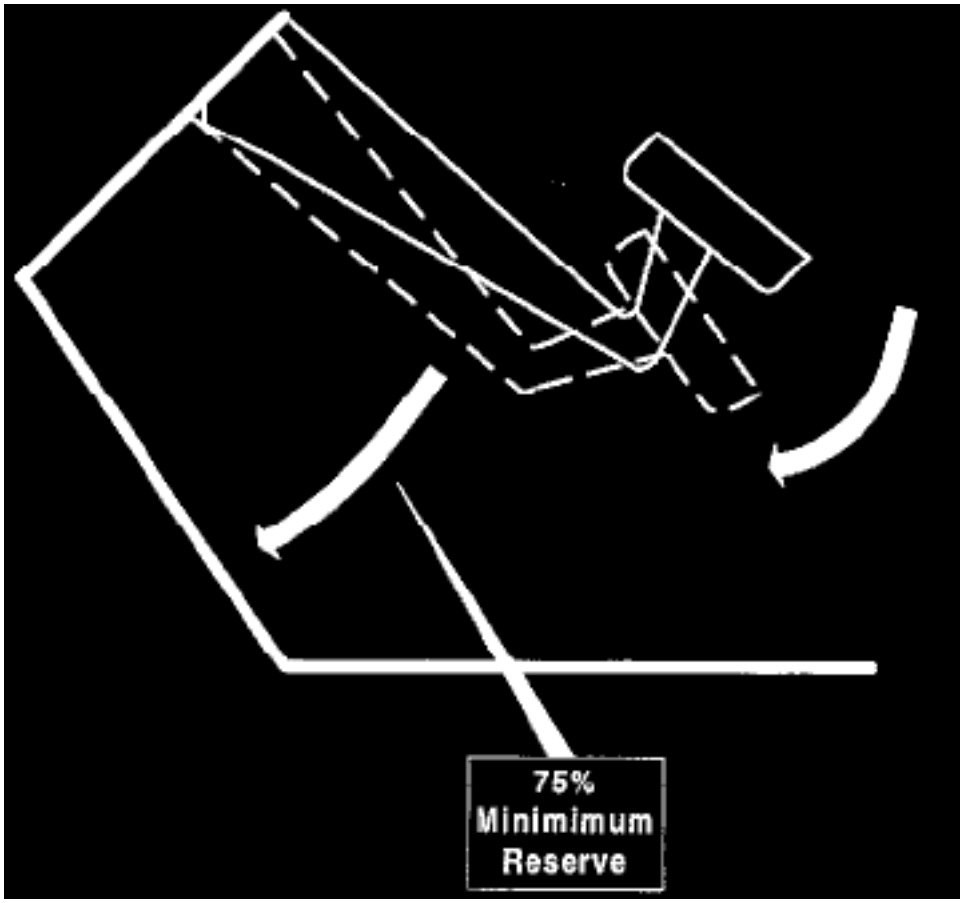
- Check all brake lines and brake assemblies for leakage.

Repair all deficiencies with related systems prior to diagnosing the master-cylinder as defective.

Check Brake Pedal Travel (Non-Antilock Brake Systems Only) -

Fully depress the brake pedal and check for the following: -

The pedal should have a 75% reserve.



Pedal Reserve Checks

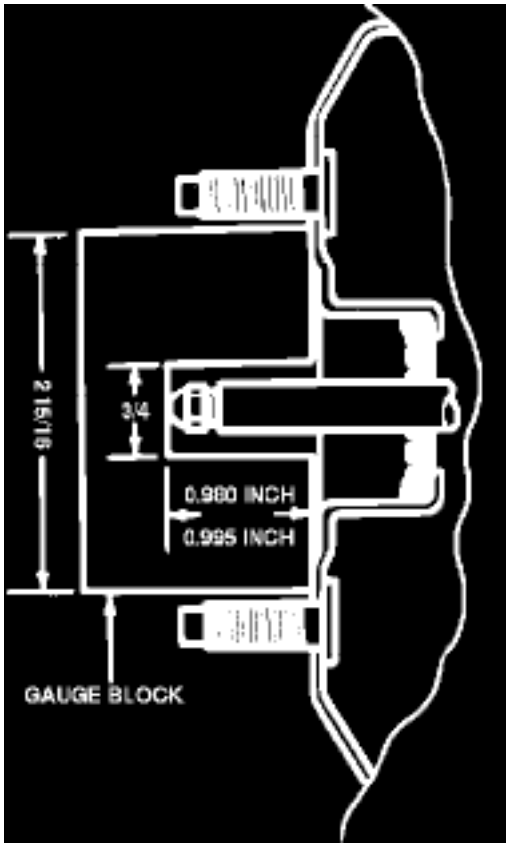
- The pedal should be firm and not leak down.

Prior to replacing a master-cylinder for poor pedal travel or feel verify the following: -

There were no problems with any of the related systems.

- The entire brake system has been bled.

- Rear brakes are properly adjusted.



Brake Master Cylinder: Adjustments

PUSHROD ADJUSTMENT

Fig. 1 Adjusting Piston Rod

To check adjustment of pushrod, fabricate a gauge and position it against master cylinder mounting surface as shown in Fig. 1. Adjust pushrod screw by turning it until the end just touches inner edge of slot in gauge.

For additional information see Push Rod Adjustment Notes.

Brake Master Cylinder: Service and Repair Master Cylinder, ABS

WITH POWER BRAKES

1. With engine off, depress brake pedal to expel vacuum from brake booster system.

2. Disconnect hydraulic lines from master cylinder.

3. Remove brake booster to master cylinder retaining nuts and remove master cylinder from brake booster.

4. Reverse procedure to install and perform system brake bleeding procedures, then refill master cylinder and bleed it.

LESS POWER BRAKES

1. Disconnect wires from stop light switch inside cab below instrument panel.

2. Remove retaining nut, shoulder bolt and spacers which secure master cylinder pushrod to brake pedal assembly, then remove stop light switch from pedal.

3. Disconnect hydraulic brake lines from master cylinder, then remove master cylinder to dash panel retaining nuts, master cylinder, and boot from master cylinder pushrod.

4. Reverse procedure to install and perform system brake bleeding procedures, then refill and bleed master cylinder.

Brake Master Cylinder: Service and Repair Master Cylinder, Brakes

Removal

For additional information see Notes, Warnings, and Hints.

CAUTION: Brake fluid will damage electrical connections and painted surfaces. Use shop cloths, drip pans and fender covers to prevent brake fluid from contacting these areas.

1. Disconnect the brake warning lamp indicator wire from the plastic reservoir low fluid level warning switch socket. 2. With the engine turned off, push the brake pedal down to expel vacuum from the brake booster system. 3. Disconnect the hydraulic lines from the brake master cylinder. Cover the ends of the lines to prevent dirt from entering system. 4. Remove the wrap around clip and attaching nut from the booster master cylinder mounting stud.

Master Cylinder

5. Remove the brake booster-to-master cylinder retaining nuts. Remove the master cylinder from the brake booster.

Installation

For additional information see Notes, Warnings, and Hints.

CAUTION: Brake fluid will damage electrical connections and painted surfaces. Use shop cloths, drip pans and fender covers to prevent brake fluid from contacting these areas.

1. Bench bleed the master cylinder. Refer to Brake Bleeding.

Fig.1 Checking Master Cylinder Pushrod Length

2. Before installing the master cylinder, check the distance from the outer end of the booster assembly push rod to the face of the brake booster

assembly. Turn the push rod adjusting screw in or out as required to obtain the specified length (see second image).

Master Cylinder

3. Position the master cylinder assembly over the booster push rod and onto the two studs on the booster assembly. Install the attaching nuts and

tighten to 18-33 Nm (13-25 ft lb).

4. Loosely connect the hydraulic brake system lines to the master cylinder. 5. Position the wrap-around clip on the mounting stud. Install and tighten the attaching nut. 6. Tighten the tube nuts to 14-20 Nm (10-15 ft lb). 7. Connect fluid level indicator switch. 8. Install the gasket and plastic cap assembly. 9. Bleed the hydraulic brake system. Refer to Brake Bleeding.

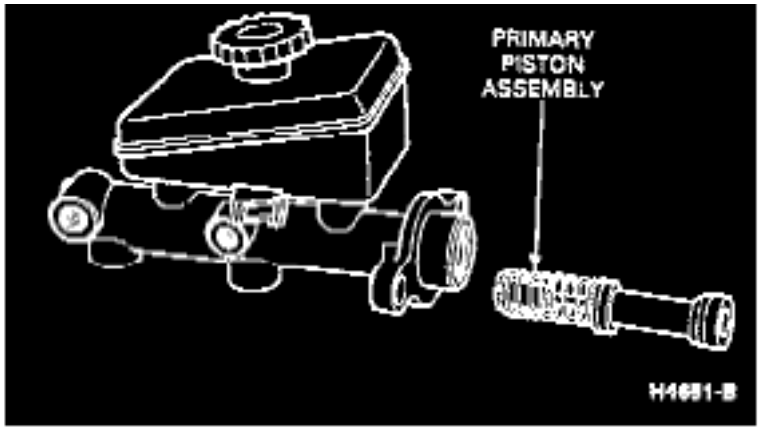
Rebuild

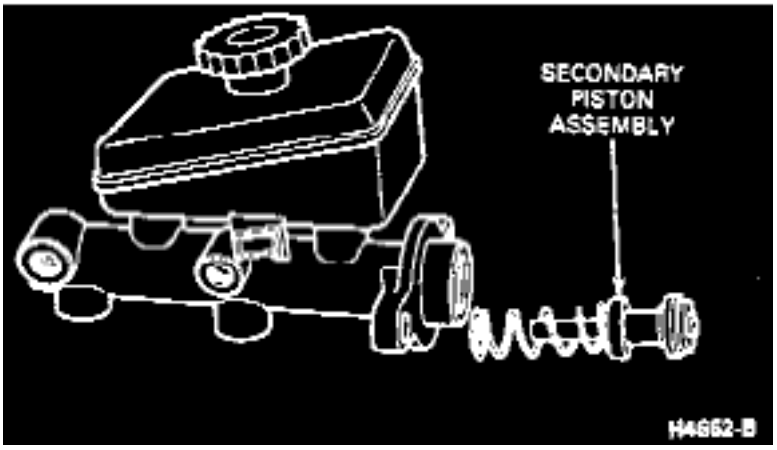
Master Cylinder

DISASSEMBLY

1. Clean the outside of the master cylinder and remove the filler cap and diaphragm. Drain and discard any brake fluid that remains in the cylinder.

Removing/Installing Snap Ring





2. Depress the primary piston and remove snap ring from retaining groove at the rear of the master cylinder bore.

3. Remove primary piston assembly from the master cylinder bore. Inspect for seal damage or twisting. Discard assembly.

4. Remove the secondary piston assembly by directing compressed air into the outlet port at the blind end of the bore while plugging the other port.

Inspect for seal damage or twisting. Discard assembly.

5. Inspect the master cylinder bore for signs of etching, pitting, scoring or other damage.

CAUTION: Thoroughly inspect bore of master cylinder for signs of etching, pitting, scoring or other damage. Do not attempt to hone a master cylinder bore if damage is found.

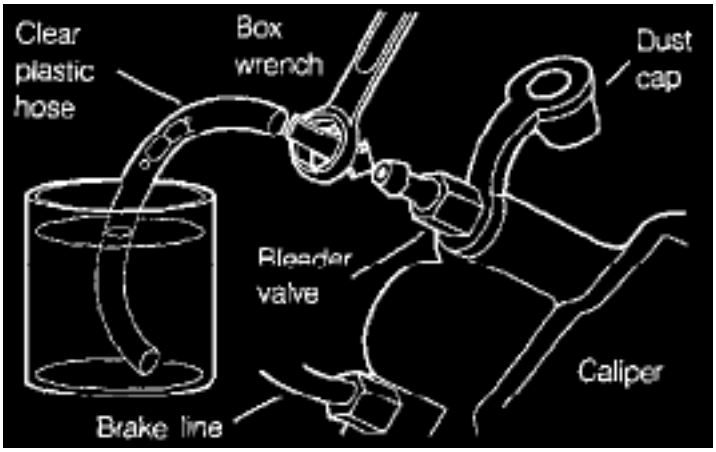
ASSEMBLY

1. Clean the master cylinder body with clean isopropyl alcohol or brake parts cleaner to remove any contamination. 2. Dip the repair kit piston assemblies in clean DOT 3 brake fluid to lubricate the seals. 3. Carefully insert the complete secondary piston assembly in the master cylinder bore.

4. Carefully insert the primary piston assembly in the master cylinder bore. 5. Depress the primary piston and install the snap ring in the cylinder bore groove. On vehicles with manual brakes, install the push rod retainer

onto the push rod and install into the primary piston. Make sure the retainer is properly seated and holding the push rod securely.

6. Install the cap and diaphragm on the master cylinder reservoir.



Brake Master Cylinder: Tools and Equipment

BASIC SERVICE (Removal and Installation)

- Fender cover (servicing and bleeding a master-cylinder can be a messy process)

WARNING: DOT 3 or 4 brake fluid is very corrosive to the vehicles finish and electrical connections.

- Drip pan. - Complete set of combination wrenches or sockets. - Brake bleeding device:

- Pressure bleeder or

- Vacuum bleeder or

- One-man brake bleeder kit or

- Length of clear plastic hose (3/16 inch ID) and a glass jar.

Brake Bleeding Setup

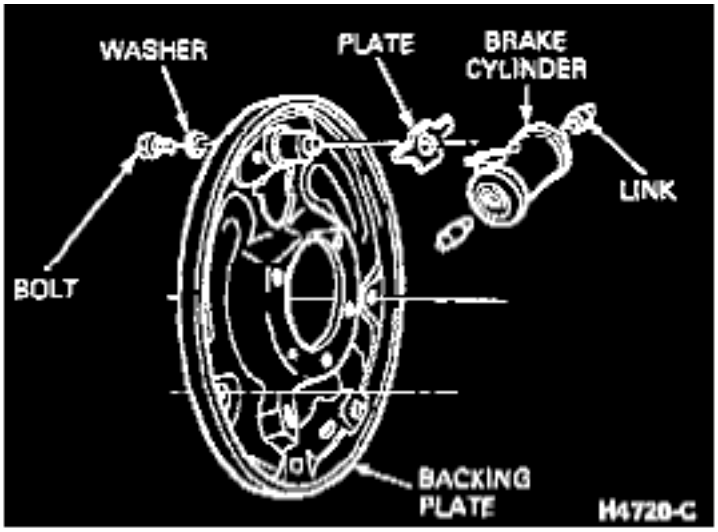
- Small ruler or depth gauge (for adjusting the pushrod) - Brake adjusting tool (rear brake adjustment should be checked) - Clean shop towels.

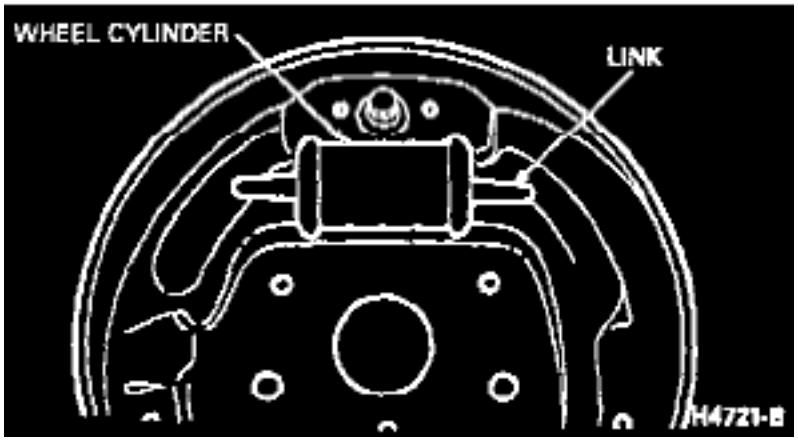
OPTIONAL

- Master Cylinder brake bleeding kit (contains plastic fittings and hoses used for bleeding master cylinders) - Suction bulb (for removing brake fluid from reservoir)

IF MASTER-CYLINDER IS OVERHAULED

- Snap-ring pliers - Small pry bar (for separating the reservoir from the cylinder) - Feeler gauges (for checking piston to cylinder clearance).





Wheel Cylinder: Service and Repair Removal

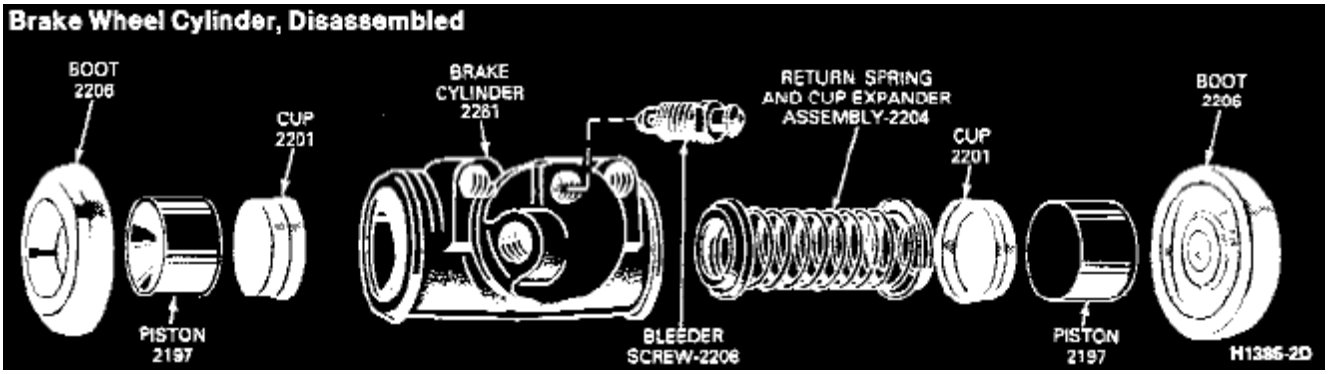
For additional information see Notes, Warnings, and Hints.

Wheel Cylinder And Backing Plate

1. Raise vehicle and position suitable safety stands under vehicle. Remove wheel and tire assembly. 2. Remove the drum, and brake shoes.

Wheel Cylinder Connecting Links

3. Remove the cylinder-to-shoe connecting links (if equipped). 4. Disconnect the brake line from the brake cylinder and plug line to prevent air from entering the system. 5. Remove the brake cylinder retaining bolts and lockwashers, and then remove the cylinder from the backing plate.



Wheel Cylinder: Service and Repair Rebuild

For additional information see Notes, Warnings, and Hints.

Wheel Cylinder Assembly

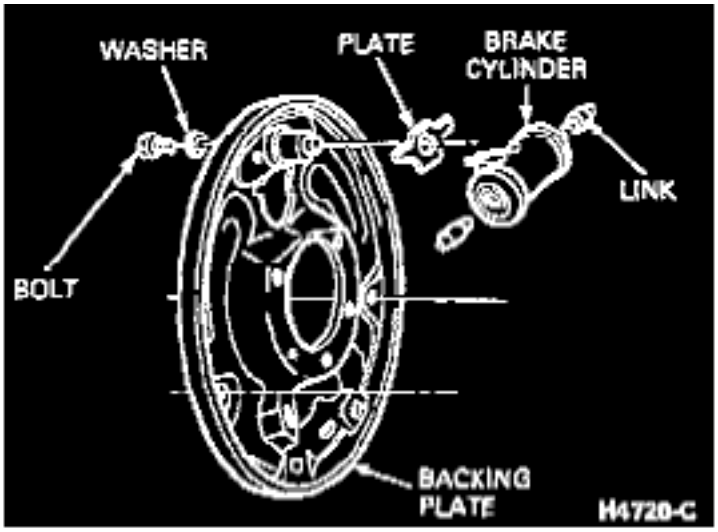
DISASSEMBLY

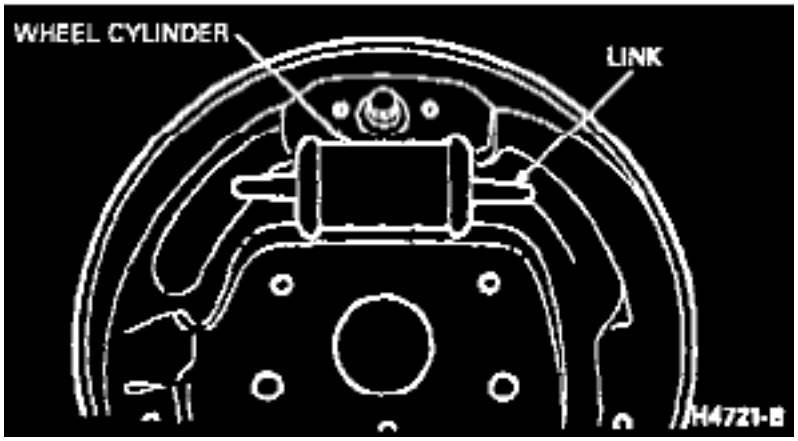
1. With the wheel cylinder removed, remove the rubber boots from the ends of the brake cylinder 2. Remove the pistons, cups, and piston return spring and cup expander assembly from the cylinder. 3. Remove the bleeder screw from the cylinder.

ASSEMBLY

1. Clean the wheel cylinder body with clean isopropyl alcohol or brake parts cleaner to remove any contamination. 2. Coat all brake cylinder parts with clean DOT 3 brake fluid. 3. Install the bleeder screw in the brake cylinder. 4. Place the piston return spring and piston expander assembly, cups, and pistons in the cylinder bore. 5. Clamp the brake cylinder pistons against the ends of the cylinder.

NOTICE: When using a brake cylinder repair kit, follow the instructions in the kit and use all of the parts provided.





Wheel Cylinder: Service and Repair Installation

For additional information see Notes, Warnings, and Hints.

Wheel Cylinder And Backing Plate

1. Place the brake cylinder on the backing plate and install the retaining bolts and lockwashers. 2. Connect the brake line to the brake cylinder.

Wheel Cylinder Connecting Links

3. Install the brake shoes and the connecting links (if equipped). 4. Install the drum. 5. Install the wheel and tire assembly. 6. Adjust the brakes and perform system brake bleeding procedures.

Ford Ranger 4wd Workshop Manual (V6-245 4.0L (1991))

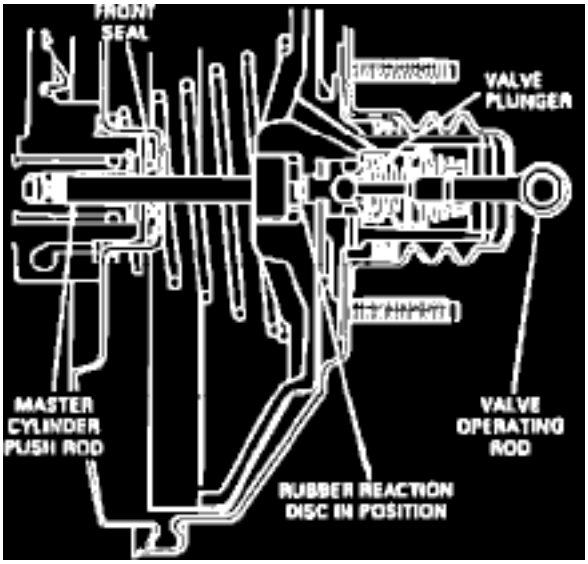
Parking Brake Warning Switch: Locations

I/P Components

Below LH Side Of I/P, On Park Brake Assembly

Vacuum Brake Booster: Description and Operation

The single and tandem vacuum boosters are self contained vacuum hydraulic power braking units. These are vacuum suspended units that use vacuum and atmospheric pressure for their power. On gasoline engine vehicles, vacuum is supplied through a fitting in the intake manifold. On diesel engine vehicles, vacuum is supplied through a vacuum pump. The three basic elements of the booster are the vacuum power chamber, mechanically actuated booster check valve and a hydraulic dual master cylinder which supplies hydraulic pressure to the brake system. The vacuum power chamber consists of a front and rear shell, diaphragm, diaphragm plate, hydraulic pushrod and vacuum diaphragm return spring. The mechanically actuated booster check valve controls degree of power brake application in accordance with foot pressure applied to valve operating rod through brake pedal linkage. This valve is integral with the vacuum power diaphragm.



Vacuum Brake Booster: Service and Repair

Fig. 2 Checking Reaction Disc Installation

Make sure booster rubber reaction disc is properly installed as shown in Fig. 2, if the master cylinder pushrod is removed or accidentally pulled out. A dislodged disc may cause excessive pedal travel and extreme operation sensitivity. The disc is black compared to the silver colored valve plunger that will be exposed after pushrod and front seal are removed. The booster unit is serviced as an assembly and must be replaced if the reaction disc cannot be properly installed and aligned, or if it cannot be located within the unit itself.

1. Disconnect battery ground cable.

2. Disconnect stop lamp switch electrical connectors.

3. Support underside of master cylinder, then remove power brake unit-to-master cylinder attaching nuts.

4. Remove vacuum hose between manifold and power brake unit, or power brake unit check valve. Remove check valve, if equipped.

5. Separate power brake unit and master cylinder, leaving master cylinder supported far enough away to allow removal of power brake unit.

6. On models equipped with pushrod mounted stop lamp switch, remove retaining pin, then slide switch, pushrod, spacers and bushing off brake pedal pin.

7. On models equipped with brake pedal mounted stop lamp switch, remove attaching bolt, nut and plastic bushing, then disconnect power brake unit pushrod from brake pedal.

8.

On all models, remove power brake unit attaching bolts and the power brake unit.

9. Reverse procedure to install.

ISSUE: Adverse braking characteristics and failure of the RABS light to indicate a RABS failure may be caused by improper servicing of RABS II equipped vehicles with RABS I electronic control units.

ACTION:

When replacing a RABS electronic control unit, refer to the following RABS Module Chart for correct parts usage.

RABS II modules have been designed with Keep Alive Memory and are to be used to service all prior year RABS I systems, except for 1987 and 1988 Bronco II vehicles.

ISSUE: The subject Module - Brake Computer (E7TZ-2C018-A, F2UZ-2C018-A, F2TZ-2C018-A, FOUZ-2C018-A and E99Z-2C018-A) are being replaced by different part numbers. They should be withdrawn from your inventory and returned to your facing PDC within 30 days of this TSB.

ACTION: Remove and return the obsolete parts from your dealership's inventory.

1. Return obsolete parts (Noted above) to your facing PDC using the least expensive transportation.

2. If claim is processed electronically via DOES II use return code "GB"; otherwise, complete a separate paper claim form FPS-340 using return code "J".

3. In the Remarks Section write "Returned per TSB 93-17-13".

LIMITS

^ The returns must be received within 30 days from the date of this TSB.

^ Returns are restricted to the subject parts.

^ The parts returned must have been purchased from FPSD in accordance with Policy and Procedure Bulletin 4000.

CREDIT

Credit for parts and prepaid freight costs will be issued.

NOTE: REPLACEMENT STOCK IS AVAILABLE FOR ORDERING IMMEDIATELY.

Behind Center Of I/P, LH Side Of Ashtray

Electronic Brake Control Module: Service and Repair

1. Disconnect battery ground cable.

2. Disconnect wiring harness from RABS module.

3. On Bronco, Bronco II, F-Series, Ranger and Explorer models, remove module to instrument panel retaining screws behind center of instrument panel.

4. On Aerostar models, remove module to instrument panel anti-skid plate retaining screws on lefthand side of engine cover under instrument panel.

5.

On E-Series models, remove parking brake actuator assembly as follows: a.

Loosen adjusting nut at equalizer.

b. From inside engine compartment, remove nuts attaching actuator assembly to cowl.

c. From under instrument panel, remove one bolt attaching actuator assembly to lower flange of instrument panel.

d. Remove parking brake cable from actuator assembly by compressing conduit end fitting prongs using a 1/2 inch box wrench.

e. Remove actuator assembly.

6. On Aerostar and E-Series models, remove two module attaching screws, then the module.

7. On all models, reverse procedure to install, then check system for proper operation.

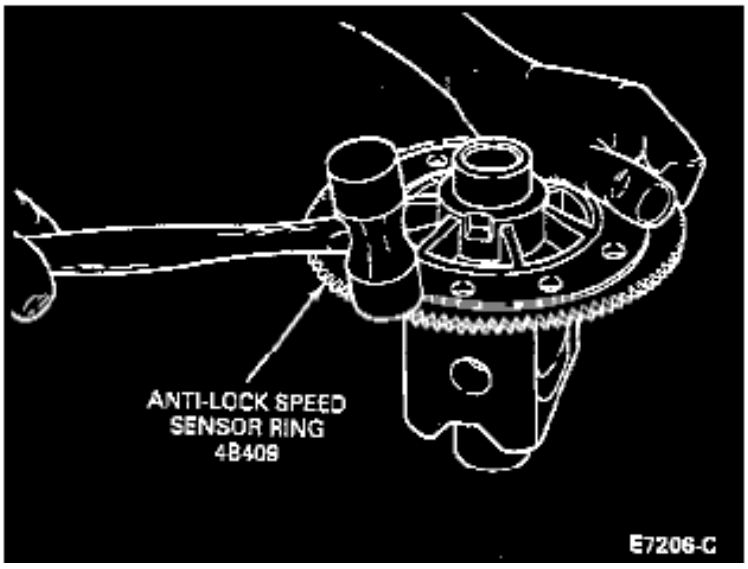
RING GEAR
PART OF 4209
GE0976-A



ANTI-LOCK SPEED
SENSOR RING
4B409
E7206-C

Wheel Speed Sensor: Service and Repair Toothed Ring

NOTE: To service the speed sensor ring, the differential case must be removed from the axle housing.

REMOVAL

1. Remove the bolts retaining the ring gear to the differential case. Remove the ring gear by striking at alternate holes around the gear.

CAUTION: Extreme care should be taken not to scratch, dent, chip or otherwise cause damage to anti-lock brake sensor ring teeth while handling or during assembly.

NOTE:

^ Before removing ring gear inspect it and determine if ring runout check is necessary.

^ Do not remove anti-lock speed sensor ring unless replacement is required. It does not have to be removed for ring gear replacement.

2. If replacement is required remove the anti-lock brake sensor ring by tapping with a soft-faced hammer. Discard the anti-lock speed sensor ring.

CAUTION: The anti-lock speed sensor ring must be discarded upon removal. If removed, a new anti-lock brake sensor ring must be installed.

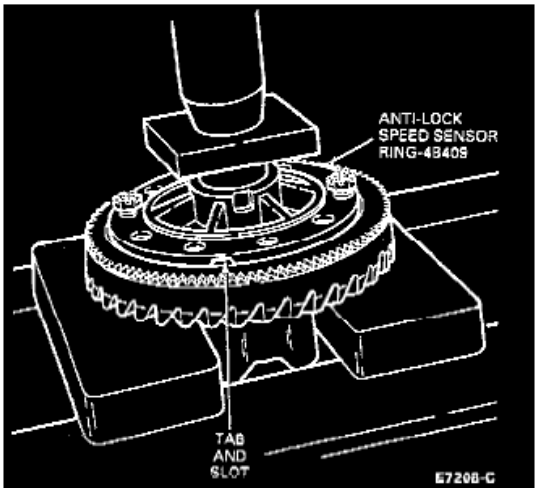
REAR GEAR
VIEW A
ANTI-LOCK SPEED SENSOR RING TAB
DIFFERENTIAL CASE SLOT
VIEW A
GE1061-A



ANTI-LOCK SPEED SENSOR RING-4B409
TAB AND SLOT
E7208-C

INSTALLATION

1. Position the ring gear and anti-lock speed sensor ring on the differential case. The tab on the anti-lock speed sensor ring must be aligned with the

slot in the differential case as shown. Start two ring gear retaining bolts through the differential case into the ring gear to make sure case-to-ring gear bolt hole alignment is achieved.

CAUTION:

^ Extreme care should be taken not to scratch, dent, chip or otherwise cause damage to anti-lock speed sensor ring teeth while handling or during assembly.

^ The tab on the anti-lock speed sensor ring must be aligned with the slot in the differential case.

2. Press the ring gear and anti-lock speed sensor ring on the differential case using the ring gear as a pilot.

3. Coat the threads of the ring gear retaining bolts with Stud and Bearing Mount EOAZ-19554-BA or equivalent meeting Ford specification

WSK-M2G349-A1. Install the bolts and alternately and evenly tighten to 95-115 Nm (70-85 ft. lbs.).

Wheel Speed Sensor: Service and Repair Wheel Speed Sensor

REMOVAL

1. At the rear axle housing pull the wiring harness connector from the speed sensor. 2. Remove the speed sensor hold down bolt and remove the speed sensor from the rear axle housing.

INSTALLATION

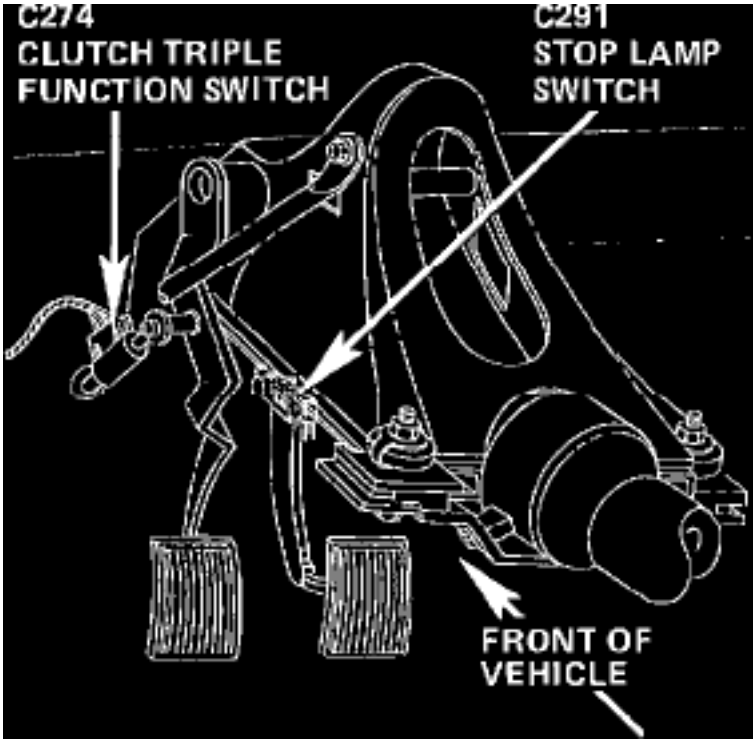
1. Clean the rear axle housing mounting surface. Use care to prevent dirt from entering the rear axle housing. 2. Inspect and clean the magnetized sensor pole piece to make sure that it is free from loose metal particles which could cause erratico■ system

operation. Inspect the speed sensor O-ring for damage and replace if necessary.

3. Lightly lubricate the speed sensor O-ring with motor oil, align the bolt hole, and install.

NOTE: Do not apply force to the plastic sensor connector. The sensor flange should slide to the mounting surface. This will make sure the air gap setting is between 0.127-1.143 mm (0.005-0.045 inches).

4. Install the speed sensor hold-down bolt and tighten to 34-40 Nm (25-29 ft. lbs.). 5. Push the connector on the speed sensor.



Brake And Clutch Switches

Clutch Pedal Position Switch: Testing and Inspection

This switch functions magnetically. Do not use magnetized tools near this switch.

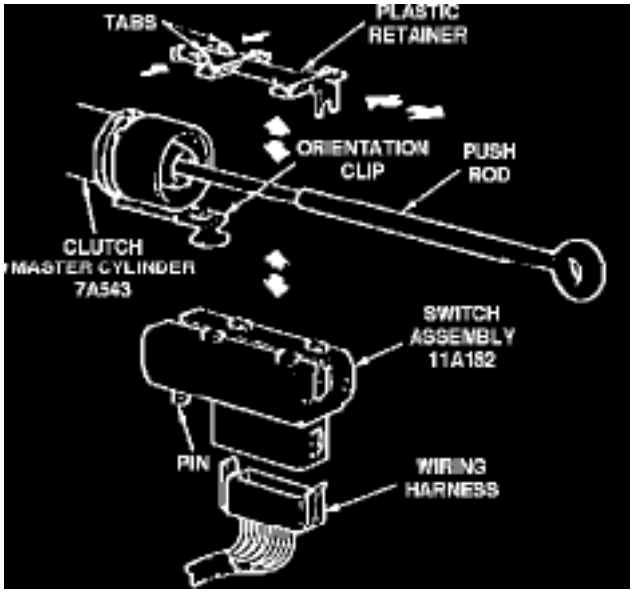
1. If the switch is open when the clutch pedal is released, speed control will not operate. This must be corrected before making any other tests. Use only a multimeter of 5000 ohm/volt rating or higher when performing the clutch switch test.

2. On all except 1990-91 Aerostar, Bronco II, Explorer and Ranger and 1992 Bronco & F150-350 models, disconnect switch pigtail connector from speed control harness connector and connect an ohmmeter to the two switch connector terminals.

3. On all 1990-91 Aerostar, Bronco II, Explorer and Ranger and 1992 Bronco & F150-350 models, connect suitable ohmmeter between two middle switch connector terminals.

4. On all models, with clutch pedal in the fully released position, the resistance should be less than 5 ohms. With clutch pedal fully depressed, the circuit should be open.

5. If switch does not function as described, remove and replace switch.



Clutch Pedal Position Switch: Service and Repair

Fig. 8 Clutch Interlock 3-way Switch

REMOVAL

1. Disconnect electrical connector from switch located on clutch master cylinder push rod, Fig. 8.

2. Pull orientation clip away from switch to separate pin, then rotate switch to expose plastic retainer.

3. Push tabs together to allow retainer to slide rearward and separate from switch.

4. Remove switch from push rod.

INSTALLATION

1. Install switch onto master cylinder push rod, ensuring that switch is properly seated.

2. Install plastic retainer, then rotate switch into position and attach orientation clip.

3. Connect electrical connector.

LIGHT TRUCK: 1983-91 BRONCO 1983-93 ECONOLINE, F-150-350 SERIES, RANGER 1986-91 AEROSTAR 1991-93 EXPLORER

ISSUE: The instrument cluster warning light(s) may be dimly lit or there may be a malfunction of the four pin low oil relay on vehicles so equipped. This could be due to the ignition switch.

ACTION:

If the vehicle displays the subject symptoms and meets the following conditions, replace the ignition switch. Refer to the appropriate Car or Light Truck Service Manual (Section 13-04 for 1983-1990 Cars, Section 11-04 for 1991-1993 Cars and Section 13-05 for 1983-1990 Light Trucks, Section 11-05 for 1991-1993 Light Trucks) for removal and installation procedures. Refer to the Parts Block in this article for correct parts usage.

CONDITIONS

^ The vehicle has 14401 wiring attached to the P2 terminal of the ignition switch. Refer to the wiring schematic and/or Electrical And Vacuum Troubleshooting Manual (EVTM) for the concern vehicle.

Ignition Switch: Customer Interest Engine - Hard Start/No Start When Cold

Article No. 91-13-9

06/26/91

^ HARD START - 4.0L - COLD ENGINE

^ NO START - 4.0L - COLD ENGINE

^ IGNITION SWITCH BOUNCE - HARD OR NO START - 4.0L COLD ENGINE

LIGHT TRUCK: 1990-91 RANGER 1991 EXPLORER

ISSUE: A hard start or no start condition may occur when the engine is cold. The engine may not start without cycling the key to the OFF position and back to START. Ignition switch bounce (loss of electrical continuity between contacts) may cause the EDIS module to recycle several times or to lock-up and not allow a start at all.

ACTION: Install a new ignition switch containing synthetic lubricant which reduces the amount of bounce. Also, install a new wiring connector containing a new material that is compatible with the new synthetic lubricant. Refer to the following procedure for service details.

REMOVAL

1. Disconnect the battery power.

2. Remove the trim panel. Refer to the 1990-91 Ranger/Explorer Shop Manual, Section 11-04B, for removal procedure.

3. Turn the lock cylinder to the RUN position.

4. Remove the two (2) nuts on the ignition switch.

5. Separate the connector from ignition switch by gently prying on the ears of the connector and pulling apart firmly.

6. Disengage the terminals from the existing connector. Discard the connector.

Figure 1

7. Insert terminal into proper locations in new connector (F2TZ-14489-A), Figure 1.

INSTALLATION

1. Remove the spring clip from the new switch (F2TZ-11572-A). This clip keeps the switch in the correct position during shipment.

2. Press the new connector (F2TZ-14489-A) onto the terminals of the ignition switch. Be sure the tabs lock securely.

3. Locate the switch on the weld studs on the steering column.

NOTE: THE END OF THE ACTUATOR ROD MUST FIT IN THE HOLE ON THE SLIDER.

4. Install the nuts on the weld stud. Tighten to 4.45-7.24 N-m (39-64 lb.in.).

5. Connect the battery terminal.

6. Check the switch operation. If necessary, adjust it. Refer to the 1990-91 Aerostar, Explorer, Ranger Truck Shop Manual, Section 11-04B, for adjustment procedure.

7. Install the trim panel.

REMOVAL

1. Disconnect battery ground cable, then raise and support vehicle.

2. Disconnect electrical connector from switch, Fig. 9, then remove switch and O-ring using neutral start switch socket T74P-77247-A or equivalent. Neutral start switch socket is a thin wall socket, other types of sockets could puncture walls of switch.

INSTALLATION

1. Install neutral start switch using socket and torque to 7-10 ft. lbs.

2. Connect electrical connector to switch, then lower vehicle.

3. Connect battery ground cable, then check operation of switch with parking brake engaged. Engine should start with selector lever in N or P only, and back-up lamps should illuminate with selector lever in R only.

Battery Cable: Technical Service Bulletins EEC IV Quick Test - Code 16 Set

Article No. 91-14-10

07/11/91

^ EEC IV QUICK TEST - SERVICE CODE 16 EXPERIENCED DURING KOEO VIP TEST - VEHICLES USED IN CANADA

^ WIRING - BATTERY GROUND CABLE TOO LONG - INTERACTION BETWEEN DRL AND EDIS MODULE/VRS SENSOR - VEHICLES USED IN CANADA

LIGHT TRUCK: 1990-91 RANGER 1991 EXPLORER

ISSUE: A service code 16 may be experienced during the KOEO (Key-On/Engine-Off) VIP test. This is caused by the battery ground cable being too long which creates an interaction between the Daytime Running Light (DRL) and the EDIS module/VRS sensor.

ACTION: Confirm the condition and install a shorter battery ground cable. Refer to the following procedure for service details.

INSPECTION AND IDENTIFICATION

1. Perform the KOEO (Key-On/Engine-Off) VIP Self Test with the parking brake OFF and the headlights OFF. This should produce a sequence like 16-10-11.

NOTE: DURING THE TEST, THE HEADLIGHTS WILL BE ILLUMINATED AT 40% INTENSITY (PER CANADIAN LAW FOR DAYTIME DRIVING).

2. Set the parking brake and rerun the KOEO VIP Self Test. The headlights will be off with the parking brake set during this test. The codes should now be 11-10-11.

3. Check the battery cable to see that it shows a 10 gauge wire running along the negative battery cable from the frame ground to the chassis ground at G101 (body ground near the negative battery post). This cable will only have three wires connected directly at the negative battery clamp.

BATTERY GROUND CABLE REPLACEMENT

1. Remove the battery ground cable assembly and engine block heater wire, if so equipped.

2. Install a new battery ground cable (F1TZ-14301-C).

NOTE: ON THE NEW CABLE, THE CHASSIS GROUND WIRE COMES DIRECTLY FROM THE NEGATIVE BATTERY CABLE AND ATTACHES TO THE CHASSIS IN THE ORIGINAL LOCATION.

3. After all electrical connections are secured and the engine block heater is connected (if so equipped), rerun the KOEO VIP Self Test with the parking brake OFF. The DRL's should be on and the codes should read 11-10-11.

4. Check other electrical components for proper operation (i.e., radio, fan and lights) to be certain that the cables were reconnected correctly.

NOTE: VERIFY THE OPERATION OF THE TAIL AND BRAKE LIGHTS TO BE SURE THAT THE FRAME GROUND CONNECTION IS GOOD.

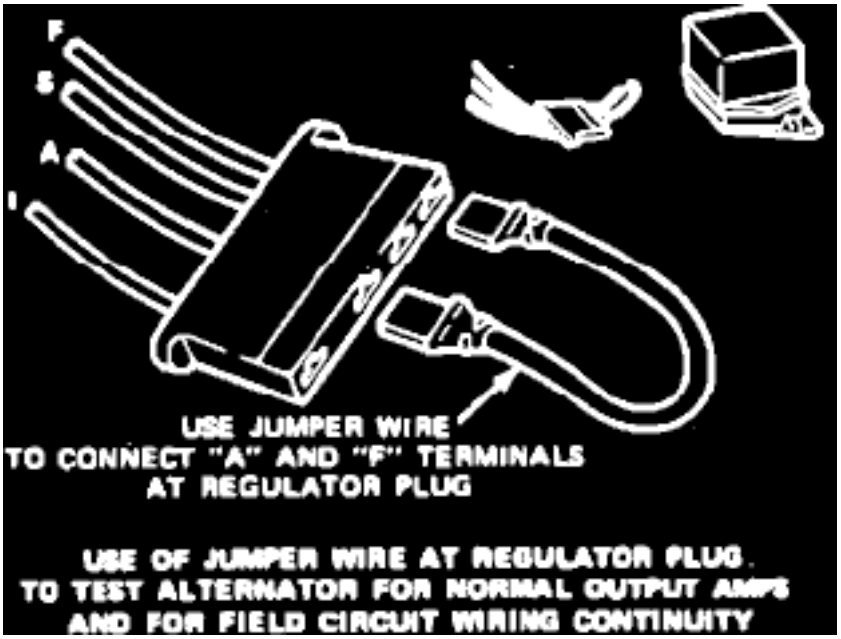
Alternator Lamp/Indicator: Description and Operation

When the ignition switch is in Start or Run position, battery current flows through the alternator warning indicator into regulator at terminal 1 and to ground through the indicator switch. The electronic control measures a low voltage at terminal A and closes the field switch. This applies battery voltage to the field through alternator terminal F. With current in the field and the rotor turning, alternator stator produces a voltage at terminals B and S. A predetermined voltage at terminal S operates the electronic control to open indicator switch, which removes ground from alternator warning indicator. Alternator current output is controlled by current in the field. Average field current depends on length of time field switch is closed. The electronic control closes field switch when voltage at terminal A is low and opens switch when voltage is high.



Diode Trio: Testing and Inspection

TEST PROCEDURES

Fig. 9 Regulator Plug. Jumper Wire Connector

1. Disconnect electric choke, if equipped.

2. Disconnect voltage regulator wiring connector.

3. Connect a jumper wire between the ``A'' and ``F'' terminals of voltage regulator wiring connector, Fig. 9.

4. Connect voltmeter to battery clamps. Then start and idle engine.

5. Observe and note voltmeter reading.

6. Move voltmeter positive lead to the alternator ``S'' terminal and note voltage reading.

TEST RESULTS

1. If voltmeter reading is within 1/2 of battery voltage, diodes are satisfactory.

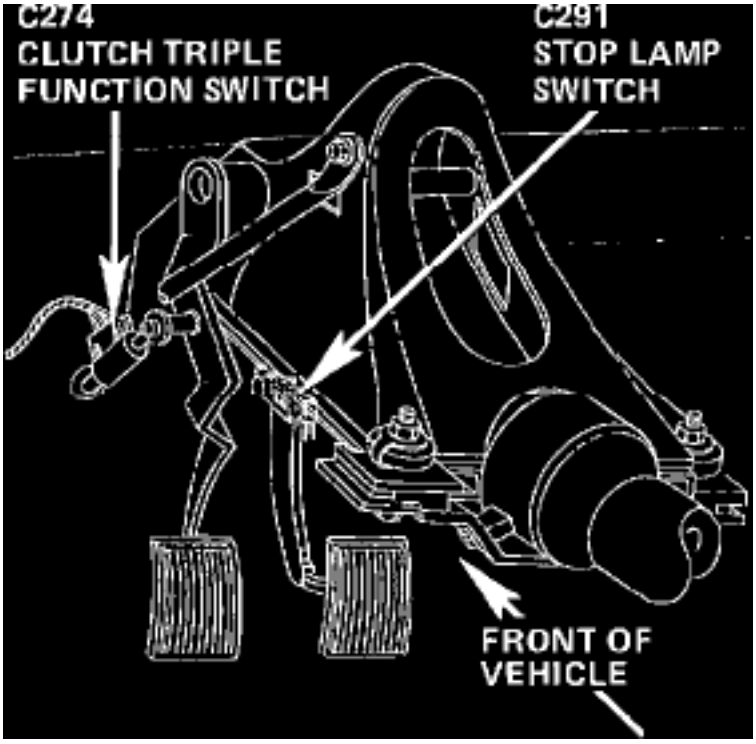
2. If voltmeter reading is approximately 1.5 volts, the alternator has a shorted negative diode or a grounded stator winding.

3. If voltmeter reading is approximately 1.5 volts less than battery voltage, the alternator has a shorted positive diode.

4. If voltage reading is approximately 1 to 1.5 volts less than 1/2 battery voltage, the alternator has an open positive diode.

5. If voltage reading is 1 to 1.5 volts above 1/2 battery voltage, the alternator has an open negative diode.

6. Reconnect electric choke into circuit after tests are completed, if equipped.



Brake And Clutch Switches

Clutch Pedal Position Switch: Testing and Inspection

This switch functions magnetically. Do not use magnetized tools near this switch.

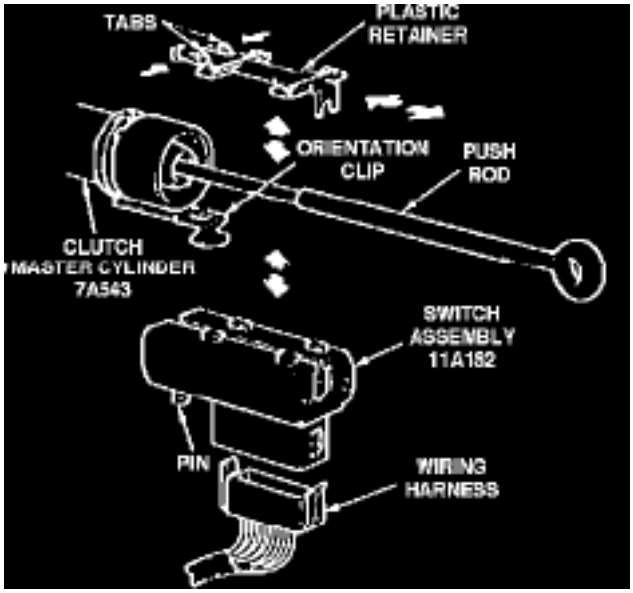
1. If the switch is open when the clutch pedal is released, speed control will not operate. This must be corrected before making any other tests. Use only a multimeter of 5000 ohm/volt rating or higher when performing the clutch switch test.

2. On all except 1990-91 Aerostar, Bronco II, Explorer and Ranger and 1992 Bronco & F150-350 models, disconnect switch pigtail connector from speed control harness connector and connect an ohmmeter to the two switch connector terminals.

3. On all 1990-91 Aerostar, Bronco II, Explorer and Ranger and 1992 Bronco & F150-350 models, connect suitable ohmmeter between two middle switch connector terminals.

4. On all models, with clutch pedal in the fully released position, the resistance should be less than 5 ohms. With clutch pedal fully depressed, the circuit should be open.

5. If switch does not function as described, remove and replace switch.



Clutch Pedal Position Switch: Service and Repair

Fig. 8 Clutch Interlock 3-way Switch

REMOVAL

1. Disconnect electrical connector from switch located on clutch master cylinder push rod, Fig. 8.

2. Pull orientation clip away from switch to separate pin, then rotate switch to expose plastic retainer.

3. Push tabs together to allow retainer to slide rearward and separate from switch.

4. Remove switch from push rod.

INSTALLATION

1. Install switch onto master cylinder push rod, ensuring that switch is properly seated.

2. Install plastic retainer, then rotate switch into position and attach orientation clip.

3. Connect electrical connector.

Wire Color Code Identification

NOTE: Whenever a wire is labeled with two colors; the first color listed is the basic color of the wire, and the second color is the tracer marking of the wire. If the second color is followed by by a D, the tracer is dots. If the second color is followed by an H, the tracer is hash marks.

For example: BR/O is a brown wire with an orange stripe, R/Y D is a red wire with yellow dots and BK/W H is a black wire with white hash marks.

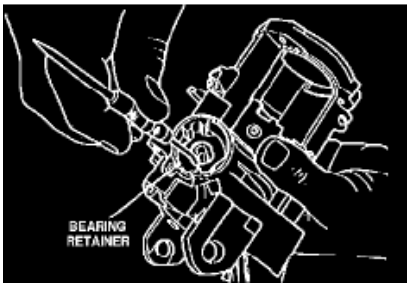
PULL LOCK CYLINDER FROM LOCK HOUSING
PUSH DOWN ON LOCK CYLINDER RETAINING PIN



BEARING RETAINER

Ignition Lock: Service and Repair

Fig. 4 Removing Ignition Lock Cylinder

WITH KEY

The following procedure applies to vehicles that have functional lock cylinders, ignition keys available for the vehicle, or ignition key numbers that are known and the proper key can be made.

Removal

1. Disconnect battery ground cable, then remove steering wheel. Ensure steering wheel is in full up position on models with tilt steering.

2. On models with tilt steering, remove tilt lever, then the steering column collar by pressing on collar from top and bottom while removing.

3. On all models, remove lower dash panel trim cover, then the column shroud retaining screws from bottom of column shroud.

4. Remove bottom half of shroud by pulling shroud down and toward rear of vehicle. Move shift lever as required to ease shroud removal on models with automatic transmission.

5. Lift top half of shroud from column.

6. Turn lock cylinder with key to ON position. Selector lever must be placed in PARK position on vehicles with automatic transmission.

7. Push down on lock cylinder retaining pin using a {1/8} inch diameter wire pin or small punch, then pull lock cylinder from column housing, Fig. 4.

8. Disconnect lock cylinder electrical connector from horn brush electrical connector.

Installation

1. Lubricate lock cylinder with suitable grease, then turn lock cylinder to ON position and depress retaining pin.

2. Insert lock cylinder into housing in flange casting, ensuring that tab at end of cylinder aligns with slot in ignition drive gear.

3. Turn key to OFF position, allowing cylinder retaining pin to extend into cylinder casting housing hole.

4. Rotate lock cylinder to all positions, ensuring cylinder is operating properly.

5. Connect lock cylinder electrical connector to horn brush electrical connector.

6. Position top half of steering column shroud onto column so that screw moldings on shroud seat in mounting bores in column. Place shift lever in lowest position to aid assembly on vehicles with automatic transmission.

7. Install bottom half of shroud by sliding guides in bottom half of shroud into tabs in top half.

8. Install shroud retaining screws and torque to 18.5-25.6 inch lbs.

9. On models with tilt steering, install steering column collar by pressing on top and bottom while installing on column.

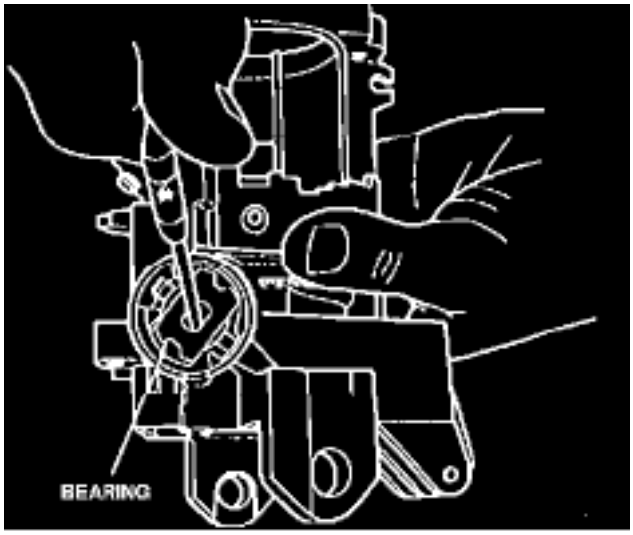
10. Install tilt lever and torque to 2.2-3.6 ft. lbs.

11. On all models, install steering wheel.

12. Install lower dash panel trim cover, then connect battery ground cable.

13. Check for proper start in P and N, and ensure that vehicle cannot be started in D or R positions and steering wheel locks in LOCK position.

Fig. 5 Removing Ignition Lock Bearing Retainer



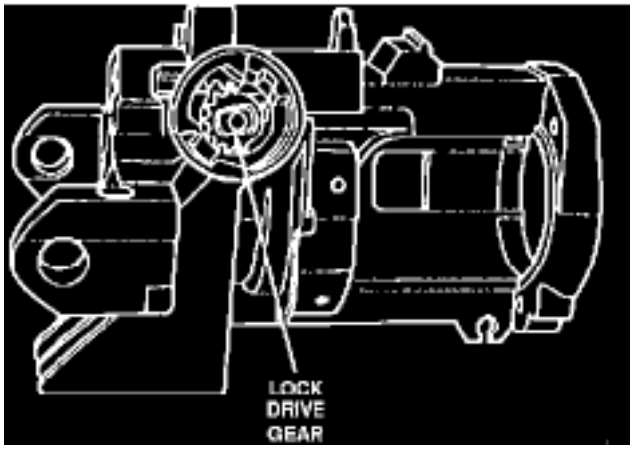


Fig. 6 Removing Ignition Lock Bearing

Fig. 7 Ignition Lock Drive Gear

LESS KEY

The following procedure applies to vehicles where the ignition lock is inoperative or lock cylinder cannot be rotated due to broken or missing ignition key and the key number is unknown, or the lock cylinder cap is damaged and/or broken so that lock cylinder cannot be rotated.

Removal

1. Disconnect battery ground cable, then remove steering wheel. Ensure steering wheel is in full up position on models with tilt steering.

2. On models with tilt steering, remove tilt lever, then the steering column collar by pressing on collar from top and bottom while removing.

3. On all models, remove lower dash panel trim cover, then the column shroud retaining screws from bottom of column shroud.

4. Remove bottom half of shroud by pulling shroud down and toward rear of vehicle. Move shift lever as required to ease shroud removal on models with automatic transmission.

5. Lift top half of shroud from column.

6. Punch lock cylinder retaining pin using a 1/8 inch maximum diameter prick punch, then drill out retaining pin using a 1/8 inch diameter drill, to a depth of 1/2 inch maximum. Use care not to damage cast housing when drilling out retaining pin.

7. Place a chisel at base of ignition lock cylinder cap, then strike chisel with sharp blows using a suitable hammer to break cap away from lock cylinder.

8. Using a 3/8 inch diameter drill, drill down middle of ignition lock key slot approximately 1 3/4 inch until lock cylinder breaks loose from steering column cover casting, then remove lock cylinder and drill shavings from base of cover cast housing.

9. Remove white plastic bearing retainer by inserting a suitable tool with a 90° bend on tip between bearing retainer and bearing and prying upward, Fig. 5. Note position of bearing retainer prior to removal.

10. Insert tip of a suitable screwdriver into double-D slot of bearing, Fig. 6, rotate 90°, then remove bearing.

11. Remove lock drive gear, Fig. 7, noting relationship of lock drive gear to rack teeth.

Installation

1. Lubricate and position lock drive gear in base of lock cylinder housing in same position as noted during removal. Position of lock drive gear is correct if last tooth on drive gear is meshed with last groove on rack.

2. Position bearing in lock cylinder housing, insert tip of screwdriver into double-D slot of bearing, then rotate bearing 90°.

3. Press white plastic bearing retainer into lock cylinder housing, ensuring retainer is in original position, then press firmly to snap into place.

4. Line up flats of drive gear with flats of washer by pulling down on column lock actuator. This will place actuator in RUN position.

5. Lubricate lock cylinder with suitable grease, then turn lock cylinder to ON position and depress retaining pin.

6. Insert lock cylinder into housing in flange casting, ensuring that tab at end of cylinder aligns with slot in ignition drive gear.

7. Turn key to OFF position, allowing cylinder retaining pin to extend into cylinder casting housing hole.

8. Rotate lock cylinder to all positions, ensuring cylinder is operating properly.

9. Connect lock cylinder electrical connector to horn brush electrical connector.

10. Position top half of steering column shroud onto column so that screw moldings on shroud seat in mounting bores in column. Place shift lever in lowest position to aid assembly on vehicles with automatic transmission.

11. Install bottom half of shroud by sliding guides in bottom half of shroud into tabs in top half.

12. Install shroud retaining screws and torque to 18.5-25.6 inch lbs.

13. On models with tilt steering, install steering column collar by pressing on top and bottom while installing on column.

14. Install tilt lever and torque to 2.2-3.6 ft. lbs.

15. On all models, install steering wheel.

16. Install lower dash panel trim cover, then connect battery ground cable.

17. Check for proper start in P and N, and ensure that vehicle cannot be started in D or R positions and steering wheel locks in LOCK position.

Article No. 93-24-10

11/24/93

^ LAMP - MALFUNCTION OF FOUR PIN LOW OIL LEVEL RELAY - VEHICLES BUILT AFTER 8/1/92 OR 1983-1993 VEHICLES THAT HAVE HAD SERVICE REPLACEMENT IGNITION SWITCHES AFTER 8/1/92

^ LAMPS - INSTRUMENT CLUSTER WARNING LIGHTS DIMLY LIT - VEHICLES BUILT AFTER 8/1/92 OR 1983-1993 VEHICLES THAT HAVE HAD SERVICE REPLACEMENT IGNITION SWITCHES AFTER 8/1/92

FORD: 1983 FAIRMONT 1983-89 CROWN VICTORIA, ESCORT 1983-93 MUSTANG, THUNDERBIRD 1983-94 PROBE 1984-86 LTD 1984-94 TEMPO

LINCOLN-MERCURY: 1983 LN7, ZEPHYR 1983-87 CONTINENTAL, LYNX 1983-89 GRAND MARQUIS, TOWN CAR 1983-93 COUGAR 1984-86 CAPRI, MARQUIS 1984-94 TOPAZ

LIGHT TRUCK: 1983-91 BRONCO 1983-93 ECONOLINE, F-150-350 SERIES, RANGER 1986-91 AEROSTAR 1991-93 EXPLORER

ISSUE: The instrument cluster warning light(s) may be dimly lit or there may be a malfunction of the four pin low oil relay on vehicles so equipped. This could be due to the ignition switch.

ACTION:

If the vehicle displays the subject symptoms and meets the following conditions, replace the ignition switch. Refer to the appropriate Car or Light Truck Service Manual (Section 13-04 for 1983-1990 Cars, Section 11-04 for 1991-1993 Cars and Section 13-05 for 1983-1990 Light Trucks, Section 11-05 for 1991-1993 Light Trucks) for removal and installation procedures. Refer to the Parts Block in this article for correct parts usage.

CONDITIONS

^ The vehicle has 14401 wiring attached to the P2 terminal of the ignition switch. Refer to the wiring schematic and/or Electrical And Vacuum Troubleshooting Manual (EVTM) for the concern vehicle.

Ignition Switch: Customer Interest Engine - Hard Start/No Start When Cold

Article No. 91-13-9

06/26/91

^ HARD START - 4.0L - COLD ENGINE

^ NO START - 4.0L - COLD ENGINE

^ IGNITION SWITCH BOUNCE - HARD OR NO START - 4.0L COLD ENGINE

LIGHT TRUCK: 1990-91 RANGER 1991 EXPLORER

ISSUE: A hard start or no start condition may occur when the engine is cold. The engine may not start without cycling the key to the OFF position and back to START. Ignition switch bounce (loss of electrical continuity between contacts) may cause the EDIS module to recycle several times or to lock-up and not allow a start at all.

ACTION: Install a new ignition switch containing synthetic lubricant which reduces the amount of bounce. Also, install a new wiring connector containing a new material that is compatible with the new synthetic lubricant. Refer to the following procedure for service details.

REMOVAL

1. Disconnect the battery power.

2. Remove the trim panel. Refer to the 1990-91 Ranger/Explorer Shop Manual, Section 11-04B, for removal procedure.

3. Turn the lock cylinder to the RUN position.

4. Remove the two (2) nuts on the ignition switch.

5. Separate the connector from ignition switch by gently prying on the ears of the connector and pulling apart firmly.

6. Disengage the terminals from the existing connector. Discard the connector.

Figure 1

7. Insert terminal into proper locations in new connector (F2TZ-14489-A), Figure 1.

INSTALLATION

1. Remove the spring clip from the new switch (F2TZ-11572-A). This clip keeps the switch in the correct position during shipment.

2. Press the new connector (F2TZ-14489-A) onto the terminals of the ignition switch. Be sure the tabs lock securely.

3. Locate the switch on the weld studs on the steering column.

NOTE: THE END OF THE ACTUATOR ROD MUST FIT IN THE HOLE ON THE SLIDER.

4. Install the nuts on the weld stud. Tighten to 4.45-7.24 N-m (39-64 lb.in.).

5. Connect the battery terminal.

6. Check the switch operation. If necessary, adjust it. Refer to the 1990-91 Aerostar, Explorer, Ranger Truck Shop Manual, Section 11-04B, for adjustment procedure.

7. Install the trim panel.

Neutral Safety Switch: Service and Repair

Fig. 9 Neutral Start Switch

REMOVAL

1. Disconnect battery ground cable, then raise and support vehicle.

2. Disconnect electrical connector from switch, Fig. 9, then remove switch and O-ring using neutral start switch socket T74P-77247-A or equivalent. Neutral start switch socket is a thin wall socket, other types of sockets could puncture walls of switch.

INSTALLATION

1. Install neutral start switch using socket and torque to 7-10 ft. lbs.

2. Connect electrical connector to switch, then lower vehicle.

3. Connect battery ground cable, then check operation of switch with parking brake engaged. Engine should start with selector lever in N or P only, and back-up lamps should illuminate with selector lever in R only.

^ 1991 Light Truck-Engine: Section 03-06A

ACTION: Refer to Disassembly and Assembly in this TSB article for the additional information.

NOTE: THIS TSB ARTICLE INCLUDES REVISED PAGES FROM THE 1989, 1990 AND 1991 CAR SHOP MANUALS LISTED ABOVE, THE 1991 COMPACT TRUCK SHOP MANUAL AND THE 1990 AND 1991 LIGHT TRUCK SHOP MANUALS. ALTHOUGH NOT SHOWN, THE REVISIONS APPLY TO ALL LIGHT TRUCK AND COMPACT TRUCK MANUALS LISTED ABOVE.

NOTE: THE PROCEDURE IN THIS TSB ARTICLE APPLIES TO VEHICLES WITH 4-INCH STARTERS ONLY.

OTHER APPLICABLE ARTICLES: NONE WARRANTY STATUS: INFORMATION ONLY OASIS CODES:

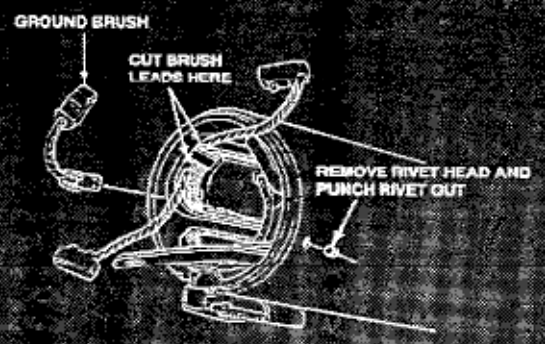
DISASSEMBLY AND ASSEMBLY (Continued)

Starter Drive Replacement

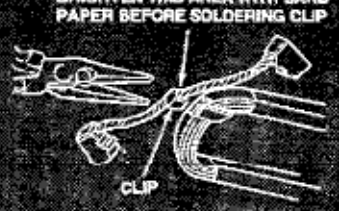
1. Remove plunger lever cover.
2. Remove pivot pin retaining starter drive plunger lever.
3. Loosen through bolts enough to allow removal of drive end housing, starter drive plunger lever and return spring.
4. Remove drive gear stop ring retainer and stop ring from groove in armature shaft, and remove drive gear assembly.
5. Apply a thin coating of Lubriplate 777 or equivalent on armature shaft splines. Install new drive gear assembly on armature shaft. Install a new stop ring.
6. Position starter gear plunger lever on starter frame. **Ensure that plunger lever properly engages starter drive assembly.**
7. Install a new stop ring retainer. Partially fill drive end housing bearing bore with grease (approximately one-quarter full). Position starter drive plunger lever return spring and drive end housing to starter frame. Tighten through bolts to 6-9 N·m (55-80 lb-in). Install pivot pin.
8. Position starter drive plunger lever cover on starter. Tighten retaining screw.

Starter Motor Brushes Replacement

1. Remove starter drive plunger lever cover.
2. Remove the two through bolts from the starter.
3. Remove the brush end plate.
4. Remove brush spring and pull brushes loose from brush holder.
5. Remove brush holder.
6. Remove the drive end housing and the plunger lever return spring.



7. Remove the starter drive plunger lever pivot pin and lever and remove the armature.
8. Ground brushes: Remove rivet head with file or chisel and remove rivet with 1/8" punch.
9. Cut the brush leads from the field coils as close to the field connection point as possible.
10. Clean and inspect the starter motor.
11. Position the new field brush lead on the field coil connection. Position and crimp the clip provided with the brushes to hold the brush lead to the connection. Solder the lead clip and connection together using rosin core solder. Use a 300 watt iron.



12. Rivet the ground brush leads to the frame with rivets provided in the brush kit.
13. Clean the commutator with 00 or 000 sandpaper.
14. Install the armature in the starter frame.
15. Install the starter drive gear plunger lever to the frame and starter drive assembly and install the pivot pin.
16. Install brush holder and insert brushes in holder and install brush springs.
17. Install the brush end plate.
18. Install the two through bolts to the starter frame.
19. Install starter drive plunger lever cover and tighten retainer screw.
20. Connect the starter to a battery and check operation.

Armature Replacement

1. Remove plunger lever cover.
2. Remove through bolts, pivot pin, drive end housing, drive plunger lever return spring and brush end plate.
3. Remove starter gear plunger lever. Remove brushes and lift out brush holder.
4. Remove armature. If starter drive gear assembly is being reused, remove stop ring retainer and stop ring from end of armature shaft. Remove drive gear assembly.
5. Place drive gear assembly on new armature with a new stop ring, thrust washer and retainer.

290000

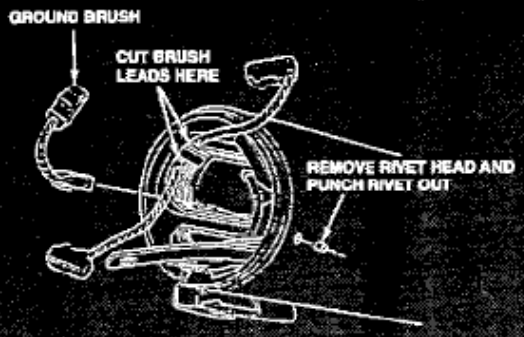
DISASSEMBLY AND ASSEMBLY (Continued)

Starter Drive Replacement

1. Remove cover screw, cover and through bolts.
2. Remove pivot pin retaining starter gear plunger lever and remove lever, starter drive end housing, armature and drive plunger return spring.
3. Remove the drive gear stop ring retainer and stop ring from the groove in the armature shaft and remove the drive gear assembly.
4. Apply a thin coating of Lubriplate 777 or equivalent, on the armature shaft splines. Install the new drive gear assembly on the armature shaft and install a new stop ring.
5. Position the starter gear plunger lever on the starter frame. **Ensure that the plunger lever properly engages the starter drive assembly.**
6. Install a new stop ring retainer and thrust washer. Partially fill the drive end housing bearing bore with grease (approximately one-quarter full). Position the starter drive plunger lever return spring and drive end housing to the starter frame, and then tighten the through bolts to 6-9 N·m (55-80 lb-in). Install pivot pin.
7. Position the starter drive plunger lever cover on the starter. Tighten the retaining screw.

Starter Motor Brushes Replacement

1. Remove starter drive plunger lever cover.
2. Remove the two through bolts from the starter.
3. Remove the brush end plate.
4. Remove brush spring and pull brushes loose from brush holder.
5. Remove brush holder.
6. Remove the drive end housing and the plunger lever return spring.



7. Remove the starter drive plunger lever pivot pin and lever and remove the armature.
8. Ground brushes: Remove rivet head with file or chisel and remove rivet with 1/8" punch.
9. Cut the brush leads from the field coils as close to the field connection point as possible.
10. Clean and inspect the starter motor.
11. Position the new field brush lead on the field coil connection. Position and crimp the clip provided with the brushes to hold the brush lead to the connection. Solder the lead clip and connection together using rosin core solder. Use a 300 watt iron.

12. Rivet the ground brush leads to the frame with rivets provided in the brush kit.
13. Clean the commutator with 00 or 000 sandpaper.
14. Install the armature in the starter frame.
15. Install the starter drive gear plunger lever to the frame and starter drive assembly and install the pivot pin.
16. Install brush holder and insert brushes in holder and install brush springs.
17. Install the brush end plate.
18. Install the two through bolts to the starter frame.
19. Install starter drive plunger lever cover and tighten retainer screw.
20. Connect the starter to a battery and check operation.

Armature Replacement

1. Remove cover screw, cover and through bolts.
2. Remove pivot pin retaining starter gear plunger lever and remove lever, starter drive end housing, armature, and drive plunger return spring.
3. Remove the armature. If the starter drive gear assembly is being reused, remove the stop ring retainer and stop ring from the end of the armature shaft, and remove the drive.
4. Place the drive gear assembly on the new armature with a new stop ring and retainer.
5. Install the armature in the starter frame.
6. Position the drive gear plunger lever to the frame and drive gear assembly.

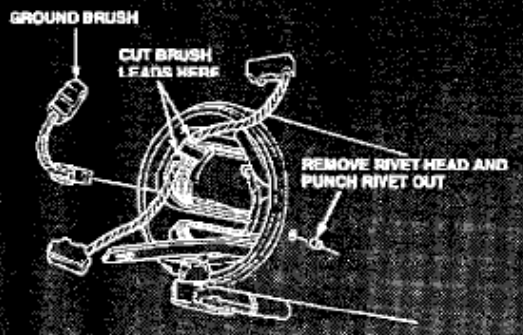
DISASSEMBLY AND ASSEMBLY (Continued)

Starter Drive Replacement

1. Remove cover screw, cover and through bolts.
2. Remove pivot pin retaining starter gear plunger lever and remove lever, starter drive end housing, armature and drive plunger return spring.
3. Remove the drive gear stop ring retainer and stop ring from the groove in the armature shaft and remove the drive gear assembly.
4. Apply a thin coating of Lubriplate 777 or equivalent, on the armature shaft splines. Install the new drive gear assembly on the armature shaft and install a new stop ring.
5. Position the starter gear plunger lever on the starter frame. **Ensure that the plunger lever properly engages the starter drive assembly.**
6. Install a new stop ring retainer and thrust washer. Partially fill the drive end housing bearing bore with grease (approximately one-quarter full). Position the starter drive plunger lever return spring and drive end housing to the starter frame, and then tighten the through bolts to 6-9 N·m (55-80 lb-in). Install pivot pin.
7. Position the starter drive plunger lever cover on the starter. Tighten the retaining screw.

Starter Motor Brushes Replacement

1. Remove starter drive plunger lever cover.
2. Remove the two through bolts from the starter.
3. Remove the brush end plate.
4. Remove brush spring and pull brushes loose from brush holder.
5. Remove brush holder.
6. Remove the drive end housing and the plunger lever return spring.



7. Remove the starter drive plunger lever pivot pin and lever and remove the armature.
8. Ground brushes. Remove rivet head with file or chisel and remove rivet with 1/8" punch.
9. Cut the brush leads from the field coils as close to the field connection point as possible.
10. Clean and inspect the starter motor.
11. Position the new field brush lead on the field coil connection. Position and crimp the clip provided with the brushes to hold the brush lead to the connection. Solder the lead clip and connection together using rosin core solder. Use a 300 watt iron.

12. Rivet the ground brush leads to the frame with rivets provided in the brush kit.
13. Clean the commutator with 00 or 000 sandpaper.
14. Install the armature in the starter frame.
15. Install the starter drive gear plunger lever to the frame and starter drive assembly and install the pivot pin.
16. Install brush holder and insert brushes in holder and install brush springs.
17. Install the brush end plate.
18. Install the two through bolts to the starter frame.
19. Install starter drive plunger lever cover and tighten retainer screw.
20. Connect the starter to a battery and check operation.

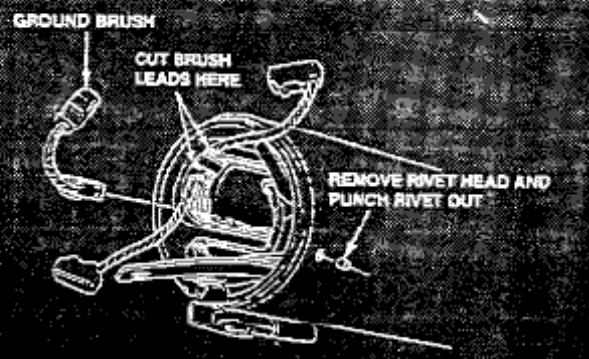
Armature Replacement

1. Remove cover screw, cover and through bolts.
2. Remove pivot pin retaining starter gear plunger lever and remove lever, starter drive end housing, armature, and drive plunger return spring.
3. Remove the armature. If the starter drive gear assembly is being reused, remove the stop ring retainer and stop ring from the end of the armature shaft, and remove the drive.
4. Place the drive gear assembly on the new armature with a new stop ring and retainer.
5. Install the armature in the starter frame.
6. Position the drive gear plunger lever to the frame and drive gear assembly.

DISASSEMBLY AND ASSEMBLY (Continued)

Starter Motor Brushes Replacement

1. Remove starter drive plunger lever cover.
2. Remove the two through bolts from the starter.
3. Remove the brush end plate.
4. Remove brush spring and pull brushes loose from brush holder.
5. Remove brush holder.
6. Remove the drive end housing and the plunger lever return spring.



7. Remove the starter drive plunger lever pivot pin and lever and remove the armature.
8. Ground brushes: Remove rivet head with file or chisel and remove rivet with 1/8" punch.
9. Cut the brush leads from the field coils as close to the field connection point as possible.
10. Clean and inspect the starter motor.
11. Position the new field brush lead on the field coil connection. Position and crimp the clip provided with the brushes to hold the brush lead to the connection. Solder the lead clip and connection together using rosin core solder. Use a 300 watt iron.

12. Rivet the ground brush leads to the frame with rivets provided in the brush kit.
13. Clean the commutator with 00 or 000 sandpaper.
14. Install the armature in the starter frame.
15. Install the starter drive gear plunger lever to the frame and starter drive assembly and install the pivot pin.
16. Install brush holder and insert brushes in holder and install brush springs.
17. Install the brush end plate.
18. Install the two through bolts to the starter frame.
19. Install starter drive plunger lever cover and tighten retainer screw.
20. Connect the starter to a battery and check operation.

Armature Replacement

1. Remove plunger lever cover.
2. Remove through bolts, pivot pin, drive end housing, drive plunger lever return spring and brush end plate.
3. Remove starter gear plunger lever. Remove brushes and lift out brush holder.
4. Remove armature. If starter drive gear assembly is being reused, remove stop ring retainer and stop ring from end of armature shaft. Remove drive gear assembly.
5. Place drive gear assembly on new armature with a new stop ring, thrust washer and retainer.
6. Install armature in starter frame.
7. Position drive gear plunger lever to frame and drive gear assembly.
8. Partially fill drive end housing bearing bore with grease (approximately one-quarter full). Position drive plunger lever return spring, and drive end housing to starter frame. Ensure stop ring retainer is seated properly in drive housing. Install pivot pin.
9. Install brush holder and insert brushes in holder. Install brush springs. Positive brush leads should be positioned in their respective slots to prevent grounding.
10. Install brush end plate. (Be certain end plate insulator is positioned properly on end plate).
11. Install two through bolts to starter frame. Tighten to 6-9 N·m (55-80 lb-in).
12. Install plunger lever cover and tighten retaining screw.
13. Check the starter no-load current draw. The starter no-load current draw specification is 80 amps.

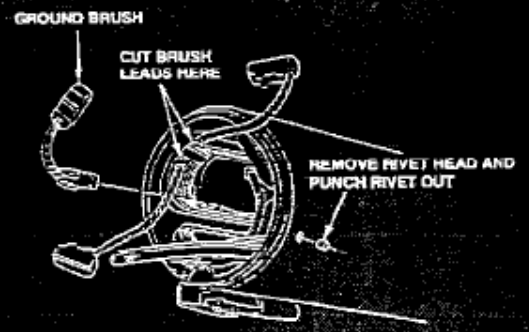
DISASSEMBLY AND ASSEMBLY (Continued)

Starter Drive Replacement

1. Remove cover screw, cover and through bolts.
2. Remove pivot pin retaining starter gear plunger lever and remove lever, starter drive end housing, armature and drive plunger return spring.
3. Remove the drive gear stop ring retainer and stop ring from the groove in the armature shaft and remove the drive gear assemby.
4. Apply a thin coating of Lubriplate 777 or equivalent, on the armature shaft splines. Install the new drive gear assembly on the armature shaft and install a new stop ring.
5. Position the starter gear plunger lever on the starter frame. **Ensure that the plunger lever properly engages the starter drive assembly.**
6. Install a new stop ring retainer and thrust washer. Partially fill the drive end housing bearing bore with grease (approximately one-quarter full). Position the starter drive plunger lever return spring and drive end housing to the starter frame, and then tighten the through bolts to 6-9 N·m (55-80 lb-in). Install pivot pin.
7. Position the starter drive plunger lever cover on the starter. Tighten the retaining screw.

Starter Motor Brushes Replacement

1. Remove starter drive plunger lever cover.
2. Remove the two through bolts from the starter.
3. Remove the brush end plate.
4. Remove brush spring and pull brushes loose from brush holder.
5. Remove brush holder.
6. Remove the drive end housing and the plunger lever return spring.



7. Remove the starter drive plunger lever pivot pin and lever and remove the armature.
8. Ground brushes: Remove rivet head with file or chisel and remove rivet with 1/8" punch.
9. Cut the brush leads from the field coils as close to the field connection point as possible.
10. Clean and inspect the starter motor.
11. Position the new field brush lead on the field coil connection. Position and crimp the clip provided with the brushes to hold the brush lead to the connection. Solder the lead clip and connection together using rosin core solder. Use a 300 watt iron.

12. Rivet the ground brush leads to the frame with rivets provided in the brush kit.
13. Clean the commutator with 00 or 000 sandpaper.
14. Install the armature in the starter frame.
15. Install the starter drive gear plunger lever to the frame and starter drive assembly and install the pivot pin.
16. Install brush holder and insert brushes in holder and install brush springs.
17. Install the brush end plate.
18. Install the two through bolts to the starter frame.
19. Install starter drive plunger lever cover and tighten retainer screw.
20. Connect the starter to a battery and check operation.

Armature Replacement

1. Remove cover screw, cover and through bolts.
2. Remove pivot pin retaining starter gear plunger lever and remove lever, starter drive end housing, armature, and drive plunger return spring.
3. Remove the armature. If the starter drive gear assembly is being reused, remove the stop ring retainer and stop ring from the end of the armature shaft, and remove the drive.
4. Place the drive gear assembly on the new armature with a new stop ring and retainer.
5. Install the armature in the starter frame.
6. Position the drive gear plunger lever to the frame and drive gear assembly.

DISASSEMBLY AND ASSEMBLY (Continued)

Armature Replacement (Continued)

7. Partially fill the drive end housing bearing bore with grease (approximately one-quarter full). Position the drive plunger lever return spring, and the drive end housing to the starter frame. Be sure that the stop ring retainer is seated properly in the drive housing. Install pivot pin.
8. Install brush holder and insert brushes in holder and install brush springs. Positive brush leads should be positioned in their respective slots to prevent grounding.
9. Install the brush end plate. (Be certain end plate insulator is positioned properly on end plate).
10. Install the two through bolts to the starter frame and tighten to 6-9 N·m (55-80 lb-in).
11. Install plunger lever cover and tighten retaining screw.
12. Check the starter no-load current draw. Starter no-load current draw specification is 80 amps.

SPECIFICATIONS

Starter

Positive Engagement Starter Motor								Starter Brushes				Torque Specifications					
Diameter		Current Draw Under Normal Load	Normal Engine Cranking Speed	Min. Stall Torque @ 5 Volts		Max. Load	No Load	Mfg. Length		Spring Tension		Through Bolt		Mounting Bolt		Cable Attaching Screw

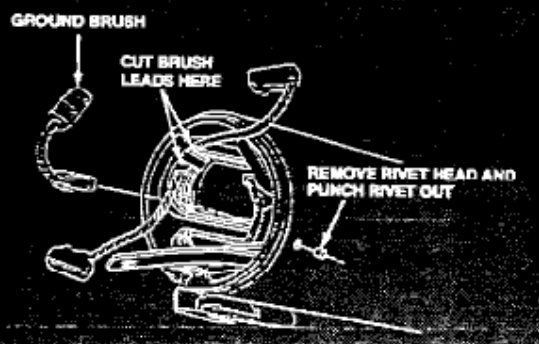
DISASSEMBLY AND ASSEMBLY (Continued)

Starter Drive Replacement

1. Remove cover screw, cover and through bolts.
2. Remove pivot pin retaining starter gear plunger lever and remove lever, starter drive end housing, armature and drive plunger return spring.
3. Remove the drive gear stop ring retainer and stop ring from the groove in the armature shaft and remove the drive gear assembly.
4. Apply a thin coating of Lubriplate 777 or equivalent, on the armature shaft splines. Install the new drive gear assembly on the armature shaft and install a new stop ring.
5. Position the starter gear plunger lever on the starter frame. **Ensure that the plunger lever properly engages the starter drive assembly.**
6. Install a new stop ring retainer and thrust washer. Partially fill the drive end housing bearing bore with grease (approximately one-quarter full). Position the starter drive plunger lever return spring and drive end housing to the starter frame, and then tighten the through bolts to 6-9 N·m (55-80 lb-in). Install pivot pin.
7. Position the starter drive plunger lever cover on the starter. Tighten the retaining screw.

Starter Motor Brushes Replacement

1. Remove starter drive plunger lever cover.
2. Remove the two through bolts from the starter.
3. Remove the brush end plate.
4. Remove brush spring and pull brushes loose from brush holder.
5. Remove brush holder.
6. Remove the drive end housing and the plunger lever return spring.



7. Remove the starter drive plunger lever pivot pin and lever and remove the armature.
8. Ground brushes: Remove rivet head with file or chisel and remove rivet with 1/8" punch.
9. Cut the brush leads from the field coils as close to the field connection point as possible.
10. Clean and inspect the starter motor.
11. Position the new field brush lead on the field coil connection. Position and crimp the clip provided with the brushes to hold the brush lead to the connection. Solder the lead clip and connection together using rosin core solder. Use a 300 watt iron.

12. Rivet the ground brush leads to the frame with rivets provided in the brush kit.
13. Clean the commutator with 00 or 000 sandpaper.
14. Install the armature in the starter frame.
15. Install the starter drive gear plunger lever to the frame and starter drive assembly and install the pivot pin.
16. Install brush holder and insert brushes in holder and install brush springs.
17. Install the brush end plate.
18. Install the two through bolts to the starter frame.
19. Install starter drive plunger lever cover and tighten retainer screw.
20. Connect the starter to a battery and check operation.

Armature Replacement

1. Remove cover screw, cover and through bolts.
2. Remove pivot pin retaining starter gear plunger lever and remove lever, starter drive end housing, armature, and drive plunger return spring.
3. Remove the armature. If the starter drive gear assembly is being reused, remove the stop ring retainer and stop ring from the end of the armature shaft, and remove the drive.
4. Place the drive gear assembly on the new armature with a new stop ring and retainer.
5. Install the armature in the starter frame.
6. Position the drive gear plunger lever to the frame and drive gear assembly.

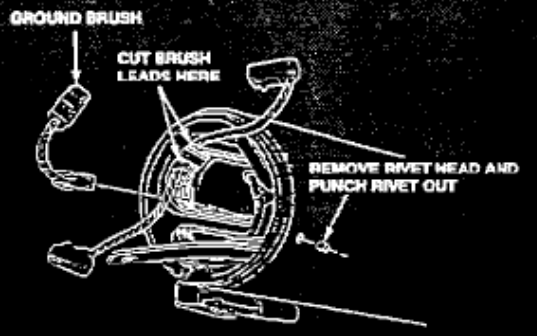
1989 TEMPO/TOPAZ, ESCORT

DISASSEMBLY AND ASSEMBLY (Continued)

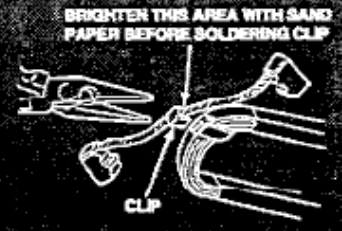
6. Position starter gear plunger lever on starter frame. **Ensure that plunger lever properly engages starter drive assembly.**
7. Install a new stop ring, retainer and thrust washer. Partially fill drive end housing bearing bore with grease (approximately 1/4 full). Position starter drive plunger lever return spring and drive end housing to starter frame. Tighten through bolts to 6-9 N·m (55-80 lb-in). Install pivot pin.
8. Position starter drive plunger lever cover on starter. Tighten retaining screw.

Starter Motor Brushes Replacement

1. Remove starter drive plunger lever cover.
2. Remove the two through bolts from the starter.
3. Remove the brush end plate.
4. Remove brush spring and pull brushes loose from brush holder.
5. Remove brush holder.
6. Remove the drive end housing and the plunger lever return spring.



7. Remove the starter drive plunger lever pivot pin and lever and remove the armature.
8. Ground brushes: Remove rivet head with file or chisel and remove rivet with 1/8" punch.
9. Cut the brush leads from the field coils as close to the field connection point as possible.
10. Clean and inspect the starter motor.
11. Position the new field brush lead on the field coil connection. Position and crimp the clip provided with the brushes to hold the brush lead to the connection. Solder the lead clip and connection together using rosin core solder. Use a 300 watt iron.



12. Rivet the ground brush leads to the frame with rivets provided in the brush kit.
13. Clean the commutator with 00 or 000 sandpaper.
14. Install the armature in the starter frame.
15. Install the starter drive gear plunger lever to the frame and starter drive assembly and install the pivot pin.
16. Install brush holder and insert brushes in holder and install brush springs.
17. Install the brush end plate.
18. Install the two through bolts to the starter frame.
19. Install starter drive plunger lever cover and tighten retainer screw.
20. Connect the starter to a battery and check operation.

Armature Replacement

1. Remove plunger lever cover.
2. Remove through bolts, pivot pin, drive end housing, drive plunger lever return spring and brush end plate.
3. Remove starter gear plunger lever. Remove brushes and lift out brush holder.
4. Remove armature. If starter drive gear assembly is being reused, remove stop ring retainer and stop ring from end of armature shaft. Remove drive gear assembly.
5. Place drive gear assembly on new armature with a new stop ring and retainer.
6. Install armature in starter frame.
7. Position drive gear plunger lever to frame and drive gear assembly.
8. Partially fill drive end housing bearing bore with grease (approximately 1/4 full). Position drive plunger lever return spring, and drive end housing to starter frame. Ensure stop ring retainer is seated properly in drive housing. Install pivot pin.
9. Install brush holder and insert brushes in holder. Install brush springs. Positive brush leads should be positioned in their respective slots to prevent grounding.
10. Install brush end plate. (Be certain end plate insulator is positioned properly on end plate).

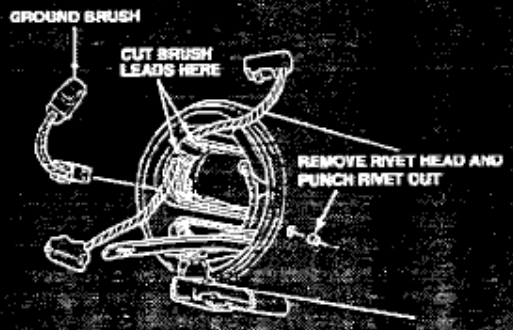
DISASSEMBLY AND ASSEMBLY (Continued)

Starter Drive Replacement

1. Remove cover screw, cover and through bolts.
2. Remove pivot pin retaining starter gear plunger lever and remove lever, starter drive end housing, armature and drive plunger return spring.
3. Remove the drive gear stop ring retainer and stop ring from the groove in the armature shaft and remove the drive gear assembly.
4. Apply a thin coating of Lubriplate 777 or equivalent, on the armature shaft splines. Install the new drive gear assembly on the armature shaft and install a new stop ring.
5. Position the starter gear plunger lever on the starter frame. Ensure that the plunger lever properly engages the starter drive assembly.
6. Install a new stop ring retainer and thrust washer. Partially fill the drive end housing bearing bore with grease (approximately one-quarter full). Position the starter drive plunger lever return spring and drive end housing to the starter frame, and then tighten the through bolts to 6-9 N·m (55-80 lb-in). Install pivot pin.
7. Position the starter drive plunger lever cover on the starter. Tighten the retaining screw.

Starter Motor Brushes Replacement

1. Remove starter drive plunger lever cover.
2. Remove the two through bolts from the starter.
3. Remove the brush end plate.
4. Remove brush spring and pull brushes loose from brush holder.
5. Remove brush holder.
6. Remove the drive end housing and the plunger lever return spring.



7. Remove the starter drive plunger lever pivot pin and lever and remove the armature.
8. Ground brushes. Remove rivet head with file or chisel and remove rivet with 1/8" punch.
9. Cut the brush leads from the field coils as close to the field connection point as possible.
10. Clean and inspect the starter motor.
11. Position the new field brush lead on the field coil connection. Position and crimp the clip provided with the brushes to hold the brush lead to the connection. Solder the lead clip and connection together using rosin core solder. Use a 300 watt iron.

12. Rivet the ground brush leads to the frame with rivets provided in the brush kit.
13. Clean the commutator with 00 or 000 sandpaper.
14. Install the armature in the starter frame.
15. Install the starter drive gear plunger lever to the frame and starter drive assembly and install the pivot pin.
16. Install brush holder and insert brushes in holder and install brush springs.
17. Install the brush end plate.
18. Install the two through bolts to the starter frame.
19. Install starter drive plunger lever cover and tighten retainer screw.
20. Connect the starter to a battery and check operation.

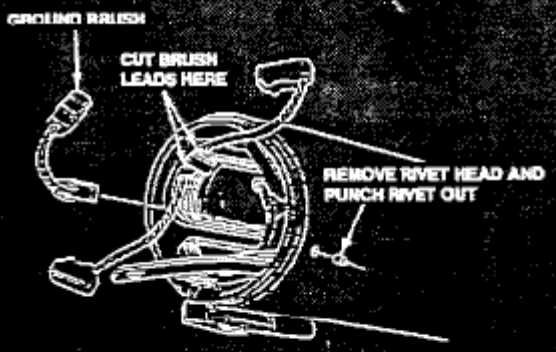
Armature Replacement

1. Remove cover screw, cover and through bolts.
2. Remove pivot pin retaining starter gear plunger lever and remove lever, starter drive end housing, armature, and drive plunger return spring.
3. Remove the armature. If the starter drive gear assembly is being reused, remove the stop ring retainer and stop ring from the end of the armature shaft, and remove the drive.
4. Place the drive gear assembly on the new armature with a new stop ring and retainer.
5. Install the armature in the starter frame.
6. Position the drive gear plunger lever to the frame and drive gear assembly.

DISASSEMBLY AND ASSEMBLY (Continued)

Starter Motor Brushes Replacement

1. Remove starter drive plunger lever cover.
2. Remove the two through bolts from the starter.
3. Remove the brush end plate.
4. Remove brush spring and pull brushes loose from brush holder.
5. Remove brush holder.
6. Remove the drive end housing and the plunger lever return spring.



7. Remove the starter drive plunger lever pivot pin and lever and remove the armature.
8. Ground brushes: Remove rivet head with file or chisel and remove rivet with 1/8" punch.
9. Cut the brush leads from the field coils as close to the field connection point as possible.
10. Clean and inspect the starter motor.
11. Position the new field brush lead on the field coil connection. Position and crimp the clip provided with the brushes to hold the brush lead to the connection. Solder the lead clip and connection together using rosin core solder. Use a 300 watt iron.

12. Rivet the ground brush leads to the frame with rivets provided in the brush kit.
13. Clean the commutator with 00 or 000 sandpaper.
14. Install the armature in the starter frame.
15. Install the starter drive gear plunger lever to the frame and starter drive assembly and install the pivot pin.
16. Install brush holder and insert brushes in holder and install brush springs.
17. Install the brush end plate.
18. Install the two through bolts to the starter frame.
19. Install starter drive plunger lever cover and tighten retainer screw.
20. Connect the starter to a battery and check operation.

Armature Replacement

1. Remove plunger lever cover.
2. Remove through bolts, pivot pin, drive end housing, drive plunger lever return spring and brush end plate.
3. Remove starter gear plunger lever. Remove brushes and lift out brush holder.
4. Remove armature. If starter drive gear assembly is being reused, remove stop ring retainer and stop ring from end of armature shaft. Remove drive gear assembly.
5. Place drive gear assembly on new armature with a new stop ring, thrust washer and retainer.
6. Install armature in starter frame.
7. Position drive gear plunger lever to frame and drive gear assembly.
8. Partially fill drive end housing bearing bore with grease (approximately one-quarter full). Position drive plunger lever return spring, and drive end housing to starter frame. Ensure stop ring retainer is seated properly in drive housing. Install pivot pin.
9. Install brush holder and insert brushes in holder. Install brush springs. Positive brush leads should be positioned in their respective slots to prevent grounding.
10. Install brush end plate. (Be certain end plate insulator is positioned properly on end plate).
11. Install two through bolts to starter frame. Tighten to 6-9 N·m (55-80 lb-in).
12. Install plunger lever cover and tighten retaining screw.
13. Check the starter no-load current draw. The starter no-load current draw specification is 80 amps.

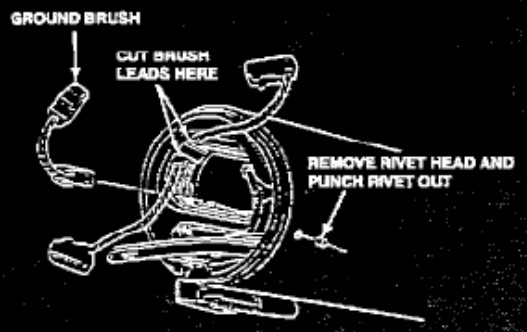
DISASSEMBLY AND ASSEMBLY (Continued)

Starter Drive Replacement

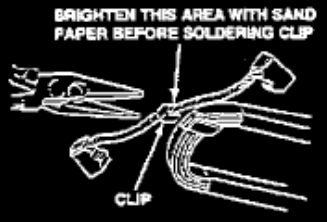
1. Remove cover screw, cover and through bolts.
2. Remove pivot pin retaining starter gear plunger lever and remove lever, starter drive end housing, armature and drive plunger return spring.
3. Remove the drive gear stop ring retainer and stop ring from the groove in the armature shaft and remove the drive gear assemby.
4. Apply a thin coating of Lubriplate 777 or equivalent, on the armature shaft splines. Install the new drive gear assembly on the armature shaft and install a new stop ring.
5. Position the starter gear plunger lever on the starter frame. **Ensure that the plunger lever properly engages the starter drive assembly.**
6. Install a new stop ring retainer and thrust washer. Partially fill the drive end housing bearing bore with grease (approximately one-quarter full). Position the starter drive plunger lever return spring and drive end housing to the starter frame, and then tighten the through bolts to 6-9 N·m (55-80 lb-in). Install pivot pin.
7. Position the starter drive plunger lever cover on the starter. Tighten the retaining screw.

Starter Motor Brushes Replacement

1. Remove starter drive plunger lever cover.
2. Remove the two through bolts from the starter.
3. Remove the brush end plate.
4. Remove brush spring and pull brushes loose from brush holder.
5. Remove brush holder.
6. Remove the drive end housing and the plunger lever return spring.



7. Remove the starter drive plunger lever pivot pin and lever and remove the armature.
8. Ground brushes: Remove rivet head with file or chisel and remove rivet with 1/8" punch.
9. Cut the brush leads from the field coils as close to the field connection point as possible.
10. Clean and inspect the starter motor.
11. Position the new field brush lead on the field coil connection. Position and crimp the clip provided with the brushes to hold the brush lead to the connection. Solder the lead clip and connection together using rosin core solder. Use a 300 watt iron.



12. Rivet the ground brush leads to the frame with rivets provided in the brush kit.
13. Clean the commutator with 00 or 000 sandpaper.
14. Install the armature in the starter frame.
15. Install the starter drive gear plunger lever to the frame and starter drive assembly and install the pivot pin.
16. Install brush holder and insert brushes in holder and install brush springs.
17. Install the brush end plate.
18. Install the two through bolts to the starter frame.
19. Install starter drive plunger lever cover and tighten retainer screw.
20. Connect the starter to a battery and check operation.

Armature Replacement

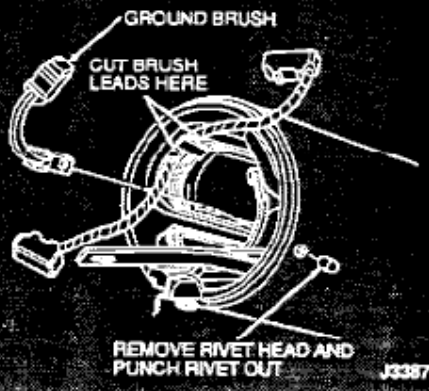
1. Remove cover screw, cover and through bolts.
2. Remove pivot pin retaining starter gear plunger lever and remove lever, starter drive end housing, armature, and drive plunger return spring.
3. Remove the armature. If the starter drive gear assembly is being reused, remove the stop ring retainer and stop ring from the end of the armature shaft, and remove the drive.
4. Place the drive gear assembly on the new armature with a new stop ring and retainer.
5. Install the armature in the starter frame.
6. Position the drive gear plunger lever to the frame and drive gear assembly.

DISASSEMBLY AND ASSEMBLY (Continued)

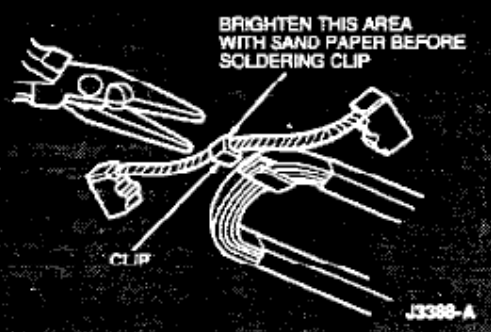
6. Install a new stop ring retainer and thrust washer. Partially fill the drive end housing bearing bore with grease (approximately one-quarter full). Position the starter drive plunger lever return spring and drive end housing to the starter frame, and then tighten the through bolts to 6-9 N·m (55-80 lb-in). Install pivot pin.
7. Position the starter drive plunger lever cover on the starter. Tighten the retaining screw.

Starter Motor Brushes Replacement

1. Remove starter drive plunger lever cover.
2. Remove two through bolts from starter.
3. Remove brush end plate.
4. Remove brush spring and pull brushes loose from brush holder.
5. Remove brush holder.
6. Remove drive end housing and plunger lever return spring.



7. Remove starter drive plunger lever pivot pin and lever and remove armature.
8. Ground brushes. Remove rivet head with file or chisel and remove rivet with 1/8 inch punch.
9. Cut brush leads from field coils as close to field connection point as possible.
10. Clean and inspect starter motor.
11. Position new field brush lead on field coil connection. Position and crimp clip provided with brushes to hold brush lead to connection. Solder lead clip and connection together using rosin core solder. Use a 300 watt iron.



12. Rivet ground brush leads to frame with rivets provided in brush kit.
13. Clean commutator with 00 or 000 sandpaper.
14. Install armature in starter frame.
15. Install starter drive gear plunger lever to frame and starter drive assembly and install pivot pin.
16. Install brush holder and insert brushes in holder and install brush springs.
17. Install brush end plate.
18. Install two through bolts to starter frame.
19. Install starter drive plunger lever cover and tighten retainer screw.
20. Connect starter to a battery to check operation.

Armature Replacement

1. Remove cover screw, cover and through bolts.
2. Remove pivot pin retaining starter gear plunger lever and remove lever, starter drive end housing, armature, and drive plunger return spring.
3. Remove the armature. If the starter drive gear assembly is being reused, remove the stop ring retainer and stop ring from the end of the armature shaft, and remove the drive.
4. Place the drive gear assembly on the new armature with a new stop ring and retainer.
5. Install the armature in the starter frame.
6. Position the drive gear plunger lever to the frame and drive gear assembly.
7. Partially fill the drive end housing bearing bore with grease (approximately one-quarter full). Position the drive plunger lever return spring, and the drive end housing to the starter frame. Be sure that the stop ring retainer is seated properly in the drive housing. Install pivot pin.
8. Install brush holder and insert brushes in holder and install brush springs. Positive brush leads should be positioned in their respective slots to prevent grounding.
9. Install the brush end plate. (Be certain end plate insulator is positioned properly on end plate).

DISASSEMBLY AND ASSEMBLY (Continued)

10. Install the two through bolts to the starter frame and tighten to 6-9 N·m (55-80 lb-in).
11. Install plunger lever cover and tighten retaining screw.
12. Check the starter no-load current draw. Starter no-load current draw specification is 80 amps.

DISASSEMBLY AND ASSEMBLY (Continued)

7. Install a new stop ring retainer and thrust washer. Partially fill drive end housing bearing bore with grease (approximately 1/4 full). Position starter drive plunger lever return spring and drive end housing to starter frame. Tighten through bolts to 6-9 N·m (55-80 lb-in). Install pivot pin.
8. Position starter drive plunger lever cover on starter. Tighten retaining screw.

Starter Motor Brushes Replacement

1. Remove starter drive plunger lever cover.
2. Remove two through bolts from starter.
3. Remove brush end plate.
4. Remove brush spring and pull brushes loose from brush holder.
5. Remove brush holder.
